PGD IN CHEMICAL SCIENCE (PROGRAM CODE: CHEM00)

Program Code : CHEM00	Programme Outcome	Building strong foundation in areas of chemical and nuclear sciences
		Prepare young chemists for pursuing research in frontier areas of chemical and nuclear sciences
		Train the manpower for DAE in chemical aspects in nuclear science and technology
		Prepare the manpower for societal and strategic areas of DAE

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**
2. **IGCAR**
    - **SYLLABUS**
    - **PSO-CO**

PGD IN ENGINEERING SCIENCE (PROGRAM CODE: ENGG00)

Program Code : ENGG00	Programme Outcome	To provide DAE with a manpower trained in the nuances of Nuclear Science & Technology
		Building strong foundation in the area of engineering and nuclear sciences
		Expose the young students to state-of-the art experimental techniques and development of experimental facilities
		Teach fundamental aspects pertaining to latest developments in the field of engineering and nuclear sciences
		Understanding the role of engineering sciences in DAE programmes
		Understating the role of engineering sciences in societal and strategic programmes

1. **BARC**
   - **SYLLABUS**
   - **PSO-CO**
2. **BARC - AMD GEOLOGY & GEOPHYSICS**
   - **SYLLABUS**
   - **PSO-CO**
3. **BARC - NFC**
   - **SYLLABUS**
   - **PSO-CO**
4. **IGCAR**
   - **SYLLABUS**
   - **PSO-CO**
5. **RRCAT**
   - **SYLLABUS**
   - **PSO-CO**

PGD IN LIFE SCIENCE (PROGRAM CODE: LIFE00)

Program Code : LIFE00	Programme Outcome	To provide DAE with a manpower trained in the nuances of Nuclear Science & Technology in Life Sciences
		Building strong foundation in the area of Life and nuclear sciences
		Expose the young students to state-of-the art experimental techniques
		Teach fundamental aspects pertaining to latest developments in the field of Life and nuclear sciences
		Understanding the role of Life Science in DAE programmes
		Understanding the role of biology in societal and strategic programmes

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

PGD IN PHYSICAL SCIENCE (PROGRAM CODE: PHYS00)

Program Code : PHYS00	Programme Outcome	To provide DAE with a manpower trained in the nuances of Nuclear Science & Technology in Physical Sciences
		Building strong foundation in the area of physical and nuclear sciences
		Expose the young students to state-of-the art experimental techniques
		Teach fundamental aspects pertaining to latest developments in the field of physical and nuclear sciences
		Understanding the role of physics in DAE programmes
		Understanding the role of physics in societal and strategic programmes

BACK TO MAIN

M.Tech.
(PROGRAM CODE: ENGG01)

Program Code : ENGG01	Programme Outcome	Advanced knowledge in engineering science with required knowledge in Physics and mathematics for understanding complex engineering problems
		Training in working with various equipment, computational tools and familiarizing with simulation and modeling

1. **BARC**
   - **SYLLABUS**
   - **PSO-CO**
2. **BARC - AMD GEOLOGY & GEOPHYSICS**
   - **SYLLABUS**
   - **PSO-CO**
3. **BARC - NFC**
   - **SYLLABUS**
   - **PSO-CO**
4. **IGCAR**
   - **SYLLABUS**
   - **PSO-CO**
5. **RRCAT**
   - **SYLLABUS**
   - **PSO-CO**
6. **IPR**
   - **SYLLABUS**
   - **PSO-CO**

BACK TO MAIN

M.Phil. in CHEMICAL SCIENCE (PROGRAM CODE: CHEM02)

Program Code : CHEM02	Programme Outcome	Building strong foundation in fundamentals of core subjects in chemical sciences including Inorganic, Nuclear, Physical and Analytical Chemistry
		Development of skills in applying the basic knowledge in chemical sciences to applications in DAE programme
		Skill developments in effective communication of scientific results
		Development of skill set necessary for starting a research career in chemical sciences and allied areas
		Appreciate the central role of chemistry in DAE programmes and apply these to take up research in key issues such energy, health and medicine.

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**
2. **IGCAR**
    - **SYLLABUS**
    - **PSO-CO**

M.Phil. in PHYSICAL SCIENCE (PROGRAM CODE: PHYS02)

Program Code : PHYS02	Programme Outcome	Manpower development with the ability to apply basic concepts and methods in physics to research problems.
		Training in working with interdisciplinary subjects with physics as one of the disciplines
		Developing an understanding of modern mathematical methods and using them in the research environment.

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**
2. **IGCAR**
    - **SYLLABUS**
    - **PSO-CO**
3. **RRCAT**
    - **SYLLABUS**
    - **PSO-CO**

M.Sc. in ENGINEERING SCIENCE (PROGRAM CODE: ENGG03)

Program Code : ENGG03	Programme Outcome	Apply the knowledge of Natural sciences, mathematics and engineering sciences to the solution of complex engineering problems in the field of specialisation
		Ability to Identify new research problem, formulate the problem, to find the appropriate best solution to the complex engineering problem with relevant input from research literature, performing the requisite experiments and computational calculation

1. **BARC**
   - **SYLLABUS**
   - **PSO-CO**
2. **IGCAR**
   - **SYLLABUS**
   - **PSO-CO**
3. **IPR**
   - **SYLLABUS**
   - **PSO-CO**

BACK TO MAIN

Ph.D. in APPLIED SYSTEMS ANALYSIS (Program Code: APSA04)

Program Code : APSA04	Programme Outcome	To conduct policy-oriented research into problems involving multi-disciplinary approach

1. **NISER**

    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

Ph.D. IN CHEMICAL SCIENCE
(PROGRAM CODE: CHEM04)

Program Code : CHEM04	Programme Outcome	Foundation in the fundamentals of core chemical sciences fields including those in Analytical, Inorganic, Nuclear and Physical Chemistry.
		Skill development in critical thinking and problem solving applied to scientific problems.
		Development of skills to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large.
		Development of skill set necessary for starting a research career in chemical sciences and allied areas
		Appreciate the central role of chemistry in DAE programmes and apply these to take up research in key issues such energy, health and medicine.

1. **BARC**
   - **SYLLABUS / PSO-CO**
2. **IGCAR**
   - **SYLLABUS**
   - **PSO-CO**
3. **NISER**
   - **SYLLABUS**
   - **PSO-CO**

BACK TO MAIN

Ph.D. IN ENGINEERING SCIENCE (PROGRAM CODE: ENGG04)

Program Code : ENGG04	Programme Outcome	Manpower development with the ability to apply basic concepts and methods in physics, mathematics and engineering to the complex engineering problems.
		A thorough understanding of knowledge within their research area in engineering sciences and basic understanding in allied areas
		Skill development in critical thinking and problem solving applied to complex engineering problems.
		Development of skills to clearly communicate the results of engineering research work in oral, written and electronic formats to both technocrats and the public at large.
		Development of skill set necessary for starting a research career in engineering sciences and allied areas
		Appreciate the central role of engineering sciences in DAE programmes and apply these to take up research in key issues like advanced reactor design, reactor safety, material development etc.

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**
2. **IGCAR**
    - **SYLLABUS**
    - **PSO-CO**
3. **VECC**
    - **SYLLABUS**
    - **PSO-CO**
4. **IPR**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

Ph.D. IN LIFE SCIENCE (PROGRAM CODE: LIFE04)

Program Code : LIFE04	Programme Outcome	A thorough understanding of knowledge within their research area in life sciences and basic understanding in allied areas
		Skill development in critical thinking and problem solving applied to scientific problems.
		Development of skills to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large.
		Development of skill set necessary for starting a research career in Life sciences and allied areas
		Appreciate the central role of life sciences in DAE programmes and apply these to take up research in key issues such food, agriculture, health and medicine.

1. **BARC**
   - **SYLLABUS / PSO-CO**
2. **SINP**
   - **SYLLABUS**
   - **PSO-CO**
3. **TMC**
   - **SYLLABUS**
   - **PSO-CO**
4. **IMSc**
   - **SYLLABUS**
   - **PSO-CO**
5. **NISER**
   - **SYLLABUS**
   - **PSO-CO**

BACK TO MAIN

Ph.D. in MATHEMATICAL SCIENCES (PROGRAM CODE: MATH04)

Program Code : MATH04	Programme Outcome	At the end of the program, the student should be knowing the basic concepts and tools in the core subjects of pure mathematics to undertake research for thesis work.

1. **HRI**
   - **SYLLABUS**
   - **PSO-CO**
2. **IMSc**
   - **SYLLABUS**
   - **PSO-CO**
3. **NISER**
   - **SYLLABUS**
   - **PSO-CO**

Ph.D. in COMPUTER SCIENCES (PROGRAM CODE: MATH04)

Program Code : MATH04	Programme Outcome	A deep understanding of foundational and theoretical aspects of Computer Science
		Development of critical analytic skills applicable across sub-areas
		Development of self-direction and originality in problem-solving

1. **IMSC**
   - **SYLLABUS**
   - **PSO-CO**
2. **NISER**
   - **SYLLABUS**
   - **PSO-CO**

BACK TO MAIN

Ph.D. IN PHYSICAL SCIENCE (PROGRAM CODE: PHYS04)

Program Code : PHYS04	Programme Outcome	Manpower development with the ability to apply basic concepts and methods in physics to research problems.
		Training of manpower to take up research in frontier areas of physics
		Building human resource in carrying out R&D in physical and nuclear sciences
		Training of manpower in working in interdisciplinary subjects with physics as one of the subjects

Ph.D. IN MEDICAL & HEALTH SCIENCES (PROGRAM CODE: HLTH04)

Program Code: HLTH04	**Program Outcomes**	Knowledge and scientific competencies: research methods, information literacy, scientific writing, professional conduct, ethics and integrity, and awareness of interdisciplinary contexts.
		Organization and management competencies: project management, self-management, and teaching.
		Training in application of Nuclear Medicine in diagnosis and therapy of diseases.

1. **TMC**
    - **SYLLABUS**
    - **PSO-CO**

INTEGRATED Ph.D. in ENGINEERING SCIENCE

(DOUBLE DEGREE)

(Program Code: ENGG05)

Program Code : ENGG05	Programme Outcome	Manpower development with ability to apply basic concepts and methods in physics to engineering problems
		Skill development in working in interdisciplinary research problems
		Developing understanding of modern mathematical methods and using them in research environments
		Ability to apply the basic knowledge in engineering science to DAE programme

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**
2. **IGCAR**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

INTEGRATED Ph.D. LIFE SCIENCES

(DOUBLE DEGREE)
(Program Code: LIFE05)

Program Code : LIFE05	Programme Outcome	To provide DAE with manpower trained in the nuances of Nuclear Science & Technology in Life Sciences
		Building strong foundation in the area of Life and nuclear sciences
		Expose the young students to state-of-the art experimental techniques
		Teach fundamental aspects pertaining to latest developments in the field of Life and nuclear sciences
		Understanding the role of Life Science in DAE programmes
		Understanding the role of biology in societal and strategic programmes

1. IMSc

- **SYLLABUS**
- **PSO-CO**

BACK TO MAIN

INTEGRATED Ph.D. MATHEMATICAL SCIENCES

(DOUBLE DEGREE)

(Program Code: MATH05)

Program Code : MATH05	Programme Outcome	Original research in chosen specialized area
		Knowledge of literature in chosen area and related areas
		Ability to apply concepts and techniques in problem solving
		Ability to communicate clearly both orally and in writing
		Ability to critically evaluate current research

1. IMSc

- **SYLLABUS**
- **PSO-CO**

BACK TO MAIN

INTEGRATED Ph.D. in PHYSICAL SCIENCE

(DOUBLE DEGREE)

(Program Code: PHYS05)

Program Code : PHYS05	Programme Outcome	Manpower development with the ability to apply basic concepts and methods in physics to research problems.
		Training of manpower with the ability to work in interdisciplinary subjects, particularly those in the interface of different disciplines in physics.
		Developing an understanding of modern mathematical methods and using them in the research environment.
		Training of manpower which has the ability to work in diverse areas and adapt to change in professional and national requirements.

1. **HRI**
   - **SYLLABUS**
   - **PSO-CO**
2. **IMSC**
   - **SYLLABUS**
   - **PSO-CO**
3. **NISER**
   - **SYLLABUS**
   - **PSO-CO**

DIPLOMA in MEDICAL RADIOISOTOPE TECHNIQUES (DMRIT) (Program Code: HLTH07)

Program Code :HLTH07	Programme Outcome	To develop human resource, in the form of Nuclear Medicine Technologist, for nuclear medicine departments of various hospitals in the country, possessing specialized knowledge in theoretical & experimental nuclear medicine techniques.
		Understand techniques in Scintigraphy and PET-CT for application of radioisotopes in nuclear medicine -diagnosis & -treatment.
		To develop theoretical and practical knowledge and the required competencies to function in a nuclear medicine setup.
		To be able to adopt and apply, both established and evolving techniques & technologies, in radiopharmaceutical formulations, for both SPECT & PET agents, nuclear medicine imaging techniques and laboratory applications like radioimmunoassay (RIA), Immunoradiometric assay (IRMA) and other related methods.

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**

M.Sc. in PHYSICAL SCIENCES (Program Code: PHYS08)

Program Code : PHYS08	Programme Outcome	Develop manpower with the ability to apply basic concepts and methods in physics to understand diverse phenomena.
		Develop manpower with the ability to work in interdisciplinary subjects, particularly those in the interface of physics and engineering
		Develop manpower with the understanding of modern mathematical methods and the ability to apply them in any quantitative analysis.

1. **HRI**

- **SYLLABUS**
- **PSO-CO**

M.D.
(PROGRAM CODE: HLTH09A)

Program Code : HLTH09	Programme Outcome	Ability to provide evidence-based treatment to the patient.
		Well informed about the established and evolving biomedical and Clinical sciences and ability to apply the knowledge for patient's care in the area of specialisation.
		Ability to communicate with the patient effectively about health care advice and treatment.
		Ability to carry out professional work by maintaining high ethical standards.

I. M.D. (PATHOLOGY)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

II. M.D. (RADIO – DIAGNOSIS)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

III. M.D. (RADIATION ONCOLOGY)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

IV. M.D. (MICROBIOLOGY)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

   - PSO-CO
2. TMC
   - SYLLABUS
   - PSO-CO

VI. M.D. (PALLIATIVE MEDICINE)

1. TMC
   - SYLLABUS
   - PSO-CO

VII. M.D. (IMMUNO – HEMATOLOGY & TRANSFUSION MEDICINE)

1. TMC
   - SYLLABUS
   - PSO-CO

VIII. M.D. (ANESTHESIA)

1. TMC
   - SYLLABUS
   - PSO-CO

BACK TO MAIN

D.M.
(PROGRAM CODE: HLTH10A)

Program Code : HLTH10A	Programme Outcome	Ability to diagnose health issues and provide comprehensive care to the patient in the area of super specialization.
		Ability to carry out all necessary diagnostic and therapeutic procedures as required in the area of super specialization.
		Extensive knowledge in the area of super specialization and the ability to apply the knowledge for optimal treatment of the patient.
		Ability to counsel parents and relatives of the patient with empathy and compassion
		Ability to design and execute research projects and interact with medical colleagues in multiple disciplines
		Ability to conduct teaching sessions, bedside seminars and lectures

I. D.M. (MEDICAL ONCOLOGY)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

II. D.M. (PAEDIATRIC ONCOLOGY)

1. **TMC**
   - **SYLLABUS**
   - **PSO-CO**

III. **D.M. (GASTROENTEROLOGY)**

1. **TMC**
    - **SYLLABUS**
    - **PSO-CO**

IV. **D.M. (CRITICAL CARE MEDICINE)**

1. **TMC**
    - **SYLLABUS**
    - **PSO-CO**

V. **D.M. (ONCOPATHOLOGY)**

1. **TMC**
    - **SYLLABUS**
    - **PSO-CO**

VI. **D.M. (INTERVENTIONAL RADIOLOGY)**

1. **TMC**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

M.Ch

(PROGRAM CODE: HLTH10B)

Program Code : HLTH10B	Programme outcome	Development of trained man power in Oncology.
		Building strong foundation in clinical research and surgery.

1. **M.Ch (SURGICAL ONCOLOGY)**
   - **SYLLABUS**
   - **PSO-CO**
2. **M.Ch (GYNECOLOGICAL ONCOLOGY)**
   - **SYLLABUS**
   - **PSO-CO**
3. **M.Ch (PLASTIC SURGERY & RECONSTRUCTIVE SURGERY)**
   - **SYLLABUS**
   - **PSO-CO**
4. **M.Ch (HEAD & NECK ONCOLOGY)**
   - **SYLLABUS**
   - **PSO-CO**

Post M. Sc. Diploma in Radiological Physics (Dip. R. P.) (Program Code: HLTH11)

Program Code : HLTH11	**Programme Outcome**	Apply principles of basic science concepts in understanding, analysis and predication
		To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application of Medical Physics and ionising radiation safety concepts.
		To introduce advanced ideas and techniques required in emergent area of Medical Physics and radiation safety in cancer care.
		To develop human resources with specialization in theoretical and experimental technique as well as radiation safety required for medical, industrial and research applications of ionizing radiation.

1. **BARC**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

INTERGRATED M.Sc. in CHEMICAL SCIENCES (Program Code: CHEM13)

Program Code : CHEM13	Programme Outcome	Ability to learn and engage in emerging areas of chemical science
		Ability to collaborate and work in interdisciplinary areas of science where chemistry knowledge is required
		Ability to pursue a career in chemical research
		Human resource with knowledge base in theoretical and experimental chemistry
		Ability to work on societal problems involving chemistry
		Ability to apply the basic concepts and principles of chemistry in solving real life problems

1. **NISER**
    - **SYLLABUS**
    - **PSO-CO**

INTEGRATED M.Sc. in LIFE SCIENCES (Program Code: LIFE13)

Program Code : LIFE13	Programme Outcome	Ability to learn and engage in emerging areas of bioscience
		Ability to collaborate and work in interdisciplinary areas of science where bioscience knowledge is required
		Ability to pursue a career in bioscience research
		Human resource with knowledge base in theoretical and experimental bioscience
		Ability to work on societal problems involving bioscience
		Ability to apply the basic concepts and principles of bioscience in solving real life problems

1. **NISER**

- **SYLLABUS**
- **PSO-CO**

INTEGRATED M.Sc. in MATHEMATICAL SCIENCES
(Program Code: MATH13)

Program Code : MATH13	Programme Outcome	The Integrated M.Sc. Program in Mathematics aims to provide comprehensive training to the students so that they will be able to build a carrier in Mathematics for themselves
		The program aims to train people who are oriented towards research and teaching in both basic and advanced areas of Mathematical sciences.
		After successful completion of this program students will be able to apply knowledge of Mathematics in different fields of science and technology.

1. **NISER**

- **SYLLABUS**
- **PSO-CO**

INTEGRATED M.Sc. IN PHYSICAL SCIENCE (PROGRAM CODE: PHYS13)

Program Code : PHYS13	Programme Outcome	Building the manpower with ability to apply basic concepts and methods in physics to understand diverse phenomena.
		Building of manpower with the ability to work in interdisciplinary subjects, particularly those in the interface of physics and engineering
		Understanding of modern mathematical methods and ability to apply them in any quantitative analysis.

1. **NISER**
    - **SYLLABUS**
    - **PSO-CO**

BACK TO MAIN

M.Sc. NURSING

(PROGRAM CODE: HLTH15)

Program code: HLTH15	**Program Outcome**	Developing skilled man power with knowledge of patient care.
		Building trained man power for patient care, assisting the docter, effective oral communication and ethical practises.

1. TMC

- **SYLLABUS**
- **PSO-CO**

BACK TO MAIN

PGDFIT
(PROGRAM CODE: HLTH16)

Program Code : HLTH16	Programme Outcome	To develop highly skilled human resource in nuclear medicine technology.

1. TMC

- **SYLLABUS**
- **PSO-CO**

M. Sc. in CLINICAL RESEARCH (Program Code: HLTH17)

Program Code : HLTH17	Programme Outcome	To train the students in various aspects of clinical research – Ethics, Guidelines and Rules; and roles and responsibilities of a clinical research professional.
		This will also enable the individual to be a good trained knowledgeable clinical research person while supporting new drug development and clinical trials.
		To be able to participate in clinical trials management, including planning and execution of the trial and be a part of the multidisciplinary team delivering ethical clinical trials meeting all national and international norms and guidelines.

1. TMC

- **SYLLABUS**
- **PSO-CO**

FOUNDATION COURSES

CY 501: Mathematics, Quantum Chemistry and Computational Methods (40/10/10)

Differential Equations & Integral Transforms

Introduction to differential equations: order and degree; Different methods of solution; Overview of Legendre, Lagurre and Hermite differential equations;
Introduction to Fourier series, Fourier transform and Laplace transform.

Vector Calculus

Vector differentiation and integration: Concepts of gradient, divergence and curl; Laplacian operator.

Matrix Algebra
Elementary operations and elementary matrices. Solution of linear equations; Similarity transformations; Eigenvalues and eigenvectors; Diagonalization and inversion of matrices.

Group Theory and Symmetry in Chemistry
Concepts of groups, sub groups and classes; Symmetry elements, and symmetry operations; Point groups and matrix representations; Great orthogonality theorem and its importance in chemistry, Reducible and irreducible representations; Character Tables and their applications to spectroscopy, molecular geometry and chemical reactions.

Quantum Chemistry

Postulates of quantum mechanics, Classes of operator: Linear and Hermitian, Physical significance of eigen value in quantum mechanics; Boundary value problem in quantum mechanics; Exactly solvable problems: Particle in a box and ring; simple harmonic oscillator; rigid rotor and hydrogen atom; Approximation methods: Variation method; perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules; Extended systems: From bonds to bands; Applications to few simple molecules.

Computer Programing and Numerical Methods
Computers and modeling in chemistry; Basics of computer programming: Variables, constants, input/output and control statements, arrays, functions, and subroutines. Computer oriented numerical methods: Newton-Raphson method for finding roots, differentiation, integrations by quadrature techniques, solutions of differential equations, diagonalisation and inversion of matrices. Curve fitting. Basics of computer simulation: Monte Carlo and molecular dynamics simulations.

CY 502: Analytical Chemistry (40/8/5)

Introduction
Relevance of Analytical Chemistry in Atomic Energy Programme, Terminologies in Analytical Chemistry, Quality Assurance in Analytical Chemistry, Accreditation and its importance

Separation Technique
Solvent extraction: Principles and Applications, Conventional solvent extraction, Liquid membranes, Bulk membranes, Supported and Emulsified liquid membrane, Super critical fluid extraction (SFE).
Ion Exchange: Principles and Applications, Conventional ion exchange, Solid Phase Extraction (SPE)
Chromatography: Principles and Applications, Gas chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion chromatography (IC), Supercritical fluid Chromatography(SFC),Capillary electrophoresis.

Electrochemical Techniques
Introduction to the oxidation and reduction process, equilibrium electrochemistry, Activity, Nernst equation, Butler-Volmer equation, Tafel treatment. Potentiometry/potentiometric titration and ion Selective Electrodes (ISE), Modified electrodes.
Electrochemical double layer, Mass transfer processes, Fick's law of diffusion, Polarisation, Voltammetry & Polarography, working electrode, reference electrode and counter electrodes, Votammetric techniques like; Linear sweep voltammetry, Cyclic voltammetry, Pulse and Stripping Voltammetry, Coulometry and Amperometry, Hydrodynamic voltammetry.
Electrochemical Impedance spectroscopy and modelling of the electrochemical interface. Electrochemistry at ultramicro electrode, Scanning Electrochemical Microscopy, electrochemistry at confined geometry and detection at single molecule level, Hyphenated in-situ spectro-electrochemical techniques.

Spectrochemical Techniques
An introduction to spectrometric methods, Performance Characteristics of instruments, Calibration of instrumental methods, Quantitative aspects of spectrochemical measurements.
Atomic Absorption spectrometry(AAS), Sources of radiation(Hollow Cathode lamp, Continuum Source), Atom cell, Flame Atomic Absorption Spectrometry (FAAS), Electrothermal Atomic Absorption Spectrometry (ETAAS), Cold vapor Atomic Absorption Spectrometry (CVAAS), Hydride generation Atomic Absorption Spectrometry (HGAAS), Types of Interferences in AAS and Background correction methods.
Optical Emission Spectrometry, Emission sources: Flame, Inductively Coupled plasma, Glow Discharge, DC-Arc, Inductively Coupled Plasma Optical Emission Spectrometry(ICP-OES), Types of interference in ICP-OES and background correction methods, Laser Induced Fluorescence(LIF).

Mass Spectrometry
Basic principle, Ion sources: Thermal Ionisation (TI), Electron Impact(EI), Inductively Coupled Plasma(ICP), Glow Discharge(GD), Laser Ablation (LA), Secondary Ionisation (SI), Resonance Ionisation (RI), Matrix Assisted Laser Desorption and Ionisation (MALDI), mass analysers: Magnetic Sector, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance(ICR),detectors: Faraday Cup, Channeltron and Daly detector, resolution, abundance sensitivity, Laser Induced Breakdown Spectroscopy (LIBS), Resonance Ionization Mass Spectroscopy (RIMS) Hyphenated Technique - IC-MS, HPLC-MS, GC-MS.

Thermal Methods
Principle and applications, Thermogravimetric Analysis (TGA), Derivative Thermogravimetric Analysis (DTG), Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Evolved Gas Analysis (EGA)

Nuclear Methods
Principle of Activation Analysis – Neutron Activation Analysis (NAA), Charged Particle Activation Analysis (CPAA), X-ray fluorescence (XRF) spectrometry: Principles, methodology and matrix effect.

Statistics in Chemical Analysis
Accuracy, Precision, Errors in quantitative analysis, Classification of errors, Propagation of errors, treatment of errors, Normal distribution, Tests of Significance and Confidence Limits, Reporting of analytical results

Laboratory Experiments (Any Five)
1. Determination of trace impurities in high purity materials by AAS.
2. Application of electroanalytical methods to trace analysis.
3. Anion analysis by ion selective electrode.
4. TGA and DTA study of inorganic compounds
5. Neutron Activation Analysis of trace constituents in a complex matrix
6. Analysis of an alloy sample by EDXRF
7. Chromatographic separation and measurement of the components in a mixture
8. Isotopic Analysis by Mass Spectrometry

CY 503: Material Science (20/5/2)

Crystal Structure
Different types of unit cells, Space lattices, Miller indices, atomic packings, radius ratio, structures of NaCl, CsCl. ZnS, diamond, CaF_2, perovskite, double pervoskites, pyrochlores, spinels, garnet structure and framework solids, aperiodic systems, symmetry, relevance of crystal structures to nuclear materials (glass, ceramics, intermetallics and alloys).

Powder X-ray Diffraction Technique for Phase Identification
Concept of X-ray diffraction, reciprocal space, Ewald construction, structural and scattering factors, grain/particle size effects, different techniques of recording diffraction patterns, indexing of diffraction patterns, Diffraction data files and their utility, Neutron diffraction, electron diffraction.

Types of Bonding in Solids
Van der Waals interactions, Lennard-Jones potential, crystals of inert gases, ionic bonding, Madelung energy and its calculation in the case of NaCl/CsCl, covalent bonding, hydrogen bonding.

Defects in Solids
Defects and defect concentration, dependence on temperature, 0- D, 1- D, 2-D defects, Experimental methods for their characterisation, color centres, phase transitions, classification with examples, dependence of phase transition on T and P, thermodynamic classification of phase transitions, order- disorder phase transitions, austenite- martensite phase transitions in alloys. Solid solutions, their significance, simple and complex solid solutions, methods to characterize solid solutions.

Transport Properties of Solids
Ionic conductivity, electronic conductivity, dielectric, ferro, piezo and pyro electric materials. structural basis and applications, superconductivity, thermal conductivity with examples.

Basic techniques for characterization
Concept of various characterization techniques based on X-rays and electrons: XRF, EPMA, XPS, AES, EELS and their application with examples

Methods of material preparation and processing
Solid state reactions and soft chemical routes, concepts of annealing, sintering and calcination, processing techniques like spin coating, powder coating, screen printing etc.

Laboratory Experiments: (Any two)
1. XRD characterization, indexing and cell parameter determination
2. Micro structure of metal/alloy by metallography and SEM
3. Electrical resistivity and its temperature dependence

CY 504: Radiation Detection and Measurement (20)

Interaction of Radiation with Matter
Interaction of Heavy Charged Particle with matter
Ionization in gaseous medium, Bragg's curve, stopping power, Bethe Equation for stopping power, Range of heavy charged particle and straggling, Range energy relationship.

Interaction of Fast Electrons with Matter
Comparison with heavy charged particle, LET for electron, Bremsstrahlung radiation, Cerenkov radiation, Bethe Equation, path length and range of electrons, Attenuation and absorption of β particles, Backscattering of β- and Positron annihilation.

Interaction of Electromagnetic Radiations (γ, X-Rays) with Matter
Photoelectric Effect, Compton Scattering, Pair Production, .Variation of cross section for different process with γ energy and Z of the medium, Attenuation and Absorption of gamma rays

Interaction of neutrons with matter
Elastic and Inelastic Scattering of neutrons and slowing down, nuclear reactions

Radiation Detectors
Principle of Radiation Detectors: Pulse height spectrum, Counting Characteristics, plateaus, Detection efficiency, Energy resolution, Dead time, Counting Statistics
Gas filled Detectors
Ionization Chamber, Proportional counter, GM counter

Scintillation Detectors
Organic and Inorganic scintillators, Liquid scintillation counter, Pulse shape discriminator, Solid state scintillation detectors: NaI(TI), CsI and $LaBr_3$ detectors

Semiconductor Detectors
p-n junction, HPGe detector for gamma ray spectroscopy, Clover detectors, Si(Li) for x-ray spectroscopy, Silicon detectors for charged particle spectroscopy

Neutron Detectors
BF3, 3He gas filled counters.

Solid State Nuclear Track Detectors (SSNTD)
Basic principle and applications

Application of Radiation Detectors in Nuclear Probes

References
[1] Radiation detection and measurement, G.F. Knoll, John Wiley & Sons

---

CY 505: Nuclear and Radiochemistry (40/8/5)

Radioactivity
Radioactivity, Radioactive decay laws, Half-life and radioactive equilibria.

Nuclear Stability
Concept of nucleus, Nuclear mass and Binding energy, Nuclear force.

Nuclear Models
Liquid drop model, Shell model, Concept of spin, Parity electric and magnetic moments, Isomerism.

Modes of Decay
α decay, β decay, Electron captures, γ de-excitation, Internal conversion.

Nuclear reaction and fission

Q value equation, Reaction threshold, Centre of mass system, Cross-section for neutron and charged particle induced reactions , Nuclear Temperature, Compound nucleus mechanism, Nuclear fission: observables and models, Synthesis and separation of heavy and trans-actinides, Accelerators, Application of accelerators in ion beam analysis

Techniques in Nuclear Chemistry
Target preparation and target chemistry, Radiochemical separations, Concept of tracer and carrier, Chemical yield, Radiochemical purity, Application of radiotracers in chemical sciences, Determination of half-life.

Laboratory Experiments (Any Five)
1. GM Counter: plateau, statistics and dead time
2. Gamma-ray spectrometry using NaI(Tl) and HPGe detector: Energy Calibration, Resolution, Efficiency
3. Separation of actinides using solvent extraction technique
4. Alpha spectrometry

5. Determination of half-life of a radioisotope
6. Solid State Nuclear Track Detector
7. Separation of fission products / Transient equilibrium

CY 506: Thermodynamics (20/4)

Introduction to Chemical and Statistical Thermodynamics
Laws of thermodynamics, Fundamental equations and thermodynamic potentials, Introduction to statistical thermodynamics, Einstein and Debye theories of specific heats of solids, Phase transitions, Thermodynamics of solutions, ideal and regular solution models.

Chemical Equilibrium
Solid-gas equilibrium, Ellingham diagram.

Relation between Thermodynamics and Phase Diagrams
Binary and ternary phase diagrams, CALPHAD definition of phases, Degree of freedom rule and lever-rule, Calculation of simple binary phase diagrams from thermodynamic properties, Chemical potential variations across phase diagrams

Phase Diagram and Thermodynamics of Nuclear Fuels
Relevant phases for nuclear fuel applications, Change in chemical potentials with compositions of virgin fuels, Change in chemical potentials with burn-up, Thermodynamics of Fuel-Clad and Coolant-Clad interactions, Thermodynamics of molten fluorides, Concepts of metastable materials.

Experimental Thermodynamics
Calorimetric measurements, Vapor pressure measurements, Estimation of thermodynamic quantities

CORE COURSES

CY 601: Lasers (10/0/1)

Basic principles - Spontaneous & stimulated emission, population inversion, laser components, Einstein coefficients, optical amplification, optical & electrical pumping, rate equations (two, three and four level laser systems)

Properties of laser beams - coherence (spatial and temporal), monochromaticity, intensity, polarization

Optical resonators – Types, properties, spatial field distribution in resonators, stable & unstable resonators, gain and losses in the cavity, Q-factor, threshold condition, laser modes (longitudinal and transverse),
Types & some laser systems - Solid state lasers, gas lasers, dye lasers, diode lasers, fiber lasers, free electron laser and quantum cascade lasers, tunable lasers

Generation of short and ultrashort pulses - Q-switching and mode locking, chirp pulse amplification

Non-linear optical techniques – Phase matching, harmonic generation, optical parametric oscillator & amplifier

Modulation in laser pulses-amplitude, wavelength, temporal

Characterization of laser pulses - Measurement of the pulse temporal profile (electronic & optical), spectral measurements (interferometric), amplitude - phase measurements (FROG)

Laser applications & laser safety.

[5] Laser Safety- Roy Henderson and Karl Schulmeister

Laboratory experiment: Time-frequency bandwidth relationship for laser pulses-Checking the Heisenberg uncertainty principle

---

CY 602: Electronics and Chemical Instrumentation (20/4/5)

Electronics
DC & AC Fundamentals: Concept of charge, current, voltage, power, Ohms law, AC –Sinusoidal, Peak & RMS values, Frequency.
Electronic components: Resistors, capacitors, diodes, transformer
Power Supply, Rectification, Filter, Line/Load Regulation, Regulator Chips, Low Voltage & High Voltage power supplies, SMPS.

Analogue Electronics
Operational Amplifiers, Ideal Characteristics, Inverting, Non-invertingAmplifier, Integrator, Comparator, Summer, Pulse Amplifier and Instrumentation Amplifier.

Digital Electronics
Number system and Logic gates - Decimal, Binary and Hexadecimal number systems, Logic gates, Flip Flop, Counter, Decoder, Display Device.
Analog to Digital Converters and Digital to Analog Converters

Instrumentation
Concept of Instrumentation, Order of instruments, concept of broad specifications (accuracy, precision etc), Voltmeter and Current meter, concept of Multimeter & concept of loading.
Signal & Noise: Concept of Noise & Signal, dB, S/N ratio and improvement techniques.
Transducers: Transducers and their applications (temperature sensors, PMT, photo diode and vacuum gauges)
Signal analysis & Processing: Selective signal amplification, filter, Lock-in-amplification, Boxcar Averager, Fast Fourier Transform.

Computer in Labs
PCs & interfacing concepts, RS232, USB ports, Embedded systems, Lab View programming.

CY 603: Production and Applications of Radioisotopes (20/4)

Introduction to the course
Relevance and contribution of the isotope program in DAE.

Production of Radioisotopes
Need for radioisotope production, Basic principles and different routes of radioisotope production using nuclear reactors and charged particle accelerators. Szilard-Chalmers effect and its utility in radioisotope production. Derivation of equation to calculate production yields in nuclear reactors and charged particle accelerators, Calculations of production yields; Bateman's equation and its utility in production yield calculations.

Production of some important radioisotopes in nuclear reactor and in cyclotron, Selection of target material, Methods of target preparation, Methods of processing of irradiated targets, Methods of production of some important radioisotopes (such as, $^{32/33}P$, ^{60}Co, ^{82}Br, ^{99}Mo, ^{99m}Tc, ^{125}I, ^{131}I, ^{137}Cs, ^{153}Sm, ^{166}Ho, ^{177}Lu, $^{186/188}Re$, ^{192}Ir, and ^{11}C, ^{13}N, ^{15}O, ^{18}F, ^{44}Sc, ^{64}Cu, ^{67}Ga, ^{68}Ge, ^{89}Zr, $^{123/124}I$, ^{201}Tl etc.).

Concept of radionuclide generators; Growth and decay of activity in a radionuclide generator; Different types radionuclide generators with special emphasis to ^{99}Mo-^{99m}Tc generators along with their relative advantages and disadvantages; Few other important generator systems such as, ^{68}Ge-^{68}Ga, ^{90}Sr-^{90}Y, ^{188}W-^{188}Re etc.

Applications of Radioisotopes in Medicine
Concept of nuclear medicine and radiopharmaceuticals, Classification of radiopharmaceuticals, Characteristics of diagnostic (SPECT and PET) and therapeutic radiopharmaceuticals. Basis of designing radiopharmaceuticals, Preparation of radiopharmaceuticals and Methods of radiolabeling.

New approaches in radiopharmaceuticals chemistry - ^{99m}Tc-tricarbonyl method, ^{99m}Tc-nitrido method, ^{99m}Tc-HYNIC method etc., Advantages of new approaches.

Some important organ-specific diagnostic radiopharmaceuticals (myocardial imaging, brain imaging, renal imaging, tumor and inflammation imaging, receptor-specific imaging agents etc.). Radioimmunoscintigraphy (RIS), PET radiopharmaceuticals - Principle and applications.

Concepts of brachytherapy and teletherapy.

Therapeutic radiopharmaceuticals for some specific applications [Metastatic Bone Pain Palliation (MBPP), Radiation Synovectomy (RSV), Peptide Receptor Radionuclide Therapy (PRRT), Radioimmunotherapy (RIT) etc.]

Quality control of radiopharmaceuticals - physicochemical and biological quality control tests.

Industrial Applications of Radiation Technology
Fundamental aspects of radiation processing and radiation technology, Radiation sources and effects of ionizing radiation on materials, Comparison of different radiation sources for different applications, Radiation dosimetry for industrial radiation sources.

Radiation polymerization vis-à-vis conventional polymerization, Polymerization kinetics and polymer characterization, Radiation effects on Polymers under different conditions, Theories of radiation crosslinking.

Radiation induced modification of polymers for industrial and environmental applications, wire and cable crosslinking, surface curing and grafting, heat-shrinkable materials, radiation cured polymer coatings and radiation grafted functional polymers for various applications, radiation degradation of polymers and applications, etc..

Radiation processed polymers for healthcare applications, Introduction to radiation sterilization of medical products (process, D_{10} value, SAL, inactivation factor and safety factor), hydrogels and their property standardization using radiation for wound dressings, radiation processed drug delivery devices.

Radiation processing of food, Objectives and dose limits for different food items

Radiation chemistry aspects of radiation hygienization of sewage sludge process and process control

Radiation processing of flue gases and radiolysis of flue gas components

Radiation induced enhancement in the functional attribute of blends and composites, Introduction to rheology of polymers, crosslinking and degradation behavior of multi-phase system, microscopic and mechanical characterization of blends and composites.

Application of radioisotopes as tracers in process optimization, trouble shooting in industries and sediment transport in harbours.

Application of Radioisotopes as Tracers
Principle and industrial applications of radiotracers, Process optimization and trouble shooting in industries-blockage location in buried pipelines, Leak detection in buried pipelines & industrial systems, Wear rate of anti-fungal paints, Flow rate determination in industrial processes.
Environmental isotopes and artificial radioisotopes in hydrology. Application of environmental isotopes in studying ground water salinity, pollution, recharge etc., Artificial radioisotopes in studying dam seepage, effluent dispersion etc.

CY 604: Reactor Physics and Reactor Chemistry (20)

Fission, Energy from fission, Burn-up, Spontaneous and induced fission, Chain reaction, Fissile-Fissionable-fertile materials, Prompt and delayed neutrons, Four factor formula, Neutron interaction with matter, Fission products, Critical mass, Neutron Diffusion Theory, Multiplication factor, Reactor kinetics and control.

Different types of homogeneous and heterogeneous reactors, Components of reactors.

Introduction to the types of water cooled power reactors & their process systems. Schemes of preparation of dimineralized water, Variation in properties of water and heavy water as a function of temperature and pressure. An overview of types of corrosion, methods of evaluation of corrosion and its prevention. An overview of materials of construction for the different components of reactor systems. Hot Conditioning of PHT circuit in PHWR. An overview of water chemistry regimes in BWR, PWR & PHWR.

Principles and processes relevant to chemistry control in primary heat transport systems. Radioactivities in reactor waters & their control. CRUD generation and activity transport in the primary heat transport system of reactors its control. Radiolysis of water, related hazard, and its control, Reactivity control through chemistry: Use of soluble neutron poisons- for chemical shim and for emergency shutdown. Purification of reactor cover gas by Catalytic recombination and adsorption techniques.

Chemistry control in secondary heat transport system, pH control methodologies of secondary system, Scaling and methodology of its control in secondary system.

Chemistry control in the tertiary heat transport system, Bio-fouling and its control methodologies.

CY 605: Molecular Structure and Spectroscopy (30/6/4)

Coordination Chemistry
Werner's Coordination theory, Valence Bond Theory, Crystal Field Theory, splitting of "d" orbital in different geometry, Jahn Teller effect, Thermodynamic effects of crystal field, Coordination chemistry of lanthanide and actinide ions, Brief introduction to group theory, Application of group theory for d-d transition, Racah parameters, electronic spectra of complex ions, Tanabe Sugano diagram, nephelauxetic effect, ligand metal orbital overlaps, magnetic properties and susceptibility measurements of complex ions, drawbacks of CFT, f-f transitions in lanthanides.

Molecular orbital theory and construction of molecular orbital diagram from concepts of group theory, MO's for Sigma bonding in AB_6 molecules, tetrahedral AB_4 case, MO's for pi bonding in AB_6 molecules, Metal organic framework materials. Dissociative & associative reaction mechanism of ligand replacement in octahedral and square planar complexes, trans effect and its implications.

Characterization Techniques of Complexes
NMR: Basic Principles of NMR Spectroscopy, Chemical Shift, Spin-Spin Coupling, Decoupling Experiments, Pulse NMR, Relaxation Effects, Two-Pulse Experiment, T1-Measurment, T-2 measurement, solid state NMR, ESR: Basic Principles of ESR Spectroscopy, The g-value, Hyperfine Coupling, Electron Nuclear Double Resonance (ENDOR), Mossbauer spectroscopy

Electronic, Vibrational and Rotational Spectroscopy
Classification of molecules, their characteristic spectral features and selection rules, pure microwave, Rotational Raman, Vibrational and rotational vibrational spectroscopy, IR and Raman spectroscopy.
Basic principles of Fourier transform spectroscopy (FTIR, FT-RAMAN).
Surface enhanced Raman spectroscopy (SERS), Terahertz spectroscopy, Nonlinear optical methods, sum & difference frequency generation (SFG & DFG).
Synchrotron radiation and its application in spectroscopy, X ray absorption based techniques (XANES, EXAFS)
X ray Photoelectron Spectroscopy.
Doppler-free high-resolution spectroscopy

Laboratory Experiments

CY 606: Radiation and PhotoChemistry (30/6/4)

Radiation Chemistry
Interaction of High-energy Radiation with Matter
Chemical consequences, absorption coefficients, G-values, track entities and LET effects, radiation sources.
Diffusion kinetics and homogeneous reaction stages, time scales of events in radiation chemistry, ion-pairs, ion-molecule reactions

Radiation Chemistry of Water and Nonpolar Liquids
Radiolysis of water & heavy water, radical and molecular yields, material balance, chemical dosimetry
Radiolysis of non-polar solvents, geminate recombination, electron salvation
Radiation chemistry of micro heterogeneous systems and ionic liquids
Comparative aspects of radiolysis of liquids, solids and gases

Experimental Techniques
Detection of primary species and free radicals using pulse radiolysis coupled with optical absorption

spectroscopy, ESR, conductivity, resonance Raman spectroscopy
Evaluation of absolute rate constants, pK values of transient species, one-electron redox potentials, picoseconds pulse radiolysis

Application
Radiolytic synthesis of nanoparticles
Radiation chemistry of water at high temperature and high pressure
Radiation chemistry of antioxidants and radioprotectors.

Photochemistry
Photophysical Processes
Electronic transitions, oscillator strength, selection rules
Franck-Condon principle, absorption, emission and fluorescence excitation spectra, charge-transfer spectra.
Deexcitation processes - fluorescence, phosphorescence, delayed emission, triplet-triplet annihilation, heavy atom effect, kinetics of excited state processes, quantum yields of photo-processes
Fluorescence anisotropy
Photophysical processes in semiconductors, multiphoton processes
Environment effect- polarity, viscosity (anisotropy), temperature

Photochemical Processes
Excited state acid-base properties, redox potentials, geometry, dipole moments
Kinetics and mechanism of processes like photo-dissociation, photo-ionization, electron transfer, energy transfer, proton transfer, supra-molecular interactions

Experimental Techniques
Steady-state absorption and fluorescence techniques
Time-resolved absorption and fluorescence techniques like time-correlated single photon counting, fluorescence up-conversion, nanosecond laser flash photolysis and ultrafast pump-probe spectroscopy; single molecule spectroscopy, fluorescence correlation spectroscopy

Applications
Photosynthesis, vision, solar energy conversion, photocatalysis, fluorescence sensors.

Laboratory Experiments
Radiation Chemistry
[1] Fricke dosimetry and estimation of G-values.
[2] Study of free radical reactions using pulse radiolysis technique.
Photochemistry
[1] Fluorescence quenching studies: determination of quenching rate constant.
[2] Excited state properties: determination of acid dissociation constant using absorption & fluorescence techniques.

CY 607: Chemistry in Nuclear Fuel Cycle (40)

Separation and purification of uranium and thorium from their ores, Principles of isotope separation, enrichment of uranium, systematics and processes.

Conversion processes for preparation of UO_2, $(U,Pu)O_2$, UC, (U,Pu)C, UN (U,Pu)N, metals and alloys.

Separation and purification of zirconium from its ore, Principle and process for heavy water production.

Fuel fabrication processes and chemical quality control

Behavior of nuclear fuels (thermal/fast) during irradiation

Post irradiation studies, fuel clad chemical interaction, Burn-up etc.

Thermo-physical and themo-chemical aspects of fuel, Properties of oxide, carbide, nitride and metallic fuel materials, Coated particle based fuels.

Cladding, moderator, coolant materials and their properties, Liquid metal coolants like sodium and lead-bismuth, Chemical aspects of corrosion, Monitoring and maintenance of the purity of coolant.

Reprocessing of thermal and fast reactor fuels, chemistry of various process PUREX, THOREX etc., Systematic and process of pilot plant CORAL, Challenges in reprocessing of fast reactor fuel.

Waste processing and management, classification of waste and treatment practices of gaseous, liquid and solid waste.

Vitrification of high level liquid waste, Partitioning of actinides from high level liquids waste, Decontamination process.

Nuclear safety, Management of H_2, Xe, Kr, I_2 and tritium in operating nuclear power plants

CY 608: Advanced Chemical Kinetics and Dynamics (20/4)

Intermolecular interaction potential, Collision theory, Potential energy surfaces, Activated complex theory, adiabatic and non-adiabatic reactions, Landau-Zener crossing, Lindemann's theory of unimolecular reactions, energy transfer, fall-off region and its limitations, Hinshelwood's Treatment. Rice-Ramsperger and Kassel (RRK) model, and Marcus refinement of RRK model (RRKM) for the calculation of rate constants of simple unimolecular reactions.

Molecular beam experiments, types & characteristics of molecular beams, scattering as a probe; differential cross-section; quantum mechanical approach to elastic scattering; conservation of angular momentum – Newton diagram, lab–to-centre of mass transformation, reaction cross section - reaction probability; opacity function – steric factor; reactive asymmetry – angular distribution in reactive collisions – direct reaction versus collision complex; forward, backward, and forward–backward scattering; potential energy contour diagram, reactions with early & late barrier. Different molecular energy transfer processes. Laser based spectroscopic techniques- LIF, REMPI, CRDS, detection and measurement of trace constituents and free radicals, rate coefficient measurement, chemical kinetics and dynamics studies, atmospheric chemistry.

IR laser chemistry, laser isotope separation, mode and bond selective chemistry, intramolecular vibrational energy redistribution (IVR), coherent control of chemical reaction,

CY 609: Health Physics and Radiation Biology (20)

Health Physics
Fundamentals of Radiation Protection
Radioactivity, Ionizing radiation, Radiation quantities and units**,** Basis and structure of the system for radiation protection, System of radiological protection for human, natural radiation.

Basic Radiation Physics and Radiation Dosimetry Aspects
Interaction of radiation with matter, External and internal radiation hazards in nuclear and radiation facilities, Radiation dosimetery: basics, concepts and definitions, External radiation dosimetry and dosimetry of internally deposited radio nuclides, Radiation detection principles, Monitoring instruments and Personnel monitoring devices

Operational Monitoring and Safety Aspects of Facility Design
Exposure situations as per ICRP-103 recommendations, Control of external and internal radiation hazards, Radiation dose limits and its basis, General principles and techniques of radiation monitoring, air activity and area contamination, Assessment and control of radiation hazards in nuclear fuel cycle facilities with special reference to metallurgical, radiochemical and radioisotope facilities and fuel reprocessing plants, Criticality safety aspects, Environmental safety aspects during operation of nuclear and radiation facilities, Industrial hygiene and safety aspects during operation of nuclear and radiation facilities.

Radiological Safety Aspects in Design of Radio-Chemical Laboratories
Safety aspects of design of radiochemical laboratory, its types and operational aspects, Partial containment/confinement systems and ventilation system in a laboratory.

Emergency Preparedness and Response System at Nuclear and Radiation Facilities
Classification of radiation emergency, Emergency preparedness and response system, Reference levels and guidance values for emergency workers.

Basic Radiation Radiobiology
Water radiolysis, Free radicals and its reactions with biological systems, Oxygen effect.

Radiation damage at bio-molecular level, Damage to DNA and chromosomes (single and double structural breaks, chromosomal aberrations) and its biological consequences, Radiation damage to membrane and its biological consequences, Major health effects of radiation exposure.

Mode of interaction of different types of radiation with biological systems, Track structure, Concept of LET, Radiobiological effectiveness (RBE), Radiation dose units with reference to radiobiology, Direct and indirect effect of radiation.

Molecular and Cellular Effects of Radiation
Assay for radiation damage in human cells (survival curve), Physical and biological factors affecting the cellular radio-sensitivity, Dose and dose rate effect, Dose fractionation, Inverse dose rate effect, Oxygen enhancement ratio and Optimum LET, Radio-protectors and radio-sensitizers.
Cell cycle arrest and radiation damage repair, Cancer and its induction by radiation, Radiobiology of cancer radiotherapy approaches

CY 610: Research Methodology (20)

Objectives and types of research: Motivation and objectives - Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem - Literature review – Primary and secondary sources - reviews, treatise, monographs-patents - web as a source - searching the web - Critical literature review - Identifying gap areas from literature review - Development of working hypothesis.

Research design and methods - Research design – Basic Principles - Need of research design - Features of good design – Important concepts relating to research design - Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Value of Statistics; Errors and Statistics - Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results - students's t test; F-test; Chi Square test; propagation of errors.

Reporting and thesis writing – Structure and components of scientific reports - Types of report - Technical reports and thesis - Significance - Different steps in the preparation – Layout, structure and Language of typical reports - Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation - Planning - Preparation - Practice - Making presentation - Use of visual aids - Importance of effective communication - Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on 'Experimental data and Literature Survey'.

Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation - Copy right - Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights - Reproduction of published material - Plagiarism - Citation and acknowledgement - Reproducibility and accountability.

CY 611 Safety in Chemical and Radiochemical labs (10)

Chemical labs

Definition of chemical safety and its assessment, general chemical safety awareness, Classification of chemicals: Corrosive, Flammables, explosives, toxics, pyrophoric, carcinogen. Chemical which create lachrymation and smoke, Entry of such chemicals into human/biological system and its consequences, precautionary and safe methods for handling such chemicals, Compatibility issues with chemicals, Understanding the Safety Data Sheets (Material Safety Data Sheets) for different chemicals. Storing different chemicals, incompatible chemicals, making inventory of chemicals, labelling chemicals depending upon its nature, safe disposal of chemicals, precautions and safe operating procedures (SOP) to be taken into consideration for chemical spills, chemical protective clothing, chemical accidents and their classification and consequences, Emergency Procedures during chemical accidents, Personal Protective equipment from chemical exposure, precautions to be taken with chemical which need to be refrigerated. Safe practices while using vacuum lines and laser. Fire safety and different types of fire extinguishers.

Radiochemical labs

Classification of laboratories, classification of radioactive zones in the laboratory, ventilation, Shielding and dosimetry requirements for handling different types of radioactivity, Radioactivity handling in fume-hoods and glove boxes, Movement of radioactivity within the lab, Washing of radioactive glass wares, Disposal of radioactive aqueous and organic waste, Disposal of compressible and non-compressible radioactive waste, fire safety in radioactive labs, Personnel radiation monitors, Managing personnel and laboratory contamination, Precautions in a radioactive lab and emergency procedures.

ELECTIVE COURSES

CY 701: Nanomaterials and Chemical Sensors (20)

An overview of the course

Physics of nanomaterials
Finite size systems, cluster science, bulk versus nanomaterials, quantum confinement effects in nano-regime, evolution of electronic structure from atoms to bulk, density of states, dimensionality and its effect on electronic structure, surface effects, calculation of surface-to-volume ratio for different structural arrangements, size dependent physico-chemical properties, carbon based materials (0D, 1D, 2D and 3D).

Chemistry of nanomaterials
Top down and bottom up approaches for synthesis of nanomaterials, such as laser ablation, ball-milling, sputtering, combustion, metathesis, sol-gel etc.

Common characterization techniques for nanomaterials
Characterization techniques at different length scales, application of XRD, TEM, SEM, AFM and DLS for characterization of nanomaterials.

Properties of nanomaterials
Fundamentals of Semiconductors, direct and indirect band gaps, semicounductor in nano-dimesnions (quantum dots, core-shell nano-particles of semiconductors), metallic nanoparticles and surface plasmon, an overview of magnetic, optical and catalytic properties of nanomaterials.

Applications of nanomaterials
Nanomaterials in energy conversion (solar cell, rechargable batteries, supercapacitors and materials for hydrogen energy), nanomaterials for bio-applications (drug delivery), environmental applications (sorbents) and DAE application.

Chemical sensors and their applications
Threshold limit values (TLV) of common toxic species, selection of sensor materials mechanism of sensing action, features of sensors (selectivity, response time, reproducibility and regeneration), typical examples of nanomaterials based sensors for H_2S, NH_3, SO_2, and heavy metal ions, common bio-sensors, sensors for DAE applications.

[5] Functional Materials: Preparation, Processing and Applications, Eds. S. Banerjee and A. K. Tyagi, Elsevier Publishers (2012)

CY 702: Soft Condensed Matter (20)

Introduction to Soft Matter
Forces, energies, length and time scales in soft matter. Soft matter systems (colloids, surfactant / micellar systems, gels, polymer solutions, polymers, polyelectrolytes, microemulsions, membrances, biological macromolecules), Interactions (electrostatic, van der Walls, hydrophilic and hydrophobic interactions, depletion interaction). Viscous, elastic and viscoelastic behavior, Liquids and Glasses, Soft matter in nature:

Experimental techniques to investigate structure and dynamics in soft matter
Scattering techniques (Small-angle X-ray scattering (SAXS), Ultra-small-angle-X-ray scattering (USAXS), Small-angle (SANS) Static and Dynamic light scattering (SLS & DLS)
Colloids
Introduction, Brownian motion of colloidal particles. Sterically stabilized and Charge stabilized colloids, Colloidal interactions, Liquid phase synthesis of colloidal particles, Structural ordering, Dynamics, Phase Transitions [Gas-liquid, Melting /freezing, Glass Transition, Crystal-amorphous]

Surfactants
Types of surfactants, Micellization, Langmuir- Blodgett films, Monolayer, Bilayers and Vesicles, Lyotropic liquid crystalline phases, Micro emulsions.

Polymers and Polyelectrolytes
A single ideal chain, mean-squared end to-end distance, radius of gyration. Gaussian chain, Freely joined chain. Excluded volume, solvent quality, theta-temperature. Polymer solutions : Flory-Huggins theory, osmotic pressure, scaling laws for good solvents, Size of a polymer in semi-dilute solutions : osmotic pressure, light scattering, intrinsic viscosity, Classes of gels : physical gels, chemical gels and photo-polymerized gels, Sol-Gel transition, Swelling and shrinking of gels, theory of gelation. Polyelectrolytes : Debye-Huckle theory, Donnan equilibrium, manning condensation. Dynamics of polymeric liquids : Maxwell model. Rouse theory, Zimm theory, Reptation theory : tube model, reptation dynamics, self –assembly and order-disorder transitions of diblock copolymers

Applications of Soft Matter
Nanoparticle suspensions as heat transfer fluids. Colloidal assemblies in liquid-liquid extraction systems. Ionic liquids as extractants. Foams and Gels for decontamination. Foamability of surfactants. Dynamic interfacial tension and foamability. Defoamers, Soft matter in drug delivery and diagnostics.

CY 703: Nuclear Probes for Material Characterization (20)

Positron Annihilation Spectroscopy
Introduction to positron, positronium, formation and its systematic, Experimental techniques, applications in molecular solids, defect studies in metals, alloys and semiconductors, Slow positron accelerators and associated developments in materials characterization.

Ion beam analysis

Introduction to ion beam analysis, Rutherford backscattering spectrometry, elastic recoil detection analysis, nuclear reactions analysis, particle induced gamma ray emission, particle induced X-ray emission-Theory and applications.

Neutron Scattering Techniques
Neutron Sources, Properties of Neutron, Neutron Scattering Lengths and Cross-sections, Coherent and Incoherent Neutron Scattering

Small-Angle Neutron Scattering
Scattering from General Two Phase Systems, Scattering from Fractal Aggregates, Nuclear vs. Magnetic Scattering

Small-Angle Neutron Scattering Instrumentation
Experimental Aspects, Data Treatment

Analysis of Small-Angle Neutron Scattering Data
Model Independent Analysis, Model Dependent Analysis, Contrast Variation

Applications
Nanomaterials, Colloids, Biological Systems, Porous and Fractal Structures)

X-ray absorption Spectroscopy
Introduction of X-ray absorption spectroscopy including different processes of absorption of X-rays in materials, Theoretical formalism of EXAFS, Derivation of the EXAFS equation with physical interpretation, Experimental techniques with some introduction to Synchrotron radiation, Data analysis (EXAFS & XANES), Usefulness of the EXAFS technique in material characterization- with few case studies.

CY 704: Molecular Bioorganics (20)

New paradigm in synthesis
Rational synthetic design, convergent and divergent strategies, multi-component and domino reactions, sequential reactions, high-throughput synthesis, organocatalysis, substrate and reagent controlled asymmetric synthesis
New paradigm in synthetic approaches
Green strategies, atom economy, bio-catalysis and solvent engineering, microwave and sono-chemistry, non-conventional reaction media (room temperature ionic liquids, super critical fluids, florous phase, super-heated steam), template-driven synthesis.

New paradigm in functional targets
Design and synthesis of functional molecules/ molecular assemblies, non-covalent interactions, electro-magnetic radiation active organics, organic-inorganic hybrids, organics in nuclear fuel cycles.

CY 705: Laser Spectroscopy (20)

Coherence properties of radiation fields
Temporal and spatial coherence, coherence volume, degree of coherence, coherence of atomic systems.

Widths and profiles of spectral lines
Natural line width, Doppler width, collisional broadening of spectral lines, transit time broadening, homogeneous and inhomogeneous line broadening, spectral line profiles in liquids and solids.

Nonlinear optical mixing techniques
Phase matching, second harmonic generation, sum frequency and higher harmonic generation, difference frequency generation, optical parametric oscillator and amplifier, tunable Raman laser, Gaussian beams.

Spectrometers, interferometers, wavemeters and detectors
Basic concepts of spectrometers and interferometers, different kinds of interferometers - Michelson interferometer, Mac-Zhender interferometer, Fabry - Perot interferometer, multilayer dielectric coatings, interference filters, tunable interferometers. Webmeters - Michelson, Sigmameter, Fabry - perot and Feazeu. Detectors – photoconductive and photovoltaic detectors, fast and avalanche photodiodes, photodiode arrays, photomultipliers, multichannel platesand image intensifiers.

Absorption and emission spectroscopic techniques
High sensitivity methods of absorption spectroscopy - cavity ring down spectroscopy. Laser induced fluorescence spectroscopy, photoacoustic spectroscopy, optothermal spectroscopy, ionization spectroscopy, optogalvanic spectroscopy.

Nonlinear spectroscopy
Nonlinear absorption, saturation of inhomogeneous line profiles, hole burning spectroscopy, lamb dip spectroscopy, saturation spectroscopy, polarization spectroscopy, multiphoton spectroscopy, Doppler free two photon spectroscopy, saturated interference spectroscopy.

Laser Raman spectroscopy
Stimulated Raman, coherent anti-Stokes Raman spectroscopy (CARS), Resonance Raman and surface enhanced Raman scattering.

Applications of laser spectroscopic techniques in physics, chemistry and biology

CY 706: Actinide Chemistry (20)

Position in Periodic Table: Electronic configuration, The Actinide Concept, Transuranium elements.

Actinide Spectroscopy: Electronic states, Atomic properties, UV-visible absorption and emission spectroscopy. Time resolved fluorescence spectroscopy (TRFS).
Electronic structure and bonding: Introduction to *'f'* orbitals and their splitting in the ligand field. Relativistic effect and its consequences. Modern techniques for understanding the bonding in actinide compounds.

Co-ordination Chemistry: Ionic radii, Coordination number, Hydration Energy.

Redox Behavior: Redox potentials, Eh-pH diagrams, Variable oxidation states, Ionic species, unusual oxidation states in actinides and their stabilization, Thermodynamic/ kinetics of redox reactions, Disproportionation.

Hydrolysis of Actinides: Hydrolysis, Polymerization / Depolymerization.

Auto-radiolysis: Auto-radiolytic effects in aqueous solutions, Auto-radiolysis effects in solid compounds of actinides.

Complexation behaviour with inorganic/organic ligands: Ion-exchange, Solvent extraction methods for actinides (inter and intra-group separations), Complexation reactions relevant in CQC of nuclear fuels, Analytical chemistry of transplutonium elements, Lanthanides-actinide separation, SANEX process.
Actinides in the Environment: Natural abundance of actinides, Oklo phenomenon, Actinide speciation in aquatic environment, Complexation with naturally occurring organics such as humic acid and fulvic acid, Sorption and Migration, Interaction with rock, clay, mica etc. Formation and migration of radiocolloids.

Biochemistry of Actinides: Actinide-microbe interaction, Actinide migration in the food chain, Fixation in human, Pu in blood, Intra-cellular uptake of Pu, Sequestering using chelation therapy, Bioremediation of nuclear wastes.

Transactinides: Production, Rapid separation techniques, Atom-at-a-time chemistry. Aqueous chemistry of elements 104, 105 and 106

CY 707: Computational Chemistry (20)

Introduction: Revision to Classical Mechanics, Revision to Quantum Mechanics
Force Field Methods: Force Field Energy , Stretching, Bending, Out-of-plane bending, Torsion, van der Waals, Electrostatic, cross terms, Validation of Force Fields, Advantage & Limitations.
Optimization Techniques: Finding Minima-Steepest descent, Conjugate gradient methods, Newton–Raphson methods; Finding Saddle Points-linear and quadratic synchronous transit, gradient norm minimization, Newton–Raphson; Conformational Sampling and the Global Minimum Problem; Stochastic and Monte Carlo methods; Simulated annealing.
Electronic Structure Methods: Self Consistent Field Theory, Restricted & unrestricted HF, Semi-empirical Methods.
Electron Correlation Methods: Configuration Interaction Methods, Multi Configuration Self-Consistent Field, Many Body Perturbation Theory, Couple Cluster Method.
Basis Sets: Slater and Gaussian Type Orbitals, Pople style basis sets, Dunning–Huzinaga basis sets, Correlation consistent basis sets, Plane Wave Basis Functions, Basis Set Superposition Errors.
Density Functional Methods: Kohn–Sham Theory, Reduced Density Matrix Methods, Exchange–Correlation Functionals-Local Density Approximation, Hybrid or hyper-GGA methods, DFT Problems.
Wave Functional analysis: Population Analysis Based on Basis Functions, Population Analysis Based on the

Electrostatic Potential, Population Analysis Based on the Electron Density, Localized Orbitals, Natural Atomic Orbital and Natural Bond Orbital Analysis.
Molecular Properties: Perturbation Methods, Derivative Techniques, Electric Field Perturbation, Magnetic Field Perturbation.
Simulation Techniques: Monte Carlo Methods, Molecular dynamics methods.
Computer Laboratory Work: Ab initio electronic structure calculation of small systems-designing of input using a visualization program, running an electronic staructure calculation applying GAMESS program, analyzing output manually and using visualization program.

CY 708: Advanced NMR Spectroscopy (20)

The basics of NMR experiment
Basics of NMR spectroscopy, Pulse NMR, The mechanisms of relaxation, The components of a modern NMR instrument, Basic data acquisition and processing

The NMR of Important Nuclei
Chemical shifts for ^{1}H, ^{13}C and ^{31}P nuclei, Homolnuclear and heteronuclear couplings (J), Factors that influence the sign and magnitude of J

Double Resonance Techniques and Complex pulse sequences
Decoupling experiments (homonuclear and heteronuclear), Nuclear Overhauser Effect (NOE), Distortionless Enhancement by Polarization Transfer (DEPT) Experiments

The study of dynamic processes by NMR
Reversible and irreversible dynamic processes, Reversible complexation and chemical shift reagents, Variable temperature NMR, Determination of activation parameters

Two-Dimensional NMR Spectroscopy
Basics of 2D NMR experiments, ^{1}H-^{1}H Correlation Spectroscopy, ^{1}H-^{13}CCorrelaion Spectroscopy,

Nuclear magnetic resonance in solids
Basic NMR interactions in the solid state and their relative magnitudes, Chemical shift tensors and their orientation, Dipolar and quadrupolar couplings, Electron Paramagnetic effects in solid state NMR, Differences in the solid state NMR spectra from spin ½ and quadruple nuclei, Detection of NMR signals in solids, Wide line and zero field NMR experiments

High resolution Solid State NMR experiments
Magic Angle Spinning (MAS) NMR experiments, Side band manipulations and line shape analysis in MAS NMR experiments, Evaluation of chemical shift anisotropy parameters form side band intensity analysis, Cross Polarization Magic Angle Spinning (CP MAS) NMR experiments with suitable examples, Probing the local environmentaround nuclei and measurement of inter-nuclear distances by different solid state NMR techniques, Variable temperature MAS NMR experiments, Multi Quantum (MQ) MAS NMR experiments, Application of solid state NMR techniquesfor characterization of glasses, porous and amorphous materials, polymers, biomaterials, nano-materials, hybrid-materials, catalysts etc.,

Principle of NMR imaging.

CY 709: Atmospheric Chemistry (20)

Structure of Atmosphere
Physical characteristics, Chemical Composition, Carbon, Hydrogen and oxygen cycle.

Atmospheric Radiation
Terrestrial and solar radiation, Energy balance for Earth and Atmosphere, Radiative flux, Actinic flux; Spectroscopy, Absorption of radiation by atmospheric gases and aerosols, Absorption by O_2 and O_3, Radiative forcing, Photolysis rate as a function of altitude.

Chemistry of Troposphere and Stratosphere
Stratosphere - Chapman mechanism - HO_x, NOx cycle
Troposphere - Hydroxyl radicals and other tropospheric oxidants, Photochemical cycles of NO_2, NO and O_3 , Chemistry of NO_x, carbon monoxide, Methane, Definition of tropospheric lifetimes, Importance of gas phase kinetics.

Atmosphere Pollutants
Oxides of nitrogen, Volatile Organic Compounds (VOCs), Halogenated compounds, Sulfur compounds and particulate matter.

Effects of pollution
Photochemical smog - production of ozone and NOx; trends in trophospheric ozone concentration, relationship of VOCs and NOx to O_3, atmospheric chemistry of ozone and its precursors, chemistry of sulfur and nitrogen compounds, Acid Deposition.

Global effects of pollutio
Green House Effect, Global Warming Potential, Stratospheric Ozone Depletion, Ozone depletion Potential, Montreal / Kyoto protocol.

Laboratory and field measurements
Techniques for species identification and quantification, Aerosoles - formation, sampling and characterization. Experimental methods to study reactions of importance in the atmosphere (Laser Induced Fluorescence, Chemiluminescence, Cavity Ring Down Spectroscopy).

NON-SUBJECT ASSIGNMENTS

CY 591: Viva Voce

In addition to the formal assessment carried out by the method of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

CY 592: Mini-Project

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the Mini-Project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provide useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.

CY 593: Seminar

As a part of the course curriculum, all trainees have to make a seminar presentation. For this purpose, the trainee is asked to choose a topic of presentation based upon his/her aptitude and area of research interest. The objective of this exercise is to inculcate skills in the trainee on aspects such as analysis of the experimental data, details discussion on the results and hypothesis presented and drawing of meaningful conclusions. A Seminar Committee constituted for this purpose evaluates the presentation based upon attributes such as scientific content, quality of presentation and ability of the trainee to defend the subject of presentation. A maximum of 100 marks have been allocated for the seminar.

Kalpakkam – 603 102 Tamil Nadu, India

Chemical Sciences Courses offered in HBNI & Course coordinators

CH-1 : Mathematics and Computational methods (6 credits)

CH-2 : Chemical Thermodynamics (6 credits)

CH-3 : Electrochemistry and Corrosion Science (4 credits)

CH-4 : Introduction to Materials Science and Engineering (6 credits)

CH-5 : Analytical Chemistry for Nuclear Fuel Cycle (6 credits)

CH-6 : Chemical Instrumentation and Laboratory Techniques (6 credits)

CH-7 : Health Physics and Radiation Sciences (6 credits)

CH-9 : Chemistry of Fuel Cycle-I(6 credits)

CH-10 : Chemistry of Fuel Cycle-II: Actinide chemistry and separation science (6 credits)

CH-11 : Materials for Nuclear Reactors and Fuel Cycle Processing Systems (6 credits)

CH-12 : Nuclear and Radiochemistry (6 credits)

CH13 : Corrosion Science and Engineering (6 credits)

CH-14 Quantum Chemistry & Group Theory (6 credits)

CH-15 : Molecular Spectroscopy (6 credits)

CH-16 : Lasers and Application (6 credits)

CH-17 : Nanomaterials and Advanced Chemical Sensors (6 credits)

CH-RM: Course on Research Methodology (3 credits)

CH-1: Mathematics, computational methods, numerical analysis and computer programming

Course content

1. **Differential Equations & Integral Transforms:** Linear differential equations: Series method of solution; Legendre, Lagurre and Hermite differential equations. Use of ladder operators for solutions to differential equations; applications to quantum chemistry.

Orthogonal Polynomials and Special functions – Dirac Delta function, gamma function, error function. Introduction to Fourier series, Fourier transform and Laplace transform – applications in quantum chemistry and spectroscopic techniques – FT-NMR, FT-IR.

Convolutions of functions, use of Fourier transforms in convolution, Applications in chemistry.

2. **Vectors:** Vector differentiation and integration: Concepts of gradient, divergence and curl and their physical significance. Orthogonal vectors, Gram-Schmidt process – applications in quantum chemistry. Vector fields in space – Gauss and Stokes theorem with applications.

3. **Matrix Algebra:** Elementary operations and elementary matrices. Rotation matrices, Similarity transformations; Applications of numerical techniques in matrix algebra to evaluate eigenvalues and eigenvectors; Diagonalization and inversion of matrices. Applications in chemistry.

4. **Numerical Methods:** Newton-Raphson method for finding roots, differentiation, integrations by quadrature techniques, solutions of differential equations.

Book suggested

1. Advanced Mathematics for Engineers and Scientists, M.R. Spiegel, Schaum's Outline Series(1983).
2. Mathematical Methods for Physics Engineering, K.F. Riley, M.P. Hobson and S.J. Bence, Cambridge University Press (1998).
3. Theory and Problems of Vector Analysis, M.R. Spiegel, Schaum's Outline Series (1981).
4. Computer Oriented Numerical Analysis, V. RajaRaman, Prentice Halls India, 3rd ed. (1999)
5. Mathematical Physics, E. Butkov, Addison-Wesley Publishing Company, California (1968).

CH-2: Chemical Thermodynamics

Course content

1. **Laws of Chemical Thermodynamics:** Thermodynamic laws, thermodynamic properties of the system, criterion for equilibrium, Heat engines, Helmholtz energy, Gibbs energy, Closed system, Maxwell's equations, Gibbs-Helmholtz equation.

2. **Behaviour of Gases:** Gas laws, ideal gas and deviations from ideality, Vander Waal's equation, equation of state, critical phenomena,Thermodynamic treatment of non-ideal gases, gas mixtures.

3. **Solutions:** Raoult's and Henry's laws, activity of a component in solution, Gibbs-Duhem equation, Properties of Raoultian ideal solutions, Colligative properties, Non ideal and regular solutions, Partial and Integral thermodynamic property evaluation, alpha function, Gibbs free energy of formation of regular solutions, Criteria for stability of regular solutions, Miedema's model, associated solution model, sub-regular solutions, Models for ternary systems such as Colinet's model.

4. **Phase Equilibria:** Phase rule, Gibbs Free energy as a function of temperature and pressure, Equilibrium between a vapor and a condensed phase in a single component system, Graphical representation of phase equilibria in a single component system, Gibbs energy and thermodynamic activity, phase diagrams- single component, binary and ternary diagrams, simple calculation of thermodynamic properties from phase diagram, pressure-composition diagrams, CALPHAD and models for optimization of phase diagrams.

5. **Reactions in Gases and Condensed Phases:** Reaction equilibria in homogeneous and heterogeneous media, effect of temperature and pressure on equilibrium constant, Le Chatlier's principle, Reaction equilibria in H2/ H2O, CO/CO2 systems, Ellingham diagrams, Effect of phase transformation, use of different standard states for representing reactions in condensed phases, phase stability diagrams, application of phase diagrams in material systems.

6. **Statistical Thermodynamics:** Entropy and disorder in an atomic scale, concept of microstate, most probable microstate, influence of temperature, Boltzmann equation, partition functions, configurational entropy and thermal entropy.

7. **Experimental Thermodynamics:** Calorimetry - classification of calorimeters, different types of calorimeters, heat capacity measurements, thermochemical calorimetry, estimation of thermodynamic quantities.

Vapor pressure measurements- static methods, transpiration, boiling point method, isopiestic method, Knudsen effusion method , Langmuir evaporation method, role of mass spectrometry for study of vaporization reactions, second and third law methods, Gibbs energy functions from spectroscopy data, measurements at very high temperatures.

Galvanic cell EMF methods for activity measurements, - solid electrolyte and molten salt EMF methods.

Measurement of oxygen and carbon potentials – gas equilibration/ EMF methods

Determination of phase diagrams- spot technique, thermal analysis, enthalpies of transformations, transformation temperature, order of transformation, DTA, TGA, thermal expansion, resistivity- as a function of temperature , thermal diffusivity, measurement of thermal diffusivity and thermal conductivity.

Books Suggested:

1. Physical Chemistry, G W Castellan, Addison Wesley, 1971
2. Introduction to Metallurgical Thermodynamics, David R Gaskell, McGraw Hill, 1973.
3. Physical Chemistry, P W Atkins, 7th Ed, Cambridge University Press, 2004.
4. Principles of Chemical Equilibrium with Applications in Chemistry and Chemical Engineering, K Denbigh, Cambridge University Press, 1981.
5. Chemical and Process Thermodynamics, 2nd Ed, B G Kyle, Prentice Hall, 1992.
6. Thermodynamics, G N Lewis, M Randall, revised by K S Pitzer and L Brewer, McGraw Hill, 1961.
7. Differential Scanning Calorimetry: An Introduction for Practitioners, G W H Hohne, Springer Verlag, 1996.
8. Characterisation of high temperature vapours, Ed by J L Margrave, John Wiley, New York, 1967.
9. Physicochemical Measurements in Metal Research, Ed by R F Bunshah, Wiley Interscience, New York, 1970.

CH-3: Electrochemistry

Course content

1. Electrolytes – Different electrolyte systems (aqueous, ionic melts and solid electrolytes) and their conductivities; Debye-Huckle theory, Techniques for measuring electrical conductivities - DC and AC techniques

2. Electrochemical cells - Electrochemical potentials, Nernst equation and electrochemical series, Molten salt and solid electrolyte based cells

3. Electrode processes and kinetics – Diffusion layers & characteristics of the diffusion layers, over potentials, Butler-Volmer and Tafel equations, polarisable and non-polarisable electrodes, reference electrodes, voltammetric techniques, polarography, Cyclic Voltammetry, rotating electrodes and micro-electrodes, chronpotentiometric and chronoamperometric techniques, elucidation of mechanisms of electrochemical reactions.

4. Applications of electrochemical principles - Electro-analytical techniques and electrochemical sensors; energy conversion and storage systems (fuel cells and batteries); thermochemical data measurements.

Reference Books:

1. "Electrochemical Methods: Fundamentals and Applications**",** AJ Bard & LR Faulkner, Wiley, New York, 1987.
2. "Electrode Dynamics**",** AC Fisher, Oxford University Press, Oxford, 1996.
3. "Electrochemistry", **P**.H. Reiger, Prentice-Hall International, Englewood Cliffs, 1995.
4. "Solid electrolytes and their Applications", (Ed) E.C.Subba Rao, Plenum, New York, 1980.
5. "Electrochemistry", C. M. A. Brett and A. M. O. Brett, Oxford University Press, 1993.
6. "Laboratory Techniques in Electroanalytical Chemistry", 2nd Ed., by P. T. Kissinger and W. R.Heineman, Marcel Dekker, 1996.
7. "Chemical Sensor Technology", Vol.2, (ed) T.Seiyama, Kodansha Ltd., Tokyo, 1989.
8. "Chemical Sensor Technology", Vol.3, (ed) N.Yamazoe, Elsevier, Amsterdam, 1991.
9. "Solid State Gas Sensors", P.T.Mosley and B.C.Toefield, Adam Hilger, Bristol, 1987.
10. "Advances in Electroanalytical Chemistry", Vol.2, A.J.Bard, Macel Dekker, New York, 1967.
11. "Fuel Cell Systems", L.J.M.J.Blowmen and M.N.Mugerwa, Plenum Press, New York, 1993.

CH-4: Introduction to Materials Science & Engineering

Course content

1. **Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.

2. **Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.

3. **Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams & Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley & Sons, N.Y., 2003.

7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.

15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

CH-5: Analytical Chemistry for Nuclear Fuel Cycle

Course content

1. **Instrumental Methods – Principles and Applications:**

Spectrochemical Methods: Detectors- Photomultiplier Tube (PMT), Charge Coupled Device (CCD), Charge Injection Device (CID), Spectrometers – Czerny Turner, Echelle, Sample Introduction Devices – Flame, Electrothermal, Laser Ablation, Direct Sample Insertion Devices, Interferences, detection limits, sensitivity, Absorption Spectrometry – Flame Atomic Absorption Spectrometry, (FAAS), Electrothermal Atomic Absorption Spectrometry (ETAAS), Optical Emission Spectrometry (OES) with Inductively Coupled Plasma (ICPOES), Glow Discharge (GDOES), Fluorescence Spectrometry – Laser Induced Fluorescence (LIF), Recent advances – Continuum Source (CS-AAS), Single Atom Detection.
Mass Spectrometry: Mass Analysers – Magnetic, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance, Features – Resolution, Dispersion, Abundance, Sensitivity, Detectors – Faraday Cup, Channeltron, Daly, Ion Sources –Thermal Ionisation (TI), Electron Impact, ICP, GD, Laser Ablation (LA-ICP), Secondary Ionisation (SI), Resonance Ionisation (RI), Matrix Assisted Laser Desorption and Ionisation (MALDI), Hyphenated Technique – ICP-MS, HPLC-MS, GC-MS.

Thermal Methods: Thermogravimetric Analysis (TGA), Derivative Thermogravimetric Analysis (DTG), Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Evolved Gas Analysis (EGA).

Nuclear Methods: Activation Analysis – Neutron Activation Analysis (NAA), Charged Particle Activation Analysis (CPAA), X-ray fluorescence (XRF) spectrometry, Ion Beam Analysis – Backscattering Spectrometry (BS), Particle Induced □-ray Emission (PIGE), Nuclear Reaction Analysis (NRA), Elastic Recoil Detection Analysis (ERDA), Particle Induced X-ray Emission (PIXE).

2. **Separation Techniques – Principles and Applications:**

Solvent Extraction Technique: Conventional, Liquid Membranes – Bulk, Supported and Emulsified, Solid Phase Extraction (SPE).

Ion Exchange: Conventional and Membranes.

Chromatography: Gas chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion chromatography (IC).

3. **Statistical Methods in Chemical Analysis:** Methods of sampling and associated errors, Classification of errors, Propagation of errors, treatment of errors, Normal distribution, Tests of Significance and Confidence Limits. Method of Least squares – linear and non-linear, weighted least squares formalism, constrained least squares fitting

4. **Laboratory Experiments (any 5):**

Determination of trace impurities in high purity materials by AAS.

Application of Electroanalytical Methods to trace analysis

TGA and DTA study of inorganic compounds

Neutron Activation Analysis of trace constituents in a complex matrix

Analysis of an alloy sample by EDXRF

Anion analysis by ion selective electrode.

Chromatographic separation and measurement of the components in a mixture

Isotopic Analysis by Mass Spectrometry

Books suggested:

1. Fundamentals of Analytical Chemistry, D.A. Skoog, D. M. West, F. J. Holler, S.R. Crouch, 8th Edition, Thomson (2004).
2. Principles of Instrumental Analysis, D.A. Skoog, F. J. Holler, T. A. Niemann, 5th Edition, Saunders College Publishing (1998).
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).
4. Statistics for Analytical Chemistry, J. C. Miller and J. N. Miller, 2nd Edition, Wiley (1998).

CH-6: Chemical Instrumentation and Laboratory Techniques

Course content

1. **Passive Circuit Elements and Configurations:** Circuit behaviour of resistors,inductors and capacitors; the potential divider and the wheatstone Bridge (resistive and capacitive), R-L-C-circuits as filters and resonance circuits.

2. **Electronic Devices and Their Role in Power Conversion and Amplification:** The junction diode, SCR, triacs and their role in rectification and AC power control; bipolar transistor and IGBT and their role in linear/switched mode power supplies and in amplification of signals; constant current power supplies Inverter circuits; issues in measurement of signals - Concept of input impedence and the role of J-FETs and MOSFETs.

3. **Operational Amplifiers and their Various Functionalities:** The basic OP-AMP and its desired characteristics; the inverting amplifier, the non-inverting amplifier, summing configuration;

The differentiator and integrator circuits; comparator; precision rectifier; waveform generation.

4. **Fundamental Issues Related to Chemical Instrumentation:** Role of chemical instrumentation in the nuclear fuel cycle, with relation to selectivity, sensitivity and automation amenability.

The basic anatomy of excitation with energy source-interaction with analyte-detection of the effect produced; issues related to selectivity; sensitivity and detection limits; sources of noise and measures to minimize the effect; boxcar integrator, lock-in-amplifier.

5. **UV-VIS-IR Instruments:** Phenomenon of resonant absorption and Beer's law of photometry; implementation of Beer's law in a spectrophotometer; compensation for spectral response of the detector; slit servo mechanism for compensation of optical emission.

Atomic absorption spectrophotometer-flame ionization, compensation for molecular absorption, hollow cathode lamp excitation for high specificity.

Atomic emission spectrometry-principles, instrumentation and data interpretation

Laser fluorescence spectrometry-laser basics, three stage power supply for flash lamp excitation.

Non dispersive spectrometer- FTIR - principle, data collection scheme.

6. **X-Ray Spectrometry:** Generation of X-Rays, The X-Ray tube, setting the energy and intensity; Bragg's law; X-Ray fluorescence, X-Ray diffraction, ESCA for surface analysis.

7. **Mass Spectrometry:** Ion sources-thermal ionization, Knudsen effusion and electron impact ionization, inductively coupled plasma source, Laser induced vapourisation, spark source.

Magnetic analysers, quadrupole analysers, time-of-flight analysers.

Detectors-faraday, SEM, Channeltron.

Mass scanning, peak centering, signal handling and digitization and counting.

8. **Thermal Analysis:** Thermal excitation - furnaces, temperature profiling and furnace power control.

Thermal effects - TGA, DTA, DSC, dilatometry.

Thermal measurements - thermocouples, RTDs, signal conditioning and handling.

9. **Additional Methods of Analysis:** Gas chromatography - mobile and stationary phases; separation on the basis of retention time; TCD and FID detectors.

Instrumentation for pH meters and conductivity meters; automated titro-processors and applications of coulometry.

Radioactive assay based on multi-channel gamma ray spectrometry.

10. **Digital Electronics:** Logic gates; flipflops, counters, astable and monostable multivibrators; decoders; logic families; data conversion-various types of ADCs and DACs.

Microprocessor systems-processor architecture, memory circuits, I/O subsystems; interfacing techniques; assembly language programming.

11. **Laboratory Techniques:** Machine Drawings Projections: orthographic – 1st & 3rd Angles

pictorial; Oblique: Perspective. Conventional representation of common features and sections;

Dimensioning and tolerancing; Scales, lines and lettering; Threads; Fastenings. Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Vacuum systems - equipment for vacuum generation - rotary pumps, diffusion pumps, ion pumps, turbo molecular pumps; Generation of high temperatures, measurement of vacuum and temperatures, centrifuges, chemicals and laboratory safety.

12. **Vacuum Generation and measurements:** Kinetic theory of gases – Velocity distribution – Mean free path – Monolayer formation – vacuum units – Viscous and molecular Flow regimes – Reynold's and Knudsen Numbers viscosity and thermal conductivity of gases – Gas release from solids – vaporization – out gassing – diffusion – permeation – Vacuum pumps – Titanium Sublimation pumps – Ion pumps – Cryogenic pumps and maters for construction of Vacuum chamber.

Gauges: Thermal conductivity, cold cathode, hot cathode ionization gauges and their Principle of operation.

Books suggested:

1. Principles of Instrumental Analysis, D. A. Skoog and J. Leary, McMillan Publishers,
2. Instrumental Methods of Analysis, H. H. Willard, L. L. Merritt, Jr., J. A. Dean, F. A. Settle, Jr. CBS Publishers and Distributors, New Delhi 1986.
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).

CH-7: Health Physics and Radiation Sciences

Course content

1. **Interaction of Radiation With Matter:** Ionization in gaseous medium, Bragg's curve, stopping power, Bethe equation, range of particles and straggling, LET, attenuation and absorption of beta particles, backscattering, photoelectric, compton and pair production processes for gamma radiation, variation with gamma energy and Z of medium, attenuation and absorption of gamma rays, elastic and inelastic scattering of neutrons.

2. **Radiation Detection and Measurement:** Principles of radiation detectors, counting characteristics, detection efficiency and energy resolution, dead time and counting statistics, Gas filled detectors, scintillation processes and detectors, organic and inorganic scintillators, NaI(Tl), LaBr3, semiconductor detectors, p-n junctions, germanium and silicon detectors, room temperature semiconductors, neutron detectors including bubble detectors, solid state nuclear track detectors, nuclear probes - positron annihilation, perturbed angular correlation, mossbauer effect.

3. **Shielding and Dose Calculations:** Shielding (beta, gamma and neutron sources).

Shielding from mixed sources; calculation of dose for point, line and volume sources.

4. **Dosimetry:** Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effective dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective half-life and their relation and the concept of the same and their importance. Concept of ALI and DAC.

5. **Radiation Protection Principles:** Radiation protection philosophy, objectives and principles of radiation protection, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types of exposure (natural, occupational, medical and public).

External and internal exposures; routes of intake of radioactive material. Use of personal dosimeters (Film badge, TLDs, pocket dosimeters). Calculation of internal dose, Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Bragg-Gray principle.

Fundamentals of ICRP respiratory model, entry through ingestion, GI track model, wholebody counting and bioassay techniques.

6. **Radiation Protection Procedures:** Procedures followed in radiation work places, supervised and controlled areas, work permits, contamination control methods (air-borne, surface and personnel), swipe samples, and rubber areas, spill pack (gloves + absorbing paper), decontamination and de-corporation techniques; bore wells and inspection chambers; precautions during radioactive source storage and handling.

Types of radiation monitors / radioactivity measurement methods adopted for radiation protection. Personnel monitoring, area monitoring and stack monitoring.

7. **Waste Management:** Radioactive waste classification and management – An overview.

8. **Emergency Preparedness:** Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, counter measures.

9. **Nuclear Fuel Cycle Applications:** Radiological aspects and environmental impact of FBRs. Criticality safety and Radiological aspects in nuclear cycle facilities.

10. **Regulatory Details:** Atomic Energy Act, National and International regulatory bodies, their role and responsibilities, Radiation Protection Rules, Nature of duties and responsibilities of Radiation Safety Officer / Health Physicist, radio toxicity and classification of laboratories, design of lab for radioactive work, Safe handling of radioisotopes, Transport of radioactive materials.

11. **Basic Radiobiology:** Interaction of ionizing radiation with living cells, Ionizing radiations, excitation and ionization process, basic structure and components of cell, chemical and biological consequences of radiation action, radicals and reactions in cell killing, direct and indirect effect and relevant biological damage.

12. **Molecular and Cellular Effects of Radiation:** Radiation action and organizational level in cell, Damage to DNA, single and double structural breaks in units membrane dose and survival curve, cellular radioactivity, radiobiological effectiveness and linear energy transfer Dzz dose, rate effect, dose fractionation, Mitotic delay, chromosome aberration and mutations by radiation action on cells.

13. **Modification of Biological Effects of Radiation:** Oxygen effect, OER, Chemical radio sensitizers, Chemical radio protectors, Mechanisms of action and importance in nuclear research programme.

14. **Radiobiology and Radiotherapy:** Radiation and cancer, cell cycle and radiosensitivity, rationale of using radiation for tumor cell kill, problems.

15. **Basics of Radiation Chemistry:** Interaction of high energy radiation with matter, G-values, radiation induced reactions in solids, liquids and gases.

Laboratory Experiments:

1. Plancheting, alpha counting and spectroscopy
2. Counting characteristics of gas detectors
3. Half life determination and attenuation coefficient determination
4. High resolution gamma spectrometry
5. Dose Measurements: Whole Body Counting laboratory, Bio-dosimetry laboratory, TLD personnel monitoring services laboratory.

Demonstrations:

1. **Use of Personnel Protective Equipment (PPE):** Proper checking and wearing of gloves, and other plant dresses (shoe covers, boiler suits, overcoats etc).

Respirators (dust, gas mask, self contained breathing apparatus, and fresh air-line) TLD, Film badge, neutron film, criticality badge and bubble detector

2. **Use of Radiation Monitoring Equipment: Installed and Portable Radiation Monitors:** AGM (audio and visual alarm, setting up of alarm limits); staplex air sampler (estimation of air-borne activity-both alpha and beta-gamma), different types of survey meters (low to high range), ALSCIN and GM based contamination monitors (side window and end window, hand and foot monitor, cloth monitor), continuous air monitor, criticality alarm system.

Books suggested:

1. Introduction to Health Physics by Herman Camber
2. Biological Effects of Radiation by J. E. Coggle
3. Radiobiology for Radiologist by Eris J. Hall
4. Detection and Measurement of Radiation - Glenn T Knoll.

CH-9: Chemistry of Fuel Cycle-I

Course content

1. Recovery of the starting compounds bearing U, Pu or Th from their primary and secondary sources. Mining, beneficiation, pre-concentration, purification and recovery.

2. **Oxide Fuels:** Preparation of UO2, PuO2, MOX and ThO2. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

3. **Advanced Ceramic Fuels:** Carbides U-C, Pu-C, U-Pu-C, U-Pu-C-O and U-Pu-C-O-N, Nitrides U-N, Pu-N, U-Pu-N. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

4. **Advanced Fuel Fabrication Techniques:** Oxides, Methods based on sol-gel and novel techniques. Carbides; sol-gel method, direct pressing and arc casting.

5. Preparation of U, Pu and Th.

6. **Alloy Fuels:** Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-RM, U-Pu- MA), dispersions and composites – Salient physical and chemical properties, relevant phase diagrams, fabrication and quality control.

7. **Inert Matrix Fuels for Partitioning and Transmutation:** A brief account on the current developments.

8. **Fuel – Clad Interaction:** Significance of FCCI and FCMI. Specifics pertaining to oxide, carbide and metallic fuels. Role of chemical thermodynamics in the prediction and understanding of Fuel clad chemical compatibility.

9. **In Pile Behaviour of Fuels:** Chemistry and redistribution of fission products, role of chemical potentials of the constituents in the breach of clad in oxide, carbide and alloy fuel pins and detection mechanisms.

Books suggested:

1. Donald R. Olander, Fundamental aspects of nuclear reactor foel elements fundamental aspects of nuclear reactor foel elements, Springfield, BTIS, 1985.
2. H. J. Matzke, Science of Advanced LMFBR fuels, North Holland, Amsterdam, 1986.
3. M. Benedict and T.H. Pigford, Nuclear Chemical Engineering, Mc Graw Hill, New York, 1957. (Specific journal articles and other references will be cited during the lectures)

CH-10: Chemistry of Fuel Cycle–II

Course content

1. **Actinide Chemistry:** Discovery of actinide elements, electronic structure, oxidation states, inter-conversion of oxidation states, complexes of actinide ions, actinide contraction, comparison of actinides with lanthanides. Actinides in environment.

Purification of actinides using techniques such as ion-exchange, Solvent Extraction, Liquid membranes and Chromatographic Methods.

Hydrolysis, colour, spectroscopy and magnetic properties of actinides, nuclear properties of actinides, decay modes.

Thorium: isotopes, occurrence and production; Uranium: isotopes, occurrence, resour0ces and production.

Transuranium Elements: production of transuranic elements, Neptunium, Plutonium, Americium and Curium; Actinide synthesis by heavy ion reactions.

Fission Product Chemistry.

2. **Aqueous Reprocessing:** Introduction to nuclear fuel reprocessing; Need for reprocessing; PUREX, TRUEX, THOREX.

Latest developments. Solvent extraction for actinide purification; basic principles, introduction to extractants, classification of extractants.

Purification of uranium, plutonium; lanthanide actinide separations.

3. **Pyrochemical Reprocessing:** Introduction to non aqueous reprocessing: Objectives and advantages of non aqueous reprocessing in fast reactor fuel cycle, Advanced fuel cycle flowsheets involving non aqueous reprocessing, Recent trends in pyrochemical reprocessing of oxide and metallic fuels.

Oxide electrowinning flowsheet, Pyrochemical reprocessing of metallic fuels (IFR process) - Integral Fast Reactor Concept, Differences in electrorefining and electrowinning.

4. **NUMAC:** Importance of Nuclear Material Accounting; techniques used for analysis of nuclear materials.

NUMAC with techniques such as Potentiometry, Coulometry, Amperometry.

Mass Spectrometry, Calorimetry, Gamma counting, neutron counting etc. Advantages and drawbacks of individual methods.

5. **Post Irradiation Techniques:** Introduction to post-irradiation examination methods of nuclear reactor fuels; importance of PIE methods, burn-up measurements; NDE testing of fresh fuel pins.

Non-destructive evaluation of irradiated fuels (X-ray and neutron radiographic examination of fuel pins, Fission gas analysis, Metallographic examinations).

6. **Nuclear Waste Management:** Introduction - industrial waste, nuclear waste & its speciality, generation of radioactive wastes, radioactivity in the environment, Solid, liquid & gaseous wastes, international classification. Basic philosophy & methods of radioactive waste management, environmental monitoring. HLW & spent fuel waste. Radioactive waste immobilization matrices & their ultimate disposal.

CH-11: Materials for Nuclear Reactors and Fuel Cycle Processing Systems

1. Fundamentals of reactor physics and different reactor systems

a) Fission reactors: Thermal reactor, fast reactor, advanced reactor, b) Fusion reactors: Thermonuclear reactor

2. Health Physics and Radiation Sciences

Interaction of radiation with matter, Radiation detection and measurement – use of gas filled detectors, scintillators, semi-conductor detectors, neutron detectors, Radiation Units and Limits.

Hazards Control and Evaluation, Biological effects of radiation, Dose and dose limits for occupational workers and members of public, Radiation Protection Procedures, Dosimeters.

Transport and release, Classification of nuclear waste and their management –Emergency Preparedness, Radiation Chemistry, G-values, radiation induced reactions in solids, liquids and solids.

3. Introduction to Reactor Materials

Moderators (Requirements, properties of D_2O and graphite), C**ontrol rod materials (**Requirements, properties), **Coolants** (Requirements, properties and handling - water, liquid sodium, lead-bismuth alloys, helium, CO_2), **Cover gas (**Cover gas purification, monitoring for hydrogen, fission gases)

4. Introduction to Coolant chemistry:

Na, Pb-Bi and Pb-Li chemistry: Monitoring and maintaining purity of coolants, on-line monitoring using EC monitors, sampling and analysis.

Water chemistry (Introduction to fast reactor water chemistry, condenser cooling and process water chemistry, de-mineralising plant and condensate polishing unit chemistry, on-line monitoring, biological shield cooling water chemistry, related analytical techniques, Chemical aspects of corrosion in liquid metal coolant systems

5. Fuel reprocessing: Chemistry of Actinides with respect to reprocessing, Aqueous methods - Purex, Thorex, use of novel extractants, Non-aqueous methods - pyrochemical processes.

Books Suggested:

1. S. Glasstone, Source Book on Atomic Energy, Allied East-West Press Pvt. Ltd., NewDelhi.
2. S. Glasstone and Sesonske, Nuclear Reactor Engineering, Chapman Hall, London, 1994.
3. H.U. Borgstedt and C.K. Mathews, Applied Chemistry of the Alkali Metals, Plenum Press, 1987.
4. C.C. Addison, The Chemistry of the Liquid Alkali Metals, John Wiley and Sons, 1984.
5. Power Plant Chemistry: A practical guide, Buecher Braid, Penwell, Oklahoma, 1997.
6. Modern Power Station Practice, III Edition, Pergamon, NY, 1992.

CH-12: Nuclear and Radiochemistry (CH12)

Course content

1. **Nuclear Properties:** Concept of nucleus, nuclear spin, parity, electric and magnetic moments, isomerism, nuclear mass and binding energy, elemental abundance, radioactive decay laws, radioactive equilibria, Bateman's equation, liquid drop and shell models.
2. **Nuclear Structure and Decay Modes:** Nuclear force, structure of complex nuclei, liquid drop, shell and collective models, nucleon emission, beta decay, gamma de-excitation and internal conversion, selection rules.
3. **Nuclear Reactions and Accelerators:** Basic principles and energetics, cross sections, nuclear fission, charge and mass distribution in fission, compound nucleus reactions, direct reactions, types and details of accelerators.
4. **Radiochemical Separations:** Concepts of traces, chemical yields, radiochemical purity, applications.
5. **Nuclear Techniques:** Nuclear probes, PAC, NDA and on-line monitoring.
6. **Radio-isotope Production:** Basic principles of isotope production in both reactors and accelerators, Szilard - Chalmers effect and its utility, concept of generators, Moly generators.
7. **Applications of Radioisotopes:** Concepts of nuclear medicine and radio-pharmaceuticals, SPECT, PET, brachytherapy and and teletherapy Radio-immuno assay, industrial, agricultural and biological applications.

Laboratory Experiments:

1. Fission product separation and transient equilibrium.
2. Separation of actinides using ion-exchange or solvent extraction
3. Neutron activation analysis.

Books Suggested:

1. Nuclear and Radiochemistry (1981) - G. Friedlander, J. Kennedy, J.M. Miller and J.W. Macias
2. Atomic Nuclear (1955) - R.D. Evans
3. Source book of atomic energy (1969) - S. Glasstone
4. Essentials of Nuclear Chemistry (1982) - H.J. Arnikar
5. The chemistry of Transuranium Elements (1971) - J. Keller
6. G.R. Chopin and Rydberg: Nuclear Chemistry, Theory and Applications, Pergamon Press, Great Transuranium elements and transactinides.
7. Manual for reactor produced isotopes, IAEA-TECDOC-1340 (1999)
8. Radionuclides in therapy - R.P. Spencer, R.H. Sievers, A.M. Friedman. CRC Press (1987
9. Radioimmunoassay: Principles and Practice, M.R.A. Pillai and S.D. Bhandarkar, 2nd Edition, BARC, 1998
10. Industrial applications of radioisotopes - G. Foldiak

CH-13: Corrosion Science and Engineering (CH13)

Course content

1. **Thermodynamics of Aqueous Corrosion:** Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.

2. **Kinetics of Aqueous Corrosion:** Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.

3. **Forms of Corrosion:** General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion.

Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.

4. **Corrosion in Reactor and Reprocessing Plants:** Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.

5. **Prevention and Control of Corrosion:** Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.

6. **Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.

7. **Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, "Corrosion and corrosion control – An introduction to corrosion science and engineering", Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, "Corrosion Engineering", Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.
4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

CH-14: Quantum Chemistry and Group Theory

1. Fundamental principles

Brief review of the fundamentals of quantum mechanics – postulates, measurements, operators, de Broglie equation, Heisenberg principle, Schrodinger Equation.

2. Exactly solvable problems

Particle in a box with walls at infitine and finite potential; Double box potential, tunneling, effect of barrier height on splitting of degenerate energy levels and its application in understanding double well potential. Particle in a ring. Simple harmonic oscillator, rigid rotor, hydrogen atom problem solution using both the power series method and ladder operators.

3. Approximation methods

Variation method, perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules.

4. Group Theory

Symmetry elements and operations, point groups, matrix representation, reducible and irreducible representations, the Great Orthogonality theorem, direct product representation, projection operators.

5. Applications of Group Theory in Chemistry

Vibrational problem, hybridization, SALC, ligand field theory.

Reference Books

1. "Quantum Chemistry", I. N. Levine, Allyn & Bacon, Inc. (Boston) 5ed. (2000).
2. "Introduction to Quantum Chemistry", F. S. Levine, Cambridge Univ. Press (2002).
3. "Quantum Chemistry", W. Kauzmann, Academic Press (1957).
4. "Chemical Applications of Group Theory", F. A. Cotton, Wiley Eastern Limited, (1989).
5. "Group Theoretical Techniques in Quantum Chemistry", C. D. H. Chisholm, Academic Press (1976).

CH-15: Molecular Spectroscopy

1. Vibrations and rotations of diatomic molecules, selection rules, nuclear spin statistics.

2. Electronic spectroscopy of diatomic molecules, coupling of angular momentum, Hunds coupling cases, term states of molecules, potential energy functions – analytical and numerical (e.g. RKR), Dissociation energy, Franck Condon principle, numerical methods to evaluate Franck Condon factors.

3. Vibrations of polyatomic molecules – classical mechanics of vibrations, symmetry and normal vibrations – applications of group theory.

4. Experimental techniques in spectroscopy: Fourier transform spectroscopy (FTIR, FT-RAMAN), time resolved FTIR and its applications in absorption and emission studies. Laser based experimental methods, Introduction and application of Terahertz spectroscopy.

5. Studies on ultrafast processes: Nanosecond and picosecond laser flash photolysis, fluorescence time domain spectroscopy with special emphasis on energy transfer and electron transfer reactions and studies on excited state properties**.**

6. NMR & ESR: Basics of NMR and ESR, Multipulse techniques in NMR, FTNMR, 2D-NMR. Time domain ESR, Electron Nuclear Double Resonance (ENDOR)-principle and applications.

Reference Books:

1. "Introduction to Lasers Physics", K. Shimoda, Springer Verlag, 1984 Berlin
2. "Laser Spectroscopy basic concepts and Instrumentation", W. Demtroder, Springer 2003, Berlin.
3. "Molecular Spectroscopy", C. N. Banwell, 4 Edn, Tata McGraw Hill, Delhi.
4. "Infra red spectra of Inorganic and coordination compounds", K. Nakamoto, 5 Ed, John Wiley 1978, NewYork.

CH-16: Lasers and Their Applications

Introduction to Lasers

1. Rate equation for absorption, induced and spontaneous emission, Einstein's A and B coefficients – Concepts of laser action and population inversion – rate equations for two, three and four level systems.

2. Laser and its sub-systems – Optical amplifier – optical resonator – excited state pump – Properties of laser beams – Spatial and temporal coherence.

3. Different types of passive resonators, modes of a passive resonator – Active resonators – Gain & Threshold condition for lasing actions – laser modes – Gain saturation and mode competition – spatial and velocity hole burning.

4. Wavelength and Intensity stabilization of lasers – turning of wavelength of lasers – prisms, grating and elations – controlled wavelength turning – Selection of axial modes, Experimental realization of single mode.

5. Generation of short pulses – Q-switching and mode locking – active and passive methods

6. Principles of various types of lasers – UV, vis & IR lasers, metal vapour lasers, solid state lasers, Gas lasers, Dye lasers, Semiconductor-diode laser and free electron laser

Laser Spectroscopic Techniques:

Important features of lasers useful for spectroscopy – monochromaticity, directionality, high intensity, tunability, short pulses etc. Advantages of lasers for spectroscopy – high sensitivity and selectivity. Short review of spectral line broadening mechanisms.

Doppler-limited spectroscopy
a) High sensitivity methods of Absorption – frequency modulation, intracavity absorption.
b) Photoacoustic spectroscopy; c) Resonance ionization spectroscopy combined with mass spectrometry – multiphoton processes; d) Optogalvanic spectroscopy

Laser Induced Fluorescence: a) Molecular Spectroscopy by LIF; b) Experimental aspects and advantages of LIF (c) LIF in supersonic molecular beams

Laser Raman Spectroscopy: (a) Linear Raman Spectroscopy; (b) Non-linear Raman Spectroscopy – Stimulated Raman scattering (c) Coherent Anti-Stokes Raman Spectroscopy (CARS)

Analytical applications of lasers: a)Laser induced break down spectroscopy, cavity ring down spectroscopy; (b) Atmospheric measurements with LIDAR

Laser material interactions: a) Vaporization, desorption and ablation. b) Surface modification; c) Laser cooling (d) Laser Induced Chemical Reactions/ Laser Isotope Separation

3. “Principles of lasers”, O. Svelto and D. C. Hanna, Plenum, 1989, New York
4. “Chemical and biochemical applications of lasers-vol I & III”, C.B. Moore, (Ed) Academic Press, New York (1974)
5. “Lasers”, P.W. Milonni and J.H. Eberly, World Scientific, Singapore (1981)

CH 17 - Nano materials and advanced chemical sensors

Introduction
Nanoscale– its importance, definitions, nanomaterial science- One dimension, Two dimensions (carbon nanotubes, inorganic nanotubes, nanowires, biopolymers), Threee dimensions (nanoparticles, fullerenes C-60, dendrimers, quantum dots) properties (electrical, optical, mechanical & chemical)

Synthesis and characterization
Synthesis -Chemical methods (precipitation, sol-gel, CVD, ion-exchange, dispersion), Physical methods (milling, PVD, pyrolysis, ion-implantation). Consolidation of nanopowders – sintering introduction, theories of sintering, sintering of nanomaterials, novel methods for consolidation of nanopowders. Characterization – X-ray techniques, spectroscopic techniques, electron beam techniques, optical methods

Applications
Structural and functional ceramics, coatings, sensors, power sources, additives and catalysts, composites, lubricants, magnetic materials, medical implants & nuclear ceramics. Sintering – introduction, theories, methods for consolidation and sintering of nanostructured materials

Introduction to chemical sensors
Fundamental definitions and principles; rationale of sensor design and operation; basic theoretical considerations

Electrochemical Sensors
(Potentiometric sensors, Voltammetric and Amperometric sensors)
Ion selective electrodes(ISEs) – principles, solid (glass and fast ion conductor based) and liquid membrane based electrodes, Electrochemical gas sensors, Semiconductor devices (ISFETs, MOSFETs), Conductance gas and vapour sensors based on metal oxides, semiconductors and conducting polymers. Biosensors- oxygen and glucose biosensors; mediated enzyme electrodes and enzyme field effect transistors (ENFETs).

Piezoelectric Sensors
Piezoelectricity and mechanical resonance: stress, strain and polarization; constitutive relationships; equations of wave motion and wave representation.
The transverse-shear mode sensor, or quartz crystal microbalance: application to gas- and liquid-phase sensing; applications to VOC sensing, immunosensing and biosensors.

Optical Sensors
IR and UV sensors - semiconductors - optical irradiation – recombination - Quantum efficiency - p-n junctions - IV characteristics - forward bias and reverse bias - applications.

Micro Electro Mechanical System (MEMS) based sensors and electronic noses
Cantilever based sensors – Sensing Principles, types of cantilevers, use of different detection techniques, examples and applications
Chemometrics as applied to chemical detection and identification; Olfaction and electronic noses; Salient features

Sensor fabrication methods
Sensor configurations and geometries, Use of nano-materials in sensors
Thin/thick film formation techniques (physical, chemical and LB film formation techniques), MEMs based sensor fabrication
Surface analysis and characterization

Practicals

Testing of a solid electrolyte based potentiometric oxygen sensor
Testing of an amperometric sensor for oxygen
Fabrication and testing of a thick-film hydrogen sensor

CH-RM: Course on Research Methodology

Unit-I - Objectives and types of research: Motivation and objectives – Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Unit-II - Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem – Literature review – Primary and secondary sources – reviews, treatise, monographs-patents – web as a source – searching the web - Critical literature review – Identifying gap areas from literature review - Development of working hypothesis.

Unit-III - Research design and methods – Research design – Basic Principles- Need of research design –– Features of good design – Important concepts relating to research design – Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Unit-IV – Value of Statistics; Errors and Statistics – Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results – students's t test; F-test; Chi Square test; propagation of errors.

Unit-V - Reporting and thesis writing – Structure and components of scientific reports - Types of report – Technical reports and thesis – Significance – Different steps in the preparation – Layout, structure and Language of typical reports – Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation – Planning – Preparation – Practice – Making presentation – Use of visual aids - Importance of effective communication –.Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on "Experimental data and Literature Survey". **Unit-VI** - Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation – Copy right – Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights – Reproduction of published material – Plagiarism - Citation and acknowledgement - Reproducibility and accountability. GOVERNMENT OF INDIA

BHABHA ATOMIC RESEARCH CENTRE

PGD IN ENGINEERING SCIENCE (PROGRAM CODE: ENGG00)

SYLLABUS

Orientaion Course for Engineering Graduates and Science Post Graduates (OCES)

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as “Radiological Safety Engineering’ course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods, liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

2. Strosal and Vapet, "Power Plant Engineering & Economics".
3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
  - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
  - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
  - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

References:

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons
- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction
- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process
- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors
- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics
- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up
- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons
- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients
- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)
- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.

- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)
- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)
- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN602: Advanced Electrical Engineering Design-I (20)

- Materials: Soft Magnetic Materials and their properties and applications, Permanent Magnetic Materials and their properties and applications, Super conducting Materials and their properties and applications. (5)
- Special Electrical Machines and their applications: Servo motors, their design and application in control rod mechanisms, Hysteresis motors, Switched Reluctance motors, Canned motors, High speed motors (5)
- Control Machines: Conventional control, Vector control (5)
- Special Techniques of Magnetic Circuit Design: Finite Difference Methods, Finite Element Methods, Their applications, design of machines and Transformer, chokes and other Electromechanical Equipment.
- NDT Methods: MFL Technique, Eddy current Technique, Remote Field eddy current Methods. (5)

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN606: Advanced Operating Systems (25)

- General Overview: Basic Components, Structures, Comparison between Unix & Windows NT, Security
- File Subsystem: File System Data Structures, Concepts of NFS / VFS / NTFS
- Processs Subsystem : Processes & Threads, System calls for creating and managing processes & threads, Signal handling, Scheduling
- Memory & I/O Subsystem : Memory Management Policies, Virtual Memory, I/O System Structure, Synchronous & Asynchronous I/O, Device drivers, Kernel I/O data structures, Plug & Play I/O [1][4]
- Interprocess Communication : Message Queues, Shared Memory, Semaphores, Mailboxes, Sockets, Fundamentals of Socket Programming, Remote Procedure Calls [1][6]
- Multiprocessing: Fundamentals, Symmetric and asymmetric multiprocessing, Features of distributed Unix, Logical time, Concurrency Control [1][5]
- Unix Shells: Unix Shell Commands & Fundamentals of Shell Programming [1][2]

- Linux: Packaging and Distribution, Loaders, Virtual Terminals, Internal and External Drivers, Threads, Interfaces, X Window System, Hard Disk Partitions, File System Enhancements, Extended File Systems, Virtual File System, System Tuning. [3, 9, 10]

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:
- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:
- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design
- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology
- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra
- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics
- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures
- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations
- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.

- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)

- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):

- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):

- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)
- Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

EN 612: Computer Based System Design- I (25)

Hardware Design

- Overview of microprocessors and peripherals: 8086, 68000, Digital Signal Processor (TMS320) DMA controller, serial communication controller and timer/counter.
- Personal computer architecture, memory organization, industrial PC
- Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications
- Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL)
- Case Study: Design of a single board computer with shared memory interface, I/O board design using ADC, DAC etc with emphasis on signal conditioning and isolation
- System design concepts: Fault tolerance, hot standby, live insertion, triple modular redundancy and safety issues

EN 613: Computer Graphics and Visualization (35)

- Introduction overview, Graphics software/hardware and types of graphics applications (1)
- 2D/3D Geometric Transformations, Affined transformations-Translation, Rotation, Scaling, Shear and reflection. (3)
- Homogeneous coordinates, composite transformations, rotation with qutenion, current transformations and matrix stacks. (3)
- Two dimensional viewing 2D viewing – window, viewport, viewport transformations, clipping operations, line clipping algorithms – Cohen-Sutherland, Liang-Barsky, polygon clippimg algorithm – Sutherland-Hodgman. (4)
- Three dimensional graphics – Planer geometric projections – parallel and perspective, Mathematics for projections, classical three-dimensional viewing, specifying views, viewing transformations, 3D clipping operations. (4)
- Hidden surface removal, object space and image space approach, back face culling, z-buffer algorithm, LOD.(2)
- Illumination and shading – Basic illumination models, light sources, material properties, polygon shading methods – flat, gouraud and phong shading, ray tracing methods. (2)
- Color - Color perception, color models – RGB,CMY,HSV (1)
- Visual Realism – Depth cuing, texture mapping, transparency, shadow, steropsis. (2)
- Curves and surfaces – Representation of curves and surfaces, Algebric and geometric form, Blending functions, interpolation, Hermite, Bezier, B-spline curves and surfaces, Rational polynomials, NURBS (5)
- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

EN 615: Corrosion (15)

- Definition and importance of corrosion, corrosion principles; thermodynamic and electrochemical aspects; electrode potentials; polarization and corrosion rates; passivity, mixed potential theory, environmental effects: Dissolved Oxygen, temperature, pH, Velocity bacteria, dissolved salts and metallurgical variables, composition and heat treatment. (3 Lectures)
- Forms of corrosion: uniform attack; corrosion rate measurements, Galvanic corrosion, pitting and crevice corrosion; selective leaching; erosion corrosion; intergranular corrosion, low temperature sensitization, corrosion of weldments; stress corrosion cracking (SCC), irradiation assisted SCC; hydrogen embrittlement, hydrogen attack, corrosion fatigue; oxidation; microbiological induced corrosion (MIC), Corrosion testing procedures, failure analysis, specification tests, advanced methods for on-line corrosion monitoring. (7 Lectures)
- General principles of corrosion control – anodic and cathodic protection, inhibitors and passivators, corrosion protection by alloying, surface treatment and surface modification. (1 Lecture)
- Corrosion in the nuclear industry – Corrosion in nuclear fuel reprocessing, waste management and heavy water plants. corrosion in fluoride and ammonia containing environments; liquid metal corrosion. low alloy steels, stainless steels and Ni and Cu base alloys, protective magnetite formation on carbon steel, stress corrosion cracking of stainless steels and nickel base alloys. high temperature oxidation and hydriding of zirconium alloys, materials for fast breeder reactor system. Effects of radiation on corrosion (4 Lectures).

EN 616: Distributed Computing (45)

Advanced Computer Architecture

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

  c. Approaches for improving interconnect performance
  d. Case studies – Ethernet, Infiniband, SCI
- Cache
  a. Associative, Direct mapped
  b. Write through, Write back
  c. MESI
  d. Shared caches
- Advances in storage systems
  a. Direct attached storage, Network attached storage, Storage Area Networks
  b. File level and block level accesses
  c. Storage protocols
  d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
  e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing
  a. Need for HPC
  b. Applications of HPC
  c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)
- Pipelining, Vector processing, SIMD
  a. Pipeline, Speedup and Efficiency of pipeline
  b. Pipeline stalls, out of order execution
  c. Techniques to improve pipeline efficiency
  d. Superscalar, Superpipelined, VLIW, EPIC architecture
  e. Vector processors, vector instruction sets, registers
- MIMD Architecture
  a. Classification of MIMD machines
  b. UMA, NUMA, CC-NUMA, COMA, NORMA
- Interconnection networks and topologies
  a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
  b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.
- Current Parallel Architectures
  a. Parallel Vector processor
  b. Symmetric Multiprocessors
  c. CC-NUMA
  d. Massively Parallel Computers
  e. Clusters of workstations
- Clusters
  a. Classification of clusters
  b. Cluster software
  c. File systems for clusters
- Software concepts of High Performance Computing
  a. Parallelism – Algorithmic, Geometric, Event, Data
  b. Granularity – Coarse and Fine grains
  c. Speedup, Efficiency, Amdahl’s and Gustaffson’s Laws
- Parallel Programming Models
  a. Shared Variable Model
  b. Message Passing Model
  c. Threads Model
  d. Data parallel Model
- Design of parallel algorithms
  a. Data dependencies
  b. Data partitioning
  c. Communication patterns
  d. Synchronization
  e. Load balancing
- Parallel Programming Environments
  a. Parallel Languages
  b. Parallel Extensions to Sequential Languages
  c. Parallel APIs – MPI, OpenMP
- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)
  a. Introduction to MPI
  b. MPI constructs
  c. Example programs in MPI
- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

EN 618: Electrical Systems for Nuclear Power Plants (30)

- Interaction of Nuclear Power Station With The Grid Number of evacuation lines; Optimum size of NPP in grid; Brief introduction to Power System Analysis - Short circuit, load-flow and stability studies, Tariff and Capacity factor.
- Ehv Switchyard Design Switching schemes; Clearances; Com parison between types of svvitchyards; Brief introduction to equipments in switchyard and their functions; Lightning arresters and insulation co-ordination; Lightning protection.

- Protection Line protection; Generator protection; Transformer protection; Motor protection.
- Selection of Transformers Accessories; Types; Specifications and testing; Voltage regulation calculations.
- Selection of MV & LV Switchgear Types; specifications and testing, MCCS; Distribution boards; Generator circuit breaker; ELCB.
- Motors In NPP Types of motors; Radiation withstand requirements; Performance requirements.
- Station Auxiliary Systems of NPP Class 1, 11, Ill and IV systems classifications; Nature of electrical loads and supply voltages; Effect of voltage variation on Electrical equipments and remedial measures; Emergency transfer system; Load shedding scheme; Auto transfer schemes; synchronizing schemes.
- Class 1 e requirements Cabling, lighting & grounding Specific requirements for safety related electrical equipments & systems in NPR Cabling, Lighting, Grounding systems in NPP; Bus ducts. Introduction to seismic qualification of electrical equipments., Electrical system control from Control Room. Introduction to []G sets, UPS & Batteries.
- Billing and metering scheme for a typical NPP. Introduction to brushiess and static excitation systems for Generators. Introduction to SCADA systems.

EN 619: Embedded & Computer Based System Design (45)

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 620: Extractive Metallurgy (40)

Principles of Metallurgical Thermodynamics (15)

- Thermodynamic Functions: Enthalpy, Entropy, Free Energy, Chemical Equilibria
- Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Phase Diagrams
- Solution Thermodynamics, Integral and Partial Molar Thermodynamic Properties
- Experimental Methods- Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.
- Computation of predominance area diagram and Phase diagrams

Kinetics(5)

- Principles of Chemical Kinetics, Homogeneous Reactions, Effect of Concentration, Effect of Temperature
- Theory of Reaction Rates, Heterogeneous Reactions, Reaction Models, Mass Transport Phenomena, Heat Transport Phenomena.

Process Metallurgy (25)

- Methods of attaining High Temperatures,Measurement of Temperature,
- Vacuum Metallurgy Principles and Equipments,
- Process Metallurgy of Rare and Refractory Metals,
- Resources of Special Metals, Beneficiation Methods, Physical, Chemical, Separation Methods, Halide Metallurgy, Vacuum Metallurgy, Electro Metallurgy, Reduction Processes, Refining Processes, Ultrapurification Processes,
- Preparative aspects of Special Materials and Alloys,
- Advanced Materials Processing Techniques,
- Reprocessing of irradiated nuclear fuels, Process Metallurgy of - Uranium, Thorium, Plutonium, Beryllium, Zirconium, Hafnium, Niobium, Tantalum, Rare Earths.

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)

- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)

- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)

- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity

- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:

- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour

- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys

- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics

- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:

- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)

- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)

- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

<u>Design Basis Hazards (Natural)</u>

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall
- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications
- FTP, DNS, Mail, application based attacks

Network Security
- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms
- Symmetric and Asymmetric.

Symmetric Algorithm
- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms
- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)
- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)
- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)
- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli’s Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.

- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)

- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory

- Introduction to state-space controls, state & measurement equations, general solution **o**f the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls

- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation

- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:

- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 704: Computer Based System Design- II (25)

Communication, Networking, Realtime systems, RTOS and Software

- Asynchronous and synchronous communication
- Standards like RS232, RS422, RS485
- USB
- Encoding schemes
- Local Area Networks
- OSI 7 layer model and TCP/IP reference model
- Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth
- Networking hardware – cables, hub, switch, router, etc
- Role of fibre optics in communication
- Fieldbus standards
- Deterministic communication techniques
- Case study: various techniques used in NPP for communication and networking
- Realtime Systems, their characteristics and applications
- Realtime Operating Systems:
- Concepts of
- Process and threads
- Concurrency
- Latency, context switching
- Scheduling policies
- Inter process communication
- Semaphores
- Priority inversion
- Shared memory
- Common systems calls, Communication features in RTOS
- Comparative study of various RTOSs
- Integrated S/W development environment

EN 705: Data Base Management System and Web Technology(30)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to PostgreSQL and MySQL(3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(1)
- Content Management Systems(1)
- Web 2.0 / Semantic Web(2)

EN 706: Digital Signal Processing and Image Processing (30)

Digital Signal Processing

- **Introduction**

Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**

  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT.
- Fast Fourier Transform

Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- Digital filters

FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- DSP Applications

  Applications of digital signal processing in nuclear and other fields.

Image Processing

- **Introduction**

  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- **Image Enhancement**

  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- **Image Segmentation andAnalysis**

  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation; Boundary extraction and representation;
- **Morphological operations**

  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy- based methods;

  Image Compression Models, Error free compression, Lossy compression, Standards;

- Stability: Definition, Routh-Hurwitz criterion, Nyquist criterion. Relative stability, Gain and Phase margins.

EN 709:Fluid Power Technology (25)

Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics

- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal's Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli's theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air

- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors

- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.
- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.
- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design
- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:
- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:
- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :
1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing
- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;
- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision

- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:

- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices

- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods

- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric 'O' rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques

- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:

- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
    - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
    - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
    - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
    - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

- Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
- Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
- Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, llllcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
- o Scheduling in a project by critical path method, CPM
- o Scheduling in a project by Precedence Diagram Method.
- o Use of Project Management Software for project planning, scheduling & monitoring.
- o Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
  - o Constraints of project and its effective management o Development of Six Monthly Plan and its review process o Resource based planning
  - o Physical & Financial Monitoring of project, Use of S-curve
  - o Capital Budgeting & expenditure control in a project
  - o Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 718: Reliability Engineering (ME) (25)

- Reliability Mathematics – Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
- Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
- Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
- Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
- System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
- Application of Reliability - PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
- Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.

Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control. Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5

Final control element - Linear pneumatic control valve.

Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.

Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

BARC TRAINING SCHOOL - AMD CAMPUS

ORIENTATION COURSE FOR ENGINEERING GRADUATES & SCIENCE POST-GRADUATES (OCES)

SYLLABUS

GEOSCIENCES

Course No.: 102
Subject: Nuclear Physics and Radiation Detection

S. No.	Topics	Chapters
1	Nuclear Physics	Structure of nucleus - Atom, Electron, Proton and Neutron, the Proton-Electron hypothesis of the constitution of the nucleus, Proton-Neutron hypothesis
		Magnetic and Electric property of the Nucleus
		Additional Properties of Atomic Nucleus
		Natural Radioactivity - Basic theory of Radioactive disintegration, disintegration constant, Half-life, Mean-life
		Radioactive equilibrium, Units of Radioactivity
		Alpha decay - Velocity and Energy of Alpha Particle, Absorption of Alpha Particle, Range, Ionization and Stopping Power, Range-Energy curve, Nuclear Energy Levels and the Theory of Alpha Decay;
		Beta decay - Velocity and Energy of Beta Particle, Absorption of Beta Particle, Range, Ionization and Stopping Power, Range-Energy curve, Nuclear Energy Levels and the Theory of Beta Decay, Symmetry law and Non-conservation of parity in Beta Decay
		Gamma decay - Gamma decay, Internal Conversion, Nuclear energy levels theory, Absorption of gamma ray with matter; Interaction of radiation with matter - Interaction of charged particles, Interaction of gamma rays: Photoelectric effect, Compton scattering, Electron-Positron pair-production;
		Natural decay series - Uranium Series, Thorium Series, and Actinium Series
		Radioactive growth and decay: Mathematical explanation of growth and decay curve
		Disequilibrium: Secular Equilibrium, Transient Equilibrium, Ideal Equilibrium
		Nuclear fission: Discovery of Nuclear fission, Fission cross-section and threshold, Neutron emission in fission and theory of fission process, Energy distribution in fission process
		Nuclear fusion: Discovery of Nuclear fusion, theory of fusion process, Energy distribution in fusion process; Counting statistics: Explanation of Binomial
		Distribution, Poisson Distribution and Gaussian Distribution
		Propagation of errors; Artificial radioactivity: Explanation of Induced Radioactivity, Radioactivity cross-section.
2	Radiation detection and measurement	General properties of detectors - Efficiency, Resolution, Dead time of the detectors; Gaseous detectors - Ionization Chamber, Proportional Counter
		Geiger-Muller Detector etc; Scintillation detectors

S. No.	Topics	Chapters
		The basic function of a scintillation detectors, photo multiplier tube and its function
		Various types of Scintillation detectors, Detection mechanism of NaI(Tl); Semiconductor detectors
		The Basic principle of Semiconductor Detector, Energy Gap, Various types of semiconductor detectors and its principles, Resolution, Fano factor; Neutron detectors
		Slow and Fast Neutron detection methods
		Nuclear Reaction of Interest in Neutron Detection
		Counters based on Neutron Moderation
		Other detectors - Explanation of Cherenkov Detectors, Photographic Emulsions, Thermoluminescent Dosimeters, Track Etch Detectors etc. Pulse processing and measurements - Pre amplifier, Amplifier and MCA etc.
3	Lab	
3.1	Gamma ray spectrometry	Measurement of gamma ray energy for the estimation of Ra(eq), ThO2 & %K
		Beta-Gamma technique
		Explanation and practice of technique used for the estimation of U3O8 in the sample
		Gamma ray logging & core analysis
		Explanation and practice of technique used for Gamma ray logging
		Shielded Probe Logging, and analysis of core samples
3.2	Instrumental Neutron Activation Analysis (INAA)	Principle and operation of INAA
3.3	Radon Emanometry	Methods for the measurement of Radon: CCT-Method, SSNTD Method, and ROAC Method
4	References	1. Radiation Detection and measurement – By G.F.Knoll. 2. Nuclear Physics- By D.C.Tayal. 3. The Atomic Nucleus- By R.D.Evans. 4. Measurement and Detection of Radiation- By N. Tsoulfanidis. 5. Nuclear Physics -by Irving Keplan 6. Basic Electronics, - Bernard Grob

S. No.	Topics	Chapters

Course No : 103
Subject: Basic Geophysics for Geologists

S. No.	Topics	Chapters
1	Introduction	Geophysical methods and the associated physical properties
		Classification of geophysical methods
		Role of geophysical methods in mineral exploration
		Effectiveness and limitations of various geophysical techniques with special reference to uranium exploration
		Geophysical signatures of uranium deposits
2	Magnetic and gravity methods of prospecting	Magnetic Method - Earth's magnetic field and its variations
		Magnetic properties of materials, Remnant magnetization
		Instruments for measuring magnetic field
		Field surveys, Corrections Reduction of magnetic data
		Magnetic anomalies due to bodies of simple geometry
		Gravity Method -Earth's gravity field and its variations, Figure of Earth, Isostacy, Absolute and relative measurements of gravity field
		Instruments for measuring gravity field, Field surveys, Reduction of gravity data Interpretation of gravity and magnetic data
		Anomaly patterns, Characterization of anomalies. Anomalies due to bodies of simples geometry (1D, 2D and 3D).
		Variation of magnetic anomaly in relation to magnetic latitude, azimuth and dip of the body, Ambiguity in interpretation of data, Forward and inverse modeling
		Applications and field examples
3	Electrical methods	Classification of electrical geophysical method
		electrical properties of rocks
		Self Potential method: Origin of self potentials field equipment and survey, anomalies due to bodies of simple shape

S. No.	Topics	Chapters
		Interpretation, field examples and applications
		Resistivity method: Ohm's law,
		True and apparent resistivity
		Geoelectrical sections, Different electrode arrays, resistivity profiling and sounding
		Field equipment
		Interpretation of field data
		typical resistivity profiles over simple geological structures, use of Master curves for interpretation of data over multilayered medium
		Applications and Field examples
		Induced Polarization method: Origin, Membrane polarization, Electrode polarization, Time domain and frequency domain measurements, Parameters measured, Field equipment
		Typical profiles, Interpretation, Applications, Field examples
		Electromagnetic methods: Classification of methods
		Elementary theory of propagation of electromagnetic waves.
		Primary, Secondary and Resultant fields, Skin depth
		Frequency domain methods: Fixed source method, Moving source-moving receiver method, Very low frequency (VLF) method
		Ground penetrating radar technique, Parameters measured
		Field equipment
		Presentation of data
		Applications and field examples
		Time Domain method: Principle, Merits and demerits
		Survey configuration, Field procedure and equipment, typical profiles
		Applications and field examples Natural source EM methods.
		Telluric and magnetotelluric methods: Sources and the frequencies studied, Typical profiles, Applications and field examples.
4	Seismic methods	Elastic constants, Longitudinal, Transverse and Surface waves

S. No.	Topics	Chapters
		Hooke's law, reflection, refraction and diffraction from multilayered media
		Seismic energy sources and detectors
		Refraction seismic: Principle, Critical angle, critical distance, Velocity inversion, Refractions at parallel and non-parallel interfaces. Source-detector arrays, Fan shooting, applications and case histories
		Reflection seismic: Principle, Acoustic impedance. Time-distance graph, Reflections at parallel and non-parallel interfaces, Field procedures, Common Depth Point technique
		Applications and field examples.
5	Borehole logging methods	Objectives, different logging techniques, Principles
		Instrumentation and operational procedures of Self Potential, Electrical resistivity, Induction, Magnetic susceptibility, Sonic, Caliper, density, I.P. and radiometric logging techniques
		Applications and field examples
6	Tutorials	Computation of magnetic and gravity anomalies over regular shaped bodies;
		Smoothing of data by filtering techniques
		Estimation of mass from gravity data
		Interpretation of vertical electrical sounding curves
		Preparation of pseudo-sections of resistivity and IP data
		Interpretation of HLEM data using standard curves
		Interpretation of seismic refraction data by graphical and analytical methods
		Identification of formational boundaries from well logs.

Course No.: 104
Subject: Basic Geology for Geophysicists

S. No.	Topics	Chapters
1	Introduction to geology	The origin and internal structure of the Earth
		Composition of crust mantle and core
		Surface and internal processes: geomorphic processes and sedimentation; orogenic processes, mountain building, volcanism, metamorphism and rock deformation

S. No.	Topics	Chapters
		Rock structure: folds, faults and joints, brittle and ductile deformation, lineation and foliation
		Principles of stratigraphy
		Geological Time Scale, correlation and geochronology
		Elements of Indian stratigraphy
		Precambrian shield areas
		Important Phanerozoic successions, elements of Himalayan geology.
2	Introduction to minerals and their identification	Major rock forming silicates and common ore minerals
		Brief introduction to the formation and classification of common igneous, sedimentary and metamorphic rocks
		primary igneous and sedimentary structures, unconformity, dip and strike.
3	The dynamic earth	Continental drift, theory of plate tectonics
		different types of plate margins, association of metallic deposits in different tectonic settings
4	Introduction to ore forming processes and mode of occurrence of common ore deposits	Epigenetic and syngenetic deposits. Classification of ore deposits
		Orthomagmatic processes and examples of orthomagmatic deposits
		Pegmatitic and pneumatolitic deposits
		Classification of pegmatites, skarn and metasomatic deposits
		Hydrothermal processes Examples of modern ore solutions, aqueous transport of metals and deposition of metals from ore solutions, meteoric and juvenile solutions and their discrimination
		Hydrothermal deposits forms and classifications
		Weathering, supergene enrichment and residual deposits.
		Sedimentary deposits, deposits formed by mechanical transport and by chemical precipitation, Eh-pH diagrams
		Metamorphic and metamorphosed ore deposits.
5	Lab	Identification and interpretation of geological features in topographic maps
		Identification and interpretation of structural elements in geological maps: Faults, folds, unconformities

S. No.	Topics	Chapters
		Construction of geological cross-sections, stratum contours, isopach maps
		Stereographic plotting of planes and lines
		Study of stratigraphic maps of India
		Analysis of folds, Analysis of faults, Strain measurements
		Identification and description of hand specimens of common silicate minerals, common igneous, sedimentary and metamorphic rocks, common sulphides and oxide ore minerals and economic rocks
		Introduction to optical identification of minerals

Course No.: 105

Subject: Uranium Geology, Survey , Prospecting

S. No.	Topics	Chapters
1	Introduction	Objectives and challenges
		Geological considerations, time and project value estimation, terrain, legal, political and local issues
2	Uranium in the crust	Distribution of uranium - crustal abundance
		Time bound character
		Uranium in different rocks and minerals with some examples;.
		Classification of uranium deposits; uranium deposits in the world
3	Exploration guides	Controls of mineralization – stratigraphic, structural, lighological and other controls;
		Stratigraphic guides: earl
		Lithological guides
		Structural guides - fault, fracture, foliation and their intersections, fault-breccia systems;
		Geochemical guides - Indicator/pathfinder elements,
		Mineralogical guides - Poly metallic mineralisation- Pb, Cu, Ni, Co, Se, As, Au, Ag, Te and Zn and sulphide mineralization
		Weathering and alteration, diffusion aureole, leakage anomaly, dispersion and mobility patterns, K2O/ MgO, U, Ni, As, V, Mn and B abundances,
		Geochemical association of uranium with other trace elements
		Proterozoic basal Quartz- Pebble Conglomerate (QPC) type
		Proterozoic unconformity type
		Porous, permeable carbonaceous matter rich Mesozoic sandstone type
		Intrusive and reactivated granites
		Carbonaceous/ graphitic metapelites
		Graphitic schists, black shales
		Calcrete
4	Exploration methodology	
		Literature survey and conceptual modeling - study of available maps, identification of favourable parameters and

S. No.	Topics	Chapters
		geological environments;
		Reconnaissance and detailed survey – geological mapping from exploration point of view by remote sensing and ground surveys, narrowing down the target area;
		Uranium mineralogy – primary and secondary uranium minerals, their field identification.
5	Geochemical techniques	Stages of geochemical survey (Planning, deciding parameters for exploration, Orientation survey, Reconnoitory survey, detailed surveys)
		Hydrogeochemical techniques (Uranium and radium in surface and ground water, sampling);
		Lithogeochemical and pedogeochemical techniques (choosing grid pattern, sampling techniques),
		interpretation of analytical data
6	Radiometric techniques	Ground radiometric survey, gross gamma and spectometric measurements, demonstration of field equipments,
		Traverse planning, background radiation and anomaly detection, evaluation of anomaly
		Isorad mapping, channel sampling, shielded probe logging and radiometric assay of grab samples
		radon emanometry - isotopes of radon, migration, sampling techniques (CCT, SSNTD, ROC) and limitations
		Helium survey - principle, diurnal variation, sampling system, uses
7	Prospecting for uranium	Sampling: point, grab, grid samples; channel sampling; sample volumes; Sampling by drilling,
		stratigraphic, reconnoitary, exploratory and evaluation drilling;
		Planning of boreholes, choosing location and grid pattern,
		Borehole plan, selection of type of drilling(non-core/core),
		Lithological and geophysical logging
		Drift/deviation
		Borehole correlation sections,
		Preservation core, core skeletonization, sampling of boreholes sludge/core, comparative study of physical and chemical assay results of boreholes
		Estimation of disequilibrium.
		Assaying, rock density;
		Averaging of assay values from one location – samples of equal length/unequal lengths
		Averaging of assay values from different locations – evenly spaced samples, unevenly spaced samples;

S. No.	Topics	Chapters
		Compensation for varying rock density; erratic assays;
		Recent trends in uranium exploration
		Present status of uranium supply and demand, new discovery of uranium deposit in the world and in India; Case studies using different exploration techniques with examples from India and World.
8	References:	1. Economic Mineral Deposit-Alan M. Bateman 2. Uranium Supply and Demand-Michael J.Spriggs, Uranium Inst London 3. Uranium resources, production and demand summary-OECD-NEA and IAEA 4. Classification of Uranium deposits-F. J. Dahlkamp 7. Radioactivity in geology: principles and applications- E.M.Durrance

Course No.: 106
Subject: Surveying, Drilling and Mining

S. No.	Topics	Chapters
1	Surveying	Types of surveys and applicability
		Principles and methods of surveying & mapping
		Surveying Equipment – Compass, The Transit, Optical Distance Measuring
		Modern surveying electronic equipments - Digital levels, Digital theodolites, EDMs and Total stations
		Principles, working and applications
		Survey Methods - Co-ordinate methods, Bearings, Traversing and Trilateration (Topo)
		Detail Survey, Orientation and position, Determination of True bearing, Horizontal and vertical control, Accuracy standards;
		Positioning – Introduction, Differential positioning,
		GPS instruments, Global Positioning Augmentation Systems; Errors in measurements – Blunders, Systematic errors, Random errors, Most probable value, Average error, Standard deviation
		Analysis and adjustment of measurements
		Distribution, Adjustment of errors by Approximate method and Least squire method

S. No.	Topics	Chapters
		Coordinate System in Geodesy - Geocentric Cartesian Coordinates, Topocentric Cartesian or local geodetic Cartesian Coordinates, Geodetic Coordinates, Planimetric Cartesian coordinate
		Datums - Horizontal datums - Everest spheroid, WGS – 84, datum transformation; Vertical datums - Mean Sea Level, Geoid, EGM 96
		Projection – Polyconic projection, Traverse Mercator projection (TM Projection), Universal Transverse Mercator Projection
2	Tutorials	Adjustment of instrument errors by approximate method and Least square method. Datum transformation exercises.
3	Drilling	History of Drilling; Methods of soil sampling - Auger, Drive sampling;
		Rock Drilling – Percussive, Attritive, Rotary Cutting, Shearing etc.,
		Rotary reverse circulating, Rotary with down hole motors, Cable tool method;
		Diamond Drilling - Diamond quality, types of diamond bits, natural and synthetic diamonds, Rotary core drilling equipment, Drilling standards, circulating media, Drilling fluid properties
		Controlled Directional Drilling - Deviation in drilling, Measurement of deviation and control, Tools for directional drilling, Downhole motors
		Various types of drills in use in AMD

Course No.: 107
Subject: Theory of Fields

S. No.	Topics	Chapters
1		Mathematical and physical fields, Continuity, Scalar and Vector fields.
		Static fields in free space, Coloumb's law, Newton's law, Field intensity, lines of force, charge density, Curl of vector, Stoke's theorem, Gauss's law, Gauss's divergence theorem, Poisson's and Laplace's equations, Electrical dipole, Double layer. Dielectrics and conductors, Polar and non-polar dielectrics.

S. No.	Topics	Chapters
		Harmonic functions, orthogonal curvilinear, spherical and cylindrical co-ordinates, Method of images, Green's theorem, Green's function, Green's equivalent stratum, Dirichletand Neumann problems
		Electric fields in conductors, Ohm's law in integral and differential forms. Magnetic fields, Magnetic flux, Magnetic vector potential, Induction in magnetic media, Relation between gravity and magnetic potentials. Electromagnetic induction.
		Laws of induction, Electric and magnetic energy densities, displacement currents, Poynting's theorem
		Electromagnetic radiation from an oscillating dipole.
	References:	1. V.L.S. Bhimasankaram And S.V. Seshagiri Rao, 1973, Theory Of Fields, Osmania University, Hyderabad, 2. Alexander A. Kaufman, 1992, Geophysical Field Theory And Method: Gravitational, Electric And Magnetic Fields. Academic Press.

Course No.108
Subject: Geochemistry and Geochemical Exploration

S. No.	Topics	Chapters
1	Geochemistry	Geochemistry as a branch of Chemistry, Brief understanding of the periodic table and inter-relationships between various elements, Hunds rule, Aufbau principle, Pauling's exclusion principle, Ionisation energy, electron affinity, electronegativity etc
		Primary geochemical differentiation, Geochemical classification of elements, geochemical associations
		Distribution of Major and trace elements in primary and secondary environment,Partition coefficient/ distribution coefficient and separation constants, Stable isotopes, Geochemical cycle of Uranium, Geochemistry of uranium, REE Geochemistry
		Eu and Ce anomaly interpretations
2	Geochemical thermodynamics	Equilibrium thermodynamics, state functions, ideal and real gases, equations of state, properties of vapours and solutions
		Laws of thermodynamics, reversible and irreversible processes, internal energy, enthalpy, heat capacity and entropy, calorimetric measurements
		Gibb's free energy in relation to temperature and pressure. Chemical potential, Gibb's-Duhem equation, heterogeneous equilibria and phase rule
		Standard states, activity and fugacity. Ideal solutions, Henry's law, Roults law

S. No.	Topics	Chapters
		Non-ideal solutions
		Phase diagrams.
3	Water chemistry	Solutions and solubilities, solute-solvent, solubility product and ion activity product
		Ionic strength of the solution, Debye-Huckel theory, Davies equations, units of concentration- molarity, molality, mole fraction, equivalents and normality
		pH and Eh concepts, Nernst equation (derivation), Geochemical fences, Limits of water stability
		Ore Genesis-Physico-chemical environment of ore genesis, Major theories- Origin due to Internal processes, Magmatic segregation, Magmatic deposits, Sublimation
		Hydrothermal deposits, metamorphic deposits, Contact metasomatism and wall rock alterations. Origin due to surface processes-Evaporation, residual and mechanical concentration/accumulation
		Origin due to secondary processes-Oxidation and Supergene enrichment.
4	Geochemical Exploration	Geochemical surveys–litho geochemical, hydro geochemical, pedo geochemical, Geobotanical /biogeochemical and Atmo geochemical techniques, Pathfinder and indicator elements
		Dispersion - Primary dispersions-Zonality, Wall rock alterations
		Secondary dispersions-mechanical, Gaseous, Residual, outcropping concealed and superimposed
		Hydro geochemistry- Significance of Eh, pH, T°C, Ec. solubility index and its significance in the secondary environment
		Eh-pH Diagrams constructions and their Significance
		Soil geochemistry, ionic potential and geochemical separation. Geochemical maps
	Tutorials	Evaluation Analysis & Interpretation of Geochemical Data (litho- pedo- hydro- biogeo & atmo- geochemical data) using conventional techniques and through use of various geo-software
		Derivation and interpretation of Partition coefficient/ distribution coefficient and separation constants.REE data normalisation using different rock standards, Eu and Ce anomaly interpretations
		Gibbs free energy in relation to temperature and pressure
		Gibbs- Duhem equation, construction of phase diagrams, solubility product and ion activity product, derivation of solubility index, Nernst equation (derivation), Calculation of limits of water stability using thermodynamic data, Geochemical fences, construction of Eh-pH Diagrams, Preparation of various geochemical maps

Course No. : 109
Subject: Seismic methods

S. No.	Topics	Chapters
1		Basic concepts, Hooke's law, Elastic wave propagation Wave equation, Elastic constants, Elasticc waves, Huygene's and Fermat's principles, Snell's law, Reflection, refraction and diffraction from multilayered media; Factors affecting seismic wave velocities, Partition of energy at an interface, acoustic impedance, Reflection and transmission coefficients, Zoeppritz's equation, Structure of Earth; Seismic refraction method - Head wave refraction, critical angle, Time distance curves, Critical distance, Geometry of refraction paths – two layer and multilayer media; Velocity inversion/hidden layer problem, Field lay outs, Fan shooting, Interpretation of refraction data – graphical and analytical approaches; Seismic reflection method- Principle, Time-distance graph, Geometry of reflection paths – horizontal reflector, dipping reflector; Common depth point technique, Stacking chart and CDP diagram for normal and crooked profiles, Static corrections, NMO, Velocity analysis, Migration, Wavelet propagation, attribute analysis. Wide angle reflections; Deep seismic soundings; Field procedure; Vertical seismic profiling; 3D and 4D seismic exploration, Seismic tomography, Basic concepts; Data acquisition; Energy sources – dynamite, vibroseis, hammer, airgun, Detectors – geophone, hydrophone; Grouping of geophones, Noise profile analysis, Source-detector arrays, Directional shooting, Instrumentation, Digital seismic recording- general lay out, pre-amplifier, filters, multiplexers, A-D converter, AGC, SEG formats; Telemetry systems;
2	Tutorials	Construction of wavefronts for two and three layer cases, Interpretation of refraction data –graphical approach (Mean minus T and Hale's methods) and analytical approach (Generalised reciprocal method).; Construction of CDP diagram and stacking chart for normal and crooked profiles; NMO correction; Determination of velocity and interface from reflection data; Plotting of reflection points on dipping reflecting layers; Noise profile analysis and optimum group spacing; Seismic data processing from demultiplexing to migration using standard software package; Simulation of seismic responses by finite element and finite difference methods.

Course No. 110

Subject: Remote Sensing and GIS

S. No.	Topics	Chapters
1	Introduction	Fundamental concepts of Remote Sensing – Electromagnetic Spectrum, Energies available for sensing, Interaction of EMR with the atmosphere and terrain features
		. Mineral and Rock spectra. Application of energy bands for Geological studies
2	Imaging systems and sensors	Sensors in space today- Radiometric, Spectral and Spatial resolutions
		Selection of spectral and spatial resolutions for different geological themes
		Identification of the satellite data product, product codes, browsing of quality, product availability and procurement procedure
3	Elements of remote sensing and data interpretation	Fundamentals of image interpretation and geological applications-Tone, Texture, Drainage patterns and anomalies, colour, size and Object to background relationship
		Applications of geomorphology. Lithological and structural interpretation from satellite data
4	Digital image processing	Objective of Digital Image Processing, Georectification, Image mosaicing
		Image enhancement: Single band enhancement - Contrast stretching – Linear contrast stretching, Multiple linear stretching, Logarithmic or functional stretching, Gaussian stretching, Histogram equalization stretching and Density slicing
		Application of stretching techniques for geological interpretation and for anomaly zone extraction from airborne radiometric images; Edge enhancement – Anisotropic Kerenels (Linear edge), Gradiant image (1st Derivative), Laplacian image (2nd Derivative), Image smoothening
		Application of different edge enhancements to radiometric images; multiple Image Enhancement - Addition and substration of Images, Principle component Transformation, Image ratioing.
		Application of these transformations for Geological and radiometric interpretation; Spectral and spatial resolution merging – different methods, and its application to geological studies

S. No.	Topics	Chapters
5	Digital Image classification	Supervised classification, unsupervised classification, Application of classification for geological studies
6	Geographical Information Systems (GIS)	Introduction to GIS, Basic map concepts and Data layer generation, Topology building and Attribute Table generation
		Getting spatial data into GIS and making spatial data usable
		Getting attribute table in GIS and making it Linked and usable
		Defining real world coordinate system and Map projections to multi-coverage database
		Performing GIS analysis – Spatial operation, generating buffers, manipulating spatial features, polygon overlay and Tabular analysis
7	Geo-modelling	Introduction, principles of various modelling techniques in mineral exploration; concepts of mathematical modelling
		Vector and Raster geographical information system
		Geological, geophysical and geochemical data used in modelling
		Presentation of case study- nature of data, grid file generation, interpolation algorithms, validation of surface fitting, mathematical equations of trend surface, estimation of parameters of surface equations, goodness of fit, preparation of residual maps for variables and uranium accumulation trend analysis
8	Lab	Handling data products: different sensors and scale; procedure of browsing and selecting data; Interpretation of satellite data based on elements of Remote sensing - sedimentary, Igneous and Metamorphic terrain; Interpretation of structural features.
		Digital Image Processing: Georectification and Mosaicing; contrast stretching, edge enhancement, multiple image enhancements, Merging images, and image classification, using both satellite and radiometric data.
		GIS: working on ERDAS DIPS and ArcGIS for spatial data creation; defining real world coordinate system and Map projections; working on ArcGIS for some GIS analysis; Map Presentation

Remote Sensing Geology - Ravi P. Gupta

Course No.: 202

Subject: Exploration for Beach sands

S. No.	Topics	Chapters
1	Placers and the placer environments	Classifying the environments,
		Environmental change, the placer geological time-scale,
		Types of placer minerals
2	Placer sediments and sedimentation	Energy balance, Process-response elements, Sedimentary processes - Mechanical agents of weathering, Chemical agents of weathering, Biological agents of weathering, susceptibility of minerals to change, resistance of minerals to change, Erosion;
		Properties of sediments- Particle size, Particle shape, Particle density;
		Characteristic properties of placer minerals
		Sedimentation - flow of solids through fluids-sediment transportation and settling, Transitional marine sedimentation.
3	Placers and their formation:	Provenances and related minerals, Time related provenances, Tectonically related provenances, Regional aspects of provenance and placer mineral distribution ,Connecting provenance with minerals characteristics;
		Placer formation- Continental placers, Transitional placers, marine placers
		Transitional (Beach) Placers
		Beach terminology, beach morphology, common HMs on the beaches
4	Exploration and prospecting	The placer exploration model- Programme logistics, Exploration tools, Remote sensing and satellite imagery, aerial photography, geophysical and geo-chemical methods
		Prospecting – Reconnaissance, close testing, drilling methods,sampling,analytical methods
5	Placer valuation:	Classification of ore reserves and resources - geometrical and geo-statistical methods - cut-off grade, blending, dilution, feasibility studies
6	Placer mining and placer mineral processing:	Mining methods- Mechanical mining - wet and dry methods – dredging, ecological consideration; Mineral processing: Gravity concentration, magnetic and electro static separation
7	Economic value of placer	

S. No.	Topics	Chapters
	resources – world scenario	

Course No.: 202

Subject: Rare metals and Rare Earths

S. No.	Topics	Chapters
1		Introduction to Rare Metal & Rare Earth minerals and their significance in Modern Technology
		Geochemistry and mineralogy of RM RE minerals
		Geological characteristics of Rare Metal bearing granites, pegmatites ,carbontites and alkaline rocks
		Potential Rare Metal bearing of pegmatite belts of India and world scenario
		Rare metal bearing carbonatite-alkaline rock complexes of India and World scenario
		Geologic characteristics and genetic problems associated with development of granite hosted deposits of Tantalum and niobium
		Exploration Techniques for rare metals minerals
		Geochemical methods in exploration of Rare Metals and their ore reserve estimation
		Gravity Technique for Recovery of Rare Metals

Course No.:203

Subject: Inversion methods in Geophysics and signal processing

S. No.	Topics	Chapters
1	Inversion techniques	Fundamental concepts, Inverses with discrete and continuous models
		Inverse methods based length, generalized matrix,
		inverses and maximum likelihood methods
		Non-uniqueness, applications of vector space, resolving kernels
		singular value decomposition, non-linear inverse problems
		Optimization techniques and algorithms, Marquardt algorithm, Parametric, generalized and constrained inversion procedures
		Backus-Gilbert Inverse problem, Applications of inverse theory to geophysics
2	Signal Processing	Signal processing in geophysics, Periodic function, Even and odd functions; Delta function Step function, Analog to Digital conversion; Integral transforms, Fourier transform, Discrete Fourier transform, Fast Fourier transform; Hilbert transform, Hankel transform, Walsh transform, Laplace transform, Z transform; Impulse response, Transfer function, Digital filtering; Convolution, Deconvolution; Auto correlation , Cross correlation; Sampling and reconstruction, Statistical Signal processing; Auto regression, Moving average. Auto recursive moving average filters; Weiner least square method for designing shaping and spiking filters, Butter worth filter, Applications in geophysics

Course No.: 204

Subject: Ore Reserve Estimation

. No.	Topics	Chapters
1	Ore Reserve Estimations	An overview and outline, Exploration and Data Collection (Resource database) - Survey information, Geological data,
		Geological model, Density factor, Sampling issues
		Analytical procedures, Digital databases and validation, Audits of the resource database
		Geological interpretation and Geological modeling
		Role of geological interpretation
		Interpretative techniques, Geological interpretation and modeling for mineral resource estimation
		Ore reserve estimation- Area of Influence methods, Estimation for flat lying deposits
		Uniform area of influence method
		Variable area of influence method
		Polygonal method
		Triangular method
		Cross-section method
		Isopach method and General outline method;
		Estimation method for steeply dipping deposits;
		Inverse distance method
		Geostatistical methods

. No.	Topics	Chapters
		Variography, Variography and data validation, Optimization of sampling grid and Domaining, Semivariogram, Kriging techniques (linear and nonlinear); Conditional simulation
		Mineral sands – Evaluation, resource estimation and reporting
		Reserve categories: Measured/indicated/Inferred, RAR/EAI/EAII/Speculative
		Feasibility studies: Environmental issues and Ore reserve estimation
	Tutorials	Calculation of ore reserves by different methods
	References:	1. Edwards, A.C., (Ed) (2001). Mineral Rersource and Ore reserve estimation – The AusIMM Guide to Good Practice (Monograph 23). Published by The Australiasian Institute of Mining and Mettallurgy, Carlton Victoria Australia. 2. International Atomic Energy Agency (1985). Methods for the estimation of Uranium ore reserve, An instruction Manual. Technical Reports series no.255.

Course No.: 205

Subject: Gravity and magnetic methods

S. No.	Topics	Chapters
1	Gravity method	Earth's gravitational field , Gravitational potential, Potential field equations, Derivatives of potential
		Poisson's equation Geoid
		Figure of Earth, Isostacy, ,Geodetic measurements Density estimations from field data
		Absolute and relative measurement s of gravity
		Theory and principle of gravimeter, zero length spring, Super conducting gravimeter, Calibration of gravimeter, Field procedure, Reduction of gravity data, Free Air, Bouguer and Isostatic anomalies,
		Gravity anomalies due to regular bodies- Sphere, vertical and horizontal cylinders, sheet, step/fault and bodies of arbitrary shape, Simple interpretation methods using thumb rules, characteristic curves, curve matching , excess mass estimation, location of mass centre, over burden effects, maximum-depth rules.
2	Magnetic method	Geomagnetic field, Magnetic field of external and internal origin,
		Van Allen radiation belts, diurnal variation, magnetic storms, Dipole-nondipole fields and their origin, Secular variation
		Magnetic petro physics
		Factors affecting magnetization of rocks and magnetic minerals, magnetism of igneous , metamorphic and sedimentary

S. No.	Topics	Chapters
		rocks
		magnetic signatures in different ore environments
		Remnant magnetization
		Magnetic character of continental and oceanic crusts, reversals of magnetic field, sea floor spreading and plate tectonics
		Theory and principles of magnetometers -Flux gate, Proton precision, Optical pumping and SQUID. Gradiometers
		Measurement of remanence and magnetic susceptibility
3	Processing of gravity and magnetic data	Regional-residual separation, graphical method, Polynomial fitting, Spectral analysis, Average depth estimates
		Smoothing and enhancement techniques, wavelength filtering, matched filtering,
		Werner Deconvolution, Euler depth estimates, Upward and downward continuation, derivatives, reduction to pole for magnetic data, analytical signal, susceptibility mapping, direct and inverse methods of interpretation.
4	Lab	Computation of gravity and magnetic anomalies due to two dimensional and three dimensional regular shaped bodies
		Study of variation of magnetic anomaly with magnetic latitude, azimuth and dip of the body
		Application of spectral analysis for interpretation of field data
		Computation of radially averaged spectrum
		Average depth estimates, upward, downward continuation of data
		Regional-residual separation
		Computation of vertical derivatives,
		Reduction to pole for magnetic data
		Computation of analytical signal
		Euler depth estimates
		Inversion of gravity and magnetic anomalies,
		Estimation of anomalous mass from gravity data,
		Modelling of gravity anomaly over a outcropping sedimentary basin

Course No.: 206

Subject: Petro-graphic techniques in uranium exploration

S. No.	Topics	Chapters
1	Optics and Mineralogy	Electromagnetic spectrum, light, double refraction; Polarised light microscopy,
2	Transmitted light microscopy	Minerals in plane polarized light – shape and cleavage, relief, colour, pleochroism/diachroism, opacity, vibration direction, birefringence
		Minerals in cross polarized light – anisotropism, interference colors, extinction angle, twinning, mineral identification; Interference figures – significance; sign of elongation
		Unitarian optics – determining optic sign with gypsum plate, quartz wedge
		Biaxial optics – determining optic sign with optic axis figure and acute bisectrix figure, determining 2V/Mallards method
		Becke's lines, oblique illumination method for determining relief, determination of plagioclase compositions using the Michel Levy method;
		Modal analysis, norm calculation
3	Reflected light microscopy:Properties to be studied under	Colour, bireflectance and reflection pleochroism, anisotropism, internal reflections
		Structural and morphological characters – crystal form and habit, cleavage and parting, twinning. Mineral identification
		Qualitative methods –; Colour – quantitative measurement of colour, reflectance, microindentation hardness, standard measure of Vicker's hardness, Knoop's hardness, standards, factors affecting microindentation hardness values for minerals;

S. No.	Topics	Chapters
	reflected light	polishing hardness, scratch hardness; paragenesis
4	Petrography	Petrography, petrology, petrogenesis
		Igneous petrology – rock classification-plutonic and volcanic rocks, textures, alkaline rocks and carbonatites
		Sedimentary petrology – clastic rocks, classification and origin, provenance of accessory minerals in sandstones, significance of glauconite, tectonics and sandstone compositions, climate and sandstones, diagenesis of sandstones, cementation, sandstone interpretation guide
		Chemical and biochemical sedimentary rocks – carbonate mineralogy, classification
		Tectonic setting
		Texture as an indicator of energy levels
		Metamorphic petrology – definition, grade, types, classification, nomenclature, textures and metamorphic settings.
5	Radioactive, Rare earth element and rare metal bearing minerals	. Uranium mineralogy, different stages of formation of uranium minerals, occurrence of radioactive minerals in different rock types
		Thorium: Mineralogical expression of radioactivity
		Types of radioactive minerals/phases, location and identification of radioactive minerals, optical properties of radioactive minerals – colour, reflectance, bireflectance, reflection pleochroiism, anisotropism and isotropism, internal reflection, micro indentation hardness
		primary uranium minerals, complex oxides of uranium and thorium
6	Presentation and preservation of data and assessment	Entry in registers, database, slide cataloging, photomicrography and report writing
7	Lab Petromineralogical techniques	
		Preparation of polished slab, polished thin section -advantages, araldite mount (cold setting), Bakelite mount, preparation of wafers for fluid inclusion studies
		Determination of specific gravity
		staining techniques – feldspars and carbonates

S. No.	Topics	Chapters
		Density separation of mineral grains – coarser than 200 mesh sieves and finer than 200 mess sieves; unconsolidated sediments,
		Identification of minerals, special techniques for radioactive minerals – chromogram test
		CN-85 film autoradiography/SSNTD study, fission tract studies, separation of secondary uranium minerals
8	Parts of the microscope	Objective lenses, ocular lenses, illuminating systems, accessory plates and their uses, monochromators, photometers, stage micrometers, sample holders
		Resolution, numerical aperture calibration of the micrometer, field of view, centering of the objectives
9	Transmitted light microscopy	Minerals in plane polarized light – shape and cleavage, relief, colour, pleochroism/diachroism, opacity, vibration direction, birefringence
		Minerals in cross polarized light – anisotropism, interference colors, extinction angle, twinning, mineral identification
		Interference figures – significance; sign of elongation; Unitarian optics – determining optic sign with gypsum plate, quartz wedge
		Biaxial optics – determining optic sign with optic axis figure and acute bisectrix figure, determining 2V/Mallards method
		Becke's lines, oblique illumination method for determining relief, determination of plagioclase compositions using the Michel Levy method; Modal analysis,
10	Reflected light microscopy	Mineral identification, Kalb's line. Qualitative methods Colour – quantitative measurement of colour, reflectance
		Microindentation hardness, standard measure of Vicker's hardness, Knoop's hardness, standards, factors affecting microindentation hardness values for minerals; polishing hardness, scratch hardness
11	Petrology	Study of thin sections of common igneous, sedimentary and metamorphic rocks
12	Radioactive, Rare earth element and rare metal bearing minerals	Mineralogical expression of radioactivity; types of radioactive minerals/phases, location and identification of radioactive minerals
		Optical properties of radioactive minerals – colour, reflectance, bireflectance, reflection pleochroiism, anisotropism and isotropism, internal reflection, micro indentation hardness
		Primary uranium minerals, complex oxides of uranium and thorium, common accessory radioactive minerals, labile uranium along grain boundaries, secondary uranium minerals
		uranium minerals in igneous, sedimentary and metamorphic environments.

Course No. 207

Subject: Electrical and electromagnetic Methods

. S. No.	Topics	Chapters
1	Electrical Methods	Classification of electrical methods, Natural and artificial source methods,
		Conduction in rocks, Electrical properties of rocks and minerals and their measurement
2	Self Potential method-	Origin of self potentials, Electro-filtration, Diffusion, Adsorption, Mineral potential occurrence and stability ,
		Field procedure, equipment, non-polarizable electrodes, Interpretation of anomalies due to simple shaped bodies.

. S. No.	Topics	Chapters
3	Resistivity method-	True and apparent resistivity, Current flow and potential in homogenous and non homogenous media, Potential at a plane interface, Surface potential due to horizontal beds, Effect of anisotropy and topography.
		Geo-electrical parameters- Longitudinal conductance, Transverse resistivity, longitudinal resistivity
		Various configurations and their geometric factors, Comparison of electrode arrays, Principle of reciprocity, Electrode effect, Depth of investigation, Field about a point, Dipole field region, Concept of image in potential theory, analytical continuation of potential fields, numerical methods in potential theory, Resistivity profiling and sounding.
		Typical profiles across contacts, dykes
		Expressions for apparent resistivity over layered earth, Principle of equivalence and suppression, Resistivity transform and linear filter theory, Interpretation of vertical electrical sounding curves. Applications and case histories
4	Induced Polarization method	IP phenomenon, electrochemical theory, over voltage, fixed layer, double layer, Faradaic and non-Faradaic paths, Warburg impedance, equivalent circuits, IP phase angle, mathematical formulation of IP response, Factors affecting IP phenomenon, Time domain, frequency domain and Spectral IP measurements and their equivalence
		Complex resistivity, Cole-Cole model, Discrimination of minerals, Negative IP, Field procedure and equipment, EM and capacity coupling, Computation of theoretical IP curves, IP soundings and interpretation, Magnetic Induced Polarization method, Field procedure and equipment, advantages, Applications and case histories
5	Electromagneti c methods	Classification of electromagnetic methods, Sources for EM waves, EM wave propagation
		Maxwell' s equations, Boundary conditions, wave equation, self and mutual inductance
		Electromagnetic energy and power, Poynting vector
		Diffusion equation and its solution, skin effect and skin depth, Reflection and transmission of electrical and magnetic fields, elliptic polarization
		radiation from dipole, retarded potential, near and far fields, radiation resistance, Field due to a rectangular loop, horizontal wire, horizontal circular coil, vertical straight wire, Phasor diagram, Electric circuit analogy for an EM system
		Negative screening, overburden effect, current channeling and current gathering.
		EM response over bodies with high magnetic permeability.
		EM scale modeling. Cagniard's resistivity
6	Frequency domain EM	Dip angle, Compensator method, Turam method, Horizontal and vertical loop EM methods, Controlled source audio magneto telluric method

. S. No.	Topics	Chapters
	methods-	Frequency and geometric soundings, Very low frequency (VLF) method- VLF station, parameters measured Ground Penetrating Radar method
		Field procedures and equipment
		Processing of Turam data Interpretation of HLEM data and Turam data using standard curves
		Fraser and Hjelt filters, Derivation of Current density cross section from VLF data
7	Time Domain EM methods	Comparison of FDEM and TDEM methods
		Survey configuration, Impulse and Step response measurements, Diffusion time, Transient EM response over confined targets, homogenous half-space, layered earth, thin sheets
		Field procedure and equipment. Interpretation using plate model
		Interpretation of sounding data over layered earth.
8	Natural source EM methods	Magneto-telluric, telluric and AFMAG methods. Source and the frequencies investigated
		Field procedure and equipment. Interpretation of the MT soundings. Applications and case histories
	Lab	Construction of two, three and multilayered VES curves, Interpretation of two ,three and multilayered VES curves using auxiliary point charts and master curves, Interpretation of VES curves by direct and inverse methods, Preparation of pseudo-sections, Current density cross sections from VLF data, Interpretation of HLEM data using master curves, Processing of Turam data and interpretation by using characteristic curves Interpretation of TEM profiles using plate mode, interpretation of TEM sounding data using inversion

Course No.: 208
Subject: Mineral process Engineering

S. No.	Topics	Chapters
1	Ore preparation	Significance of mineralogy in ore/mineral beneficiation
		Mineral liberation, locking factor, image analysis, Particle size analysis
		graphical representation of the results, number, mass, surface area, volume distributions as function of particle size
		statistical distributions, Laser particle analyzer
		Crushing and grinding of ores, operating principles, work index of ores, grinding efficiency and various grinding mills, mathematical treatment of grinding operation, design of grinding circuits

S. No.	Topics	Chapters
		Classification of ground ores, various types of classifiers, classifier performance, classifier efficiency
2	Ore processing by physical beneficiation	Principles of physical beneficiation of ores, qualitative and quantitative separation efficiencies, metallurgical accounting methods applicable to ore processing
		Gravity separation using the differences in specific gravities of mineral constituents, flow of particles in fluid medium, free and hindered settling, terminal velocity
		Introduction to various gravity separators, such as jigs, shaking tables, spiral concentrators, FLOATEX separators
		Electrostatic and high tension separation, the operating principle and applications in processing of atomic and strategic minerals, Froth flotation, basic principles, significance of surface properties in determining the floatability of heavier-than-water minerals, flotation equipment
		Magnetic separation, Principles of operation, magnetic separators Case studies with respect to processing of ores of atomic and strategic minerals such as those of uranium, beach sand minerals (thorium and zirconium), niobium-tantalum, tin, tungsten, molybdenum, cobalt etc
		Fine particles processing, challenges and techniques of separation, introduction to commercially available fine particle processing machines/techniques such as multi-gravity separator (MGS), Knelson concentrators, column flotation and other novel methods
3	Ore processing by chemical and bio-processing methods, hydro-metallurgical operations	Principles of leaching, acid and alkaline leaching, atmospheric and pressure leaching, factors affecting leaching behaviour
		Solid-liquid separation, various types of filters, filtration efficiency
		Hydrometallurgical unit operations, ion exchange, solvent extraction, principles of ion exchange and solvent extraction, process equipment to carry out these operations,
		Recovery of metals from the concentrated/purified solutions including precipitation
		Bio-processing of minerals, bacterial leaching, Case studies of flow sheets for processing uranium ores including those of Jaduguda, Narwapahar, Turamdih, Tummalapalle and Gogi
		Uranium recovery from secondary sources like phosphate ores, copper plant tailings and monazite
		Pilot Plant studies, scale-up and design of industrial size uranium recovery plants and project planning, management and execution
		Material and energy balancing. Process engineering, synthesis and flow sheet design.
4	Tailing processing, effluent treatment and disposal	Dewatering operations, thickening and drying and material handling.
		Significance of tailings and effluent processing in uranium ore processing Tailings neutralization, mine backfilling, tailings pond, fixing of deleterious heavy metal ions and radioactive ions, Bioremediation and impact analysis.

S. No.	Topics	Chapters
5	Lab	Size reduction of ores in laboratory ball and rod grinding mills. Screen analysis of ground ore, data presentation, by graphical methods using standard models and interpretation of data
		Settling characteristic for mineral particles in ground ore slurries and determination of parameters for dewatering of slurries
		Determination of Bonds Work Index in Ball mill, estimation of power requirement and sizing a mill for specific design specification
		Gravity separation of heavy minerals using spirals, jigs, shaking table, estimation of valuable mineral content, calculation of recovery and grade
		Magnetic separation of heavy mineral concentrates from beach sands on low and high intensity magnetic separators
		Froth Flotation of sulfide minerals, generation of kinetic curve of flotation determination of optimum grade and recovery from the graphical plots. Agitation chemical leaching of uranium ores by acid / alkaline leaching methods and computation of leachability.

Course No.: 209
Subject: Airborne geophysical methods

S. No.	Topics	Chapters
1	Introduction	Procedures for obtaining needed licenses for flying in an area
2	Survey	Survey design, and fixation of survey parameters- flight height, flight line spacing and direction, and selection of suitable

S. No.	Topics	Chapters
	designing and implementation	geophysical methods.
3	Airborne survey instruments	Magnetometer, Gravimeter, Electromagnetic system, Gamma Ray Spectrometer and their working principles.
4	Navigation aids-	DGPS, Radio-altimeter and Barometer. Types of platforms. Precautionary measures in flying – weak link mechanism, airworthiness of equipment.
5	Data acquisition	Selection of base frequency, pulse duration in case of EM methods, Sampling interval, format of output data. Types of noise in different sets of data. Quality control, data validation. Calibration procedures.
6	Processing of data	Application of attenuation coefficients, stripping coefficients, gridding, interpolation procedures, contouring
7	Presentation of data	Profiles, contour maps, images, ratio maps, conductivity –depth sections, DTM. Qualitative interpretation- Characterization of gravity and magnetic anomalies and delineation of lineaments, identification of structures
		Delineation of zones of anomalous distribution of radio-elements and identification of alteration zones. Marking positions of conductors and their extent.
8	Quantitative interpretation	Depth estimates using radially averaged spectrum of gravity and magnetic anomalies, Euler depth estimates. Forward and inverse modeling of different sets of data using available software. Modeling of conductors using plate model. Integration of various geophysical data sets and surface geological data in order to refine geological maps.
9	Tutorials	Quality control and validation of various data sets, Processing of radiometric, gravity and magnetic data, after applying the needed corrections, Presentation of data in the form of profiles, contour maps, images using available software. Qualitative interpretation to identify various litho-units and structural features. Computation of derivatives, analytical signal, Quantitative estimates using radially averaged spectrum, Euler depth estimates. Delineation of alteration zones, younger intrusive from processed radiometric data. Forward and inverse modeling of gravity, magnetic and electromagnetic data using available software. Preparation of a refined geological map after integrating various data sets.

Subject: Analytical techniques in geosciences

S. No.	Topics	Chapters
1	DC Arc spectroscopy	Dispersion of light - Basic operating principle, Dispersion devices used for spectral analysis, Prism and grating, Linear dispersion, Fundamental principles of prism dispersion, Deviation angle, Snellins – Descartes law, Prism dispersion , instrument main components, Littrow and Cornu prisms
		Optical spectra - classification of spectra, structure of line spectra, Instrumentation, Overall arrangement, Arc and spark discharge, Electrodes
		Sample preparation - General aspects, Sampling and preparation of non conducting solid substances, Spectroscopic buffer
		Behavior of elements in an arc discharge
		Simultaneous multi element analysis, Method development, Major and minor element analysis, Trace element analysis, Photo plate detection
		Measurement of the intensity of spectral lines, Straightening of the characteristic curve, Determination of the density of spectral lines, Semi quantitative/ quantitative reconnaissance analysis
	Lab	Sample preparation-weighing-filling of standards and samples in electrodes; arcing; photo plate

S. No.	Topics	Chapters
		development-computation-reporting
2	X-Ray Diffraction	Principles and methods of X-ray diffraction, Preparation of different types of geological samples for XRD studies
		Use of search-match methods for identification of primary and secondary uranium and associated minerals
		Use of search-match methods for identification of rare metal and rare earth and related minerals
		Use of search-match methods for identification of iso-structural, metamict and clay minerals
		XRD techniques for determination of unit cell parameters of atomic minerals
	Lab	Sample preparation-sample diffraction-data output-search and match method-study of diffractogram-identification of minerals-reporting
3	Electron Microprobe (EMP)	X-ray generation by electron bombardment of a sample, the detection of x-rays by WD Spectrometers, qualitative microanalysis
		Standards-based quantitative WDS microanalysis, detection limits, precision and Accuracy, methods for assessment of data quality
		technique of electro microprobe Analysis, imaging, qualitative and quantitative data acquisition, Processing & documentation
	Lab	Sample preparation and operation of EPMA Instrument for both qualitative and quantitative microanalysis.
4	X-ray fluorescence Analysis (XRF)	Qualitative and quantitative rock analyses; Standards-based quantitative WDS XRF analysis; detection limits, precision and Accuracy
		methods for assessment of data quality
		technique of XRF [WDS & EDS] Analysis, qualitative and quantitative data acquisition, data Processing and documentation.
	Lab	Sample preparation and operation of WDS XRF Instrument for both qualitative and quantitative analyses of major and minor elements, in major rock types
5	Chemical Analysis	Introduction to chemical analysis/characterization of geological materials
		Whole rock analysis - Major, minor, trace and ultra trace analysis; Sample types
		Conventional and Modern instrumental analytical techniques
		Sample preparation - Solid sampling, Solution methods for rocks, soils, water, minerals and concentrates, HF & other mineral acid dissolutions(open & closed), Fusions & fluxes
		Field measurements - pH, conductivity, TDS, Eh and Titrimetry for anions, ferrous etc
		Optical emission techniques - Flame Emission - theory, instrumentation, merits, limitations & applications

S. No.	Topics	Chapters
		Fluorimetry - Laser & Pellet methods, theory, instrumentation, merits, limitations & applications
		Atomic Absorption Spectrometry - Flame Hydride Generation and Electro thermal - theory, instrumentation, merits, limitations & applications
		UV-Visible Spectrophotometry - theory, instrumentation, merits, limitations & applications
		ICP-AES - theory, instrumentation, merits, limitations & applications
		ICP-MS - theory, instrumentation, merits, limitations & applications
		Data Quality Assurance - Errors - types, minimization
		figures of merit like accuracy, precision; standard reference materials, statistical criteria for accuracy, precision.
	Lab	Sample solution preparation for Whole rock analysis, beach minerals, niobate-tantalate
		Determination of uranium in water samples by laser fluorimetry using Scintrex analyzer and solid samples by pellet fluorimetry
		Determination of Na, K by flame photometry and Si, Ti, P by Spectrophotometer
		Determination of Fe, Mn, Al, Cu, Co etc. by FAAS
		Determination of rare earths etc. by ICP-AES; Analysis of hydro-geochemical samples for major cations & anions
6	Geochronology and Isotope Geochemistry	K-Ar system, Rb-Sr system, Sm-Nd System, U-Th-Pb System, Zircon Dating, U-Decay Series Dating, Other Decay Systems
		Analytical Methodology Radiogenic Isotope Geochemistry
		Radiogenic Isotope Geochemistry of the Mantle, Isotopic Evolution of the Mantle and models, Isotope Geochemistry of the Continental Crust
		Isotope Geochemistry of Subduction Zone
		Magmas Stable Isotope Geochemistry
		Stable Isotope Theory - Equilibrium Fractionations, Kinetic Fractionation and the Hydrologic Cycle Isotope Fractionation in the Biosphere
		Stable Isotope Applications - at High Temperatures, Oxygen Isotopes as An Indicator of Assimilation
		High Temperature Applications in Subduction zones, Hydrothermal Activity, Metamorphism, and Ore Deposits
	Lab	Sampling and sample preparation; Sample dissolution techniques and ion exchange separation for Rb/Sr, Sm/Nd, U and Pb
		Isotopic analysis using TIMS; Stable Isotope (C,S and O) analysis using IRMS

Course No.:
Subject: Borehole Logging methods

S. No.	Topics	Chapters
1.		Objective, Basic concepts- Archie's equation, Humble's equation, borehole conditions, Principles, operational procedures, equipment, applications of various well logging techniques
		Self-Potential Logging.- Sources for S.P. Use of Self Potential Logs for Oil exploration Shale base line, Sand base line Interpretation of SP logs Use of Self Potential Logs for mineral exploration
		Single point resistance log
		Resistivity Logging - Normal resistivity logging Lateral resistivity logging Microlog resistivity logging Focussed –current logging Induction logging
		Interpretation of logs
		Sonic Logging -Elastic waves in boreholes Estimation of porosity. I.P. Logging
		Nuclear Logging Nuclear Processes Gamma Ray Logging Neutron Logging, Pulsed neutron logging. Magnetic Susceptibility Log
		Nuclear Magnetic-Resonance Log. Borehole gravity log. CalliperLog
		Qualitative and quantitative interpretation of well logs. Determination of reservoir parameters. Delineation of lithology and fractures from logs
		Saline water-fresh water interface from log data. Applications. Field examples.
2.	Lab	Computation of normal and lateral log responses. Identification and delineation of sub-surface formations from well log data. Calculation of formation factor, porosity, permeability, resistivity, fluid saturation, correlation of rock units. Saline water-fresh water interface rom log data.
3.	References	1. O.Serra, 2003. Well Logging And Geology, Technip, Paris 2. O. Serra, 1984. Fundamentals of Well Log Interpretation, Elsevier. 3. R.M. Course No.: 212
Subject: Nuclear Reactor: Theory, Types and Nuclear Fuel Cycle

S. No.	Topics	Chapters
1	Introduction	The need for nuclear energy, power scenario in India, Atomic Energy establishments in India and programmes of DAE.
2	Nuclear reactor theory and types of reactors	Scientific fundamentals of fission and fusion processes and resultant release of energy
		Interaction of sub-atomic particles and ionization radiations with matter
		Nuclear structure and functions of the reactor systems
		Various types of reactors
		Moderator and coolant
		Typical reactor control system
		Steady and dynamic behavior of reactors
		Requirements of safety systems in nuclear power plants
2	Nuclear Fuel Cycle	Nuclear fuel cycle options for PHWR, BWR, PWR and FBR: Nuclear materials, Nuclear fuel cycle in India, specifications of fuel
		Mining, processing, enrichment, manufacturing, usage and burning of fuel
		Quality control aspects
		Storage and safe transportation of spent fuel bundles
		Nuclear fuel enrichment; fuel reprocessing ; generation and management of radioactive wastes
3	Environmental issues	Need for environmental protection
		Indian legislation and controls related to environment, environmental impact assessment clearances related to setting up of a nuclear power plant and its operation
		Environment survey requirements

Wait. Pergamon 1959

Course No.: 101 & 201
Subject: Basic Mathematics for Geoscientists I and II

S. No.	Topics	Chapters
1	Basic mathematical concepts	Concepts of a Set, Functions and Relation
		Graphs of Functions,
		Trigonometric Functions, Basic Trigonometry
		Hyperbolic Functions and summation of Trigonometric series

S. No.	Topics	Chapters
		De Movire’s Theorem
		Mathematical Induction
		Quadratic Equations
		Permutations and Combinations,
		Binomial Theorem
		Concept of a Sequence, Series
		Exponential, Logarithmic and Power series
		Convergence, Divergence tests
		Equations of Lines and Circles in 2-Dimensional Geometry and Basics of 3-D Geometry Spheres, Cones, Cylinders
2	Calculus	General, Limits and Continuity
		Differentiation- Basic concepts
		Curve stretching, Maxima and Minima
		Exponential functions and Exponential models
		Differentiation of Trigonometric
		Logarithmic and Exponential Functions
		Integration- Basic Concepts
		Indefinite and Definite Integrals ,Area and integration, Numerical Integration
		Ordinary differential equations- First Order Equations,
		Homogeneous and Non homogeneous equations
		Multiple Integrals
		Functions of several variables
		Double integral, Limits at infinity and Improper Integrals
3	Matrices	Concept of Matrix, matrix operations, determinant,
		Inverse of a Matrix
		Orthogonal Hermition, skew-Hermition and unitary matrices,
		rank Solution of simultaneous equations, quadratic forms
		Linear dependence and independence of vectors

S. No.	Topics	Chapters
		Linear and orthogonal transformations
		Eigen values and Eigen vectors
		properties of Eigen values, Caley-Hamilton theorem
4	Numerical methods	Solution of non-linear algebraic and transcendental equations
		Newton-Raphson, iterative, false position and bisection method
		Generalized Newton's method for multiple roots
		Numerical intergration by Taylor series
		Finite difference operators and their relations
		Factorial notation of a polynomial, data smoothing
		Newton-Gregory and Lagrange's interpolation formulae
		Inverse interpolation by Lagranges and interactive methods
		Numerical differentiation and integration – trapezoidal
		Simpson and Weddle rules, Gaussian quadrature formula
		Matrix and system of linear equation- Pivoting, Triangular factorisation, eigen value problem solving
5	Statistical concepts	Concept of frequency distribution, moments, skewness and kurtosis
		Probability- various approaches of probability- classical, frequency, statistical, subjective and axiomatic, theorems on probability, conditional probability, Independence
		Bayes theorem random variable – discrete and continuous
		Distribution functions and their properties
		Central tendency, probability mean and density function
		Mathematical expectation / moment generating function and its properties
		Probability distribution,Bernoulli's, Binomial
		Poisson and Gaussian distribution Theory of least squares and curve fitting
		Regression Analysis Variance, SD,Covariance
		Correlation – regression lines, regression coefficients Test of significance, normal test, t-test, Chi-square test and f-test
		Filters and smoothening functions
		Moving Averages, Kriging

S. No.	Topics	Chapters
		Trend surfaces Distribution of points, Contouring, Splines, Semi variograms Discriminant functions, Cluster analysis, Eigen values and Eigen vector methods
		Methods of Factor analysis – Prinicpal component analysis

Course No.: 106

Subject: Surveying, Drilling and Mining

S. No.	Topics	Chapters
1	Surveying	Types of surveys and applicability
		Principles and methods of surveying & mapping
		Surveying Equipment – Compass, The Transit, Optical Distance Measuring
		Modern surveying electronic equipments - Digital levels, Digital theodolites, EDMs and Total stations
		Principles, working and applications
		Survey Methods - Co-ordinate methods, Bearings, Traversing and Trilateration (Topo)
		Detail Survey, Orientation and position, Determination of True bearing, Horizontal and vertical control, Accuracy standards;
		Positioning – Introduction, Differential positioning,
		GPS instruments, Global Positioning Augmentation Systems; Errors in measurements – Blunders, Systematic errors, Random errors, Most probable value, Average error, Standard deviation
		Analysis and adjustment of measurements
		Distribution, Adjustment of errors by Approximate method and Least squire method
		Coordinate System in Geodesy - Geocentric Cartesian Coordinates, Topocentric Cartesian or local geodetic Cartesian Coordinates, Geodetic Coordinates, Planimetric Cartesian coordinate
		Datums - Horizontal datums - Everest spheroid, WGS – 84, datum transformation; Vertical datums - Mean Sea Level, Geoid, EGM 96
		Projection – Polyconic projection, Traverse Mercator projection (TM Projection), Universal Transverse Mercator Projection
	Tutorials	Adjustment of instrument errors by approximate method and Least square method. Datum transformation exercises.
2.	Drilling	History of Drilling; Methods of soil sampling - Auger, Drive sampling;
		Rock Drilling – Percussive, Attritive, Rotary Cutting, Shearing etc.,

S. No.	Topics	Chapters
		Rotary reverse circulating, Rotary with down hole motors, Cable tool method;
		Diamond Drilling - Diamond quality, types of diamond bits, natural and synthetic diamonds, Rotary core drilling equipment, Drilling standards, circulating media, Drilling fluid properties
		Controlled Directional Drilling - Deviation in drilling, Measurement of deviation and control, Tools for directional drilling, Downhole motors
		Various types of drills in use in AMD
	References:	1.Drilling Technology by C.P. Chugh 2.Drilling Technology Part 1 & 2 by British Drilling Association 3.Thomas, L.J. An Introduction to Mining, Methuen, Brisbane, 1978. 4.Sinha, R.K. and Sharma, N.L. An Introduction to Mineral Economics, Wiley Eastern, 1993. 5.Chatterjee, K.K. An Introduction to Mineral Economics, Wiley Eastern, 1993.
3.	Mining	Introduction to Mining
		Mining Terminologies
		Types of mining
		Techniques in Open Cast mining
		Techniques in Underground Mining
		Stages of mine development
		Blasting technique
		Economic feasibility studies andMining, milling and waste disposal etc.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Project Work	**Code:** P-NFC-BARC-01
Discipline: Chemical, Electrical, Mechanical and Quality Assurance	**No. of Lectures: 175**

Following Placement in various DAE Units, the Trainee Scientific Officers will carry out project work at their respective places of posting under the guidance of their Reporting officers, on a well-defined project/problem for a period of 7-8 weeks. The Project work will commence immediately after the Placement Committee meeting leading to the placement of TSOs in various DAE Units. The TSOs shall submit a project report at the end of the project duly certified by the project guide.

****

General Lectures

1) Series of Invited Lectures by Eminent Speakers on various programmes of DAE (about 4-6 talks to be arranged during the year)

2) Lectures on

   a) Public Speaking & Presentation Techniques (2 Hrs)
   b) Administrative Procedures (2 Hrs)
   c) Vigilance & Service Conduct Rules (2Hrs)
   d) Financial & Accounts Procedures (2 Hrs)
   e) Purchase Procedures (2 Hrs)
   f) Contract/Works Procedures (2 Hrs)
   g) Role of Official Language In Central Government Offices (2Hrs)
   h) Fire Safety (2 Hrs)
   i) Security (2 Hrs)

Nuclear Engg. Module

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Engineering Mathematics	**Code: E01 E02-CMEI-30**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Part – A

Overview of arithmetic errors in computations
Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
Linear systems solutions by direct methods, iterative methods and acceleration techniques.
Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
Linear systems: Eigen values.
Non -Linear systems: Newton-Rapson & Successive Approximation methods
Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

Part - B

Finite Difference Approximation in 1-D and 2-D
Solution of steady and unsteady heat conduction equations
Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
Response Surface Method 2K+1, factorial design, 3k factorial design
Monte Carlo Method
Artificial Intelligence and Genetic Algorithm
Artificial Neural Network
Gram-Schmidtt Orthogonalization
Transformation of matrix
Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.

Syllabus

Subject: Nuclear and Reactor Physics	**Code: NE 2-E07 -CMEI-45**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 35**

NUCLEAR AND REACTOR PHYSICS (35)

1. **Properties of Nuclei:**
    - Binding energy-formula and interpretation, nuclear forces, nuclear structure.
2. **Fission process:**
    - Fission rate and reactor power
    - Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
    - Fissile, fertile and fissionable materials
    - Fission product activity after shut down –decay heat.
3. **Interaction of Neutrons with Matter**
    - Production of neutrons
4. **Concept of microscopic cross section:**
    - Inelastic and elastic scattering
5. **Variation of cross-section with energy**
    - Fast, resonance and thermal ranges
    - 1/v law of neuron cross-section
    - Resonance absorption, Doppler effect.
    - Eta vs E curve conversion & breeding concept
    - Thorium utilization
6. **Diffusion of Neutrons**
    - Fick's law and its validity
    - Steady state neutron diffusion equation
    - Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.
7. **Chain Reaction**
    - Four Factor formula
    - Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
    - Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,
8. **Slowing Down Process**
    - Neutron slowing down
    - Slowing down power/ moderating ratio of moderators
    - Slowing down with spatial migration
    - Fermi age concepts, migration length
    - Multi zone reactors
    - Ideas of reflectors/blankets, reflector savings, form factor.

Contd…

9. Heterogeneous Reactors

- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

10. Reactor Kinetics

- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

11. Core Burn Up

- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

12. Neutron Poisons

- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

13. Reactivity Coefficients

- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Reactor Engineering & Radiation Shielding	**Code: NE 03-E 13-CMEI -30**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Introduction to reactor system & Indian Nuclear power programme; station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems, classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR, AGR, HTGR, AHWR etc,.), Fast reactors; Research reactors (CIRUS, DHRUVA etc.) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.

Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems. Heat flow & temperature distribution in plate & solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example. **(10Hours)**

Brief description of various types of fuel; metallic (DHRUVA, CIRUS) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; heat and mass balance in a BWR; boiling height in a BWR core; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pr, temp) in various reactors.

Nuclear Fuel Cycle:
Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
Global options of fuel cycles; Issues related to Resources, Long-lived radioactive waste, Proliferation, and Advanced Technologies.
Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle, Thorium utilization; Indian capabilities in: managing nuclear waste, long lived radio active waste and fuel cycle technologies.
Advanced fuel cycles; Role of ADS. **(10 Hours)**

Contd……

Radiation Shielding

Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors. **(10 hours)**

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Health Physics, Chemical Plant Safety And Environmental Engineering	Code: NEM - FC02, E06, CC09-CMEEI-25
Discipline: Mechanical, Chemical, Electrical Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Health Physics (8 Lectures)
Radiation Sources, Quantities & Units: Natural & Technologically enhanced radiation sources, Radiometric quantities, Interaction coefficients, Dosimetry, Radioactivity, Exposure-dose relationship. Calculation of dose from alpha, beta, gamma & neutron sources.

Fundamentals of Radiation Protection: Objectives of radiation protection, ICRP system of dose limitation, radiation protection standards, annual limit of intake, derived air concentration. Exposure and absorbed dose, equivalent dose, effective dose and their units (old & new), Limits of intake for radio nuclides including radon, accidental & emergency exposure, Atomic Energy Act, Radiation Protection Rules, Safety organization, Regulatory aspects of radiation protection.

Non- stochastic or immediate effects: Acute radiation sickness - LD 50 / 60, radiation effect on gonads, blood & blood, storming organs, lung, thyroid & skin.
Stochastic or Delayed effects: Cancer, life shortening linearity of dose effect:
Effects on embryo & foetus, genetic effects, doubling dose. Human data for calculating risk coefficients.

Operational Radiation Protection: Modes of exposure, Exposure control.
1.External: time, distance & shielding
2.Internal: containment, ventilation, plastic suits, respirators. Design of hot laboratories, zoning of areas, personal control, medical control, concept of controlled area, supervised area, radiation protection procedures, special work permit, barrier rubber stations.
Radiation Protection Monitoring: Work place monitoring for external radiation levels, air born contamination, surface & personnel contamination, monitoring instruments, collection of air & swipe samples & their counting, Individual monitoring of external exposure - TLD, film badge, monitoring for internal exposure - whole body counting, bioassay, dose records, collective dose equivalents. Radiation emergency; onsite and offsite procedure of handling emergencies, early phase, intermediates, late phase and counter measure.

Industrial Safety (8 Lectures)
Introduction: Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques
Hazards due to physical agents: UV and IR radiation, Lasers, Microwave radiation; noise, heat
Chemicals hazards: Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals
Evaluation: Instrumental methods, air sampling methods, liquid effluent monitoring
Occupational exposure limits: Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50
Handling, storage and control: Engineering control measures and safety features, Safety management techniques such as safety audit, Personal/ administrative control, and Medical control
Fire and explosion hazards: Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits, USNFPA Classification of Flammable/combustible liquids: flammable gases; Engineering safety for prevention of fire and explosion, Hazard area classification, selection of equipment, detection and extinguishing systems

Contd….

Hazard identification, assessment and control: Hazard identification: Concept of risk and Risk management; Formal methods of hazard identification and assessment: Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies, Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation. Specific hazards in HWPs and various facilities of NFC. Area classifications for hazardous chemicals, types of protection & Protective equipments. Safety work permit system

Management of major hazard Installations: (6 Lectures) Plant Layout and Engineering Design Considerations, Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic. Releases, Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment, Emergency Planning Guidelines, Development of On-site & off site emergency preparedness plans

Health and safety regulatory aspects: Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate. EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

Environmental Engineering & Environment Protection: (8 Lectures)
PRINCIPLES: Population, economic growth, industrialization, urbanization and energy-use, as causes of environmental pollution. Application of environmental principles (technical and non-technical) to: water resource management, water and wastewater treatment, air pollution control, solid waste management, environmental impact assessment, and environmental ethics. Thermal pollution, noise pollution, greenhouse effect, acid precipitation, ozone depletion, air toxics, and ground-level ozone and fine particulates (photochemical smog). Sustainable development, life cycle analysis, and principles of environmental quality objectives, standards and guidelines.

Environment Impact assessment, various effluents generated from HWPs & NFC and their treatment methods strategies, Limiting concentration of pollutants and pollution control measures. MSDS, toxic releases; Emission & dispersion

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Nuclear Power Plant Engineering	**Code: NE 05 -CMEI-30**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 30**

a) PHWRs (12 Lectures)

Description of schematic of NPP; siting requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building; Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting. Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.

Reactivity control mechanisms - Zone control / Regulating rods, Absorber rods and shim rods; Shut down System.

Fuel Transfer System.

Auxiliary systems - Ventilation, Annular gas, Process water & Fire water systems.

Secondary System - Description of flow sheet and major components, Comparison of operating conditions, Thermal Cycles and Major Components of thermal and nuclear units.

Power Plant Control and Instrumentation: Reactor Power control (neutronic and thermal signals), Coolant and Steam pressure control, Integration with grid for base load operation. Control and protection channels with typical examples.

Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system. Brief description of systems components like Bus bar, Switchyard, Circuit Breakers, Switchgear, Bus duct, Generator, Transformer, Cables and their selection, Layout and Scaling.

Nuclear Power Plant Safety: Design principles for providing nuclear safety :-Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

Safety Evaluation and Safety Criteria Description of Deterministic and Probabilistic approaches. Safety Monitoring of Operating Plants- IAEA Classification, NUSS Codes. Safety systems, Description of Safety Systems (shutdown system, ECCS, Containment and Engineered Safety Description of features) Exclusion Zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.

Description of a typical Design Basis Accident Scenario - build up event tree to describe sequential role of safety features. Broad description of TMI, Chernobyl accident, NAPS fire incident.

Advanced reactor concepts with passive safety features.

Nuclear Architecture: Design of integrated layout of Equipment, Piping, Electrical/ Instrumentation Cables etc. to provide Operation and Maintenance Convenience (to minimize man rem and meet safety objectives), Non propagation of incidents/ accidents.

Contd...

b) PWRs / BWRs (8 lectures)

Pressurized Water Reactors : Reactor pressure vessel and internals, reactor core and fuel, methods of reactivity control, reactor coolant system & equipments, pressurizer, Engineered Safety features, reactor auxiliary systems including turbine & generator.

Boiling Water Reactors; Introduction, reactor vessel and internals, neutron monitoring, reactor coolant recirculation systems including secondary steam, reactor protection system, turbine generator.

c) Fast Breeder Reactors (10 Lectures)

INTRODUCTION: Breeding, definition & reactions; Breeders as an Inexhaustible Energy Source; Fast reactors as breeders: Classification of power reactors; Characteristics & types of fast reactors: Comparison of some characteristics of fast and thermal reactors; Role of Fast Reactors in Indian Nuclear Power Programme.

Fuel: Fuel pin diameter, number of fuel pins per sub-assembly, reactivity worth of sub-assembly, Sub-assembly outlet temperature.

Shielding Principles: Special features of sodium cooled reactor shielding, reactor shielding, shield for activation products, shielding for fuel management.

Thermal analysis: Sodium heat transfer coefficient (empirical relation), calculation of temperature of fuel pin, hot spot analysis (brief outline).

Coolant for fast reactor: General requirements for fast reactors coolant; Comparison of various coolants & choice of sodium as coolant; Properties of sodium: Physical & chemical; Methods of sodium purification & purity control: Cold & hot traps; Oxide measuring & indicating devices.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Material Science In Nuclear Engineering	Code: NE 06 -CMEI-25
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	No. of Lectures: 25

Shri. Chittaranjan Das

Properties of Engineering Materials: (21 Lectures)
Metals, alloys, ceramics, metal cladding semiconductors, polymers, and composites. Mechanical properties and their evaluation as per ASTM or equivalent standards. Stress-strain diagram, Principle stresses, Biaxial stresses, creep, fatigue and fracture toughness. Material testing for tensile strength, hardness, fracture, creep, fatigue wear.
Material Processing: Metal forming, casting, cutting and joining: ASTM standards, quality control during processing.
Metallurgy of Steels: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, Austenitic and Martensitic S.S. Selection of Steel for hydrogen services, different types of corrosion aspects in heavy water plants (Ammonia based & Sulfide based); their protection method and the selection of structural material. Selection of steel for high temperature and radiation environment, Welding and heat treatment. Powder Metallurgy for fuel fabrication

Shri. R. Tewari

Nuclear Materials: Fabrication, properties and application of nuclear materials like Zircoloy, Zr-Nb alloys, Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and application.
Decontamination, radiolysis, specification for chemistry parameters in process systems of BWRs & PHWRs.

Shri. Kamalesh Chan.

Corrosion Engineering: Corrosion, activation of corrosion products.
Chemical properties: Oxidation, corrosion, gaseous corrosion, stress corrosion, corrosion prevention, chemical degradation.
Basic Corrosion principles, types of corrosion & their mechanism and prevention; Crevice corrosion, SCC, IGSCC and other under deposit corrosion, Electro- chemical corrosion and erosion corrosion, cathodic protection of pipelines and vessels; Corrosion in chemical process industries and their prevention methods.

Smt. K.S. Lakshmi

Non Destructive testing: (4 Lectures)
Covering basic aspects of various types of NDT Techniques like UT, Radiography, Edycurrent, Magnetic Particle testing, Dye penetrant testing & Visual Inspection Methods.

NFC, Hyderabad
Syllabus

Subject: Nuclear Fuel Cycle And Water Chemistry	**Code: - NE 7-FC07 FC08-CMEI-50**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Hours: 45**

Nuclear Fuel Cycle: (19 Hours) General description for different types of reactors. Front end and back end processes. Three stage Nuclear Power Programme of DAE.
Basic considerations of Fuel Design. Types of Nuclear Fuels, Research/Power Reactors Fuels, Thermal/ Fast Reactor Fuels. Metallic, ceramic fuels, cermet and dispersion fuels, Advantages/ disadvantages. Cladding Materials, zirconium alloys,stainless steels, aluminum and alloys.
Manufacturing processes for Uranium. Uranium ore mining and milling, Production of Uranium metal, alloying of U, Fuel for CIRUS & Dhruva; their properties and fabrication methods, methods of fuel plate fabrication. Uranium oxide powder preparation, compaction, sintering. Problems with U Fuel, Oxide Fuels, Mixed Oxide and Carbide fuels, properties of Pu Fuels, U & Pu Carbide fuel plate fabrication, FBTR fuel pin fabrication method,
Manufacturing processes for production of nuclear grade zirconium
Production of nuclear grade Zirconium Oxide, Iodide Process and Kroll process for production of sponge. Thermal decomposition, electrolysis etc., Specification of Zr-Sponge in Nuclear reactor applications. Melting Practices: Arc Melting, plasma melting and Electron beam melting methods for producing zirconium alloy ingots.

Fabrication: Cold working & hot working, Forging, rolling, extrusion, pilgering, tube drawing, rod fabrication, wire drawing and metal joining (Resistance welding, TIG welding and EB welding), Heat treatment of Zirconium alloys; Vacuum annealing & Stress relieving, Pickling & finishing of zirconium alloys. Manufacture of Fuel Tubes, Coolant Tubes, Calandria Tubes and other structurals
Irradiation effects in fuel and cladding materials. Pellet Clad Interaction & Stress Corrosion Cracking. Delayed hydride cracking, Performance of pressure tubes Advanced Fuels, Canflex, Dupic, thorium utilisation

Heavy Water Production (8 Hours)
Heavy Water: Properties and importance of Heavy Water in Nuclear Power Generation, scenario of D2O requirement, Unique features of deuterium separation, details of various methods of production, distillation and electrolysis processes of D2O and their comparison. Chemical exchange processes: H2S - H2O, NH3-H2 processes, description of sulphide process, separation factor, flow sheet, utilities, effluent treatment, special components.
Ammonia - H2, mono-thermal and bi-thermal processes description, flow sheet, effluents, NH3 – H2O front end process, salient features of equipments like ejector tray towers, etc. Ammonia-Hydrogen Front end process

Reprocessing of spent Nuclear Fuels. **(4 Hours)** Introduction to radiochemistry, difference between conventional & radiochemical plant, process and equipment limitations, criticality, safety and other hazards, ventilation and shielding. Spent fuel storage, decontamination, solvent extraction, Purex process, Reprocessing of thorium based fuels.

Contd…

Nuclear Waste management: (4 Hours) Sources, Characteristics and classification of radioactive waste, general philosophy of radioactive waste management. Methods of treatment for low, intermediate and high level solid, liquid and gaseous wastes with examples. Conditioning of radioactive waste, cementation, bituminisation and vitrification methods. Storage for primary/secondary solid waste and ultimate disposal.

Aspects of Heavy Water and its Analytical Chemistry (6 Hours)
Fundamentals of analytical chemistry, IR, UV, Neutron scattering, atomic absorption spectrophotometry, GC, GLC, HPLC, Mass spectrum.
Specific analytical instruments used in process & mineral plants, Measurements of impurities in gas / liquid like CO, CO2 , SO2, H2S, NH3 etc.
Measurement of SPM in stack, ambient air etc.
Online measurement of O2, sulfides (for H2S), pH etc.
Water source and Impurities, External treatment: Aeration, chlorination, clarification, filtration, precipitation softening processes, Ion exchange and DM water production
Boiler water systems & treatment
Cooling water systems & treatment
Industrial waste water treatment

Isotope separation Process (4 Hours)
Equilibrium and non Equilibrium Processes,
Thermodynamic minimum work for separation
Value function separative work
Cascade theory, Ideal cascade and squared of cascade.
Various reversible separations processes
Isotopic separation systems

Reference Books
Fundamentals of Analytical chemistry- Douglas, A.S.; Donald, M. W., Fourth edition
BETZ handbook of Industrial Water conditioning, eighth edition, 1980
Chemical engineer's Handbook- Perry J.H. and Green, Seventh edition
Nuclear Reactor Engg – Reactor Design basics 4th edition, Vol.1
Nuclear Reactor Engg – Reactor Systems Engg 4th edition Vol.II
By Glasstone, Samuel , Pub: Sesonske, Alexander, Pub: CBS, New Delhi

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Advanced Chemical Reaction Engineering	**Code: CEM:E 30:C-25**
Discipline: Chemical Engineering	**No. of Lectures: 25**

Review of basic concepts of reaction engineering

Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.

Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations

Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.

Reactor design: counter-current moving bed reactors, fluidized bed reactors.

Advanced topics in reaction engineering- three phase reactors, integral reactor-separators, complex systems.

Examples from nuclear chemical engineering.

Reference Books:

1. Chemical Reactor Design and Operation – K.R. Westerterp, W.P.M Van Swaaij, AACM Beenackers, John Wiley & Sons, 1984.

2. Elements of Chemical Reaction Engineering – H.S. Fogler, 2nd ed, Prentice Hall, 1987.

3. Chemical Engineering (vol.3): Chemical Reactor Design, Biochemical Reaction Engineering including Computational Techniques and Control. – Coulson & Richardson 2nd ed., Pergamon Press, 1979.

4. Chemical Reaction Engineering – Octave Levenspeil, 2nd ed., John Wiley and Sons, 1995.

5. Research and Technological Studies on Liquid Phase Oxidation Reaction Process : Hazardous Toxic Chemical Mitigation Techniques. – T.V. Subramanian, Chennai: Emerald Publishers, 1997. (Class No. : 66.094.3-936.35 A97 at Central Library)

6. Hartland, Stanley, "Counter-current Extraction: An Introduction to Design & Operation of Counter-current Extractors", Pergamon Press, 1970

7. Smith Robin, "Chemical process Design, MGH (New York), 1995

8. H. Scott Fogler, " Elements of Chemical Reaction Engineering" 4th Edition, Pearson, 2006

Core Engg. Module

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Advanced Mass Transfer, Equipment Design and Solvent Extraction	Code: CEM-04:E32 AC03:C 45
Discipline: Chemical Engineering	**No. of Lectures: 45**

Theories of mass transfer: 15 Hrs

Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fiber extractors. Adsorption and ion exchange equipment. Membrane separation and other advanced mass transfer processes. Process intensification approaches.

Mass Transfer Equipment Design: 10 Hrs

Different types of mass transfer equipment for gas liquid operations. Selection criteria for tray v/s packed columns. Design of cross flow and multiple d/c type sieve trays, Ejector Trays Hydro dynamics of trays & packed columns, Structured & random packings Performance evaluation of plate & packed column, spray, packed & tray columns trickle bed reactors.

Solvent extraction: 20 Hrs

Introduction to liquid-liquid extraction: Molecular and eddy diffusion, inter phase mass transfer, Lewis-Whitman theory calculation of No. of stages for cross flow and counter current flow, selection of solvent. Three component system. One pair partially soluble, two pairs partially soluble Binodal solubility curve, Representation in equilateral triangular coordinates, interpretation of equilibrium curves, extraction in multi component systems, use of "pinching " in extraction & scrubbing operation.

Dispersion & Coalescence: axial and radial dispersion, Factors influencing dispersion, Primary and secondary break ,types of impellers, dispersion in spray columns, sieve plate column packed column and in agitated systems. Factors affecting coalescence, coalescence in spray column, packed column in settlers.

Equipment for solvent extraction: Selection criteria for contractors, classification of contractors, contractors effectiveness, spray columns, packed columns, sieve tray, pulsed sieve plate column, mixer-settlers, centrifuge.

Contd...

Design of mixer settlers: Design from 1st principles, Batch and continuous equipment, (Design of batch mixer settler), Principles of scale up of designs, mixer and scale up hydrodynamic balance and location of aqueous ,mixed and organic parts.

Chemistry of Uranium Extraction: Different solvents, Mechanism of Uranium extraction, diluents, third phase formation, Phase or diluents modifiers.

Extraction processes in Nuclear industry: Ore concentration, DDPA process, DEHPA, AMEX process,TBP-UO_2 $(NO_3)_2$ refining ,PUREX process, Thorex Process, TBP-$Zr(NO_3)_4$ process

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Basic Process Instrumentation and Control	Code: CEM:CC03-M - 20
Discipline:Mechanical, Chemical & QA Engineering	No. of Lectures: 20

Instrument terminology, symbols & performance:
Instrument terminology: Accuracy, Precision, Resolution, Repeatability, Reproducibility, Drift, Dead band, Flow sheet symbols, Instrument performance, Standard unit of measurements, P&I diagrams.

Measurements: **Flow measurement**:
Mechanical type flow meters: Orifice meter, Venture meter, Pitot tube, Elbow meters.
Variable area flow meters, Magnetic flow meters, Turbine flow meters, Ultrasonic flow meters

Level measurements:
Level gauges, floats, Differential pressure type level detectors, Displacer type level detectors, Conductivity type, Capacitance type, Ultrasonic type, Radiation type

Temperature measurement: Filled-bulb and glass type thermometers, Bimetallic type, Resistance temperature detectors, Thermocouples, Pyrometers

Pressure measurement:
Bourdon & helical type pressure sensors, Bellow type pressure sensors, Diaphragm type, Differential transmitters, Manometers,Vacuum sensors.

Panel display instruments: Indicators, Recorders, Controllers
Signal transmission methods & Annunciations.

Automatic control theory: Control basics, Control modes, Closed loop response, Feed back & feed forward control, Tuning of PID controllers.
Final control elements: Control valve sizing, Control valve types, Actuators, Accessories & positioners

Control & Instrumentation, Sensors and Transmitters
Final control elements. Control valves, actuators, and positioners Controllers Automatic controllers

Distributed Digital Control System
(a) Signal conditioning, (b) Data acquisition system (c) PC based instrumentation (d)Organisation of distributed control system; (e) Control software and qualification aspects (f) Data processing and SCADA.

Contd….

Reference Books:

1. Fundamentals of Temperature. Pressure and Flow Measurements – Benedict
2. Measurement Engineering – Stein P.K. Pub-fished by Stein Engineering Services
3. Mechanical Measurements – T.G. Backwith and N. Leins Suck, Addison Wesley
4. instrument Technology, Vols. 1 to 5, - E.B. Jones, Butterworth and London
5. Experimental Methods for Engineering – J.P. Holman, McGraw Hill
6. Measurement in Applied Physics – A.A. Burr K.J. Dean, Chapman and Hall
7. Mechanical and Industrial Measurements – R.K. Jain, Khanna Publishers, NewDelhi.
8. Instrumentation for Scientific Research – Kurt S. Lion, McGraw Hill
9. Industrial Instrumentation Fundamentals – A.E. Fribance, Tata McGraw Hill
10. Measurement system, Application and Design, Ernest D. Deophhlin, McGraw Hill

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Computational Fluid Dynamics and Heat Transfer	Code: CEM:E 21:CM-40
Discipline: Mechanical and Chemical Engineering	**No. of Lectures: 40**

Basics of Fluid Flow, Heat Transfer and Numerical Analysis: 15 Hrs
Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
Classification of Partial Differential Equations (PDEs)
Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
Temporal integration: explicit, implicit scheme
Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
Discretization of convection-diffusion problem: exponential scheme, power-law scheme

Laminar Boundary Layer and Forced Convective Heat:
Formulation of differential equation for hydrodynamic and thermal boundary layer
Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
Convective heat transfer for internal and external flows
Low and high Prandtl number limits and different thermal boundary conditions
Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer:
Reynolds decomposition for turbulence ; Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder ; Calculation of friction factor and drag coefficient ; Analytical and semi-analytical correlations for calculating heat transfer coefficients ; Analogy between heat and momentum transfer ;Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models,Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

Natural Convection :
Basic Equations of natural convection : Boussinesq approximation : Derivation of Dimensionless groups from basic equations : Analytical approximations : Numerical solution of approximate equations

Contd....

Numerical Solution of Complete Fluid Flow and Energy Equation : 6 Hrs
Formulations of governing equations used in numerical simulation:
Streamfunction-temperature formulation
Streamfunction-vorticity-temperature formulation
Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
Primitive-Variable (P-V-T) formulation
Pressure velocity coupling for incompressible flow:
Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
Simple grid generation techniques for structured grid:
Elliptic, parabolic and hyperbolic equation method
Grid adaptation
Domain decompositions in CFD and heat transfer
SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer : 10 Hrs
Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Heat Transfer With Phase Change : 9 Hrs
Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model); Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation) ; Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.Critical Flow: Models for single – phase and two-phase critical flow.

NFC, Hyderabad
Syllabus

Subject: Process Dynamics, Analysis and Control	Code: CEM:E31 E29:50
Discipline: Chemical Engineering	No. of Lectures: 40

Review of Basic Control: 40 Hrs

Dynamic models, Transfer function Transient analysis - Rouths criteria etc., Stability, Frequency analysis - Nyquist criteria with examples using MATLAB etc., Discrete models, z-transforms, Sampled data control, Introduction to state space control, State feed back, Pole placement, Controllability, Observability, Stochastic Processes, Kalman filtering. Process identification from plant data; SISO with PID control, Inadequacies; Cascade, feed forward, dead time compensation; Introduction to adaptive control, non-linear control; Poorly defined system, and fuzzy control. Multivariable systems, Model predictive control: internal model control, Dynamic matrix control, multivariable control, and optimal control. Introduction to Fault Detection and Diagnosis. The assignments include problem solving with simulation software.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Process Modeling, Simulation and Optimization	Code: CEM-5:E 33:C-20
Discipline: Chemical Engineering	**No. of Lectures: 20**

Process Simulation: 10 Hrs
Introduction to process modeling, simulation and optimization. Deterministic versus stochastic models. Dynamic and steady state models.
Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
Approaches to Plant Simulation: Sequential modular; Equation oriented; Simultaneous modular
Steady-State Sequential Modular Simulators:
Concepts of partitioning, tearing and nesting as applied to flow sheets: Methods of representation of plant topology; recycle detection and calculation ordering algorithms; recycle convergent methods.

Steady State Equation Oriented Simulators:
Strategies for formulation of plant models; sparse systems and Solution procedures; Solution methods for simultaneous modular approach; General Approaches For Non-Linear Systems; Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eign-value method. Examples of solving non-linear systems; Commercial Simulators ;Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization: 10 Hrs
Classification of optimization problems, necessary and sufficiency conditions for optimum; Search procedures for unconstrained optimization problems; Non-linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator; Case Study: Simulation and modeling of heavy water cascade, use of lumping and de-lumping strategies, application on Optimisation techniques. Decomposition of complex topology, rate base model versus equilibrium base model for tower internals, evaluation of transport co-efficients using mass transfer with reaction models, use of analogies for evaluation of interface co-efficient introduction, Recent Developments: Multi-objective optimization, Plant optimization by Genetic Algorithms and Neural Network.

Reference Books:
1) Process Modeling, Simulation And Control for Chemical Engrs. 2nd Edition: Luyben William L, Publisher: McGraw-Hill, New York .
2) Optimization of Chemical Processes ; Edgar, Himmelblau & Lasdon

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Applied Process Instrumentation and Control	Code: CEM :E 50:CEEI-45
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 45**

Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: **15 Hrs**
Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annular, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices, venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flow meter; Ultrasonic flow meters- transit time, Doppler type, Clamp on type ultrasonic flow meters, Coriolis and thermal mass flow meters. Applications and limitations of various flow meters. Two phase flow measurements.

Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermo well, thermo well installation aspects. Surface temperature measurement techniques; Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

Pressure: 15 Hrs
Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.>Analytical Instrumentation: Conductivity, pH, ORP and Turbidity measurement.
Automatic Control Theory: Control busses, Control Modes, closed looping response, PID controllers, feed back & feed-forward control, timing of PID controllers. Auto tuning and self adaptive controls. Operational amplifiers and its applications.

Contd...

Instrumentation Field Busses: HIRE Foundation Field Bus, profi bus, mod bus, TCP/IP, Industrial Ethernet, device net & CAN

Introduction of Advance Sensor Technology: Wireless sensors.
Basics of Pneumatics : Instrument Air Quality, Air requirement, Flaper nozzle mechanism, signal booster.
Other Measurements: Relative humidity; viscosity and density measurement

Introduction to Neural Network and Fuzzy Logic : 5 Hrs

Control valves: 10 Hrs

Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve range ability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings; P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

NFC, Hyderabad
Syllabus

Subject: Electrical Engineering Practices- I	Code: CEM:AC13:E -30
Discipline: Electrical Engineering	**No. of Lectures: 30**

1. **EHV Switchyard Design**: Switching schemes; clearance; Comparison between types of switchyards; Brief introduction to equipments in switchyard and their functions; Lighting arrestors and insulation co-ordination; Lightning protection, Maintenance of Switch yards, Selection of instrument transformers for measurement and protection.
2. **Selection Of Transformers**: Types & classifications; Special design features; Accessories; Specifications and testing; Voltage regulation calculations, Maintenance, Transformer oil, requirements, specifications and maintenance.
3. **Motor & Their Applications**: Types of motors; System requirements; Performance requirements, Drives, Selection of starters, Installation and maintenance, Insulation classes and maintenance.
4. **Station Auxiliary Systems**: Class 1, II , III and IV systems classifications.
5. **Introduction to DG Sets, Ups & Batteries**: DG sets: Engine, auxiliaries, Generator, Electrical equipment, brush-less and static excitation systems and introduction to SCADA
6. **UPS:** Types, different configurations, selection.
7. **Batteries**: types, selection criteria, charging methods, Testing methods
8. **Cabling, Lighting & Grounding**: Cabling: Types, sizing, laying and de-rating factors, terminations, fault location Grounding systems; Bus ducts.
9. **Selection of MV & LV Switchgear:** Types ; specifications and testing MCCs; Distribution boards; ELCB, Internal protection, Maintenance.
10. **Electrical Equipment**: Requirement In Hazardous Areas: Specific requirements for safety related electrical equipments & systems in Chemical Industries. Fire wall, barrier and stops.
11. **Electrical Control Circuits**: Symbols, development of control circuit, Single-line/schematic diagram Latest Trends In Electrical Engineering
12. **Protection**: Line protection; generator protection; Transformer protection; Motor protection.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Electrical Engineering Practices - II	Code: CEM: EEP-II: E:20
Discipline: Electrical Engineering	**No. of Lectures: 20**

Electric Drive: Advantages of electric drive; Factors governing selection of motors; Nature of electric supply; Nature of the drive: Individual drive, group drive: Nature of load: Starting torque, behavior of load with respect to speed, high inertia loads, Electrical characteristics of motors: Starting Characteristics, running characteristics, speed control, braking characteristics

Size and rating of motors: Sizing calculation, Duty cycle of motor, continuous, intermittent, over load capacity and pull out torque: Mechanical considerations: Type of enclosure, type of bearings, transmission of drive, noise level Cost: Capital cost, running cost.

Electric Heating: Advantages of electric heating Methods of heating Resistance heating; direct resistance heating; indirect resistance heating; types of heating elements, selection of heating elements, requirements of a good heating material, causes of failure of heating elements, temperature control resistance furnaces, introduction to design of heating element. Introduction to refractory materials for furnaces.

Illumination Engg: Fundamentals of radiation, visible range of light, colour temperature, Eye end vision. Laws of illumination and units. Various light sources: incandescent and discharge lamps. Illumination system: Luminnaire, Ballast and starters. Colour and glare, Interior and exterior lighting applications and controls. Lighting calculation and design. DC Power surfaces for industrial applications

Electric Arc Furnaces: Definition and Characteristics of arc, power supply and control of arc furnace.

Plasma furnaces: Definition and characteristics of plasma, start plasma, power supply and control of plasma furnace.

Electron beam melting: Introduction, generation of electron beam, power supply and control of electron beam

High frequency heating Induction heating: skin effect, aspects of power supply Di-electric heating, Introduction, advantages

Electric Welding: Electric arc welding, Electric resistance welding, Electron beam welding

Contd....

Electrolytic Processes: Laws of electrolysis, electroplating,
Earthing & lightening protection-effect of current to human body.

Introduction to power quality:

Perspective on power quality--Categories and origin of power quality--
Power system harmonics--Non linear loads--
Effect of power quality on industrial loads--
Motor issues--Electro magnetic interaction--
VFD issues

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Modern Electronic Control of AC and DC Drives	Code: CEM:JNTU:30
Discipline: Electrical Engineering, Electronics Engineering and Instrumentation Engineering	**No. of Lectures: 25**

A. Power Control of DC Drives

UNIT-I Three phase naturally commutated bridge circuit as a rectifier or as an inverter Three phase controlled bridge rectifier with passive load impedance, resistive load and ideal supply – Highly inductive load and ideal supply for load side and supply side quantities, shunt capacitor compensation, three phase controlled bridge rectifier inverter.

UNIT – II Phase controlled DC Motor drives
Three phase controlled converter, control circuit– Two quadrant, Three phase converter controlled DC motor drive – DC motor and load, converter

UNIT – III Current and Speed controlled DC Motor drives
Current and speed controllers – current and speed feedback – Harmonics and associated problems – sixth harmonics torque.

UNIT – IV Chopper controlled DC motor drives
Principle of operation of the chopper – Four- quadrant chopper circuit – Chopper for inversion – Chopper with other power devices – model of the chopper – input to the chopper – rating of the devices – Pulsating torque.

UNIT – V Closed loop operation of DC motor drives
Speed controlled drive system – current control loop – pulse width modulated current controller – hysterisis current controller

B. Power Control of A.C. Drives

UNIT I Introduction to AC Drives
Introduction to motor drives – Torque production – Equivalent circuit analysis – Speed-Torque Characteristics with Variable voltage operation, Variable frequency operation, constant v/f operation – Variable stator current operation – Induction motor characteristics in constant torque and field weakening regions

UNIT II Control of Induction motor drives at Stator side
Scalar control – Voltage fed inverter control – Open loop volts/Hz control – speed control slip regulation – speed control with torque and flux control – current controlled voltage fed inverter drive – current-fed inverter control – Independent current and frequency control – Speed and flux control in Current-Fed inverter drive – Volts/Hz control of Current-fed inverter drive – Efficiency optimization control by flux program

Contd...

UNIT III Vector control of Induction Motor Drives

Principles of Vector control – Vector control methods – Direct method of vector control – Indirect method of vector control – Adaptive control principles

Techniques of motor drive configuration.

Reference Books:

NFC, Hyderabad
Syllabus

Subject: Networking Communications	**Code: CEM-9:E61: Etrn-I-20**
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 20**

Data Communication Topics: Basic Concepts, V.24 and V.35 standards, Dial up modems, xDSL technology, Techniques of Flow Control, Error Control, Switching, Multiplexing, and Routing. (4)

Digital Networks: ISDN BRA, ISDN PRA, Introduction to Frame Relay and ATM. (2)

Topologies: OSI Layer Model

Link Layer Communication: Types of Local Area Networks, Types of Ethernet, Ethernet frame structure, CSMA/CD, Hubs, Switches, Wireless LAN, Point-to-point Protocol. (3)

Internetworking: Repeater, Bridge, Router, Spanning tree Algorithm, Tunneling, Packet Fragmentation. (3)

TCP/IP: IP packet format, IP Addressing, Subnets, Introduction to CIDR and DHCP, IPv6,TCPsegment format,TCP Call Control. (3)

IP Routing: IP Routing Algorithm, ARP, and ICMP. IP Routing Protocols: RIP, OSPF, and BGP. Domain Name System. (2)

Network Application and Security: Half/full Association, Client Server and peer-to-peer working, Unix socket programming, E-mail, http, concepts of firewall and proxies, Encryption, Digital signatures. (3)

Reference Books:

1. Data and Computer Networks: William Stalling. Prentice Hall of India
2. Internetworking with TCP/IP – D.E Comer, Vol. I. Prentice Hall of India
3. Unit Network Programming – W.R Stevens. Prentice Hall of India.
4. Practical Data Communications: Roger L. Freeman. John Wiley and Sons
5. Basandra, Suresh K, "Local Area Networking", Galgotia, 1995
6. A.S.Tanenbaum, "Computer networks", 4th Edition, Pearson, 2003

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Programmable Logic Controllers and Applications	Code: CEM:EEI-40
Discipline: Electronics, Electrical and Instrumentation Engineering	**No. of Lectures: 30includes Practical Demos**

20 Hrs

Unit 1: PLC Basics: PLC system, *VO* modules and interfacing, CPU processor, programming equipment, programming formats, construction of PLC ladder diagrams, devices connected to *VO* modules.

Unit 2: PLC Programming: Input instructions, outputs, operational procedures, programming examples using contacts and coils. Drill press operation.

Unit 3: Digital logic gates, programming in the Boolean algebra system, conversion examples. Ladder diagrams for process control: Ladder diagrams & sequence listings, ladder diagram construction and flow chart for spray process system.

Unit 4: PLC Registers: Characteristics of Registers, module addressing, holding registers, input registers, output registers.

Unit 5: Sensors as input devices to PLC- Various types of proximity sensors: Inductive, capacitive, photo electric, magnetic, laser, UV and ultra sonic sensors. Brief discussion on other input devices like pressure switch, flow switch etc.

20 Hrs

Unit 6: PLC Functions: Timer functions & Industrial applications, counters, counter function industrial applications, Arithmetic functions, Number comparison functions, number conversion functions.

Unit 7: Data Handling functions: SKIP, Master control Relay, Jump, Move, FIFO, FAL, ONS, CLR & Sweep functions and their applications.

Unit 8: Bit Pattern and changing a bit shift register, sequence functions and applications, controlling of two axis & three axis Robots with PLC, Matrix functions.

Unit 9: Analog PLC operation: Analog modules & systems, Analog signal processing, multi bit data processing, analog output application examples, pm principles, position indicator with pm control, pm modules, pm

Unit 10: Introduction to CNC controls

Reference Books:

1. Programmable Logic Controllers - Principle and Applications by John W. Webb & Ronald A. Reiss, , Fifth Edition, PHI

2. Progranunable Logic Controllers - Programming Method and Applications by JR. Hackworth & F.D Hackworth Jr. - Pearson, 2004.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Digital Signal Processing and Machine Vision	Code :CEM : New
Discipline: Electronics and Instrumentation Engineering	**No. of Lectures :30**

Digital Signal Processing:

Introduction : Basic elements of a digital signal processing system, Fourier series and fourier transform, Z-transform, convolution, correlation, sampling theory, aliasing anti-aliasing filter, quantization noise and signal reconstruction. (4 Hrs)

Discrete Fourier Transform(DFT) : Interpretation of DFT, Properties of DFT, DFT of real signals, convolution and correlation using DFT (2 Hrs)

Fast Fourier Transform (FFT) : Efficient computation of DFT, Inverse FFT algorithm, Use in linear filtering and correlation. (2 Hrs)

Design of Digital Filters : IIR & FIR filters, design techniques and realization. (2 Hrs)

Overview of DSP Processors : Harvard architecture, pipelining, general purpose, fixed point and floating point processors. (2 Hrs)

DSP Applications : in Nuclear and other fields (2 Hrs)

Image Processing:

Fundamentals of Image Processing : Image acquisition, Image model, sampling, quantization, relationship between pixels, distance measures, connectivity, Histogram : definition, decision of contract basing on histogram, image stretching, sliding, histogram equalization. (4 Hrs)

Image transforms, Image enhancement by spatial domain methods and frequency domain methods (1Hrs)

Applications of digital image processing. (1 Hrs)

Machine Vision:

- Image Model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflection, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, boundary representation, Mathematical Morphology ;
- Intermediate Vision: Line, Circle, Elipse and Polygon detection, Hough Transform for detection, Corner detection, Generalized Hough Transform;
- High level Vision: Scene interpretation;

• Contd....

- Texture - Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & Pattern classes, Classifiers in general, Distance Metric, Classification and recognition, various methods of recognition & interpretation, Template matching and area correlation, matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Embedded and Computer Based Systems Design	Code: CEM:E 54:Electrn-40
Discipline: Electronics Engineering	**No. of Lectures: 40**

Microprocessor Based Hardware Design: 14 Hrs
Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Microcontrollers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
Industry Standard Bus Systems: ISA, PCI, VME, PXI: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, and testability.
Embedded computer system design example.

Computer Communication and Networks: 7 Hrs
Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables,hub,switch,routers etc.)
Fault Tolerant and Distributed Architectures : Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues; Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

Real-Time System Design: 15 Hrs
Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.
Overview of LINUX and Embedded NT.

Introduction to VLSI Design: 4Hrs

Reference Books:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, And 80486: Barry. B. Brey, - McGraw Hill

NFC, Hyderabad
Syllabus

Subject: Computer Aided Design and Manufacturing	Code: CEM-14: M-35
Discipline: Mechanical Engineering	**No. of Lectures: 35**

Introduction to CAD & CAM: 35 Hrs

Extensive definition of CE - CE design methodologies - Organizing for CE - CE tool box collaborative product development. IT support - Solid modeling - Product data management -Collaborative product commerce - Artificial Intelligence- Expert systems - Software hardware co-design. Life-cycle design of products - opportunity for manufacturing enterprises - modality of Concurrent Engineering Design - Automated analysis idealization control - Concurrent engineering in optimal structural design - Real time constraints. Manufacturing competitiveness - Checking the design process - conceptual design mechanism – Qualitative physical approach - An intelligent design for manufacturing system - JIT system - low inventory - modular - Modeling and reasoning for computer based assembly planning - Design of Automated manufacturing Lathe Machining, Milling Machining, EDM Wire Cut, Turret Punch Press, Absolute & Incremental Prog., Canned Cycle, Tool Selection, G / M code programming, CNC maintenance & macro programming, Generative machining. FEA, Mechanisms and Sheet Metal, CNC Technology, Robotics. Life Cycle semi realization - design for economics - evaluation of design for manufacturing cost concurrent mechanical design - decomposition in concurrent design - negotiation in concurrent engineering design studies - product realization taxonomy - plan for Project Management on new product development – bottleneck technology development.

Modeling : 3D Solid Modeling, Surface Modeling, Advance Surfacing, Assembly & Animation, Drafting & Detailing. Model Generation, Loading & Solution, Post Processing, Structural Analysis, Thermal Analysis using I-deas code for 2-D and 3-D cases using ANSYS.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Engineering design and FEM	Code: CEM:AC09,
Discipline: Mechanical & Quality Assurance Engineering	No. of Lectures: 45

Introduction (2 lectures):

Failure modes of pressure vessels and heat exchangers: yielding,Tensile instability,creep effects,fatigue,flow induced vibration, uckling,etc. Type of stress, significance of stress, theories of failure, stress intensities, ASME Sec.VIII Div. I and ASME Sec.111 omparisons

Theories of failure, Stress invariants and yield surfaces (3 lectures):

Mohr's circle, state of stress and invariants (2 D and 3 D) Hydrostatic state (dilatational) and distortional (Pure shear) state. Vonmises failure theory based on second invariant of distortional stress tensor and based on distortional energy theory; Tresca theory and comparison with Vonmises theory. Yield surfaces of Vonmises theory and Tresca theory in 3 - D with respect to O1, O2 and O3 axes.

Collapse load assuming elastic perfectly plastic material (3 lectures)

Long thick cylindrical shell under internal pressure. Pressure at I which yielding starts, pressure at which interface radius is p and collapse pressure (full section yielding) by Vonmises and Tresca theories. Limiting moment or collapse moment of beams of various cross sections (Rectangular, circular) and reduce shape factor. Collapse moment of a straight pipe (Treating as a beam) and deduce shape factor for pipe section.

Design aspects of cylindrical pressure vessel (3 lectures)

Major design options: Vertical, horizontal, choosing length and diameter of a vessel, support options (Lug! Bracket Vs skirt support), choice of closures. Formulae for thickness as per Sec. VIII, Div. I and numerical problem. Background to external pressure charts, effect of ovality / imperfection and plasticity, factor of safety for cylinders and factor of safety for sphere under external pressures. Sizing of stiffening ring. Flange design as per code: Bolt design and flange thickness calculation.

Heat exchangers: (3 lectures):

Shell and tube plate types heat exchangers. Tubesheet
thickness as per TEMA, Sec VIII Div 1 and see III (including concept of equivalent solid plate and modified elastic constants). Effect of axial rigidity of tubes in tubesheet thickness. Methods of joining tube to tubesheets. (rolled/expansion joints and welded joints); Pullout load. (strength of tube to tubesheet joint) Accomodating differential expansion among tubes and shells: Bend tube, U tube and Bellows. Buckling strength of tube and FIV of tubes (FIV mechanisms: Vortex shedding (lock-in), Fluid elastic instability and a acoustic resonance.

Stress and Strain concentration factors (Ka and K €) - 3 lectures:

Importance of local strain (peak strain) variation - fatigue damage rules (Coffin Mansion and Cumulative fatigue damage). Stress concentrations (i) elliptical holes in the center of a

Contd….

large plate subjected to uniaxial load (ii) circular hole in a plate subjected to uniaxial/biaxialloading (iii) circular hole in a cylindrical shell subjected to pressure loading. Stress and strain uncertain due to a small hole in an infinite plate subjected to hydrostatic in plane loading (based on thick shell formula for external pressure) and based on component stress and equivalent stress. (Elastic factors) and plastic stress and strain concentration factors. Approximate methods to obtain local plastic strain at point of interest: Nueber's rule and Molshy-Glinka rule. (Analytical equations and graphical representation and comparisons); Introduction to simplified elastic plastic analysis as per ASME.

Fracture Mechanics, Non ductile failure and Hydrostatic test (3 lectures):

Introduction to fracture mechanics, stress Intensification factors, fracture toughness, Paris' Law, concept of plastic domain at crack tip, J - integral, JIC, Transition temperature, (RTNDT), Methods to prevent brittle fracture, Integrity assessment diagram, appendix: G of ASME, Sec III Div 1, Maximum postulated defect, allowable pressure as a function of (T -RTNDT) and Hydrostatic test temperature.

Introduction to FEM and Modelling: 25hrs:

Historical Background - Weighted Residual Methods - Basic Concepts of FEM - Variational Formulation of B.V.P - Ritz Method - Finite Element Modeling - Element Equations – Linear and Quadratic Shape functions - Bar, Beam Elements - Applications to Heat Transfer. Basic Boundary Value Problems in 2 Dimentions - Triangular, quadrilateral, higher order elements - Poissons and Laplace Equations - Weak Formulation - Elements Matrices and Vectors - Application to Solid mechanics, Heat transfer, Fluid Mechanics. Natural Co-ordinate System - Lagrangian Interpolation Polynomials - Iso- parametric Elements - Formulation - Numerical Intergration - 1D -2D Triangular elements – rectangular elements - Illustrative Examples. Introduction to Theory of Elasticity - Plane Stress - Plane Strain and Axisymmetric Formulation - Principle of virtual work - Element matrices using energy approach. Dynamic Analysis - Equation of Motion - Mass Matrices - Free Vibration analysis - Natural frequencies of Longitudinal - Transverse and torsional vibration - Introduction to transient field problems. Non linear analysis. Use of software - h & p elements - special element formulation.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Pressure Vessel and Piping Design	Code: CEM-13:E 20 CC08:M-30
Discipline: Mechanical Engineering	No. of Lectures: 30

20 Hrs

Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference among Sec. VIII Div.1, Div.2. and Div.3
Difference between metallic pressure vessel and FRP pressure vessels

Contd...

Piping Design & Engg :10 Hrs

Fundamentals of piping, pipe sizing and their economics, selection of pipe diameter, Pipe design pressure and input parameter.
Selection of pipe materials, Galvanizing of pipes, piping lining techniques & uses
Pipe classification, piping specification, and pipe schedule, ratings
Pipes and pipe fittings, branch connection criteria
Evaluation of bill of materials in piping & estimation
Pipe flexibility analysis, Expansion loops, Bellows
Pipe stress analysis
Pipe safety in two-phase flow and other flow induced vibrations
Valves
Insulation & painting of pipe lines, costing of piping schemes
Pipe supporting arrangements
Spring hangers, spring boxes, Pipe jointing, C.I. pipe caulking, Threaded piping, Construction welding of piping, Isometric drawings preparation & reading, Piping GA drawing preparation & reading, Inch-dia, Inch-M concept, Rack piping philosophy, under ground piping, coating-wrapping of underground pipe line, Holiday detection of coating & wrapping.

Syllabus

Subject: Vibrations	**Code: C EM :E26: M:20**
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.

Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.

Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N

Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinery.

Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required, vibrations with special reference to vibrations of reciprocating systems.

Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, a periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Design aspects of Nuclear Fuel and Structurals	Code: CEM:QA-03
Discipline: Quality Assurance Engineering	**No. of Lectures: 30**

Fuel Bundle Design Approach (10 hrs) :
Design basis, Applicable codes, Material selection, Bundle design and analysis, Physics calculation, Radial flux depression across the bundle, Axial flux peaking, Engineering of the fuel bundle assembly, Pellet design, Dimensional requirements, Surface finish, UO2 chemical composition, UO2 density, Oxygen to Uranium ratio, UO2 microstructure and visual standard, Sheath (clad) design, Collapse behavior of sheath, Mechanical properties, Corrosion, Hydriding, Manufacturing process, Graphite coating, End plug design, Fuel bundle assembly design, End plate design, Bearing pad, Bearing spacer and Spacers design, Fuel bundle packing, Design analysis of fuel assembly, Thermo-mechanical analysis, Temperature distribution, Fission gas, Fuel thermal expansion, Stresses and strains in sheath, Sub channel analysis, CHF estimation, Stress analysis, Fuel bundle assembly, Analysis of end plate, Bundle droop, Fuel sheath collapse, Power ramp analysis, Fuel temperature during spent fuel transfer, Built-in safety features, Testing requirements and Type testing

PHWR Fuel Bundle operation (8 hrs):
Environmental condition, Primary coolant system requirements, Coolant channel / Linear tube region requirements, Fuel movement in Fuel handling system, Normal operation, Operational transients, Fuel thermal power, Fuel bundle power envelopes, Duty envelopes, Bundle power operating limit envelope derived from design, Linear heat ratings (LHR) and ∫Kdt (Integral Kdt), Fuel burnup, Fuel residence time in the reactor, Power ramps, Fueling machine compressive loads on fuel bundle, Refueling impact load on bundle, Defueling, Fuel bundle decay heat, Shutdown refueling, Fuel bundle operation during upset condition, Abnormal thermal power, Abnormal fueling machine loads, Sheath overheating, Sheath over-straining.

Pressure Tube Operation and design approach (8 hrs):
Operating Environment for fuel Channel, Material Selection for Pressure tube, manufacturing process for pressure tubes, degradation and failures modes for pressure tube like irradiation diametric and axial Creep, Growth, corrosion, Delayed Hydride Cracking, Design approaches based on degradation and failure mechanisms, Leak before Break (LBB) criteria, mitigation irradiation changes in the pressure tube, interaction of pressure tube with fuel bundle during operation.

Calenderia tube and Garter Spring (4 hrs):
Operating Environment, Material Selection for calandria tube and garter spring, manufacturing process, Failures modes, PC-CT contact, irradiation induced changes, Design approach, mitigation irradiation changes, corrosion mechanisms, interaction of pressure tube with Calanderia tube and Garter Spring.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Materials characterization and Applications	**Code: CEM:EN713,**
Discipline: Quality Assurance Engineering	**No. of Lectures: 25**

Microscopy Techniques (10 hrs)

Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Importance lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, Sample preparation, Etching of samples and Etchants for various materials. Quantitative analysis using optical microscopy (Grain Size, Inclusion Analysis-Size and Distribution etc.) , Interpretation of Micrograph for defects.

Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.

Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast,. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice, and Ewald sphere construction, indexing of selected area diffraction patterns, High resolution electron microscopy.

Scanning electron microscopy : interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and focus Other modes of operation, Application in failure analysis, fracture surfaces etc.

Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, field ion microscopes.

X-Ray Diffraction and Applications (10 hrs)

Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production, and detection of x-rays. Intensity of diffracted beams - scattering by an electron by an atom, by a unit cell, structure-factor calculations; factors to be considered in calculating the intensities.
Experimental methods in x-ray analysis; Laue methods, power photographs diffractometer and spectrometer measurements.

Applications: orientation of single crystal, crystal structure of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline aggregates, crystal size crystal perfection, crystal orientations:

Analytical Techniques: (5 hrs)

Methodologies of Chemical Characterization of Nuclear Materials by Wet chemical and instrumental methods. Introduction on principles of spectroscopic techniques Analysis of Uranium based materials produced at NFC for metallic impurities by spectroscopic techniques Analysis of Zirconium based materials produced at NFC for metallic impurities by spectroscopic techniques Analysis of steel based materials produced at NFC for metallic impurities by spectroscopic techniques

Contd…

Introduction on principles of wet chemical methods, Analysis of Uranium based raw materials and process intermediates by wet chemical methods, Analysis of Zirconium based raw materials and process intermediates by wet chemical methods, Analysis of steels by wet chemical methods

Introduction to Gas Analyzers, Analysis of Uranium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of Uranium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of zirconium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of steels for non-metallic impurities by Gas Analyzers

BARC Training School

NFC, Hyderabad

Syllabus

Subject: NDT and QC of Nuclear Fuel and structural components	**Code: CEM:QA-02**
Discipline: Quality Assurance Engineering	**No. of Lectures: 40**

NDT Techniques for Inspection of Materials: (28 hrs)

Ultrasonic testing (UT) : Principle and propagation of ultrasound, Properties of Ultrasound, Types of Transducers, Ultrasonic Testing Methods, UT Techniques, Calibration of Equipment, Instrument Control, Method for Evaluating Discontinuities, UT Procedures for casting, forging, tubes, bars and welds, Limitation, Code Requirement, Acceptance Criteria for Weld Metals.
Eddy current testing (ECT) : Physical Principles, Electricity, Magnetism, Electromagnetic Induction, Factors effecting Induction, ECT probes, Practical Characteristics of Probes, Design of Probes, Instrumentation of ECT equipment, Testing Procedures, Reference Standards, Applications, Presentation of Results
Radiography (RT) : Type of Industrial Radiation sources and Application, Radiographic Exposure Factors and Technique, GAMA Ray and X-Ray Equipment, Type of film and Screens, Image Quality Indicators Section, Radiographic Techniques, Film Processing, Viewing of Radiographs, Radiograph Interpretation, RT Procedure Qualification, RT Procedures for welds, RT Acceptable Level of Welds and radiation safety Codes.
Leak testing : Theory and Principle of Leak Testing, Equipment, Techniques and Calibration, Interpretation and Evaluation of Results, Leak Testing Procedures, Leak Testing Specifications.
Visual testing and Liquid Penetrant testing (LPT): Overview, Physics of light, Light Sources, Optical Aids, Measuring/Inspection Equipment, Surface Condition, Interpretation of Results and Evaluation. Principle of LPT, Equipment, LPT Procedures, Materials, Evaluation of Indication, Application of LPT, Hazards Precautions, Code Requirements.
Magnetic Particle Testing (MPT) : Principle of MPT, Type of Magnetization, Type of Magnetizing Current, MPT Equipment, Method of De-Magnetization, MPT, MPT, MPT Procedures, Evaluation of Indications.
Applicable Codes and Standards for NDT

Quality Checks during Fabrication of Tubes, Components, Fuel and Structurals (5 hrs)

Fuel Fabrication: Qualification of machine, material and men, Quality checks during PHWR fuel fabrication, viz Powder, pellet and Fuel bundles, Quality checks during BWR fuel fabrication, Quality checks for Fast reactor fuel and components.
Zircaloy Tubes and Components: Process Qualification, Types of Defects and Origin, Testing Procedures, Inspection of Ingot, Billets, Blanks, Dimansional and visual Inspection of Tubes,
Pressure Tubes and calandria Tubes: Process Qualification, Types of Defects and Origin, Testing Procedures, Inspection of Ingot, Billets and blanks. Specifications, relevance and final Inspection of tubes, Report Generation and Documentation.

Contd...

Introduction to Metrology (5 hrs):

Drawing symbols and methods of measurement, Linear metrology instruments viz. vernier caliper, vernier height gauge, micrometers, bore gauges etc., Measurement of straightness, flatness, squareness, parallelism, roundness, surface finish, Taper measurement, angle measurement, radius measurement, end squareness measurement, Introduction to CMM and non contact measurement system, Documentation

Advanced NDT Techniques (2 hrs)

Acoustic Emission, Infrared Thermography etc

References:

3. Practical Non-destructive testing, Baldev Raj et al, 1997
4. Practical radiography-Baldev Raj, B.Venktraman, 2004
5. Non-destructive testing of Welds-Baldev Raj, T.Jayakumar, 1999
6. Practical Eddy Current Testing, BPC Rao, 2007
7. Eddy Current Testing, Theory & Practice, ASNT reference Manual 1995
8. General Dynamics, Non-destructive Testing, General Dynamics, IV Edition
9. ASNT Level-III Study Guide, Electromagnetic Testing, Radiography, Ultrasonic Testing, Visual Testing
10. Acoustic Emission Testing, Leak Testing, Materials and Processes for NDT Technology, III Edition.

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Statistical Quality Control for QA	Code: CEM:QA-01
Discipline: Quality Assurance Engineering	**No. of Lectures: 30**

Introduction and Planning for Quality (3 hrs)

Concepts of quality, Inspection , Quality control , Quality Assurance, Total Quality Management, Cost of quality. Quality Policy, Quality plans, Quality control Instructions, Quality Audit and Surveillance.Factors Effecting Quality, Tools for quality improvement viz. Pareto Analysis, Cause and Effect Diagram, Failure Mode & Effect Analysis, SQC tools and Six sigma. Report generation and documentation

Descriptive statistics (5 hrs)

Sample, population, parameter, qualitative and quantitative characteristics etc., summarization of data; frequency distributions; histograms; visual methods of representation of data; measures of central tendency and dispersion; Skewness and Kurtosis; regression and correlation.

Probability Theory (2 hrs)

Classical definition of probability, conditional probability, independence, random variables, expectation, Hypergeometric, Binominal, Poisson and Normal distributions.

Inference (6 hrs)

Sampling distributions : Chi-square, t and F. Estimation of parameters; point and interval estimates standard error of estimates. Tests on proportions, means and standard deviations, simple non-parametric tests, introduction to analysis of variance.

SQC Techniques (6 hrs)

Theory Control Charts Concepts of quality and meaning of control, basic philosophy and principle of rational subgrouping. Different types of control charts (Xbar-R, np, p and c-charts). Specification and process capability. Economic centering of the process; Setting approval, statistical concepts of fits and tolerances. Modification of Control Charts - Group control charts, sloping control charts, modified control charts, median and midrange charts, narrow limit gauging, Control Chart to eccentricity, Cumulative sum charts, Master control charts.

Contd…

Acceptance Sampling (5 hrs)

Sampling Vs. 100 percent inspection, basic concepts of sampling inspection, conflicting interests of producer and customer, attributes inspection, producer's and consumer's risk, AQL, LTPD, OC curves, AOQL, ATI, Single, Double, Multiple and Sequential sampling plans. Published sampling plans –, MIL-STD 105D, IS-2500 (PartI), variables inspection plans, MIL-STD 414, IS-2500 (Part-II), Hamilton Lot-Plot Method.

Industrial Experimentation (3 hrs)

Principles of experimentation: randomization, replication, local control. Introduction to factorial experiments and Orthogonal Array Designs.

Core Electives Module

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Systems Management : A B C D and E	**Code: C Elect :AC06,AC08, CC10: CEEIM:50**
Discipline: Chemical, Electrical, Electronics & Instrumentation and Mechanical Engineering	**No. of Lectures: 45**

A: Project Management: 10 Hrs
B: Operations Management: 10 Hrs
C: Maintenance Management: 10 Hrs
D: Quality, Environment, Health & Safety Management: 5 Hrs
E: Reliability Engg. : 10 Hrs

A) Project Management AC06 (10 Lectures)
Introduction, terminology, definitions: Differences between Project Management and other functions management: special safety aspects for Nuclear Projects., legal requirements.

Project life cycle – important stages, activities in each flow-chart of clearances/ approvals at each stage: Project conceptualization, pre feasibility, Techno economic feasibility report (TEFR): Detailed Project Report (DPR) – major contents.

Time value of money, Investment Criteria, Economic evaluation methods for Project alternatives/ investments –(ROI, IRR, DCF): cost estimation methods – unit rates, factoring, data capture fran close-out reports : Items of cost in procurement of major equipments (imported) (duties, customs' clearance, receipt, octroi, insurance etc): Site selection for project – quantitative and qualitative aspects numerical problems using Brown – Gibson model for choice.

Organisation structure for projects – Matrix type –adv/limitations, responsibility allocation, team building, HR aspects.

Project scheduling: Gantt charts, Network diagrams, PERT – CPM, Numerical problems, Float, Crashing, Work breakdown structure, time monitoring / contour.

Resource planning, optimization, leveling, monitoring, control through budgets, 'S' curves, Bell curves, histograms, use of milestones, reports, meetings, communication

Use of computer software like MS Project, PRIMAVERA, Capabilities, reports, decision support / monitoring & control tools hands on working of simple projects.

Analysis of failures / delays of earlier projects – reasons, case studies, recommendation to avoid repletion for future.

Presentations by small groups of small typical project including PLC stages, CPM, resources, monitoring / control reports.

Contd....

B) Operations Management CC10 (10 Lectures)

Quality Management System (QMS) as per ISO.9001-2008
Environment Management System (EMS) as per ISO.14001

Principles of Auditing of QMS & EMS
Operations (systems) function in the organization, conversion process, operations management-definition, different views- classical, behavioral and modeling views of management. Frame work of managing operations - planning, organizing and controlling, operations objectives.

Planning: Strategic Planning for Production! Operation, Forecasting in operations, forecasting models, forecasting requirements, constraints setting production targets! capacity planning, materials requirement planning, MRP objectives, MRP system components - Master Production schedule, inventory status, Bill of materials manpower, maintenance spares, scheduling of production targets.

Organizing: Implementation of operations plans, startups, shut down of process systems under normal & abnormal conditions. Operations procedures, Technical specifications, safety manuals, emergency preparedness plans. Monitoring of plant parameters, evaluation of plant performance indicators, plant trips/ failures analysis and feed back, energy & utility consumptions, Inter group coordination for plant maintenance, prioritizing the maintenance activities, safe handling of process system for maintenance safety work permit system & ensuring safety during maintenance, handling emergency conditions.

Controlling: Controlling the conversion process inventory control fundamentals, inventory concepts, multistage inventories, multiechelon inventories, inventory systems, inventory costs, inventory models managing for quality, product quality, quality management system, analysis for improvement, quality costs or pay. (2 Hr)

C) Maintenance Management AC08 (10 Lectures)

Meaning of the term 'Maintenance' - nature of failures of components and systems in different contexts like civil, electrical, electronics (both hardware items and software systems), instrumentation, and mechanical engineering. Objectives of the Maintenance function.

Manufacturing process and production equipment - study of relation between failure rate of a component population and the related component life-time - causes of failures, remedial strategies for different periods of the component life (infant mortality / useful life / wear-out periods).

Concept of availability and related definitions, failure statistics, repair statistics - various terms used in maintenance engineering and their definitions / explanation.

Study of various maintenance techniques — Break Down Maintenance (or Reactive / Unplanned / Run-to-failure / Emergency Maintenance), Preventive Maintenance, Planned Maintenance, Routine Maintenance, Predictive Maintenance (or Condition-Based Maintenance - CBM), Reliability Centred Maintenance (RCM), Total Productive Maintenance (TPM), Total Quality Maintenance (TQMain).

Contd...

Spare parts management.

Computerized Maintenance Management Systems (CMMS).

Maintenance organization, fundamentals of maintenance planning, work scheduling, safety in maintenance - work permit system, work flow and control, establishing basic values in maintenance, maintenance audit, performance metrics in the maintenance function - the role of management & leadership.

Organization of the Maintenance Function at NFC.

D: Quality & Environment Management: 5 Hrs

ISO Systems

- **Systems Standards vs product standards**
- **ISO 9000 Family of Standards for Quality Management System**
  Genesis, Purpose, Scope, Quality Management Principles, First release, Revisions, Terms and definitions, clauses of ISO 9001:2008, Customer satisfaction, continual improvement, Documentation requirements, Policy Manual, Control of documents, Control of records, Responsibility, authority and Communication, Management review, Human resources, product realization, Design & Development, Purchasing, Control of Production, Validation of processes, Identification & traceability, Monitoring & measurement, Calibration, Analysis of data, Corrective and preventive actions etc.

- **ISO 14000 family of Standards for Environmental Management System**
  Ozone depletion, Global warming due to Green House Gases, Pollution, Social responsibility, Sustainable development, Statutory requirements Public hearing, Environmental policy, conservation of resources; control of discharges to air, land and water bodies; Environmental aspects, evaluation of impact of environmental aspects, Environmental objectives, Management programs for prevention of pollution, Emergency preparedness and response, Environmental monitoring, Management review of environmental performance, Continual improvement of environmental performance etc.

- **OHSAS 18001:2007 Specification for Occupational Health & Safety Management System:**
  Statutory requirements, Hazards, Evaluation of risk associated with hazards, Safety indices, Incidents, Accidents, Near Misses, Loss prevention, designing for safety, PPEs, Management programs for minimizing risk, Safety training, Mock drills and Emergency handling

- 3rd party certification of the Management Systems of an organization as per the international standards (ISO 9001, 14001, 18001 etc...)
  Internal audits, external audits, certification, validity of certificate, need and benefits of certification.

Contd....

E: Reliability Engg: 10 Hrs

Reliability mathematics: Probability, Distribution functions, some discrete and continuous distributions in Reliability, Definitions of Reliability, Availability, Life characteristic curve, Exponential Law of reliability.
System Reliability: Systems with components in series/parallel, Redundancy techniques, failure Mode & Effect Analysis (FMEA),Boolean methods, Cut-Set Tie Set methods, Fault-Trees and Event Trees, Design for Reliability including Fail Safe concepts, single failure criteria etc.

Probabilistic Risk/Safety Assessment: Risk, PSA of Nuclear Power Plants, identification of initiating Events, dominating IEs.
Reliability Testing: Environmental Testing, confidence interval Estimation, Time Terminated, and failure terminated tests.
Human Reliability Analysis: Human errors, Skill, Rule and Knowledge Based Actions, Human Reliability during Emergency conditions, cognitive errors.
Economics of Reliability Engineering: Manufacturer's cost, consumer cost, life cycle cost, Economic Decision Models.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Electrical Engineering Practices in Process Industries	Code: CElect:FC09:E -20
Discipline: Chemical Engineering	**No. of Lectures: 20**

Fundamentals of electricity: DC/AC , Concepts of Active, reactive & apparent power Power factor & methods to improve the system power factor, Electricity tariff, Maximum demand, average demand, Load and capacity factor
Power Supplies: Classification of power supplies (Class I,II,III,IV) – batteries and their types, battery chargers, invertors & uninterrupted power supply system, diesel generator, protection to be given to batteries, UPS and DG sets.
Electrical Machines : Transformers, losses in Transformers, efficiency, Induction & Synchronous Motors, Technical Specifications, Characteristics Operations & Maintenance, Motor Starters calculation of percentage loading of motors, Motor efficiency calculations, factors affecting performance of motors,
Variable Speed AC drives: Need & selection, advantages
Industrial Electrical Heating Systems: Types of furnaces, Selection of heating elements, Thermal Insulation & System heat losses.
Classification of electrical equipment in hazardous areas, properties of hazardous gases, selection and installation of electrical equipment in hazardous areas, standards applicable for electrical equipment in hazardous areas.

Circuit Brakers : Types and applications
Safety Aspects: Electrical Shock ---- Various definitions-Let Go Current, Touch Voltage, Time current curves/zones for AC and DC currents, Effect of frequency, Resistance of the human body
Likely effects of current flow through human body, Risk of electric shock from various sources such as batteries, domestic mains, industrial mains, power distribution system and lightning, protection against electric shock, Methods of earthing, Earth grid, Soil resistance, Use of ELCBs on appliances.

Cables & Cables Trays: Types of cables, Power & Control Cables, PVC, HRPVC & XLPE cables, FRLS cables (their properties), Fire survival cables.

Reference Books:
Electrical Engrs. Ref book 5th edition by G.R.Jones & others, Pub:Newnes
Standard Handbook for Elec. Engrs. 14th edition, Donald Fink & HW.Beaty,Pub:McGraw Hill, New York

Encyclopedic dictionary of Electronic terms by Traister, John & Traister, Robert J Prentice Hall, New Jersey
Source book of Electronic circuits by Markus John, Pub: McGraw Hill, New York
Electrical control for machines 3rd edition, by Rexford, Kenneth B, Pub: Delmer
Elec Engg materials by A.J. Dekker, Prentice Hall, New Jersey
Basic Elec. Engg 2nd edition by D.P. Kothari & I.J. Nagrath Pub: Tata McGraw Hill, New York S.Rao, "Testing, Commissioning, Operation & Maintenance of Electrical Equipment", Khanna Publishers, 2008

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Energy Conservation and Demand Side Management	**Code: CElect:AC07-CMI-20**
Discipline: Chemical and Electrical Engineering	**No. of Lectures: 20**

Energy Scenario: Primary energy sources, commercial energy production in the world and in India, energy needs of growing economy, long term energy scenario, energy security, energy conservation & its importance, Global environmental concerns, UN Framework convention on climate change (UNFCC), sustainable development, Kyoto Protocol, Clean Development Mechanism (CDM), Energy Conservation Act – 2001 and its features.

Thermodynamic Analysis: Concept of energy, energy analysis, min. energy requirements, energy flow diagram/sankey diagram, Bench marking of energy consumption in the chemical process units...etc. Energy Economics, energy saving and cost involved, evaluation through pay back period, cost-to–benefit ratio.

Energy Conservation Techniques:
Energy efficiency in thermal utilities:- Boilers, steam distribution system, Furnaces, insulation & refractories, cogeneration, waste heat recovery, heat exchanger Networking, Energy saving potential & identification.

Energy Efficiency in Electrical utilities: Electric load management & maximum demand control, power factor improvement, distribution & transformer losses, energy efficient motors. Losses in compressed air system, Refrigeration system, pumping systems, cooling towers, lighting system. Energy efficient technologies – max. demand controllers, automatic Power factor controllers, energy efficient motors, variable speed drives, and energy efficient transformers.
Energy Audit: Purpose of Energy Audit, steps involved in energy audit, measurement of important parameters, collection of data & analysis, preparation of audit reports, energy index calculation, recommendation.

Reference Books:

NFC, Hyderabad
Syllabus

Subject: Vacuum Technology	**Code: CElect :M-13 :New-C-20**
Discipline: Chemical and Mechanical Engineering	**No. of Lectures: 20**

1. INTRODUCTION TO VACUUM

Basic terms and concepts in vacuum, Units used Pressure ranges in vacuum and their characterization.

2. VACUUM PHYSICS

Gas laws and models. Continuum theory. Kinetic gas theory. Types of flow and conductance.

3. VACUUM GENERATION & IMPORTANCE OF SEQUENCE OF OPERATION

Classification of pumps based on the operating Principle. Compression pumps. Water ring pumps, steam ejector pump, mechanical rotary pumps (rotary vane and rotary piston), diffusion pumps, mechanical booster pump, oil vapor booster pump, turbo molecular pumps, seals for vacuum pumps. Condensation and getter type pumps. Cryopumps, sputter ion pumps, sorption pumps.

4. VACUUM MEASUREMENT

Fundamentals of low-pressure measurement. Classifications of different gauges. Hydrostatic gauges. McLeod gauge, bourdon tube, capsule gauge and u-tube manometer. Thermal energy gauges. Thermocouple and pirani gauges. Electrical energy gauges
Hot cathode and ionization gauge, cold cathode ionization (penning gauge)

5. CONSIDERATIONS IN SYSTEM DESIGN

Calculations of conductance values. Gas and vapor load. Matching pump combination.

6. LEAK DETECTION OF SYSTEMS & MEASUREMENT

Leak location by rough methods.Penetrant dye, spark tester etc. Leak location by over pressure methods. Bubble methods, halide torch etc.
Leak location by vacuum methods. Discharge tube, mass spectrometer etc.

7. APPLICATIONS

Low-pressure applications (e.g. mechanical handling based on rubber suction pads)
Low molecular density applications (e.g. removal of impurities during chemical processes) Vacuum metallurgy. Decrease in energy transfer applications (e.g. thermal insulation, electrical insulation) Large mean free path applications (e.g. electron tubes, nuclear physics)

8. QUALIFICATION OF VACUUM SYSTEMS

9. INTER LOCKS & SAFETY IN VACUUM SYSTEMS

10. VACUUM CASE STUDIES

Reference Books:

1) Guide to the measurement of Pressure and Vacuum : The Institute of Measurement and Control, London
2) Introduction to Vacuum Technology by Dr. K G Bhushan under the Indian Vacuum Society
3) A.Chambers et al, "Basic Vacuum Technology", 2nd Edition, Oversees Press, 2005

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Statistics for Engineers	**Code: C.Elect 10:New M C:20**
Discipline: Chemical and Mechanical Engineering	**No. of Lectures: 20**

1. Treatment of data – Graphical methods: Stem – and – Leaf, Box plots, etc. Descriptive methods: Sample mean, median, mode, variance, percentiles
2. Basic probability: Counting, basic laws, and elementary theorems; independent events
3. Discrete random variables and distributions – Binomial , hyper geometric, poisson, mean and variance, poisson process
4. Continuous random variables and distributions – normal , normal approximation to binomial, gamma exponential , probability plots
5. Random sampling and sampling distributions : "t" distribution, chi square and "F" distributions
6. Estimation: Confidence intervals, sample size determination, prediction and tolerance levels
7. Tests of hypothesis for one and two means, sample sizes, paired sample tests
8. Simple linear regression: Curve fitting, Linear correlation, and models
9. Control charts : X- bar , R and "p" charts

Reference books:

1. Probability and statistics for engineers and scientists (7^{th} edition by Walpole , Myers and Ye-2002)
2. Minitab software

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Industrial Instrumentation Practices and Human Machine Interface	**Code: CElect 17:E51 E50:I-30**
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 20**

Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems. Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices. Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design-relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.

PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. OPC Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Contd....

Overview of plant automation. (1 lecture)
Design of HMI, Soft Console versus Conventional control panels (1 lecture)
Guidelines for design of HMI displays (1 lecture)
Case study of a commercially available Professional HMI package. (10 lectures)
Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
Practical (2 lectures)

Reference Books:

1. Biomedical Instrumentation and Measurements : Cronwell Leslic - Prentice Hall, New Jersy
2. Tranducers and Instrumentation: Murthy DVS – Prentice Hall, New Delhi
3. Instruments Engineers Handbook: Process Measurement: Liptak, Belag –Chilton Books
4. Instruments Engineers Handbook: Process Measurement & Analysis: Liptak, Belag Butter Worths
5. Instruments Engineers Handbook Vol - II: Process Control - Liptak, Belag –Chilton Books
6. Process / Industrial Instruments & Control Hand Book : Considne DM – MGH, New York
7. Considine, D A, "Process Instruments and Controls Handbook", McGraw Hill, 1957
8. A.D.Helfric & W.D.Cooper, "Modern Electronic Instrumentation and Measurement Techniques"

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Mechatronics	**Code: CElect. AC14:EEMI :20**
Discipline: Electrical, Electronics, Mechanical and Inst Engineering	**No. of Lectures: 20**

Pneumatic control engineering: - Introduction, compressed air line installation, Pneumatic equipment like cylinders, seals, control valves and accessories. Graphical symbols for energy conversion, control valves, energy transfer and conditioning, actuators, converters, counters and sensors. Classification of cylinders based on operating medium, functions performed; basic construction, mounting style etc., various types of seals, materials, usage. Different type of directional control valves, classifications based on usage, functions and actuation, flow control valves and pressure control valves. Pneumatic circuits, electro-pneumatic circuits, bi-selector systems. Cycle times, Applications of pneumatics and trouble shooting. Standard vendor list.

Hydraulic control engineering: - Introduction, Pump, reservoir, valves and actuators. Selection of pump, tank, Air breather, Baffle plate, pipelines, relief valves, Simple valves, Directional control valves, Flow control valves, special valves, un loading valves, counter balance valves, pressure reducing valves. Filters, selection and location. Hydraulic circuits, basic, regenerative, sequencing and counter balancing circuits. Rotary motion. Hydraulic accessories like accumulator, hydraulic intensifier, pressure switches Pressure gauges and flow meter. Introduction on Hydro pneumatics and electro-hydraulic (servo) systems. Trouble shooting. Standard vendor list

Electrical/electronics control engineering: Introduction and applications of diode, transistor, thyristor, LED's, Opto-isolators, etc. Solenoid valves DC and AC selection of solenoid valves, rating, stepper motors, servo motors, encoders: rotary and linear, transducers, positional sensors.

Cont...

Mechanization: Introduction. Handling: gripping, feeding, Forging, Inserting, positioning, clamping, working, removing, transferring Etc., Orientation: Position control, turning, rotation, division. Feeding, Assembly operations, linear indexing, rotary indexing, Door control. Bulk feed like Conveyors, industrial vehicles, over head equipment's, Containers and supports, Positioning weighing and control equipment.

Introduction to Industrial Robotics: CNC

Reference Books:

1. Mechatronics: Electronics in Products and Processes:Bradeley. DA - Eswar Press, Chennai / Chapman Hall, U K
2. Mechatronics : HMT Ltd – Tata MGH. New Delhi
3. Mechatronics : Electronics Control Systems in Mechanical and Electronical Engg. 3rd Edition : W.Bolton - Pearson

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Robotics	**Code: Celect:M14:New-EC:20**
Discipline Electrical, Electronics, Inst Engineering	**No. of Lectures: 20**

Pneumatic control engineering: - Introduction, Pneumatic equipment like cylinders, seals, control valves and accessories. Graphical symbols for energy conversion, control valves, energy transfer and conditioning, actuators, converters, counters and sensors. Classification of cylinders based on operating medium, functions performed, basic construction, mounting style etc.,
Different type of directional control valves, classifications based on usage, functions and actuation, flow control valves and pressure control valves.
Pneumatic circuits, electro-pneumatic circuits, bi-selector systems.
Applications of pneumatics and trouble shooting. Standard vendor list.
(2 Lectures)

Hydraulic control engineering: - Introduction
Simple valves, Directional control valves,
Flow control valves, special valves, un loading valves, counter balance valves, pressure reducing valves.
Hydraulic circuits, basic, regenerative, sequencing and counter balancing circuits.
Pressure gauges and flow meter. Introduction on Hydro pneumatics and electro-hydraulic (servo) systems. Trouble shooting. Standard vendor list
(2 Lectures)

Electrical/electronics control engineering:
Solenoid valves DC and AC selection of solenoid valves.
Stepper motors, Servo motors, encoders: rotary and linear, transducers, positional sensors.
(1 Lecture)

Mechanization: Introduction. Handling: gripping, feeding, Forging, Inserting, positioning, clamping, working, removing, transferring Etc., Orientation: Position control, turning, rotation, division. Feeding, Assembly operations, linear indexing, rotary indexing, Door control. Bulk feed like Conveyors, industrial vehicles, over head equipment's, Containers and supports, Positioning weighing and control equipment.
(3 Lectures)

Industrial Robotics: Fundamentals. Classification of Robots. History of Robotics. Advantages and Disadvantages of Robots. Robot Components. Robot Degrees of Freedom. Robot Joints. Robot Coordinates. Robot Reference Frames. Programming Modes. Robot Characteristics. Robot Workspace. Robot Languages. Robot Applications. Social & Safety Issues
(8 Lectures)

Trajectory planning: Path vs. Trajectory. Joint Space vs. Cartesian-Space. Basics of Trajectory Planning. Joint space trajectory planning, Cartesian space trajectories.
(4 Lectures)

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Modern Control Systems	Code: CElect:E52A-EC -20
Discipline: Electronics and Instrumentation Engineering	**No. of Lectures: 20**

State Variables Descriptions Introduction, The concept of State, Elementary Definitions, State space Representations of continuous-time and discrete-time systems, State diagrams, Illustrative examples, Solution of state equation, State transition matrix, Properties of state transition matrix, Computation methods of state transition matrix, relationship between state equations and transfer functions, , Characteristic equations

Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability criteria, Principle of Duality, Controllability and Observability of discrete-time systems

Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR Technique

Reference Books:

1. John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design-Conventional and Modern" , 2nd Edition, McGraw Hill Book Co., 1986
2. Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Wintson, 1984
3. M.Gopal, "Modern Control System Theory", 2nd Edition, Wiley Eastern Ltd., 1993
4. Gene F. Franklin et al, " Feedback Control of Dynamic Systems", 3rd Edition, Addison- Wesley Publishing Co., 1994
5. B.Friedland, " Introduction to State space Methods"
6. K.Ogata, " Modern Control Engineering", Prentice-hall

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Design of High Temperature Components	**Code: CElect 11: New : Mech-20**
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Introduction: Plasticity, Viscoplasticity and mechanism of creep deformation
Deformation & fracture behavior at high temperature (HT), Creep curve, Creep rupture, Life estimation parameters, Low cycle fatigue, creep-fatigue interaction.
Material selection for HT application: Thermal stability, strength, oxidation, carburization etc.
Design codes & standards: ASME codes historical background, loading categories, stress classification,
Sub-section NB & NH: Low & High temperature failure modes and limits, Design and construction rules of RCC-MR, Efficiency diagram and Bree diagram, Life assessment as per CEGB-R5.
NDE & ISI: Surface and volumetric examinations
Models for creep crack initiation and growth
Design by analysis: FEM analysis, stress categorization, time & strain rate dependent stress-strain relations, unified treatment of plastic, creep & thermal strain, theory of viscoplastic flow, elasto-plastic and creep analysis of simple geometries, time stepping algorithm etc.
Life assessment: Remaining life prediction, API 579, inspection & interval determination, integrity of steam pipes, reheat pipes and bends, super heater tubes, gas turbine parts etc.
Reference books :

1) High Temperature Component life assessment. : George A Webster, R A Ainsworth 1994 – Technology & Engg.
2) Creep & Fracture in High Temperature Components. Design & Life assessment issues, : I A Shibli & S R Holdsworth
3) Welding Technology & Design By V M Radhakrishnan

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Welding and Quality Assurance of welds	Code: C-Elect :CC06-M-20
Discipline: Mechanical Engineering	No. of Lectures: 20

Introduction To Soldering, Brazing & Different Types Of Welding Like: Arc Welding, Gas Welding, Resistance Welding, Thermit Welding, Electron Beam Welding, Plasma Welding, Laser Welding, Explosion Bonding, Ultrasonic Welding.
Manual Metal Arc Welding: TIG/MIG & Submerged Arc Welding
Weld Joint & Geometry: (Lap/Butt/Fillet/Corner Joints: Square Butt, Single-V, Double-V, Single-U, Double-U, J-Joint, Special Joints)
M.S. Electrodes & Filler Wires: (Designation, Codes & Classification, Specifications, Fluxes & Electrode Coating – their effect on weld quality)

S.S. Electrodes: (Designation, Codes & Classification, Specifications, Electrode Coating, their effect on weld quality)
S.S. Welding: (Inter-Pass Temperature, Sensitisation & Inter-Granular Corrosion & its control, Delta Ferrite & its effect on hot cracking & Sigma Phase, Delta Ferrite Measurement – Schafflar / Delong Diagram / Magna Guage / Magnetic Saturation Method, Hard facing, Stelliting, Carburizing, Nitriding

Welding Technology:
Polarities (AC, DC(+), DC(-), Pre Heating & Carbon Equivalent , Inter-Pass Temperature, Post Weld Heat Treatment & Hydrogen Embrittlement, Stress Relieving & Solution Annealing, Distortion Monitoring, Weld Sequencing & Balanced Welding Parameters & their effect on weld quality, Weld Defects - their causes & Acceptance Criteria. Role of flux on weld quality improvement. Welding of dissimilar materials.

ASME Code Section IX
Welding Procedure Specification, Welding Procedure Qualification, Procedure Qualification Record, Welders' Qualification, Welding Machine Specification, Essential & Non Essential Variables, Positions of Welding & Their Importance

Non Destructive Testing of welds:
Radiography & Ultrasonic Examination of butt welds

Destructive tests:
All Weld Tensile Test, Transverse Tensile Test, Bend Tests, Ferrite Test, Corrosion Test, Creep Test, Micro & Macro Examination / Etching Test, Metallography Examination.

Maintenance Welding: Limitations, Difficulties, Selection of Welding Consumables. Cold welding, Powder metal spraying, underwater welding.

Reference Books:

1) Welding Metallurgy: Kou, Sindo : John Wil, New York
2) Practical Non-Destructive Testing – 2nd Edition: Baldev Raj : Narosa
3) Principles of Welding Technology-3rd Edition:Gound LM:Viva Books,New Delhi

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Manufacturing And Industrial Engineering	**Code: C-Elect- JNTU, M -20**
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Fundamentals of hot and cold working processes: Forging, extrusion, wire drawing, sheet metal working, punching, blanking, rolling, pilgering, bending, deep drawing.

Machining Processes and Machine Tool Operation: Mechanics of metal cutting, single and multipoint cutting tools, geometry and machining aspects, tool life, machinability, and economics of machining.

Inspection: Limits, fits and tolerances, linear and angular measurements, comparators, gauge design, interferometer, form and finish measurement, measurement of screw threads, alignment and testing methods.

Tool Engineering: Principles of work holding, design of jigs and fixtures, design of press working tools.

Machine Design: Machine development concepts

Advanced Manufacturing Processes: E–Manufacturing, Fundamentals of Nanotechnology, Micro-machining and High Speed Machining.

Reference Books:

1) Sensors and Control Systems in Manufacturing : Soloman, Sabrie – Mc Graw Hill, New York
2) Precision Engineering in Manufacturing : R K Murthy – New Delhi

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Corrosion Engineering	Code: CElect : C
Discipline: Chemical Engineering	No. of Lectures: 20

BASICS OF CORROSION: Electrode processes – free energy, electrode potential, emf series, Pourbaix diagrams and their practical use, Chemical Vs electrochemical mechanisms of corrosion reactions, Introduction to corrosion – Wet and dry corrosion – Theories of corrosion - corrosion rate expressions; Passivity, factors affecting passivity.

(4 h)

CORROSION AND ITS FORMS: General corrosion – atmospheric corrosion, galvanic corrosion, biological corrosion, High temperature corrosion; Localized corrosion– pitting corrosion, crevice corrosion, Intergranular corrosion, de-alloying; Mechanically assisted corrosion – erosion corrosion, cavitation corrosion, fretting corrosion, corrosion fatigue, stress corrosion cracking and hydrogen embitterment.

(5 h)

CORROSION IN REACTOR SYSTEMS: Corrosion in various reactor systems; Effect of high temperature water, cooling water, sea water; nitric acid – effect of flow, environment and metallurgical variables of materials.

(4 h)

PREVENTION AND CONTROL OF CORROSION: Corrosion control by design; Selection of corrosion resistant materials – alloying, coatings and surface treatments; Oxidation resistant materials, control of high temperature corrosion; Cathodic and anodic protection methods; Use of inhibitors-types.

(3 h)

CORROSION MONITORING & INSPECTION: Ccorrosion coupons, Electrical resistance, linear polarization resistance, electrochemical noise analysis; Inspection - liquid penetration inspection, ultrasonic testing, radiography testing, eddy current testing.

(4 h)

BOOKS FOR STUDY AND REFERENCE:

1. Herbert H. Uhlig and R.Winston Revie, "Corrosion and corrosion control", Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, "Corrosion Engineering", Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.
4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Image Processing and Machine Vision	**Code: CElect:EN-710**
Discipline: Quality Assurance	**No. of Lectures: 20**

Image Processing & Machine Vision (20 hrs)

Introduction : Digital image model representation, Image sensor, Digitalizer, Computer, Standard file format;

Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening. Histogram Modification, Colour image processing;

Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;

Boundary extraction and representation;

Morphological operations;

Image Restoration-PSF, Deconvolution, Restoration using inverse filtering. Wiener filtering & maximum entropy-based methods:

Image Compression: Models, Error free compression, Lossy compression, Standards;
Machine Vision:

Imaging model, Scene radiance and image irradiance, Reflectance model of a surface. Lamberitan and specular reflection; Photometrix stereo;

Early Vision : Low level processing for noise suppression, Segmentation by thresholding; Edge detection; representation, Mathematical Morphology;

Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, Generalized Hough Transform;

Contd....

High level vision: Scene interpretation;

Texture - Statistical, Structural and Spectral approaches;

Stereo vision and correspondence problem; Structured light; Optical flow;

Image representation: Invariants;

Unstructured objects: Snakes

Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, classification and recognition; Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
Introduction to image understanding;

Robotic applications of machine vision, Camera calibration.

Reference Books:

8. Wesley E.Snyder & Hairon QI, Machine Vision, Cambridge, 2004.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Data Base Management system and Web Technology	Code: CElect:EN-705
Discipline: Quality Assurance	No. of Lectures: 20

Data Base Management System and Web Technology (20 hrs)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to Postgre SQL and MySQL (3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(!)
- Content Management Systems(!)
- Web 2.0 I Semantic Web(2)

Reference Books:

1. Fundamentals of Database Systems Sixth Edition Ramez Elmasri, Shamkant B. Navathe, Addison-Wesley Publication 2010
2. Database Systems: A Practical Approach to Design, Implementation and Management 2014 by Thomas Connolly, Carolyn Begg
3. An Introduction to Database Systems 8th Edition by C.J. Date
4. Web Technologies: A Computer Science Perspective 1st Edition by Jeffrey C. Jackson
5. Web Technologies Paperback 2010 by Uttam K. Roy

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Advanced Computational Techniques	Code: CElect:EN-701
Discipline: Quality Assurance	No. of Lectures: 20

Advanced Computational Techniques (20)
Programming Language C++

C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.

C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initializers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogonal Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO

Contd….

• Applications using above all methods to DAE related problems.

Parallel Programming

• Introduction to parallel computers, classification, technologies, ratings
• Parallel programming concepts, examples, terms and definitions, parallelism, parallel programming models
• Different examples of parallel programs and parallelization strategies
• Message Passing Interface (MPI), concepts of MPI, MPI Library calls
• MP! Point to Point communication calls
• MPI Collective communication calls

Scientific Visualization

• Geometry Classification - 2D & 3D grids.
• Structured & Unstructured grid development.
• Data storage techniques for ID, 2D & 3D grids.
• Data visualization techniques for scalar & vector data.
• Common pitfalls in programming
• Case Studies

BARC Training School
NFC, Hyderabad
Syllabus

Practicals on Material Science & Engineering and Corrosion Engg.

Sl. No.	Name of the Experiment
1.	To evaluate the hardness of materials
2.	To evaluate the Tensile properties of materials
3.	Preparation of specimen for Metallography for microstructure evaluation
4.	To detect susceptibility to inter granular attack (associated with the precipitation of chromium carbide)in S.S. samples (Corrosion Test)
5.	Measurement of wall thickness by Ultrasonic test
6.	Familiarisation of Procedure and interpretation of indications in liquid penetrant test principle

BARC Training School
NFC, Hyderabad
Syllabus

Practicals on Health Physics

Sl.No.	Name of the experiment
1	α – particle counting
2	β- particle counting
3	- particle counting
4	Whole body counting

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments to be carried out in Process Control & Instrumentation Lab

Sl.No	Name of the Experiment	Branch
1	**Study of Flow and Level control system** a) Mention different types of instruments/equipments used in the system with their tag nos. specifications and applications b) Write the details of different material used for the system (structure & pipe lines etc).	All
2	**Study of control system (PLC & Control Panel)** a) Control system architecture b) PLC Unit (configuration & specifications) c) Control Panel (Instruments used with specifications)	All
3	Calibration of Control Valve	All
4	Calibration of Level Transmitter	All
5	Calibration of Flow Transmitter	All
6	Calibration of Differential Pressure Transmitter	All
7	Studying the characteristics of Control Valves	All
8	Single tank liquid level control using PID controller	All
9	Calibration checking of RTD/Thermocouple	All
10	Study of Field instruments	All

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments on PLC Demo unit

Sl.No	Name of the Experiment
1	Direct On Line (DOL) Starter
2	Star Delta starter
3	Up – Down Counter
4	ON – Delay Timer
5	OFF – Delay Timer
6	Arithmetic Functions
7	Number Comparison Functions
8	Paint Spray process system
9	Speed control of AC Motor through MODBUS Communication
10	Temperature controlling using PID controller of PLC

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments to be carried out in Structural Dynamics &Vibration Laboratory

Sl.No	Name of the Experiment
1	Dynamics of a three storied building frame subjected to harmonic base motion
2	Dynamics of a one-storied building frame with planar asymmetry subjected to harmonic base motions.
3	Dynamics of a three storied building frame subjected to periodic (non-harmonic) base motion.
4	Vibration isolation of a secondary system
5	Dynamics of a vibration absorber.
6	Dynamics of a four storied building frame with and without an open ground floor
7	Dynamics of one-span and two-span beams.
8	Earthquake induced waves in rectangular water tanks
9	Dynamics of free-standing rigid bodies under base motions
10	Seismic wave amplification, liquefaction and soil-structure interactions.

2.	02ENGG04-001-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single -phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:

12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No. Course content

Curriculum for Metal Forming

1. **Uniaxial tensile test**:
   a. Engineering stress, engineering stain, true stress, true strain;
   b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations;
   c. Tensile instability and significance of strain harkening exponent;
   d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2. Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3. Small strain matrix and rotation matrix obtained from the displacement functions;
4. **Elements of the theory of plasticity**:
   a. Decomposition of stress matrix to hydrostatic and deviatoric matrices;
   b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess;
   c. Normality flow rule and convexity of the yield surface; concept of equivalent strain

Curriculum for Materials Joining

1. **Welding Processes**
   a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding
   b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding
   c. Resistance Welding Processes
2. **Thermal Cycle during welding**
   a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3. **Residual Stress and Distortion**
   a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses
   b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No. Course content

1. Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2. Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber's rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O' rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson’s ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.
4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.
5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.
6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. **Engineering Mathematics (EM) (35 hours)**

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

8. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
9. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
10. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
11. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
12. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).

13. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
14. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR’s, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No. **Course content**

12. **Introduction: Reliability Engg. Applied to C&I Systems**
Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

13. **Reliability Maths/Statistics:**
    - Mathematical and statistical expressions required for reliability study.
    - Types of failures in electrical, electronic and computer components
    - Failure probability concept, statistical distribution models_
    - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
    - Chi-square distribution and its use in confidence and risk factors
    - Baye’s theorem
    - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
    - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
    - Derivation of exponential reliability expression_
    - R(t)=[exp-(lt)] for electronic components and systems.
    - Examples to solve

14. **Fault Tolerance and Systems Reliability:**
- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**
- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**
- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**
- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**
- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), ('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:

1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4. Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.

5. DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. **Fault Tolerant and Distributed Architectures**

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.

2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. **Real-Time System Design**

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.

2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	Course content
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems- Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system- Gammatography etc.,
    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
    Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.
    Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
Total		**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
Total		**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

Book suggested

15. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
16. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
17. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
18. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
19. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
20. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick’s law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

   Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

   Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR’s, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2. Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.

7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.

8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.

9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.

10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

<u>Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)</u>

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Syllabus for CE610 : Heat Transfer (10 hrs.)

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff’s law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi’s model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow’s correlation) and flow boiling (Chen’s correlation)

Condensation heat transfer: Nusselt’s theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.

Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.

Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.
5. Piquet, J. (1999): Turbulent Flows: Models and Physics, Springer-Verlag: Berlin.
6. Holman, J.P. (1997): Heat Transfer, 8"" ed., McGraw-Hill : NY.
7. Kays, W.M. and Crawford, M.E. (1993); Convective Heat Transfer, McGraw-Hill: NY.
8. Gebhart, B., et al. (1988): Buoyancy-Induced Flows and Transport, Hemisphere.
9. Barret, K. (1982): Numerical Modelling in Diffusion-Convection, Pentach Press : London, Polymouth.
10. Hussaini, M.Y. et al. (1997): Up-wind and High Resolution Schemes, Springer-Verlag : Berlin.
11. Warsi, Z.U.A. (1998): Fluid Dynamics: Theoretical and Computational Approaches, 2"" Ed., CRC Press.
12. Cebeci, T. and Bradshaw, P. (1984): Physical and Computational'Aspects of Heat Transfer, Springer-Verlag.
13. Quartepelle, L. (1993): Numerical Solution of the Incompressible Navier-Stokes Equations, Birkhauser Verlag.
14. Patankar, S.V. (1982): Numerical Heat Transfer and Fluid Flow, Hemisphere.
15. Versteeg, H.K. and Malalasekera, (1996): An Introduction to Computational Fluid Dynamics: the Finite
16. Volume Method, Addison-Weslev.
17. Gresho, P.M. et al.. (1999): Incompressible Flow and the Finite Element Method, John Wiley & Sons.
18. Comini, G., et al. (1994): Finite Element Analysis of Heat Transfer, Taylor & Francis : Washington DC.
19. Canuto, C., et al. (1988): Spectral Methods in Fluid dynamics, Springer-Verlag :NY, 557pp.
20. Thompson, J.F., Soni, B. and Weatherill, N.P. (1998): Handbook of Grid Generation, CRC Press.
21. Glowinski. R., et al. (Eds.) (1997): Domain Decomposition Methods in Science and Engineering, Wiley.
22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
   Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Froment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO's).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2nd edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2nd edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2
MS6	Metallurgical Thermodynamics	30	4
MS7	Experimental Methods for Materials Research	45	6
MS8	Structural Materials for Nuclear Reactors	45	6
MS9	NDE Science and Technology	30	4
MS10	Physical Metallurgy	45	6
MS11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
MS12	Introduction to Materials Science and Engineering	45	6
MS13	Corrosion Science and Engineering	30	4
MS14	Mechanical Behavior of Engineering Materials	30	4
MS15	Manufacturing Technology	30	4
Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:**Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:**Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods

1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;

1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):

Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation-bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM

2.2. Scanning electron microscopy:

Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;

EPMA Electron probe micro-analyzer

2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species

3.1. Ion beams – production-ion guns; manipulation- ion, filters

3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):

High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy

3.3. Nuclear reaction analysis – elemental specificity – depth profiling

3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis

3.5. Surface Mass Spectriscopy-SIMS:

Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons

4.1 Photoelectron spectroscopy:

Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin

4.2 Auger Electron Sepctroscopy:

Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.

4.3 Experimental methods;

Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. **VIBRATIONAL SPECTROSCOPIES**

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. **8.RESONANCE ABSORPTION SPECTROSCOPIES**

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.
2. Williams (D B), Carter (C B), Transmission Electron Microscopy: A Textbook For Materials Science, New York, Plenum, 1996
3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)

S.No.	Course Content
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

9. NDE Science and Technology (MS9 - 30 hours)

S.No.	Course Content
1.	**Introduction to NDE:**Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:**Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:**Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:**Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:**Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:**NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys. Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition.
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation.

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No	**Course content**
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232.
MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. **Introduction to Materials Science & Engineering (MS12/CH4-40 hours)**

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.
5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.
6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.
7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger's vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt's factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith's law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2
7.	FRE7	Seismic Design of Nuclear Reactors and Facilities	30	4
8.	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**210**	**26**

MODULE III- OPERATIONS

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE9	Plant Dynamics and Control	25	3
2.	FRE10	Turbine Generator Fundamentals	25	3
3.	FRE11	Mechanical and Electrical Equipments	25	3
4.	FRE12	Maintenance Engineering	25	3
5.	FRE13	Regulatory Framework for NPPs	25	3
6.	FRE14	Practical's	**6 Weeks**	**12**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.

12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No **Course content**

1. **Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2. **Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3. **Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4. **Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5. **Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6. **Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single - phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies
8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

AHMT

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974.
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.
3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.

13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No. **Course content**

1. **Momentum Transport:**

   1.1 Viscosity and Mechanisms of Momentum Transport: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends***.***

2. **Energy Transport:**

Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.
3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

2. Field training

a. Reactor Operation
b. Maintenance Activities
c. Technical Service Activities
d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical’s	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. El-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors- modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No. **Course content**

1. **1.** Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2. **2.** Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3. **3.** Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4. **4.** Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5. **5.** Introduction to various reactor instrumentation and radiation monitors:
6. **6.** Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
   - Fault tolerance concept for electronic and Computer based C&I systems.
   - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
   - Series, parallel, active, passive, and voting redundancy
   - Redundancy and other fault tolerance methods for software
   - FMEA, FMECA concepts for C&I and Examples to solve
   - Concepts for the analysis of System Reliability, availability, and maintainability.
   - System reliability and availability analysis methods
   - Boolean logic
   - Digraph, cutest-tie set method
   - Fault tree model, and consideration of CCF, CMF, software errors
   - Markov Model

   Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
   - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
   - Environmental qualification, testing of the C&I systems
   - Effects of various environments on the electrical/ electronic components
   - Climatic Qualification tests: Temperature, Humidity
   - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
   - Reliability Testing of the electronic components, equipment and C&I systems
   - Reliability screening tests for electronic components
   - Accelerated environmental tests
   - Failure terminated and time terminated tests
   - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
   - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
   - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
   - Explain Event Tree
   - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
   - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment
(1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher
(2001),
('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions-grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry-Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position
6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.
7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

Homi Bhabha National Institute, RRCAT, Indore

Syllabus for
PGD in Engineering Sciences
(PROGRAM CODE: ENGG00)

Raja Ramanna Centre for Advanced Technology, Indore

Courses offered at HBNI, RRCAT for PGD in ENGINEERING SCIENCES

(Specialization in Accelerators and Lasers)

- Total credit requirement for Ph. D. (Physics) : 60

Core courses	28 credits
Elective courses	20 credits
Laboratory experiments	04 credits
Two reading courses	08 credits

- Total credit requirement for M.Tech. (Engineering Physics) : 60*

Core courses	38 credits
Elective courses	12 credits
Laboratory experiments	04 credits
Short term project	06 credits

* An additional course (Foundation course) of 5 credits is offered to M.Tech. students as a bridge course.

Contents

Syllabus for PGD (Engineering Physics) courses

A : Core Courses

03ENGG00-001-C Engineering Mathematics Credit (3)

Complex Analysis: Analytic functions, Cauchy-Reimann conditions, Cauchy integral theorem, Laurent expansion, conformal mapping, singularities, calculus of residues, evaluation of definite integrals.

Vector Calculus: Gradient, divergence and curl operations and their physical interpretations, vector integrations, Gauss theorem, Stokes theorem.

Matrix: Basic concept of matrix algebra, symmetric, skew-symmetric and orthogonal matrices, eigenvalues and eigenvectors of a matrix, hermitian, skew-hermitian and unitary matrices, illustration of symplectic matrices in particle transporting accelerator.

Integral Transform: Fourier integral, Fourier transform and inversion theorem, Fourier transform of derivative, convolution theorem, transfer function, Laplace transform, Laplace transform of derivatives, convolution theorem, inverse Laplace theorem.

Ordinary and Partial Differential Equations: Review of ordinary differential equations, introductions to partial differential equations, classification of partial differential equations, boundary and types of partial differential equations, solutions of one dimensional diffusion equation, two-dimensional Laplace equation, use of integral transform in solving partial differential equations. Introduction to difference equations.

Probability and Statistics: Bayes' formula, random variables, expected value and variance, discrete and continuous distributions, location parameters, joint distributions, conditional distributions and independence, covariance and correlation, bivariate normal distribution, Poisson process, the central limit theorem, statistical inference (with an aim to better understand and analyze experimental data), point estimators, estimating variance, confidence intervals, comparing two samples, estimation methods, hypothesis testing, goodness of a fit.

2. "Mathematical Methods for Scientists and Engineers", Donald A. McQuarrie
3. "An Introduction to Probability: Theory and its Applications- Vol.1 and Vol 2", William Feller
4. "Ordinary Differential Equations" V.I. Arnold
5. "Advance Engineering Mathematics", Erwin Kreyszig

03ENGG00-002-C Magnet Physics and Technology: Credit (4)

Origin of Magnetism: Classical and quantum concepts, magnetic moments, angular momentum and quantization of angular momentum.

Classification of Magnetism: Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism, and ferrimagnetism.

Role of Magnets in Accelerators: Dipole, quadrupole, sextupole, and combined function magnets, DC and fast cyclic magnets, septum magnets, and kicker magnets.

Fundamentals of Magnet Design: Magnetic circuit, dipole, quadrupole, sextupole and higher order multipole magnets and coil design, B-H curve.

Application of Magnetic Materials in Accelerators: Materials for DC magnets: low field magnets, high field magnets, permanent magnets, and shielding.

Materials for AC Magnets: Silicon steels, laminated Ni-Fe alloys, and Ferrites. Numerical methods for magnet simulation: computer code and related mathematical formalism, methods of optimization, multipole expansion, Fourier representation of magnetic field.

Magnet Technology: Fabrication procedures, tolerances, and economic issues.
Methods of magnetic field measurements: magnetic induction, search Coil, Hall probe, and nuclear magnetic resonance.

Superconducting Magnets: Basic concept of superconducting magnets, magnet geometries for dipole magnets, superconducting materials, need for twisted composite conductors, hot spot temperature, current densities, quench, training of magnets and persistent switch.

Geodesy and Alignment of Accelerators: Introduction, survey and alignment as applicable to accelerators and its requirement. Position sensitive elements and their typical tolerances for alignment, fiducial references and adjustment system, fiducial posts and targets, and techniques of fiducialsation. Features of support elements and their adjustments during alignment.

Network and Alignment Procedure: Defining coordinate systems, control networks-types, survey procedure, data adjustment and error analysis.

Survey and Alignment Instruments and Toolings: Electronic theodolite, optical level, laser Interferometer, distinvar, inclinometer, offsetmeter etc. Different types of targets and sensors.

7. "Physics of Magnetism," S. Chikazumi
8. "Soft Ferrite its Applications", E.C Snelling
9. "Permanent Magnet Materials Their Applications," Peter
10. "Modern Ferrite Technology", Alex Goldman

03ENGG00-003-C Laser Physics and Technology: Credit (4)

Basic Formalism: Spontaneous and induced transitions, Einstein's approach, A and B coefficients, conditions for light amplification and oscillations, and characteristics of laser light. Homogeneous and inhomogeneous broadening of the transitions, spectral narrowing in a laser, gain saturation, spatial and spectral hole burning and their consequences, Lamb dip spectroscopy and its applications.

Propagation of optical beams in free space and in dielectric slab waveguides, Hermite-Gaussian beam modes, and ABCD law for Gaussian beam propagation.

Optical resonators, concept of cavity modes, resonators with spherical mirrors, resonance frequencies of optical resonators, losses in optical resonators, stable/ unstable resonators, Kirchoff's diffraction treatment for transverse modes.

Methods For Obtaining Population Inversion: Optical pumping, coherent and incoherent pumping, one- and two-photon processes, pumping geometries, pump sources, electrical pumping by discharge in gases, excitation mechanisms, self sustained and e-beam sustained operation, chemical pumping, and gas dynamic pumping.

Laser Dynamics: Laser oscillation, three and four level lasers, rate equation modeling, power in laser oscillators, optimum output coupling low- and high-loss regimes, multimode laser oscillation and mode locking. Different techniques of mode locking. Relaxation oscillations, cavity dumping and Q-switching. Techniques of Q-switching. Pulse compression techniques for ultrashort pulse generation. Spectral control of laser output, tunability of output frequency, single frequency operation, and frequency stabilization.

Physics and Technology of Specific Laser Systems: Solid state lasers, vibronic lasers, semiconductor diode lasers, diode pumped solid state lasers, fiber lasers, dye lasers, atomic and molecular gas lasers, chemical lasers, excimer lasers, free electron lasers. Measurement of parameters of a laser system.

Nonlinear Optics: Crystal optics, electro-optic effect, wave propagation in nonlinear media, phase matched second harmonic generation, optical parametric oscillator, two-photon absorption, stimulated Raman scattering, frequency mixing in gases and vapours, self-focusing, optical bistability and optical phase conjugation. Quantum optics: second quantization, non-classical effects.

03ENGG00-004-C Electromagnetic Theory: Credit (3)

Electrostatics: Laplace equation and the uniqueness theorems, variational approach to solutions of the Laplace and Poisson equations. Formal solutions of electrostatic boundary value problems with Green function. Method of relaxation for 2D electrostatic problems, method of images, separation of variables and special functions, finite element method, and multipole expansions. Electrostatic field in matter.

Magnetostatics: Maxwell equations of magnetostatic, macroscopic Maxwell equations in magnetic material and boundary conditions on B and H, and solution of boundary value problems in magnetostatics.

Electromagnetic Wave: Wave equation, solutions in free space, plane waves, Gaussian beams, equations in material media, dispersion relations, Fresnel's laws of reflection and refraction, total internal reflection and evanescent waves. Lorentz transformation of electromagnetic fields.

Wave-guides, Resonant Cavities and Optical Fibers: Hollow metallic waveguides, dielectric waveguides, optical fibers, resonant cavities, and elements of microwave transport line.

Radiation by Moving Charges: Lienard-Wiechert potentials and fields, power radiated by an accelerated charge, Larmor's formula, and angular distribution of emitted radiation.

03ENGG00-005-C Accelerator Physics and Beam Diagnostics: Credit (4)

Introduction: Motion under electric and magnetic fields. DC and RF acceleration. Relativistic kinematics, Brief history and review of particle accelerators.

Synchrotron/Storage Rings: Accelerator magnets - dipole, quadrupole and sextupole magnets. Multipole expansion method. Equation of motion, betatron oscillations, weak and strong focusing, transfer matrices, beam stability, twiss parameters, motion of particles with momentum deviation, momentum compaction, and chromaticity. Magnetic field errors, closed orbit distortion and its correction, resonances - integer and half integer, beam acceleration, synchrotron oscillations, phase stability, transition energy, beam emittance, Liouville's theorem, single turn injection, H-injection, and fast extraction.

Beam Transfer Lines: FODO cells, quadrupole triplet, phase space matching, emittance dilution.

Synchrotron Radiation Sources: Synchrotron radiation, Radiation damping, quantum excitations, equilibrium beam emittance, and beam lifetime.

Linear Accelerators: DC accelerators, various types of RF accelerators, EM mode in a simple structure, Q-factor, shunt impedance, transit time factor, filling time, energy gain, dispersion curve, TW and SW accelerators, and beam dynamics in LINACS.

Cyclotrons: Basic principle of cyclotron, resonance condition, orbit stability, limitations of classical cyclotrons, AVF cyclotrons, injection, central region, extraction, time structure, energy resolution, and beam emittance.

Microtrons: Classical microtrons, basic equations, and Racetrack microtrons.

Beam Diagnostics: Physical principles, charge collection, secondary emission, Ionization, fluorescence, scintillation, capacitive pick up, magnetic pick up, wall current, synchrotron radiation detection, and optical transition radiation.

Instrumentation: Faraday cup, secondary emission wire monitor, beam loss monitor, beam profile monitor, beam position monitor, DC beam current transformer, fast current transformer, wall current monitor, photomultiplier, photo diode, image dissector, and streak camera.

03ENGG00-006-C Reactor Physics, Radiation Physics, and Safety Issues of Accelerators and Lasers: Credit (3)

Health Physics: Radiation sources - radioisotopes, natural and manmade sources, radioactive series, reactors, accelerators, radiation facilities, solid, liquid and gaseous activity. Control measures - time, distance, decay, shielding, administrative control, radioactive discharge, waste disposal, and exposure control.

Interaction of Radiation with Matter: Interaction of light and heavy charged particles, photons, and neutrons. Interaction of high energy charged particles, electromagnetic cascade, and Hardronic cascade.

Radiation Quantities, Units, and Regulatory Recommendations: Dosimetric quantities, exposure, absorbed dose, equivalent and effective dose, committed dose, ALI, DAC, ICRP, AERB, and dose limits.

Biological Effects of Radiation: Somatic and genetic effects, stochastic and deterministic effects, and LD30/50.

Detection of Radiation: Ionisation chamber, proportional counters, GM tubes, scintillation detectors, semiconductor detectors, thermoluminiscent dosimeters, direct reading dosimeters neutron detectors, BF3 and He3 tubes, Rem-meters, CR-39-foils, pulsed radiation detection. Low and high energy radiation detection.

Reactor Physics: Introduction to nuclear energy - fission and fusion, interaction of neutrons with matter; fission process and energy release, fission cross-section, fissile and fertile materials. Chain reaction, neutron cycle and lifetime, criticality and classical four-factor formula. Thermal and fast systems, slowing down of neutrons, conversion and breeding of fissile materials, concept of neutron flux and current, neutron diffusion theory, critical size and mass, reflected systems and reflector saving, heterogeneous systems. Reactor kinetics, reactivity and importance of delayed neutrons, reactivity changes and coefficients, fission product poisoning, control devices, uranium and thorium fuel cycles and enrichment processes.

Accelerator Safety: Types of accelerators, prompt and residual radiation, source terms, radiation hazards, radiation safety systems, shielding, radiation monitoring, non-ionizing radiation safety, RF and MW safety, magnetic field safety; ozone safety, safety at synchrotron radiation beam lines, spallation neutron sources, and accelerator driven sub-critical systems.

03ENGG00-007-C Numerical and Mathematical Techniques and Scientific Programming and Computing Methodologies:

Credit (5)

Numerical Methods

System of Linear Algebraic Equations: Direct methods - Gauss elimination and Gauss Jordan methods. Iterative methods - Jacobi, Gauss-Seidel and Successive over relaxation (SOR) methods. Eigenvalue problem .

System of Nonlinear Equations: Newton-Raphson and Secant methods. Roots of polynomials, synthetic division of polynomials, and Baristow method.

Interpolation, Extrapolation, Error and Regression Analysis: Types of errors their analysis.

Numerical Integration: Newton-Cotes, Gauss quadratures, trapezoidal, Simpson's 1/3 and 3/8 rule. Numerical differentiation - forward, backward and central difference quotient.

Differential Equation: Solution of ordinary differential equations. Solution of partial differential equations. Fast Fourier transformation.

Statistical Distributions: Poisson and Gaussian distributions. Monte Carlo simulation, pseudo random numbers, and central limit theorem.

Finite Element Method (FEM)

Introduction: Basic concepts of finite element method, application of finite element method, finite element method versus classical methods, finite element method versus finite difference method, and advantage of finite element method.

Integral Formulations for Numerical Solutions: Variational method, collocation method; subdomain method, weighted residual methods, Rayleigh-Ritz method, Galarkin's method, and least square method

Elements, Nodes, and Co-ordinate Systems: Introduction, element shapes, nodes, nodal unknowns, and coordinate systems

Shape Functions: Introduction, polynomial shape functions, convergence requirement of shape function, and derivation of shape functions.

Introduction to Stiffness (Displacement) Method: Definition of the stiffness matrix, derivation of the stiffness, matrix, assembly of the total stiffness matrix, properties of the global stiffness matrix.

Application of Finite Element Method in Heat Transfer Problem: Fundamentals, one dimensional finite element formulation, and problems.

Fundamentals of Computers: Computer architecture, application of computers, input and output devices, latest processors, desktop PC and servers.

Networking Basic: TCP/IP, DNS, Internet, and Intranet.

Operating System Basic: Linux, windows, shell programming, and CLI, vi, multithreading, multiuser, multitasking, hyper threading, file permissions, and ssh.

Fundamentals of programming: Algorithm, flow charts, high-level languages like Fortran and C, and steps for creating a simple program.

Introduction to C Programming Language: Program structure, header files, basic data types, variables, and declarations.

Operators and Declarations in C: Relational, logical, increment, and decrement operators. Expressions and precedence of operators. Input and output operations, control statements, iterative loops, arrays, and pointer;

Overview of Scientific Computing: Languages and compilers and scientific libraries.

Overview of Trends and Techniques: Sequential, parallel computing, cluster and grid computing.

Architecture Taxonomy: Traditional architecture, Flynn's classical taxonomy, SISD, SIMD, MISD, and MIMD Models.

Steps for Creating a Parallel Program: Decomposition of the program, communication, computations, and composing the results. Parallel example-array processing.

03ENGG00-008-C Materials Science and Technology- I: Credit (4)

The structure of materials (metals and alloys, ceramics and glasses, polymers, composites, low dimensional materials, smart materials). Defects in materials, transport properties of materials, mechanical and thermal properties of materials, electrical, magnetic, galvanometric properties, superconductivity. Optical, nonlinear properties of optical materials, quantum size effects. Electronic materials (like spintronics, and other functional materials). Introduction to symmetry and ferroelectric materials.

03ENGG00-009-C Applications of Lasers in Nuclear Science, Industry, and Medicine: Credit (3)

Laser Applications: High resolution spectroscopy, ultra-fast spectroscopy, laser cooling, laser metrology, holography and its applications in NDT, optical data storage information processing, and optical communication. Laser photochemistry, laser application in biology and medicine

Laser Isotope Separation: Principles of selective photonic action, selective photonic action on atoms or molecules, atomic and molecular schemes for laser isotope separation, lasers for isotope separation, and uranium isotope separation technology employing lasers.

Laser Material Processing: Laser material interaction, Laser cutting, welding, surface hardening, laser surface re-solidification, laser surface alloying, and cladding, laser shock-hardening, laser rapid manufacturing, laser application in decontamination and decommissioning of nuclear installations.

03ENGG00-010-C. Applications of Accelerators in Nuclear Science, Industry, and Medicine: Credit (3)

Synchrotron Radiation and its Applications: Properties of synchrotron radiation, various types of sources like BM, wavelength shifter, wiggler, and undulators. Beamline design and

synchrotron optics. Applications of synchrotron radiation to condense matter physics, surface physics, biology and Industries

Industrial and Medical Applications of Accelerators: Accelerators for industrial and medical applications. Beam characteristics for medical and industrial applications.

Radiation Processing Using Accelerators: Radiation cross-linking, radiation curing, polymerization, de-polymerization, and radiation grafting. Dose distribution in the irradiated products.

Typical applications: Treatment of wire and cables, viscose rayon sheets, rubber products, heat shrinkable tubes, and sheets. Flue-gas treatment, waste water treatment, electron beam applications in food irradiation and sterilization.

Accelerator Based Radiotherapy: Clinical requirements of an accelerator for radiotherapy. Various components of radiotherapy machine. Photon beam therapy and electron beam therapy. Quality assurance in radiotherapy accelerator.

Applications of Accelerators in Nuclear and Particle Physics: Evolution of nuclear physics with energy of the incident beam. Nuclear physics and related phenomena at incident beam energy less than 10 MeV/nucleon, between 10 and 100 MeV/nucleon, and more than 100 MeV/nucleon. Nuclear physics with radioactive ion beams (RIB).

Spallation Source: General introduction, applications to condense matter, and nuclear physics.

03ENGG00-011-C. VacuumPhysicsandTechnology: Credit (2)

Vacuum Theory: Definitions - throughput, conductance, pumping speed etc. Pressure equations, mean free path, monolayer formation time. Units of vacuum, pressure regions in vacuum.

Vacuum Systems and Components: Vacuum pumps - rotary pumps, dry pumps, turbomolecular pump, titanium sublimation pump, non-evaporable getters, and sputter ion pump. Vacuum gauges - capacitance gauge, Pirani, thermocouple gauges, BA gauge, penning gauge, partial pressure gauge. flanges and seals, vacuum valves and leed throughs.

Vacuum System Design and Development: Design considerations, sources of gas load (vaporization, thermal desorption, diffusion, permeation, electron and ion stimulated desorption etc). Materials, fabrication techniques and leak detection. Processing to achieve ultra high vacuum.

03ENGG00-012-C. Quantum Mechanics: Credit (6)

For Ph. D. (Physics) only

Mathematical Background and Postulates: Illustrations and application of postulates by using simple two-level systems and two-slit interference experiment.

Quantum Mechanics of Composite Systems: N-particle system, identical particles, symmetrization and antisymmetrization postulates, concept of density matrix, properties of density matrix, pure and mixed states.

Symmetry: Symmetries in quantum mechanics, space and time translation, time reversal symmetry and parity invariance. Rotational invariance, angular momentum, spin, and addition of angular momenta.

Approximate Methods: Variational methods, Wentzel-Kramers-Brillouin (WKB) method, time-independent perturbation theory, time dependent perturbation theory, adiabatic and sudden approximations, Fermi-Golden rule.

Scattering Theory: Born approximation, partial wave analysis, two particle scattering.

Relativistic Quantum Mechanics: Klein-Gordon equation, Dirac equation, electron spin, and positron.

Advanced Topics: Quantization of electromagnetic field, coherent, and squeezed states, interaction of radiation with matter, spontaneous emission and Lamb shift, entangled state, EPR paradox and Bell's inequality.

03ENGG00-013-C: Research Methodology: Credit (0)

(Lecture: 20, Credit: 0)

Research Methodology: Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

Documentation: Preparing scientific papers/reports, scientific presentations.

Laboratory safety: Safe practices in laboratory.

Research ethics: Ethical conduct in science, ethical issues in scientific publication, awareness of plagiarism and other scientific misconducts.

Probability and Statistics: Bayes formula, random variable, expected value and variance, discrete and continuous distributions, joint distributions, conditional distributions, covariance and correlation, normal distribution, Poisson process, central limit theorem and its applications,
definition of precision, accuracy, systematic and random errors, propagation of errors in experimental data and their estimation, estimation of variance and confidence intervals.

Mathematical modeling: Measurement of functional relationships, order of magnitude analysis, dimensional analysis, goodness of a fit, linear regression and data fitting.

Data Security: Introduction to Data Security, Data security requirements, Different Cyber threats to Data & possible Solutions, Basic concepts of Cryptography & Data encryption algorithms, Research opportunities in Data Security.

Data management: Data planning, handling, modelling, analysis, visualization, Different Data Models, Data Management Software, Data Backup & Storage

C : Engineering Based Elective Courses

for M.Tech (Engineering Physics) only

03ENGG00-001-E. Power Supplies: Credit (4)

AC-DC Converters: Single phase and three phase diode and controlled rectifiers, effect of source inductance, ripple and harmonic analysis, 12-pulse rectifier, firing angle control schemes, THD and power factor, filters - passive and active, passive and active damping of filters.

Power factor Correction: Effects and limiting standards for line current harmonics, Passive PFC techniques, Active PFC.

DC-DC Converters: Principle of operation, steady-state analysis of buck, boost, buck-boost converters, Isolated dc-dc converters- forward, flyback and bridge converters, pulse width modulator and control of dc-dc converters.

Principles of Feedback Control System: Negative feedback, Stability criteria- gain and phase margin, steady state errors, transient response, current loop and voltage loop acting together.

Magnet power supplies in Accelerators: Requirements, Load characterisation, DC and ramping type power supplies, Pulsed power supplies.

High current magnet power supplies: Stability requirements, current cycling, Field stabilization.

Power supplies for superconducting magnets : Load requirements, quench detection, protection and training.

Laser and Plasma power supplies: Load characterisation, Gas discharge, Ballast requirements, CW/Pulsed operation, Current stabilisation, Power coupling schemes to gas discharges.

Thermal Management: Heat transfer, Heat sink design, Water- cooled heat sinks.

03ENGG00-002-E. Power Electronics: Credit (4)

Power Semiconductor Devices: Diode, SCR, MOSFET, IGBT, Static and switching characteristics, Safe operating areas, Drive requirements and circuits, Introduction to the properties of emerging materials and devices, High voltage switches, Turn-on and turn-off snubbers.

Modelling and Analysis : Introduction to modelling and analysis techniques for dc-dc converters, Averaged equivalent circuit modelling and analysis, small-signal analysis with an illustrative converter, Feedback control of power converters: Feedback controller design, voltage- mode control and current- mode control.

Soft-switching Converters: Concept of soft-switching, Load resonant converters: concept and

definition, ac analysis of converters and modes of operation, Full bridge zero voltage switching converter: Phase shifted PWM, Operation and analysis of converter in steady state.

High frequency Magnetics: Ferrites- characteristics and types, skin effect, proximity effect, parasitic components- origin, minimisation and characterisation, design of high frequency magnetic components, introduction to planar magnetics.

Electromagnetic Interference: Measurement techniques, LISN, separation of common mode and differential mode noise, limiting standards and mitigation techniques, design of high frequency filters.

03ENGG00-003-E. Advanced Course on RF and Microwaves: Credit (4)

Microwave Networks: S-parameters, Matrix representation of Microwave networks and its properties, cascade networks, periodic network system and application, mixed mode S parameters and their applications.

Generation of RF power for accelerators: Design requirements, RF power amplifiers using tetrode & triodes and solid state devices, klystrons, IOT, Gyrotron, Cooling and protection, Grounding and shielding.

High Power RF transmission: design aspect of high power RF transmission, directional couplers, dividers, combiners, high power waveguide and coaxial transmission lines, circulators, bends, magic-T, microwave windows, dummy loads, RF couplers.

Accelerator cavities: Characterizing RF cavity, determination of important cavity parameters, Fundamentals of beam-cavity interactions. RF power coupling to cavity.

Low level RF components and systems: Planar circuits, microstrips, substrate materials, lumped and distributed circuits, mixer circuits, phase shifters, filters, switches, couplers, dividers/combiners, Low level RF signal processing and RF feedback systems.

RF systems for accelerators: Design and configuration of typical RF system, Safety interlocks and operation of RF system.

RF/Microwave measurements: Specialty of high frequency measurements, Measurement of RF power, impedance, VSWR, frequency and phase. Measuring instruments used in RF/microwaves, passive and active detectors, spectrum analyzer, VNA calibration systems, Vector measurement with VNA, peak and average power meters, impedance analyzer, frequency counter.

03ENGG00-004-E. Advanced Data Acquisition and Control Systems: Credit (4)

Components of data acquisition system and their selection, signal conditioning modules, polling, hand-shaking, interrupt and event driven, DMA, data sampling methods.

Embedded system software concepts and development tools assembly and HLL, assembler,

compilers, linker, librarian, resident monitors, source level debuggers, in-circuit & in application programming (ICP/IAP) and logic analyzer. In circuit emulator (ICE), object code and HEX file formats, FPGA & CPLD architectures, logic cell structures, programmable interconnect and I/O ports, programming technologies and VHDL, implementation of combinational and sequential circuits, timing issues in FPGA synchronous circuits.

Centralized v/s distributed control system, PAC and PLCs, PC software issues and virtual instrumentation, VISA, image acquisition, data logging, online and offline data processing, data presentation and reporting, BUSES for digital data communication.

PC buses: PCI & PCI Express specifications mechanical, electrical functional.

Back plane buses: VME, CPCI, PXI, VXI mechanical electrical functional specification.

Buses for instrument network: Asynchronous & synchronous communication standards, bus, ring, net topologies, RS-232, RS-485, USB, LAN-Hub, GPIB, Ethernet, field bus serial port expansion cards on PCI, Converters: USB-GPIB, USB-Serial.

Real-time system concepts, timeliness vs speed, hard vs soft real time, scheduling method, concurrency, process & thread concepts, inter process communication and synchronization.

Software reliability: Software implemented fault tolerance, reliability and availability, safety issues. Software reliability standards and practice.

Process control elements, Set point, disturbance, servo system, regulatory system, analog vs digital control systems, Z - transform for digital control systems, feedback control system, continuous time domain PID controllers. Feed forward and cascade controls, digital controllers, digital form of PID controller, Z-transform based dead beat and Dahlin's algorithms, programmable logic controllers and applications, compensator design and stability criterion.

03ENGG00-005-E. Reliability Engineering: Credit (4)

Basic engineering statistics: Basic probability, random variables, probability density and cumulative distribution functions of engineering importance such as the binomial, poisson, normal, exponential, weibull, etc. Random sampling and sampling statistics and distribution of sampling statistics, such as the Chi-Square and Students test, point and interval parameter estimation, test of hypothesis, examples to solve on continuous and discrete distributions, mathematical equations relating to hazard rate, reliability, cumulative failure probability and

failure probability (density) function, Bath-tub curve - explanation of different parts of the life characteristic curve and corresponding failure distributions.

Quality and reliability, QA/QC concepts - Acceptance sampling plans, quality measurement, quality improvement and control methods with applications in design, development, and manufacturing, modern quality management philosophies, engineering/statistical methods including process control, control charts, process capability studies, loss functions, design of experiments, and total quality management (TQM) topics.

Reliability, availability and maintainability concepts and principles, reliability statistical analysis concept overview and application, accelerated life testing concepts, principles and application, qualitative and quantitative accelerated life testing principles, life-stress relationships and application to electronic components and semiconductor devices, software reliability issues, reliability prediction for electronic systems, system reliability concepts and case studies, role of redundancy in system reliability, design for reliability concepts and case studies, degradation analysis and case studies, reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software, hardware reliability analysis of electronic and computer based C&I systems based on MIL-STD-217, methods of measuring the reliability effectiveness of complex engineering systems, optimization theory, preventive maintenance models, and statistical analysis.

03ENGG00-006-E . Advanced Course in High Voltage Engineering: Credit (4)

High Voltage Technology: Introduction, classification of voltage levels, high voltage in electric supply network, major components of a high voltage network.

Electrostatic Fields and their Control: Electric field intensity, electric strength, classification of electric fields, degree of uniformity of electric fields, control of electric field intensity.

Dielectric Materials and their Behavior in Electric Fields:

a. Insulating Behavior of Air and other Gaseous Dielectrics: Generation of charge carriers: impact ionization, thermal ionization and photo-ionization, Negative ion formation, Breakdown by avalanche discharge (Townsend Mechanism); Breakdown voltage characteristics in uniform fields (Paschen's Law) Practical factors affecting the breakdown voltage: Corona, Fields non-uniform, high pressure and vacuum.
b. Liquid Dielectrics in High Voltage applications: Mineral insulating oils, Dielectric properties of insulating liquids, Dielectric power losses in insulating materials, Breakdown in liquid dielectrics, Aging of mineral insulating oils.
c. Solid Dielectrics and their Behavior in Electric Fields: Classification of solid insulating materials, Breakdown and pre-breakdown phenomena in solid dielectrics, Partial discharge and its effects on dielectrics.

Generation of High Voltages:

a. Alternating voltages: single step-up transformer, Transformers in cascade, Voltage control

of testing transformers, Series resonant circuits.

b. Direct Voltages: Half wave and full wave rectification, Voltage doublers and cascade circuits.

c. Impulse Voltages: Single stage impulse generator, Multistage Marx generator, Practical Impulse Generators.

High Voltage Test & Measurement: Types of tests, Power frequency tests, DC voltage test and Impulse withstand test, Peak voltage measurements by spark gaps, Sphere gaps and uniform field gaps, Voltage measurement using ammeter in series with high impedance, Voltage measurement using potential dividers, Generating voltmeter, Voltage and current transformers.

High Voltage Design and Applications: Design considerations of high voltage bushings, power cables, transformers and switchgears; high voltage applications and electrostatic hazards.

High Voltage Safety and Protection.

03ENGG00-007-E.Digital Signal, Image Processing and Applications: Credit (4)

Introduction: Digital image, steps of digital image processing systems, elements of visual perception, connectivity and relations between pixels. Image acquisition: Frame grabber, optics and illumination Simple Operations - Arithmetic, Logical, geometric operations.

Mathematical Preliminaries: 2D LTI systems, 2D convolution, correlation, 2D random sequence, 2D spectrum.

Image Transforms: 2D orthogonal and unitary transforms- properties and examples. 2D DFT, histogram, image smoothening, image filtering, Sharpening, thresholding.

Image Segmentation and Analysis: Edge detection, line detection, curve detection, Edge linking and boundary extraction, boundary representation, region representation and segmentation, morphology-dilation, erosion, opening and closing.

Image understanding and recognition: Matching by templates, classifiers models, statistical, matching shapes by contour and texture.

Review of LTI systems: Fourier transform for discrete-time signals and its properties, comparison with continuous-time Fourier transform. Discrete time signals, sequences, representation of signals on orthogonal basis, sampling and reconstruction of signals.

Signal analysis using the Fourier transform, impulse function and complex exponential signal, modulation and frequency translation, duality, Fourier transform of periodic signals,

correlation, energy and power spectral density, Hilbert transform, Fourier transform of finite-duration discrete - time sequences.

Z-transform, Discrete Fourier Transform (DFT), Fast Fourier Transform algorithm and applications. Design of FIR & IIR digital filters, effect of finite register length in FIR filter design. Overview of DSP processors, FPGAs.

Typical applications in Lasers and Accelerators.

D : Laboratory Experiments (Credit :4)

Experiments relating to lasers, accelerators and general electronics techniques will be offered. A student needs to carry out twelve experiments (4 each from laser, accelerator and electronics related areas) in two phases with a total working time of 72 hours which will carry 4 credits.

03ENGG00-001-L: Lasers and Applications

1. Measurement of spectrum and spectral width of diode laser and their dependence on current.
2. Study of characteristics of a Q- switched Nd:YAG laser.
3. Second harmonic generation: phase matching and maker fringes.
4. Saturated absorption in atomic vapour: Doppler broadening, natural line width, power broadening.

5. Study of light propagation through fiber: coupling efficiency, bending losses, splicing and connecting fiber.
6. Studies on Nitrogen laser pumped dye laser.
7. Parametric study of a XeCl Excimer laser.
8. Output power characteristics of a diffusion-cooled CO2 laser.
9. Determination of severance energy for cutting mild steel with CO2 laser.
10. Determination of laser power coupling efficiency in Nd-YAG/CO2 laser welding of stainless steel.

03ENGG00-002-L: Accelerators Related Areas

1. Electrical resistivity measurement on metallic samples at low temperature.
2. Parametric studies of magnetic materials and operating point of magnets.
3. Outgassing of materials, discharge cleaning and ESD studies.
4. Estimation of radioactivity and shielding attenuation coefficient measurements.
5. Determination of cooling power of a cryocooler.
6. Electron gun: Operation and experimental studies.
7. Proton ion source: Operation and experimental studies.
8. X-ray fluorescence studies using radioactive source.
9. Calibration of cryogenic sensors.

03ENGG00-003-L: Electronics

1. Study of stepper motor, dc motor drive and position feed-back.
2. Study of different transducers and their interfacing.
3. Communication buses and protocols, buses for distributed embedded processing.
4. G.U.I. software familiarization and applications.
5. Digital image processing and their applications.
6. Current and voltage regulated power supplies and change from one another.
7. Study of flash lamp and measurement of flash lamp current and K0 factor.
8. Characterization of RF components.
9. Fast current transformers: Study and measurement of response.

E : Reading Courses (Credit : 8)

Ph. D. scholars will work on two reading courses each of four credit worth. For each reading course, a Ph. D. scholar is expected to do self reading (under the guidance of his/her Ph. D. supervisor) of a review paper or book(s)/monograph(s) of specialized subjects related to the

area of his/her proposed area of research. Alternatively he/she may also work out and comprehend a research paper or a part of research paper relevant to his/her Ph. D. work. The topic and the structure/contents of the two reading courses should be decided by the guide in consultation with the respective doctoral committee and the Ph. D. scholar. The two reading courses should be approved by the respective doctoral committee.

The two reading courses will be evaluated on the basis of the detailed reports that will be prepared by the scholar and presentations, which will be held at the end of first year (in the month of August). The total marks for each reading course is 150 with 100 and 50 for report and presentation respectively.

F : Foundation Courses

for M.Tech (Engineering Physics) only

03ENGG00-001-F. Physics Courses for Engineering Graduates Credit (5)

Quantum Physics: Wave-particle dualism. Wave function, operators, expectation values, Schrodinger equation, Some applications: particle in a box, harmonic oscillator and hydrogen atom.

Atomic and Molecular Physics: Hydrogen spectrum, selection rules. Fine and hyperfine structure. Many electron atoms, energy levels structure, angular momentum coupling like LS & JJ; molecular structure, chemical bonding; electronic, vibration and rotational levels of molecules, Frank-Condon principle, radiative and non-radiative processes in atoms and molecules e.g. fluorescence, phosphorescence, energy transfer, and Raman effect.

Special Theory of Relativity: Galilean transformation, Lorentz transformation, relativistic dynamics - length contraction and time dilation, mass-energy relation.

Solid-state physics: Bonding in solids. Bloch theorem, band structure in periodic systems. Fermi levels, semiconductors, metals and insulators. Normal modes of vibrations and phonons. Specific heat of solids.

Nuclear Physics: Binding energy, nuclear structure and models. Alpha, beta and gamma decay. Fission and fusion processes

Optics: Concepts of wave front amplitude, phase and coherence, Basic ideas of interference, diffraction and polarization. Michelson interferometer.

03ENGG00-002-F. Engineering courses for Physics Post-graduates Credit (5)

Engineering Drawing: Basics, dimensional management and tolerance analysis. Surface texture; standard machine elements, their specifications and usage.

Evolution of product, process of design, parameter determination based on numerical calculations; Material properties and selection; Introduction to material joining & machining processes.

Semiconductor and magnetic devices: Rectifier diode, Zener diode ,Bipolar junction transistor, MOSFET, IGBT, SCR, Triac & GTO: Principle of operation, characteristics, Specifications, Ratings, Protections, Series/Parallel operation, Thermal considerations.
Transformers, Inductors, Saturable reactors: Principle of operation, Parameters, Different types, Specifications, Ratings.

Circuit theory and applications and High voltage Switches: Thyratron, Spark gap: Principle of operation, Characteristics, Specifications, Ratings, Protections
Switching circuit analysis: R-L, R-C, R-L-C circuits.

Power amplifiers: Types, Biasing, Load line, Circuit configuration, preliminary design aspects. Basics of operational amplifiers, linear and nonlinear circuits based on opamps; Principles and types of ADC and DAC, specifications; Digital circuits- combinational and sequential; Logic families; Introduction to microprocessors and PCs, interfacing with PC with serial and parallel modes; Transducers: Temperature, pressure etc;

Electronic instruments: Oscilloscope, logic analyzer, multimeter etc.

RF and Microwave systems: Basic concepts: frequency band designations, units of RF power measurements

Transmission lines: EM waves, transmission modes TEM, TE, TM, co-axial lines, microstriplines, waveguides, VSWR, insertion loss, reflection coefficients

RF cavities: Physics of RF cavities, shunt impedance, quality factor, coupling: modes, HOs, multipactoring, transit time factor; superconducting cavities

Passive devices: Microwave diodes, isolators, circulators, directional couplers, power dividers/combiners, RF Load.

Active devices: RF transistors, FETS, klystrons, magnetrons, tetrodes, triodes, solid- state amplifier.

Measurements: Fundamentals of RF and microwave measurements, S-parameters, measuring RF instruments, VNA, spectrum Analyzers, RF power meter.

Typical RF & Microwave systems for accelerators: Pulsed microwave systems, CW RF systems for SRS and proton accelerators.

-----x-----

BACK TO MAIN

PGD in LIFE SCIENCES
(PROGRAM CODE: LIFE00)
At BARC

1 PHYSICAL SCIENCES

Code:BS502: PHYSICS, MATHEMATICS and STATISTICS

PHYSICS

Mechanics
Various forms of work, energy and power, linear and circular motion, centrifugation

Atomic Structure and Electromagnetic Radiation
Principles of quantization, production and properties of EM radiation, wave/ particle duality

Optics
Interference, diffraction and polarization; CD and ORD spectra, Beer Lambert's law (spectrophotometer), fluorescence and phosphorescence

Radioactivity and interaction of Radiation with Matter
Types of radiation-ionizing and non-ionizing, laws of radioactive decay, binding energy, nuclear reactions, interaction of radiation with matter (scintillation counting / autoradiography)

Principles of Electricity and applications
Concept of voltage, current, power and electric field (electrophoresis)

Transducers
Devices to convert sound, light, heat, mechanical pressur and other energies to electrical signals.

MATHEMATICS

Logarithms
Definition, laws of logarithms, rule for change of base, common and natural logarithms, characteristic and mantissa, positive and negative bases. Accuracy and precision, number of significant digits

Linear and Polynomial Equations
Linear and quadratic equations and identities, slope, roots, relation between roots and coefficients (will be covered in practicals in the context of IRMA assays where polynomials are relevant)

Permutations and Combinations
Permutation and combination, ${}^{n}C_{r}$ and ${}^{n}P_{r}$ notations, factorials

Calculus and Trigonometry
Definition of derivative, physical significance -differentiation of simple functions, maxima and minima, integration and summation, definition of trigonometric functions, identities

STATISTICS

Basic Concepts:
Probability, a priori and posteriori probabilities. Statistical significance of probabilities, sample and population, variables, classification of variables, nominal, ordinal, interval and ratio, fixed and random

Population Distributions
Binomial distributions and Poisson distributions – their properties, parameters and applications.
Normal and 't' distributions – population and sample parameters measures of central tendency, measures of dispersion, variance, degrees of freedom, confidence limits and intervals; Probability of occurrence – use of Z and t tables

Sampling, Estimates and Hypothesis testing
Sampling methods, random sampling and estimates of population parameters from samples, sample statistics, hypothesis testing, drawing inferences and confidence limits, P values, Students t test for comparing means, general and paired t tests, special cases where variances are unequal, central limit theorem

Analysis of Variance:
F-Distribution - test for homogeneity of variance one way ANOVA, comparison of means of multiple groups by partitioning of the total sum of squares as within and between sum of squares, assumptions in ANOVA, missing values, Two way ANOVA design of experiments

Correlation and Regression:
Pearsons' product moment correlation coefficient, comparison of correlation coefficients, partial and multiple correlation, linear regression analysis; Interpretation of regression coefficients, application of correlation and regression in method comparison and evaluation

Nonparametric Statistics:
Spearman's coefficient of rank correlation, Chi square test, nonparametric methods for hypothesis testing based on ranks, Mann Whitney U test, Wilcoxon signed rank T test

Tutorials in Biostatics:

Code: BS501: CHEMISTRY and RADIOCHEMISTRY

Free Radical Chemistry
Water radiolysis, free radical generation by radiation and chemical methods. Mechanism of reaction, stability and detection and ESR spectroscopy

Structural Chemistry
Nature of chemical bond, weak interactions and their Implications in biology.

Mechanisms and Synthesis
Types of organic reactions, disconnection approach, secondary metabolites, isolation, characterization and biosynthesis, role of secondary metabolites.

Bio-Organic Chemistry
Pheromones, phytoalexins and allelomones bioinorganic chemistry

Radioisotopes
Concept of tracers, general principles of radionuclide production, nuclear reactions, production of radioisotopes, Szillard-Chalmer reaction, separation techniques and radiochemical purity, examples of production of biologically and medically useful radioisotopes (reactor produced cyclotron produced generator produced applying transient and secular radioactive equilibria)

Radiopharmaceuticals chemistry
Radiolabelling techniques, therapeutic radiopharmaceuticals, clinical translation of *in vitro* to *in vivo* application

2 BIOLOGICAL SCIENCES

Code: BS601: BIOCHEMISTRY

Intermediary Metabolism:
Overview of different metabolic pathways and their interaction: carbohydrate, fatty acid and nitrogen metabolism

Proteins and Post Translational Modification
Protein structure: Concept of domains, cytoskeletal, transmembrane, secretory and cytosolic proteins.
Types of post-translational modification: Role of leader and signal peptides, organelle targeting. Protein folding, chaperonins, protein splicing, role of ER resident proteins, golgi etc.

Enzymes:
Multienzyme complexes and their significance, membrane bound enzymes, supramolecular organization, non-aqueous enzymology.
Bioenergetics:
Energy transduction, biological oxidation / Reduction, electron transport

Code: BS608: MOLECULAR BIOLOGY

Basics on DNA Structure and replication
Change in structure and topology of DNA in response to microenvironment change, prokaryotic and eukaryotic genomes size and content. Basic differences in the mechanisms underlying chromosomal, plasmid, phage and mitochondrial DNA replication. Regulation of DNA replication in prokaryotes and eukaryotes. Control of plasmid Copy Number and incompatibility. Mechanism of genome segregation in bacteria and eukaryotes.

Regulation of Gene Expression:

Transcription: A brief outline of catabolic and anabolic operon regulation in bacteria (one example each). Structure of typical regulatory cis elements modules in bacteria and eukaryotes. Chromatin structure, remodeling and implication in regulation of gene expression.
Posttranscriptional processing of transcripts: Different types of RNA splicing mechanisms and alternative splicing, and RNA editing.
Translation: A brief outline of protein synthesis in bacteria and eukaryotes. Mechanisms of ribosome processivity and regulation of translation fidelity at various steps of protein synthesis.

Understanding RNA biology
A brief outline of structure and function of tRNA and rRNA, Secondary and 3D structures of RNA their roles in synthesis and stability of RNA and proteins. Noncoding RNA, RNA trafficking, tRNA maturation, Biogenesis of RNA protein complexes including telomerase function. RNA interference, RNA aptamers and the SELEX protocol, SnRNA, MicroRNA and SiRNA and their possible uses in research in biology.

DNA Damage and Repair

DNA damage produced by ionizing and non-ionizing radiations and chemical mutagens, its detection and repair mechanisms in prokaryotes and eukaryotes. DNA repair deficiency syndromes. Kinetics of DSB repair during post irradiation recovery in bacteria.

Basic tools in molecular biology
DNA protein interaction. Experimental approaches for studying genetic redundancy in genomes maintenance.

Code: BS603: CELL BIOLOGY

Signal Transduction in Animal Systems

Receptors (membrane linked and cellular) receptors with enzyme activity, G proteins, tyrosine kinase related transduction, preview of three modes of signaling (MAP kinase pathway, NFκB pathway and JAK/STAT signaling)
Radiation induced signal transduction and cell death
Cytoprotective and cytotoxic pathways activated By radiation, Cross communication. Bystander effects

Cell Cycle and apoptosis

Predivision stages, G1, S and G2 phases and their significance. Genetic regulation of cell cycle, Oncogenes and tumor suppresors. Detection of changes in cell cycles, apoptosis. Activation of radiation damage sensors and alarm signals. Mechanisms of radiation induced apoptosis. Techniques used in detection of apoptosis, flow cytometry.

Immunology

Innate and acquired immunity; Dichotomy in immune response; Immunocompetent cells and their sub populations; Cell cooperation. Antigen presentation T cell and B cell activation; Cytokines; Tolerance and autoimmunity

Antibodies structure and diversity; Affinity and Avidity; Hybridomas; T cell receptor, structure and diversity; MHC structure and polymorphism; MHC restriction; Immuno defficiency; vaccines and immunotherapeutics

Animal Biotechnology

Stem cell therapy (stem cells identification and asymmetric division), cancer stem cells, characterstics, methods of identification, isolation and characterisation, role in cancer relapse after chemo/radiotherapy, ways to target CSC, gene therapy, pharmacogenomics

Code: BS604: CROP SCIENCE

Linkage, Recombination & Genetic map in crop improvement
Mendelian genetics, Gene interaction, linkage, recombination and linkage maps, mapping functions, linkage/genetic maps vs. physical maps. Cytoplasmic inheritance**.** Chromosome engineering and crop improvement

Quantitative Genetics
Multiple factor hypothesis, transgressive segregation, analysis of quantitative traits, components of variance, heritability, population genetics, Hardy-Weinberg principle, changes in gene frequency

Plant Breeding

Hybridization of Crop Plants: Pedigree method, back cross methods. Male sterility and hybrid seed technology,

Principles of mutation breeding: use of induced mutations for crop improvement with emphasis on achievements in DAE; methodology and protocol for testing and release of cultivars for commercial cultivation.
Disease resistance: Mechanism, sources, screening methodologies and strategies for resistance breeding.
Quality Improvement: Different traits, genetic control, sources and analytical methods, Improvement in quality traits like protein, oil, anti-nutritional factors and vitamins
Abiotic stress: drought, salinity and heat stress tolerance. Basics of abiotic stress tolerance, consequences and mitigation strategies

Crop Management

Plant pathology
Principles of plant pathology, evolution of parasitism, host-parasite interactions and plant immunity, economically important pathogens, plant disease management

Radiation in Insect Pest control: Insect resistant crop plants, use of radiations in pest control - radiosensitivity of insects - SIT and F1 inherited sterility - IPM concepts

Pesticides for crop protection:
Pesticide and their role in crop protection,
environmental issues associated with pesticides applications, pesticide residues analysis

Soil Science
Types of soil, manure, fertilizer, testing and analysis

Plant Tissue culture

Methods in plant cell, tissue and organ culture, regeneration pathways – organogenesis and somatic embryogenesis. Synthetic seeds, apomixis, secondary metabolites in *in vitro* cultures

Code: BS607: MICROBIOLOGY & BIOTECHNOLOGY

Microbial Diversity, Nutrition, Growth
Identification of bacteria: taxonomy and molecular phylogeny, media requirement (enriched and mineral media) and culture techniques.
Antibiotic resistance: mechanism and challenges

Growth kinetics &factors affecting growth, chemostat and continuous cultures, synchronous cultures and their utility, single cell culture, VBNC, concept of microbiome.

Biofouling
Biofilms, biofouling and biocorrosion

Industrial Microbiology
Types of fermentation/ fermentors with examples

Bacterial and Viral Genetics
Genetics of representative phages – lambda, P1, filamentous, retroviruses. Genomic organization, integration into host genome, packaging.

Transformation, transduction and conjugation, kinds of recombination. Basic concepts including gene conversion; Models of recombination, genetics and biochemistry of recombination, site specific recombination, transposons; Rearrangement and amplification of genes.

Gene Mutation
Molecular basis of mutagenesis and mutator genes. Random versus directed mutations, conditional mutations, nonsense mutations and suppressors.
CRISPR: different phases of CRISPR immunity (adaptation, expression and interference), biomedical and other applications of CRISPRs.

Code: BS606: HUMAN GENETICS

Cytogenetics
Constitutional anomalies: Numerical and structural, causes and their implications in human health. Chromosomal disorders.

Molecular Genetics
Mendelian genetics, polygenic and multifactorial inheritance, variability in expression, non-Mendelian inheritance of single gene disorders, monitoring and screening of human population, genetic polymorphisms: VNTRs, SNPs, copy number variations, association studies, pharmacogenetics

Genome Mapping: Physical and genetic mapping, low and high resolution mapping: somatic cell hybrids, radiation hybrids, contigs, chromosome walking, linkage maps, genetic markers, polymorphism information content (PIC), expressed sequence tags (EST), sequence tagged site, (STS), human genome project, and ethical Issues, human genome diversity project.

Next generation sequencing (NGS) and different platforms, paired end sequencing, pyrosequencing, exome sequencing, miRNA and small RNA sequencing, transcriptome sequencing.

Code: BS602: BIOINFORMATICS

-

Introduction to Databases
Biological databases including primary and derived databases.

Sequence Analysis/Alignment techniques
Pair wise sequence alignment: local and global alignment, consensus sequence (sequence logo), frequency matrices (PAM, BLOSUM), log odds score, penalty, introduction to graphical, dyanamic programming and heuristic methods, database similarity searches-BLAST/FASTA algorithms

Multiple sequence alignment: clustering, dendogram/tree construction, molecular phylogeny

Genomics, Structural and Functional Analysis
Methodologies for high throughput analysis including microarrays and, application of bioinformatics in genomics

Bioinformatics applications in proteomics: introduction to mass spectrometry based proteomics, MASCOT, protein sequence database and their use, gel based and gel free quantitative proteomic approaches, interpretation and validation of proteomics results, functional proteomics.

Structural Biology and Structural Bioinformatics
Theory and practices of protein crystallography, introduction to the protein structural databases (PDB, CATH, SCOP etc.),
Instrumentation: structural/functional genomics initiatives, evolution of structural motifs and molecular evolution (convergent/divergent evolution), structure prediction methods with particular focus on homology/comparative modelling, structural validation approaches, protein structures in biotechnology (drug design/protein engineering etc.)

Code: BS609: RADIATION BIOLOGY

Introduction to Radiation Biology
Radiation and Life, concept of radiation dose, stepwise development of radiation injury, targets of radiation damage. Concept of RBE and LET. Dose-effect relationships.

Radiation Protection standards , units and concepts:
Introduction, objectives of radiation protection, radiation units, radiobiological data base for radiation protection standards, criteria and standards. Low dose effects and concept of radiation hormesis.

Free Radical Biology and Radioprotection
Biological effects of free radicals, biological defense against free radicals. 0_2 effect, acute radiation syndromes – bone marrow syndrome, gastrointestinal syndrome and CNS syndrome. Sub-lethal and potentially lethal damage and recovery physical, chemical and biological factors modifying radiation damage. Chemical radio-protectants

Radio-Sensitization and Radiotherapy of Cancer:
Basic Concepts, chemical radiosensitizers. Their applications in radiotherapy of cancer. Hyperthermia and modification of radiation injury. Properties of tumor cells relevant to radiotherapy, end points for *in vitro* and *in vivo* cell survival. Dose fractionation, biologically effective dose for teletherapy and brachytherapy, MFD and CHART. Radiosensitivity of tumor cells.

Genetic Effects of Radiation
Dose response relationship, utero exposure, risk estimation of genetic diseases and malformations, Biological dosimetry: partial and whole body exposure, Calibration curves, Cytogenetic and molecular end points: dicentrics, translocations, CBMN assay, pancentromeric, telomeric and whole chromosome FISH, premature chromosome condensation, HPRT assay, comet assay, gamma-H2AX.

Radiation and Immune System:
Radiation effects on immune system. Radiosensitivities of different cell populations. Cytokines and radiation injury. Low dose radiation effects in immune system and their mechanisms. Radioadaptation.

Radiation Dosimetry:
Basic concepts definition and areas of dosimetry, ionisation methods of radiation dosimetry of internally deposited radionuclides, personal monitoring devices and radiation survey instruments.

Operational Monitoring:
General principles and techniques of monitoring, assessment and control of radiation hazards in nuclear fuel cycle facilities with special reference to metallurgical, radiochemical, radioisotope facilities and fuel reprocessing plants including safety aspects of their design and operation, criticality safety

Environmental Aspects of Nuclear Fuel Cycle Operation:
Environmental release, management of solid, liquid and gaseous wastes, tritium hazards from PHWRs
Radiation Emergency Preparedness:
Discussion of type of incidents/accidents likely to be encountered, procedures for handling such events

Code: BS605 : FOOD TECHNOLOGY

Food Chemistry

Physical & chemical properties, macro & micronutrients, food colours, flavours, and additives

Chemical changes, nutritional qualities and functional properties of radiation processed foods

Nutraceuticals properties of food

Food Microbiology

Spoilage and pathogenic microbes, radiation microbiology, fermentation and enzymes

Food processing

Radiation processing: Applications and wholesomeness

Conventional methods for food preservation, emerging concepts in food processing (hurdle technology, HACCP, high pressure processing (HPP) Ohmic heating, ultrasonic treatment), food packaging

Sensory analysis and detection methods for irradiated food

Food irradiation plants: Engineering, process control and economic aspects

Code: BS592 :RESEARCH METHODOLOGIES

3.1) Cell Biology Techniques
Chromosomal analysis with mammalian cells metaphase preparation, micronuclei, G-banding, chromosomal aberrations, cytogenetic effects of radiation.
Immunology:, ELISA, isolation of lymphocytes from lymphoid tissues and peripheral blood, immunophenotyping of T and B cells, E-rosettes and PFC assays, tissue culture methods, blast transformation, cytokine assays. Flow cytometry
Radioimmunoassay and related procedures and tracer distribution in animals

3.2) General techniques
Confocal microscopy

TLC, GC-MS, mass spectrometry, ESR,
NMR/ FT-NMR, IR, UV-VIS spectroscopy

Protein purification, isolation of enzymes, enzyme kinetics, ion-exchange and gel filtration, polyacrylamide gel electrophoresis.

Electrophoretic resolution of proteins (1D & 2D), *in vitro* radiolabeling and autoradiography, western blotting & immunodetection.

Enzyme and cell Immobilization, permeabilization and bioreactors

3.3) Molecular Biology and Microbiology
Transduction, conjugation, repair of UV induced damage, screening of markers

Isolation and purification of DNA from plants & labeling of DNA, Southern hybridization, mRNA Isolation and Northern hybridization

Cloning: screening and reporter assay

Isolation, purification and quantification of DNA and total RNA from peripheral blood and Mammalian Cells, polymerase chain reaction, amplified fragment length polymorphism (Amp-FLP) analysis and silver staining in PAGE, cDNA synthesis, quantitative real time –PCR

Microbiology: Enumeration of bacteria – plating techniques Isolation & identification of Salmonella, MPN for coliforms, radiation survival curve

3.4) Radiation Techniques

Radiation Biology & Radiation Measurements:
Radioisotope tracer techniques and radiation measurements, GM counting system, counting statistics; half life, absorption and scattering, isotope dilution, crystal scintillation counting

Chemical dosimetry & ESR

Food Irradiation
Hurdle technology (water activity, antioxidants, packaging & gamma irradiation), analysis (microbial, chemical & sensory)

Code: BS594 SEMINARS

This module is designed for cultivating the art of communication and presentation in the trainees and helps towards value addition to the professional ability and personality development of the trainees

4.1 Paper Seminar

Seminar on a selected paper published by reputed scientists. The purpose of the paper seminar is to prepare the trainee to acquire skills in the presentation of published research work. Aspects such as analysis of the experimental data, details discussion on the results and hypothesis presented and drawing of meaningful conclusions are expected to be inculcated during the process. In addition, the trainee is encouraged to point out the strengths and lacunae if any in the publication and suggest feasible steps to enhance the quality of the publication.

4.2 Review Seminar

Seminar on a review to be presented by trainees. Broad areas/ processes/topics/concepts of current research interest are communicated to the trainees for choosing a topic for review. The seminar committee allocates the review topic to the trainee from amongst the topics submitted by him/her based upon the suitability, interests and aptitude of the trainee. The trainee is expected to review as many papers as feasible on the specified topic and submit a brief summary on the review topic assigned followed by an open defense. A senior HBNI faculty in Biosciences is assigned as a mentor to each trainee to guide them.

AUDIT LECTURES

Reactor Science

Basic concepts of nuclear energy
Properties of nuclei, binding energy, cross section, nuclear fission process and energy release, fission products, fission product activity, fission gammas, Neutron flux
Interaction of neutrons with matter
Neutron reactions, production of neutrons, nuclear reactions with thermal and fast neutrons
Concept of a nuclear reactor
Chain reaction, multiplication factor, four factor formula, nuclear reactor materials, fissile, fertile, fissionable nuclides, fuel, moderator, coolant, structural materials, concepts of irradiation, burn up, criticality
Exposition to different reactor systems
Indian nuclear power programme, thorium utilisation (AHWR)

Biosciences
Bio safety and animal ethics

Scientific Research & Documentation
Preparation of manuscript for publication: research & review papers, thesis writing, patent filing etc.

Intellectual Property Rights

Occupational safety, health and environment at work place

Syllabus
Regulatory framework of BARC, Atomic Energy Act 1962, Atomic Energy Factory Rules, Radiation Protection Rules
Surveillance of occupational health, medical care and management of Internal contamination
Preparedness for fire safety 1. Fire process 2. Fire detectors and alarms 3. Fire extinguishers 4. Fire protection systems 4. Do's and don's during fire emergency
Non-ionizing radiation safety
Chemical safety
Basic of radiation and sources of radiation, interaction of radiation with matter, radiation quantities and units, principles of radiation detection and measurement, effects of radiation, fundamentals of radiation protection

BS701 - BS714: ELECTIVE COURSES

Code	Title
BS701	Advances in enzyme technology
BS702	Assessment of health effects from exposure to low levels of ionizing radiation
BS703	Biology of stress and adaptive response in bacteria
BS704	Challenges for sustainable and clean environment
BS705	Food borne pathogens
BS706	Immunological methods in biochemical and chemical analysis
BS707	Molecular markers and genomics for crop improvement
BS708	Oxidative stress and redox modifiers in disease management
BS709	Cancer- hallmarks, pathogenesis, microenvironment and therapeutics (previously *Overview of cancer*)
BS710	Plant genetic engineering
BS711	Advances in genome biology
BS712	Principle and practices in structural biology
BS713	Advanced instrumentation for bioanalysis and imaging
BS714	Molecular biology methods in tuberculosis and thyroid cancer

Annexure-II

BARC

PGD in Physical Science
(Program Code: PHYS00)

SYLLABUS

PHYSICAL SCIENCES

Course work for Training School Officers (OCES)

The course work structure is divided into 5 foundation courses (A1-A5), 9 core courses (B6-B14), 3 experimental and laboratory courses (C15-C17) and 2 elective courses (D18, D19), as given in Table-1. The topic ‘Research methodology’ is explicitly included as a part of the course work (C16) as per the requirement of UGC. Total lecture hours are 490 + 75 tutorials and 7 weeks duration for a mini project (C17). Total credits are 60 as per the requirement of HBNI. Detailed course structure for individual subjects is provided separately. Some specific issues are as follows:

Research Methodology and methods of Experimental Physics

The course work includes specific topics related to ‘research methodology’ that are not covered elsewhere in the syllabus. These include design, analysis and presentation of scientific projects, objectives and planning of research, literature survey, statistical methods, mathematical modeling, documentation and presentation, laboratory safety and research ethics. Other topics in are related to the experimental techniques in areas such as vacuum, low temperature, X-ray, neutrons, spectroscopy, lasers and accelerators.

Mini Project

As regards the Mini Project (C17), it is understood that the project will be carried out after the completion of the trimester and allotment of trainees to various units of the DAE. The mini project will run concurrently with the elective courses.

Elective Courses

The elective courses are organized under five broad groups as shown in Table-2, which also provides the list of Divisions of BARC involved in closely related R&D activities. This grouping has been done so as to help a TSO to select an elective course that will help him/her to obtain advanced training required for the R&D work to be carried out in the division where he/she is allotted. Such grouping will ensure minimum number of students opting for a given elective course.

It is recommended that the two elective courses in respect of a TSO will be chosen in the following manner:

Elective-1: This elective will be from the group to which the Division of joining of a TSO belongs to (*cf.* Table-2).

Elective-2: This elective can be chosen from any of the other groups depending on the interest of the TSO.

Training School Physics Committee will advise the TSOs on the selection of the elective courses.

Elective-1: This elective will be from the group to which the Division of joining of a TSO belongs to (*cf.* Table-2).

Elective-2: This elective can be chosen from any of the other groups depending on the interest of the TSO.

Training School Physics Committee will advise the TSOs on the selection of the elective courses.

FOUNDATION COURSES

PY 501: Mathematical Physics

Symmetries and groups: Point groups, abelian and non-abelian groups, characters, representations of simple groups, Lie groups, symmetric groups, braid group

Functions of a complex variable: Analytic and multi-valued functions, Cauchy residue theorem and complex integration, Riemann surfaces, applications to fluid mechanics and quantum mechanics.

Ordinary differential equations (ODE): Linear and nonlinear first-order equations, classification of ODEs, linear independence and Wronskian, singular points, Frobenius series solutions for second-order differential equations, Green function, system of ODEs, phase portraits, hypergeometric and confluent hypergeometric equations, relation with special functions

Partial differential equations: Classification, characteristics, method of integral transforms, Green functions for Poisson equation, diffusion equation, wave equation, Helmholtz equation

Integral equations: Fredholm, Volterra, Abel integral equations, solutions by Liouville-Neumann, Fredholm method, Hilbert-Schmidt theory, Sturm-Liouville problems

PY 502: Quantum Mechanics

Background: Recollection of the experimental facts exposing limitations of the classical theory; Bohr model: Quantization of angular momentum, Schrodinger's approach to building a new theory leading to Schrodinger equation; Wavefunction, Statistical Interpretation; Probability, Normalization.

Formalism: Postulates of quantum mechanics: Representation of a state as a vector in Hilbert space; Scalar products; Dirac's bra and ket notation, Schwarz's inequality and linear operations on Hilbert space; representation of observables as hermitian operators; adjoints, eigenvalues and eigenvectors; hypothesis of measurement; Uncertainty relation as a consequence of Schwarz's inequality and the concept of minimum uncertainty states. Quantum mechanics in coordinate and momentum space representations and their relationship.

Quantum mechanics in 1-dimension: Free particle and wave packet, phase and group velocities, completeness; Uncertainty principle, minimum uncertainty, Ehrenfest's theorem; Step potential, transmission and reflection coefficients, transfer matrix;Particle in a well/box, density of states; Simple Harmonic Oscillator potential, creation and annihilation operators.

Quantum mechanics in 2-dimensions; Simple harmonic Oscillator potential, isotropic and non-isotropic.

Quantum Mechanics in 3-dimension: Angular Momentum; Angular momentum algebra; Free particle in 3-d; Particle in central potential; Hydrogen atom; Virial theorem, Feynman-Hellmann theorem;

Identical Particles: Two particle systems; Pauli's principle, Fermions and Bosons; Spin of an electron

Approximation methods: Wentzel-Kramers-Brillouin (WKB) method, Time-independent perturbation theory for non-degenerate as well as degenerate Hamiltonians; Variational method; Time-dependent perturbation theory.

Scattering theory: Lippmann-Schwinger equation, Born approximation, optical theorem, Eikonal approximation, method of partial waves.

PY 503: Statistical Physics

Background: Revision of main results of thermodynamics

Formalism: Introduction to micro-canonical, canonical and grand canonical ensembles with examples for each, derivation of Fermi-Dirac and Bose-Einstein distribution for a quantum ideal gas, Specific heat of a degenerate Fermi gas, Blackbody radiation, Bose-Einstein Condensation.

Phase transitions: Introduction to phase transitions, notion of continuous and discontinuous transitions, Landau Theory-Mean field and Gaussian fluctuations.

Monte Carlo Techniques and applications: Introduction to Monte Carlo methods, Metropolis algorithm, Application to numerical integration, application to Ising Model.

Applications: BBKGY equations, Vlasov equation, Saha ionization formula, Statistical nuclear physics

Irreversible processes: Master equation, Brownian motion and Langevin equation, Fluctuation-Dissipation theorem and calculation of friction constant

PY504 : Electromagnetic Theory

Background: Overview of EM theory and revision of basic concepts. Role and scope of EM theory and its applications.Laws of induction.Induced fields.Displacement current.Maxwell's equations in vacuum and media.

Electrostatics and Magneto-statics: Boundary value problems. Separation of variables Numerical methods.Finite difference representation of Poisson's Equation. Relaxation methods and Successive Over Relaxation Method (SOR)

Maxwell's equations: General solutions of Maxwell's Equation and Electromagnetic radiation. Electromagnetic waves in free space. General time dependent solutions of Maxwell's Equation: Wave-guides and cavities. Microwaves.Dipole Radiation.Bremsstrahlung.Cyclotron.Radiation as a diagnostic tool.

Propagation of electromagnetic waves through matter: reflection of waves in bounded media. Phase velocity; group velocity; wave equation; continuity theorem; Brilliouin diagram for empty cavity, etc.; Generation of modes in a cavity/waveguide; TEM, TE, TM modes; mode creation and identification. Boundary conditions; Generation of an electric field in an empty cavity; dispersion relation; frequency mode evaluation, etc.

Potentials and Fields: Gauge transformations. Retarded potentials.Lienard-Wiechert potentials.

Relativistic electrodynamics: Lorentz Transformations. Four Vectors.Covariant and contravariant tensors.Electrodynamics in Tensor Notation.Relativistic Potentials.Invariance.

Dynamics of charged particles in Electromagnetic fields: Orbit theory. Drifts (ExB, grad B perpendicular and parallel to B).Adiabatic invariance.Magnet mirror.

PY 505: Computational Physics

Computer Programming: Introduction to Linux, Programming in Fortran, Introduction to C and Parallel Processing, Hands on experience at the computer, Data plotting using programs such as gnuplot.

Numerical Methods: Errors in Numerical Methods, Data Statistics & Curve Fitting, Interpolation and Extrapolation, Integration of Functions, Solution of System of Linear Equations, Solution of Nonlinear Equation or Root Finding, Solution of Ordinary Differential Equations, Solution of Partial Differential Equations, Solution of Integral Equations.

Project Assignments: various realistic physics problems to be solved using numerical algorithms coded into programs to be run on the computer.

CORE COURSES

PY 601: Nuclear Physics

Background: Basic properties of nuclei, systematic of nuclear ground states (low lying states) properties, size, shape, electric and magnetic moment, nuclei away from the line of stability, isomers, nuclear decay, symmetries.

Nuclear Forces: Phenomenological description of nuclear forces, deuteron problem, N-N scattering, microscopic description, meson theory of nuclear forces, N-B interaction with fundamental degrees of freedom, nuclear resonances, quarks and gluons, QCD and chiral symmetry, colour quantum number, standard model, GUT.

Nuclear structure: Multipole composition of radiation, transition matrix, selection rules for multipole transitions, collective and single particle excitations, shell and collective models, giant resonances, high spin states and shape deformations, relativistic mean field theory, Fermi gas model, weak interaction, beta decay, neutrino interaction and oscillations.

Nuclear reactions: Definition of cross-sections, phase shifts, low energy behavior and astrophysics, compound nucleus theory, optical model, statistical model, direct reactions, heavy ion reactions and fission, semiclassical description of nuclear reactions, impact parameter representation, Galuber model, relativistic heavy ion collisions, energy density and rapidity, equation of state of QGP and hadronic matter phase transition, QGP in RHIC, LHC, experimental signatures.

Applied nuclear physics: RBS, NRA, NAA, AMS etc.

5. *Introduction to Elementary Particle Physics*, E. Griffiths (Wiley, New York 1987).
6. *Introduction to High Energy Heavy Ion Collisions*, Cheuk-Yin Wong (World Scientific).

PY 602: Atomic, Molecular and Laser Physics

Atomic and Molecular Physics

Background of atomic and molecular structure: Energy level structure, effect of external electric and magnetic fields, Rydberg and autoionizing levels, Nuclear effects: hyperfine structure and isotope shifts, Radiative and non-radiative

processes, Born-Oppenheimer approximation, Vibrational, rotational and electronic spectroscopy of diatomic molecules including selection rules and intensities. Frank-Condon principle, Rotational and vibrational, Raman spectroscopy.
Molecular symmetry and group theory: Groups, Symmetry operations, Point groups, Character tables, Application to molecular problems.

Polyatomic molecules: Rotational energy levels and nuclear spin statistical weight effect, Vibrational spectra of polyatomic molecules: normal modes, energy levels and selection rules, types of bands, group theoretical treatment, inversion, torsional vibrations, etc. Designation of electronic states of diatomic molecules, coupling cases, Molecular orbital theory.

Accelerator based atomic/molecular physics: Spectroscopy with Synchrotron radiation: VUV and soft X-ray spectroscopy of atoms and molecules, photo-ionization /dissociation/ fragmentation, inner shell processes, techniques of electron spectroscopy, Beam foil spectroscopy and Collinear fast beam spectroscopy with ion accelerators.

Laser spectroscopy: Atomic/molecular beam and vapour sources, Theory and practice of Doppler-limited spectroscopic techniques: absorption, fluorescence, opto-galvanic, opto-acoustic spectroscopy. Non-linear and Doppler-free laser spectroscopy: Saturated absorption, polarization and two-photon spectroscopy. Multi-photon and multi-step processes and spectroscopy: Multi-step Resonance excitation/ionization, Multi-photon absorption/ionization.

Applications of laser spectroscopy: Trace analysis, Laser isotope separation, Laser cooling and trapping, Ion traps.

Laser Physics

Theory of Optical Resonators: Resonator modes, Stability criterion, Gaussian beams and their propagation.
Principles of laser oscillation: Pumping mechanisms, Rate equation for three/four level laser systems, Population inversion, Gain coefficient and threshold population inversion, Gain clamping, Single mode and multimode oscillations, Spatial and spectral Hole burning.

Intense and ultra-intense lasers: Techniques for generation of short laser pulse, Q-switching and mode-locking including active/passive schemes, Chirped pulsed amplification.

Types of Lasers: Solid state lasers- Nd:YAG, Ti:S; Gas and metal vapour Laser, Dye lasers, Semiconductor lasers and Diode pumped solid state lasers.

Non-linear Optics: Classical theory of nonlinear response, Wave propagation in nonlinear media, General properties of polarizability tensor, Three wave mixing– Second harmonic generation, Phase matching condition, Sum and difference frequency generation, Optical parametric oscillator and amplifier, Four wave mixing: Third order non linearity, Intensity dependent refractive index, Third harmonic generation, Elementary treatment of stimulated Raman scattering, Stimulated Brillouin scattering, Self phase modulation, and Optical phase conjugation.

Laser Applications: Laser Fusion, Laser accelerators, Laser material processing

PY 603: Plasma Physics and Technology

Background: Introduction to Plasma, the fourth state of matter, collective behaviour, charge neutrality, space and time scales. Concept of plasma temperature, Debye length, plasma frequency, plasma parameters. Debye shielding, plasma sheath and dielectric properties, plasma in nature and laboratory: elementary concepts of thermal, nonthermal plasmas, laser produced plasmas, non-neutral plasmas.

Basic processes in plasmas: Collisions in plasmas, significance of small angle scatterings, ionisation, recombination, concepts of diffusion, mobility, ambipolar diffusion. Thermal ionisation and the Saha equation, LTE and equilibrium models.

Plasma Theory: Fluid theory of plasmas, single & multi fluid approximations, generalized Ohm's law. MHD equations, Waves and instabilities in plasmas.

Plasma production and diagnostics: Various plasma production techniques, Electrical breakdown in gases using dc, rf, microwave and high frequency fields, Glow and arc discharge. Langmuir probes, magnetic probes, spectroscopic diagnostics, active and passive techniques.

High temperature plasma applications: controlled thermonuclear fusion, Introduction to thermonuclear fusion, fusion reactions, cross sections, radiative processes in plasmas, energy loss, Lawson criterion, break even and ignition, magnetic and inertial confinement scheme and devices, emission of X rays and neutrons, fusion plasma diagnostics.

Low temperature plasma applications: plasma processing of materials, Physics of high and low pressure plasma sources and applications to materials processing, brief review of plasma based surface coatings in low pressure and high pressure plasmas Plasma applications to metal cutting, melting, spraying and waste processing in nuclear, space and semiconductor industries.

PY 604: Physics of Materials and Surfaces

Background: Symmetry, nature of bonding, crystalline structure and classification, 2D and 3D lattice types, symmetry tables, constraints on physical properties by symmetry, diffraction for structure studies, nuclear and magnetic scattering, small angle scattering.

Lattice vibrations and phonons: Debye model, dynamical matrix, acoustic and optical branches, outline of experimental techniques, like neutron inelastic scattering, Raman and Brillouin scattering; special features in phonon spectra like softening, Kohn anomaly, etc.

Molecular dynamics simulation technique: simulations as a function of pressure and temperature.

Electron states, independent particle picture and periodic boundary conditions, metal-insulator-semiconductor bands, Fermi surface, relation to many electron system and total energy, exchange-correlation terms, relation to experiments like photoemission, optical absorption, etc.

Magnetism: Magnetic materials, types of magnetic ordering and interactions, principles of adiabatic demagnetization and cooling, magnetic domains, linearized spin waves in ferromagnets.

Superconductivity: Meissner effect, energy gap, London equation, type-I and type-II superconductors, vortices, tunneling junctions, outline of modern superconductivity theories, new superconducting materials.

Semiconductors: Intrinsic and extrinsic semiconductors, p-n junction and its applications, heterostructures and semiconductor superlattices.

Dielectrics and Ferroelectrics: Dielectric relaxation and loss, ferroelectric and related materials, comparison with ferromagnets.;

Introduction to surface structures, stability and reactivity.Surface reconstructions and relaxation.Surface processes: Physisorption and chemisorptions.

Surface modification techniques: Physical vapor deposition (thermal evaporation, electron beam, laser ablation, sputtering, molecular beam epitaxy), chemical vapor deposition. Self-assembled monolayers, Langmuir-Blodgett techniques.

Surface characterization techniques: Morphology (optical, scanning electron, atomic force, scanning tunneling and tunneling electron microcopies); Structure (low energy electron diffraction, high energy reflected electron beam diffraction, grazing x-ray diffraction); composition (X-ray photoelectron spectroscopy, energy dispersive X-ray analysis, Rutherford back scattering, secondary ion mass spectrometry).

PY 605: Reactor Physics and Technology

Basics Neutron Physics Concepts: Fission process, Definition of flux, current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section. International Nuclear Data files & processing for reactor application.

Steady State Neutron Transport Equation: Transport equation : Differential & integral forms, Diffusion approximation, One speed neutron diffusion theory, Boundary conditions, Source-sink problem, Sub-critical reactors with flux independent source, K-infinity, four factor formula, Critical reactor and concept of K, Separation of space and energy.

Homogeneous Reactor: Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector savings.

Slowing Down and Energy Dependence: Elastic scattering, Inelastic scattering, Anisotropy, average energy loss per neutron, Concept of lethargy. Fermi age theory, age of neutron, Logarithmic energy decrement, Slowing down spectra, Slowing down in hydrogen, Definition of resonance integral, Shape of thermal neutron-Maxwell spectrum.

Resonance Absorption: Resonance cross sections, Resolved and unresolved region, Spatial and energy self shielding, Narrow resonance and intermediate resonance approximation, Concept of potential scattering cross section, Resonance integral in homogeneous media, Doppler broadening of resonance.

Multi-group Diffusion Theory: Energy group and group fluxes, Flux weighted group constants, One group theory for thermal neutrons, Two group theory, Two group two region model core with reflector.

Reactor Kinetics: Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, One group delayed neutrons, One dollar of reactivity, Prompt criticality.

Reactor Control: Cold start-up, Hot power operation, Temperature loads, Effects of burnup and fission products. Function of control rods. Theory of control rods, Xenon load during operation, Xenon iodine concentrations after shutdown, Xenon override, Xenon poison out condition, Samarium poisoning. Temperature coefficient of reactivity, Density temperature coefficient.

Experimental reactor physics aspects: Neutronic Instrumentation (source and power range monitors/detectors); Neutron Sources - requirement vis a vis reactor type (eg external localised sources in LWRs & Fast Reactors; internal distributed spontaneous fission/photo neutron sources in PHWRs) ; Approach to criticality in different reactors; different steps of initial start up in different reactors (research and power reactors); Low power experiments for validation of reactor physics evaluations - subcritical and critical experiments; experimental determination of reactivity coefficients; General methods of flux measurement - foil/wire activation methods; spectrum unfolding; differential measurements for reaction rates; Dynamic methods for reactivity evaluation - power run-down experiments and period measurements; Process parameter measurements using neutronics - eg., coolant flow measurement with N-16 gamma signals; Delayed neutron and noble gas fission

Nuclear Fuel Cycles: Uranium-Plutonium, Uranium-Thorium. Brief Description of Nuclear Reactors like PHWRs, AHWR,VVER, HTR and FBR. Brief discussion of Accelerated Driven Subcritical System (ADSS)

PY 606: Accelerator Physics and Technology

Basic Accelerator Physics

Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons; intersecting storage rings; ion sources.

General equations of motion in a combined electric and magnetic field, in Cartesian co-ordinate system; in cylindrical co-ordinate system; beam rigidity; relativistic expressions.

Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.

Expression for vertical betatron frequency; expression for horizontal betatron frequency; weak focusing principle; stop bands.

Tunes and Resonances in betatron oscillations; imperfection resonances; sum and difference resonances; non-linear resonances; tune diagram; working point of an accelerator; general design of a cyclic accelerator.

Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;

Matrix techniques in beam optics; first order transfer matrix of dipole/quadrupole, transfer matrix of a drift space; quadrupole doublet; condition for double focusing; other focusing conditions; aberrations; second order transfer matrix; matching and design of beam transport systems.

Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters

Strong focusing principle; analysis of betatron frequencies using matrix technique; condition for strong focusing; lattice design.

Momentum compaction; Longitudinal stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.

Physics of synchrotron radiation sources; spectrum of emitted radiation; Schwinger's expressions; brilliance of a source; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators, FEL; fundamental wavelength.

RF Linacs

Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.

Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac

Transit time factor and the energy gained in a linac.

Longitudinal stability; stability criteria; separatrix ; synchronous oscillation with small and large amplitudes; longitudinal wave vector; time period; phase damping; acceleration through v=c traveling wave linac and damping phenomena; acceleration conditions therein etc.

Transverse stability; stability criteria; impulse due to radial field; focal strength of a radial defocusing impulse.

Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.

General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature structures; superconducting structures (SC); general advantages of SC systems over room temperature ones; Breakdown mechanisms in SC cavities.

Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac

Introduction to space charge effects.Linear space charge and KV envelope equations.

Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Applications: Accelerator Driven Systems.

High power DC and pulsed electron accelerators

Electron emission processes; thermionic cathodes; field emission; explosive field emission.

Pulse power systems; Marx generators; Tesla transformer, transmission line spark gaps; induction linac.

Relativistic electron beam generation, propagation and applications in generation of microwaves, neutrons, ion beams and X-rays.

Industrial DC electron accelerators.

PY 607: Astrophysics

Introduction to Astrophysics and Astronomy: Celestial sphere, coordinate system, time references, cosmic-rays, multi-wavelength observations.

Astrophysical Objects: Stars, clusters, galaxies, x-ray binaries, pulsars, supernova remnants, active galactic nuclei etc.

Non Thermal Universe: Cosmic-ray spectrum and composition, Cosmic emissions at keV-TeV energies, first order and second order Fermi acceleration, diffusive shock acceleration.

Experimental Techniques in Astronomy: Gas filled detectors, solid state detectors, satellite based experiments, ground based experiments, extensive air showers, simulation studies, atmospheric Cherenkov technique.

Fundamentals of Radiative Transfer: Electromagnetic spectrum, radiative flux, specific intensity and its moments, basic equations of radiative transfer, bremsstrahlung, synchrotron and inverse Compton process, proton-proton collision, neutral pion decay, proton-photon interaction.

Theory of Accretion: Spherical accretion, Eddington luminosity, disc accretion and its basic equations, equations for structure of discs and their standard solution.

Jets and Outflows: Microquasars, Blazars and Radio Galaxies, radiation emission from jets, Doppler boosting, Lorenz transformations, observed spectra and spectral models.

Note: First four topics (with first three references) constitute the regular 15 lecture course (See Table-1) while all the topics together constitute the 30 lecture course (see Table-3).

PY 608: Electronics

Digital Electronics

Overview of Digital Integrated Circuits: Boolean Algebra and Truth Tables, Integrated circuit Families and their applications, Digital Gates, Flip-Flops, Counters, Multiplexer, Memories.

Number system: Binary, Octal, Hexadecimal with examples. Conversion from one to the other.

Half Adder, Full Adder, 4 bit Adder/Subtractor.

Digital Computer Systems: Basics of Digital computers, 8085 microprocessor architecture and interfacing of memory and I/O peripheral devices.

Buses: Synchronous, Asynchronous. Basics of ISA and PCI buses

Interface standards: RS232, USB; basic protocol, voltage levels, data transfer rate, length etc.
SCADA – Overview

Analog Electronics

Overview of Electronic Devices and Circuits: Diodes, Zeners, Transistors and FETS. Switching Circuits.

Linear Integrated Circuits: Characteristics of OP AMP, Applications of OP AMP (Amplifier, Integrator, Differentiator etc) and Comparator.

Power Supplies: Linear and Switch Mode Power Supplies, High Voltage and Power supplies.

Data Converters: Sampling Theorem, Analog to Digital Converters, Digital to Analog Converters, Sample and Hold Circuits

3. *Electronic Principles,* A. P. Malvino, 7th Edition (Tata McGraw-Hill Publishing).

PY 609: Health Physics and Radiation Detectors

Part-I: Nuclear and Radiation Detectors

Interaction of radiation with matter: Energy loss of heavy charged particles in matter – Electronic stopping power (Bohr and Bethe-Bloch formulae), Cherenkov radiation.Energy loss of electrons and positrons: Electronic stopping and energy loss by bremsstrahlung radiation,Interaction of photons: Photoelectric absorption, Compton scattering, pair production, Electromagnetic shower in high energy photon and electron interaction with matter**,** Interaction of Neutrons: elastic scattering, radiative capture, positive Q-value reactions such as (n,p), (n,a), (n,fission) and hadron shower production at high energies.

Radiation detectors: General characteristics of detectors: efficiency, response in energy, time, position and corresponding resolutions, recovery time or count rate handling capability**,** Gas detectors: Basic processes, Q-V characteristics as a function of primary ionization, charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter. Large area MWPC, PPAC.Semiconductor detectors: Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium detectors (planar and cylindrical geometry). Photovoltaic cells, charged coupled devices.Scintillation detectors: Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes**,** Compton suppressed high purity germanium detectors for high-resolution gamma spectroscopy,Miscellaneous detectors:Cryogenic detectors, thermal detectors, channeltrons and microchannel plates, plastic track detectors, hybrid detectors.

Experimental techniques: Electronics modules for pulse processing: Preamplifiers(charge, voltage sensitive), amplifiers (spectroscopy or high resolution, fast and timing filter), timing discriminators(leading edge and constant fraction types), gate and delay generators, coincidence(fast and slow) units, linear gate and stretchers, scalers and rate dividers, SCA, TAC, ADC, QDC, TDC, MCA, computer based data acquisition systems (DAQ). Particle identification methods (dE-E telescope, pulse shape discrimination, Cerenkov radiation), time of flight technique, magnetic spectrometers including recoil mass separator.Monte Carlo simulation of detectors.

Part-II: Health Physics

Introduction: Radiation sources, quantities and units: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given). Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given), Exposure dose relationship, Bragg-Grayprinciple.

Biological effects, Radiation Protection and Regulation: Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell.Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Importance of radiation protection programme in DAE. Types of exposure (natural, occupational, medical and public).National and International regulatory bodies, their role and responsibilities. Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems).Latest recommendations of ICRP-103.Fundamentals of ICRP respiratory model (only basics), entry through ingestion, GI track model (only basics).Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Radiation protection and measurement (External and Internal): Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources.Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area monitoring, air monitoring. bioassay, whole body counting and Liquid Scintillation Spectrometry (LSS) techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures: Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation.

Nuclear Accidents, Emergency Preparedness and Management: Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

Industrial Safety (Non radioactive): Principles of industrial safety and industrial hygiene; legislation related to health and safety and major hazard control.

PY 610: Engineering Drawing and Workshop Practices

Overview of Engineering Drawing

Drawing Instruments, Standards and Codes: Introduction; Drafting Instruments-Drawing board, T-square, Set-square, Compass, Dividers, Scales, French curves and Drafting machines; Various Indian and International standards and codes related to drafting.

*Sheet Layout and Sketching***:** Sheet layout; Sheet sizes; Scales and scale drawing.

*Types of drawing***:** Assembly drawing- General assembly drawing, Schematic assembly drawing, Exploded assembly drawing; Sub assembly drawing; Part drawing; Production drawing; Drawing for manual and catalogue.

*Lines, Lettering and Dimensioning***:** Introduction; Types of lines; Types and sizes of letter; Dimensioning- Types, Terms and notations, Placing of dimensions, Unit of dimensioning, general rules and practical hints on dimensioning.

*Orthographic Projection***:** Introduction, principle of projection; Methods of projection, Orthographic projection, Planes of projection, First angle projection, Third angle projection, B.I.S. code of practice and conventions employed.

Sectional Views: Introduction; Cutting plane line; Types of sectional views- Full section, Half section, Partial or broken section, Revolved section, Removed section and Offset section; Sectioning conventions; Hatching or section lines and conventions of section lines.

*Tolerances, Limits and Fits:*Introduction;Linear and angular tolerances; Tolerance zone – limits and deviations; Tolerance sizes, Standard tolerance grades; Geometric tolerances; Classification of fits – Clearance, Transition and Interference; System of fits – Hole basis and Shaft basis.

Surface Parameters: Surface texture; Surface irregularities; Surface roughness assessment methods; Roughness grades – symbols, values and grade numbers; Principle reasons for controlling the surface texture; Factors affecting the surface roughness; Disadvantages of excessive roughness; surface roughness achievable from different manufacturing process.

Computer Aided Drafting: Introduction; Benefits and limitations of CAD; Hardware and software of CAD system; AutoCAD–Brief introduction; Drawing environment, layout and sketching; How to access commands;Getting help; Starting a drawing**-**Existing drawing & New drawing**;** Basic settings – Units, Scale, Limits**,** Grids, & Snap**;** Elements of drawing-Line, Multi-line, Rectangle, Polygon, Curve, Circle, Donut, Points, Sketch, Spline, Ellipse, Hatch & Fill;Object Properties - Line type, Colour and Layer; Undoing mistakes;Drawing accurately; Viewing and Editing commands– Zoom, PAN, Move, Align, Rotate, Copy, Mirror, Array, Offset, Trim, Extend, Chamfer, Fillet and Erase;Text; Dimensioning and Printing / Plotting of drawing. Brief introduction of Solid modeling software and its command.

Threads and fasteners: Introduction; Parts of threads; Forms of threads; Single and multiple start threads; LH & RH threads; Brief introduction of bolts, studs, screws, plain & spring washers, set screw and split pin.

Overview of Workshop Practices

Manufacturing Process: Introduction; Classification of manufacturing process- Machining, Joining and Forming.

Metal Cutting using machine tools: Introduction; Theory of metal cutting; Process of metal cutting; Single point and Multipoint cutting tools; Tool signature; Machine reference system; Commonly used metal cutting machines, its parts and related operations / processes viz. Turning, Drilling, Boring, Milling, Shapers, Planer, Grinding etc.

*Unconventional machining operations***:** Introduction; Various types of machines and its operations viz. AJM, USM, ECM, EDM, EBM, and LBM.

*Metal Cutting using hand tools***:** Introduction; Various types of hand tools, its parts and related machining operations viz. saws, Files, Hand drills, Taps, and Reamers.

*Metal Forming***:** Introduction; Various types of forming tools, its parts and related forming process viz. Rolling, Bending, Spinning and Drawing.

*Joining Methods***:** Introduction; Various metal joining tools and related processes viz. Soldering, Brazing and Welding; Various types of demountable joints, flanges and coupling.

PY 611. Research Methodology and Methods of Experimental Physics

Research Methodology: Definition and characteristics of research,Objectives, importance and planning of research, types and stages of research, scientific methods, accessing scientific literature, *Experimental design*: control of errors, calibration of instruments, data analysis,*Statistical methods*:Definition of precision, accuracy, systematic and random errors**,** propagation of errors in experimental data and their estimation, estimation of confidence level.*Mathematical modeling*: measurement of functional relationships, order of magnitude analysis, function fitting, *Documentation*: preparing scientific papers/reports and presentations, *Laboratory safety*: Safe practices, *Research ethics:* acknowledgment of the source of ideas, awareness of plagiarism and other scientific misconducts.

Vacuum Techniques: Definition of Vacuum, Basic theory of Gas dynamics**,** Importance of Vacuum for various experiments, Low temp, Accelerators etc.**,** Flow Regimes in vacuum systems**,** Line Conductance, Calculation of pump-down time**,** Pumps and their ranges: Rotary vane pumps, Diffusion pumps, Ion pumps, Cryo-pumps, Sorption pumps, Gettering pumps**,** Vacuum Gauges in various ranges: Thermal Conductivity gauges, Ionization gauges, Ultrahigh vacuum gauges**,** Vacuum valves**,** Design of vacuum systems**,** Leak detection

Low Temperature Techniques: Requirement of Low Temperature *techniques* for experiments, Heat transfer mechanisms at low *temp*: conduction, convection and radiation, Thermal properties of materials at low temp: Sp. Heat, Thermal conductance etc.Thermodynamic properties of liquid cryogens, Liq. $N_2$and Liq. He, Low *temp* thermometry, Design of small scale laboratory cryostats: Material selection, their properties, Vacuum components, type of measurements, Superconducting magnets, Various inserts, Experiments at low temp: Transport properties, Magnetic properties, Faraday balance, Vibrating Sample magnetometer, SQUID, A.C. Susceptibility, Torque magnetometry

X- ray and Neutron Techniques for Condensed matter studies: Neutrons and X-rays as probes for condensed matter. Complementarities of the techniques**,** Neutron and X-ray sources: Nuclear reactors, Spallation Neutron Sources, Laboratory X-ray sources, Synchrotron X-ray sources**,** Elastic scattering of neutrons and X-rays. Experiments and examples**,** Inelastic scattering of neutrons. Dynamics in solids**,** Possible inelastic experiments in synchrotron sources using X-rays

Laser-Raman and Infrared spectroscopy: Theory of Raman spectroscopy, Laser Raman spectrometer, Molecular symmetry and Raman active modes, Some typical examples, Theory Infrared spectroscopy, Fourier Transform IR (FTIR) Instrument, Typical examples. Comparison with Laser-Raman spectroscopy, IR experiments in synchrotron sources

Laser and Laser spectroscopy Techniques: *Laser diagnostic techniques*: measurement of energy/intensity/power, pulse width, bandwidth, polarization etc. Synchronization of laser pulses, optical alignment. *Laser spectroscopy*: Techniques of some laser spectroscopy experiments in brief i.e. Intracavity laser absorption spectroscopy, CRDS, fluorescence, Saturation absorption spectroscopy, optical pumping and double resonance techniques, Design and implementation, maximization of signal, calibration of frequency

Plasma Physics and Technology: Understanding operation of plasma torches: construction of plasma torches, I-V characteristics of arcs, requirement of I-V characteristics of power supplies for plasma torches, gases suitable to be used for production of plasma, method of ignition of plasma, water cooling systems, interlocks etc. Determination of temperature in thermal plasma jets by spectroscopy techniques.

Experiments in accelerator physics and nuclear physics.

ELECTIVE COURSES

Elective Courses in General Physics

PY 701: Special topics in Mathematical Physics

Difference equations: Homogeneous linear difference equations (constant-coefficient equations, linear independence, initial and boundary-value problems, Euler equations, generating functions, eigenvalue problems); Inhomogeneous linear and nonlinear difference equations

Local analysis: Singular points, local behaviour of solutions at irregular singular points of homogeneous linear equations, inhomogeneous linear equations, asymptotic relations, asymptotic series, approximate solutions of nonlinear differential equations, nonlinear autonomous systems, singular points of difference equations and local behaviour of solutions, regular and singular perturbation theory, perturbative eigenvalue problems

Global analysis: Boundary layer theory (examples, mathematical structure, simple boundary layer problems), Multiple-scale analysis (resonance and secular behaviour, formal theory, examples), Floquet theory of stability, Mathieu equation, Fermi-Pasta-Ulam problem

Reference

1. *Advanced Mathematical Methods for Scientists and Engineers*, C. M. Bender, S. A. Orszag (Springer, 2010).

PY 702: Selected Topics in Classical Mechanics

Basic concepts: Principle of least time, connection with Huygens principle, optics-mechanics analogy – the basic ideas of Hamilton's mechanics, Euler-Lagrange equations and Hamilton's equations, applications

Transformation theory of mechanics: Generating functions, contact transformations, canonical transformations, canonical group, motion in phase space, Poincaré-Cartan invariant, action-angle variables, adiabatic invariance, examples

Integrable systems: One degree of freedom, Liouville-Arnold theorem, dynamical systems, more than one freedom, noncanonical variables

Canonical perturbation theory: Resonances, classical perturbation theory, adiabatic perturbation theory, secular perturbation theory, applications

Near–integrable systems: KAM stability, three-body problem, applications to celestial mechanics, plasma physics

References

1. *Regular and chaotic dynamics*, A. J. Lichtenberg and M. A. Lieberman (Springer, 1992).
2. *Chaos in dynamical systems*, E. Ott (Cambridge University Press, 2001).
3. *Classical dynamics - a contemporary approach*, J. V. Jose, E. J. Saletan (Cambridge University Press, 2002).

PY 703: Chaos and Nonequilibrium Statistical Mechanics

Introduction: Laws of mechanics and the law of large numbers, Boltzmann ergodic hypothesis, Gibbs' mixing hypothesis, problems in modern nonequilibrium statistical mechanics

Boltzmann and Liouville equation: Derivation, H-theorem, Kac ring, diffusion, BBGKY heierarchy, Poincare recurrence theorem, Birkhoff ergodic theorem, mixing systems, distribution functions

Green-Kubo formulae: Linear response theory, van Kampen's objections, Green-Kubo formula for diffusion

Nonlinear maps: Baker map, Boltzmann equation for Baker map, Bernoulli sequences, irreversibility, Arnold cat map, Kolmogorov-Sinai entropy, Pesin's theorem, Markov partitions, Frobenius-Perron equation

Open systems: Smale horseshoe, escape-rate formalism, thermodynamic formalism for chaos, transport coefficients, deterministic diffusion, Sinai-Ruelle-Bowen measures, entropy, Gallavotti-Cohen fluctuation formula

Dynamical foundation of Boltzmann equation: Lorentz gas, Sinai formula, Lorentz-Boltzmann equation

References

1. *An introduction to chaos in nonequilibrium statistical mechanics*, J. R. Dorfman (Cambridge University Press, 1999).
2. *Chaos, scattering, and statistical mechanics*, P. Gaspard (Cambridge University Press, 1998).

PY 704: Nonlinear Dynamics

Introduction to Nonlinear Dynamics: Introduction to nonlinear dynamical systems (continuous-time): local and global bifurcations, Explanations of Feigenbaum sequence and other routes-to-chaos through standard maps. Characterization of chaos: fractal dimension and other measures; Feigenbaum universal constants. Nonintegrable Hamiltonian dynamics: KAM theorem, Transition from regular to chaotic state, KAM Torus Breakdown.

Instabilities and chaos of periodically forced nonlinear oscillators: Harmonic and various subharmonic resonances. Period doubling, tripling, quadrupling, n-tupling bifurcations, Synthesis of bifurcation structure: recurrent features. Multistability and basins of attraction; Crises of chaotic attractors.

Examples of bifurcations and chaos in laboratory-scale systems: Feigenbaum sequence, multistability and crises in lasers, Instabilities and chaos in electronic circuits, Fluid dynamical instabilities in natural circulation thermal hydraulics and in plasma. Dynamical diseases: cardiac and neurological. Introduction to soliton wave propagation.

Control and synchronization of nonlinear phenomena: Control of Chaos-theoretical concepts, Control of multistability and multi-state hopping intermittency, Coupled nonlinear dynamical systems: various modes of synchronization, secure communication.

Experiments and Numerical projects: Hands-on experience on analyzing various types of bifurcations, crises, chaos, multistability, noise-induced intermittency etc with nonlinear electronic circuits. Computations of subharmonic bifurcation curves of the periodically forced nonlinear systems.Analysis of nonlinear phenomena in the case of autonomous nonlinear systems.

PY 706: Stochastic Physics

Classical theory of Brownian Motion*: Langevin's Formulation***:** Motion of a particle in a fluid; Continuum theory of viscous drag; Molecular fluctuations- resolution into mean and fluctuating force; Langevin's equation for a free particle; Force correlations and ensemble averaging; Approach to equilibrium; fluctuation dissipation theorem; implications; Stochastic motion of a harmonically bound particle. *Random-walk Model*: Markov process; Simple Markovian random-walks; position distribution using Fourier transforms; Levy flights; asymptotic law of root mean square displacements; continuous time random walks; random walk with memory; Monte-Carlo techniques of random walk simulations. *Passage to Differential equation*:Concept ofTransition probability;Constraints on moments;Integral formulation; Derivation of phase space Fokker-Planck equation (FPE); special solutions. *Diffusion approximation***:** Moments Equations of FPE; Closure problem; Reduction to diffusion equation; Discussion on boundary conditions.

Nucleation and Coagulation theory: *Homogeneous nucleation theory*: Thermodynamics of phase equilibrium; Free energy of a spherical drop; concept of critical size; Free energy barrier; cluster size distribution; detailed balancing; derivation of nucleation rate-Becker-Doring theory; Zeldovich Factor; Lifshitz-Slozov theory; Experimental studies on homogeneous nucleation rates; multi-component and ion-induced nucleation. *Mathematical theory of coagulation*: Onset of irreversibility post nucleation; The absorption condition; Derivation of formulae for Kernels; Smoluchowski's formulation of colloid coagulation; Integro-differential formulation; scaling theory; self-preserving distributions; Classification of Kernels; Gelation condition; numerical approaches; Practical examples in aerosols. *Escape over barrier*: Transition state theory; Kramer's rate formula.

Growth Models: *Aggregation theory*: fractal concepts; compact and fractal aggregates; mathematical and statistical fractals; Ballistic Aggregates; Eden clusters. *Fractal aggregates:*Diffusion limited growth; Mullins-Sekerka instability; Diffusion Limited Aggregate (DLAs); Witten-Sanders Model; spectral, walker and chemical dimensions; Current state of understanding of DLAs; Cluster-cluster aggregation Model; Relation to coagulation problem; dynamic scaling theory. *Numerical simulation techniques*: Lattice and off-lattice simulations; Monte-Carlo techniques.

Elective Courses in Nuclear and Accelerator Physics

PY 707: Selected Topics in Nuclear Physics

Brief introduction to heavy ion fusion reactions: General features, Energy dependence at low energy, Limitation at high energy

Decay of the compound nucleus and the statistical model analysis: Bohr hypothesis and Hauser-Feshbach evaporation model, Optical model, Transmission coefficients, Nuclear level densities (NLD)

Particle evaporation spectra and nuclear level densities: Evaporation spectra of neutron and charged particles, Experimental measurements, Extraction of NLD from evaporation spectra

Electromagnetic decay of excited nuclei: Electromagnetic interaction in nuclei – a brief introduction, Single particle and collective gamma transition

Brief introduction to giant resonances in nuclei: Giant resonances – definition, Energy and width systematic, Macroscopic and microscopic description – brief treatment, Giant Dipole Resonance (GDR) in deformed nuclei

Giant Dipole Resonance in excited nuclei: Brink-Axel hypothesis, GDR on excited states in proton capture reactions, GDR in hot nuclei formed in heavy ion reactions

Properties of GDR from high energy gamma spectra using statistical model: Inclusion of GDR emission in statistical model, Measurement of high energy gamma spectra – detectors, experimental procedures, Extraction of GDR information from measured spectra using statistical model, Shape evolution and fluctuation of hot rotating nuclei

Experiments with radioactive Ion Beams (RIB) and future directions: Production of RIB – different methods, GDR in exotic nuclei

4. *Theoretical Nuclear Physics*, A. de Shalit and H. Feshbach (Wiley, NY 1974)

PY 708: Advanced Accelerator Physics & Technology

Proton and Heavy Ion Accelerators:DC Accelerators, Linacs, Cyclotrons, Synchrotrons etc,Positive and negative ion sources, Ionization, Recombination, Charge transfer and other processes in ion sources, Beam extraction, Low energy beam transport - matching to an accelerator, Radio Frequency Quadrupole, DTL, CCDTL and CCL, High Current Accelerators, Introduction to ADS Systems, Linacs for ADS. Normal and Superconducting accelerator structures, Space charge effects, Waveguide resonators etc.

Gigawatt Pulsed Power and Industrial Electron Accelerators: Electron emission processes and technology of cathodes, Electron gun design and related areas. Gigawatt to Terrawatt power pulsed electron guns, beam transport, HPM generation, Flash X Ray generation and applications. DC and RF Industrial Electron Accelerators- sub systems and applications

Beam Dynamics and advanced accelerators: Beam emittance, Liouville's theorem, Beam transfer lines, FODO cells, quadropole triplet, phase space matching, emittance dilution, Synchrotrons & Storage Rings, Synchrotron Radiation (SR) Sources, Linac Based SR Sources.
New Accelerators: Free Electron Lasers, Laser Acceleration, Plasma Beat Wave Accelerators

4. *Accelerator Physics,* 2nd ed., S.Y. Lee (World Scientific, 2004)
5. *Free Electron Lasers*, C. A Brau, (Academic Press, Oxford, 1990)

PY 709: Introduction to Neutrino Physics

The course is intended to introduce the basics of neutrino physics. By the end of the course it is hoped that one will be able to appreciate the intense activity worldwide in thisfield. A brief exposition of a non-invasive method of monitoring fissile materials using neutrinos will also be given.

Present understanding of fundamental particles and their interactions: neutrinos and their properties. Weak decays such as nuclear beta decay, muon and pion decay. Higher order processes such as double beta decay in nuclei.

Neutrino sources: Stellar (including the sun and supernovae), atmospheric, natural radioactivity, reactors and particle accelerators

Interactions of neutrino with matter: charged and neutral current processes, quasielastic and deep inelastic scattering

Neutrino oscillations: two flavour oscillations in vacuum and matter, three flavor oscillations

Some key experiments in neutrino physics: discovery experiments of ν_e,ν_μ,ν_τetc.; what has been learnt and what we do not yet know; ongoing and planned experiments

3. *The Neutrino Matrix*, APS Multidivisional Study Group report (2004)

PY 710: High Energy Astrophysics

Introduction to Astrophysics and Astronomy: Celestial sphere, coordinate system, time references, cosmic-rays, multi-wavelength observations.

Astrophysical Objects: Stars, clusters, x-ray binaries, pulsars, supernova remnants, active galactic nuclei etc.

Non Thermal Universe: Cosmic-ray spectrum and composition, Cosmic emissions at keV-TeV energies, first order and second order Fermi acceleration, diffusive shock acceleration.

X- ray and Gamma-ray emission: Observed spectra from galactic and extragalactic sources, bremsstrahlung, synchrotron and inverse Compton scattering, IC spectra from optically thin and thick sources, electron-positron pair physics, thermal electrons and radiation, non-thermal electrons and radiation, gamma-rays from proton-proton and proton-photon interactions.

Theory of Accretion: Spherical accretion, Eddington luminosity, disc accretion and its basic equations, a alpha prescription of viscosity, equations for structure of discs and their standard solution.

Jets and Outflows: Microquasars, Blazars and Radio galaxies, radiation emission from jets, Doppler boosting, Lorenz transformations, observed spectra and spectral models.

Experimental Techniques in Astronomy: Satellite based experiments, ground based experiments, extensive air showers, simulation studies, atmospheric Cherenkov technique.

Elective Courses in Atomic, Molecular, Laser and Plasma Physics

PY711: Synchrotron Radiation and its Applications

Production and properties of SR: Physics of production of SR, general properties and advantages of SR, Storage rings, properties of bending magnet radiation, important relations/equations, Radiation from insertion devices (Wiggler, undulator), FELs, Historical development and current scenario, overview of Indus-1 & Indus-2.

Basics of Beamline Instrumentation: Considerations in optical design of beamlines, Special requirements in VUV, Soft-X-ray, Hard X-Ray, IR, types of monochromators, Mirrors, gratings, detectors, vacuum systems, electronics etc.

Experimental Techniques: Overview of typical experiments carried out at synchrotron facilities, brief introduction to various techniques, Spectroscopy (VUV, soft X-ray/hard X-ray spectroscopy, PES, ARPES, IR, THz), Scattering (Diffraction, crystallography, small angle scattering, Inelastic X-ray scattering, etc), Imaging (X-ray imaging, IR imaging, Microscopy, Lithography), Special techniques utilizing the polarization or time structure of SR

Atomic, Molecular & Cluster Physics using SR: Physics of autoionisation, Rydberg states, superexcited states, chemical dynamics, advantages of using SR to study these phenomena. Techniques: Photoabsorption, photoionization, fluorescence, PES (incl. ZEKE, MATI, etc.), Laser + SR, coincidence experiments, etc: Basic principles, design of experimental stations, information obtained. Recent developments & current status of the field internationally. Currently available facilities & ongoing research programs of AMPD at Indus-1(PPBL, HRVUV, photoabsorption studies of stable gases/free radicals, matrix isolation spectroscopy, etc.; Beamline & experimental stations planned at Indus-2.

PY 712: Selected Topics in Atomic and Molecular Physics

Coherent spectroscopy: Transition from Doppler to sub-Doppler to natural linewidth to sub-natural linewidth, theory and practice of sub-natural linewidth spectroscopy, atomic frequency stabilization techniques, error signals and stability, applications of coherent spectroscopy including slow light generation.

Physics with trapped ions and atoms: Techniques ofion-traps (Paul trap, linear quadrupole trap etc) and atom traps (magneto-optical trap, dipole trap), ultra-precision measurements of atomic parameters and fundamental constants, quantum jumps and parity violation in atoms/ions, quantum degenerate gases, ultra-cold molecules.

Atoms and molecules in intense fields: Multi-photon processes in atomic and molecular systems, cross-sections, Intense and super-intense laser-atom/molecule interaction, pondermotive force, Keldysh parameter, above threshold ionization, high harmonic generation, atomic stabilization, theoretical techniques involving Floquet and split operator methods, experimental techniques. Atoms in high magnetic fields.

PY 713: Advanced Photonics

Review of wave optics: wave-particle duality concepts and experiments, Maxwell's equations, wave equation for light. Light propagation in conducting and non conducting medium, sources of light, characteristics of light (coherence and polarization), light in bulk materials.

Basics of lasers: emission and absorption of light, Einstein coefficients, population inversion, threshold condition, laser beam characteristics and parameters.

Fiber and non-linear optics: Reflection and refraction at plane wave interface, total internal reflection, TE and TM polarization, Goos-Hanchen shift, modes in optical waveguides, step index and graded index fibers, fiber in optical communication, fiber amplifiers and fiber lasers. Non-linear optics of materials, when and how non-linear response arise, dispersion relations, phase matching conditions, second and third harmonic non- linear optical effects, frequency mixing, Kerr effect and electro-optics effect. Applications of non-linear optics

Introduction to nanophotonics: Optical materials from bulk to nano-scale, why nanophotonics, light scattering mechanism in nano-scale structures, optics of quantum dots, nano-plasmonic crystals, surface plasmons, Fermi-Golden rule, photon density of states, different approaches to fabricate nanophotonic structures, application of nanophotonics.

Meta-materials: What are meta-materials, classes of materials and their exotic properties, photonic band gaps, one, two and three-dimensional band gaps for light, wave equation in photonic crystals, different methods to calculate photonic band structure, origin of band gap, spontaneous emission in photonic band gap, nanophotonics switching, optics of cavities, experimental realization of photonic crystals, different characterization techniques.

PY 714: Quantum Optics and Information

Quantum theory of radiation: Quantum states of radiation field, non-classical states, squeezing, photon statistics, correlations, noise properties of light.

Quantum theory of light-atom interaction: Optical Bloch equations, quantum theory of damping and master equation, dressed atom approach, quantum theory of lasers, coherent control, electromagnetically induced transparency.

Ultra-cold atoms and quantum degenerate gases: Laser cooling and trapping of atoms, interactions involving ultra-cold atoms, ultra-cold quantum gases, Bose-Einstein condensation, Gross-Pietavskii equation.

Elements of Atom optics: Atom optical elements, atom interferometry, non-linear atom optics, quantum atom optics.

Elements of Quantum information: Entanglement and its measures, quantum measurement, quantum teleportation, quantum communication, physical realization of quantum computer.

PY 715: High Power Lasers and Applications

Basics: Coherence, Resonator modes, Gaussian & Non-Gaussian beams, propagation through optical systems, beam quality, focusing, atmospheric propagation effects and adaptive optics techniques.

Nonlinear optical processes: Second Harmonic Generation, Third Harmonic G with pulsed and cavity enhanced CWorking lasers, Parametric generation, SRS, Two-photon absorption, Self-focusing and Self phase modulation, Nonlinear optical effects in optical fibers.

Types of lasers: Excitation techniques & Laser properties in different media: Gas (He-Ne, CO_2, Excimer, Cu Vapor, Chemical), Solid state : (Nd:YAG, Nd:Glass, Yb:YAG), Semiconductor diode, Free Eelectron Laser. Tunable lasers: Dye, Diode, Ti:Sapphire, Optical Parametric Oscillator, Frequency selection & tuning techniques, frequency stabilization.

Laser dynamics & pulse generation: Brief recapitulation of Relaxation oscillations, Q-switching, cavity dumping

Ultrashort pulse generation: Mode locking, Group Velocity Dispersion compensation in Kerr Lens Modelocking cavities, Pulse compression.

Power scaling: Special resonators, Pulsed laser amplifiers (CO2, Nd:YAG/Glass, Dye, CVL, Master Oscillator Power Amplifier chains) – gain saturation, efficiency, spectral narrowing, Injection locking. Diode laser arrays & amplifiers, Diode Pumped Solid State Lasers, Fiber lasers

Ultrashort pulse amplification and compression: Chirped pulse amplification in Ti:S, Opt Para CPA, regenerative amplifier, multipass amplifier – typical system architectures.

Applications: Laser Ionization Spectroscopy – applications in science & technology. Laser requirements and system architecture. Material processing, Reflection, transmission & absorption of laser beams in materials, ultrafast material processing.

High intensity laser interaction with materials: Basic phenomenology of: High intensity effects, High order harmonic generation, production and acceleration of charged particles, laser induced nuclear reactions, X-ray lasers, Laser fusion.

PY 716: Laser-Matter Interactions and Applications to Advanced Material Processing

Introduction to Laser Matter Interaction; Basics ofPulsed, Ultrashort and CW lasers typically employed for Laser processing; Mode Locking, Kerr Lens Modelocking, Pulse Compression, Chirped Pulse Amplification

Surface Characterization, Measurement & Diagnostic Techniques: (i). SEM, Optical microscope, X-ray Diffraction Technique (XRD), Atomic Force Microscopy (AFM), X-ray photoelectron spectroscopy (XPS), Electron probe X-ray micro-analysis (EPMA), Auger electron Microscopy (AES) Energy Dispersive X-ray spectroscopy (EDX), Differential Thermal Analysis (DTA) Surface Profilometer Surface hardness, Micro-indentation test

Plasma and Vapour diagnostics: Time of Flight (TOF), Langmuir Probe, LIBS, TRLIF etc.

Laser diagnostics: Short pulse – autocorrelator, FROG (frequency resolved optical gating), SPIDER (spectral phase interferometry for direct electric field reconstruction), Spatial profilometer- array detector

Laser Matter Interaction: Excitation Mechanisms, and Relaxation Times, Multiphoton Excitation, Photochemical Process- Catalytic Effects, Photophysical & Thermal Processes ; Heating & Surface melting, Evaporation

PY 717: Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique

Basics: Necessity for plasma simulation. Approaches to plasma simulation, fluid and kinetic theory methods, examples of physical systems appropriate for each of the different approaches.

Introduction to the PIC method: The mathematical model. The physical model, Principles of finite differencing, Converting Maxwell's equations into their finite difference form.

Solution of Maxwell's equation: Interative methods for solving Poisson's equation, Solution of curl equations using FDTD method, The concept of superparticles, Weighing methods, Shape factor, Realtion between particles and fields.

Self consistent charge and current density: Lorentz force integrator with and without magnetic fields. The computational cycle.Electrostatic programs.Electromagnetic programs.

Sources of errors and stability

PY 718: Nonlinear Plasma Theory

Basics: Revision of linear theory, including Langmuir waves, ion-acoustic waves, Alfven waves, waves from local pulsed source, Cerenkov emission and Kelvin wakes, wakes in ion-acoustic waves, Vlasov equation, Chandrasekhar equation, cold plasma waves, Landau damping.

Nonlinear waves: beams of non-interacting particles, ordinary progressive waves, waves in weakly dispersive media, Korteweg de Vries equation (KdV), solitons, Analytical solution of the KdV equation, Ion-acoustic wave overturn

Nonlinear wave-wave interaction: Three wave processes, dispersion laws and decay spectra, triads, Manley-Rowe conservation laws and nonlinear superposition, analogy with Euler equations for rigid bodies, resonant interactions between plasma waves, many-wave interaction in random phase approximation, nonlinear explosive instability, Interaction of low-frequency waves with high-frequency waves, plasma turbulence, kinetic equation and instabilities.

Wave-particle interaction: Statistical preliminaries, Random phase approximation, quasilinear diffusion equation in two and three dimensions, single and many waves, quasi-linear theory of some instabilities, non-resonant wave-particle interaction, effect of transverse waves on ions, quasilinear theory of Alfven wave turbulence.

Nonlinear wave-particle interaction: Electron plasma oscillation turbulence, nonlinear theory of the drift instability, and the effect of thermal fluctuations.

Elective Courses in Condensed Matter Physics

PY 719: Modeling and Simulations in Physics

Basics: Modeling in different domains: Continuum, Mesoscopic, Atomistic and Quantum descriptions, Setting up a computer experiment: Starting structure and dynamics length and time scales

Electronic structure Theory: Many-body Schroedinger Equation, Born-Oppenheimer approximation, Hartree-Fock theory and Slater Determinants, Density Functional theory(DFT)
Thomas-Fermi and Exchange and Correlation(and different xc types)

Methods of Solution: Basis sets: Gaussian and Plane Wave, Analytic gradients and Hessians, The potential surface, Geometry optimization, Transition state calculations.

Simulation Methods:***Monte Carlo (MC):***Monte Carlo integration, Averaging procedure in various ensembles, Importance sampling, Metropolis scheme, ***Classical Molecular Dynamics (MD):*** Newtonian, Lagrangean and Hamiltonian dynamics, Basic algorithms, Time averages and ensemble averages, Molecular Dynamics in various ensembles, Interatomic potentials (pair potentials and beyond), Force-fields and their parameterization, Handling long-range forces, Analysis of Simulation results, ***First Principles MD:*** Born-Oppenheimer Molecular Dynamics, Car-Parrinello Molecular Dynamics (CPMD), Mermin functional and Free Energy MD (FEMD), ***Hybrid schemes:*** Combined classical MD and DFT – hybrid QM/MM schemes, ***Reactive schemes:*** General problem in chemical reactions, Path sampling methods, Blue Moon ensemble approach, Metadynamics

Beyond DFT: Time dependent DFT, Dynamical Mean Field Theory, GW-Approximation

Quantum Chemistry Methods: Configuration interaction, Many-body perturbation theory, Moller-Plesset perturbation theory, Multi-Configuration self consistent field theory, Coupled cluster theory

PY 720: Selected topics in Condensed Matter Theory

The course will deal with the theory and application of quantum mechanical and atomistic lattice dynamics and computer simulations to model, understand, and predict the properties of real materials. It is designed for students in Physics, Chemistry, Engineering and Materials Science interested in (i) the modeling of the properties of materials with advanced quantum mechanical and atomistic techniques and (ii) experimentalists using theory for the interpretation and analysis of complex experimental data. The course will have a strong focus on applications. However a minimal background in quantum mechanics and solid state physics (or equivalent) will be required.

First principles calculations of the total energies, electronic structure and phonon spectra: Density functional theory, Electronic structure calculations, Lattice vibrations, Theoretical calculations for the interpretation and analysis of experimental Raman, infrared, neutron and synchrotron data.

Lattice dynamics calculations and molecular dynamics simulations of complex solids: Microscopic to Macroscopic: From phonon spectra to thermodynamic properties. Studies of phase transitions, thermodynamic properties and melting at extreme conditions of pressure and temperature.

Project work: First principles calculations of the total energies, Electronic structure Calculations, Calculations of crystal structure, long-wavelength phonons, elastic constants, Calculations of the Phonon density of states, Calculations of the thermodynamic properties

PY 721: Organic Semiconductor Devices

Introduction to organic semiconductors: Organic materials: bonding, hybridization, conjugation and origin of semiconducting properties, Comparison of inorganic and organic semiconductors, types of organic semiconductor: molecular and polymeric, donor and acceptor materials, molecular ordering, light absorption and emission, different charge carriers and excitations, charge carrier injection: organic metal contacts and interfaces, charge transport models: tunnelling, Schottky, Poole-Frankel, space charge limited conduction, variable range hopping etc.

Organic thin films and their characterization: ***Preparation techniques***:*Thin/thick film*: Drop casting, doctor blading, spin casting, screen printing, inkjet printing, chemical polymerization, electrochemical polymerization and interfacial polymerization, physical vapour deposition, *Monolayer/multilayer*: Self-assembly, Langmuir-Blodgett and electrografting. ***Characterization techniques***: *Spectroscopic techniques*: UV/Vis, Raman spectroscopy, Fourier transform infrared spectroscopy (FTIR), X-ray photoelectron spectroscopy, Auger electron spectroscopy, electron energy loss spectroscopy (EELS) etc. ***Structure and surface analysis techniques***: X-Ray diffraction (XRD), low-energy electron diffraction (LEED), SEM, TEM, AFM, NSOM, confocal microscopy and contact angle measurements. ***Thickness measurements***: x- ray reflectivity (XRR), ellipsometery and profilometer. ***Electrical characterization***: current-voltage measurement and impedance analysis.

Organic devices: ***Molecular electronics***: Basic concepts of molecular electronics, making contact to single molecule molecular and self-assembled monolayer, molecular rectifiers, molecular resonant tunnel diodes, molecular memory, molecular transistors. ***Organic electronics***: Fabrication and characterization of organic field effect transistors and organic light emitting diodes. ***Organic solar cells***:Solar spectrum, interaction of photons with materials, solar cell operational parameters, bulk hetrojunction polymer solar cells, small molecule based solar cells and dye sensitized solar cells. ***Organic gas sensors*:** Gas sensors and their necessity, interaction between toxic gases with organic films, fabrication and characterization of chemi-resistive gas sensors.

PY722: Single Crystal Growth and Devices

Introduction: History, importance, applications and scope of single crystals and related devices.

Transportation, nucleation, growth and thermodynamics: Phase diagram, material synthesis and characterization of synthesized materials.Transportation of reactants to the growth surface.Absorption at the growth surface and nucleation (first order phase transformation) thereafter.Growth of nucleus (minimization of Gibbs free energy due to interplay of entropy and enthalpy).

Single crystal growth techniques: ***Growth from the liquid-phase*****:** From melt**,** Czochralski growth technique**,** Bridgman, Float Zone**, *From solution*:**TSSG (top seed solution growth)**,** Aqueous solution growth**, *Growth from vapour phase***:PVD**,** MBE**,** Thermal evaporation technique**,** Electron-beam evaporation technique**,** CVD**,** MOCVD

Characterization: ***Crystallography***: Symmetry operations and crystal structure determination (single crystal XRD).Orientation and topography (Laue back reflection method).***Crystal defect analysis***: Point defects, Dislocation lines, Sub-grain boundaries.Defect formation during single crystal growth.***Electronic structure and Electrical properties***: Band structure (theory and first principle calculations).Electrical and thermal conductivity.Luminescence properties: Photo-luminescence process**,** Thermo-luminescence process, Scintillation process

Specific single crystals and related devices: ***Scintillator/phosphor single crystals*****:** Doped alkali halides**,** CsI:Tl, NaI:Tl, $LaBr_3$:Ce etc**,** Doped and un-doped Oxide**,** LBO, LSO, BGO, YAP etc**,** Gamma detectors**,** TL readers**. *Optical Window*:** Fluorides, Sapphire**, *Solid state laser crystals***:YAG, Sapphire, Double tungstates**,** Laser cavity (diode pumped)**, Non-linear crystals**: KDP, BBO, LBO etc**,** Second harmonic generation**,** SAW devices**, *Ferroelectric crystals*:** $BaTiO_3$, $LiTaO_3$ etc**,** Remote temperature sensors**, *Semiconductor crystals***: Si, Ge, GaAs etc**. Superconductors:** $YBa_2Cu_3O_{7-\delta}$, $Bi_2Sr_2CaCu_2O_{8+\delta}$ etc

PY 723: Advanced Magnetism and Superconductivity

Magnetism: Types of phase transitions- first and second order; Examples of magnetic and superconducting phase transitions

Type of magnetic exchange interactions: Direct exchange, Indirect exchange, Superexchange, Double exchange, RKKY exchange, D-M interaction, Dipolar interaction, etc.

Classification of magnetic systems: Diamagnetism, paramagnetism, ferromagnetism, ferrimagnetism, antiferromagnetism, superparamagnetism, spin-glass, cluster spin-glass, metamagnetism, modulated spin structures, etc.; Magnetic ordering under external perturbations such as magnetic field, pressure, ion irradiation, quenched disorder, etc

Low dimensional magnetism: 1D, Quasi-1D, 2D, and Quasi-2D.

Spintronics; Magneto-caloric effect; Gaint magnetoresistance (GMR) and colossal magnetoresistance (CMR); Magnetic nanoparticles, molecular magnetism

Superconductivity: Thermodynamics of Superconductors; London Theory–A phenomenological approach to understand Superconductivity; Application of London theory – Electrodynamics of Superconductors; Ginzburg – Landau Theory - Origin of vortex state, vortex structure, flux pinning; Josephson effect

Co-existence of superconductivity and magnetism

Neutron scattering in magnetism and superconductivity

PY 724: Neutron as a Probe of Condensed Matter

The short-range strong interaction of neutron with matter and its inherent magnetic moment of neutron make neutron scattering a unique probe in condensed matter research. The other important advantage of neutrons over other forms of radiation in the study of structure and dynamics on a microscopic level are they are uncharged, which allows them to penetrate the bulk of materials. They interact via strong nuclear force with the nuclei of the material and the scattering cross section varies randomly between various elements and even between isotopes. This allows one to observe light atoms such as hydrogen in the presence of heavier ones and distinguish neighbouring elements in the periodic table easily. One can exploit isotopic substitution and contrast variation methods. Matching wavelength and energy of thermal neutron to the lattice spacing and excitations in condensed matter makes it an indispensable tool to both study structure and dynamics. Over and above neutron has a magnetic moment that suits to study magnetic structures and the fluctuations and excitations of spin systems.

Why neutron scattering? basic properties of neutron; Basics principles of Neutron Scattering, Neutron scattering cross-section, correlation functions, coherent and incoherent scattering, Principle of detailed balance, magnetic scattering, polarized neutron.

Neutron sources: Reactor and spallation, Moderation of neutrons.

Structural study by Diffraction: Cross section, structure factors, Scattering of neutrons by atoms, Diffraction by crystals and polycrystals, Extinction and absorption, Experimental technique for diffraction, Principles of magnetic scattering, Investigation of magnetic materials, Diffraction by gases, amorphous materials and liquids.

Small-Angle Neutron Scattering: Scattering from general Two Phase Systems, Scattering from Fractal Aggregates, Nuclear vs. Magnetic Scattering, Small-Angle Neutron Scattering Instrumentation (Experimental Aspects, Data Treatment), Analysis of Small-Angle Neutron Scattering Data (Model Independent Analysis, Model Dependent Analysis, Contrast Variation),
Applications (Nanomaterials, Colloids, Biological Systems, Porous and Fractal Structures)

Neutron Reflectometery: Theoretical aspects of neutron reflectivity from Stratified Media, specular reflectivity from thin films and multilayers, description of Rough Multilayers, Reflectivity on Non-Magnetic Systems, Neutron Reflectivity on Magnetic Systems, Polarized Neutron Reflectometry on Magnetic Systems, instrumental setup for neutron reflectivity, Off-Specular (diffuse) reflectivity

Dynamics in condensed matter: ***Deterministic***: Basic Lattice Dynamics and Neutron Inelastic Scattering**:** Theoretical lattice dynamics (LD): Debye model, dynamical matrix, acoustic and optical branches. One phonon scattering, phonon dispersion relations: monoatomic and diatomic crystals, Incoherent scattering: phonon density of states, Coherent scattering. ***Stochastic (Diffusion)*****:** Theoretical formalism of quasielastic neutron scattering (QENS), self and distinct van Hove correlation functions. Different kinds of motions and contributions to scattering law, different model for translation motion: continuous diffusion, jump diffusion and localized translational diffusion. Different models for rotational motions:continuous rotational diffusion on a circle, jump rotation among N equivalent sites on a circle and isotropic rotational diffusion on a surface of a sphere.Instruments and methods for quasielastic neutron scattering, general aspects of data analysis, examples of QENS studies.

Elective Courses in Condensed Matter Physics

PY 726: Advanced Reactor Physics

Neutron Transport theory: Various formulations of neutron transport theory: Integro-differential equation, Integral equation, surface integral equation, invariant imbedding theory; Transport equations for special geometries; Numerical methods for solution of transport equation: Energy groups and group cross sections, Pn method and diffusion theory, Discrete ordinates and discrete Sn methods, Collision probability and related methods and their applications, Method of characteristics; Adjoint equation, perturbation theory, variational method.

Numerical methods for solution of the Multi-group neutron diffusion equation: Finite difference method and nodal methods

The Monte Carlo method: Random numbers: methods of generation and properties tests for randomness; Methods for sampling distributions; Mechanics of particle transport; Source and criticality problems; Errors and variance reduction methods.

Methods for burnup and control rod worth calculation

Reactor Dynamics: Point kinetics: point kinetics equations, Stability Analysis, Linear Stability theory, Routh's stability criterion, Root-Locus method, Nyquist plot, Non linear stability analysis; Space dependent reactor Dynamics and related topics; Accident analysis for thermal and fast reactors

Reactor Noise and its applications: Stochastic kinetics and zero power Reactor Noise, Power reactor noise, Reactor Noise in Accelerator Driven Systems

PY727: High Energy Density Physics: Theory

This course is intended for those interested in acquiring basic knowledge in the physics of matter existing at very high temperatures and / or densities as occurring in inertial confinement fusion system, astrophysical objects etc.

Introduction to High Energy Density Physics (HEDP): Static and dynamic high pressures, parameters defining High Energy Density, Laboratory generation of HED matter using lasers and particle beams, Basic processes involved in HEDP.
Hydrodynamic and shock waves: Hydrodynamic flow of compressible fluids, Equations of gas-dynamics, Euler and Lagrange formulation, Rarefaction and Compression Waves, Rankine-Hugoniot Relation, Hugoniot curves, self similar solutions, artificial viscosity, numerical methods.
Equation of State and radiation opacities: Thermodynamic properties of Gases, Entropy, Thermodynamic Equilibrium and Equipartition, Specific Heats and Thermodynamic Exponent, Thermodynamics of Condensed Matter, Gamma-Law Equations of State, Matter At High Pressures, Thomas-Fermi Theory, Radiation opacities and emissivities, Rosseland and Planck means, models to calculate opacities.
Radiation Hydrodynamic: Radiation Transfer Equation, Equilibrium Diffusion Limit, Non-equilibrium Diffusion, Marshak Waves, Three-Temperature Model, Radiation matter coupling, Basic radiation hydrodynamic equations, approximate solutions, Numerical Methods
Hydrodynamic Instabilities: Rayleigh–Taylor, Richtmyer–Meskov & Kelvin–Helmholtz Instabilities, Fluid-Dynamics Description, R-T Instability with Two Uniform Fluids, Effects of Viscosity, Effect Density Gradients
Inertial Confinement Fusion: Fusion reaction, Thermonuclear burn and ignition schemes, central hot spot ignition, fusion Energy gain, direct and indirect ICF Schemes.

PY 728: High Energy Density Physics: Experimental

Physics of High Energy Density Effects in Matter: Tensor representation of strain and strain. Linear and nonlinear waves, ideal shock wave; Rankine Hugoniot relations, Shock representation in x-t and p-u_p plane, p-x and p-t plots, entropy and temperature under shock compression. Interaction of Shock waves, reflection of shock wave from rigid boundary etc. Development of rarefaction waves, interaction involving rarefactions, Negative pressures/ isentropic compression in materials.

Energy Storage Systems, Energetic Materials and Applications: Various Types of Energy Storage Systems and their Characteristics. Ideal detonation (ZND model); Chapman Jouget (CJ) pressure and density; detonation interaction.Concept of reaction zone; effect of diameter on detonation velocity, detonation failure diameter, effect of density/ temperature.Initiation, critical energy fluence, run distance versus pressure, impactor thickness and diameter effect on impact initiation. Wave shaping and lens design. Single stage gas gun, two stage light gas gun, propellant gun; electric gun and, rail gun. Ultra high magnetic field and magnetic pressures using flux compression generators. Pulse radiation, lasers and particle beams. Z-pinch, Gas-Puff and Plasma Focus devices for Thermonuclear Fusion.

Diagnostic Techniques and Data Interpretation: Measurement of shock velocity; particle velocity and stress history; shock temperature, sound velocity behind shock front; shock overtaking experiments. Velocity measurement using Displacement, VISAR, Fabry-Perot interferometers. Macroscopic measurements in shock compressed materials. Inductive Loops, Rogowski Coil, Voltage Dividers, Faraday Rotation. Visible and x-ray spectroscopy, Faraday cup, Thomson Parabola, X-ray, Ion and Neutron Imaging. Determination of equation of state, Hugoniot elastic limit, phase transition pressure and spall from experimental data. *Ab-initio* calculations for determination of isotherm, Hugoniot and phase transition pressures for interpreting the experimental shock wave data.

PY 729: Nuclear Data Physics for Advanced Nuclear Applications

Introduction to nuclear physics data: Types of Nuclear data, Variation of cross section with energy, Simple nuclear interactions theory, Measurement and model based predictions, Transmission experiment for total cross section, measurement of differential scattering cross section, Time-of-flight method, sources of errors in measurement, Optical model, Statistical model etc., exposition to SAMMY, EMPIRE. Training in online retrieval of data using Indian Mirror Website: www-nds.indcentre.org.in.

Representation of nuclear data : General purpose and special purpose ENDF libraries, Sub libraries for neutron, photon and charged particle interactions, Radioactive decay data, Fission product yields, formats and procedures, Tabulated and parametric representations in ENDF, Mathematical formalisms for Resonance representation viz. , single and multi-level resonance formalisms, Rieche-Moore, R-Matrix formalism, Breit- wigner formalism, interpolations schemes.

Nuclear data processing: Steps for processing evaluated data, linearization, resonance reconstruction, tolerances, Doppler broadening, , importance of target temperature for Thermal scattering data, Group averaging, PREPRO code systems, SIGACE package.

Multi-grouping: Multigrouping techniques, Energy groups and limits, considerations for grouping, , weighting functions: flux and current weighting, self-shielding, anisotropy and Legendre moments, group-to-group transfer cross sections, GROUPIE/GROUPR, transport cross section, group collapsing , Photon production cross section, Photo-atomic interaction cross sections, GAMINR, activation cross sections, coupled neutron-gamma cross section sets,
Continuous energy data for Monte Carlo codes (ACER), Nuclear data for ADSS applications (MATXSR).

Concept of critical facility; AHWR CF, Difference between critical facility and actual reactors, ICSBEP criticality benchmarking, Illustrati ons with benchmarking of KAMINI, PURNIMA-I and PURNIMA-II in the US-DOE ICSBEP International Handbook.

Exposure to Error Propagation and sensitivity studies, Variance-Covariance error matrix in nuclear data, Propagation of errors in assessment of uncertainty margins. Philosophy and mathematics of adjustment of cross sections to fit integral data from critical experiments.

PY 730: Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport

Solution of transport equation: P_N method (Plane and curved geometries)**,** Discrete ordinates method (Plane and curved geometries, Quadrature sets)**,** Collision probabilities methods Collision probability method in 1-D and 2-D geometries, Interface current method, Characteristics method. Discrete ordinates methods in 1-D, 2-D and 3-D geometries.Diamond differencing scheme.Solution procedures**.**

Neutron thermalization: Neutron scattering laws, Scattering from mono-atomic gas, bound-atom scattering, Liquid moderators, Nelkin model.

Treatment of resonances: NR, IR and WR approximations, Sub-group method

Solution of time dependent transport equation: Differencing of time dependent transport equation, Point kinetic equations, Space-time kinetics, Adiabatic approximation. IQS; explicit andimplicit time differencing methods

Solution of the fuel depletion equations: Formalism of the detailed burnup chain, Formulation of fuel depletion equations, production-destruction of actinides and fission products, branching ratios **,**Solution of the burnup equations, Constant flux and constant power approximations. Solution for decay heat and other potential reactor applications

Monte Carlo methods: Exposition to neutron and particle tracking principles

PY 731: Accelerator Driven Systems

Neutron Source: Various types of accelerator based neutron sources and their properties: Electron accelerator based source, spallation source and fusion source - advantages and limitations.

The spallation process: Theory and mechanism, various types of targets and projectiles. Neutron yield, energy spectrum, angular and spatial distribution in the target. Spallation products; Heat distribution; Codes in use.

Spallation target: Thermal hydraulics of spallation targets: heat removal and suitable coolants; Radiation damage in window and other structural materials; Windowless designs; Radioactivity of coolant / target.

Sub-critical Reactor: Neutron multiplication in sub-critical reactors, source importance, Ks, Keff and reactivity; Power and power distribution in ADS; Considerations in deciding the degree of sub-criticality of an ADS.

Theoretical Techniques and analysis: Transport theory and Monte Carlo methods: computer codes for ADS analysis; Nuclear data requirements and sources; Burnup and its effect on fuel and core properties; ADS kinetics and safety issues – comparison with critical reactors.

ADS related experiments: Measurements of parameters, Reactor noise in ADS.

Comparative study: Breeding in critical reactors and sub-critical ADS, Fuels and fuel cycles for ADS.

Waste transmutation: Issues in waste management, Waste transmutation in different types of reactor systems, Advantages of ADS.

ADS Types: Proposed ADS types for power generation, breeding and waste transmutation.

NON-SUBJECT ASSIGNMENTS

PY 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

PY 592:

Experiments

PY593: Mini

Project

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.

1. Mathematical Methods (PY1) : (45 lectures)

S.No	Course content
1.	Linear vector spaces, linear dependence and independence, basis and dimension. Linear transformations. Inner product, norm, continuity, convergence, completeness. Hilbert spaces.
2.	Fundamentals of matrices, eigenvalues, eigenfunctions, adjoints, inverse etc sparse matrices; diagonal dominance; non-positive and non-negative matrices; positivity theorems; large set of simultaneous equations.
3.	Functions of a complex variable. Rieman surfaces, Analytic functions Cauchy Rieman conditions and harmonic functions. Contour integration and Cauchy's integration formula. Residue theorem and evaluation of integrals.
4.	Ordinary differential equations - Order and degree of a differential equation, appearance and number of arbitrary constants in the solution of a n-th order differential equation, families of curves and orthogonal trajectories, first order homogeneous and exact equations, methods of reduction of order of some specific differential equations, second order linear homogeneous equations, superposition principle, method of finding second independent solution when one solution is known, qualitative properties of the solution, Sturm comparison theorem, operator methods for second order linear equation with constant coefficients, power series solution for second order linear equations, ordinary and regular singular points of a differential equation, indices corresponding to a regular singular points, hypergeometric and confluent hypergeometric equation, explicit example through solution of Bessel's equation.
5.	Partial differential equations – First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations, system of surfaces.
6.	Integral equations – Definition, homogeneous, inhomogeneous, linear, non-linear equations, Fredholm and Volterra equations, eigenfuctions, Schmidt-Hilbert method of solutions.
7.	Integral Transforms. Fourier, Laplace Transforms and the inverse transforms, connection to physical problems Other transforms such as Mellin and Hankel transforms, and transforms generated by Green's function. Applications for obtaining solution of ordinary/partial differential equations.

Books suggested

1. Mathematical Methods for Physicists, G. B. Arfkin and H. J. Weber, Academic Press(2001) Also Prism Books, Bangalore
2. Elements of Partial Differential Equations, I. Sneddon, McGraw Hill (1957)
3. Theory of Functions of a Complex Variable, E. T. Copson, Oxford University Press (1935)

2. Computational Methods in Physics (PY2): (35 lectures + 10 Tutorials)

S.No	Course content
1.	**Computers, Computational Physics and Scientific Programming**

a) Introduction to Computational Physics

b) Components of a high performance computer- memory hierarchy, CPU design, Vector processing, Virtual memory, Number representation- Arithmetic of Fixed and Floating

point numbers, Machine precision, Errors and uncertainties in computation Types of errors, Error propagation

c) Computing software basics

d) Computer languages, Programming concepts, Programme design, Structured programming, Introduction to Fortran and C, C & Unix, Dialects of C, Functions and Program structure, Basic Data Types, Arrays, Strings, Expressions and Operators, Precedence of C Operators, C Preprocessors, Control Statements, Pointers, Pointer arithmetic, Arrays handling with Pointers, Functions in detail, Input and Output Operations and C file handling Operations, Structures & Unions in C, Dynamic Memory allocation, Macro definitions, Compilation and Execution of C program, Fortran to C Linking procedures.

e) Introduction to Parallel processing, High performance computing, Profiling and tuning, Visualization of scientific data

f) Highlights of FORTRAN-90 programming language. Programming in MATLAB

2. **Numerical Methods**

Linear algebra

a) Matrices

b) Solution of Linear Algebraic Equations and Singular Value Decomposition

c) Eigenvalue problems, Computing Eigenvalues and Eigenvectors

d) Iterative methods for Linear systems

e) Software for linear systems- LINPACK and LAPACK

Solution of Nonlinear equations

a) Bracketing and Bisection

b) Secant Method, False Position Method, and Ridders' Method

c) Newton-Raphson method

d) Software for nonlinear equations

Interpolation, Extrapolation and Numerical Differentiation

a) Differentiation- Forward, backward and central differences

b) Polynomial Interpolation and Extrapolation

c) Rational Function Interpolation and Extrapolation

d) Interpolation using Splines

Optimization methods

a) Optimization in one dimension

b) Multivariate problems- Steepest descent, Newton and quasi-Newton methods, Conjugate gradient methods. Constrained optimization

c) Maximum entropy and Genetic methods

d) Least square fitting, Non-linear least square fitting, Goodness of fit

e) Software for optimization- energy minimization

Numerical Integration

a) Integration- Newton-Cotes integration formulae, Gaussian quadrature

b) Integral equations

Probability , Random numbers and Monte Carlo methods

a) Uniformly distributed Pseudo random numbers

b) Exponentially and Normally distributed Pseudo random numbers

c) Testing of pseudo random number sequences

d) Simulation of radioactive decay

e) Numerical Integration

f) Monte Carlo simulation techniques

Fourier and Wavelet transforms

a) Fast Fourier Transform- Convolution and deconvolution, Correlation, Filtering, Power spectrum estimation

b) Wavelet transforms- Wavelets, de-noising, de-trending, Texture analysis, Pattern recognition, Image compression

Ordinary Differential equations

a) Initial value problems for systems of ode's

b) Runge-Kutta Method, and adaptive step size control

c) Stiff differential equations

d) Boundary value problems

e) Galerkin method

Partial differential equations

a) Finite difference methods for Parabolic, Hyperbolic and Elliptic equations

b) Truncation errors, consistency, stability

c) Introduction to finite element methods.

Tutorials: Assignments of problems and computations based on these and other methods using FORTRAN-77 / FORTRAN-90/ C++

Books Suggested:

1. Computational physics- Problem solving with computers, Rubin H. Landau, Manuel J. Paez, John Wiley & sons 1997.
2. Numerical Recipes in Fortran-77 / F-90 / C, W.H. Press et. al., Cambridge Univ. Press.(1996)
3. A First Course in Computational Physics, P.L. DeVries, John Wiley and Sons (1994)
4. Numerical Methods for Engineering Application, J.H. Ferziger, John Wiley and Sons (1998)
5. Scientific Computing: An Introduction with Parallel Computing, G. Golub and J.M. Ortega, Academic Press, (1993)
6. Scientific Computing: An Introductory Survey, Michael T. Heath, McGraw-Hill, New York,

2002.
7. Computational Physics, J. M. Thijssen, Cambridge University Press, Cambridge, 1999.
8. Guide to Neural Computing Applications, L. Tarassenko, Arnold Publishers, 1998.
9. Genetic Algorithms in Search, Optimization, and Machine Learning, D. E. Goldberg, Addison Wesley, Reading, Massachusetts, 1989.

3. Introductory Reactor Physics and Engineering (PY3): (35 lectures)

S.No.	Course content
	Part I
1.	Basic nuclear physics concepts. Properties of nuclei. Nuclear forces. Nuclear models. Nuclear decay. Liquid drop model and nuclear stability. Nuclear reactions including fission. Compound nucleus formation. Microscopic cross-section. Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	Chain reaction; four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.
5.	**Reactor Kinetics**: Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.
	Part II
1.	Neutron distribution in a system; assumptions in setting up the neutron balance equation; applicability of Maxwell-Boltzmann statistics; Time dependent neutron balance (transport) equation, with delayed neutrons
2.	**Steady State Neutron Transport Equation:** Transport equation – differential & integral forms, Diffusion approximation, One speed neutron diffusion theory, Boundary conditions, Source-sink problem, Sub-critical reactors with flux independent source, Separation of space and energy.
3.	**Slowing Down and Energy Dependence:** Elastic scattering, Inelastic scattering, Anisotropy, average energy loss per neutron, Concept of lethargy. Fermi age theory, age of neutron, Logarithmic energy decrement, Slowing down spectra, Slowing down in hydrogen, Definition of resonance integral, Shape of thermal neutron-Maxwell spectrum.
4.	**Resonance Absorption:** Resonance cross sections, Resolved and unresolved region, Spatial and energy self shielding, Narrow resonance and intermediate resonance approximation, Concept of potential scattering cross section, Resonance integral in homogeneous media, Doppler broadening of resonance and importance for safety.
5.	**Multigroup Diffusion Theory:** Energy group and group fluxes, Flux weighted group constants, One group theory for thermal neutrons, Two group theory, Two group two region

model core with reflector. Adjoint equation.

6. **Reactor Control:** Cold start-up, Hot power operation, Temperature loads, Effects of burnup and fission products. Function of control rods. Theory of control rods, Xenon load during operation, Xenon iodine concentrations after shutdown, Xenon override, Xenon poison out condition, Samarium poisoning. Temperature coefficient of reactivity.

   Density temperature coefficient.

7. **Fast Reactors:** Fast reactors as breeders, comparison of fast and thermal reactors, role of fast reactors in Indian 3 stage nuclear power program

8. Neutron spectrum in FBR, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, delayed neutron fraction, fuel expansion and bowing, sodium void reactivity effect, Optimisation of blanket thickness. Effect of burnup on fuel composition and reactivity coefficients

9. General features of FBR core, specific power, linear rating, fluence, requirement and choice of core materials (fuel, coolant and structural materials), types of fast reactors – pool and loop type. Optimisation of core height and pin diameter. Salient physics aspects of FBTR and PFBR

Books suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C.Edlund. Van Nostrand, 1952.
2. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand, 1990
4. The Physical Theory of Neutron Chain Reactors, Weinberg A. M. and Wigner E.P.
5. Nuclear Reactor Theory, Bell and Glasstone, Van Nostrand, 1970
6. Physics of Nuclear Reactors, Jakeman D.
7. A. E. Walter and A. B. Reynolds, “Fast Breeder Reactors”, Pergamon Press, 1981
8. Weston M. Stacey, “Nuclear Reactor Physics”, John Wiley & Sons, Inc., 2001

4. Nuclear Physics and Nuclear data (PY4): (30 lectures)

S.No	Course content
	Part I - Nuclear Physics
1.	Properties of Nuclei; Binding Energy Curve; Stability Curve – neutron rich isotopes; nuclear interactions: neutron scattering, isotropic and anisotropic scattering. neutron capture, (n,xn) reactions; reaction thresholds, fission; Variation of cross-section with respect to (nuclide) material, reaction and incident energy; Resonance (Resolved/Unresolved) and Continuum regions; Mathematical formalisms to represent these data.
2.	**Nuclear models:** Nuclear potential; liquid drop, shell and optical models. Fission process; Fission barrier; (n,f) - thermal and high energy neutron induced fissions; Fission products and decay; FP elemental mass/isotope chains and distribution; prompt fission and delayed fission neutron energy distributions; energy yield per fission; neutron yield in fission with neutron energy (nu-p); photo neutron.
3.	Important neutron reactions with fuel, control and structural materials in reactor systems.

4. High energy proton interactions with heavy metals; spallation process; spallation products; neutron source distribution from spallation.

Part II - Nuclear Data

1. Four major kinds of nuclear data, viz. nuclear constants data, nuclear structure data, nuclear decay data, and nuclear reaction data. Importance to application areas, like therapeutic treatments, agriculture, and nuclear energy. Kinds of data, like neutron interaction data, neutron/gamma production data, gamma-atom interaction data, etc., pertinent to reactor physics applications.

   Measurements and model based predictions; Transmission experiment for total cross-section, measurement of differential scattering cross-section; Time of flight method, sources of errors in measurement – energy resolution; Optical model, Statistical Model, etc.; Examples of model based computer codes.

2. **Nuclear data Evaluation:** Problems of scarcity and/or abundance of nuclear data, need of nuclear data evaluation; Evaluated nuclear data files (ENDF), ENDF/A, ENDF/B,JENDL and JEFF; General purpose and Special purpose libraries; Sublibraries for neutron, photon, and charged particle interactions, Fission product yields and decay data; Problems of multiple evaluations; Formats and procedures; MAT, MF, MT conventions; Representation of different kinds of data, tabulated and parametric representations, single/multi level resonance formalisms in the resolved/unresolved region, BW formulation, partial & total widths, negative resonance energies, interpolation schemes. IAEA-NDS; Related websites.

3. **Nuclear data Processing:** Need for processing of an evaluated data Steps of processing; Simplifying assumptions and tolerances; Precautions on consistency and accuracy. Popular processing cods: PREPRO and NJOY and their modules, Linearisation: Advantages of linearization; interval halving procedure, tolerance (error criterion), probable pitfall – position of maximum deviation; Program LINEAR.

   Resonance Reconstruction. Doppler broadening: Effect of target temperature on cross-sections – for low energies, for resonances and for threshold reactions; kernel broadening approach, submerging small resonances due to broadening. Validation of evaluated and processed cross-sections.

4. **Multigrouping:** Consideration for deciding the number of groups and group limits. Neutron cross-section averaging: conservation of reaction rate, transport cross-sections, flux and current weighting, self-shielding, dilution and temperature dependences, multigroup cross-section set, effective cross-sections, mixture cross-sections, collapsing of cross-sections, group-to-group transfer cross-sections; Anisotropy and Legendre moments. GROUPIE/GROUPR programs; Validation of multigroup cross-sections.

   Photon production cross-sections; photo-atomic interaction cross-sections; coupled multigroup cross-section set; GAMINR program.Activation cross-sections; relevance of residual nuclear levels. Displacement cross-sections; relevance to radiation damage in reactor materials.

Books suggested:

1. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen (Ed.) CRC Press, West PalmBeach, Florida (1986).
2. ENDF – 102, Data Formats and Procedures for the Evaluated Nuclear Data for ENDF – VI, M.Herman (Ed.) BNL-NCS-44945-05, (2005)
3. Special Issues on Evaluated Nuclear Data File ENDF/B-VII.0, J.K.Tuli, Nuclear Data Sheets, Vol-107 (2006)
4. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, (2002)

5. Engineering Drawing and Laboratory Practices (PY5 & PY5A): (20 lectures)

S.No	Course content
1.	**Machine Drawings Projections:** orthographic – 1st & 3rd Angles pictorial; Oblique: Perspective.
2.	Introduction; Indian and International standards for drafting and related subjects.
3.	**Line, lettering and dimensioning:** Outline hidden lines, Centre lines, Dimensional lines, Extension/Projection lines, Construction lines, Section lines, Leader/pointer lines, Cutting plane lines, Border lines, Short & long break lines, Representation of welded joints.
4.	**Dimensioning and tolerancing:** Definition and general principles, Arrangement of dimensions - Chain and parallel dimensioning, method of dimensioning common features; Rules for inscription of tolerancing. Limits fits. Tolerances and surface finish.
5.	**Scales, lines and lettering:** Recommended scales; Different type of lines, their illustration and application; Recommended size of letters and numerals.
6.	**Sections:** Full Section, Half section, Partial section, Revolved section.
7.	**Projections:** Orthographic – 1st & 3rd Angles; Pictorial – Oblique and Isometric
8.	**Conventional representation of common features and sections:** Conventional representation of gears and gear assembly, Threads, springs, bearing, welded joints. Hatching, sectioning, cutting planes.
9.	**Fastenings:** Bolts, studs, screw, washers, set screw, split pins.
10.	Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Laboratory Practices:

1. Errors in measurement. Accuracy and precision. Software, data analysis, filtering and plotting.

   Electronic components of detector systems.Analog electronics, Electromagnetic interference, shieldind and grounding of electronic equipments. Measurement of temperature, pressure, mass, volume and flow. Instrument time constant and response time.
   Production and measurement of (low pressures)vacuum and high pressures.
   Production and measurement of high temperature and low temperatures.

   Computer hardware. Intelligent systems, Computer control and automatic data acquisition. User friendly experimental automation with G (graphical) language.

Books suggested:

1. Indian Standard Code of Practice for General Engineering Drawings (Second Revision); Bureau of Indian Standards.
2. Geometrical and Machine Drawing by N.D. Bhatt; Charotar Publishing House, Anand (WR), India

6. Reactor Materials (PY6): (30 lectures)

S.No	Course content
1.	Properties of fuel materials. Uranium metal, Uranium dioxide, Carbide and nitride fuels. Plutonium fuel materials. MOX fuels. Thorium fuel materials. Fabrication of fuel pellets: sintered and vibropacked.
2.	Dispersion type fuels. Inert matrix fuels, Metallic fuels, sol-gel process. Fuel for HTRs – coated particle / TRISO/ spherical fuel balls for high powered systems.
3.	General requirements of structure and clad materials. (neutronic and physical) Aluminum and alloys. SS and low alloy steels. Nickel alloys. Zirconium and alloys. Properties of moderator and coolant materials. Graphite, Beryllium, water and heavy water. Liquid metals. Heat transfer coefficients.
4.	Mechanical properties of materials. Stress-train relationships. Ductile and brittle failure. Ductile to brittle transition, Fatigue failure, Creep and dilation.
5.	Stress analysis, Thermal stress in fuel clad. Thermal stress in hollow cylinder with no heat generation, Thermal stress in hollow cylinder with exponential heat source, Factors affecting thermal stress.
6.	Radiation effects in materials. Atomic displacements. Mechanisms in radiation damage, General irradiation effects in metals. Thermo-physical properties of fuel (pellet) materials; variations with burnup Temperature dependent swelling. Helium embrittlement. Typical limits of irradiation damage
7.	Corrosion of metals. Chemical corrosion, erosion and fretting corrosion, Stress- corrosion cracking, Hydrogen embrittlement. Fuel clad failure process.
8.	Advaced materials for future FBR, ADS and high temperature reactor. Ferritic steels, oxide dispersed steels and carbon based materials

Books suggested:

1. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand.
2. Fundamental Aspects of Nuclear Reactor Fuel Elements, D.R. Olander, ERDA report, TID 26711-P1 (1976).

7. Radiation Detection and Measurement (PY7): (20 lectures)

S.No	Course content
I	**Interaction of radiation with matter:**
1.	Energy loss of heavy charged particles in matter – Electronic stopping power (Bohr and Bethe-Bloch formulae), Cherenkov radiation. Energy loss of electrons and positrons – Electronic stopping and energy loss by Bremsstrahlung radiation.
2.	Interaction of photons – Photoelectric absorption, Compton scattering, pair production, Electromagnetic shower in high energy photon and electron interaction with matter.
3.	Interaction of Neutrons – elastic scattering, radiative capture, positive Q-value reactions such as (n,p), (n,gamma), (n,fission) and hadron shower production at high energies.

II **Radiation detectors:**

1. General characteristics of detectors – efficiency, response in energy, time, position and corresponding resolutions, recovery time or count rate handling capability.
2. Gas detectors Basic processes, Q-V characteristics as a function of primary ionization, charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter.
3. Semiconductor detectors Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium detectors (planar and cylindrical geometry). Photovoltaic cells, charged coupled devices.
4. Scintillation detectors. Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes.
5. Techniques and detectors for neutron and spectrum measurements. Fission ionization chambers. Boron filled and coated detectors. Gamma compensation. Self powered neutron detectors.
6. Pulse processing instrumentation, preamplifiers(charge, voltage sensitive), amplifiers (spectroscopy or high resolution, fast and timing filter), single channel analyzers, timing discriminators(leading edge and constant fraction types), gate and delay generators, coincidence(fast and slow) units, linear gate and stretchers, time to amplitude converter(TAC), scalers and rate dividers, analog to digital converter(ADC), charge to digital converter(QDC), time to digital converter(TDC), data acquisition systems (multichannel analysers and computer based multiparameter systems).
7. Experimental techniques and simulation - Particle identification methods (pulse shape discrimination, Cerenkov radiation), Compton suppressed high purity germanium detectors for high-resolution gamma spectroscopy, magnetic spectrometers including recoil mass separator. Monte Carlo simulation of detectors.

Books suggested:

1. Techniques for Nuclear and Particle Physics Experiments – W.R. Leo, 2nd Ed. (Springer International Student Edition published by Narosa Publishing House, New Delhi 1995).
2. Radiation Detection and Measurement – G.F. Knoll, 3rd edition (John Wiley, New York 2000)
3. Nuclear Radiation Detectors – S.S. Kapoor and V.S. Ramamurthy (Wiley Eastern Ltd, New Delhi 1986)
4. Radiation Detectors, C.F.G. Delaney and E.C. Finch (Clarendon Press 1992).

8. Reactor Types and Advanced Reactor Concepts (PY8): (20 lectures)

S.No	Course content
1.	**Thermal Reactors:** History. Development of Gas Cooled Reactors (GCR). Reactor types AGR and RBMK. Development of BWR. Development of PWR and VVER. Development of PHWR and SGHWR.
2.	**Fast Reactors:**

History. Development of LMFBR.

3. **Advanced Reactors:**

   Different generation of nuclear reactors. Evolutionary improvements and revolutionary improvements. High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR).

   Metal fuelled FBR and increased fuel breeding.

   Accelerator driven systems (ADS)

   Fusion Systems. JET and ITER. Concept and need for tritium breeding.

4. **Indian Reactors (Experimental and power producing):** For each type of reactor - brief principles of the reactor; typical Power/ Research reactor system; Fuel cluster/assembly; number of channels; core; coolant/moderator/reflector/blanket and shield as the case maybe; average neutron energy spectrum; control and shut down systems.

   - APSARA/ CIRUS/ DHRUVA
   - PHWR –India (220, 540 and 700 MWe)
   - LWRs
   - BWR (TAPS 1&2, modern BWRs,)
   - VVER (KK)
   - FBTR and PFBR

5. International Initiatives in Advanced Nuclear Systems: INPRO (IAEA) and GEN-IV. US proposal GNEP. International concerns. Nonproliferation, (proliferation indices), NPT, FMCT, CTBT.

Books Suggested:

1. W. Marshall ed. Nuclear Power Technology, Volumes I to IV, Clarendon Press, Oxford, (1984).

9. Radiation Shielding Design and Protection (PY9): (40 lectures)

S.No **Course content**

1. **Basics of radiation physics and dosimetry**

   Radiation sources, its interaction with matter; natural and induced radioactive sources, half-life, decay constant, specific activity; basic interaction mechanisms of alpha, beta, gamma/x-rays and neutrons with matter (*summary only*).

   Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effetive dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective halflife and their relation and their importance. Concept of ALI and DAC with suitable problems.

   Human Body: cells, tissues and organs, structure of cell, cellular effects. Factors which influence the damage of cell. Interaction of radiation with biological matter. stochastic and deterministic effects. Acute and delayed effects. LD 50/60, Doubling dose. Radiation toxicity, Risk factor.

2. **Radiation Protection**

   Radiation protection philosophy, objectives and principles of radiation protection ALARA, stochastic and deterministic effects, justification, optimization and dose limitation, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types

of exposure (natural, occupational, medical and public).

External and internal exposures; internal routes of intake of radioactive material. Use of personal dosimeters (TLDs, pocket dosimeters). Calculation of dose, Exposure measurement: Free air and air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Fundamentals of ICRP respiratory model, ingestion, Gastro intestinal track model, wholebody counting and bioassay techniques.

Atomic Energy Act, National and international regulatory bodies, their role and responsibilities, Radiation protection rules, Safety during transport of radioactive materials, Radioactive waste classification and management.

3. **Radiation Shielding**

Shielding concepts- gamma shielding- Attenuation factors. Buildup factor concept for homogeneous and multiple layers. Semi-analytical methods for gamma shield design. Dose rates of gamma rays for various source geometries. Gamma energy dependence of dose. Half layer thickness of different materials. Heat generation.

Neutron shielding. Shielding in thermal reactors. Importance of shielding in fast reactors. In-vessel shields and reduction of dose to components and operating personnel. Activation of structural material and heat generation. Shielding in accelerators and fusion systems.

Computational problems. Transport theory methods. Large problem size and large flux attenuation. Importance of anisotropy effects in scattering. Neutron slowing down and need for fine energy treatment. Monte Carlo methods. Streaming through gaps, voids and pipes. Analytical methods. Complementary shielding.

Selection of shield materials. Shielding from mixed sources. Life of shield materials.

4. **Nuclear Emergency management**

Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, countermeasures. Aerosol physics for core disruptive accidents, Atmospheric transport processes, environmental impact studies.

Books suggested:

1. Nuclear Radiation Detection - W.J. Price, McGraw Hill (1964)
2. Radiation Detection and Measurement - G.F. Knoll, John Wiley and Sons (1989)
3. Biological Effects of Radiation – J.E. Coggle, Taylor and Francis (1983)
4. Atoms,Radiation and Radiation Protection by James E.Turner, Wiley (2007)
5. Problems and Solutions in Radiation Protection by James E. Turner et al., Wiley, (1988)
6. Introduction to Health Physics – Herman Cember, McGraw Hill (1996)
7. Introduction to Radiation Protection –Alan Martin and Samuel Harbison, Chapman and Hall (1986)
8. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998.
9. Radiation Shielding- Three volumes of Compendium on Radiation Shielding, O.Sisman and J. Jaeger et.al., ed. (1975)
10. Radiation Shielding Manual T Rockwell et.al ed. AEC-US, (1958).

10. Reactor Dynamics and Safety Analysis (PY10): (35 Lectures)

S.No	Course content
1.	**Reactor Dynamics** Neutron kinetics and thermal effects. Feed back effects. Time constants. Loosely and strongly coupled reactor systems; Reactor size and eigenvalue separation; fundamental and higher modes. Description of main reactor systems. Coolant system behaviour. Plant dynamics (open loop and closed loop). Flow perturbations. Reactivity perturbations. Thermal perturbations. System stability. Linear and non-linear stability analysis; Nyquist critera; Liapunov methods. Xe dynamics equations; spatial and time dependent oscillations and stability. Safety concepts. Defence in Depth (5 levels) Accident Categories / classification: Design basis events (DBE) and Beyond DBE (BDBE). Loss of Regulation Accident(LORA), Transient Over Power Accident(TOPA), Loss of Coolant Accident(LOCA), Loss of Flow Accident(LOFA), cold coolant additions – with shut down action; Anticipated Transients with out SCRAM(ATWS)- Un protected Loss of Flow (ULOF) and Unprotected Transient over Power (UTOP). Accident scenarios in thermal and fast reactors. Brief description of accidents at Three Mile Island, Chernobyl and FERMI reactor. Computer codes for modeling accidents in thermal and fast reactors. RELAP and SAS4A. Kinetics of ADS.
2.	**Safety Systems** Engineered safety systems. Safety Critical Systems (SCS); Safety Groups, SCS, actuation systems, safety support systems. Shut down Systems. Different shut down states; Shut down margins (SDM). Guaranteed shutdown states (GSS). General safety criteria. Examples of safety analysis of PHWR, LWR and FBR.
3.	**Introduction to Reliability and Probabilistic Safety Analysis (PSA)** Probability, random variable, probability distributions used in Reliability Analysis; uniform, exponential, Weibull, Normal and χ^2 distributions, Central Limit Theorem. Basic component reliability models, definition and other measures of reliability such as Availability, failure frequency, dependability, fail safe design, safe failures/unsafe failures. Reliability Block Diagram, series and parallel systems, minimal cutsets, Combinatorial (Fault Tree / Event Tree) and State Space methods (Markov Models), Binary Decision Diagram. Common Cause Failures, Human Reliability Analysis: Models of Common Cause failures and Human Reliability Analysis, independence, redundancy, diversity. Probabilistic Safety Assessment of Nuclear reactor, measures of risk, core damage frequency, Level-1, Level-2, Level-3 PSA (introduction).

Books suggested:

1. Fast Reactor Safety, John Graham, Academic Press (1972).

2. The Technology of Nuclear Reactor Safety, Vol-I and II, T.J.Thompson and J.G.Beckerley, MIT Press (1971).
3. Reactivity Coefficients in Large Fast Power Reactors, H.H.Hummel and D.Okrent, ANS (1970).

11. Fuel Cycle Physics and Introduction to Fuel Cycle (PY11) : (30 lectures)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.
8.	Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9.	U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10.	Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11.	Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12.	Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13.	Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14.	Isotopic separation operation of bred uranium in thorium cycles to remove U-232. MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:
1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Fluid Mechanics and Thermal Hydraulics PY12 (25 lectures)

S.No	Course content
1.	**Fluid Mechanics** Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines, streak lines, path lines – equation of Continuity, Euler's equations of motion – Navier Stokes equations. Hydrostatics – Manometry – Fluid force on planes and curved surfaces, – Aerostatics – variation of pressure, temperature and density with altitude – stability of atmosphere – Fluids subjected to uniform linear acceleration and uniform rotation. Analysis of fluid motion in integral form – Concept of a system and a control volume – equations of continuity, energy, linear momentum and angular momentum as applied to a control volume in fluid flow and their applications to propellers, pumps and turbines. Dimensional analysis, similitude and model testing – Laminar and turbulent flows – Viscous effects – Boundary layer – Separation phenomena – Losses in pipes.
2.	**Thermal hydraulics** **Conduction:** Steady state conduction in one and two-dimensional systems – One dimensional unsteady state conduction; analytical and numerical methods. Heat generation in cylindrical and plate fuel elements; Steady state heat transfer from fuel to coolant; concept of $\int KdT$; Axial temperature distribution in the fuel element; Maximum clad surface temperature. **Convection:** Basic equations, Boundary layers; Forced convection: External and internal flows, correlations, Natural convection. Natural circulation cooling during pump trip transients; flow coastdown; decay heat removal; natural circulation in advanced reactor concepts, flow instabilities. **Radiation heat transfer:** Basic laws, Properties of surfaces, view factors, network method and enclosure analysis for gray – diffuse enclosures containing transparent media, Engineering treatment of gas radiation. **Boiling heat transfer:** bubble nucleation; transition and film boiling (a) pool boiling and (b) flow boiling; heat transfer coefficients in pool and flow boiling. Horizontal and vertical surfaces. Two-phase flow; flow regimes; mixture quality; void fraction; mixture density; pressure drop. **Concept of pressure drop in nuclear channels:** objectives and methods of flow orificing; orificing in BWRs and FBRs. Hot spot factors; classification; determination of subfactors; overall hot spot factor-statistical and multiplicative approaches. **Condensation:** Surface tension- bulk Condensation – Dropwise condensation on solid surfaces, Film condensation, Nusselt's theory. **Critical heat flux:** mechanism of dryout and Departure from Nucleate Boiling (DNB); thermal margin – MCHFR; MDNBR; critical power concept.

Books Suggested:

1. Thermal Hydraulic Fundamentals, Neil E. Todreas, Hemisphere (1990).
2. Fluid Mechanics, F. Dougles et al., Pearson Education, 2006.

3. Heat Transfer, J.P. Holman, Eighth Edition, McGraw Hill, 1997.
4. F.P. Incropera and D.P. Dewitt, "Fundamentals of Heat and Mass Transfer, John Wiley and Sons, Fourth Edition, 1998.
5. Fast Breeder Reactors, Waltar A.E. and Reynolds A.B, Pergamon Publishers, New York, 1981.

13. Advanced Computational Methods in Reactor Physics (PY13): (35 lectures)

S.No.	Course content
1.	**Methods of solving neutron Diffusion equation:** Finite differencing of diffusion equation. Centre and corner mesh differencing schemes. Rectangular and triangular (hexagonal) meshes; Inner and outer iteration schemes. Acceleration methods for inner iteration scheme. Spectral radius and determination of acceleration parameter. Acceleration methods for outer iteration scheme. Power iteration and dominance ratio.
2.	Modern nodal methods. General weighted residual methods. Finite element method- its advantages and disadvantages. Coarse mesh rebalancing.
3.	Estimation of fundamental and higher harmonics; subtraction methods
4.	**Methods of solving neutron transport equation** **(i) Lattice:** (a) P_N method (b) Discrete ordinates method (c) Collision probabilities methods Collision probability method in 1-D and 2-D geometries. Interface current method. (d) Characteristics method.
5.	**(ii) Core and Shield:** Discrete ordinates methods in 1-D, 2-D and 3-D geometries. Diamond differencing scheme. Computer code ATES-3. Monte Carlo methods for core calculation; deep penetration problems. Computer code MCNP.
6.	Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations. (ORIGIN
7.	Differencing of kinetic equations in time. Approximate solution of point kinetic equations. Space time kinetics. Adiabatic approximation. IQS; explicit and implicit time differencing methods.

Books suggested:

1. E.E.Lewis and W.F. Miller, Computational Methods of Neutron Transport, Wiley (1984) and ANS (1993).
2. G.I.Bell and S. Glasstone, Nuclear Reactor Theory, Van Nostrand (1970).
3. A.F. Henry, Nuclear Reactor Analysis, MIT Press (1975).
4. M. Clark and K.F. Hansen, Numerical Methods of Reactor Analysis, Academic Press (1964).

14. Experimental and Operational Reactor Physics (PY14): (35 lectures)

S.No	Course content
	I. Experimental Reactor Physics (10 hrs)
1.	Source and power range neutron detectors; Neutron sources- requirement vis-à-vis reactor type-External localised sources in LWRs and FBRs - internal distributed spontaneous fission / photo-neutron sources in PHWRs. Different steps of initial start-up in different research and power reactors.

2. Moderator experiments-measurement of diffusion length, age, migration length. Exponential experiment-Alpha dieaway (decay) experiment. Subcritical multiplication experiments-Critical mass measurements.

3. Low power experiments at criticality for validation of reactor physics evaluations-Measurement of neutron flux-Thermal and fast-Activation analysis-cadmium ratio-General methods of flux measurement- foil/wire activation methods, Measurement of buckling, power peaking and power distribution.

4. Neutron spectrum unfolding; differential measurements for reaction rates.

5. Dynamic methods of reactivity evaluation Reactor Period measurements-Measurement of reactivity-control Rod Calibration-power run-down experiments-reactivity coefficients measurements –Temperature and void coefficients measurements. Dose and shielding experiments-cross-section measurements.

6. Reactor noise methods- Process parameter measurements using neutronics-coolant flow measurement with N-16 gamma signals- failed fuel detection using delayed neutrons and noble gas fission products.

7. **Critical Facilities:**

   Thermal – ZERLINA, AHWR-CF, PURNIMA (1,2,3) ZED-2

   Fast – GODIVA (US), ZEBRA (UK), ZPPR (US), MASURCA (France), BFS (Russian).

8. **Subcritical Facilities with source:** MUSE, YELINA, PURNIMA-SCF, AHWR-C with source.

II. Operational Reactor Physics (20 hrs)

1. First Approach to Criticality; low power physics experiments; control requirements; general control schemes (auto or manual control as the case may be); spatial power control; nominal operation, power rise schemes; set-back and step back (as applicable); Reactivity balance in operating reactors.

2. Thermal power estimation using secondary and primary parameters – station heat balance. Assembly/ Bundle power, channel power, Linear Heat Rating (LHR): operational and safety limits; Bundle power envelops in PHWRs.

3. Failed fuel detection – delayed neutron monitoring; Fission Product (FP) gammas and volatile-gaseous FPs Back ground activities in the coolant.

4. Research Reactors: APSARA/CIRUS/DHRUVA – application. FBTR operation and applications. KAMINI operation and applications

5. Power Reactors: Operation of 220 and 540 MWe PHWRs : Incore flux mapping system BWR (TAPS- 1&2), PWR / VVER , PFBR

Books Suggested:

1. Experimental Reactor Physics, A.Edward Profio, John Wiley and Sons.

15. Design Methods in Thermal and Fast Reactors including Computer Codes (PY15): (35 lectures)

S.No **Course content**

I. Thermal Reactors

1. Popular multigroup nuclear data libraries and their group structure.
2. Spatial heterogeneity in different thermal reactors. Wigner-Seitz cell approximation. Self shielding effects in space and energy. Neutron transport treatment. Computer codes MURLI and CLUCOP.
3. Fuel assembly heterogeneity and supercell concept. Neutron transport treatment. Computer codes –SUPERB, CLUB, CASMO. Analysis of plate fuel assemblies. Special treatment of burnable absorbers and control rods.
4. Treatment of hexagonal lattices, EXCEL, TRIHEX.
5. WIMS Methodology ; HELIOS Computer code
6. Generation of cell and assembly parameters as a function of burnup and boron concentration in moderator.
7. Core computations. Core follow up and refueling. Computer codes DIF3D, VENTURE and COMESH. Core simulation codes TRIVENI and COMETG.

II. Fast Reactors

1. Popular multigroup libraries and their group structure.
2. Treatment of slowing down and energy self shielding. Heterogeneity effects in absorber rods. Computer code COHINT.
3. Breeding ratio and its variation with core material geometry. Radial and axial heterogeneous designs. Oxide, carbide and metal fuel and their effect on core safety parameters.
4. Hexagonal geometry effects. Optimisation of blanket thickness. Sodium void reactivity effects. Fuel burnup modeling.
5. Fuel management schemes in FBTR and PFBR. Effects on breeding ratio and power distribution. Computation of peak linear heat rating from measured outlet temperature distribution.
6. Computer code FARCOB. Code system ERANOS.

Books suggested:

1. R.J.J. Stammler and M.J.Abbate, Methods of Steady State Reactor Physics Nuclear Design, Academic Press (1983).
2. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen Ed. CRC Press, West Palm Beach, Florida (1986).

16. In Core Fuel Management (PY16): (25 lectures)

S.No **Course content**

1. General in-core fuel management schemes. Advantages and dis-advantages of on-line and batch fuelling. Initial and equilibrium core concepts.

   PHWR: Online fueling; refueling strategies; core burnup - power distribution optimization; time average and snap shot evaluations; theory of computer code TAQUIL. Average exit burnup. Core followup; theory of TRIVENI code. Channel Power Peaking Factor (CPPF). Rules of channel selection. Fuelling in PHWRs: (220 & 540) Discharged bundle data – Pu production & Pu-vector.

2. **BWR:** Initial fuel loading; equilibrium cycle Batch fueling concepts; different core loading concepts – checker board, out-in, sector symmetric. Cycle length and Haling principle. SDM demonstration. Control rod pattern. Power distribution optimization. Core followup computer code COMETG. Minimum Critical Heat Flux Ratio (MCHFR).
3. **PWR and VVER:** Initial loading, equilibrium loading. Boron poison management. Fuel enrichment change and use of burnable absorber. Departure from Nucleate Boiling Ratio (DNBR).
4. **AHWR:** Basic principles of fuelling
5. **HTR:** Basic principles of fuelling

suggested:

1. P. Silvennoinen, Reactor Core Fuel Management, Pergamon Press (1976).
2. R.G. Cochran and N. Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

SYLLABUS

Orientaion Course for Engineering Graduates and Science Post Graduates (OCES)

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as “Radiological Safety Engineering’ course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

12. The Principles of Circular Accelerators and Storage Rings - Philip Byrant.
13. Introduction to Vacuum Technology-Compiled by K.G. Bhushan, BARC

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 503: Engineering Maths-II (20) (ME Group)

- Introduction to discretization methods and approximate solution of differential equations (FDM, FEM and FVM), Finite Difference Approximations in 1-D, Solution of steady and unsteady heat conduction equations, wave equation
- Formulation of the matrix methods by equilibrium concepts (1D-heat conduction, 2D-truss and 1D-hydraulic flow examples).
- Approximate solution of differential equations – Weighted residual method, collocation, least squares and Galerkin's methods, Piecewise approximations. Basis of Finite Element Method, energy principles in structural mechanics and principles of minimum potential energy, assembly concept.
- Solution of steady and unsteady heat conduction equations with finite element method, Implicit and explicit methods.
- Finite element formulations of convection dominated problems using classical Galerkin methodology and need for alternate trial functions and upwinding.
- Finite element formulation for laminar and turbulent flows.
- Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
- Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
- Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
- Response Surface Method 2K+1, factorial design, 3k factorial design
- Monte Carlo Method
- Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.
- Artificial Intelligence and Genetic Algorithm
- Artificial Neural Network
- Gram-Schmidtt Orthogonalization
- Transformation of matrix

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods, liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

2. Strosal and Vapet, "Power Plant Engineering & Economics".
3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
    - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
    - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
    - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

References:

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons
- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction
- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process
- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors
- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics
- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up
- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons
- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients
- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)
- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.

- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)
- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)
- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:

- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:

- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design

- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology

- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra

- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics

- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures

- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations

- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame’s equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.

- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)

- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):

- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):

- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)
- Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

EN 615: Corrosion (15)

- Definition and importance of corrosion, corrosion principles; thermodynamic and electrochemical aspects; electrode potentials; polarization and corrosion rates; passivity, mixed potential theory, environmental effects: Dissolved Oxygen, temperature, pH, Velocity bacteria, dissolved salts and metallurgical variables, composition and heat treatment. (3 Lectures)
- Forms of corrosion: uniform attack; corrosion rate measurements, Galvanic corrosion, pitting and crevice corrosion; selective leaching; erosion corrosion; intergranular corrosion, low temperature sensitization, corrosion of weldments; stress corrosion cracking (SCC), irradiation assisted SCC; hydrogen embrittlement, hydrogen attack, corrosion fatigue; oxidation; microbiological induced corrosion (MIC), Corrosion testing procedures, failure analysis, specification tests, advanced methods for on-line corrosion monitoring. (7 Lectures)
- General principles of corrosion control – anodic and cathodic protection, inhibitors and passivators, corrosion protection by alloying, surface treatment and surface modification. (1 Lecture)
- Corrosion in the nuclear industry – Corrosion in nuclear fuel reprocessing, waste management and heavy water plants. corrosion in fluoride and ammonia containing environments; liquid metal corrosion. low alloy steels, stainless steels and Ni and Cu base alloys, protective magnetite formation on carbon steel, stress corrosion cracking of stainless steels and nickel base alloys. high temperature oxidation and hydriding of zirconium alloys, materials for fast breeder reactor system. Effects of radiation on corrosion (4 Lectures).

EN 616: Distributed Computing (45)

Advanced Computer Architecture

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

c. Approaches for improving interconnect performance
d. Case studies – Ethernet, Infiniband, SCI

- Cache

a. Associative, Direct mapped
b. Write through, Write back
c. MESI
d. Shared caches

- Advances in storage systems

a. Direct attached storage, Network attached storage, Storage Area Networks
b. File level and block level accesses
c. Storage protocols
d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing

a. Need for HPC
b. Applications of HPC
c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)

- Pipelining, Vector processing, SIMD

a. Pipeline, Speedup and Efficiency of pipeline
b. Pipeline stalls, out of order execution
c. Techniques to improve pipeline efficiency
d. Superscalar, Superpipelined, VLIW, EPIC architecture
e. Vector processors, vector instruction sets, registers

- MIMD Architecture

a. Classification of MIMD machines
b. UMA, NUMA, CC-NUMA, COMA, NORMA

- Interconnection networks and topologies

a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.

- Current Parallel Architectures

a. Parallel Vector processor
b. Symmetric Multiprocessors
c. CC-NUMA
d. Massively Parallel Computers
e. Clusters of workstations

- Clusters

a. Classification of clusters
b. Cluster software
c. File systems for clusters

- Software concepts of High Performance Computing

a. Parallelism – Algorithmic, Geometric, Event, Data
b. Granularity – Coarse and Fine grains
c. Speedup, Efficiency, Amdahl's and Gustaffson's Laws

- Parallel Programming Models

a. Shared Variable Model
b. Message Passing Model
c. Threads Model
d. Data parallel Model

- Design of parallel algorithms

a. Data dependencies
b. Data partitioning
c. Communication patterns
d. Synchronization
e. Load balancing

- Parallel Programming Environments

a. Parallel Languages
b. Parallel Extensions to Sequential Languages
c. Parallel APIs – MPI, OpenMP

- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)

a. Introduction to MPI
b. MPI constructs
c. Example programs in MPI

- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

~~EN 617~~

EN 618: Electrical Systems for Nuclear Power Plants (30)

- Interaction of Nuclear Power Station With The Grid Number of evacuation lines; Optimum size of NPP in grid; Brief introduction to Power System Analysis - Short circuit, load-flow and stability studies, Tariff and Capacity factor.
- Ehv Switchyard Design Switching schemes; Clearances; Com parison between types of svvitchyards; Brief introduction to equipments in switchyard and their functions; Lightning arresters and insulation co-ordination; Lightning protection.

- Protection Line protection; Generator protection; Transformer protection; Motor protection.
- Selection of Transformers Accessories; Types; Specifications and testing; Voltage regulation calculations.
- Selection of MV & LV Switchgear Types; specifications and testing, MCCS; Distribution boards; Generator circuit breaker; ELCB.
- Motors In NPP Types of motors; Radiation withstand requirements; Performance requirements.
- Station Auxiliary Systems of NPP Class 1, 11, Ill and IV systems classifications; Nature of electrical loads and supply voltages; Effect of voltage variation on Electrical equipments and remedial measures; Emergency transfer system; Load shedding scheme; Auto transfer schemes; synchronizing schemes.
- Class 1 e requirements Cabling, lighting & grounding Specific requirements for safety related electrical equipments & systems in NPR Cabling, Lighting, Grounding systems in NPP; Bus ducts. Introduction to seismic qualification of electrical equipments., Electrical system control from Control Room. Introduction to []G sets, UPS & Batteries.
- Billing and metering scheme for a typical NPP. Introduction to brushiess and static excitation systems for Generators. Introduction to SCADA systems.

EN 619: Embedded & Computer Based System Design (45)

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 620: Extractive Metallurgy (40)

Principles of Metallurgical Thermodynamics (15)

- Thermodynamic Functions: Enthalpy, Entropy, Free Energy, Chemical Equilibria
- Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Phase Diagrams
- Solution Thermodynamics, Integral and Partial Molar Thermodynamic Properties
- Experimental Methods- Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.
- Computation of predominance area diagram and Phase diagrams

Kinetics(5)

- Principles of Chemical Kinetics, Homogeneous Reactions, Effect of Concentration, Effect of Temperature
- Theory of Reaction Rates, Heterogeneous Reactions, Reaction Models, Mass Transport Phenomena, Heat Transport Phenomena.

Process Metallurgy (25)

- Methods of attaining High Temperatures,Measurement of Temperature,
- Vacuum Metallurgy Principles and Equipments,
- Process Metallurgy of Rare and Refractory Metals,
- Resources of Special Metals, Beneficiation Methods, Physical, Chemical, Separation Methods, Halide Metallurgy, Vacuum Metallurgy, Electro Metallurgy, Reduction Processes, Refining Processes, Ultrapurification Processes,
- Preparative aspects of Special Materials and Alloys,
- Advanced Materials Processing Techniques,
- Reprocessing of irradiated nuclear fuels, Process Metallurgy of - Uranium, Thorium, Plutonium, Beryllium, Zirconium, Hafnium, Niobium, Tantalum, Rare Earths.

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)

- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)

- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)

- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity

- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:

- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour

- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys

- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics

- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:

- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

7. Deformation and Fracture Mechanics of Engineering Materials - R. W. Hertzberg

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)

- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)

- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

Design Basis Hazards (Natural)

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall
- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications
- FTP, DNS, Mail, application based attacks

Network Security
- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms
- Symmetric and Asymmetric.

Symmetric Algorithm
- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms
- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)
- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)
- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)
- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli's Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.

- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)

- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory

- Introduction to state-space controls, state & measurement equations, general solution **o**f the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls

- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation

- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:

- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 704: Computer Based System Design- II (25)

Communication, Networking, Realtime systems, RTOS and Software

- Asynchronous and synchronous communication
- Standards like RS232, RS422, RS485
- USB
- Encoding schemes
- Local Area Networks
- OSI 7 layer model and TCP/IP reference model
- Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth
- Networking hardware – cables, hub, switch, router, etc
- Role of fibre optics in communication
- Fieldbus standards
- Deterministic communication techniques
- Case study: various techniques used in NPP for communication and networking
- Realtime Systems, their characteristics and applications
- Realtime Operating Systems:
- Concepts of
- Process and threads
- Concurrency
- Latency, context switching
- Scheduling policies
- Inter process communication
- Semaphores
- Priority inversion
- Shared memory
- Common systems calls, Communication features in RTOS
- Comparative study of various RTOSs
- Integrated S/W development environment

EN 705: Data Base Management System and Web Technology(30)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to PostgreSQL and MySQL(3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(1)
- Content Management Systems(1)
- Web 2.0 / Semantic Web(2)

EN 706: Digital Signal Processing and Image Processing (30)

Digital Signal Processing

- **Introduction**

Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**

  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT.
- Fast Fourier Transform

Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- Digital filters

FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- DSP Applications

  Applications of digital signal processing in nuclear and other fields.

Image Processing

- **Introduction**

  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- **Image Enhancement**

  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- **Image Segmentation andAnalysis**

  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation; Boundary extraction and representation;
- **Morphological operations**

  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy- based methods;

  Image Compression Models, Error free compression, Lossy compression, Standards;

EN 708: Feedback Control Systems (25)
- Introduction: The control systems, Basic elements of FIB control systems, Types of FIB control systems.
- Transfer Function: Transfer function of linear systems, Impulse response, Block diagrams, Signal flow graphs, Mason's gain formula, Polar plots, Bode plot.
- State Variable Characterization: State concept, State equation, Standard representation, State transition matrix and solution of state equations, relationship between state equations and transfer functions, Characteristic equation, Illus- trative examples of some electrical, mechanical, electromechanical systems.
- Time Domain Analysis: Test input signals, Time domain perform- ance characteristics, Transient response of a typical second order system, PID controllers
- Stability: Definition, Routh-Hurwitz criterion, Nyquist criterion. Relative stability, Gain and Phase margins.

EN 709:Fluid Power Technology (25)
Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics
- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal's Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli's theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air
- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors
- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.
- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.
- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design
- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:
- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:
- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :
1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing
- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;
- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision
- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:
- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices
- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods
- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric 'O' rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques
- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:
- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
    - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
    - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
    - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
    - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

- Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
- Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
- Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, llllcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
- Scheduling in a project by critical path method, CPM
- Scheduling in a project by Precedence Diagram Method.
- Use of Project Management Software for project planning, scheduling & monitoring.
- Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
  - Constraints of project and its effective management
  - Development of Six Monthly Plan and its review process
  - Resource based planning
  - Physical & Financial Monitoring of project, Use of S-curve
  - Capital Budgeting & expenditure control in a project
  - Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 718: Reliability Engineering (ME) (25)

- Reliability Mathematics – Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
- Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
- Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
- Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
- System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
- Application of Reliability - PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
  - Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
  - Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.
Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control.

Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5
Final control element - Linear pneumatic control valve.
Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.
Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

BACK TO MAIN

BARC TRAINING SCHOOL - AMD CAMPUS

ORIENTATION COURSE FOR ENGINEERING GRADUATES & SCIENCE POST-GRADUATES (OCES)

SYLLABUS

GEOSCIENCES

Course No.: 102
Subject: Nuclear Physics and Radiation Detection

S. No.	Topics	Chapters
1	Nuclear Physics	Structure of nucleus - Atom, Electron, Proton and Neutron, the Proton-Electron hypothesis of the constitution of the nucleus, Proton-Neutron hypothesis
		Magnetic and Electric property of the Nucleus
		Additional Properties of Atomic Nucleus
		Natural Radioactivity - Basic theory of Radioactive disintegration, disintegration constant, Half-life, Mean-life
		Radioactive equilibrium, Units of Radioactivity
		Alpha decay - Velocity and Energy of Alpha Particle, Absorption of Alpha Particle, Range, Ionization and Stopping Power, Range-Energy curve, Nuclear Energy Levels and the Theory of Alpha Decay;
		Beta decay - Velocity and Energy of Beta Particle, Absorption of Beta Particle, Range, Ionization and Stopping Power, Range-Energy curve, Nuclear Energy Levels and the Theory of Beta Decay, Symmetry law and Non-conservation of parity in Beta Decay
		Gamma decay - Gamma decay, Internal Conversion, Nuclear energy levels theory, Absorption of gamma ray with matter; Interaction of radiation with matter - Interaction of charged particles, Interaction of gamma rays: Photoelectric effect, Compton scattering, Electron-Positron pair-production;
		Natural decay series - Uranium Series, Thorium Series, and Actinium Series
		Radioactive growth and decay: Mathematical explanation of growth and decay curve
		Disequilibrium: Secular Equilibrium, Transient Equilibrium, Ideal Equilibrium
		Nuclear fission: Discovery of Nuclear fission, Fission cross-section and threshold, Neutron emission in fission and theory of fission process, Energy distribution in fission process
		Nuclear fusion: Discovery of Nuclear fusion, theory of fusion process, Energy distribution in fusion process; Counting statistics: Explanation of Binomial
		Distribution, Poisson Distribution and Gaussian Distribution
		Propagation of errors; Artificial radioactivity: Explanation of Induced Radioactivity, Radioactivity cross-section.
2	Radiation detection and measurement	General properties of detectors - Efficiency, Resolution, Dead time of the detectors; Gaseous detectors - Ionization Chamber, Proportional Counter
		Geiger-Muller Detector etc; Scintillation detectors

S. No.	Topics	Chapters
		The basic function of a scintillation detectors, photo multiplier tube and its function
		Various types of Scintillation detectors, Detection mechanism of NaI(Tl); Semiconductor detectors
		The Basic principle of Semiconductor Detector, Energy Gap, Various types of semiconductor detectors and its principles, Resolution, Fano factor; Neutron detectors
		Slow and Fast Neutron detection methods
		Nuclear Reaction of Interest in Neutron Detection
		Counters based on Neutron Moderation
		Other detectors - Explanation of Cherenkov Detectors, Photographic Emulsions, Thermoluminescent Dosimeters, Track Etch Detectors etc. Pulse processing and measurements - Pre amplifier, Amplifier and MCA etc.
3	Lab	
3.1	Gamma ray spectrometry	Measurement of gamma ray energy for the estimation of Ra(eq), ThO2 & %K
		Beta-Gamma technique
		Explanation and practice of technique used for the estimation of U3O8 in the sample
		Gamma ray logging & core analysis
		Explanation and practice of technique used for Gamma ray logging
		Shielded Probe Logging, and analysis of core samples
3.2	Instrumental Neutron Activation Analysis (INAA)	Principle and operation of INAA
3.3	Radon Emanometry	Methods for the measurement of Radon: CCT-Method, SSNTD Method, and ROAC Method
4	References	1. Radiation Detection and measurement – By G.F.Knoll. 2. Nuclear Physics- By D.C.Tayal. 3. The Atomic Nucleus- By R.D.Evans. 4. Measurement and Detection of Radiation- By N. Tsoulfanidis. 5. Nuclear Physics -by Irving Keplan 6. Basic Electronics, - Bernard Grob

S. No.	Topics	Chapters

Course No : 103
Subject: Basic Geophysics for Geologists

S. No.	Topics	Chapters
1	Introduction	Geophysical methods and the associated physical properties
		Classification of geophysical methods
		Role of geophysical methods in mineral exploration
		Effectiveness and limitations of various geophysical techniques with special reference to uranium exploration
		Geophysical signatures of uranium deposits
2	Magnetic and gravity methods of prospecting	Magnetic Method - Earth's magnetic field and its variations
		Magnetic properties of materials, Remnant magnetization
		Instruments for measuring magnetic field
		Field surveys, Corrections Reduction of magnetic data
		Magnetic anomalies due to bodies of simple geometry
		Gravity Method -Earth's gravity field and its variations, Figure of Earth, Isostacy, Absolute and relative measurements of gravity field
		Instruments for measuring gravity field, Field surveys, Reduction of gravity data Interpretation of gravity and magnetic data
		Anomaly patterns, Characterization of anomalies. Anomalies due to bodies of simples geometry (1D, 2D and 3D).
		Variation of magnetic anomaly in relation to magnetic latitude, azimuth and dip of the body, Ambiguity in interpretation of data, Forward and inverse modeling
		Applications and field examples
3	Electrical methods	Classification of electrical geophysical method
		electrical properties of rocks
		Self Potential method: Origin of self potentials field equipment and survey, anomalies due to bodies of simple shape

S. No.	Topics	Chapters
		Interpretation, field examples and applications
		Resistivity method: Ohm’s law,
		True and apparent resistivity
		Geoelectrical sections, Different electrode arrays, resistivity profiling and sounding
		Field equipment
		Interpretation of field data
		typical resistivity profiles over simple geological structures, use of Master curves for interpretation of data over multilayered medium
		Applications and Field examples
		Induced Polarization method: Origin, Membrane polarization, Electrode polarization, Time domain and frequency domain measurements, Parameters measured, Field equipment
		Typical profiles, Interpretation, Applications, Field examples
		Electromagnetic methods: Classification of methods
		Elementary theory of propagation of electromagnetic waves.
		Primary, Secondary and Resultant fields, Skin depth
		Frequency domain methods: Fixed source method, Moving source-moving receiver method, Very low frequency (VLF) method
		Ground penetrating radar technique, Parameters measured
		Field equipment
		Presentation of data
		Applications and field examples
		Time Domain method: Principle, Merits and demerits
		Survey configuration, Field procedure and equipment, typical profiles
		Applications and field examples Natural source EM methods.
		Telluric and magnetotelluric methods: Sources and the frequencies studied, Typical profiles, Applications and field examples.
4	Seismic methods	Elastic constants, Longitudinal, Transverse and Surface waves

S. No.	Topics	Chapters
		Hooke's law, reflection, refraction and diffraction from multilayered media
		Seismic energy sources and detectors
		Refraction seismic: Principle, Critical angle, critical distance, Velocity inversion, Refractions at parallel and non-parallel interfaces. Source-detector arrays, Fan shooting, applications and case histories
		Reflection seismic: Principle, Acoustic impedance. Time-distance graph, Reflections at parallel and non-parallel interfaces, Field procedures, Common Depth Point technique
		Applications and field examples.
5	Borehole logging methods	Objectives, different logging techniques, Principles
		Instrumentation and operational procedures of Self Potential, Electrical resistivity, Induction, Magnetic susceptibility, Sonic, Caliper, density, I.P. and radiometric logging techniques
		Applications and field examples
6	Tutorials	Computation of magnetic and gravity anomalies over regular shaped bodies;
		Smoothing of data by filtering techniques
		Estimation of mass from gravity data
		Interpretation of vertical electrical sounding curves
		Preparation of pseudo-sections of resistivity and IP data
		Interpretation of HLEM data using standard curves
		Interpretation of seismic refraction data by graphical and analytical methods
		Identification of formational boundaries from well logs.

Course No.: 104
Subject: Basic Geology for Geophysicists

S. No.	Topics	Chapters
1	Introduction to geology	The origin and internal structure of the Earth
		Composition of crust mantle and core
		Surface and internal processes: geomorphic processes and sedimentation; orogenic processes, mountain building, volcanism, metamorphism and rock deformation

S. No.	Topics	Chapters
		Rock structure: folds, faults and joints, brittle and ductile deformation, lineation and foliation
		Principles of stratigraphy
		Geological Time Scale, correlation and geochronology
		Elements of Indian stratigraphy
		Precambrian shield areas
		Important Phanerozoic successions, elements of Himalayan geology.
2	Introduction to minerals and their identification	Major rock forming silicates and common ore minerals
		Brief introduction to the formation and classification of common igneous, sedimentary and metamorphic rocks
		primary igneous and sedimentary structures, unconformity, dip and strike.
3	The dynamic earth	Continental drift, theory of plate tectonics
		different types of plate margins, association of metallic deposits in different tectonic settings
4	Introduction to ore forming processes and mode of occurrence of common ore deposits	Epigenetic and syngenetic deposits. Classification of ore deposits
		Orthomagmatic processes and examples of orthomagmatic deposits
		Pegmatitic and pneumatolitic deposits
		Classification of pegmatites, skarn and metasomatic deposits
		Hydrothermal processes Examples of modern ore solutions, aqueous transport of metals and deposition of metals from ore solutions, meteoric and juvenile solutions and their discrimination
		Hydrothermal deposits forms and classifications
		Weathering, supergene enrichment and residual deposits.
		Sedimentary deposits, deposits formed by mechanical transport and by chemical precipitation, Eh-pH diagrams
		Metamorphic and metamorphosed ore deposits.
5	Lab	Identification and interpretation of geological features in topographic maps
		Identification and interpretation of structural elements in geological maps: Faults, folds, unconformities

S. No.	Topics	Chapters
		Construction of geological cross-sections, stratum contours, isopach maps
		Stereographic plotting of planes and lines
		Study of stratigraphic maps of India
		Analysis of folds, Analysis of faults, Strain measurements
		Identification and description of hand specimens of common silicate minerals, common igneous, sedimentary and metamorphic rocks, common sulphides and oxide ore minerals and economic rocks
		Introduction to optical identification of minerals

Course No.: 105

Subject: Uranium Geology, Survey , Prospecting

S. No.	Topics	Chapters
1	Introduction	Objectives and challenges
		Geological considerations, time and project value estimation, terrain, legal, political and local issues
2	Uranium in the crust	Distribution of uranium - crustal abundance
		Time bound character
		Uranium in different rocks and minerals with some examples;.
		Classification of uranium deposits; uranium deposits in the world
3	Exploration guides	Controls of mineralization – stratigraphic, structural, lighological and other controls;
		Stratigraphic guides: earl
		Lithological guides
		Structural guides - fault, fracture, foliation and their intersections, fault-breccia systems;
		Geochemical guides - Indicator/pathfinder elements,
		Mineralogical guides - Poly metallic mineralisation- Pb, Cu, Ni, Co, Se, As, Au, Ag, Te and Zn and sulphide mineralization
		Weathering and alteration, diffusion aureole, leakage anomaly, dispersion and mobility patterns, K2O/ MgO, U, Ni, As, V, Mn and B abundances,
		Geochemical association of uranium with other trace elements
		Proterozoic basal Quartz- Pebble Conglomerate (QPC) type
		Proterozoic unconformity type
		Porous, permeable carbonaceous matter rich Mesozoic sandstone type
		Intrusive and reactivated granites
		Carbonaceous/ graphitic metapelites
		Graphitic schists, black shales
		Calcrete
4	Exploration methodology	
		Literature survey and conceptual modeling - study of available maps, identification of favourable parameters and

S. No.	Topics	Chapters
		geological environments;
		Reconnaissance and detailed survey – geological mapping from exploration point of view by remote sensing and ground surveys, narrowing down the target area;
		Uranium mineralogy – primary and secondary uranium minerals, their field identification.
5	Geochemical techniques	Stages of geochemical survey (Planning, deciding parameters for exploration, Orientation survey, Reconnoitory survey, detailed surveys)
		Hydrogeochemical techniques (Uranium and radium in surface and ground water, sampling);
		Lithogeochemical and pedogeochemical techniques (choosing grid pattern, sampling techniques),
		interpretation of analytical data
6	Radiometric techniques	Ground radiometric survey, gross gamma and spectometric measurements, demonstration of field equipments,
		Traverse planning, background radiation and anomaly detection, evaluation of anomaly
		Isorad mapping, channel sampling, shielded probe logging and radiometric assay of grab samples
		radon emanometry - isotopes of radon, migration, sampling techniques (CCT, SSNTD, ROC) and limitations
		Helium survey - principle, diurnal variation, sampling system, uses
7	Prospecting for uranium	Sampling: point, grab, grid samples; channel sampling; sample volumes; Sampling by drilling,
		stratigraphic, reconnoitary, exploratory and evaluation drilling;
		Planning of boreholes, choosing location and grid pattern,
		Borehole plan, selection of type of drilling(non-core/core),
		Lithological and geophysical logging
		Drift/deviation
		Borehole correlation sections,
		Preservation core, core skeletonization, sampling of boreholes sludge/core, comparative study of physical and chemical assay results of boreholes
		Estimation of disequilibrium.
		Assaying, rock density;
		Averaging of assay values from one location – samples of equal length/unequal lengths
		Averaging of assay values from different locations – evenly spaced samples, unevenly spaced samples;

S. No.	Topics	Chapters
		Compensation for varying rock density; erratic assays;
		Recent trends in uranium exploration
		Present status of uranium supply and demand, new discovery of uranium deposit in the world and in India; Case studies using different exploration techniques with examples from India and World.
8	References:	1. Economic Mineral Deposit-Alan M. Bateman 2. Uranium Supply and Demand-Michael J.Spriggs, Uranium Inst London 3. Uranium resources, production and demand summary-OECD-NEA and IAEA 4. World uranium deposits: uranium exploration geology; Proceedings of a panel, IAEA, Vienna-S. H. U. Bowie 5. Uranium Geology and Exploration -Richard H. De Voto 6. Classification of Uranium deposits-F. J. Dahlkamp 7. Radioactivity in geology: principles and applications- E.M.Durrance

Course No.: 106
Subject: Surveying, Drilling and Mining

S. No.	Topics	Chapters
1	Surveying	Types of surveys and applicability
		Principles and methods of surveying & mapping
		Surveying Equipment – Compass, The Transit, Optical Distance Measuring
		Modern surveying electronic equipments - Digital levels, Digital theodolites, EDMs and Total stations
		Principles, working and applications
		Survey Methods - Co-ordinate methods, Bearings, Traversing and Trilateration (Topo)
		Detail Survey, Orientation and position, Determination of True bearing, Horizontal and vertical control, Accuracy standards;
		Positioning – Introduction, Differential positioning,
		GPS instruments, Global Positioning Augmentation Systems; Errors in measurements – Blunders, Systematic errors, Random errors, Most probable value, Average error, Standard deviation
		Analysis and adjustment of measurements
		Distribution, Adjustment of errors by Approximate method and Least squire method

S. No.	Topics	Chapters
		Coordinate System in Geodesy - Geocentric Cartesian Coordinates, Topocentric Cartesian or local geodetic Cartesian Coordinates, Geodetic Coordinates, Planimetric Cartesian coordinate
		Datums - Horizontal datums - Everest spheroid, WGS – 84, datum transformation; Vertical datums - Mean Sea Level, Geoid, EGM 96
		Projection – Polyconic projection, Traverse Mercator projection (TM Projection), Universal Transverse Mercator Projection
2	Tutorials	Adjustment of instrument errors by approximate method and Least square method. Datum transformation exercises.
3	Drilling	History of Drilling; Methods of soil sampling - Auger, Drive sampling;
		Rock Drilling – Percussive, Attritive, Rotary Cutting, Shearing etc.,
		Rotary reverse circulating, Rotary with down hole motors, Cable tool method;
		Diamond Drilling - Diamond quality, types of diamond bits, natural and synthetic diamonds, Rotary core drilling equipment, Drilling standards, circulating media, Drilling fluid properties
		Controlled Directional Drilling - Deviation in drilling, Measurement of deviation and control, Tools for directional drilling, Downhole motors
		Various types of drills in use in AMD

Course No.: 107
Subject: Theory of Fields

S. No.	Topics	Chapters
1		Mathematical and physical fields, Continuity, Scalar and Vector fields.
		Static fields in free space, Coloumb's law, Newton's law, Field intensity, lines of force, charge density, Curl of vector, Stoke's theorem, Gauss's law, Gauss's divergence theorem, Poisson's and Laplace's equations, Electrical dipole, Double layer. Dielectrics and conductors, Polar and non-polar dielectrics.

S. No.	Topics	Chapters
		Harmonic functions, orthogonal curvilinear, spherical and cylindrical co-ordinates, Method of images, Green's theorem, Green's function, Green's equivalent stratum, Dirichletand Neumann problems
		Electric fields in conductors, Ohm's law in integral and differential forms. Magnetic fields, Magnetic flux, Magnetic vector potential, Induction in magnetic media, Relation between gravity and magnetic potentials. Electromagnetic induction.
		Laws of induction, Electric and magnetic energy densities, displacement currents, Poynting's theorem
		Electromagnetic radiation from an oscillating dipole.
	References:	1. V.L.S. Bhimasankaram And S.V. Seshagiri Rao, 1973, Theory Of Fields, Osmania University, Hyderabad, 2. Alexander A. Kaufman, 1992, Geophysical Field Theory And Method: Gravitational, Electric And Magnetic Fields. Academic Press.

Course No.108
Subject: Geochemistry and Geochemical Exploration

S. No.	Topics	Chapters
1	Geochemistry	Geochemistry as a branch of Chemistry, Brief understanding of the periodic table and inter-relationships between various elements, Hunds rule, Aufbau principle, Pauling's exclusion principle, Ionisation energy, electron affinity, electronegativity etc
		Primary geochemical differentiation, Geochemical classification of elements, geochemical associations
		Distribution of Major and trace elements in primary and secondary environment,Partition coefficient/ distribution coefficient and separation constants, Stable isotopes, Geochemical cycle of Uranium, Geochemistry of uranium, REE Geochemistry
		Eu and Ce anomaly interpretations
2	Geochemical thermodynamics	Equilibrium thermodynamics, state functions, ideal and real gases, equations of state, properties of vapours and solutions
		Laws of thermodynamics, reversible and irreversible processes, internal energy, enthalpy, heat capacity and entropy, calorimetric measurements
		Gibb's free energy in relation to temperature and pressure. Chemical potential, Gibb's-Duhem equation, heterogeneous equilibria and phase rule
		Standard states, activity and fugacity. Ideal solutions, Henry's law, Roults law

S. No.	Topics	Chapters
		Non-ideal solutions
		Phase diagrams.
3	Water chemistry	Solutions and solubilities, solute-solvent, solubility product and ion activity product
		Ionic strength of the solution, Debye-Huckel theory, Davies equations, units of concentration- molarity, molality, mole fraction, equivalents and normality
		pH and Eh concepts, Nernst equation (derivation), Geochemical fences, Limits of water stability
		Ore Genesis-Physico-chemical environment of ore genesis, Major theories- Origin due to Internal processes, Magmatic segregation, Magmatic deposits, Sublimation
		Hydrothermal deposits, metamorphic deposits, Contact metasomatism and wall rock alterations. Origin due to surface processes-Evaporation, residual and mechanical concentration/accumulation
		Origin due to secondary processes-Oxidation and Supergene enrichment.
4	Geochemical Exploration	Geochemical surveys–litho geochemical, hydro geochemical, pedo geochemical, Geobotanical /biogeochemical and Atmo geochemical techniques, Pathfinder and indicator elements
		Dispersion - Primary dispersions-Zonality, Wall rock alterations
		Secondary dispersions-mechanical, Gaseous, Residual, outcropping concealed and superimposed
		Hydro geochemistry- Significance of Eh, pH, T°C, Ec. solubility index and its significance in the secondary environment
		Eh-pH Diagrams constructions and their Significance
		Soil geochemistry, ionic potential and geochemical separation. Geochemical maps
	Tutorials	Evaluation Analysis & Interpretation of Geochemical Data (litho- pedo- hydro- biogeo & atmo- geochemical data) using conventional techniques and through use of various geo-software
		Derivation and interpretation of Partition coefficient/ distribution coefficient and separation constants.REE data normalisation using different rock standards, Eu and Ce anomaly interpretations
		Gibbs free energy in relation to temperature and pressure
		Gibbs- Duhem equation, construction of phase diagrams, solubility product and ion activity product, derivation of solubility index, Nernst equation (derivation), Calculation of limits of water stability using thermodynamic data, Geochemical fences, construction of Eh-pH Diagrams, Preparation of various geochemical maps
	References	1. Mason, B. Principles of Geochemistry, Wiley Eastern, 1982.

Thermodynamics in Geochemistry- the Equilibrium Model, Oxford Univ. Press, NY, 1993. 4. Wood, B.J. and Fraser, D.G. Elementary thermodynamics for geologists. Oxford, 1977. Nordstrom, D.K. and Munoz, J.L. Geochemical Thermodynamics, The Benjamin/ Cummings Publishing Co., Inc. 1985.

Course No. : 109
Subject: Seismic methods

S. No.	Topics	Chapters
1		Basic concepts, Hooke's law, Elastic wave propagation Wave equation, Elastic constants, Elasticc waves, Huygene's and Fermat's principles, Snell's law, Reflection, refraction and diffraction from multilayered media; Factors affecting seismic wave velocities, Partition of energy at an interface, acoustic impedance, Reflection and transmission coefficients, Zoeppritz's equation, Structure of Earth; Seismic refraction method - Head wave refraction, critical angle, Time distance curves, Critical distance, Geometry of refraction paths – two layer and multilayer media; Velocity inversion/hidden layer problem, Field lay outs, Fan shooting, Interpretation of refraction data – graphical and analytical approaches; Seismic reflection method- Principle, Time-distance graph, Geometry of reflection paths – horizontal reflector, dipping reflector; Common depth point technique, Stacking chart and CDP diagram for normal and crooked profiles, Static corrections, NMO, Velocity analysis, Migration, Wavelet propagation, attribute analysis. Wide angle reflections; Deep seismic soundings; Field procedure; Vertical seismic profiling; 3D and 4D seismic exploration, Seismic tomography, Basic concepts; Data acquisition; Energy sources – dynamite, vibroseis, hammer, airgun, Detectors – geophone, hydrophone; Grouping of geophones, Noise profile analysis, Source-detector arrays, Directional shooting, Instrumentation, Digital seismic recording- general lay out, pre-amplifier, filters, multiplexers, A-D converter, AGC, SEG formats; Telemetry systems;
2	Tutorials	Construction of wavefronts for two and three layer cases, Interpretation of refraction data –graphical approach (Mean minus T and Hale's methods) and analytical approach (Generalised reciprocal method).; Construction of CDP diagram and stacking chart for normal and crooked profiles; NMO correction; Determination of velocity and interface from reflection data; Plotting of reflection points on dipping reflecting layers; Noise profile analysis and optimum group spacing; Seismic data processing from demultiplexing to migration using standard software package; Simulation of seismic responses by finite element and finite difference methods.

		4. Dobrin, M.B., 1984. An Introduction To Geophysical Prospecting Mcgraw Hill, New Delhi, 5. Encyclopedic Dictionary Of Exploration Geophysics. Sheriff, R.E. Society Of Exploration Geophysicists, 1984

Course No. 110

Subject: Remote Sensing and GIS

S. No.	Topics	Chapters
1	Introduction	Fundamental concepts of Remote Sensing – Electromagnetic Spectrum, Energies available for sensing, Interaction of EMR with the atmosphere and terrain features
		. Mineral and Rock spectra. Application of energy bands for Geological studies
2	Imaging systems and sensors	Sensors in space today- Radiometric, Spectral and Spatial resolutions
		Selection of spectral and spatial resolutions for different geological themes
		Identification of the satellite data product, product codes, browsing of quality, product availability and procurement procedure
3	Elements of remote sensing and data interpretation	Fundamentals of image interpretation and geological applications-Tone, Texture, Drainage patterns and anomalies, colour, size and Object to background relationship
		Applications of geomorphology. Lithological and structural interpretation from satellite data
4	Digital image processing	Objective of Digital Image Processing, Georectification, Image mosaicing
		Image enhancement: Single band enhancement - Contrast stretching – Linear contrast stretching, Multiple linear stretching, Logarithmic or functional stretching, Gaussian stretching, Histogram equalization stretching and Density slicing
		Application of stretching techniques for geological interpretation and for anomaly zone extraction from airborne radiometric images; Edge enhancement – Anisotropic Kerenels (Linear edge), Gradiant image (1st Derivative), Laplacian image (2nd Derivative), Image smoothening
		Application of different edge enhancements to radiometric images; multiple Image Enhancement - Addition and substration of Images, Principle component Transformation, Image ratioing.
		Application of these transformations for Geological and radiometric interpretation; Spectral and spatial resolution merging – different methods, and its application to geological studies

S. No.	Topics	Chapters
5	Digital Image classification	Supervised classification, unsupervised classification, Application of classification for geological studies
6	Geographical Information Systems (GIS)	Introduction to GIS, Basic map concepts and Data layer generation, Topology building and Attribute Table generation
		Getting spatial data into GIS and making spatial data usable
		Getting attribute table in GIS and making it Linked and usable
		Defining real world coordinate system and Map projections to multi-coverage database
		Performing GIS analysis – Spatial operation, generating buffers, manipulating spatial features, polygon overlay and Tabular analysis
7	Geo-modelling	Introduction, principles of various modelling techniques in mineral exploration; concepts of mathematical modelling
		Vector and Raster geographical information system
		Geological, geophysical and geochemical data used in modelling
		Presentation of case study- nature of data, grid file generation, interpolation algorithms, validation of surface fitting, mathematical equations of trend surface, estimation of parameters of surface equations, goodness of fit, preparation of residual maps for variables and uranium accumulation trend analysis
8	Lab	Handling data products: different sensors and scale; procedure of browsing and selecting data; Interpretation of satellite data based on elements of Remote sensing - sedimentary, Igneous and Metamorphic terrain; Interpretation of structural features.
		Digital Image Processing: Georectification and Mosaicing; contrast stretching, edge enhancement, multiple image enhancements, Merging images, and image classification, using both satellite and radiometric data.
		GIS: working on ERDAS DIPS and ArcGIS for spatial data creation; defining real world coordinate system and Map projections; working on ArcGIS for some GIS analysis; Map Presentation
9	Reference	1. Remote Sensing and Image Interpretation - Thomas M, Lillesand and Ralph, W. 2. Remote Sensing Application for Mineral Exploration - Ed.William L. Smith 3. Remote Sensing Geology - Ravi P. Gupta

Course No.: 202

Subject: Exploration for Beach sands

S. No.	Topics	Chapters
1	Placers and the placer environments	Classifying the environments,
		Environmental change, the placer geological time-scale,
		Types of placer minerals
2	Placer sediments and sedimentation	Energy balance, Process-response elements, Sedimentary processes - Mechanical agents of weathering, Chemical agents of weathering, Biological agents of weathering, susceptibility of minerals to change, resistance of minerals to change, Erosion;
		Properties of sediments- Particle size, Particle shape, Particle density;
		Characteristic properties of placer minerals
		Sedimentation - flow of solids through fluids-sediment transportation and settling, Transitional marine sedimentation.
3	Placers and their formation:	Provenances and related minerals, Time related provenances, Tectonically related provenances, Regional aspects of provenance and placer mineral distribution ,Connecting provenance with minerals characteristics;
		Placer formation- Continental placers, Transitional placers, marine placers
		Transitional (Beach) Placers
		Beach terminology, beach morphology, common HMs on the beaches
4	Exploration and prospecting	The placer exploration model- Programme logistics, Exploration tools, Remote sensing and satellite imagery, aerial photography, geophysical and geo-chemical methods
		Prospecting – Reconnaissance, close testing, drilling methods,sampling,analytical methods
5	Placer valuation:	Classification of ore reserves and resources - geometrical and geo-statistical methods - cut-off grade, blending, dilution, feasibility studies
6	Placer mining and placer mineral processing:	Mining methods- Mechanical mining - wet and dry methods – dredging, ecological consideration; Mineral processing: Gravity concentration, magnetic and electro static separation
7	Economic value of placer	

S. No.	Topics	Chapters
	resources – world scenario	

Course No.: 202

Subject: Rare metals and Rare Earths

S. No.	Topics	Chapters
1		Introduction to Rare Metal & Rare Earth minerals and their significance in Modern Technology
		Geochemistry and mineralogy of RM RE minerals
		Geological characteristics of Rare Metal bearing granites, pegmatites ,carbontites and alkaline rocks
		Potential Rare Metal bearing of pegmatite belts of India and world scenario
		Rare metal bearing carbonatite-alkaline rock complexes of India and World scenario
		Geologic characteristics and genetic problems associated with development of granite hosted deposits of Tantalum and niobium
		Exploration Techniques for rare metals minerals
		Geochemical methods in exploration of Rare Metals and their ore reserve estimation
		Gravity Technique for Recovery of Rare Metals

Course No.:203

Subject: Inversion methods in Geophysics and signal processing

S. No.	Topics	Chapters
1	Inversion techniques	Fundamental concepts, Inverses with discrete and continuous models
		Inverse methods based length, generalized matrix,
		inverses and maximum likelihood methods
		Non-uniqueness, applications of vector space, resolving kernels
		singular value decomposition, non-linear inverse problems
		Optimization techniques and algorithms, Marquardt algorithm, Parametric, generalized and constrained inversion procedures
		Backus-Gilbert Inverse problem, Applications of inverse theory to geophysics
2	Signal Processing	Signal processing in geophysics, Periodic function, Even and odd functions; Delta function Step function, Analog to Digital conversion; Integral transforms, Fourier transform, Discrete Fourier transform, Fast Fourier transform; Hilbert transform, Hankel transform, Walsh transform, Laplace transform, Z transform; Impulse response, Transfer function, Digital filtering; Convolution, Deconvolution; Auto correlation , Cross correlation; Sampling and reconstruction, Statistical Signal processing; Auto regression, Moving average. Auto recursive moving average filters; Weiner least square method for designing shaping and spiking filters, Butter worth filter, Applications in geophysics
3	References:	1. W. Menke, 1989, Geophysical Data Analysis: Discrete Inverse Theory, Academic Press. 2. J.A. Scales, M.L. Smith and S. Course No.: 204

Subject: Ore Reserve Estimation

. No.	Topics	Chapters
1	Ore Reserve Estimations	An overview and outline, Exploration and Data Collection (Resource database) - Survey information, Geological data,
		Geological model, Density factor, Sampling issues
		Analytical procedures, Digital databases and validation, Audits of the resource database
		Geological interpretation and Geological modeling
		Role of geological interpretation
		Interpretative techniques, Geological interpretation and modeling for mineral resource estimation
		Ore reserve estimation- Area of Influence methods, Estimation for flat lying deposits
		Uniform area of influence method
		Variable area of influence method
		Polygonal method
		Triangular method
		Cross-section method
		Isopach method and General outline method;
		Estimation method for steeply dipping deposits;
		Inverse distance method
		Geostatistical methods

. No.	Topics	Chapters
		Variography, Variography and data validation, Optimization of sampling grid and Domaining, Semivariogram, Kriging techniques (linear and nonlinear); Conditional simulation
		Mineral sands – Evaluation, resource estimation and reporting
		Reserve categories: Measured/indicated/Inferred, RAR/EAI/EAII/Speculative
		Feasibility studies: Environmental issues and Ore reserve estimation
	Tutorials	Calculation of ore reserves by different methods
	References:	1. Edwards, A.C., (Ed) (2001). Mineral Rersource and Ore reserve estimation – The AusIMM Guide to Good Practice (Monograph 23). Published by The Australiasian Institute of Mining and Mettallurgy, Carlton Victoria Australia. 2. International Atomic Energy Agency (1985). Methods for the estimation of Uranium ore reserve, An instruction Manual. Technical Reports series no.255.

Course No.: 205
Subject: Gravity and magnetic methods

S. No.	Topics	Chapters
1	Gravity method	Earth's gravitational field , Gravitational potential, Potential field equations, Derivatives of potential
		Poisson's equation Geoid
		Figure of Earth, Isostacy, ,Geodetic measurements Density estimations from field data
		Absolute and relative measurement s of gravity
		Theory and principle of gravimeter, zero length spring, Super conducting gravimeter, Calibration of gravimeter, Field procedure, Reduction of gravity data, Free Air, Bouguer and Isostatic anomalies,
		Gravity anomalies due to regular bodies- Sphere, vertical and horizontal cylinders, sheet, step/fault and bodies of arbitrary shape, Simple interpretation methods using thumb rules, characteristic curves, curve matching , excess mass estimation, location of mass centre, over burden effects, maximum-depth rules.
2	Magnetic method	Geomagnetic field, Magnetic field of external and internal origin,
		Van Allen radiation belts, diurnal variation, magnetic storms, Dipole-nondipole fields and their origin, Secular variation
		Magnetic petro physics
		Factors affecting magnetization of rocks and magnetic minerals, magnetism of igneous , metamorphic and sedimentary

S. No.	Topics	Chapters
		rocks
		magnetic signatures in different ore environments
		Remnant magnetization
		Magnetic character of continental and oceanic crusts, reversals of magnetic field, sea floor spreading and plate tectonics
		Theory and principles of magnetometers -Flux gate, Proton precision, Optical pumping and SQUID. Gradiometers
		Measurement of remanence and magnetic susceptibility
3	Processing of gravity and magnetic data	Regional-residual separation, graphical method, Polynomial fitting, Spectral analysis, Average depth estimates
		Smoothing and enhancement techniques, wavelength filtering, matched filtering,
		Werner Deconvolution, Euler depth estimates, Upward and downward continuation, derivatives, reduction to pole for magnetic data, analytical signal, susceptibility mapping, direct and inverse methods of interpretation.
4	Lab	Computation of gravity and magnetic anomalies due to two dimensional and three dimensional regular shaped bodies
		Study of variation of magnetic anomaly with magnetic latitude, azimuth and dip of the body
		Application of spectral analysis for interpretation of field data
		Computation of radially averaged spectrum
		Average depth estimates, upward, downward continuation of data
		Regional-residual separation
		Computation of vertical derivatives,
		Reduction to pole for magnetic data
		Computation of analytical signal
		Euler depth estimates
		Inversion of gravity and magnetic anomalies,
		Estimation of anomalous mass from gravity data,
		Modelling of gravity anomaly over a outcropping sedimentary basin

Course No.: 206
Subject: Petro-graphic techniques in uranium exploration

S. No.	Topics	Chapters
1	Optics and Mineralogy	Electromagnetic spectrum, light, double refraction; Polarised light microscopy,
2	Transmitted light microscopy	Minerals in plane polarized light – shape and cleavage, relief, colour, pleochroism/diachroism, opacity, vibration direction, birefringence
		Minerals in cross polarized light – anisotropism, interference colors, extinction angle, twinning, mineral identification; Interference figures – significance; sign of elongation
		Unitarian optics – determining optic sign with gypsum plate, quartz wedge
		Biaxial optics – determining optic sign with optic axis figure and acute bisectrix figure, determining 2V/Mallards method
		Becke's lines, oblique illumination method for determining relief, determination of plagioclase compositions using the Michel Levy method;
		Modal analysis, norm calculation
3	Reflected light microscopy:Properties to be studied under	Colour, bireflectance and reflection pleochroism, anisotropism, internal reflections
		Structural and morphological characters – crystal form and habit, cleavage and parting, twinning. Mineral identification
		Qualitative methods –; Colour – quantitative measurement of colour, reflectance, microindentation hardness, standard measure of Vicker's hardness, Knoop's hardness, standards, factors affecting microindentation hardness values for minerals;

S. No.	Topics	Chapters
	reflected light	polishing hardness, scratch hardness; paragenesis
4	Petrography	Petrography, petrology, petrogenesis
		Igneous petrology – rock classification-plutonic and volcanic rocks, textures, alkaline rocks and carbonatites
		Sedimentary petrology – clastic rocks, classification and origin, provenance of accessory minerals in sandstones, significance of glauconite, tectonics and sandstone compositions, climate and sandstones, diagenesis of sandstones, cementation, sandstone interpretation guide
		Chemical and biochemical sedimentary rocks – carbonate mineralogy, classification
		Tectonic setting
		Texture as an indicator of energy levels
		Metamorphic petrology – definition, grade, types, classification, nomenclature, textures and metamorphic settings.
5	Radioactive, Rare earth element and rare metal bearing minerals	. Uranium mineralogy, different stages of formation of uranium minerals, occurrence of radioactive minerals in different rock types
		Thorium: Mineralogical expression of radioactivity
		Types of radioactive minerals/phases, location and identification of radioactive minerals, optical properties of radioactive minerals – colour, reflectance, bireflectance, reflection pleochroiism, anisotropism and isotropism, internal reflection, micro indentation hardness
		primary uranium minerals, complex oxides of uranium and thorium
6	Presentation and preservation of data and assessment	Entry in registers, database, slide cataloging, photomicrography and report writing
7	Lab Petromineralogical techniques	
		Preparation of polished slab, polished thin section -advantages, araldite mount (cold setting), Bakelite mount, preparation of wafers for fluid inclusion studies
		Determination of specific gravity
		staining techniques – feldspars and carbonates

S. No.	Topics	Chapters
		Density separation of mineral grains – coarser than 200 mesh sieves and finer than 200 mess sieves; unconsolidated sediments,
		Identification of minerals, special techniques for radioactive minerals – chromogram test
		CN-85 film autoradiography/SSNTD study, fission tract studies, separation of secondary uranium minerals
8	Parts of the microscope	Objective lenses, ocular lenses, illuminating systems, accessory plates and their uses, monochromators, photometers, stage micrometers, sample holders
		Resolution, numerical aperture calibration of the micrometer, field of view, centering of the objectives
9	Transmitted light microscopy	Minerals in plane polarized light – shape and cleavage, relief, colour, pleochroism/diachroism, opacity, vibration direction, birefringence
		Minerals in cross polarized light – anisotropism, interference colors, extinction angle, twinning, mineral identification
		Interference figures – significance; sign of elongation; Unitarian optics – determining optic sign with gypsum plate, quartz wedge
		Biaxial optics – determining optic sign with optic axis figure and acute bisectrix figure, determining 2V/Mallards method
		Becke's lines, oblique illumination method for determining relief, determination of plagioclase compositions using the Michel Levy method; Modal analysis,
10	Reflected light microscopy	Mineral identification, Kalb's line. Qualitative methods Colour – quantitative measurement of colour, reflectance
		Microindentation hardness, standard measure of Vicker's hardness, Knoop's hardness, standards, factors affecting microindentation hardness values for minerals; polishing hardness, scratch hardness
11	Petrology	Study of thin sections of common igneous, sedimentary and metamorphic rocks
12	Radioactive, Rare earth element and rare metal bearing minerals	Mineralogical expression of radioactivity; types of radioactive minerals/phases, location and identification of radioactive minerals
		Optical properties of radioactive minerals – colour, reflectance, bireflectance, reflection pleochroiism, anisotropism and isotropism, internal reflection, micro indentation hardness
		Primary uranium minerals, complex oxides of uranium and thorium, common accessory radioactive minerals, labile uranium along grain boundaries, secondary uranium minerals
		uranium minerals in igneous, sedimentary and metamorphic environments.

Course No. 207

Subject: Electrical and electromagnetic Methods

. S. No.	Topics	Chapters
1	Electrical Methods	Classification of electrical methods, Natural and artificial source methods,
		Conduction in rocks, Electrical properties of rocks and minerals and their measurement
2	Self Potential method-	Origin of self potentials, Electro-filtration, Diffusion, Adsorption, Mineral potential occurrence and stability ,
		Field procedure, equipment, non-polarizable electrodes, Interpretation of anomalies due to simple shaped bodies.

. S. No.	Topics	Chapters
3	Resistivity method-	True and apparent resistivity, Current flow and potential in homogenous and non homogenous media, Potential at a plane interface, Surface potential due to horizontal beds, Effect of anisotropy and topography.
		Geo-electrical parameters- Longitudinal conductance, Transverse resistivity, longitudinal resistivity
		Various configurations and their geometric factors, Comparison of electrode arrays, Principle of reciprocity, Electrode effect, Depth of investigation, Field about a point, Dipole field region, Concept of image in potential theory, analytical continuation of potential fields, numerical methods in potential theory, Resistivity profiling and sounding.
		Typical profiles across contacts, dykes
		Expressions for apparent resistivity over layered earth, Principle of equivalence and suppression, Resistivity transform and linear filter theory, Interpretation of vertical electrical sounding curves. Applications and case histories
4	Induced Polarization method	IP phenomenon, electrochemical theory, over voltage, fixed layer, double layer, Faradaic and non-Faradaic paths, Warburg impedance, equivalent circuits, IP phase angle, mathematical formulation of IP response, Factors affecting IP phenomenon, Time domain, frequency domain and Spectral IP measurements and their equivalence
		Complex resistivity, Cole-Cole model, Discrimination of minerals, Negative IP, Field procedure and equipment, EM and capacity coupling, Computation of theoretical IP curves, IP soundings and interpretation, Magnetic Induced Polarization method, Field procedure and equipment, advantages, Applications and case histories
5	Electromagneti c methods	Classification of electromagnetic methods, Sources for EM waves, EM wave propagation
		Maxwell' s equations, Boundary conditions, wave equation, self and mutual inductance
		Electromagnetic energy and power, Poynting vector
		Diffusion equation and its solution, skin effect and skin depth, Reflection and transmission of electrical and magnetic fields, elliptic polarization
		radiation from dipole, retarded potential, near and far fields, radiation resistance, Field due to a rectangular loop, horizontal wire, horizontal circular coil, vertical straight wire, Phasor diagram, Electric circuit analogy for an EM system
		Negative screening, overburden effect, current channeling and current gathering.
		EM response over bodies with high magnetic permeability.
		EM scale modeling. Cagniard's resistivity
6	Frequency domain EM	Dip angle, Compensator method, Turam method, Horizontal and vertical loop EM methods, Controlled source audio magneto telluric method

. S. No.	Topics	Chapters
	methods-	Frequency and geometric soundings, Very low frequency (VLF) method- VLF station, parameters measured Ground Penetrating Radar method
		Field procedures and equipment
		Processing of Turam data Interpretation of HLEM data and Turam data using standard curves
		Fraser and Hjelt filters, Derivation of Current density cross section from VLF data
7	Time Domain EM methods	Comparison of FDEM and TDEM methods
		Survey configuration, Impulse and Step response measurements, Diffusion time, Transient EM response over confined targets, homogenous half-space, layered earth, thin sheets
		Field procedure and equipment. Interpretation using plate model
		Interpretation of sounding data over layered earth.
8	Natural source EM methods	Magneto-telluric, telluric and AFMAG methods. Source and the frequencies investigated
		Field procedure and equipment. Interpretation of the MT soundings. Applications and case histories
	Lab	Construction of two, three and multilayered VES curves, Interpretation of two ,three and multilayered VES curves using auxiliary point charts and master curves, Interpretation of VES curves by direct and inverse methods, Preparation of pseudo-sections, Current density cross sections from VLF data, Interpretation of HLEM data using master curves, Processing of Turam data and interpretation by using characteristic curves Interpretation of TEM profiles using plate mode, interpretation of TEM sounding data using inversion

Course No.: 208
Subject: Mineral process Engineering

S. No.	Topics	Chapters
1	Ore preparation	Significance of mineralogy in ore/mineral beneficiation
		Mineral liberation, locking factor, image analysis, Particle size analysis
		graphical representation of the results, number, mass, surface area, volume distributions as function of particle size
		statistical distributions, Laser particle analyzer
		Crushing and grinding of ores, operating principles, work index of ores, grinding efficiency and various grinding mills, mathematical treatment of grinding operation, design of grinding circuits

S. No.	Topics	Chapters
		Classification of ground ores, various types of classifiers, classifier performance, classifier efficiency
2	Ore processing by physical beneficiation	Principles of physical beneficiation of ores, qualitative and quantitative separation efficiencies, metallurgical accounting methods applicable to ore processing
		Gravity separation using the differences in specific gravities of mineral constituents, flow of particles in fluid medium, free and hindered settling, terminal velocity
		Introduction to various gravity separators, such as jigs, shaking tables, spiral concentrators, FLOATEX separators
		Electrostatic and high tension separation, the operating principle and applications in processing of atomic and strategic minerals, Froth flotation, basic principles, significance of surface properties in determining the floatability of heavier-than-water minerals, flotation equipment
		Magnetic separation, Principles of operation, magnetic separators Case studies with respect to processing of ores of atomic and strategic minerals such as those of uranium, beach sand minerals (thorium and zirconium), niobium-tantalum, tin, tungsten, molybdenum, cobalt etc
		Fine particles processing, challenges and techniques of separation, introduction to commercially available fine particle processing machines/techniques such as multi-gravity separator (MGS), Knelson concentrators, column flotation and other novel methods
3	Ore processing by chemical and bio-processing methods, hydro-metallurgical operations	Principles of leaching, acid and alkaline leaching, atmospheric and pressure leaching, factors affecting leaching behaviour
		Solid-liquid separation, various types of filters, filtration efficiency
		Hydrometallurgical unit operations, ion exchange, solvent extraction, principles of ion exchange and solvent extraction, process equipment to carry out these operations,
		Recovery of metals from the concentrated/purified solutions including precipitation
		Bio-processing of minerals, bacterial leaching, Case studies of flow sheets for processing uranium ores including those of Jaduguda, Narwapahar, Turamdih, Tummalapalle and Gogi
		Uranium recovery from secondary sources like phosphate ores, copper plant tailings and monazite
		Pilot Plant studies, scale-up and design of industrial size uranium recovery plants and project planning, management and execution
		Material and energy balancing. Process engineering, synthesis and flow sheet design.
4	Tailing processing, effluent treatment and disposal	Dewatering operations, thickening and drying and material handling.
		Significance of tailings and effluent processing in uranium ore processing Tailings neutralization, mine backfilling, tailings pond, fixing of deleterious heavy metal ions and radioactive ions, Bioremediation and impact analysis.

S. No.	Topics	Chapters
5	Lab	Size reduction of ores in laboratory ball and rod grinding mills. Screen analysis of ground ore, data presentation, by graphical methods using standard models and interpretation of data
		Settling characteristic for mineral particles in ground ore slurries and determination of parameters for dewatering of slurries
		Determination of Bonds Work Index in Ball mill, estimation of power requirement and sizing a mill for specific design specification
		Gravity separation of heavy minerals using spirals, jigs, shaking table, estimation of valuable mineral content, calculation of recovery and grade
		Magnetic separation of heavy mineral concentrates from beach sands on low and high intensity magnetic separators
		Froth Flotation of sulfide minerals, generation of kinetic curve of flotation determination of optimum grade and recovery from the graphical plots. Agitation chemical leaching of uranium ores by acid / alkaline leaching methods and computation of leachability.

Course No.: 209

Subject: Airborne geophysical methods

S. No.	Topics	Chapters
1	Introduction	Procedures for obtaining needed licenses for flying in an area
2	Survey	Survey design, and fixation of survey parameters- flight height, flight line spacing and direction, and selection of suitable

S. No.	Topics	Chapters
	designing and implementation	geophysical methods.
3	Airborne survey instruments	Magnetometer, Gravimeter, Electromagnetic system, Gamma Ray Spectrometer and their working principles.
4	Navigation aids-	DGPS, Radio-altimeter and Barometer. Types of platforms. Precautionary measures in flying – weak link mechanism, airworthiness of equipment.
5	Data acquisition	Selection of base frequency, pulse duration in case of EM methods, Sampling interval, format of output data. Types of noise in different sets of data. Quality control, data validation. Calibration procedures.
6	Processing of data	Application of attenuation coefficients, stripping coefficients, gridding, interpolation procedures, contouring
7	Presentation of data	Profiles, contour maps, images, ratio maps, conductivity –depth sections, DTM. Qualitative interpretation- Characterization of gravity and magnetic anomalies and delineation of lineaments, identification of structures
		Delineation of zones of anomalous distribution of radio-elements and identification of alteration zones. Marking positions of conductors and their extent.
8	Quantitative interpretation	Depth estimates using radially averaged spectrum of gravity and magnetic anomalies, Euler depth estimates. Forward and inverse modeling of different sets of data using available software. Modeling of conductors using plate model. Integration of various geophysical data sets and surface geological data in order to refine geological maps.
9	Tutorials	Quality control and validation of various data sets, Processing of radiometric, gravity and magnetic data, after applying the needed corrections, Presentation of data in the form of profiles, contour maps, images using available software. Qualitative interpretation to identify various litho-units and structural features. Computation of derivatives, analytical signal, Quantitative estimates using radially averaged spectrum, Euler depth estimates. Delineation of alteration zones, younger intrusive from processed radiometric data. Forward and inverse modeling of gravity, magnetic and electromagnetic data using available software. Preparation of a refined geological map after integrating various data sets.

Course No.: 210

Subject: Analytical techniques in geosciences

S. No.	Topics	Chapters
1	DC Arc spectroscopy	Dispersion of light - Basic operating principle, Dispersion devices used for spectral analysis, Prism and grating, Linear dispersion, Fundamental principles of prism dispersion, Deviation angle, Snellins – Descartes law, Prism dispersion , instrument main components, Littrow and Cornu prisms
		Optical spectra - classification of spectra, structure of line spectra, Instrumentation, Overall arrangement, Arc and spark discharge, Electrodes
		Sample preparation - General aspects, Sampling and preparation of non conducting solid substances, Spectroscopic buffer
		Behavior of elements in an arc discharge
		Simultaneous multi element analysis, Method development, Major and minor element analysis, Trace element analysis, Photo plate detection
		Measurement of the intensity of spectral lines, Straightening of the characteristic curve, Determination of the density of spectral lines, Semi quantitative/ quantitative reconnaissance analysis
	Lab	Sample preparation-weighing-filling of standards and samples in electrodes; arcing; photo plate

S. No.	Topics	Chapters
		development-computation-reporting
2	X-Ray Diffraction	Principles and methods of X-ray diffraction, Preparation of different types of geological samples for XRD studies
		Use of search-match methods for identification of primary and secondary uranium and associated minerals
		Use of search-match methods for identification of rare metal and rare earth and related minerals
		Use of search-match methods for identification of iso-structural, metamict and clay minerals
		XRD techniques for determination of unit cell parameters of atomic minerals
	Lab	Sample preparation-sample diffraction-data output-search and match method-study of diffractogram-identification of minerals-reporting
3	Electron Microprobe (EMP)	X-ray generation by electron bombardment of a sample, the detection of x-rays by WD Spectrometers, qualitative microanalysis
		Standards-based quantitative WDS microanalysis, detection limits, precision and Accuracy, methods for assessment of data quality
		technique of electro microprobe Analysis, imaging, qualitative and quantitative data acquisition, Processing & documentation
	Lab	Sample preparation and operation of EPMA Instrument for both qualitative and quantitative microanalysis.
4	X-ray fluorescence Analysis (XRF)	Qualitative and quantitative rock analyses; Standards-based quantitative WDS XRF analysis; detection limits, precision and Accuracy
		methods for assessment of data quality
		technique of XRF [WDS & EDS] Analysis, qualitative and quantitative data acquisition, data Processing and documentation.
	Lab	Sample preparation and operation of WDS XRF Instrument for both qualitative and quantitative analyses of major and minor elements, in major rock types
5	Chemical Analysis	Introduction to chemical analysis/characterization of geological materials
		Whole rock analysis - Major, minor, trace and ultra trace analysis; Sample types
		Conventional and Modern instrumental analytical techniques
		Sample preparation - Solid sampling, Solution methods for rocks, soils, water, minerals and concentrates, HF & other mineral acid dissolutions(open & closed), Fusions & fluxes
		Field measurements - pH, conductivity, TDS, Eh and Titrimetry for anions, ferrous etc
		Optical emission techniques - Flame Emission - theory, instrumentation, merits, limitations & applications

S. No.	Topics	Chapters
		Fluorimetry - Laser & Pellet methods, theory, instrumentation, merits, limitations & applications
		Atomic Absorption Spectrometry - Flame Hydride Generation and Electro thermal - theory, instrumentation, merits, limitations & applications
		UV-Visible Spectrophotometry - theory, instrumentation, merits, limitations & applications
		ICP-AES - theory, instrumentation, merits, limitations & applications
		ICP-MS - theory, instrumentation, merits, limitations & applications
		Data Quality Assurance - Errors - types, minimization
		figures of merit like accuracy, precision; standard reference materials, statistical criteria for accuracy, precision.
	Lab	Sample solution preparation for Whole rock analysis, beach minerals, niobate-tantalate
		Determination of uranium in water samples by laser fluorimetry using Scintrex analyzer and solid samples by pellet fluorimetry
		Determination of Na, K by flame photometry and Si, Ti, P by Spectrophotometer
		Determination of Fe, Mn, Al, Cu, Co etc. by FAAS
		Determination of rare earths etc. by ICP-AES; Analysis of hydro-geochemical samples for major cations & anions
6	Geochronology and Isotope Geochemistry	K-Ar system, Rb-Sr system, Sm-Nd System, U-Th-Pb System, Zircon Dating, U-Decay Series Dating, Other Decay Systems
		Analytical Methodology Radiogenic Isotope Geochemistry
		Radiogenic Isotope Geochemistry of the Mantle, Isotopic Evolution of the Mantle and models, Isotope Geochemistry of the Continental Crust
		Isotope Geochemistry of Subduction Zone
		Magmas Stable Isotope Geochemistry
		Stable Isotope Theory - Equilibrium Fractionations, Kinetic Fractionation and the Hydrologic Cycle Isotope Fractionation in the Biosphere
		Stable Isotope Applications - at High Temperatures, Oxygen Isotopes as An Indicator of Assimilation
		High Temperature Applications in Subduction zones, Hydrothermal Activity, Metamorphism, and Ore Deposits
	Lab	Sampling and sample preparation; Sample dissolution techniques and ion exchange separation for Rb/Sr, Sm/Nd, U and Pb
		Isotopic analysis using TIMS; Stable Isotope (C,S and O) analysis using IRMS

S. No.	Topics	Chapters

Course No.:

Subject: Borehole Logging methods

S. No.	Topics	Chapters
1.		Objective, Basic concepts- Archie's equation, Humble's equation, borehole conditions, Principles, operational procedures, equipment, applications of various well logging techniques
		Self-Potential Logging.- Sources for S.P. Use of Self Potential Logs for Oil exploration Shale base line, Sand base line Interpretation of SP logs Use of Self Potential Logs for mineral exploration
		Single point resistance log
		Resistivity Logging - Normal resistivity logging Lateral resistivity logging Microlog resistivity logging Focussed –current logging Induction logging
		Interpretation of logs
		Sonic Logging -Elastic waves in boreholes Estimation of porosity. I.P. Logging
		Nuclear Logging Nuclear Processes Gamma Ray Logging Neutron Logging, Pulsed neutron logging. Magnetic Susceptibility Log
		Nuclear Magnetic-Resonance Log. Borehole gravity log. CalliperLog
		Qualitative and quantitative interpretation of well logs. Determination of reservoir parameters. Delineation of lithology and fractures from logs
		Saline water-fresh water interface from log data. Applications. Field examples.
2.	Lab	Computation of normal and lateral log responses. Identification and delineation of sub-surface formations from well log data. Calculation of formation factor, porosity, permeability, resistivity, fluid saturation, correlation of rock units. Saline water-fresh water interface rom log data.
3.	References	1. O.Serra, 2003. Well Logging And Geology, Technip, Paris 2. O. Serra, 1984. Fundamentals of Well Log Interpretation, Elsevier. 3. R.M. Bateman, 1985, Open Hole Log Analysis And Formation Evaluation, Reidel, Dordrect. 4. G. Asquith and C. Gibson, 1982. Basic Well Log Analysis for Geologists, Academic Press, London.

Course No.: 212
Subject: Nuclear Reactor: Theory, Types and Nuclear Fuel Cycle

S. No.	Topics	Chapters
1	Introduction	The need for nuclear energy, power scenario in India, Atomic Energy establishments in India and programmes of DAE.
2	Nuclear reactor theory and types of reactors	Scientific fundamentals of fission and fusion processes and resultant release of energy
		Interaction of sub-atomic particles and ionization radiations with matter
		Nuclear structure and functions of the reactor systems
		Various types of reactors
		Moderator and coolant
		Typical reactor control system
		Steady and dynamic behavior of reactors
		Requirements of safety systems in nuclear power plants
2	Nuclear Fuel Cycle	Nuclear fuel cycle options for PHWR, BWR, PWR and FBR: Nuclear materials, Nuclear fuel cycle in India, specifications of fuel
		Mining, processing, enrichment, manufacturing, usage and burning of fuel
		Quality control aspects
		Storage and safe transportation of spent fuel bundles
		Nuclear fuel enrichment; fuel reprocessing ; generation and management of radioactive wastes
3	Environmental issues	Need for environmental protection
		Indian legislation and controls related to environment, environmental impact assessment clearances related to setting up of a nuclear power plant and its operation
		Environment survey requirements

Course No.: 101 & 201
Subject: Basic Mathematics for Geoscientists I and II

S. No.	Topics	Chapters
1	Basic mathematical concepts	Concepts of a Set, Functions and Relation
		Graphs of Functions,
		Trigonometric Functions, Basic Trigonometry
		Hyperbolic Functions and summation of Trigonometric series

S. No.	Topics	Chapters
		De Movire's Theorem
		Mathematical Induction
		Quadratic Equations
		Permutations and Combinations,
		Binomial Theorem
		Concept of a Sequence, Series
		Exponential, Logarithmic and Power series
		Convergence, Divergence tests
		Equations of Lines and Circles in 2-Dimensional Geometry and Basics of 3-D Geometry Spheres, Cones, Cylinders
2	Calculus	General, Limits and Continuity
		Differentiation- Basic concepts
		Curve stretching, Maxima and Minima
		Exponential functions and Exponential models
		Differentiation of Trigonometric
		Logarithmic and Exponential Functions
		Integration- Basic Concepts
		Indefinite and Definite Integrals ,Area and integration, Numerical Integration
		Ordinary differential equations- First Order Equations,
		Homogeneous and Non homogeneous equations
		Multiple Integrals
		Functions of several variables
		Double integral, Limits at infinity and Improper Integrals
3	Matrices	Concept of Matrix, matrix operations, determinant,
		Inverse of a Matrix
		Orthogonal Hermition, skew-Hermition and unitary matrices,
		rank Solution of simultaneous equations, quadratic forms
		Linear dependence and independence of vectors

S. No.	Topics	Chapters
		Linear and orthogonal transformations
		Eigen values and Eigen vectors
		properties of Eigen values, Caley-Hamilton theorem
4	Numerical methods	Solution of non-linear algebraic and transcendental equations
		Newton-Raphson, iterative, false position and bisection method
		Generalized Newton's method for multiple roots
		Numerical intergration by Taylor series
		Finite difference operators and their relations
		Factorial notation of a polynomial, data smoothing
		Newton-Gregory and Lagrange's interpolation formulae
		Inverse interpolation by Lagranges and interactive methods
		Numerical differentiation and integration – trapezoidal
		Simpson and Weddle rules, Gaussian quadrature formula
		Matrix and system of linear equation- Pivoting, Triangular factorisation, eigen value problem solving
5	Statistical concepts	Concept of frequency distribution, moments, skewness and kurtosis
		Probability- various approaches of probability- classical, frequency, statistical, subjective and axiomatic, theorems on probability, conditional probability, Independence
		Bayes theorem random variable – discrete and continuous
		Distribution functions and their properties
		Central tendency, probability mean and density function
		Mathematical expectation / moment generating function and its properties
		Probability distribution,Bernoulli's, Binomial
		Poisson and Gaussian distribution Theory of least squares and curve fitting
		Regression Analysis Variance, SD,Covariance
		Correlation – regression lines, regression coefficients Test of significance, normal test, t-test, Chi-square test and f-test
		Filters and smoothening functions
		Moving Averages, Kriging

S. No.	Topics	Chapters
		Trend surfaces Distribution of points, Contouring, Splines, Semi variograms Discriminant functions, Cluster analysis, Eigen values and Eigen vector methods
		Methods of Factor analysis – Prinicpal component analysis

Course No.: 106
Subject: Surveying, Drilling and Mining

S. No.	Topics	Chapters
1	Surveying	Types of surveys and applicability
		Principles and methods of surveying & mapping
		Surveying Equipment – Compass, The Transit, Optical Distance Measuring
		Modern surveying electronic equipments - Digital levels, Digital theodolites, EDMs and Total stations
		Principles, working and applications
		Survey Methods - Co-ordinate methods, Bearings, Traversing and Trilateration (Topo)
		Detail Survey, Orientation and position, Determination of True bearing, Horizontal and vertical control, Accuracy standards;
		Positioning – Introduction, Differential positioning,
		GPS instruments, Global Positioning Augmentation Systems; Errors in measurements – Blunders, Systematic errors, Random errors, Most probable value, Average error, Standard deviation
		Analysis and adjustment of measurements
		Distribution, Adjustment of errors by Approximate method and Least squire method
		Coordinate System in Geodesy - Geocentric Cartesian Coordinates, Topocentric Cartesian or local geodetic Cartesian Coordinates, Geodetic Coordinates, Planimetric Cartesian coordinate
		Datums - Horizontal datums - Everest spheroid, WGS – 84, datum transformation; Vertical datums - Mean Sea Level, Geoid, EGM 96
		Projection – Polyconic projection, Traverse Mercator projection (TM Projection), Universal Transverse Mercator Projection
	Tutorials	Adjustment of instrument errors by approximate method and Least square method. Datum transformation exercises.
2.	Drilling	History of Drilling; Methods of soil sampling - Auger, Drive sampling;
		Rock Drilling – Percussive, Attritive, Rotary Cutting, Shearing etc.,

S. No.	Topics	Chapters
		Rotary reverse circulating, Rotary with down hole motors, Cable tool method;
		Diamond Drilling - Diamond quality, types of diamond bits, natural and synthetic diamonds, Rotary core drilling equipment, Drilling standards, circulating media, Drilling fluid properties
		Controlled Directional Drilling - Deviation in drilling, Measurement of deviation and control, Tools for directional drilling, Downhole motors
		Various types of drills in use in AMD
	References:	1.Drilling Technology by C.P. Chugh 2.Drilling Technology Part 1 & 2 by British Drilling Association 3.Thomas, L.J. An Introduction to Mining, Methuen, Brisbane, 1978. 4.Sinha, R.K. and Sharma, N.L. An Introduction to Mineral Economics, Wiley Eastern, 1993. 5.Chatterjee, K.K. An Introduction to Mineral Economics, Wiley Eastern, 1993.
3.	Mining	Introduction to Mining
		Mining Terminologies
		Types of mining
		Techniques in Open Cast mining
		Techniques in Underground Mining
		Stages of mine development
		Blasting technique
		Economic feasibility studies andMining, milling and waste disposal etc.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Project Work	**Code:** P-NFC-BARC-01
Discipline: Chemical, Electrical, Mechanical and Quality Assurance	**No. of Lectures: 175**

Following Placement in various DAE Units, the Trainee Scientific Officers will carry out project work at their respective places of posting under the guidance of their Reporting officers, on a well-defined project/problem for a period of 7-8 weeks. The Project work will commence immediately after the Placement Committee meeting leading to the placement of TSOs in various DAE Units. The TSOs shall submit a project report at the end of the project duly certified by the project guide.

****

General Lectures

1) Series of Invited Lectures by Eminent Speakers on various programmes of DAE (about 4-6 talks to be arranged during the year)

2) Lectures on

   a) Public Speaking & Presentation Techniques (2 Hrs)
   b) Administrative Procedures (2 Hrs)
   c) Vigilance & Service Conduct Rules (2Hrs)
   d) Financial & Accounts Procedures (2 Hrs)
   e) Purchase Procedures (2 Hrs)
   f) Contract/Works Procedures (2 Hrs)
   g) Role of Official Language In Central Government Offices (2Hrs)
   h) Fire Safety (2 Hrs)
   i) Security (2 Hrs)

Nuclear Engg. Module

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Engineering Mathematics	**Code: E01 E02-CMEI-30**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Part – A

Overview of arithmetic errors in computations
Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
Linear systems solutions by direct methods, iterative methods and acceleration techniques.
Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
Linear systems: Eigen values.
Non -Linear systems: Newton-Rapson & Successive Approximation methods
Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

Part - B

Finite Difference Approximation in 1-D and 2-D
Solution of steady and unsteady heat conduction equations
Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
Response Surface Method 2K+1, factorial design, 3k factorial design
Monte Carlo Method
Artificial Intelligence and Genetic Algorithm
Artificial Neural Network
Gram-Schmidtt Orthogonalization
Transformation of matrix
Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.

Syllabus

Subject: Nuclear and Reactor Physics	**Code: NE 2-E07 -CMEI-45**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 35**

NUCLEAR AND REACTOR PHYSICS (35)

1. **Properties of Nuclei:**
   - Binding energy-formula and interpretation, nuclear forces, nuclear structure.
2. **Fission process:**
   - Fission rate and reactor power
   - Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
   - Fissile, fertile and fissionable materials
   - Fission product activity after shut down –decay heat.
3. **Interaction of Neutrons with Matter**
   - Production of neutrons
4. **Concept of microscopic cross section:**
   - Inelastic and elastic scattering
5. **Variation of cross-section with energy**
   - Fast, resonance and thermal ranges
   - 1/v law of neuron cross-section
   - Resonance absorption, Doppler effect.
   - Eta vs E curve conversion & breeding concept
   - Thorium utilization
6. **Diffusion of Neutrons**
   - Fick's law and its validity
   - Steady state neutron diffusion equation
   - Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.
7. **Chain Reaction**
   - Four Factor formula
   - Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
   - Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,
8. **Slowing Down Process**
   - Neutron slowing down
   - Slowing down power/ moderating ratio of moderators
   - Slowing down with spatial migration
   - Fermi age concepts, migration length
   - Multi zone reactors
   - Ideas of reflectors/blankets, reflector savings, form factor.

Contd…

9. Heterogeneous Reactors

- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

10. Reactor Kinetics

- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

11. Core Burn Up

- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

12. Neutron Poisons

- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

13. Reactivity Coefficients

- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Reactor Engineering & Radiation Shielding	**Code: NE 03-E 13-CMEI -30**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Introduction to reactor system & Indian Nuclear power programme; station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems, classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR, AGR, HTGR, AHWR etc,.), Fast reactors; Research reactors (CIRUS, DHRUVA etc.) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.

Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems. Heat flow & temperature distribution in plate & solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example. **(10Hours)**

Brief description of various types of fuel; metallic (DHRUVA, CIRUS) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; heat and mass balance in a BWR; boiling height in a BWR core; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pr, temp) in various reactors.

Nuclear Fuel Cycle:
Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
Global options of fuel cycles; Issues related to Resources, Long-lived radioactive waste, Proliferation, and Advanced Technologies.
Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle, Thorium utilization; Indian capabilities in: managing nuclear waste, long lived radio active waste and fuel cycle technologies.
Advanced fuel cycles; Role of ADS. **(10 Hours)**

Contd……

Radiation Shielding

Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors. **(10 hours)**

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Health Physics, Chemical Plant Safety And Environmental Engineering	Code: NEM - FC02, E06, CC09-CMEEI-25
Discipline: Mechanical, Chemical, Electrical Electronics and Instrumentation Engineering	**No. of Lectures: 30**

Health Physics (8 Lectures)
Radiation Sources, Quantities & Units: Natural & Technologically enhanced radiation sources, Radiometric quantities, Interaction coefficients, Dosimetry, Radioactivity, Exposure-dose relationship. Calculation of dose from alpha, beta, gamma & neutron sources.

Fundamentals of Radiation Protection: Objectives of radiation protection, ICRP system of dose limitation, radiation protection standards, annual limit of intake, derived air concentration. Exposure and absorbed dose, equivalent dose, effective dose and their units (old & new), Limits of intake for radio nuclides including radon, accidental & emergency exposure, Atomic Energy Act, Radiation Protection Rules, Safety organization, Regulatory aspects of radiation protection.

Non- stochastic or immediate effects: Acute radiation sickness - LD 50 / 60, radiation effect on gonads, blood & blood, storming organs, lung, thyroid & skin.
Stochastic or Delayed effects: Cancer, life shortening linearity of dose effect:
Effects on embryo & foetus, genetic effects, doubling dose. Human data for calculating risk coefficients.

Operational Radiation Protection: Modes of exposure, Exposure control.
1.External: time, distance & shielding
2.Internal: containment, ventilation, plastic suits, respirators. Design of hot laboratories, zoning of areas, personal control, medical control, concept of controlled area, supervised area, radiation protection procedures, special work permit, barrier rubber stations.
Radiation Protection Monitoring: Work place monitoring for external radiation levels, air born contamination, surface & personnel contamination, monitoring instruments, collection of air & swipe samples & their counting, Individual monitoring of external exposure - TLD, film badge, monitoring for internal exposure - whole body counting, bioassay, dose records, collective dose equivalents. Radiation emergency; onsite and offsite procedure of handling emergencies, early phase, intermediates, late phase and counter measure.

Industrial Safety (8 Lectures)
Introduction: Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques
Hazards due to physical agents: UV and IR radiation, Lasers, Microwave radiation; noise, heat
Chemicals hazards: Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals
Evaluation: Instrumental methods, air sampling methods, liquid effluent monitoring
Occupational exposure limits: Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50
Handling, storage and control: Engineering control measures and safety features, Safety management techniques such as safety audit, Personal/ administrative control, and Medical control
Fire and explosion hazards: Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits, USNFPA Classification of Flammable/combustible liquids: flammable gases; Engineering safety for prevention of fire and explosion, Hazard area classification, selection of equipment, detection and extinguishing systems

Contd....

Hazard identification, assessment and control: Hazard identification: Concept of risk and Risk management; Formal methods of hazard identification and assessment: Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies, Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation. Specific hazards in HWPs and various facilities of NFC. Area classifications for hazardous chemicals, types of protection & Protective equipments. Safety work permit system

Management of major hazard Installations: (6 Lectures) Plant Layout and Engineering Design Considerations, Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic. Releases, Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment, Emergency Planning Guidelines, Development of On-site & off site emergency preparedness plans

Health and safety regulatory aspects: Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate. EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

Environmental Engineering & Environment Protection: (8 Lectures)

PRINCIPLES: Population, economic growth, industrialization, urbanization and energy-use, as causes of environmental pollution. Application of environmental principles (technical and non-technical) to: water resource management, water and wastewater treatment, air pollution control, solid waste management, environmental impact assessment, and environmental ethics. Thermal pollution, noise pollution, greenhouse effect, acid precipitation, ozone depletion, air toxics, and ground-level ozone and fine particulates (photochemical smog). Sustainable development, life cycle analysis, and principles of environmental quality objectives, standards and guidelines.

Environment Impact assessment, various effluents generated from HWPs & NFC and their treatment methods strategies, Limiting concentration of pollutants and pollution control measures. MSDS, toxic releases; Emission & dispersion

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Nuclear Power Plant Engineering	Code: NE 05 -CMEI-30
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	No. of Lectures: 30

a) PHWRs (12 Lectures)

Description of schematic of NPP; siting requirements; Layout of Nuclear Power plant- Zoning requirements, layout within Reactor Building; Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting. Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
Reactivity control mechanisms - Zone control / Regulating rods, Absorber rods and shim rods; Shut down System.
Fuel Transfer System.
Auxiliary systems - Ventilation, Annular gas, Process water & Fire water systems.
Secondary System - Description of flow sheet and major components, Comparison of operating conditions, Thermal Cycles and Major Components of thermal and nuclear units.
Power Plant Control and Instrumentation: Reactor Power control (neutronic and thermal signals), Coolant and Steam pressure control, Integration with grid for base load operation. Control and protection channels with typical examples.
Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system. Brief description of systems components like Bus bar, Switchyard, Circuit Breakers, Switchgear, Bus duct, Generator, Transformer, Cables and their selection, Layout and Scaling.
Nuclear Power Plant Safety: Design principles for providing nuclear safety :-Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

Safety Evaluation and Safety Criteria Description of Deterministic and Probabilistic approaches. Safety Monitoring of Operating Plants- IAEA Classification, NUSS Codes. Safety systems, Description of Safety Systems (shutdown system, ECCS, Containment and Engineered Safety Description of features) Exclusion Zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.

Description of a typical Design Basis Accident Scenario - build up event tree to describe sequential role of safety features. Broad description of TMI, Chernobyl accident, NAPS fire incident.

Advanced reactor concepts with passive safety features.

Nuclear Architecture: Design of integrated layout of Equipment, Piping, Electrical/ Instrumentation Cables etc. to provide Operation and Maintenance Convenience (to minimize man rem and meet safety objectives), Non propagation of incidents/ accidents.

Contd...

b) PWRs / BWRs (8 lectures)

Pressurized Water Reactors : Reactor pressure vessel and internals, reactor core and fuel, methods of reactivity control, reactor coolant system & equipments, pressurizer, Engineered Safety features, reactor auxiliary systems including turbine & generator.

Boiling Water Reactors; Introduction, reactor vessel and internals, neutron monitoring, reactor coolant recirculation systems including secondary steam, reactor protection system, turbine generator.

c) Fast Breeder Reactors (10 Lectures)

INTRODUCTION: Breeding, definition & reactions; Breeders as an Inexhaustible Energy Source; Fast reactors as breeders: Classification of power reactors; Characteristics & types of fast reactors: Comparison of some characteristics of fast and thermal reactors; Role of Fast Reactors in Indian Nuclear Power Programme.

Fuel: Fuel pin diameter, number of fuel pins per sub-assembly, reactivity worth of sub-assembly, Sub-assembly outlet temperature.

Shielding Principles: Special features of sodium cooled reactor shielding, reactor shielding, shield for activation products, shielding for fuel management.

Thermal analysis: Sodium heat transfer coefficient (empirical relation), calculation of temperature of fuel pin, hot spot analysis (brief outline).

Coolant for fast reactor: General requirements for fast reactors coolant; Comparison of various coolants & choice of sodium as coolant; Properties of sodium: Physical & chemical; Methods of sodium purification & purity control: Cold & hot traps; Oxide measuring & indicating devices.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Material Science In Nuclear Engineering	Code: NE 06 -CMEI-25
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 25**

Shri. Chittaranjan Das

Properties of Engineering Materials: (21 Lectures)
Metals, alloys, ceramics, metal cladding semiconductors, polymers, and composites. Mechanical properties and their evaluation as per ASTM or equivalent standards. Stress-strain diagram, Principle stresses, Biaxial stresses, creep, fatigue and fracture toughness. Material testing for tensile strength, hardness, fracture, creep, fatigue wear.
Material Processing: Metal forming, casting, cutting and joining: ASTM standards, quality control during processing.
Metallurgy of Steels: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, Austenitic and Martensitic S.S. Selection of Steel for hydrogen services, different types of corrosion aspects in heavy water plants (Ammonia based & Sulfide based); their protection method and the selection of structural material. Selection of steel for high temperature and radiation environment, Welding and heat treatment. Powder Metallurgy for fuel fabrication

Shri. R. Tewari

Nuclear Materials: Fabrication, properties and application of nuclear materials like Zircoloy, Zr-Nb alloys, Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and application.
Decontamination, radiolysis, specification for chemistry parameters in process systems of BWRs & PHWRs.

Shri. Kamalesh Chandra

Corrosion Engineering: Corrosion, activation of corrosion products.
Chemical properties: Oxidation, corrosion, gaseous corrosion, stress corrosion, corrosion prevention, chemical degradation.
Basic Corrosion principles, types of corrosion & their mechanism and prevention; Crevice corrosion, SCC, IGSCC and other under deposit corrosion, Electro- chemical corrosion and erosion corrosion, cathodic protection of pipelines and vessels; Corrosion in chemical process industries and their prevention methods.

Smt. K.S. Lakshmi

Non Destructive testing: (4 Lectures)
Covering basic aspects of various types of NDT Techniques like UT, Radiography, Edycurrent, Magnetic Particle testing, Dye penetrant testing & Visual Inspection Methods.

Reference Books

9. Uhlig, Herbert H and Revie R Wniston, "Corrosion and Corrosion Control- An Introduction to Corrosion Science Engineering", 3rd Edition, John Wiley, 1984

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Nuclear Fuel Cycle And Water Chemistry	**Code: - NE 7-FC07 FC08-CMEI-50**
Discipline: Mechanical, Chemical, Electrical, Electronics and Instrumentation Engineering	**No. of Hours: 45**

Nuclear Fuel Cycle: (19 Hours) General description for different types of reactors. Front end and back end processes. Three stage Nuclear Power Programme of DAE.
Basic considerations of Fuel Design. Types of Nuclear Fuels, Research/Power Reactors Fuels, Thermal/ Fast Reactor Fuels. Metallic, ceramic fuels, cermet and dispersion fuels, Advantages/ disadvantages. Cladding Materials, zirconium alloys,stainless steels, aluminum and alloys.
Manufacturing processes for Uranium. Uranium ore mining and milling, Production of Uranium metal, alloying of U, Fuel for CIRUS & Dhruva; their properties and fabrication methods, methods of fuel plate fabrication. Uranium oxide powder preparation, compaction, sintering. Problems with U Fuel, Oxide Fuels, Mixed Oxide and Carbide fuels, properties of Pu Fuels, U & Pu Carbide fuel plate fabrication, FBTR fuel pin fabrication method,
Manufacturing processes for production of nuclear grade zirconium
Production of nuclear grade Zirconium Oxide, Iodide Process and Kroll process for production of sponge. Thermal decomposition, electrolysis etc., Specification of Zr-Sponge in Nuclear reactor applications. Melting Practices: Arc Melting, plasma melting and Electron beam melting methods for producing zirconium alloy ingots.

Fabrication: Cold working & hot working, Forging, rolling, extrusion, pilgering, tube drawing, rod fabrication, wire drawing and metal joining (Resistance welding, TIG welding and EB welding), Heat treatment of Zirconium alloys; Vacuum annealing & Stress relieving, Pickling & finishing of zirconium alloys. Manufacture of Fuel Tubes, Coolant Tubes, Calandria Tubes and other structurals
Irradiation effects in fuel and cladding materials. Pellet Clad Interaction & Stress Corrosion Cracking. Delayed hydride cracking, Performance of pressure tubes Advanced Fuels, Canflex, Dupic, thorium utilisation

Heavy Water Production (8 Hours)
Heavy Water: Properties and importance of Heavy Water in Nuclear Power Generation, scenario of D2O requirement, Unique features of deuterium separation, details of various methods of production, distillation and electrolysis processes of D2O and their comparison. Chemical exchange processes: H2S - H2O, NH3-H2 processes, description of sulphide process, separation factor, flow sheet, utilities, effluent treatment, special components.
Ammonia - H2, mono-thermal and bi-thermal processes description, flow sheet, effluents, NH3 – H2O front end process, salient features of equipments like ejector tray towers, etc. Ammonia-Hydrogen Front end process

Reprocessing of spent Nuclear Fuels. **(4 Hours)** Introduction to radiochemistry, difference between conventional & radiochemical plant, process and equipment limitations, criticality, safety and other hazards, ventilation and shielding. Spent fuel storage, decontamination, solvent extraction, Purex process, Reprocessing of thorium based fuels.

Contd…

Nuclear Waste management: (4 Hours) Sources, Characteristics and classification of radioactive waste, general philosophy of radioactive waste management. Methods of treatment for low, intermediate and high level solid, liquid and gaseous wastes with examples. Conditioning of radioactive waste, cementation, bituminisation and vitrification methods. Storage for primary/secondary solid waste and ultimate disposal.

Aspects of Heavy Water and its Analytical Chemistry (6 Hours)

Fundamentals of analytical chemistry, IR, UV, Neutron scattering, atomic absorption spectrophotometry, GC, GLC, HPLC, Mass spectrum.

Specific analytical instruments used in process & mineral plants, Measurements of impurities in gas / liquid like CO, CO2 , SO2, H2S, NH3 etc.

Measurement of SPM in stack, ambient air etc.

Online measurement of O2, sulfides (for H2S), pH etc.

Water source and Impurities, External treatment: Aeration, chlorination, clarification, filtration, precipitation softening processes, Ion exchange and DM water production

Boiler water systems & treatment

Cooling water systems & treatment

Industrial waste water treatment

Isotope separation Process (4 Hours)

Equilibrium and non Equilibrium Processes,

Thermodynamic minimum work for separation

Value function separative work

Cascade theory, Ideal cascade and squared of cascade.

Various reversible separations processes

Isotopic separation systems

Reference Books

Fundamentals of Analytical chemistry- Douglas, A.S.; Donald, M. W., Fourth edition

BETZ handbook of Industrial Water conditioning, eighth edition, 1980

Chemical engineer's Handbook- Perry J.H. and Green, Seventh edition

Nuclear Reactor Engg – Reactor Systems Engg 4th edition Vol.II

By Glasstone, Samuel , Pub: Sesonske, Alexander, Pub: CBS, New Delhi

Nuclear Radiation Detectors by Kapoor S.S. & Ram Murthy, V.S. Pub: New Age, New Delhi

Advances in Industrial waster water treatment by P.K. Geoel Pub: Jaipur

Essentials of Nuclear chemistry 4th edition by H.J. Arnikar Pub: New Age, New Delhi

Technology of Zirconium by Miller.

Villani , Stelio, " Isotopic separation (An ANS Monograph)", American Nuclear Society, 1976

Skog , Douglas A et al, " Principles of Instrumental Analysis "5th Edition , Harcourt Asia , 2001

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Advanced Chemical Reaction Engineering	**Code: CEM:E 30:C-25**
Discipline: Chemical Engineering	**No. of Lectures: 25**

Review of basic concepts of reaction engineering
Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
Reactor design: counter-current moving bed reactors, fluidized bed reactors.
Advanced topics in reaction engineering- three phase reactors, integral reactor-separators, complex systems.
Examples from nuclear chemical engineering.

Reference Books:

Core Engg. Module

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Advanced Mass Transfer, Equipment Design and Solvent Extraction	Code: CEM-04:E32 AC03:C 45
Discipline: Chemical Engineering	**No. of Lectures: 45**

Theories of mass transfer: 15 Hrs

Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fiber extractors. Adsorption and ion exchange equipment. Membrane separation and other advanced mass transfer processes. Process intensification approaches.

Mass Transfer Equipment Design: 10 Hrs
Different types of mass transfer equipment for gas liquid operations. Selection criteria for tray v/s packed columns. Design of cross flow and multiple d/c type sieve trays, Ejector Trays Hydro dynamics of trays & packed columns, Structured & random packings Performance evaluation of plate & packed column, spray, packed & tray columns trickle bed reactors.

Solvent extraction: 20 Hrs
Introduction to liquid-liquid extraction: Molecular and eddy diffusion, inter phase mass transfer, Lewis-Whitman theory calculation of No. of stages for cross flow and counter current flow, selection of solvent. Three component system. One pair partially soluble, two pairs partially soluble Binodal solubility curve, Representation in equilateral triangular coordinates, interpretation of equilibrium curves, extraction in multi component systems, use of "pinching " in extraction & scrubbing operation.

Dispersion & Coalescence: axial and radial dispersion, Factors influencing dispersion, Primary and secondary break ,types of impellers, dispersion in spray columns, sieve plate column packed column and in agitated systems. Factors affecting coalescence, coalescence in spray column, packed column in settlers.

Equipment for solvent extraction: Selection criteria for contractors, classification of contractors, contractors effectiveness, spray columns, packed columns, sieve tray, pulsed sieve plate column, mixer-settlers, centrifuge.

Contd...

Design of mixer settlers: Design from 1st principles, Batch and continuous equipment, (Design of batch mixer settler), Principles of scale up of designs, mixer and scale up hydrodynamic balance and location of aqueous ,mixed and organic parts.

Chemistry of Uranium Extraction: Different solvents, Mechanism of Uranium extraction, diluents, third phase formation, Phase or diluents modifiers.

Extraction processes in Nuclear industry: Ore concentration, DDPA process, DEHPA, AMEX process, TBP-UO_2 $(NO_3)_2$ refining ,PUREX process, Thorex Process, TBP-$Zr(NO_3)_4$ process

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Basic Process Instrumentation and Control	Code: CEM:CC03-M - 20
Discipline:Mechanical, Chemical & QA Engineering	No. of Lectures: 20

Instrument terminology, symbols & performance:
Instrument terminology: Accuracy, Precision, Resolution, Repeatability, Reproducibility, Drift, Dead band, Flow sheet symbols, Instrument performance, Standard unit of measurements, P&I diagrams.

Measurements: **Flow measurement**:
Mechanical type flow meters: Orifice meter, Venture meter, Pitot tube, Elbow meters.
Variable area flow meters, Magnetic flow meters, Turbine flow meters, Ultrasonic flow meters

Level measurements:
Level gauges, floats, Differential pressure type level detectors, Displacer type level detectors, Conductivity type, Capacitance type, Ultrasonic type, Radiation type

Temperature measurement: Filled-bulb and glass type thermometers, Bimetallic type, Resistance temperature detectors, Thermocouples, Pyrometers

Pressure measurement:
Bourdon & helical type pressure sensors, Bellow type pressure sensors, Diaphragm type, Differential transmitters, Manometers,Vacuum sensors.

Panel display instruments: Indicators, Recorders, Controllers
Signal transmission methods & Annunciations.

Automatic control theory: Control basics, Control modes, Closed loop response, Feed back & feed forward control, Tuning of PID controllers.
Final control elements: Control valve sizing, Control valve types, Actuators, Accessories & positioners

Control & Instrumentation, Sensors and Transmitters
Final control elements. Control valves, actuators, and positioners Controllers Automatic controllers

Distributed Digital Control System
(a) Signal conditioning, (b) Data acquisition system (c) PC based instrumentation (d)Organisation of distributed control system; (e) Control software and qualification aspects (f) Data processing and SCADA.

Contd....

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Computational Fluid Dynamics and Heat Transfer	Code: CEM:E 21:CM-40
Discipline: Mechanical and Chemical Engineering	**No. of Lectures: 40**

Basics of Fluid Flow, Heat Transfer and Numerical Analysis: 15 Hrs

Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.

Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.

Classification of Partial Differential Equations (PDEs)

Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.

Temporal integration: explicit, implicit scheme

Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method

Discretization of convection-diffusion problem: exponential scheme, power-law scheme

Laminar Boundary Layer and Forced Convective Heat:

Formulation of differential equation for hydrodynamic and thermal boundary layer

Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.

Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory

Convective heat transfer for internal and external flows

Low and high Prandtl number limits and different thermal boundary conditions

Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence ; Prandtl's mixing length theory, Mixing length models

Structure of turbulent boundary layer over flat plate and through circular cylinder ; Calculation of friction factor and drag coefficient ; Analytical and semi-analytical correlations for calculating heat transfer coefficients ; Analogy between heat and momentum transfer ;Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:

Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model

Reynolds stress models: algebraic and differential models,Low Reynolds number models

Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

Natural Convection :

Basic Equations of natural convection : Boussinesq approximation : Derivation of Dimensionless groups from basic equations : Analytical approximations : Numerical solution of approximate equations

Contd....

Numerical Solution of Complete Fluid Flow and Energy Equation : 6 Hrs
Formulations of governing equations used in numerical simulation:
Streamfunction-temperature formulation
Streamfunction-vorticity-temperature formulation
Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
Primitive-Variable (P-V-T) formulation
Pressure velocity coupling for incompressible flow:
Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
Simple grid generation techniques for structured grid:
Elliptic, parabolic and hyperbolic equation method
Grid adaptation
Domain decompositions in CFD and heat transfer
SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer : 10 Hrs
Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Heat Transfer With Phase Change : 9 Hrs
Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model); Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation) ; Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.Critical Flow: Models for single – phase and two-phase critical flow.

NFC, Hyderabad
Syllabus

Subject: Process Dynamics, Analysis and Control	Code: CEM:E31 E29:50
Discipline: Chemical Engineering	**No. of Lectures: 40**

Review of Basic Control: 40 Hrs

Dynamic models, Transfer function Transient analysis - Rouths criteria etc., Stability, Frequency analysis - Nyquist criteria with examples using MATLAB etc., Discrete models, z-transforms, Sampled data control, Introduction to state space control, State feed back, Pole placement, Controllability, Observability, Stochastic Processes, Kalman filtering. Process identification from plant data; SISO with PID control, Inadequacies; Cascade, feed forward, dead time compensation; Introduction to adaptive control, non-linear control; Poorly defined system, and fuzzy control. Multivariable systems, Model predictive control: internal model control, Dynamic matrix control, multivariable control, and optimal control. Introduction to Fault Detection and Diagnosis. The assignments include problem solving with simulation software.

Reference Books:

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Process Modeling, Simulation and Optimization	**Code: CEM-5:E 33:C-20**
Discipline: Chemical Engineering	**No. of Lectures: 20**

Process Simulation: 10 Hrs
Introduction to process modeling, simulation and optimization. Deterministic versus stochastic models. Dynamic and steady state models.
Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
Approaches to Plant Simulation: Sequential modular; Equation oriented; Simultaneous modular
Steady-State Sequential Modular Simulators:
Concepts of partitioning, tearing and nesting as applied to flow sheets: Methods of representation of plant topology; recycle detection and calculation ordering algorithms; recycle convergent methods.

Steady State Equation Oriented Simulators:
Strategies for formulation of plant models; sparse systems and Solution procedures; Solution methods for simultaneous modular approach; General Approaches For Non-Linear Systems; Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eign-value method. Examples of solving non-linear systems; Commercial Simulators ;Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization: 10 Hrs
Classification of optimization problems, necessary and sufficiency conditions for optimum; Search procedures for unconstrained optimization problems; Non-linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator; Case Study: Simulation and modeling of heavy water cascade, use of lumping and de-lumping strategies, application on Optimisation techniques. Decomposition of complex topology, rate base model versus equilibrium base model for tower internals, evaluation of transport co-efficients using mass transfer with reaction models, use of analogies for evaluation of interface co-efficient introduction, Recent Developments: Multi-objective optimization, Plant optimization by Genetic Algorithms and Neural Network.

Reference Books:
1) Process Modeling, Simulation And Control for Chemical Engrs. 2nd Edition: Luyben William L, Publisher: McGraw-Hill, New York .

NFC, Hyderabad
Syllabus

Subject: Applied Process Instrumentation and Control	Code: CEM :E 50:CEEI-45
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 45**

Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: **15 Hrs**

Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annular, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices, venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flow meter; Ultrasonic flow meters- transit time, Doppler type, Clamp on type ultrasonic flow meters, Coriolis and thermal mass flow meters. Applications and limitations of various flow meters. Two phase flow measurements.

Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermo well, thermo well installation aspects. Surface temperature measurement techniques; Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

Pressure: 15 Hrs

Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.>Analytical Instrumentation: Conductivity, pH, ORP and Turbidity measurement.

Automatic Control Theory: Control busses, Control Modes, closed looping response, PID controllers, feed back & feed-forward control, timing of PID controllers. Auto tuning and self adaptive controls. Operational amplifiers and its applications.

Contd...

Instrumentation Field Busses: HIRE Foundation Field Bus, profi bus, mod bus, TCP/IP, Industrial Ethernet, device net & CAN

Introduction of Advance Sensor Technology: Wireless sensors.

Basics of Pneumatics : Instrument Air Quality, Air requirement, Flaper nozzle mechanism, signal booster.

Other Measurements: Relative humidity; viscosity and density measurement

Introduction to Neural Network and Fuzzy Logic : 5 Hrs

Control valves: 10 Hrs

Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve range ability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings; P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

Syllabus

Subject: Electrical Engineering Practices- I	Code: CEM:AC13:E -30
Discipline: Electrical Engineering	**No. of Lectures: 30**

1. **EHV Switchyard Design**: Switching schemes; clearance; Comparison between types of switchyards; Brief introduction to equipments in switchyard and their functions; Lighting arrestors and insulation co-ordination; Lightning protection, Maintenance of Switch yards, Selection of instrument transformers for measurement and protection.
2. **Selection Of Transformers**: Types & classifications; Special design features; Accessories; Specifications and testing; Voltage regulation calculations, Maintenance, Transformer oil, requirements, specifications and maintenance.
3. **Motor & Their Applications**: Types of motors; System requirements; Performance requirements, Drives, Selection of starters, Installation and maintenance, Insulation classes and maintenance.
4. **Station Auxiliary Systems**: Class 1, II , III and IV systems classifications.
5. **Introduction to DG Sets, Ups & Batteries**: DG sets: Engine, auxiliaries, Generator, Electrical equipment, brush-less and static excitation systems and introduction to SCADA
6. **UPS:** Types, different configurations, selection.
7. **Batteries**: types, selection criteria, charging methods, Testing methods
8. **Cabling, Lighting & Grounding**: Cabling: Types, sizing, laying and de-rating factors, terminations, fault location Grounding systems; Bus ducts.
9. **Selection of MV & LV Switchgear:** Types ; specifications and testing MCCs; Distribution boards; ELCB, Internal protection, Maintenance.
10. **Electrical Equipment**: Requirement In Hazardous Areas: Specific requirements for safety related electrical equipments & systems in Chemical Industries. Fire wall, barrier and stops.
11. **Electrical Control Circuits**: Symbols, development of control circuit, Single-line/schematic diagram Latest Trends In Electrical Engineering
12. **Protection**: Line protection; generator protection; Transformer protection; Motor protection.

NFC, Hyderabad
Syllabus

Subject: Electrical Engineering Practices - II	Code: CEM: EEP-II: E:20
Discipline: Electrical Engineering	**No. of Lectures: 20**

Electric Drive: Advantages of electric drive; Factors governing selection of motors; Nature of electric supply; Nature of the drive: Individual drive, group drive: Nature of load: Starting torque, behavior of load with respect to speed, high inertia loads, Electrical characteristics of motors: Starting Characteristics, running characteristics, speed control, braking characteristics

Size and rating of motors: Sizing calculation, Duty cycle of motor, continuous, intermittent, over load capacity and pull out torque: Mechanical considerations: Type of enclosure, type of bearings, transmission of drive, noise level Cost: Capital cost, running cost.

Electric Heating: Advantages of electric heating Methods of heating Resistance heating; direct resistance heating; indirect resistance heating; types of heating elements, selection of heating elements, requirements of a good heating material, causes of failure of heating elements, temperature control resistance furnaces, introduction to design of heating element. Introduction to refractory materials for furnaces.

Illumination Engg: Fundamentals of radiation, visible range of light, colour temperature, Eye end vision. Laws of illumination and units. Various light sources: incandescent and discharge lamps. Illumination system: Luminnaire, Ballast and starters. Colour and glare, Interior and exterior lighting applications and controls. Lighting calculation and design. DC Power surfaces for industrial applications

Electric Arc Furnaces: Definition and Characteristics of arc, power supply and control of arc furnace.

Plasma furnaces: Definition and characteristics of plasma, start plasma, power supply and control of plasma furnace.

Electron beam melting: Introduction, generation of electron beam, power supply and control of electron beam

High frequency heating Induction heating: skin effect, aspects of power supply Di-electric heating, Introduction, advantages

Electric Welding: Electric arc welding, Electric resistance welding, Electron beam welding

Contd....

Electrolytic Processes: Laws of electrolysis, electroplating,
Earthing & lightening protection-effect of current to human body.
Introduction to power quality:

Perspective on power quality--Categories and origin of power quality--
Power system harmonics--Non linear loads--
Effect of power quality on industrial loads--
Motor issues--Electro magnetic interaction--
VFD issues

NFC, Hyderabad
Syllabus

Subject: Modern Electronic Control of AC and DC Drives	Code: CEM:JNTU:30
Discipline: Electrical Engineering, Electronics Engineering and Instrumentation Engineering	**No. of Lectures: 25**

A. Power Control of DC Drives

UNIT-I Three phase naturally commutated bridge circuit as a rectifier or as an inverter Three phase controlled bridge rectifier with passive load impedance, resistive load and ideal supply – Highly inductive load and ideal supply for load side and supply side quantities, shunt capacitor compensation, three phase controlled bridge rectifier inverter.

UNIT – II Phase controlled DC Motor drives
Three phase controlled converter, control circuit– Two quadrant, Three phase converter controlled DC motor drive – DC motor and load, converter

UNIT – III Current and Speed controlled DC Motor drives
Current and speed controllers – current and speed feedback – Harmonics and associated problems – sixth harmonics torque.

UNIT – IV Chopper controlled DC motor drives
Principle of operation of the chopper – Four- quadrant chopper circuit – Chopper for inversion – Chopper with other power devices – model of the chopper – input to the chopper – rating of the devices – Pulsating torque.

UNIT – V Closed loop operation of DC motor drives
Speed controlled drive system – current control loop – pulse width modulated current controller – hysterisis current controller

B. Power Control of A.C. Drives

UNIT I Introduction to AC Drives
Introduction to motor drives – Torque production – Equivalent circuit analysis – Speed-Torque Characteristics with Variable voltage operation, Variable frequency operation, constant v/f operation – Variable stator current operation – Induction motor characteristics in constant torque and field weakening regions

UNIT II Control of Induction motor drives at Stator side
Scalar control – Voltage fed inverter control – Open loop volts/Hz control – speed control slip regulation – speed control with torque and flux control – current controlled voltage fed inverter drive – current-fed inverter control – Independent current and frequency control – Speed and flux control in Current-Fed inverter drive – Volts/Hz control of Current-fed inverter drive – Efficiency optimization control by flux program

Contd…

UNIT III Vector control of Induction Motor Drives

Principles of Vector control – Vector control methods – Direct method of vector control – Indirect method of vector control – Adaptive control principles

Techniques of motor drive configuration.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Networking Communications	**Code: CEM-9:E61: Etrn-I-20**
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 20**

Data Communication Topics: Basic Concepts, V.24 and V.35 standards, Dial up modems, xDSL technology, Techniques of Flow Control, Error Control, Switching, Multiplexing, and Routing. (4)

Digital Networks: ISDN BRA, ISDN PRA, Introduction to Frame Relay and ATM. (2)

Topologies: OSI Layer Model

Link Layer Communication: Types of Local Area Networks, Types of Ethernet, Ethernet frame structure, CSMA/CD, Hubs, Switches, Wireless LAN, Point-to-point Protocol. (3)

Internetworking: Repeater, Bridge, Router, Spanning tree Algorithm, Tunneling, Packet Fragmentation. (3)

TCP/IP: IP packet format, IP Addressing, Subnets, Introduction to CIDR and DHCP, IPv6,TCPsegment format,TCP Call Control. (3)

IP Routing: IP Routing Algorithm, ARP, and ICMP. IP Routing Protocols: RIP, OSPF, and BGP. Domain Name System. (2)

Network Application and Security: Half/full Association, Client Server and peer-to-peer working, Unix socket programming, E-mail, http, concepts of firewall and proxies, Encryption, Digital signatures. (3)

Reference Books:

1. Data and Computer Networks: William Stalling. Prentice Hall of India
2. Internetworking with TCP/IP – D.E Comer, Vol. I. Prentice Hall of India
3. Unit Network Programming – W.R Stevens. Prentice Hall of India.
4. Practical Data Communications: Roger L. Freeman. John Wiley and Sons
5. Basandra, Suresh K, "Local Area Networking", Galgotia, 1995
6. A.S.Tanenbaum, "Computer networks", 4th Edition, Pearson, 2003
7. B.A.Forouzan etal, "Data Communications & Networking", Tata McGraw Hill, 2001

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Programmable Logic Controllers and Applications	Code: CEM:EEI-40
Discipline: Electronics, Electrical and Instrumentation Engineering	**No. of Lectures: 30includes Practical Demos**

20 Hrs
Unit 1: PLC Basics: PLC system, *VO* modules and interfacing, CPU processor, programming equipment, programming formats, construction of PLC ladder diagrams, devices connected to *VO* modules.

Unit 2: PLC Programming: Input instructions, outputs, operational procedures, programming examples using contacts and coils. Drill press operation.

Unit 3: Digital logic gates, programming in the Boolean algebra system, conversion examples. Ladder diagrams for process control: Ladder diagrams & sequence listings, ladder diagram construction and flow chart for spray process system.

Unit 4: PLC Registers: Characteristics of Registers, module addressing, holding registers, input registers, output registers.

Unit 5: Sensors as input devices to PLC- Various types of proximity sensors: Inductive, capacitive, photo electric, magnetic, laser, UV and ultra sonic sensors. Brief discussion on other input devices like pressure switch, flow switch etc.
20 Hrs
Unit 6: PLC Functions: Timer functions & Industrial applications, counters, counter function industrial applications, Arithmetic functions, Number comparison functions, number conversion functions.

Unit 7: Data Handling functions: SKIP, Master control Relay, Jump, Move, FIFO, FAL, ONS, CLR & Sweep functions and their applications.

Unit 8: Bit Pattern and changing a bit shift register, sequence functions and applications, controlling of two axis & three axis Robots with PLC, Matrix functions.

Unit 9: Analog PLC operation: Analog modules & systems, Analog signal processing, multi bit data processing, analog output application examples, pm principles, position indicator with pm control, pm modules, pm

Unit 10: Introduction to CNC controls

Reference Books:

1. Programmable Logic Controllers - Principle and Applications by John W. Webb & Ronald A. Reiss, , Fifth Edition, PHI
2. Progranunable Logic Controllers - Programming Method and Applications by JR. Hackworth & F.D Hackworth Jr. - Pearson, 2004.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Digital Signal Processing and Machine Vision	**Code :CEM : New**
Discipline: Electronics and Instrumentation Engineering	**No. of Lectures :30**

Digital Signal Processing:

Introduction : Basic elements of a digital signal processing system, Fourier series and fourier transform, Z-transform, convolution, correlation, sampling theory, aliasing anti-aliasing filter, quantization noise and signal reconstruction. (4 Hrs)

Discrete Fourier Transform(DFT) : Interpretation of DFT, Properties of DFT, DFT of real signals, convolution and correlation using DFT (2 Hrs)

Fast Fourier Transform (FFT) : Efficient computation of DFT, Inverse FFT algorithm, Use in linear filtering and correlation. (2 Hrs)

Design of Digital Filters : IIR & FIR filters, design techniques and realization. (2 Hrs)

Overview of DSP Processors : Harvard architecture, pipelining, general purpose, fixed point and floating point processors. (2 Hrs)

DSP Applications : in Nuclear and other fields (2 Hrs)

Image Processing:

Fundamentals of Image Processing : Image acquisition, Image model, sampling, quantization, relationship between pixels, distance measures, connectivity, Histogram : definition, decision of contract basing on histogram, image stretching, sliding, histogram equalization. (4 Hrs)

Image transforms, Image enhancement by spatial domain methods and frequency domain methods (1Hrs)

Applications of digital image processing. (1 Hrs)

Machine Vision:

- Image Model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflection, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, boundary representation, Mathematical Morphology ;
- Intermediate Vision: Line, Circle, Elipse and Polygon detection, Hough Transform for detection, Corner detection, Generalized Hough Transform;
- High level Vision: Scene interpretation;

• Contd....

- Texture - Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & Pattern classes, Classifiers in general, Distance Metric, Classification and recognition, various methods of recognition & interpretation, Template matching and area correlation, matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Embedded and Computer Based Systems Design	Code: CEM:E 54:Electrn-40
Discipline: Electronics Engineering	**No. of Lectures: 40**

Microprocessor Based Hardware Design: 14 Hrs

Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Microcontrollers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
Industry Standard Bus Systems: ISA, PCI, VME, PXI: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, and testability.
Embedded computer system design example.

Computer Communication and Networks: 7 Hrs

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables,hub,switch,routers etc.)
Fault Tolerant and Distributed Architectures : Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues; Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

Real-Time System Design: 15 Hrs

Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.
Overview of LINUX and Embedded NT.

Introduction to VLSI Design: 4Hrs

Reference Books:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, And 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Microcontroller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices

Syllabus

Subject: Computer Aided Design and Manufacturing	Code: CEM-14: M-35
Discipline: Mechanical Engineering	**No. of Lectures: 35**

Introduction to CAD & CAM: 35 Hrs

Extensive definition of CE - CE design methodologies - Organizing for CE - CE tool box collaborative product development. IT support - Solid modeling - Product data management -Collaborative product commerce - Artificial Intelligence- Expert systems - Software hardware co-design. Life-cycle design of products - opportunity for manufacturing enterprises - modality of Concurrent Engineering Design - Automated analysis idealization control - Concurrent engineering in optimal structural design - Real time constraints. Manufacturing competitiveness - Checking the design process - conceptual design mechanism – Qualitative physical approach - An intelligent design for manufacturing system - JIT system - low inventory - modular - Modeling and reasoning for computer based assembly planning - Design of Automated manufacturing Lathe Machining, Milling Machining, EDM Wire Cut, Turret Punch Press, Absolute & Incremental Prog., Canned Cycle, Tool Selection, G / M code programming, CNC maintenance & macro programming, Generative machining. FEA, Mechanisms and Sheet Metal, CNC Technology, Robotics. Life Cycle semi realization - design for economics - evaluation of design for manufacturing cost concurrent mechanical design - decomposition in concurrent design - negotiation in concurrent engineering design studies - product realization taxonomy - plan for Project Management on new product development – bottleneck technology development.

Modeling : 3D Solid Modeling, Surface Modeling, Advance Surfacing, Assembly & Animation, Drafting & Detailing. Model Generation, Loading & Solution, Post Processing, Structural Analysis, Thermal Analysis using I-deas code for 2-D and 3-D cases using ANSYS.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Engineering design and FEM	Code: CEM:AC09,
Discipline: Mechanical & Quality Assurance Engineering	No. of Lectures: 45

Introduction (2 lectures):

Failure modes of pressure vessels and heat exchangers: yielding,Tensile instability,creep effects,fatigue,flow induced vibration, uckling,etc. Type of stress, significance of stress, theories of failure, stress intensities, ASME Sec.VIII Div. I and ASME Sec.111 omparisons

Theories of failure, Stress invariants and yield surfaces (3 lectures):

Mohr's circle, state of stress and invariants (2 D and 3 D) Hydrostatic state (dilatational) and distortional (Pure shear) state. Vonmises failure theory based on second invariant of distortional stress tensor and based on distortional energy theory; Tresca theory and comparison with Vonmises theory. Yield surfaces of Vonmises theory and Tresca theory in 3 - D with respect to O1, O2 and O3 axes.

Collapse load assuming elastic perfectly plastic material (3 lectures)

Long thick cylindrical shell under internal pressure. Pressure at I which yielding starts, pressure at which interface radius is p and collapse pressure (full section yielding) by Vonmises and Tresca theories. Limiting moment or collapse moment of beams of various cross sections (Rectangular, circular) and reduce shape factor. Collapse moment of a straight pipe (Treating as a beam) and deduce shape factor for pipe section.

Design aspects of cylindrical pressure vessel (3 lectures)

Major design options: Vertical, horizontal, choosing length and diameter of a vessel, support options (Lug! Bracket Vs skirt support), choice of closures. Formulae for thickness as per Sec. VIII, Div. I and numerical problem. Background to external pressure charts, effect of ovality / imperfection and plasticity, factor of safety for cylinders and factor of safety for sphere under external pressures. Sizing of stiffening ring. Flange design as per code: Bolt design and flange thickness calculation.

Heat exchangers: (3 lectures):

Shell and tube plate types heat exchangers. Tubesheet
thickness as per TEMA, Sec VIII Div 1 and see III (including concept of equivalent solid plate and modified elastic constants). Effect of axial rigidity of tubes in tubesheet thickness. Methods of joining tube to tubesheets. (rolled/expansion joints and welded joints); Pullout load. (strength of tube to tubesheet joint) Accomodating differential expansion among tubes and shells: Bend tube, U tube and Bellows. Buckling strength of tube and FIV of tubes (FIV mechanisms: Vortex shedding (lock-in), Fluid elastic instability and a acoustic resonance.

Stress and Strain concentration factors (Ka and K €) - 3 lectures:

Importance of local strain (peak strain) variation - fatigue damage rules (Coffin Mansion and Cumulative fatigue damage). Stress concentrations (i) elliptical holes in the center of a

Contd....

large plate subjected to uniaxial load (ii) circular hole in a plate subjected to uniaxial/biaxialloading (iii) circular hole in a cylindrical shell subjected to pressure loading. Stress and strain uncertain due to a small hole in an infinite plate subjected to hydrostatic in plane loading (based on thick shell formula for external pressure) and based on component stress and equivalent stress. (Elastic factors) and plastic stress and strain concentration factors. Approximate methods to obtain local plastic strain at point of interest: Nueber's rule and Molshy-Glinka rule. (Analytical equations and graphical representation and comparisons); Introduction to simplified elastic plastic analysis as per ASME.

Fracture Mechanics, Non ductile failure and Hydrostatic test (3 lectures):

Introduction to fracture mechanics, stress Intensification factors, fracture toughness, Paris' Law, concept of plastic domain at crack tip, J - integral, JIC, Transition temperature, (RTNDT), Methods to prevent brittle fracture, Integrity assessment diagram, appendix: G of ASME, Sec III Div 1, Maximum postulated defect, allowable pressure as a function of (T -RTNDT) and Hydrostatic test temperature.

Introduction to FEM and Modelling: 25hrs:

Historical Background - Weighted Residual Methods - Basic Concepts of FEM - Variational Formulation of B.V.P - Ritz Method - Finite Element Modeling - Element Equations – Linear and Quadratic Shape functions - Bar, Beam Elements - Applications to Heat Transfer. Basic Boundary Value Problems in 2 Dimentions - Triangular, quadrilateral, higher order elements - Poissons and Laplace Equations - Weak Formulation - Elements Matrices and Vectors - Application to Solid mechanics, Heat transfer, Fluid Mechanics. Natural Co-ordinate System - Lagrangian Interpolation Polynomials - Iso- parametric Elements - Formulation - Numerical Intergration - 1D -2D Triangular elements – rectangular elements - Illustrative Examples. Introduction to Theory of Elasticity - Plane Stress - Plane Strain and Axisymmetric Formulation - Principle of virtual work - Element matrices using energy approach. Dynamic Analysis - Equation of Motion - Mass Matrices - Free Vibration analysis - Natural frequencies of Longitudinal - Transverse and torsional vibration - Introduction to transient field problems. Non linear analysis. Use of software - h & p elements - special element formulation.

NFC, Hyderabad
Syllabus

Subject: Pressure Vessel and Piping Design	Code: CEM-13:E 20 CC08:M-30
Discipline: Mechanical Engineering	**No. of Lectures: 30**

20 Hrs

Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference among Sec. VIII Div.1, Div.2. and Div.3
Difference between metallic pressure vessel and FRP pressure vessels

Contd...

Piping Design & Engg :10 Hrs

Fundamentals of piping, pipe sizing and their economics, selection of pipe diameter, Pipe design pressure and input parameter.
Selection of pipe materials, Galvanizing of pipes, piping lining techniques & uses
Pipe classification, piping specification, and pipe schedule, ratings
Pipes and pipe fittings, branch connection criteria
Evaluation of bill of materials in piping & estimation
Pipe flexibility analysis, Expansion loops, Bellows
Pipe stress analysis
Pipe safety in two-phase flow and other flow induced vibrations
Valves
Insulation & painting of pipe lines, costing of piping schemes
Pipe supporting arrangements
Spring hangers, spring boxes, Pipe jointing, C.I. pipe caulking, Threaded piping, Construction welding of piping, Isometric drawings preparation & reading, Piping GA drawing preparation & reading, Inch-dia, Inch-M concept, Rack piping philosophy, under ground piping, coating-wrapping of underground pipe line, Holiday detection of coating & wrapping.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Vibrations	**Code: C EM :E26: M:20**
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.

Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.

Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N

Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinery.

Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required, vibrations with special reference to vibrations of reciprocating systems.

Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, a periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Design aspects of Nuclear Fuel and Structurals	Code: CEM:QA-03
Discipline: Quality Assurance Engineering	**No. of Lectures: 30**

Fuel Bundle Design Approach (10 hrs) :

Design basis, Applicable codes, Material selection, Bundle design and analysis, Physics calculation, Radial flux depression across the bundle, Axial flux peaking, Engineering of the fuel bundle assembly, Pellet design, Dimensional requirements, Surface finish, UO2 chemical composition, UO2 density, Oxygen to Uranium ratio, UO2 microstructure and visual standard, Sheath (clad) design, Collapse behavior of sheath, Mechanical properties, Corrosion, Hydriding, Manufacturing process, Graphite coating, End plug design, Fuel bundle assembly design, End plate design, Bearing pad, Bearing spacer and Spacers design, Fuel bundle packing, Design analysis of fuel assembly, Thermo-mechanical analysis, Temperature distribution, Fission gas, Fuel thermal expansion, Stresses and strains in sheath, Sub channel analysis, CHF estimation, Stress analysis, Fuel bundle assembly, Analysis of end plate, Bundle droop, Fuel sheath collapse, Power ramp analysis, Fuel temperature during spent fuel transfer, Built-in safety features, Testing requirements and Type testing

PHWR Fuel Bundle operation (8 hrs):

Environmental condition, Primary coolant system requirements, Coolant channel / Linear tube region requirements, Fuel movement in Fuel handling system, Normal operation, Operational transients, Fuel thermal power, Fuel bundle power envelopes, Duty envelopes, Bundle power operating limit envelope derived from design, Linear heat ratings (LHR) and ∫Kdt (Integral Kdt), Fuel burnup, Fuel residence time in the reactor, Power ramps, Fueling machine compressive loads on fuel bundle, Refueling impact load on bundle, Defueling, Fuel bundle decay heat, Shutdown refueling, Fuel bundle operation during upset condition, Abnormal thermal power, Abnormal fueling machine loads, Sheath overheating, Sheath over-straining.

Pressure Tube Operation and design approach (8 hrs):

Operating Environment for fuel Channel, Material Selection for Pressure tube, manufacturing process for pressure tubes, degradation and failures modes for pressure tube like irradiation diametric and axial Creep, Growth, corrosion, Delayed Hydride Cracking, Design approaches based on degradation and failure mechanisms, Leak before Break (LBB) criteria, mitigation irradiation changes in the pressure tube, interaction of pressure tube with fuel bundle during operation.

Calenderia tube and Garter Spring (4 hrs):

Operating Environment, Material Selection for calandria tube and garter spring, manufacturing process, Failures modes, PC-CT contact, irradiation induced changes, Design approach, mitigation irradiation changes, corrosion mechanisms, interaction of pressure tube with Calanderia tube and Garter Spring.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Materials characterization and Applications	Code: CEM:EN713,
Discipline: Quality Assurance Engineering	**No. of Lectures: 25**

Microscopy Techniques (10 hrs)

Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Importance lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, Sample preparation, Etching of samples and Etchants for various materials. Quantitative analysis using optical microscopy (Grain Size, Inclusion Analysis-Size and Distribution etc.) , Interpretation of Micrograph for defects.

Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.

Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast,. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice, and Ewald sphere construction, indexing of selected area diffraction patterns, High resolution electron microscopy.

Scanning electron microscopy : interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and focus Other modes of operation, Application in failure analysis, fracture surfaces etc.

Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, field ion microscopes.

X-Ray Diffraction and Applications (10 hrs)

Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production, and detection of x-rays. Intensity of diffracted beams - scattering by an electron by an atom, by a unit cell, structure-factor calculations; factors to be considered in calculating the intensities.
Experimental methods in x-ray analysis; Laue methods, power photographs diffractometer and spectrometer measurements.

Applications: orientation of single crystal, crystal structure of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline aggregates, crystal size crystal perfection, crystal orientations:

Analytical Techniques: (5 hrs)
Methodologies of Chemical Characterization of Nuclear Materials by Wet chemical and instrumental methods. Introduction on principles of spectroscopic techniques Analysis of Uranium based materials produced at NFC for metallic impurities by spectroscopic techniques Analysis of Zirconium based materials produced at NFC for metallic impurities by spectroscopic techniques Analysis of steel based materials produced at NFC for metallic impurities by spectroscopic techniques

Contd...

Introduction on principles of wet chemical methods, Analysis of Uranium based raw materials and process intermediates by wet chemical methods, Analysis of Zirconium based raw materials and process intermediates by wet chemical methods, Analysis of steels by wet chemical methods

Introduction to Gas Analyzers, Analysis of Uranium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of Uranium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of zirconium based materials produced at NFC for non-metallic impurities by Gas Analyzers, Analysis of steels for non-metallic impurities by Gas Analyzers

BARC Training School

NFC, Hyderabad

Syllabus

Subject: NDT and QC of Nuclear Fuel and structural components	Code: CEM:QA-02
Discipline: Quality Assurance Engineering	**No. of Lectures: 40**

NDT Techniques for Inspection of Materials: (28 hrs)

Ultrasonic testing (UT) : Principle and propagation of ultrasound, Properties of Ultrasound, Types of Transducers, Ultrasonic Testing Methods, UT Techniques, Calibration of Equipment, Instrument Control, Method for Evaluating Discontinuities, UT Procedures for casting, forging, tubes, bars and welds, Limitation, Code Requirement, Acceptance Criteria for Weld Metals.

Eddy current testing (ECT) : Physical Principles, Electricity, Magnetism, Electromagnetic Induction, Factors effecting Induction, ECT probes, Practical Characteristics of Probes, Design of Probes, Instrumentation of ECT equipment, Testing Procedures, Reference Standards, Applications, Presentation of Results

Radiography (RT) : Type of Industrial Radiation sources and Application, Radiographic Exposure Factors and Technique, GAMA Ray and X-Ray Equipment, Type of film and Screens, Image Quality Indicators Section, Radiographic Techniques, Film Processing, Viewing of Radiographs, Radiograph Interpretation, RT Procedure Qualification, RT Procedures for welds, RT Acceptable Level of Welds and radiation safety Codes.

Leak testing : Theory and Principle of Leak Testing, Equipment, Techniques and Calibration, Interpretation and Evaluation of Results, Leak Testing Procedures, Leak Testing Specifications.

Visual testing and Liquid Penetrant testing (LPT): Overview, Physics of light, Light Sources, Optical Aids, Measuring/Inspection Equipment, Surface Condition, Interpretation of Results and Evaluation. Principle of LPT, Equipment, LPT Procedures, Materials, Evaluation of Indication, Application of LPT, Hazards Precautions, Code Requirements.

Magnetic Particle Testing (MPT) : Principle of MPT, Type of Magnetization, Type of Magnetizing Current, MPT Equipment, Method of De-Magnetization, MPT, MPT, MPT Procedures, Evaluation of Indications.

Applicable Codes and Standards for NDT

Quality Checks during Fabrication of Tubes, Components, Fuel and Structurals (5 hrs)

Fuel Fabrication: Qualification of machine, material and men, Quality checks during PHWR fuel fabrication, viz Powder, pellet and Fuel bundles, Quality checks during BWR fuel fabrication, Quality checks for Fast reactor fuel and components.

Zircaloy Tubes and Components: Process Qualification, Types of Defects and Origin, Testing Procedures, Inspection of Ingot, Billets, Blanks, Dimansional and visual Inspection of Tubes,

Pressure Tubes and calandria Tubes: Process Qualification, Types of Defects and Origin, Testing Procedures, Inspection of Ingot, Billets and blanks. Specifications, relevance and final Inspection of tubes, Report Generation and Documentation.

Contd...

Introduction to Metrology (5 hrs):

Drawing symbols and methods of measurement, Linear metrology instruments viz. vernier caliper, vernier height gauge, micrometers, bore gauges etc., Measurement of straightness, flatness, squareness, parallelism, roundness, surface finish, Taper measurement, angle measurement, radius measurement, end squareness measurement, Introduction to CMM and non contact measurement system, Documentation

Advanced NDT Techniques (2 hrs)

Acoustic Emission, Infrared Thermography etc

References:

3. Practical Non-destructive testing, Baldev Raj et al, 1997
4. Practical radiography-Baldev Raj, B.Venktraman, 2004
5. Non-destructive testing of Welds-Baldev Raj, T.Jayakumar, 1999
6. Practical Eddy Current Testing, BPC Rao, 2007
7. Eddy Current Testing, Theory & Practice, ASNT reference Manual 1995
8. General Dynamics, Non-destructive Testing, General Dynamics, IV Edition
9. ASNT Level-III Study Guide, Electromagnetic Testing, Radiography, Ultrasonic Testing, Visual Testing
10. Acoustic Emission Testing, Leak Testing, Materials and Processes for NDT Technology, III Edition.

BARC Training School

NFC, Hyderabad

Syllabus

Subject: Statistical Quality Control for QA	**Code: CEM:QA-01**
Discipline: Quality Assurance Engineering	**No. of Lectures: 30**

Introduction and Planning for Quality (3 hrs)

Concepts of quality, Inspection , Quality control , Quality Assurance, Total Quality Management, Cost of quality. Quality Policy, Quality plans, Quality control Instructions, Quality Audit and Surveillance.Factors Effecting Quality, Tools for quality improvement viz. Pareto Analysis, Cause and Effect Diagram, Failure Mode & Effect Analysis, SQC tools and Six sigma. Report generation and documentation

Descriptive statistics (5 hrs)

Sample, population, parameter, qualitative and quantitative characteristics etc., summarization of data; frequency distributions; histograms; visual methods of representation of data; measures of central tendency and dispersion; Skewness and Kurtosis; regression and correlation.

Probability Theory (2 hrs)

Classical definition of probability, conditional probability, independence, random variables, expectation, Hypergeometric, Binominal, Poisson and Normal distributions.

Inference (6 hrs)

Sampling distributions : Chi-square, t and F. Estimation of parameters; point and interval estimates standard error of estimates. Tests on proportions, means and standard deviations, simple non-parametric tests, introduction to analysis of variance.

SQC Techniques (6 hrs)

Theory Control Charts Concepts of quality and meaning of control, basic philosophy and principle of rational subgrouping. Different types of control charts (Xbar-R, np, p and c-charts). Specification and process capability. Economic centering of the process; Setting approval, statistical concepts of fits and tolerances. Modification of Control Charts - Group control charts, sloping control charts, modified control charts, median and midrange charts, narrow limit gauging, Control Chart to eccentricity, Cumulative sum charts, Master control charts.

Contd...

Acceptance Sampling (5 hrs)

Sampling Vs. 100 percent inspection, basic concepts of sampling inspection, conflicting interests of producer and customer, attributes inspection, producer's and consumer's risk, AQL, LTPD, OC curves, AOQL, ATI, Single, Double, Multiple and Sequential sampling plans. Published sampling plans –, MIL-STD 105D, IS-2500 (PartI), variables inspection plans, MIL-STD 414, IS-2500 (Part-II), Hamilton Lot-Plot Method.

Industrial Experimentation (3 hrs)

Principles of experimentation: randomization, replication, local control. Introduction to factorial experiments and Orthogonal Array Designs.

Core Electives Module

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Systems Management : A B C D and E	Code: C Elect :AC06,AC08, CC10: CEEIM:50
Discipline: Chemical, Electrical, Electronics & Instrumentation and Mechanical Engineering	**No. of Lectures: 45**

A: Project Management: 10 Hrs
B: Operations Management: 10 Hrs
C: Maintenance Management: 10 Hrs
D: Quality, Environment, Health & Safety Management: 5 Hrs
E: Reliability Engg. : 10 Hrs

A) Project Management AC06 (10 Lectures)
Introduction, terminology, definitions: Differences between Project Management and other functions management: special safety aspects for Nuclear Projects., legal requirements.

Project life cycle – important stages, activities in each flow-chart of clearances/ approvals at each stage: Project conceptualization, pre feasibility, Techno economic feasibility report (TEFR): Detailed Project Report (DPR) – major contents.

Time value of money, Investment Criteria, Economic evaluation methods for Project alternatives/ investments –(ROI, IRR, DCF): cost estimation methods – unit rates, factoring, data capture fran close-out reports : Items of cost in procurement of major equipments (imported) (duties, customs' clearance, receipt, octroi, insurance etc): Site selection for project – quantitative and qualitative aspects numerical problems using Brown – Gibson model for choice.

Organisation structure for projects – Matrix type –adv/limitations, responsibility allocation, team building, HR aspects.

Project scheduling: Gantt charts, Network diagrams, PERT – CPM, Numerical problems, Float, Crashing, Work breakdown structure, time monitoring / contour.

Resource planning, optimization, leveling, monitoring, control through budgets, 'S' curves, Bell curves, histograms, use of milestones, reports, meetings, communication

Use of computer software like MS Project, PRIMAVERA, Capabilities, reports, decision support / monitoring & control tools hands on working of simple projects.

Analysis of failures / delays of earlier projects – reasons, case studies, recommendation to avoid repletion for future.

Presentations by small groups of small typical project including PLC stages, CPM, resources, monitoring / control reports.

Contd….

B) Operations Management CC10 (10 Lectures)

Quality Management System (QMS) as per ISO.9001-2008
Environment Management System (EMS) as per ISO.14001

Principles of Auditing of QMS & EMS
Operations (systems) function in the organization, conversion process, operations management-definition, different views- classical, behavioral and modeling views of management. Frame work of managing operations - planning, organizing and controlling, operations objectives.

Planning: Strategic Planning for Production! Operation, Forecasting in operations, forecasting models, forecasting requirements, constraints setting production targets! capacity planning, materials requirement planning, MRP objectives, MRP system components - Master Production schedule, inventory status, Bill of materials manpower, maintenance spares, scheduling of production targets.

Organizing: Implementation of operations plans, startups, shut down of process systems under normal & abnormal conditions. Operations procedures, Technical specifications, safety manuals, emergency preparedness plans. Monitoring of plant parameters, evaluation of plant performance indicators, plant trips/ failures analysis and feed back, energy & utility consumptions, Inter group coordination for plant maintenance, prioritizing the maintenance activities, safe handling of process system for maintenance safety work permit system & ensuring safety during maintenance, handling emergency conditions.

Controlling: Controlling the conversion process inventory control fundamentals, inventory concepts, multistage inventories, multiechelon inventories, inventory systems, inventory costs, inventory models managing for quality, product quality, quality management system, analysis for improvement, quality costs or pay. (2 Hr)

C) Maintenance Management AC08 (10 Lectures)

Meaning of the term 'Maintenance' - nature of failures of components and systems in different contexts like civil, electrical, electronics (both hardware items and software systems), instrumentation, and mechanical engineering. Objectives of the Maintenance function.

Manufacturing process and production equipment - study of relation between failure rate of a component population and the related component life-time - causes of failures, remedial strategies for different periods of the component life (infant mortality / useful life / wear-out periods).

Concept of availability and related definitions, failure statistics, repair statistics - various terms used in maintenance engineering and their definitions / explanation.

Study of various maintenance techniques — Break Down Maintenance (or Reactive / Unplanned / Run-to-failure / Emergency Maintenance), Preventive Maintenance, Planned Maintenance, Routine Maintenance, Predictive Maintenance (or Condition-Based Maintenance - CBM), Reliability Centred Maintenance (RCM), Total Productive Maintenance (TPM), Total Quality Maintenance (TQMain).

Contd...

Spare parts management.

Computerized Maintenance Management Systems (CMMS).

Maintenance organization, fundamentals of maintenance planning, work scheduling, safety in maintenance - work permit system, work flow and control, establishing basic values in maintenance, maintenance audit, performance metrics in the maintenance function - the role of management & leadership.

Organization of the Maintenance Function at NFC.

D: Quality & Environment Management: 5 Hrs

ISO Systems

- **Systems Standards vs product standards**
- **ISO 9000 Family of Standards for Quality Management System**
  Genesis, Purpose, Scope, Quality Management Principles, First release, Revisions, Terms and definitions, clauses of ISO 9001:2008, Customer satisfaction, continual improvement, Documentation requirements, Policy Manual, Control of documents, Control of records, Responsibility, authority and Communication, Management review, Human resources, product realization, Design & Development, Purchasing, Control of Production, Validation of processes, Identification & traceability, Monitoring & measurement, Calibration, Analysis of data, Corrective and preventive actions etc.

- **ISO 14000 family of Standards for Environmental Management System**
  Ozone depletion, Global warming due to Green House Gases, Pollution, Social responsibility, Sustainable development, Statutory requirements Public hearing, Environmental policy, conservation of resources; control of discharges to air, land and water bodies; Environmental aspects, evaluation of impact of environmental aspects, Environmental objectives, Management programs for prevention of pollution, Emergency preparedness and response, Environmental monitoring, Management review of environmental performance, Continual improvement of environmental performance etc.

- **OHSAS 18001:2007 Specification for Occupational Health & Safety Management System:**
  Statutory requirements, Hazards, Evaluation of risk associated with hazards, Safety indices, Incidents, Accidents, Near Misses, Loss prevention, designing for safety, PPEs, Management programs for minimizing risk, Safety training, Mock drills and Emergency handling

- 3rd party certification of the Management Systems of an organization as per the international standards (ISO 9001, 14001, 18001 etc...)
  Internal audits, external audits, certification, validity of certificate, need and benefits of certification.

Contd....

E: Reliability Engg: 10 Hrs

Reliability mathematics: Probability, Distribution functions, some discrete and continuous distributions in Reliability, Definitions of Reliability, Availability, Life characteristic curve, Exponential Law of reliability.
System Reliability: Systems with components in series/parallel, Redundancy techniques, failure Mode & Effect Analysis (FMEA),Boolean methods, Cut-Set Tie Set methods, Fault-Trees and Event Trees, Design for Reliability including Fail Safe concepts, single failure criteria etc.

Probabilistic Risk/Safety Assessment: Risk, PSA of Nuclear Power Plants, identification of initiating Events, dominating IEs.
Reliability Testing: Environmental Testing, confidence interval Estimation, Time Terminated, and failure terminated tests.
Human Reliability Analysis: Human errors, Skill, Rule and Knowledge Based Actions, Human Reliability during Emergency conditions, cognitive errors.
Economics of Reliability Engineering: Manufacturer's cost, consumer cost, life cycle cost, Economic Decision Models.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Electrical Engineering Practices in Process Industries	Code: CElect:FC09:E -20
Discipline: Chemical Engineering	**No. of Lectures: 20**

Fundamentals of electricity: DC/AC , Concepts of Active, reactive & apparent power Power factor & methods to improve the system power factor, Electricity tariff, Maximum demand, average demand, Load and capacity factor

Power Supplies: Classification of power supplies (Class I,II,III,IV) – batteries and their types, battery chargers, invertors & uninterrupted power supply system, diesel generator, protection to be given to batteries, UPS and DG sets.

Electrical Machines : Transformers, losses in Transformers, efficiency, Induction & Synchronous Motors, Technical Specifications, Characteristics Operations & Maintenance, Motor Starters calculation of percentage loading of motors, Motor efficiency calculations, factors affecting performance of motors,

Variable Speed AC drives: Need & selection, advantages

Industrial Electrical Heating Systems: Types of furnaces, Selection of heating elements, Thermal Insulation & System heat losses.

Classification of electrical equipment in hazardous areas, properties of hazardous gases, selection and installation of electrical equipment in hazardous areas, standards applicable for electrical equipment in hazardous areas.

Circuit Brakers : Types and applications

Safety Aspects: Electrical Shock ---- Various definitions-Let Go Current, Touch Voltage, Time current curves/zones for AC and DC currents, Effect of frequency, Resistance of the human body

Likely effects of current flow through human body, Risk of electric shock from various sources such as batteries, domestic mains, industrial mains, power distribution system and lightning, protection against electric shock, Methods of earthing, Earth grid, Soil resistance, Use of ELCBs on appliances.

Cables & Cables Trays: Types of cables, Power & Control Cables, PVC, HRPVC & XLPE cables, FRLS cables (their properties), Fire survival cables.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Energy Conservation and Demand Side Management	Code: CElect:AC07-CMI-20
Discipline: Chemical and Electrical Engineering	**No. of Lectures: 20**

Energy Scenario: Primary energy sources, commercial energy production in the world and in India, energy needs of growing economy, long term energy scenario, energy security, energy conservation & its importance, Global environmental concerns, UN Framework convention on climate change (UNFCC), sustainable development, Kyoto Protocol, Clean Development Mechanism (CDM), Energy Conservation Act – 2001 and its features.

Thermodynamic Analysis: Concept of energy, energy analysis, min. energy requirements, energy flow diagram/sankey diagram, Bench marking of energy consumption in the chemical process units…etc. Energy Economics, energy saving and cost involved, evaluation through pay back period, cost-to–benefit ratio.

Energy Conservation Techniques:
Energy efficiency in thermal utilities:- Boilers, steam distribution system, Furnaces, insulation & refractories, cogeneration, waste heat recovery, heat exchanger Networking, Energy saving potential & identification.

Energy Efficiency in Electrical utilities: Electric load management & maximum demand control, power factor improvement, distribution & transformer losses, energy efficient motors. Losses in compressed air system, Refrigeration system, pumping systems, cooling towers, lighting system. Energy efficient technologies – max. demand controllers, automatic Power factor controllers, energy efficient motors, variable speed drives, and energy efficient transformers.
Energy Audit: Purpose of Energy Audit, steps involved in energy audit, measurement of important parameters, collection of data & analysis, preparation of audit reports, energy index calculation, recommendation.

5) Encyclopedic dictionary of Electronic terms by Traister, John & Traister, Robert J Prentice Hall, New Jersey

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Vacuum Technology	**Code: CElect :M-13 :New-C-20**
Discipline: Chemical and Mechanical Engineering	**No. of Lectures: 20**

1. INTRODUCTION TO VACUUM

Basic terms and concepts in vacuum, Units used Pressure ranges in vacuum and their characterization.

2. VACUUM PHYSICS

Gas laws and models. Continuum theory. Kinetic gas theory. Types of flow and conductance.

3. VACUUM GENERATION & IMPORTANCE OF SEQUENCE OF OPERATION

Classification of pumps based on the operating Principle. Compression pumps. Water ring pumps, steam ejector pump, mechanical rotary pumps (rotary vane and rotary piston), diffusion pumps, mechanical booster pump, oil vapor booster pump, turbo molecular pumps, seals for vacuum pumps. Condensation and getter type pumps. Cryopumps, sputter ion pumps, sorption pumps.

4. VACUUM MEASUREMENT

Fundamentals of low-pressure measurement. Classifications of different gauges. Hydrostatic gauges. McLeod gauge, bourdon tube, capsule gauge and u-tube manometer. Thermal energy gauges. Thermocouple and pirani gauges. Electrical energy gauges
Hot cathode and ionization gauge, cold cathode ionization (penning gauge)

5. CONSIDERATIONS IN SYSTEM DESIGN

Calculations of conductance values. Gas and vapor load. Matching pump combination.

6. LEAK DETECTION OF SYSTEMS & MEASUREMENT

Leak location by rough methods.Penetrant dye, spark tester etc. Leak location by over pressure methods. Bubble methods, halide torch etc.
Leak location by vacuum methods. Discharge tube, mass spectrometer etc.

7. APPLICATIONS

Low-pressure applications (e.g. mechanical handling based on rubber suction pads)
Low molecular density applications (e.g. removal of impurities during chemical processes) Vacuum metallurgy. Decrease in energy transfer applications (e.g. thermal insulation, electrical insulation) Large mean free path applications (e.g. electron tubes, nuclear physics)

8. QUALIFICATION OF VACUUM SYSTEMS

9. INTER LOCKS & SAFETY IN VACUUM SYSTEMS

10. VACUUM CASE STUDIES

Reference Books:

1) Guide to the measurement of Pressure and Vacuum : The Institute of Measurement and Control, London
2) Introduction to Vacuum Technology by Dr. K G Bhushan under the Indian Vacuum Society
3) A.Chambers et al, "Basic Vacuum Technology", 2nd Edition, Oversees Press, 2005

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Statistics for Engineers	**Code: C.Elect 10:New M C:20**
Discipline: Chemical and Mechanical Engineering	**No. of Lectures: 20**

1. Treatment of data – Graphical methods: Stem – and – Leaf, Box plots, etc. Descriptive methods: Sample mean, median, mode, variance, percentiles
2. Basic probability: Counting, basic laws, and elementary theorems; independent events
3. Discrete random variables and distributions – Binomial , hyper geometric, poisson, mean and variance, poisson process
4. Continuous random variables and distributions – normal , normal approximation to binomial, gamma exponential , probability plots
5. Random sampling and sampling distributions : "t" distribution, chi square and "F" distributions
6. Estimation: Confidence intervals, sample size determination, prediction and tolerance levels
7. Tests of hypothesis for one and two means, sample sizes, paired sample tests
8. Simple linear regression: Curve fitting, Linear correlation, and models
9. Control charts : X- bar , R and "p" charts

Reference books:

1. Probability and statistics for engineers and scientists (7^{th} edition by Walpole , Myers and Ye-2002)
2. Minitab software

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Industrial Instrumentation Practices and Human Machine Interface	Code: CElect 17:E51 E50:I-30
Discipline: Electrical, Electronics and Instrumentation Engineering	**No. of Lectures: 20**

Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems. Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices. Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design-relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.

PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. OPC Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Contd….

Overview of plant automation. (1 lecture)
Design of HMI, Soft Console versus Conventional control panels (1 lecture)
Guidelines for design of HMI displays (1 lecture)
Case study of a commercially available Professional HMI package. (10 lectures)
Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
Practical (2 lectures)

Reference Books:

1. Biomedical Instrumentation and Measurements : Cronwell Leslic - Prentice Hall, New Jersy
2. Tranducers and Instrumentation: Murthy DVS – Prentice Hall, New Delhi
3. Instruments Engineers Handbook: Process Measurement: Liptak, Belag –Chilton Books
4. Instruments Engineers Handbook: Process Measurement & Analysis: Liptak, Belag Butter Worths
5. Instruments Engineers Handbook Vol - II: Process Control - Liptak, Belag –Chilton Books
6. Process / Industrial Instruments & Control Hand Book : Considne DM – MGH, New York
7. Considine, D A, "Process Instruments and Controls Handbook", McGraw Hill, 1957
8. A.D.Helfric & W.D.Cooper, "Modern Electronic Instrumentation and Measurement Techniques"

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Mechatronics	Code: CElect. AC14:EEMI :20
Discipline: Electrical, Electronics, Mechanical and Inst Engineering	No. of Lectures: 20

Pneumatic control engineering: - Introduction, compressed air line installation, Pneumatic equipment like cylinders, seals, control valves and accessories. Graphical symbols for energy conversion, control valves, energy transfer and conditioning, actuators, converters, counters and sensors. Classification of cylinders based on operating medium, functions performed, basic construction, mounting style etc., various types of seals, materials, usage. Different type of directional control valves, classifications based on usage, functions and actuation, flow control valves and pressure control valves. Pneumatic circuits, electro-pneumatic circuits, bi-selector systems. Cycle times, Applications of pneumatics and trouble shooting. Standard vendor list.

Hydraulic control engineering: - Introduction, Pump, reservoir, valves and actuators. Selection of pump, tank, Air breather, Baffle plate, pipelines, relief valves, Simple valves, Directional control valves, Flow control valves, special valves, un loading valves, counter balance valves, pressure reducing valves. Filters, selection and location. Hydraulic circuits, basic, regenerative, sequencing and counter balancing circuits. Rotary motion. Hydraulic accessories like accumulator, hydraulic intensifier, pressure switches Pressure gauges and flow meter. Introduction on Hydro pneumatics and electro-hydraulic (servo) systems. Trouble shooting. Standard vendor list

Electrical/electronics control engineering: Introduction and applications of diode, transistor, thyristor, LED's, Opto-isolators, etc. Solenoid valves DC and AC selection of solenoid valves, rating, stepper motors, servo motors, encoders: rotary and linear, transducers, positional sensors.

Cont...

Mechanization: Introduction. Handling: gripping, feeding, Forging, Inserting, positioning, clamping, working, removing, transferring Etc., Orientation: Position control, turning, rotation, division. Feeding, Assembly operations, linear indexing, rotary indexing, Door control. Bulk feed like Conveyors, industrial vehicles, over head equipment's, Containers and supports, Positioning weighing and control equipment.

Introduction to Industrial Robotics: CNC

Reference Books:

1. Mechatronics: Electronics in Products and Processes:Bradeley. DA - Eswar Press, Chennai / Chapman Hall, U K
2. Mechatronics : HMT Ltd – Tata MGH. New Delhi
3. Mechatronics : Electronics Control Systems in Mechanical and Electronical Engg. 3rd Edition : W.Bolton - Pearson

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Robotics	Code: Celect:M14:New-EC:20
Discipline Electrical, Electronics, Inst Engineering	**No. of Lectures: 20**

Pneumatic control engineering: - Introduction, Pneumatic equipment like cylinders, seals, control valves and accessories. Graphical symbols for energy conversion, control valves, energy transfer and conditioning, actuators, converters, counters and sensors. Classification of cylinders based on operating medium, functions performed, basic construction, mounting style etc.,
Different type of directional control valves, classifications based on usage, functions and actuation, flow control valves and pressure control valves.
Pneumatic circuits, electro-pneumatic circuits, bi-selector systems.
Applications of pneumatics and trouble shooting. Standard vendor list.
(2 Lectures)

Hydraulic control engineering: - Introduction
Simple valves, Directional control valves,
Flow control valves, special valves, un loading valves, counter balance valves, pressure reducing valves.
Hydraulic circuits, basic, regenerative, sequencing and counter balancing circuits.
Pressure gauges and flow meter. Introduction on Hydro pneumatics and electro-hydraulic (servo) systems. Trouble shooting. Standard vendor list
(2 Lectures)

Electrical/electronics control engineering:
Solenoid valves DC and AC selection of solenoid valves.
Stepper motors, Servo motors, encoders: rotary and linear, transducers, positional sensors.
(1 Lecture)

Mechanization: Introduction. Handling: gripping, feeding, Forging, Inserting, positioning, clamping, working, removing, transferring Etc., Orientation: Position control, turning, rotation, division. Feeding, Assembly operations, linear indexing, rotary indexing, Door control. Bulk feed like Conveyors, industrial vehicles, over head equipment's, Containers and supports, Positioning weighing and control equipment.
(3 Lectures)

Industrial Robotics: Fundamentals. Classification of Robots. History of Robotics. Advantages and Disadvantages of Robots. Robot Components. Robot Degrees of Freedom. Robot Joints. Robot Coordinates. Robot Reference Frames. Programming Modes. Robot Characteristics. Robot Workspace. Robot Languages. Robot Applications. Social & Safety Issues
(8 Lectures)

Trajectory planning: Path vs. Trajectory. Joint Space vs. Cartesian-Space. Basics of Trajectory Planning. Joint space trajectory planning, Cartesian space trajectories.
(4 Lectures)

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Modern Control Systems	Code: CElect:E52A-EC -20
Discipline: Electronics and Instrumentation Engineering	**No. of Lectures: 20**

State Variables Descriptions Introduction, The concept of State, Elementary Definitions, State space Representations of continuous-time and discrete-time systems, State diagrams, Illustrative examples, Solution of state equation, State transition matrix, Properties of state transition matrix, Computation methods of state transition matrix, relationship between state equations and transfer functions, , Characteristic equations

Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability criteria, Principle of Duality, Controllability and Observability of discrete-time systems

Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR Technique

Reference Books:

1. John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design-Conventional and Modern" , 2nd Edition, McGraw Hill Book Co., 1986
2. Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Wintson, 1984
3. M.Gopal, "Modern Control System Theory", 2nd Edition, Wiley Eastern Ltd., 1993
4. Gene F. Franklin et al, " Feedback Control of Dynamic Systems", 3rd Edition, Addison- Wesley Publishing Co., 1994
5. B.Friedland, " Introduction to State space Methods"
6. K.Ogata, " Modern Control Engineering", Prentice-hall

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Design of High Temperature Components	**Code: CElect 11: New : Mech-20**
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Introduction: Plasticity, Viscoplasticity and mechanism of creep deformation
Deformation & fracture behavior at high temperature (HT), Creep curve, Creep rupture, Life estimation parameters, Low cycle fatigue, creep-fatigue interaction.
Material selection for HT application: Thermal stability, strength, oxidation, carburization etc.
Design codes & standards: ASME codes historical background, loading categories, stress classification,
Sub-section NB & NH: Low & High temperature failure modes and limits, Design and construction rules of RCC-MR, Efficiency diagram and Bree diagram, Life assessment as per CEGB-R5.
NDE & ISI: Surface and volumetric examinations
Models for creep crack initiation and growth
Design by analysis: FEM analysis, stress categorization, time & strain rate dependent stress-strain relations, unified treatment of plastic, creep & thermal strain, theory of viscoplastic flow, elasto-plastic and creep analysis of simple geometries, time stepping algorithm etc.
Life assessment: Remaining life prediction, API 579, inspection & interval determination, integrity of steam pipes, reheat pipes and bends, super heater tubes, gas turbine parts etc.
Reference books :

1) High Temperature Component life assessment. : George A Webster, R A Ainsworth 1994 – Technology & Engg.
2) Creep & Fracture in High Temperature Components. Design & Life assessment issues, : I A Shibli & S R Holdsworth
3) Welding Technology & Design By V M Radhakrishnan

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Welding and Quality Assurance of welds	Code: C-Elect :CC06-M-20
Discipline: Mechanical Engineering	No. of Lectures: 20

Introduction To Soldering, Brazing & Different Types Of Welding Like: Arc Welding, Gas Welding, Resistance Welding, Thermit Welding, Electron Beam Welding, Plasma Welding, Laser Welding, Explosion Bonding, Ultrasonic Welding.

Manual Metal Arc Welding: TIG/MIG & Submerged Arc Welding

Weld Joint & Geometry: (Lap/Butt/Fillet/Corner Joints: Square Butt, Single-V, Double-V, Single-U, Double-U, J-Joint, Special Joints)

M.S. Electrodes & Filler Wires: (Designation, Codes & Classification, Specifications, Fluxes & Electrode Coating – their effect on weld quality)

S.S. Electrodes: (Designation, Codes & Classification, Specifications, Electrode Coating, their effect on weld quality)

S.S. Welding: (Inter-Pass Temperature, Sensitisation & Inter-Granular Corrosion & its control, Delta Ferrite & its effect on hot cracking & Sigma Phase, Delta Ferrite Measurement – Schafflar / Delong Diagram / Magna Guage / Magnetic Saturation Method, Hard facing, Stelliting, Carburizing, Nitriding

Welding Technology:

Polarities (AC, DC(+), DC(-), Pre Heating & Carbon Equivalent , Inter-Pass Temperature, Post Weld Heat Treatment & Hydrogen Embrittlement, Stress Relieving & Solution Annealing, Distortion Monitoring, Weld Sequencing & Balanced Welding Parameters & their effect on weld quality, Weld Defects - their causes & Acceptance Criteria. Role of flux on weld quality improvement. Welding of dissimilar materials.

ASME Code Section IX

Welding Procedure Specification, Welding Procedure Qualification, Procedure Qualification Record, Welders' Qualification, Welding Machine Specification, Essential & Non Essential Variables, Positions of Welding & Their Importance

Non Destructive Testing of welds:

Radiography & Ultrasonic Examination of butt welds

Destructive tests:

All Weld Tensile Test, Transverse Tensile Test, Bend Tests, Ferrite Test, Corrosion Test, Creep Test, Micro & Macro Examination / Etching Test, Metallography Examination.

Maintenance Welding: Limitations, Difficulties, Selection of Welding Consumables. Cold welding, Powder metal spraying, underwater welding.

Reference Books:

1) Welding Metallurgy: Kou, Sindo : John Wil, New York
2) Practical Non-Destructive Testing – 2nd Edition: Baldev Raj : Narosa
3) Principles of Welding Technology-3rd Edition:Gound LM:Viva Books,New Delhi

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Manufacturing And Industrial Engineering	Code: C-Elect- JNTU, M -20
Discipline: Mechanical Engineering	**No. of Lectures: 20**

Fundamentals of hot and cold working processes: Forging, extrusion, wire drawing, sheet metal working, punching, blanking, rolling, pilgering, bending, deep drawing.

Machining Processes and Machine Tool Operation: Mechanics of metal cutting, single and multipoint cutting tools, geometry and machining aspects, tool life, machinability, and economics of machining.

Inspection: Limits, fits and tolerances, linear and angular measurements, comparators, gauge design, interferometer, form and finish measurement, measurement of screw threads, alignment and testing methods.

Tool Engineering: Principles of work holding, design of jigs and fixtures, design of press working tools.

Machine Design: Machine development concepts

Advanced Manufacturing Processes: E–Manufacturing, Fundamentals of Nanotechnology, Micro-machining and High Speed Machining.

Reference Books:

1) Sensors and Control Systems in Manufacturing : Soloman, Sabrie – Mc Graw Hill, New York
2) Precision Engineering in Manufacturing : R K Murthy – New Delhi

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Corrosion Engineering	**Code: CElect : C**
Discipline: Chemical Engineering	**No. of Lectures: 20**

BASICS OF CORROSION: Electrode processes – free energy, electrode potential, emf series, Pourbaix diagrams and their practical use, Chemical Vs electrochemical mechanisms of corrosion reactions, Introduction to corrosion – Wet and dry corrosion – Theories of corrosion - corrosion rate expressions; Passivity, factors affecting passivity.

(4 h)

CORROSION AND ITS FORMS: General corrosion – atmospheric corrosion, galvanic corrosion, biological corrosion, High temperature corrosion; Localized corrosion– pitting corrosion, crevice corrosion, Intergranular corrosion, de-alloying; Mechanically assisted corrosion – erosion corrosion, cavitation corrosion, fretting corrosion, corrosion fatigue, stress corrosion cracking and hydrogen embitterment.

(5 h)

CORROSION IN REACTOR SYSTEMS: Corrosion in various reactor systems; Effect of high temperature water, cooling water, sea water; nitric acid – effect of flow, environment and metallurgical variables of materials.

(4 h)

PREVENTION AND CONTROL OF CORROSION: Corrosion control by design; Selection of corrosion resistant materials – alloying, coatings and surface treatments; Oxidation resistant materials, control of high temperature corrosion; Cathodic and anodic protection methods; Use of inhibitors-types.

(3 h)

CORROSION MONITORING & INSPECTION: Ccorrosion coupons, Electrical resistance, linear polarization resistance, electrochemical noise analysis; Inspection - liquid penetration inspection, ultrasonic testing, radiography testing, eddy current testing.

(4 h)

BOOKS FOR STUDY AND REFERENCE:

1. Herbert H. Uhlig and R.Winston Revie, "Corrosion and corrosion control", Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, "Corrosion Engineering", Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.
4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Image Processing and Machine Vision	**Code: CElect:EN-710**
Discipline: Quality Assurance	**No. of Lectures: 20**

Image Processing & Machine Vision (20 hrs)

Introduction : Digital image model representation, Image sensor, Digitalizer, Computer, Standard file format;

Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening. Histogram Modification, Colour image processing;

Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;

Boundary extraction and representation;

Morphological operations;

Image Restoration-PSF, Deconvolution, Restoration using inverse filtering. Wiener filtering & maximum entropy-based methods:

Image Compression: Models, Error free compression, Lossy compression, Standards;
Machine Vision:

Imaging model, Scene radiance and image irradiance, Reflectance model of a surface. Lamberitan and specular reflection; Photometrix stereo;

Early Vision : Low level processing for noise suppression, Segmentation by thresholding; Edge detection; representation, Mathematical Morphology;

Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, Generalized Hough Transform;

Contd....

High level vision: Scene interpretation;

Texture - Statistical, Structural and Spectral approaches;

Stereo vision and correspondence problem; Structured light; Optical flow;

Image representation: Invariants;

Unstructured objects: Snakes

Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, classification and recognition; Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
Introduction to image understanding;

Robotic applications of machine vision, Camera calibration.

Reference Books:

5. D.A.Forsyth & J.Ponce, Computer Vision A Modern Approach, Prentice Hall, 2003.
6. Horn B.K.P.,Robot Vision, The MIT Press, 1987;
7. D.Ballard and C.Brown, Computer Vision, Prentice hall, 1982.
8. Wesley E.Snyder & Hairon QI, Machine Vision, Cambridge, 2004.

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Data Base Management system and Web Technology	Code: CElect:EN-705
Discipline: Quality Assurance	No. of Lectures: 20

Data Base Management System and Web Technology (20 hrs)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to Postgre SQL and MySQL (3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(!)
- Content Management Systems(!)
- Web 2.0 I Semantic Web(2)

Reference Books:

1. Fundamentals of Database Systems Sixth Edition Ramez Elmasri , Shamkant B. Navathe, Addison-Wesley Publication 2010
2. Database Systems: A Practical Approach to Design, Implementation and Management 2014 by Thomas Connolly , Carolyn Begg
3. An Introduction to Database Systems 8th Edition by C.J. Date
4. Web Technologies: A Computer Science Perspective 1st Edition by Jeffrey C. Jackson
5. Web Technologies Paperback 2010 by Uttam K. Roy

BARC Training School
NFC, Hyderabad
Syllabus

Subject: Advanced Computational Techniques	Code: CElect:EN-701
Discipline: Quality Assurance	No. of Lectures: 20

Advanced Computational Techniques (20)
Programming Language C++

C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.

C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initializers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogonal Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO

Contd….

- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions, parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MP! Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for ID, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

BARC Training School
NFC, Hyderabad
Syllabus

Practicals on Material Science & Engineering and Corrosion Engg.

Sl. No.	Name of the Experiment
1.	To evaluate the hardness of materials
2.	To evaluate the Tensile properties of materials
3.	Preparation of specimen for Metallography for microstructure evaluation
4.	To detect susceptibility to inter granular attack (associated with the precipitation of chromium carbide)in S.S. samples (Corrosion Test)
5.	Measurement of wall thickness by Ultrasonic test
6.	Familiarisation of Procedure and interpretation of indications in liquid penetrant test principle

BARC Training School
NFC, Hyderabad
Syllabus

Practicals on Health Physics

Sl.No.	Name of the experiment
1	α – particle counting
2	β- particle counting
3	- particle counting
4	Whole body counting

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments to be carried out in Process Control & Instrumentation Lab

Sl.No	Name of the Experiment	Branch
1	**Study of Flow and Level control system** a) Mention different types of instruments/equipments used in the system with their tag nos. specifications and applications b) Write the details of different material used for the system (structure & pipe lines etc).	**All**
2	**Study of control system (PLC & Control Panel)** a) Control system architecture b) PLC Unit (configuration & specifications) c) Control Panel (Instruments used with specifications)	**All**
3	**Calibration of Control Valve**	**All**
4	**Calibration of Level Transmitter**	**All**
5	**Calibration of Flow Transmitter**	**All**
6	**Calibration of Differential Pressure Transmitter**	**All**
7	**Studying the characteristics of Control Valves**	**All**
8	**Single tank liquid level control using PID controller**	**All**
9	**Calibration checking of RTD/Thermocouple**	**All**
10	**Study of Field instruments**	**All**

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments on PLC Demo unit

Sl.No	Name of the Experiment
1	Direct On Line (DOL) Starter
2	Star Delta starter
3	Up – Down Counter
4	ON – Delay Timer
5	OFF – Delay Timer
6	Arithmetic Functions
7	Number Comparison Functions
8	Paint Spray process system
9	Speed control of AC Motor through MODBUS Communication
10	Temperature controlling using PID controller of PLC

BARC Training School
NFC, Hyderabad
Syllabus

List of Experiments to be carried out in Structural Dynamics &Vibration Laboratory

Sl.No	Name of the Experiment
1	Dynamics of a three storied building frame subjected to harmonic base motion
2	Dynamics of a one-storied building frame with planar asymmetry subjected to harmonic base motions.
3	Dynamics of a three storied building frame subjected to periodic (non-harmonic) base motion.
4	Vibration isolation of a secondary system
5	Dynamics of a vibration absorber.
6	Dynamics of a four storied building frame with and without an open ground floor
7	Dynamics of one-span and two-span beams.
8	Earthquake induced waves in rectangular water tanks
9	Dynamics of free-standing rigid bodies under base motions
10	Seismic wave amplification, liquefaction and soil-structure interactions.

2.	02ENGG04-001-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

2. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
3. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
4. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
5. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
6. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
7. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , ‘Pressure vessel design’ CBS publication
2. Brownell. L. E & Young. E. D , ‘Process equipment design’, Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single - phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.

3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No.	Course content
	Curriculum for Metal Forming
1.	**Uniaxial tensile test**: a. Engineering stress, engineering stain, true stress, true strain; b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations; c. Tensile instability and significance of strain harkening exponent; d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2.	Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3.	Small strain matrix and rotation matrix obtained from the displacement functions;
4.	**Elements of the theory of plasticity**: a. Decomposition of stress matrix to hydrostatic and deviatoric matrices; b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess; c. Normality flow rule and convexity of the yield surface; concept of equivalent strain
	Curriculum for Materials Joining
1.	**Welding Processes** a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding c. Resistance Welding Processes
2.	**Thermal Cycle during welding** a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3.	**Residual Stress and Distortion** a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No.	Course content
1.	Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2.	Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber's rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O' rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems’ Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml’s Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., “Dynamics of Structures, Theory and applications to Earthquake Engineering”, Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures”, New York, McGraw-Hill Book Company.
3. Mariopaz, “Structural Dynamic (Theory and Computation)”, CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., “Numerical Methods in Finite Element Analysis”, Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.
4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.
5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.
6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. **Engineering Mathematics (EM) (35 hours)**

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

8. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
9. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
10. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
11. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
12. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).

13. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
14. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR’s, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No.	Course content
12.	**Introduction: Reliability Engg. Applied to C&I Systems** Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors. Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems. Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
13.	**Reliability Maths/Statistics:** • Mathematical and statistical expressions required for reliability study. • Types of failures in electrical, electronic and computer components • Failure probability concept, statistical distribution models_ • Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions • Chi-square distribution and its use in confidence and risk factors • Baye's theorem • Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software. • Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions. • Derivation of exponential reliability expression_ • R(t)=[exp-(lt)] for electronic components and systems. • Examples to solve

14. **Fault Tolerance and Systems Reliability:**

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**

- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), (‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:

1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4. Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.
5. DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. **Fault Tolerant and Distributed Architectures**

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. **Real-Time System Design**

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.
2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	Course content
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type-Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,
    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
    Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.
    Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
Total		**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
Total		**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

Book suggested

15. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
16. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
17. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
18. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
19. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
20. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. **Thermal Power Reactors :**

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. **Fast Power Reactors :**

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology**

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2. Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

<u>Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)</u>

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Syllabus for CE610 : Heat Transfer (10 hrs.)

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
   Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi's model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)

Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.
Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.
5. Piquet, J. (1999): Turbulent Flows: Models and Physics, Springer-Verlag: Berlin.
6. Holman, J.P. (1997): Heat Transfer, 8"" ed., McGraw-Hill : NY.
7. Kays, W.M. and Crawford, M.E. (1993); Convective Heat Transfer, McGraw-Hill: NY.
8. Gebhart, B., et al. (1988): Buoyancy-Induced Flows and Transport, Hemisphere.
9. Barret, K. (1982): Numerical Modelling in Diffusion-Convection, Pentach Press : London, Polymouth.
10. Hussaini, M.Y. et al. (1997): Up-wind and High Resolution Schemes, Springer-Verlag : Berlin.
11. Warsi, Z.U.A. (1998): Fluid Dynamics: Theoretical and Computational Approaches, 2"" Ed., CRC Press.
12. Cebeci, T. and Bradshaw, P. (1984): Physical and Computational'Aspects of Heat Transfer, Springer-Verlag.
13. Quartepelle, L. (1993): Numerical Solution of the Incompressible Navier-Stokes Equations, Birkhauser Verlag.
14. Patankar, S.V. (1982): Numerical Heat Transfer and Fluid Flow, Hemisphere.
15. Versteeg, H.K. and Malalasekera, (1996): An Introduction to Computational Fluid Dynamics: the Finite
16. Volume Method, Addison-Weslev.
17. Gresho, P.M. et al.. (1999): Incompressible Flow and the Finite Element Method, John Wiley & Sons.
18. Comini, G., et al. (1994): Finite Element Analysis of Heat Transfer, Taylor & Francis : Washington DC.
19. Canuto, C., et al. (1988): Spectral Methods in Fluid dynamics, Springer-Verlag :NY, 557pp.
20. Thompson, J.F., Soni, B. and Weatherill, N.P. (1998): Handbook of Grid Generation, CRC Press.
21. Glowinski. R., et al. (Eds.) (1997): Domain Decomposition Methods in Science and Engineering, Wiley.
22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Froment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO's).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2^{nd} edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2^{nd} edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2
MS6	Metallurgical Thermodynamics	30	4
MS7	Experimental Methods for Materials Research	45	6
MS8	Structural Materials for Nuclear Reactors	45	6
MS9	NDE Science and Technology	30	4
MS10	Physical Metallurgy	45	6
MS11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
MS12	Introduction to Materials Science and Engineering	45	6
MS13	Corrosion Science and Engineering	30	4
MS14	Mechanical Behavior of Engineering Materials	30	4
MS15	Manufacturing Technology	30	4
Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:** Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:**Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods

1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;

1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):

Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation-bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM

2.2. Scanning electron microscopy:

Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;

EPMA Electron probe micro-analyzer

2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species

3.1. Ion beams – production-ion guns; manipulation- ion, filters

3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):

High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy

3.3. Nuclear reaction analysis – elemental specificity – depth profiling

3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis

3.5. Surface Mass Spectriscopy-SIMS:

Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons

4.1 Photoelectron spectroscopy:

Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin

4.2 Auger Electron Sepctroscopy:

Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.

4.3 Experimental methods;

Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. **VIBRATIONAL SPECTROSCOPIES**

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. **8.RESONANCE ABSORPTION SPECTROSCOPIES**

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.

3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)

S.No.	Course Content
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

9. NDE Science and Technology (MS9 - 30 hours)

S.No.	Course Content
1.	**Introduction to NDE:**Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:**Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:**Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:**Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:**Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:**NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys. Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition.
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation.

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No Course content

1. Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2. Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3. Methods of U enrichment:
4. Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5. Advanced ceramic fuels : carbides and nitrides
6. Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7. Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232. MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Introduction to Materials Science & Engineering (MS12/CH4-40 hours)

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, "Corrosion and corrosion control – An introduction to corrosion science and engineering", Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, "Corrosion Engineering", Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, “Corrosion and corrosion protection handbook”, USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger’s vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt’s factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith’s law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2
7.	FRE7	Seismic Design of Nuclear Reactors and Facilities	30	4
8.	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**210**	**26**

MODULE III- OPERATIONS

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :** Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.

12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2.	**Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3.	**Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4.	**Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6.	**Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single - phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies
8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974.
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.
3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No. **Course content**

1. **Momentum Transport:**

1.1 Viscosity and Mechanisms of Momentum Transport: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends**.**

2. **Energy Transport:**

Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.
3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No. **Course content**

1. Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2. Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
