3. Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4. Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5. Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6. Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson’s ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

1. Chopra, A.K., “Dynamics of Structures, Theory and applications to Earthquake Engineering”, Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures”, New York, McGraw-Hill Book Company.
3. Mariopaz, “Structural Dynamic (Theory and Computation)”, CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., “Numerical Methods in Finite Element Analysis”, Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. **Class room Training**
    a. Reactor System

        Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

    b. Sodium system

        Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

    c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*
    d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

2. **Field training**
    a. Reactor Operation
    b. Maintenance Activities
    c. Technical Service Activities
    d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical's	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
   Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
   Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
   Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
   - Fault tolerance concept for electronic and Computer based C&I systems.
   - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
   - Series, parallel, active, passive, and voting redundancy
   - Redundancy and other fault tolerance methods for software
   - FMEA, FMECA concepts for C&I and Examples to solve
   - Concepts for the analysis of System Reliability, availability, and maintainability.
   - System reliability and availability analysis methods
   - Boolean logic
   - Digraph, cutest-tie set method
   - Fault tree model, and consideration of CCF, CMF, software errors
   - Markov Model

   Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
   - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
   - Environmental qualification, testing of the C&I systems
   - Effects of various environments on the electrical/ electronic components
   - Climatic Qualification tests: Temperature, Humidity
   - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
   - Reliability Testing of the electronic components, equipment and C&I systems
   - Reliability screening tests for electronic components
   - Accelerated environmental tests
   - Failure terminated and time terminated tests
   - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
   - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
   - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
   - Explain Event Tree
   - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
   - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment
(1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher
(2001),
(‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position
6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.
7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company

18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

BACK TO MAIN

Homi Bhabha National Institute, RRCAT, Indore

Syllabus for
M.Tech. in Engineering Physics courses
(PROGRAM CODE: ENGG01)

Raja Ramanna Centre for Advanced Technology, Indore

Courses offered at HBNI, RRCAT for
Ph. D. in Physics
M.Tech. in Engineering Physics
(Specialization in Accelerators and Lasers)

- Total credit requirement for Ph. D. (Physics) : 60

Core courses	28 credits
Elective courses	20 credits
Laboratory experiments	04 credits
Two reading courses	08 credits

- Total credit requirement for M.Tech. (Engineering Physics) : 60*

Core courses	38 credits
Elective courses	12 credits
Laboratory experiments	04 credits
Short term project	06 credits

* An additional course (Foundation course) of 5 credits is offered to M.Tech. students as a bridge course.

Contents

Syllabus for M.Tech. (Engineering Physics) courses

A : Core Courses

03ENGG01-001-C Engineering Mathematics Credit (3)

Complex Analysis: Analytic functions, Cauchy-Reimann conditions, Cauchy integral theorem, Laurent expansion, conformal mapping, singularities, calculus of residues, evaluation of definite integrals.

Vector Calculus: Gradient, divergence and curl operations and their physical interpretations, vector integrations, Gauss theorem, Stokes theorem.

Matrix: Basic concept of matrix algebra, symmetric, skew-symmetric and orthogonal matrices, eigenvalues and eigenvectors of a matrix, hermitian, skew-hermitian and unitary matrices, illustration of symplectic matrices in particle transporting accelerator.

Integral Transform: Fourier integral, Fourier transform and inversion theorem, Fourier transform of derivative, convolution theorem, transfer function, Laplace transform, Laplace transform of derivatives, convolution theorem, inverse Laplace theorem.

Ordinary and Partial Differential Equations: Review of ordinary differential equations, introductions to partial differential equations, classification of partial differential equations, boundary and types of partial differential equations, solutions of one dimensional diffusion equation, two-dimensional Laplace equation, use of integral transform in solving partial differential equations. Introduction to difference equations.

Probability and Statistics: Bayes' formula, random variables, expected value and variance, discrete and continuous distributions, location parameters, joint distributions, conditional distributions and independence, covariance and correlation, bivariate normal distribution, Poisson process, the central limit theorem, statistical inference (with an aim to better understand and analyze experimental data), point estimators, estimating variance, confidence intervals, comparing two samples, estimation methods, hypothesis testing, goodness of a fit.

3. "An Introduction to Probability: Theory and its Applications- Vol.1 and Vol 2", William Feller
4. "Ordinary Differential Equations" V.I. Arnold
5. "Advance Engineering Mathematics", Erwin Kreyszig

03ENGG01-002-C Magnet Physics and Technology: Credit (4)

Origin of Magnetism: Classical and quantum concepts, magnetic moments, angular momentum and quantization of angular momentum.

Classification of Magnetism: Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism, and ferrimagnetism.

Role of Magnets in Accelerators: Dipole, quadrupole, sextupole, and combined function magnets, DC and fast cyclic magnets, septum magnets, and kicker magnets.

Fundamentals of Magnet Design: Magnetic circuit, dipole, quadrupole, sextupole and higher order multipole magnets and coil design, B-H curve.

Application of Magnetic Materials in Accelerators: Materials for DC magnets: low field magnets, high field magnets, permanent magnets, and shielding.

Materials for AC Magnets: Silicon steels, laminated Ni-Fe alloys, and Ferrites. Numerical methods for magnet simulation: computer code and related mathematical formalism, methods of optimization, multipole expansion, Fourier representation of magnetic field.

Magnet Technology: Fabrication procedures, tolerances, and economic issues.
Methods of magnetic field measurements: magnetic induction, search Coil, Hall probe, and nuclear magnetic resonance.

Superconducting Magnets: Basic concept of superconducting magnets, magnet geometries for dipole magnets, superconducting materials, need for twisted composite conductors, hot spot temperature, current densities, quench, training of magnets and persistent switch.

Geodesy and Alignment of Accelerators: Introduction, survey and alignment as applicable to accelerators and its requirement. Position sensitive elements and their typical tolerances for alignment, fiducial references and adjustment system, fiducial posts and targets, and techniques of fiducialsation. Features of support elements and their adjustments during alignment.

Network and Alignment Procedure: Defining coordinate systems, control networks-types, survey procedure, data adjustment and error analysis.

Survey and Alignment Instruments and Toolings: Electronic theodolite, optical level, laser Interferometer, distinvar, inclinometer, offsetmeter etc. Different types of targets and sensors.

9. "Permanent Magnet Materials Their Applications," Peter
10. "Modern Ferrite Technology", Alex Goldman

03ENGG01-003-C Laser Physics and Technology: Credit (4)

Basic Formalism: Spontaneous and induced transitions, Einstein's approach, A and B coefficients, conditions for light amplification and oscillations, and characteristics of laser light. Homogeneous and inhomogeneous broadening of the transitions, spectral narrowing in a laser, gain saturation, spatial and spectral hole burning and their consequences, Lamb dip spectroscopy and its applications.

Propagation of optical beams in free space and in dielectric slab waveguides, Hermite-Gaussian beam modes, and ABCD law for Gaussian beam propagation.

Optical resonators, concept of cavity modes, resonators with spherical mirrors, resonance frequencies of optical resonators, losses in optical resonators, stable/ unstable resonators, Kirchoff's diffraction treatment for transverse modes.

Methods For Obtaining Population Inversion: Optical pumping, coherent and incoherent pumping, one- and two-photon processes, pumping geometries, pump sources, electrical pumping by discharge in gases, excitation mechanisms, self sustained and e-beam sustained operation, chemical pumping, and gas dynamic pumping.

Laser Dynamics: Laser oscillation, three and four level lasers, rate equation modeling, power in laser oscillators, optimum output coupling low- and high-loss regimes, multimode laser oscillation and mode locking. Different techniques of mode locking. Relaxation oscillations, cavity dumping and Q-switching. Techniques of Q-switching. Pulse compression techniques for ultrashort pulse generation. Spectral control of laser output, tunability of output frequency, single frequency operation, and frequency stabilization.

Physics and Technology of Specific Laser Systems: Solid state lasers, vibronic lasers, semiconductor diode lasers, diode pumped solid state lasers, fiber lasers, dye lasers, atomic and molecular gas lasers, chemical lasers, excimer lasers, free electron lasers. Measurement of parameters of a laser system.

Nonlinear Optics: Crystal optics, electro-optic effect, wave propagation in nonlinear media, phase matched second harmonic generation, optical parametric oscillator, two-photon absorption, stimulated Raman scattering, frequency mixing in gases and vapours, self-focusing, optical bistability and optical phase conjugation. Quantum optics: second quantization, non-classical effects.

03ENGG01-004-C Electromagnetic Theory: Credit (3)

Electrostatics: Laplace equation and the uniqueness theorems, variational approach to solutions of the Laplace and Poisson equations. Formal solutions of electrostatic boundary value problems with Green function. Method of relaxation for 2D electrostatic problems, method of images, separation of variables and special functions, finite element method, and multipole expansions. Electrostatic field in matter.

Magnetostatics: Maxwell equations of magnetostatic, macroscopic Maxwell equations in magnetic material and boundary conditions on B and H, and solution of boundary value problems in magnetostatics.

Electromagnetic Wave: Wave equation, solutions in free space, plane waves, Gaussian beams, equations in material media, dispersion relations, Fresnel's laws of reflection and refraction, total internal reflection and evanescent waves. Lorentz transformation of electromagnetic fields.

Wave-guides, Resonant Cavities and Optical Fibers: Hollow metallic waveguides, dielectric waveguides, optical fibers, resonant cavities, and elements of microwave transport line.

Radiation by Moving Charges: Lienard-Wiechert potentials and fields, power radiated by an accelerated charge, Larmor's formula, and angular distribution of emitted radiation.

03ENGG01-005-C Accelerator Physics and Beam Diagnostics: Credit (4)

Introduction: Motion under electric and magnetic fields. DC and RF acceleration. Relativistic kinematics, Brief history and review of particle accelerators.

Synchrotron/Storage Rings: Accelerator magnets - dipole, quadrupole and sextupole magnets. Multipole expansion method. Equation of motion, betatron oscillations, weak and strong focusing, transfer matrices, beam stability, twiss parameters, motion of particles with momentum deviation, momentum compaction, and chromaticity. Magnetic field errors, closed orbit distortion and its correction, resonances - integer and half integer, beam acceleration, synchrotron oscillations, phase stability, transition energy, beam emittance, Liouville's theorem, single turn injection, H-injection, and fast extraction.

Beam Transfer Lines: FODO cells, quadrupole triplet, phase space matching, emittance dilution.

Synchrotron Radiation Sources: Synchrotron radiation, Radiation damping, quantum excitations, equilibrium beam emittance, and beam lifetime.

Linear Accelerators: DC accelerators, various types of RF accelerators, EM mode in a simple structure, Q-factor, shunt impedance, transit time factor, filling time, energy gain, dispersion curve, TW and SW accelerators, and beam dynamics in LINACS.

Cyclotrons: Basic principle of cyclotron, resonance condition, orbit stability, limitations of classical cyclotrons, AVF cyclotrons, injection, central region, extraction, time structure, energy resolution, and beam emittance.

Microtrons: Classical microtrons, basic equations, and Racetrack microtrons.

Beam Diagnostics: Physical principles, charge collection, secondary emission, Ionization, fluorescence, scintillation, capacitive pick up, magnetic pick up, wall current, synchrotron radiation detection, and optical transition radiation.

Instrumentation: Faraday cup, secondary emission wire monitor, beam loss monitor, beam profile monitor, beam position monitor, DC beam current transformer, fast current transformer, wall current monitor, photomultiplier, photo diode, image dissector, and streak camera.

03ENGG01-006-C Reactor Physics, Radiation Physics, and Safety Issues of Accelerators and Lasers: Credit (3)

Health Physics: Radiation sources - radioisotopes, natural and manmade sources, radioactive series, reactors, accelerators, radiation facilities, solid, liquid and gaseous activity. Control measures - time, distance, decay, shielding, administrative control, radioactive discharge, waste disposal, and exposure control.

Interaction of Radiation with Matter: Interaction of light and heavy charged particles, photons, and neutrons. Interaction of high energy charged particles, electromagnetic cascade, and Hardronic cascade.

Radiation Quantities, Units, and Regulatory Recommendations: Dosimetric quantities, exposure, absorbed dose, equivalent and effective dose, committed dose, ALI, DAC, ICRP, AERB, and dose limits.

Biological Effects of Radiation: Somatic and genetic effects, stochastic and deterministic effects, and LD30/50.

Detection of Radiation: Ionisation chamber, proportional counters, GM tubes, scintillation detectors, semiconductor detectors, thermoluminiscent dosimeters, direct reading dosimeters neutron detectors, BF3 and He3 tubes, Rem-meters, CR-39-foils, pulsed radiation detection. Low and high energy radiation detection.

Reactor Physics: Introduction to nuclear energy - fission and fusion, interaction of neutrons with matter; fission process and energy release, fission cross-section, fissile and fertile materials. Chain reaction, neutron cycle and lifetime, criticality and classical four-factor formula. Thermal and fast systems, slowing down of neutrons, conversion and breeding of fissile materials, concept of neutron flux and current, neutron diffusion theory, critical size and mass, reflected systems and reflector saving, heterogeneous systems. Reactor kinetics, reactivity and importance of delayed neutrons, reactivity changes and coefficients, fission product poisoning, control devices, uranium and thorium fuel cycles and enrichment processes.

Accelerator Safety: Types of accelerators, prompt and residual radiation, source terms, radiation hazards, radiation safety systems, shielding, radiation monitoring, non-ionizing radiation safety, RF and MW safety, magnetic field safety; ozone safety, safety at synchrotron radiation beam lines, spallation neutron sources, and accelerator driven sub-critical systems.

03ENGG01-007-C Numerical and Mathematical Techniques and Scientific Programming and Computing Methodologies:

Credit (5)

Numerical Methods

System of Linear Algebraic Equations: Direct methods - Gauss elimination and Gauss Jordan methods. Iterative methods - Jacobi, Gauss-Seidel and Successive over relaxation (SOR) methods. Eigenvalue problem .

System of Nonlinear Equations: Newton-Raphson and Secant methods. Roots of polynomials, synthetic division of polynomials, and Baristow method.

Interpolation, Extrapolation, Error and Regression Analysis: Types of errors their analysis.

Numerical Integration: Newton-Cotes, Gauss quadratures, trapezoidal, Simpson's 1/3 and 3/8 rule. Numerical differentiation - forward, backward and central difference quotient.

Differential Equation: Solution of ordinary differential equations. Solution of partial differential equations. Fast Fourier transformation.

Statistical Distributions: Poisson and Gaussian distributions. Monte Carlo simulation, pseudo random numbers, and central limit theorem.

Finite Element Method (FEM)

Introduction: Basic concepts of finite element method, application of finite element method, finite element method versus classical methods, finite element method versus finite difference method, and advantage of finite element method.

Integral Formulations for Numerical Solutions: Variational method, collocation method; subdomain method, weighted residual methods, Rayleigh-Ritz method, Galarkin's method, and least square method

Elements, Nodes, and Co-ordinate Systems: Introduction, element shapes, nodes, nodal unknowns, and coordinate systems

Shape Functions: Introduction, polynomial shape functions, convergence requirement of shape function, and derivation of shape functions.

Introduction to Stiffness (Displacement) Method: Definition of the stiffness matrix, derivation of the stiffness, matrix, assembly of the total stiffness matrix, properties of the global stiffness matrix.

Application of Finite Element Method in Heat Transfer Problem: Fundamentals, one dimensional finite element formulation, and problems.

Fundamentals of Computers: Computer architecture, application of computers, input and output devices, latest processors, desktop PC and servers.

Networking Basic: TCP/IP, DNS, Internet, and Intranet.

Operating System Basic: Linux, windows, shell programming, and CLI, vi, multithreading, multiuser, multitasking, hyper threading, file permissions, and ssh.

Fundamentals of programming: Algorithm, flow charts, high-level languages like Fortran and C, and steps for creating a simple program.

Introduction to C Programming Language: Program structure, header files, basic data types, variables, and declarations.

Operators and Declarations in C: Relational, logical, increment, and decrement operators. Expressions and precedence of operators. Input and output operations, control statements, iterative loops, arrays, and pointer;

Overview of Scientific Computing: Languages and compilers and scientific libraries.

Overview of Trends and Techniques: Sequential, parallel computing, cluster and grid computing.

Architecture Taxonomy: Traditional architecture, Flynn's classical taxonomy, SISD, SIMD, MISD, and MIMD Models.

Steps for Creating a Parallel Program: Decomposition of the program, communication, computations, and composing the results. Parallel example-array processing.

03ENGG01-008-C Materials Science and Technology- I: Credit (4)

The structure of materials (metals and alloys, ceramics and glasses, polymers, composites, low dimensional materials, smart materials). Defects in materials, transport properties of materials, mechanical and thermal properties of materials, electrical, magnetic, galvanometric properties, superconductivity. Optical, nonlinear properties of optical materials, quantum size effects. Electronic materials (like spintronics, and other functional materials). Introduction to symmetry and ferroelectric materials.

03ENGG01-009-C Applications of Lasers in Nuclear Science, Industry, and Medicine: Credit (3)

Laser Applications: High resolution spectroscopy, ultra-fast spectroscopy, laser cooling, laser metrology, holography and its applications in NDT, optical data storage information processing, and optical communication. Laser photochemistry, laser application in biology and medicine

Laser Isotope Separation: Principles of selective photonic action, selective photonic action on atoms or molecules, atomic and molecular schemes for laser isotope separation, lasers for isotope separation, and uranium isotope separation technology employing lasers.

Laser Material Processing: Laser material interaction, Laser cutting, welding, surface hardening, laser surface re-solidification, laser surface alloying, and cladding, laser shock-hardening, laser rapid manufacturing, laser application in decontamination and decommissioning of nuclear installations.

03ENGG01-010-C. Applications of Accelerators in Nuclear Science, Industry, and Medicine: Credit (3)

Synchrotron Radiation and its Applications: Properties of synchrotron radiation, various types of sources like BM, wavelength shifter, wiggler, and undulators. Beamline design and

synchrotron optics. Applications of synchrotron radiation to condense matter physics, surface physics, biology and Industries

Industrial and Medical Applications of Accelerators: Accelerators for industrial and medical applications. Beam characteristics for medical and industrial applications.

Radiation Processing Using Accelerators: Radiation cross-linking, radiation curing, polymerization, de-polymerization, and radiation grafting. Dose distribution in the irradiated products.

Typical applications: Treatment of wire and cables, viscose rayon sheets, rubber products, heat shrinkable tubes, and sheets. Flue-gas treatment, waste water treatment, electron beam applications in food irradiation and sterilization.

Accelerator Based Radiotherapy: Clinical requirements of an accelerator for radiotherapy. Various components of radiotherapy machine. Photon beam therapy and electron beam therapy. Quality assurance in radiotherapy accelerator.

Applications of Accelerators in Nuclear and Particle Physics: Evolution of nuclear physics with energy of the incident beam. Nuclear physics and related phenomena at incident beam energy less than 10 MeV/nucleon, between 10 and 100 MeV/nucleon, and more than 100 MeV/nucleon. Nuclear physics with radioactive ion beams (RIB).

Spallation Source: General introduction, applications to condense matter, and nuclear physics.

03ENGG01-011-C. Vacuum Physics and Technology: Credit (2)

Vacuum Theory: Definitions - throughput, conductance, pumping speed etc. Pressure equations, mean free path, monolayer formation time. Units of vacuum, pressure regions in vacuum.

Vacuum Systems and Components: Vacuum pumps - rotary pumps, dry pumps, turbomolecular pump, titanium sublimation pump, non-evaporable getters, and sputter ion pump. Vacuum gauges - capacitance gauge, Pirani, thermocouple gauges, BA gauge, penning gauge, partial pressure gauge. flanges and seals, vacuum valves and leed throughs.

Vacuum System Design and Development: Design considerations, sources of gas load (vaporization, thermal desorption, diffusion, permeation, electron and ion stimulated desorption etc). Materials, fabrication techniques and leak detection. Processing to achieve ultra high vacuum.

03ENGG01-012-C. Quantum Mechanics: Credit (6)

For Ph. D. (Physics) only

Mathematical Background and Postulates: Illustrations and application of postulates by using simple two-level systems and two-slit interference experiment.

Quantum Mechanics of Composite Systems: N-particle system, identical particles, symmetrization and antisymmetrization postulates, concept of density matrix, properties of density matrix, pure and mixed states.

Symmetry: Symmetries in quantum mechanics, space and time translation, time reversal symmetry and parity invariance. Rotational invariance, angular momentum, spin, and addition of angular momenta.

Approximate Methods: Variational methods, Wentzel-Kramers-Brillouin (WKB) method, time-independent perturbation theory, time dependent perturbation theory, adiabatic and sudden approximations, Fermi-Golden rule.

Scattering Theory: Born approximation, partial wave analysis, two particle scattering.

Relativistic Quantum Mechanics: Klein-Gordon equation, Dirac equation, electron spin, and positron.

Advanced Topics: Quantization of electromagnetic field, coherent, and squeezed states, interaction of radiation with matter, spontaneous emission and Lamb shift, entangled state, EPR paradox and Bell's inequality.

03ENGG01-013-C: Research Methodology: Credit (0)

(Lecture: 20, Credit: 0)

Research Methodology: Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

Documentation: Preparing scientific papers/reports, scientific presentations.

Laboratory safety: Safe practices in laboratory.

Research ethics: Ethical conduct in science, ethical issues in scientific publication, awareness of plagiarism and other scientific misconducts.

Probability and Statistics: Bayes formula, random variable, expected value and variance, discrete and continuous distributions, joint distributions, conditional distributions, covariance and correlation, normal distribution, Poisson process, central limit theorem and its applications,
definition of precision, accuracy, systematic and random errors**,** propagation of errors in experimental data and their estimation, estimation of variance and confidence intervals.

Mathematical modeling: Measurement of functional relationships, order of magnitude analysis, dimensional analysis, goodness of a fit, linear regression and data fitting.

Data Security: Introduction to Data Security, Data security requirements, Different Cyber threats to Data & possible Solutions, Basic concepts of Cryptography & Data encryption algorithms, Research opportunities in Data Security.

Data management: Data planning, handling, modelling, analysis, visualization, Different Data Models, Data Management Software, Data Backup & Storage

C : Engineering Based Elective Courses

for M.Tech (Engineering Physics) only

03ENGG01-001-E. Power Supplies: Credit (4)

AC-DC Converters: Single phase and three phase diode and controlled rectifiers, effect of source inductance, ripple and harmonic analysis, 12-pulse rectifier, firing angle control schemes, THD and power factor, filters - passive and active, passive and active damping of filters.

Power factor Correction: Effects and limiting standards for line current harmonics, Passive PFC techniques, Active PFC.

DC-DC Converters: Principle of operation, steady-state analysis of buck, boost, buck-boost converters, Isolated dc-dc converters- forward, flyback and bridge converters, pulse width modulator and control of dc-dc converters.

Principles of Feedback Control System: Negative feedback, Stability criteria- gain and phase margin, steady state errors, transient response, current loop and voltage loop acting together.

Magnet power supplies in Accelerators: Requirements, Load characterisation, DC and ramping type power supplies, Pulsed power supplies.

High current magnet power supplies: Stability requirements, current cycling, Field stabilization.

Power supplies for superconducting magnets : Load requirements, quench detection, protection and training.

Laser and Plasma power supplies: Load characterisation, Gas discharge, Ballast requirements, CW/Pulsed operation, Current stabilisation, Power coupling schemes to gas discharges.

Thermal Management: Heat transfer, Heat sink design, Water- cooled heat sinks.

03ENGG01-002-E. Power Electronics: Credit (4)

Power Semiconductor Devices: Diode, SCR, MOSFET, IGBT, Static and switching characteristics, Safe operating areas, Drive requirements and circuits, Introduction to the properties of emerging materials and devices, High voltage switches, Turn-on and turn-off snubbers.

Modelling and Analysis : Introduction to modelling and analysis techniques for dc-dc converters, Averaged equivalent circuit modelling and analysis, small-signal analysis with an illustrative converter, Feedback control of power converters: Feedback controller design, voltage- mode control and current- mode control.

Soft-switching Converters: Concept of soft-switching, Load resonant converters: concept and

definition, ac analysis of converters and modes of operation, Full bridge zero voltage switching converter: Phase shifted PWM, Operation and analysis of converter in steady state.

High frequency Magnetics: Ferrites- characteristics and types, skin effect, proximity effect, parasitic components- origin, minimisation and characterisation, design of high frequency magnetic components, introduction to planar magnetics.

Electromagnetic Interference: Measurement techniques, LISN, separation of common mode and differential mode noise, limiting standards and mitigation techniques, design of high frequency filters.

03ENGG01-003-E. Advanced Course on RF and Microwaves: Credit (4)

Microwave Networks: S-parameters, Matrix representation of Microwave networks and its properties, cascade networks, periodic network system and application, mixed mode S parameters and their applications.

Generation of RF power for accelerators: Design requirements, RF power amplifiers using tetrode & triodes and solid state devices, klystrons, IOT, Gyrotron, Cooling and protection, Grounding and shielding.

High Power RF transmission: design aspect of high power RF transmission, directional couplers, dividers, combiners, high power waveguide and coaxial transmission lines, circulators, bends, magic-T, microwave windows, dummy loads, RF couplers.

Accelerator cavities: Characterizing RF cavity, determination of important cavity parameters, Fundamentals of beam-cavity interactions. RF power coupling to cavity.

Low level RF components and systems: Planar circuits, microstrips, substrate materials, lumped and distributed circuits, mixer circuits, phase shifters, filters, switches, couplers, dividers/combiners, Low level RF signal processing and RF feedback systems.

RF systems for accelerators: Design and configuration of typical RF system, Safety interlocks and operation of RF system.

RF/Microwave measurements: Specialty of high frequency measurements, Measurement of RF power, impedance, VSWR, frequency and phase. Measuring instruments used in RF/microwaves, passive and active detectors, spectrum analyzer, VNA calibration systems, Vector measurement with VNA, peak and average power meters, impedance analyzer, frequency counter.

03ENGG01-004-E. Advanced Data Acquisition and Control Systems: Credit (4)

Components of data acquisition system and their selection, signal conditioning modules, polling, hand-shaking, interrupt and event driven, DMA, data sampling methods.

Embedded system software concepts and development tools assembly and HLL, assembler,

compilers, linker, librarian, resident monitors, source level debuggers, in-circuit & in application programming (ICP/IAP) and logic analyzer. In circuit emulator (ICE), object code and HEX file formats, FPGA & CPLD architectures, logic cell structures, programmable interconnect and I/O ports, programming technologies and VHDL, implementation of combinational and sequential circuits, timing issues in FPGA synchronous circuits.

Centralized v/s distributed control system, PAC and PLCs, PC software issues and virtual instrumentation, VISA, image acquisition, data logging, online and offline data processing, data presentation and reporting, BUSES for digital data communication.

PC buses: PCI & PCI Express specifications mechanical, electrical functional.

Back plane buses: VME, CPCI, PXI, VXI mechanical electrical functional specification.

Buses for instrument network: Asynchronous & synchronous communication standards, bus, ring, net topologies, RS-232, RS-485, USB, LAN-Hub, GPIB, Ethernet, field bus serial port expansion cards on PCI, Converters: USB-GPIB, USB-Serial.

Real-time system concepts, timeliness vs speed, hard vs soft real time, scheduling method, concurrency, process & thread concepts, inter process communication and synchronization.

Software reliability: Software implemented fault tolerance, reliability and availability, safety issues. Software reliability standards and practice.

Process control elements, Set point, disturbance, servo system, regulatory system, analog vs digital control systems, Z - transform for digital control systems, feedback control system, continuous time domain PID controllers. Feed forward and cascade controls, digital controllers, digital form of PID controller, Z-transform based dead beat and Dahlin's algorithms, programmable logic controllers and applications, compensator design and stability criterion.

5. "Digital System Design and Prototyping Using Field Programmable Logic and Hardware Description Language", Zoran Salcic.
6. "VHDL Made Easy", David Pallerin.

03ENGG01-005-E. Reliability Engineering: Credit (4)

Basic engineering statistics: Basic probability, random variables, probability density and cumulative distribution functions of engineering importance such as the binomial, poisson, normal, exponential, weibull, etc. Random sampling and sampling statistics and distribution of sampling statistics, such as the Chi-Square and Students test, point and interval parameter estimation, test of hypothesis, examples to solve on continuous and discrete distributions, mathematical equations relating to hazard rate, reliability, cumulative failure probability and

failure probability (density) function, Bath-tub curve - explanation of different parts of the life characteristic curve and corresponding failure distributions.

Quality and reliability, QA/QC concepts - Acceptance sampling plans, quality measurement, quality improvement and control methods with applications in design, development, and manufacturing, modern quality management philosophies, engineering/statistical methods including process control, control charts, process capability studies, loss functions, design of experiments, and total quality management (TQM) topics.

Reliability, availability and maintainability concepts and principles, reliability statistical analysis concept overview and application, accelerated life testing concepts, principles and application, qualitative and quantitative accelerated life testing principles, life-stress relationships and application to electronic components and semiconductor devices, software reliability issues, reliability prediction for electronic systems, system reliability concepts and case studies, role of redundancy in system reliability, design for reliability concepts and case studies, degradation analysis and case studies, reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software, hardware reliability analysis of electronic and computer based C&I systems based on MIL-STD-217, methods of measuring the reliability effectiveness of complex engineering systems, optimization theory, preventive maintenance models, and statistical analysis.

03ENGG01-006-E . Advanced Course in High Voltage Engineering: Credit (4)

High Voltage Technology: Introduction, classification of voltage levels, high voltage in electric supply network, major components of a high voltage network.

Electrostatic Fields and their Control: Electric field intensity, electric strength, classification of electric fields, degree of uniformity of electric fields, control of electric field intensity.

Dielectric Materials and their Behavior in Electric Fields:

a. Insulating Behavior of Air and other Gaseous Dielectrics: Generation of charge carriers: impact ionization, thermal ionization and photo-ionization, Negative ion formation, Breakdown by avalanche discharge (Townsend Mechanism); Breakdown voltage characteristics in uniform fields (Paschen's Law) Practical factors affecting the breakdown voltage: Corona, Fields non-uniform, high pressure and vacuum.
b. Liquid Dielectrics in High Voltage applications: Mineral insulating oils, Dielectric properties of insulating liquids, Dielectric power losses in insulating materials, Breakdown in liquid dielectrics, Aging of mineral insulating oils.
c. Solid Dielectrics and their Behavior in Electric Fields: Classification of solid insulating materials, Breakdown and pre-breakdown phenomena in solid dielectrics, Partial discharge and its effects on dielectrics.

Generation of High Voltages:

a. Alternating voltages: single step-up transformer, Transformers in cascade, Voltage control

of testing transformers, Series resonant circuits.

b. Direct Voltages: Half wave and full wave rectification, Voltage doublers and cascade circuits.

c. Impulse Voltages: Single stage impulse generator, Multistage Marx generator, Practical Impulse Generators.

High Voltage Test & Measurement: Types of tests, Power frequency tests, DC voltage test and Impulse withstand test, Peak voltage measurements by spark gaps, Sphere gaps and uniform field gaps, Voltage measurement using ammeter in series with high impedance, Voltage measurement using potential dividers, Generating voltmeter, Voltage and current transformers.

High Voltage Design and Applications: Design considerations of high voltage bushings, power cables, transformers and switchgears; high voltage applications and electrostatic hazards.

High Voltage Safety and Protection.

03ENGG01-007-E. Digital Signal, Image Processing and Applications: Credit (4)

Introduction: Digital image, steps of digital image processing systems, elements of visual perception, connectivity and relations between pixels. Image acquisition: Frame grabber, optics and illumination Simple Operations - Arithmetic, Logical, geometric operations.

Mathematical Preliminaries: 2D LTI systems, 2D convolution, correlation, 2D random sequence, 2D spectrum.

Image Transforms: 2D orthogonal and unitary transforms- properties and examples. 2D DFT, histogram, image smoothening, image filtering, Sharpening, thresholding.

Image Segmentation and Analysis: Edge detection, line detection, curve detection, Edge linking and boundary extraction, boundary representation, region representation and segmentation, morphology-dilation, erosion, opening and closing.

Image understanding and recognition: Matching by templates, classifiers models, statistical, matching shapes by contour and texture.

Review of LTI systems: Fourier transform for discrete-time signals and its properties, comparison with continuous-time Fourier transform. Discrete time signals, sequences, representation of signals on orthogonal basis, sampling and reconstruction of signals.

Signal analysis using the Fourier transform, impulse function and complex exponential signal, modulation and frequency translation, duality, Fourier transform of periodic signals,

correlation, energy and power spectral density, Hilbert transform, Fourier transform of finite-duration discrete - time sequences.

Z-transform, Discrete Fourier Transform (DFT), Fast Fourier Transform algorithm and applications. Design of FIR & IIR digital filters, effect of finite register length in FIR filter design. Overview of DSP processors, FPGAs.

Typical applications in Lasers and Accelerators.

14. "Digital Signal Processing", D. J. DeFatta, J. G. Lucas and W. S. Hodgkiss.

D : Laboratory Experiments (Credit :4)

Experiments relating to lasers, accelerators and general electronics techniques will be offered. A student needs to carry out twelve experiments (4 each from laser, accelerator and electronics related areas) in two phases with a total working time of 72 hours which will carry 4 credits.

03ENGG01-001-L: Lasers and Applications

1. Measurement of spectrum and spectral width of diode laser and their dependence on current.
2. Study of characteristics of a Q- switched Nd:YAG laser.
3. Second harmonic generation: phase matching and maker fringes.
4. Saturated absorption in atomic vapour: Doppler broadening, natural line width, power broadening.

5. Study of light propagation through fiber: coupling efficiency, bending losses, splicing and connecting fiber.
6. Studies on Nitrogen laser pumped dye laser.
7. Parametric study of a XeCl Excimer laser.
8. Output power characteristics of a diffusion-cooled CO2 laser.
9. Determination of severance energy for cutting mild steel with CO2 laser.
10. Determination of laser power coupling efficiency in Nd-YAG/CO2 laser welding of stainless steel.

03ENGG01-002-L: Accelerators Related Areas

1. Electrical resistivity measurement on metallic samples at low temperature.
2. Parametric studies of magnetic materials and operating point of magnets.
3. Outgassing of materials, discharge cleaning and ESD studies.
4. Estimation of radioactivity and shielding attenuation coefficient measurements.
5. Determination of cooling power of a cryocooler.
6. Electron gun: Operation and experimental studies.
7. Proton ion source: Operation and experimental studies.
8. X-ray fluorescence studies using radioactive source.
9. Calibration of cryogenic sensors.

03ENGG01-003-L: Electronics

1. Study of stepper motor, dc motor drive and position feed-back.
2. Study of different transducers and their interfacing.
3. Communication buses and protocols, buses for distributed embedded processing.
4. G.U.I. software familiarization and applications.
5. Digital image processing and their applications.
6. Current and voltage regulated power supplies and change from one another.
7. Study of flash lamp and measurement of flash lamp current and K0 factor.
8. Characterization of RF components.
9. Fast current transformers: Study and measurement of response.

E : Reading Courses (Credit : 8)

Ph. D. scholars will work on two reading courses each of four credit worth. For each reading course, a Ph. D. scholar is expected to do self reading (under the guidance of his/her Ph. D. supervisor) of a review paper or book(s)/monograph(s) of specialized subjects related to the

area of his/her proposed area of research. Alternatively he/she may also work out and comprehend a research paper or a part of research paper relevant to his/her Ph. D. work. The topic and the structure/contents of the two reading courses should be decided by the guide in consultation with the respective doctoral committee and the Ph. D. scholar. The two reading courses should be approved by the respective doctoral committee.

The two reading courses will be evaluated on the basis of the detailed reports that will be prepared by the scholar and presentations, which will be held at the end of first year (in the month of August). The total marks for each reading course is 150 with 100 and 50 for report and presentation respectively.

F : Foundation Courses

for M.Tech (Engineering Physics) only

03ENGG01-001-F. Physics Courses for Engineering Graduates Credit (5)

Quantum Physics: Wave-particle dualism. Wave function, operators, expectation values, Schrodinger equation, Some applications: particle in a box, harmonic oscillator and hydrogen atom.

Atomic and Molecular Physics: Hydrogen spectrum, selection rules. Fine and hyperfine structure. Many electron atoms, energy levels structure, angular momentum coupling like LS & JJ; molecular structure, chemical bonding; electronic, vibration and rotational levels of molecules, Frank-Condon principle, radiative and non-radiative processes in atoms and molecules e.g. fluorescence, phosphorescence, energy transfer, and Raman effect.

Special Theory of Relativity: Galilean transformation, Lorentz transformation, relativistic dynamics - length contraction and time dilation, mass-energy relation.

Solid-state physics: Bonding in solids. Bloch theorem, band structure in periodic systems. Fermi levels, semiconductors, metals and insulators. Normal modes of vibrations and phonons. Specific heat of solids.

Nuclear Physics: Binding energy, nuclear structure and models. Alpha, beta and gamma decay. Fission and fusion processes

Optics: Concepts of wave front amplitude, phase and coherence, Basic ideas of interference, diffraction and polarization. Michelson interferometer.

03ENGG01-002-F. Engineering courses for Physics Post-graduates Credit (5)

Engineering Drawing: Basics, dimensional management and tolerance analysis. Surface texture; standard machine elements, their specifications and usage.

Evolution of product, process of design, parameter determination based on numerical calculations; Material properties and selection; Introduction to material joining & machining processes.

Semiconductor and magnetic devices: Rectifier diode, Zener diode ,Bipolar junction transistor, MOSFET, IGBT, SCR, Triac & GTO: Principle of operation, characteristics, Specifications, Ratings, Protections, Series/Parallel operation, Thermal considerations.
Transformers, Inductors, Saturable reactors: Principle of operation, Parameters, Different types, Specifications, Ratings.

Circuit theory and applications and High voltage Switches: Thyratron, Spark gap: Principle of operation, Characteristics, Specifications, Ratings, Protections
Switching circuit analysis: R-L, R-C, R-L-C circuits.

Power amplifiers: Types, Biasing, Load line, Circuit configuration, preliminary design aspects. Basics of operational amplifiers, linear and nonlinear circuits based on opamps; Principles and types of ADC and DAC, specifications; Digital circuits- combinational and sequential; Logic families; Introduction to microprocessors and PCs, interfacing with PC with serial and parallel modes; Transducers: Temperature, pressure etc;

Electronic instruments: Oscilloscope, logic analyzer, multimeter etc.

RF and Microwave systems: Basic concepts: frequency band designations, units of RF power measurements

Transmission lines: EM waves, transmission modes TEM, TE, TM, co-axial lines, microstriplines, waveguides, VSWR, insertion loss, reflection coefficients

RF cavities: Physics of RF cavities, shunt impedance, quality factor, coupling: modes, HOs, multipactoring, transit time factor; superconducting cavities

Passive devices: Microwave diodes, isolators, circulators, directional couplers, power dividers/combiners, RF Load.

Active devices: RF transistors, FETS, klystrons, magnetrons, tetrodes, triodes, solid- state amplifier.

Measurements: Fundamentals of RF and microwave measurements, S-parameters, measuring RF instruments, VNA, spectrum Analyzers, RF power meter.

Typical RF & Microwave systems for accelerators: Pulsed microwave systems, CW RF systems for SRS and proton accelerators.

MTech in Fusion Science and Technology (for BTech, BE, AMIE, MSc Physics)

Course CI – IPR, Gandhinagar: Degree to be awarded by HBNI, Mumbai

Starting time – 01 August 2015

Course pattern
1st year – 2 trimester courses, 1 trimester Mini Project
2nd year – Project thesis/Dissertation

IMPORTANT:
After 1st year, people who qualify will be given a job in IPR as per Scientist / Engineer SC – details to be mentioned in the Technical Training Programme (TTP) 2015 advt. IPR employees who have BTech/BE/AMIE/MSc degree can also take this course as per HBNI guidelines for employees.

Only BTech/ BE / AMIE in following disciplines are considered: Mechanical, Electrical/Electronics/Instrumentation. MSc – Physics is also considered.

Trimester 1:
All courses are common to all: 1 class (lecture) – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.)

Subject	Credits	Marks
Basic Plasma Physics (FC1)	3	100
Experimental Plasma Physics (FC2)	3	100
Tokamaks (FC3)	3	100
Fusion Plasma Diagnostics (FC4)	3	100
Measurement Techniques (FC5)	3	100
Numerical Methods (FC6)	3	100
Mathematical Methods (FC7)	3	100
Vacuum, Cryogenics and Magnets (FC8)	3	100
TOTAL	**24**	**800**

Trimester 2:
All courses in part (A) are common to all: 1 class – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.). Courses in part (B) are subject/discipline specific.

Part (A): Advanced Subjects

Subject	Credit	Marks
Fusion Neutronics (AS1)	3	100
Plasma Facing Components: First Wall, Divertors, Blankets (AS2)	3	100
Fusion Materials (AS3)	3	100
RF, Current Drive and Neutral Beam Heating (AS4)	3	100
TOTAL	**12**	**400**

Part (B): All courses in part (B) consist of 4 classes a week; 1 class – 60 minutes, 2 classes a week / faculty per subject; total number of classes/subject ~ 60 (including assignment, presentation, etc.)
Subject Credit: 30 hours – 3 Credits
60 hours – 6 Credits

Subject	Hours	Total Credits	Marks	Remarks
Magneto Hydro Dynamics (PH1)	60	21	700	For Physics
Kinetic Theory and Statistical Mechanics (PH2)	60			
Advanced Heat Transfer and Cryogenics (PH3/ME5)	60			
Tokamak Related Code (PH4)	30			
Code Design for Internal and External Pressure Vessel (ME1)	30	21	700	Mechanical Engineering
Finite Element and Volume Methods (ME2)	60			
Mechanics of Solid/Vibration/Remote Handling (ME3)	30			
Advanced Manufacturing Technologies (ME4)	30			
Advanced Heat Transfer and Cryogenics (ME5)	60			
Advanced Data Acquisition System (EE1)	30	21	700	Electrical/Electronics/ Instrumentation Engineering
Advanced Tokamak controls (EE2)	30			
High Voltage, DC& AC/ Power Supplies (EE3)	60			
Signal Conditioning and EMI/EMC Aspects (EE4)	30			
Computer Based System Design (EE5)	30			
Digital Signal Processing and Image Processing (EE6)	30			

Trimester 3: Subject/Discipline specific project work

	Credit	Marks
Mini Project	**9**	**300**

TOTAL CREDITS IN 1ST YEAR: 24 + 12 + 21 + 9 = 66
TOTAL MARKS IN 1ST YEAR - 2200

2nd YEAR: M.Tech Thesis work

	Credit	Marks
1-year project/dissertation	**30**	**1000**

TOTAL CREDITS FOR 2 YEARS: 66 + 30 = 96
TOTAL MARKS for 2 YEARS – 3200

TRIMESTER 1

FC1 - Basic Plasma Physics (30 Lectures)

- **Introduction**

Definition of plasma, description of collective behaviour in contrast to single particle behaviour, derivation of plasma frequency (slab model), Debye length (description of Boltzmann distribution), conditions for collective behaviour (Physical basis for these conditions), binary collisions (derivation of Rutherford scattering), derivation of collision frequency ν_{ei} (large angle collisions, cumulative effect of many small angle collisions, Coulomb logarithm), discussion of collective behaviour revisited with relationship between various conditions (discussion of $k\lambda_D << 1$, plasma parameter).

- **Single Particle Motion**

Lorentz force equation, Nonrelativistic motion of a charged particle in constant electric and magnetic field: motion in constant **E** field, constant **B** field (derivation of cyclotron frequency, Larmor radius), motion in crossed **E** and **B** field, general solution for arbitrary angle between **E** and **B** field (Gantmakher formula), drift in a combined magnetic field and a general force field (non-magnetic), Motion in non-uniform **B** field (guiding centre approximation): Grad B drift ($\nabla \mathbf{B} \perp \mathbf{B}$), curvature drift, $\nabla \mathbf{B} \| \mathbf{B}$ (magnetic mirrors, invariance of μ, concept of adiabatic invariance), Uniform **B** and spatially varying **E** field (Finite Larmor radius effects), Time and space varying **E** field (Ponderomotive force), Time varying magnetic field (adiabatic compression), Time varying **E** field (polarization drift)

- **Fluid Description of Plasma**

Fluid equations, Equation of state, Complete set of two fluid equations, Fluid drifts parallel and perpendicular to **B** (diamagnetic drift), Plasma Equilibrium, Transport and Stability

- **Waves in Plasma**

Notion of phase and group speeds, High frequency electrostatic waves in an unmagnetized plasma (Langmuir waves, Bohm-Gross waves), High frequency electrostatic waves in a magnetized plasma (upper hybrid oscillation), High frequency electromagnetic modes in an unmagnetized and magnetized plasma, Low frequency electrostatic waves in unmagnetized and magnetized plasma: ion-acoustic wave, ion cyclotron wave, lower hybrid oscillation, low frequency electromagnetic modes: Alfven wave, magnetosonic wave.

- **MHD Description**

Derivation of single fluid equations from two fluid equations, complete set of equations of Magneto Hydro Dynamics (MHD), MHD waves, MHD energy.

FC2 - Experimental Plasma Physics (30 Lectures)

- **Fundamental Gas Processes**

Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization, Thermal Ionization, De-ionization, Diffusion, Different Mechanisms of Electron-Ion Recombination, Electron Attachment and Detachment Processes, Ion-Ion Recombination Processes, Formation of Negative Ions, Electronic Properties of Solids, Surface Emission Processes, Thermionic Emission, Field Emission, Photoemission, Particle Interaction with Solids, Interaction of Electrons with Surfaces, Interaction of Ions with Surfaces, Interaction of Neutrals with Surfaces, Sputtering Phenomena.

- **Charged Particles in a Gas in Electric Field of Low and High E/p**

Diffusion and Drift in an Electric Field, Redistribution of Particles through Diffusion and Drift, Ion Mobility, Ambipolar Diffusion, Electron Drift Velocity, Concept of High E/p, Primary Ionization Processes, Electron Avalanche, First Ionization Coefficient.

- **Self-sustaining Discharge**

Over-exponential Carrier Multiplication, Ionization by Positive Ion Collision, Cathode Processes, Processes in the Gas, Secondary Ionization Processes, Second Townsend ionization Coefficient, Paschen's Law, Breakdown Criterion, Limitations of Townsend Mechanism.

- **Glow Discharge**

Structure of Glow Discharge, Current-Voltage Characteristics of Glow Discharges, Physical Interpretation and Theoretical Analysis of Cathode Zone, Negative and Faraday Dark Space, Positive Column and Anode Layer, Striations, Specific Glow Discharge Plasma Sources.

- **Breakdown under Special Conditions**

Breakdown under Alternating Fields, Microwave Controlled Breakdown, Mobility Controlled Breakdown, Inductively Coupled Discharge, Capacitive Coupled Discharge.

- **Arc Discharge**

Glow to Arc Transition, Current-Voltage Characteristics of Arc Discharges, Classification of Arc Discharges, Cathode and Anode Layers, Different Models of Positive Column, Different Configurations of Arc Discharges, Bennet Pinch and Electrode Jet Formation.

- **Plasma Sheath and Diagnostics**

Basic Concepts, Bohm Sheath Criterion, High Voltage Sheath, Generalized Criteria for Sheath Formation, Electrostatic Probe Diagnostics, Single Langmuir Probe, Double Probe and Emissive Probe.

- **Experimental Plasma Devices**

Large Volume Plasma Device, BETA machine, SMARTEX, Helicon Plasma Expt., Q-machine, SYMPLE, Linear Magnetized Plasma Beam Expt., Plasma Wakefield Expt., Plasma Torch.

FC3 - Tokamaks (30 Lectures)

- **Introduction to tokamaks**

Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor, Tokamak Research, Major constituents of Tokamaks, Indian Tokamaks, Tokamak Confinement, Confinement times, Ohmic Confinement, L-mode and H-mode Confinement, Confinement scaling, Radiation loses.

- **Equilibrium and Transport**

Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport, Neoclassical Transport.

- **Heating**

Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive
Ion Cyclotron Resonance Heating, Electron Cyclotron Resonance Heating.

- **MHD Stability**

Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios.

- **Tokamak Devices and Other Fusion Devices**

Operating Regimes, Tokamak Magnetic Systems, Power systems, Plasma Production, Measurements of major operational parameters, Plasma wall interaction, Runaway electrons, Impurities, Operational experience in Aditya and SST-1, Other Fusion Devices.

FC4 - Fusion Plasma Diagnostics (30Lectures)

- **Introduction to Tokomak diagnostics**

  Introduction to all the tokomak diagnostics and related measurements.

- **Electrical diagnostics**

Langmuir probe: Single probe characterisation, explanation and other issues, Probe configurations, Double and Triple probes, Emissive probes.

- **Magnetic diagnostics**

Rogowski, flux and diamagnetic loops, Configuration and other details, plasma position and shape measurements, Introduction to MHD instabilities and Mirnov oscillations.

- **Measurements of plasma density and electron temperature**

Thomson scattering diagnostics: General concepts of Thomson scattering. Principles of Thomson scattering diagnostics. Types of Thomson scattering diagnostics used in tokamaks, Description of a typical diagnostics set up, technical features of the diagnostics set-up. Advantages and limitations of the technique.

Reflectometery: General concepts of Reflectometery. Physics principles of diagnostics. Different types of Reflectometry techniques, description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

Interferometry: General concepts of Interferometry. Physics principles of diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

ECE diagnostics: Concepts of Electron Cyclotron Emission. Physics principles of the diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis, Advantages and limitations of the techniques.

- **Measurement of impurities**

Introduction to spectroscopy, basics of passive and active spectroscopy and introduction to Visible, VUV and X-ray spectroscopy. Measurements of impurities by Visible spectroscopy and VUV/X-ray spectroscopy Data analysis by using actual spectra.

- **Measurement of ion temperatures**

Charge exchange recombination spectroscopy (CXRS) : Physics principles of CXRS , typical diagnostic set up, technical features of set up and brief on analysis techniques. Estimation of ion temperature using actual data.

X –ray crystal spectroscopy : Physics principles of X-ray crystal spectroscopy diagnostics , typical diagnostic set up, technical features of set up and brief on analysis techniques.

Neutral particle analyser: Concept of charge exchange (CX) neutral flux escaping from the tokamak plasmas, introduction to the different techniques for measurement of CX flux and energy distribution, description of the diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of the techniques, presentation of data analysis and estimation of core-ion temperature, analysis of actual plasma discharge data and estimation of ion-temperature.

- **Measurements of Radiated power**

Bolometers: Concept of Bolometry, requirement of bolometric measurements for tokamak plasmas, introduction to the different Bolometry techniques available for measurement of total radiated power loss from toakamak plasma, description of the different bolometers namely: Metal foil, AXUV and Imaging Video Bolometers, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each Bolomters, presentation of data analysis and estimation of total radiated power loss, analysis of actual plasma discharge data and estimation of total radiated power loss from the plasma.

- **Measurements of operational parameters**

Soft X-ray diagnostics: Introduction to the Soft X-ray diagnostics, physics principles and measurement technique, description of the diagnostics set up, description of the technical features of the diagnostics set up, advantages and limitation of the SXR diagnostic for electron temperature measurements.

Imaging Diagnostics: Requirement of imaging diagnostics for tokamak plasma, concept of different imaging diagnostics namely: Infrared Imaging Diagnostics, Visible Imaging Diagnostics etc., physics principles involved, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each imaging diagnostics, presentation of data analysis and analysis of actual plasma discharge data available for the imaging diagnostics.

Hard X-ray monitors: Concept of runaway electrons production in tokamaks, different measurement techniques available for the runaway detections, requirements of HXR measurements on tokamaks, principles of Hard X-Ray (HXR) generation due to runaways, introduction to HXR monitors for confined and de-confined runaways, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of HXR monitors.

Motional Stark Effect diagnostics and Beam emission spectroscopy: Introduction to beam based diagnostics, description of various beam based techniques for different types of operational parameters (q profile, ne(edge),Te(edge) and neutral beam density). Description of the diagnostics setup and technical features of the diagnostics setup and data analysis techniques.

Dust and Erosion monitors and Tritium monitors : Introduction to the concept of the Dust, erosion in tokomaks. Importance of the measurement of Dust, Erosion and Tritium. Challenges involved in the measurements. Example schemes of the measurement techniques.

- **Measurement of fusion products**

Introduction to fusion product measurements and importance of the measurement and control of fusion product generation. Various techniques available for measuring fusion products.

Confined and Lost alphas: Requirements of lost alpha particle diagnostics on future fusion devices, different diagnostics techniques available for the lost alpha diagnostics, principle of detection techniques, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each techniques and future applicability to fusion devices.

Gamma ray spectroscopy: Requirements of gamma ray spectroscopy on future fusion devices, principle of detection technique, diagnostics set up, description of the technical features of the diagnostics set-up.

Neutron flux and neutron profiles: Introduction to neutron flux and neutron profile measurements, measurement principles, measurement schemes and typical diagnostics set ups and discussion on challenges involved.

- **Overview and summary of ITER Diagnostics**

Discussion on the challenges involved in diagnosing fusion grade plasmas, over view of ITER diagnostics.

FC5 - Measurement Techniques (30Lectures)

- **Measurement System**

Introduction, Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems.

- **Specifications parameters of Measurement Systems**

Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability.

- **Electrical Measurements and Disturbances in Measuring System**

Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power.
Disturbances in Measuring System, Leakage Current, Parasitic Capacitive Coupling, Parasitic Inductive Coupling, Disturbances caused by: Electromagnetic Field, Feeding Cables, Improper Grounding.

- **Sensors/Transducers and Their Applications to Physical Measurements**

Sensors and Transducers – Performance Parameters, Selection of Sensors/Transducers, Temperature measurements, Pressure measurements, Flow measurements, Measurement of Linear/Angular acceleration, Velocity and Displacement, Measurement of Force and Torque, Measurement of radiant energy/light with Photosensitive Devices, Physical parameters sensing with Plasma diagnostics.

- **Analog Electronics**

  Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Pre-amplifiers, Pulse Amplifier, Signal isolation, Filters, Attenuators.

- **Introduction to Data Acquisition**

  Data Acquisition (DAQ) overview, Major components in development of Data Acquisition System (DAS), PC based data acquisition system, Data plotting and analysis. DAQ Software: Overview of Graphical/command based programming for the acquisition, Data processing and presentation of data: MATLAB, LabVIEW Application development environment, Concept and importance of Data Storage System, Microprocessors/Microcontrollers based measurement system.

- **Noise in Measurement System**

  Introduction to EMI/EMC, Methods of Noise Coupling, Methods of eliminating interference, Grounding, Cabling, Shielding, Intrinsic Noise source, Digital Circuit Noise, Sensor – DAS interface, Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for measurement.

FC6 - Numerical Methods (30 Lectures)

- **Modeling, computation and error analysis:**

Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study.

- **Solutions of Linear Algebraic equations:**

Matrix algebra, Eigen value problems, Gauss elimination and LU factorization, Matrix inverse and conditions, Singular value decomposition, Iterative methods, Case study.

- **Numerical Differentiation and Integration**

Numerical differentiation, Numerical Integration, Case study.

- **Roots, optimization and nonlinear sets of Equations**

Bracketing methods, Open methods Optimization - Case study.

- **Application of Ordinary Differential equations**

Initial Value problems, Adaptive methods and stiff systems, Boundary value problems, Case study.

•**Application of Partial Differential equations**
Methods to solve PDEs, Case study.

•**Application of Curve fitting methods**
Linear Regression analysis, Fast Fourier Transform, Power spectral analysis, Bispectral analysis, Polynomial interpolation and extrapolation, Cubic spline interpolation, Nonlinear Least **Square** methods Case study.

FC7 - Mathematical Methods (30 Lectures)

- Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl. Gauss, Green's And Stokes Theorems. Laplacian Operator in Different Coordinate Systems.
- Matrix Algebra: Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors; Similarity transformation and diagonalisation of a matrix.
- Complex analysis: Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series, singularities(poles and essential singularity) , Residues, Cauchy Residue theorem, Contour integration, Conformal Mapping and its application to the solution of Laplace equation.
- Differential equations: First and second order differential equations with constant and variable coefficients; Linear differential equations: Approximate method for solving ODE's (Series method of solution; Legendre and Bessel's differential equations and their solutions); Orthogonal polynomials and Special functions - Bessel functions, Gamma functions and Beta functions.
- Partial differential equations: First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations. Method of charateristics, Separation of variables.
- Integral Transforms: Fourier, Laplace Transforms and the inverse transforms, connection to physical problems. Applications for obtaining solution of ordinary/partial differential equations.

FC8 - Vacuum, Cryogenics and Magnets (30 Lectures)

- **Fundamental of vacuum**
- The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pumpdown time, Outgassing and permeation. Exposure to pumps and gauges.

- **Design of a vacuum system**

Selection of materials, Pumps, Gauges, Valves, Rules for operating vacuum system. Permanent seals, Demountable seals, Vacuum components, Cleaning techniques.

- **Fundamental of cryogenics**

Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.

- **Design of cryogenics system**

Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
Basics of Cryogenic valves, sizing, leaks and heat load estimation, Instrumentation at cryogenic temperatures. Safety aspects in handling cryogens.

- **Applications of Cryogenics Engineering in Fusion machines**

SST-1 Magnets, Cryo pumps, pellet injectors.

- **Fundamentals of Magnet system**

Resistive and Superconducting Magnet Systems,LTS and HTS based conductors, Flux Jumps, Filament twisting, AC losses, Cryo-stability, Monolithic & Cable-in-conduit-conductor (CICC) concepts.

- **Design and fabrication of magnet system**

Magnetic field calculations (analytical & computational tools), Magnetic force calculations, Structural design for magnets, Conductor design & Magnet winding pack design. Magnet winding pack fabrication & engineering issues, Insulation systems in magnets manufacturing, Magnets winding pack consolidation, QA/QC in magnets manufacturing.

- **Magnet operation**

Sensors and Instrumentations in Superconducting Magnets, Superconducting Magnet Quench and Protection aspects, Superconducting Magnet Tests & auxiliary test facilities, SST-1 Magnet System.

TRIMESTER 2 – PART A

(Part A is common to all)

AS1 - Fusion Neutronics (30 Lectures)

- **Neutronics Basics**

Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes, nuclear reactions, cross section, and thermalisation, scattering & absorption processes.

- **Particle transport phenomena in matter**

Neutron & photon transport, mathematical transport problem-Boltzmann transport equation, -probabilistic particle transport simulation - MCNP Monte Carlo code, tools: MCNP, Attila, Validation of computational tools and data.

- **Basics of fusion neutronics & blanket neutronics**

Neutronics design optimization, nuclear design of reactor components (blankets, divertor, first wall, heating systems, diagnostics etc.), Nuclear design analysis – optimization, source modelling, nuclearresponsecalculations,neutronandgammafluxes,nuclearheating,tritiumproductionrates,gasproductionanddpa.Amountoftritiumrequiredforafusionreactor,TritiumBreedingRatio, activation products & decay heat assessments, radiation damage & transmutation

- **Principles of Neutron & Fusion product diagnostics**

Processes in the plasma leading to non-maxwellian fuel ion distribution, experimental neutron, gamma-ray & alpha particle detection techniques, computational techniques to extract relevant information about the velocity functions of fusing ions out of measured neutron signals. Concepts of integrated modelling to assess and analyze the neutron emission features.

- **Radiation and licensing**

Radiation units, Radiation protection standards, Biological & genetic effects of radiations, Radiation shielding principles, composite shielding materials. Concepts of licensing & decommissioning of nuclear installations.

- **Radiation damage & transmutation**

Activation & after-heat, tools for calculations EASY-2010, concept of direct one step (D1S) method and Rigorous 2 step (RS2) process (MCNP-FISPACT) in estimating the dose rate on components of a fusion reactor after reactor shut down. Generation & management of radioactivewastefromatypicalfusionreactor.Quantification&Categorizationofradioactivewaste

- **Nuclear Safety aspects**

Basic concepts in safety, reliability and RAMI analysis, loss of coolant accidents, conceptual design of safety systems, risk and reliability analysis of systems, operational safety procedures, regulatory process, introduction to safety related instrumentation, remote handling of irradiated components

- **Fusion Neutronic Activities Worldwide**

Overview &Latest neutron facilities being built all over the world and recent trends. 4th generation nuclear reactors (high temp & compact reactors), Accelerator Driven Systems (ADS), IFMIF & CTF, Spallation Neutron Source (SNS), Fus-Fis hybrid systems (breeders), Transmutation of radiation wastes

---

AS2 - Plasma Facing Components: First Wall, Divertors, Blankets (30 Lectures)

- **First Wall**
  - **Firstwall Concepts :** Basic Design of Firstwall.
  - **Loads on Firswtall: I**nertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Firstwall:** Material Challenges, Fabrication Challenges, Operational Challenges.

- **Divertors**
  - **Divertor Concepts:** Basic Design of Diveror, Toroidal & Poloidal Divertor, Single-Null Divertor, Double-Null Divertor.
  - **Loads on Divertor:** Inertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Divertor:** Material Challenges, Fabrication Challenges, Operational Challenges.
  - **Divertor Testing:** Destructive Testing, Non-Destructive Testing, Metrology.
  - **Novel Divertor Concepts:** Helium Cooled Divertor, Liquid Divertor.

- **Blankets**
  - **Blanket Concept**: Requirement and essential features of Shield Blanket (SB) and Breeding Blanket (BB) in a fusion reactor.
  - **Shield Blanket:** Types of SB and SB material, SB Design Concept, Thermal-hydraulic and thermo-mechanical analysis of SB.
  - **Breeding Blanket:** Types of BB and blanket materials (solid and liquid), concept of Indian BB, Indian Lead Lithium cooled Ceramic Breeder (LLCB) Test Blanket Module (TBM) for ITER, concept of LLCB-TBM design, thermal-hydraulic and thermo-mechanical analysis of SB, LOCA and LOFA analysis of BB, Diagnostics of BB.
  - **Solid Ceramic Breeder (CB) Technology:** Development of Li CB, characterization of Li CB material, characterization of Li CB pebble bed, thermal and thermo-mechanical analysis of pebble bed.
  - **Liquid Metal (PbLi) Technology: C**omposition and developmental process of PbLi eutectic alloy, Study of basic (PbLi) loop and loop components, PbLi diagnostics. Liquid

metal MHD studies – basic analytical formulation (Velocity profile and Pressure drop studies), liquid metal MHD code development (Electric potential Method and Magnetic induction method), code benchmarking, Liquid Metal MHD experiments (Experimental set up, experimental results), liquid metal (Pb-Li) Corrosion studies (Corrosion experiments, experimental results, numerical formulation).

- **Fusion Fuel Cycle:** Requirement and essential features of fusion cycle of a fusion reactor, inner & outer fuel cycle of a fusion reactor, tritium handling technologies, tritium storage & delivery system, tritium extraction system, Tokamak exhaust processing system, tritium diagnostics.
- **Blanket Safety:** Gaseous and liquid releases during normal operation and maintenance, accidental conditions – Design Basis Accidents (DBA), Beyond Design Based Accidents (BDBA), Loss of Coolant Accidents (LOCA), Loss of Flow Accidents (LOFA), complete loss of active cooling.

AS3 - Fusion Materials (30 Lectures)

- **Fundamentals of Material Science**

  - Crystalline nature of matter - Structure and bonding of atoms, atomic arrangements in materials, Structural phase formation and transition, Types of materials (Metals, Alloys, ceramics, composites, glasses, polymers, Superconductors).
  - Defects in solids – Imperfections, Frenkel pairs, Dislocation theory, Grain-boundary, Stress Fields and Strain Energy
  - Metallurgical Aspects of materials – Solid solutions, solubility, Precipitation, Diffusion in solids (Diffusion Laws), ordering in alloys, Phase diagrams, strengthening and hardening Mechanisms, Annealing and heat treatment.
  - Physical Properties of materials – Electrical, Thermal, Magnetic, Dielectric, optical and other properties of materials
  - Mechanical Behaviour of materials – Elastic and Plastic deformation, metallic Creep and fatigue, Strengthening and toughening of steels and non-ferrous alloys, fracture and DBTT , toughness
  - Introduction & Survey of Computational Tools, Multi-scale Models

- **Fusion Materials Requirements & Issues**

  - High heat flux handling – HHF source types, parameters and effects.
  - Erosion & Corrosion – Sputtering, erosion due to heat and particle bombardment, erosion and corrosion due to liquid metals, Hydrogen embrittlement, Oxidation, Pitting and crevice corrosion

- **Material Development and Joining Technologies**

- Manufacturing Methods & Processes – Steels and alloys melting, Powder metallurgy route, Ceramics preparation methods, Composites developments, Superconducting materials manufacturing.
- Structural Materials – Austenite and Ferritic Martensitic (FM) steels, ODS alloys, Vanadium and Titanium alloys, Carbon and SiCf/SiC composites
- Functional Materials – Plasma facing Materials (Tungsten, graded and other materials), Tritium Breeding & Blanket materials, special ceramics, Superconducting materials, Heat sink Materials, shielding Materials, Diagnostics and window materials, coatings
- Joining Technologies – Methods and Issues (Welding, Brazing, Diffusion Bonding, Hiping)

- **Material Characterization & Qualification**

- Structural Characterization – Crystal and Microstructural Analysis, defect structure, Phase Transition (XRD, SEM, TEM, Neutron Diffraction, PAS)
- Compositional Characterization & Surface Techniques (EPMA, EDX, ICP-MS, XPS and AES, SIMS), Impurity limits
- Particle beam Techniques (ERDA, RBS, NRA, Synchrotron Source)
- Mechanical Property Testing- Hardness, Fatigue, Fracture, Tensile, Creep
- Thermal Property Testing – High Heat Flux test, Thermal conductivity, Thermal Expansion coefficient, Electrical Property Testing & NDT, codes and standards – Resistivity (AC &DC), Radiography, Ultrasonic techniques

AS4 - RF, Current Drive and Neutral Beam Heating (30Lectures)

- **Heating and current drive physics by neutral beam**

Basic process during beam-plasma interaction, Beam injection geometry and its implication, Energy transfer mechanism from energetic neutral beam particle to plasma, Energetic particles orbits in asymmetric field structure, Physics of current drive by NBI, Role of fast ions in Neutral Beam Current Drive efficiency.

- **Neutral beam injector system design and engineering**

Basic NBI configuration, Optimization procedure of beamline configuration, Pressure profile optimization, Beam transmission optimization.I on source design and engineering, Different Plasma production mechanism, Positive ion and negative ion production, Ion extractor and accelerator system, Beamline component design and engineering, Neutralizer, Residual Ion Dump (RID), Calorimeter or V – target, Vacuum system design and engineering, Vacuum vessel, NBI – tokamak interface duct, Cryopumps and cryogenic system, Auxiliary pumping system, Diagnostic system design and engineering, Ion source plasma diagnostics, Electrical Probe based, Spectroscopy based, Negative ion diagnostic, Laser photo-detachment, Cavity ring down method, Hairpin resonator based, Ion-acoustic wave based, Beam profile diagnostic, Doppler shift spectroscopy, Thermal imaging diagnostic, Calorimetric diagnostic, Power supply system design and engineering, RF Power supply, HV power supply for ion extraction and acceleration.

- **Introduction to RF heating**

Introduction to Fusion Reactor: Why RF and Microwave Power is required for Fusion? Interaction of electromagnetic waves with plasma.

- **Waves**

Theory of waves in unmagnetized plasma, EM waves, Longitudinal waves, Transverse wave, Ion acoustic waves. Theory of waves in magnetized plasma, EM waves, X-mode, O-mode, Hybrid waves. Classification of RF regimes. RF Requirements of Fusion Reactor, Different heating, pre-ionization and current drive mechanisms. Dispersion relations. Wave propagation in toroidal plasma geometry. Power absorption, Landau damping, Current drive mechanisms in different regime.

- **RF devices and Design tools**

Introduction to general type Waveguide, RF amplifier and Oscillators, Antennas, Engineering issues, RF design software.

- **ICRH**

Introduction to RF applications in ICRH, its design and issues. Introduction to RF transmitter, Power transmission, Antenna design, Auxiliary systems for ICRH. Diagnostic system, Impedance matching unit, Control system. Important results on different tokamaks about ICRH system. Introduction to Aditya and SST-1 ICRH Systems

- **ECRH**

Introduction to RF application in ECRH its design and issues. Introduction to Gyrotron source. Power transmission, Antenna design, Auxiliary systems for ECRH. Diagnostic system. Control system. Important results on different tokamaks about ECRH system. Introduction to Aditya and SST-1 ECRH Systems.

- **LHCD**

Introduction to LHCD system its design and issues. Introduction to Klystron source, Power transmission, Antenna design, Auxiliary systems for LHCD. Impedance matching unit, Diagnostic system, Control system. Important results on different tokamaks about LHCD system. Introduction to Aditya and SST-1 LHCD System.

- **Other types of wave heating**

Alfven wave heating, Bernstein wave heating, Design and its issues, Introduction to its sources, Power transmission, Antenna design, Impedance matching unit, Diagnostic system, Control system. Important results on different machines.

TRIMESTER II – PART B

Part –B contains the details of the core subjects.

PHYSICS

PH1 - Magnetohydrodynamics (60 Lectures)

- Physical description of electrically conducting fluids
- Derivation of basic MHD equations: Continuity, Equation of motion, Energy flow, Ohm's law, Validity of MHD equations
- The low frequency dynamics of the electromagnetic field
- Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of resistivity, Similarity scaling, The Wöltjer invariants and helicity
- Equilibrium: General considerations, The Virial Theorem, Examples of simple equilibria: -pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm ashape, etc.
- Comparison of fusion confinement systems: Spheromak, FRC, RFP, Spherical Tokamak
- Tokamak Equilibrium: In large aspect ratio limit with arbitrary choice of profile, Solovev equilibrium with finite aspect ratio and linear profile in poloidal flux, Solution with arbitrary aspect ratio and arbitrary choice of profiles (numerical)

PH2 - Kinetic theory and Statistical mechanics (60 Lectures)

- Gas dynamic way of describing an uncharged fluid – heuristic
- Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
- Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
- Using heuristic arguments in single particle phase space (x,v) to obtain "fluid equations" in phase space – namely – the Vlasov-Poisson Equations
- Introduce conservation of Energy and other physical quantities as constraints.
- Using constrained variation technique demonstrate how entropy extremization leads to Maxwell-Boltzmann distribution f_mb(x,v) and importance of Maxwell-Boltzmann distribution
- Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
- Linear Landau Damping – why is this not seen in fluid equations?
- Two stream instability and Phase Space structure formation
- Many stream interpretation of an equilibrium distribution f_mb(x,v)

- Stability – Newcomb-Gardner Theorems and Penrose Stability Criteria
- Nonlinear Landau damping and Theory of BGK modes – revisit Two stream instability.
- Stability of BGK modes.
- Particle correlations and need for two-body and higher order distributions
- Equations governing two body distrution f_2(x,v,t) and its relationship to f(x,v,t) the one-body or Vlasov distribution studied earlier – Introduction of pair correlations
- Construction of a N-body distribution function f_N and BBGKY Hierarchy issues.
- Klimontovich-Dupree (KD) procedure – Obtaining a "statistical N-body" distrituion from KD equation.
- Green-Kubo formalism – Transport and Correlations
- Examples of GK formalism and obtained transport
- Very cursory introduction to Onsager relationships

PH3 - Advanced Heat Transfer and Cryogencis (60 Lectures)

(PLEASE SEE ME5 – these are common courses for Physics and Mechanical disciplines)

PH4 - Tokamak related Code (30 Lectures)

- **Plasma core modelling:**

— Plasma equilibrium IPREQ

— Plasma transport TSC

— Plasma stability ERATO, PEST2

— ICRH heating TORIC

— NBI heating NUBEAMS

— Plasma start up model

— Reactor system code

— Eddy current analysis

— TF modelling EFFI

— Vertical instability analysis

- **Edge-SOL studies**

— 2D blob transport

— Divertor study SOLPS (B2+ERINE)

— 3D plasma study ERINE-3D

- **First principle simulations**
  - Low frequency (w/wc <<1) transport – what is Gyrokinetic method?
  - What are the transport processes neglected by gyrokinetic formalism?
  - What are global and local simulations – examples (flux tube modes and global models)?
  - Under what conditions do results from these two simulations are expected to match?
  - Gyrokinetic equations derived from Vlasov-Poisson equations using Bessel function procedure
  - How does Gyrokinetic formation capture the physics of Finite Larmor Radius to all orders at low frequencies?
  - Numerical Advantages of Gyrokinetic formalism – examples
  - Simulating very large scale systems (100s of larmor radii) using very large parallel computers – Issues and Advantages
  - Modelling energetic particle transport using Gyrokinetic formalism

MECHANICAL

ME1- Code Design for internal and external pressure vessel (30 Lectures)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive

Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1and Div.2.

- Difference between metallic pressure vessel and FRP pressure vessels.
- Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Failure modes of pressure vessels, Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and piping's.

ME2 - Finite element and volume methods (60 Lectures)

Finite Elements methods (30 Lectures):

- Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation, piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
- Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
- Bar element: Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss.
- Beam element: Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- 2D plane elements – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- 2D isoparametric formulation – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress.
- Introduction and Application to 3D elements: Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Shell element: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions.
- Introduction to Nonlinear problems: Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method.

- Finite element applications for design: Finite element modelling and discretization criterion,h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

Finite Volume Methods (30 Lectures):

Basics of Fluid Flow, Heat Transfer and Numerical Analysis

- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity',momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme

Laminar Boundary Layer and Forced Convective Heat

- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Convective heat transfer for internal and external flows.
- Low and high Prandtl number limits and different thermal boundary conditions.

Turbulent Flow and Heat Transfer

- Reynolds decomposition for turbulence.
- Prandtl's mixing length theory, Mixing length models.
- Structure of turbulent boundary layer over flat plate and through circular cylinder.
- Calculation of friction factor and drag coefficient.
- Analytical and semi-analytical correlations for calculating heat transfer coefficients.
- Reynolds analogy & Low Reynolds number models.
- Turbulence Modelling.
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model.
- Reynolds stress models: algebraic and differential models.

Natural Convection

- Basic Equations of natural convection.
- Derivation of Dimensionless groups from basic equations.
- Analytical approximations.
- Numerical solution of approximate equations.

Numerical Solution of Complete Fluid Flow and Energy Equation

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation.
- Primitive-Variable (P-V-T) formulation.
- Pressure velocity coupling for incompressible flow
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE, SIP and SIMPLEN family of Methods.
- Simple grid generation techniques for structured grid.
- Elliptic, parabolic and hyperbolic equation method.
- Domain decompositions in CFD and heat transfer.

ME3 - Mechanics of solid/vibration/ remote handling (30 Lectures)

Mechanics of solids

- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of stress

- Description / Notations of Forces & Stress.
- Component of stress.
- Reciprocity of shear stress in 3D.
- Stresses Transformation using direction cosines.
- Stress Traction Vectors or Traction Vectors.
- Stress component on an arbitrary plane.
- Principal stresses & Mohr’s Diagram for 3D state of stress.
- Stress Invariants.
- Hydrostatic and Deviator components of stress.
- Principle planes and their orthogonally.
- Octahedral plane, Octahedral stresses.
- State of pure shear.

Analysis of strain

- Description / Notation of Strain in 3D.
- Components of strain.
- Strain Transformation using direction cosines.
- Principle Strains, Strain Invariants.
- Strain Deviator Tensor.

Principles and fundamental Equations of Elasticity

- Strain and displacement relations (Cauchy's equations).
- Compatibility equations (Saint-Venant's Equations).
- Generalized Hook's Law.
- Anisotropy and Isotropy of elastic behaviour.
- Stress and strain relationship.
- Equations of equilibrium (Navier's Equations, Lame's equations).
- Strain Energy.
- Uniqueness theorem.
- Bounds on elastic constants.
- Superposition Principles.
- Saint-Venant's Principle.
- General Solution Procedures for an elasticity problem.

Vibrations

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations underdamped, overdamped and critically damped systems; Response to harmonic loading -complementary solution and particular solution; Response to periodic loadings using Fourier Series
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems;Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration).

Remote handling

- Automation and introduction to remote handling.
- Industrial manipulators.
- Kinematics of manipulators specifying position and orientation of rigid bodies, Euler angles, homogeneous coordinate transformations, D-H representations of kinematic linkage, velocity analysis of manipulators.

ME4 - Advanced Manufacturing Technology (30 Lectures)

ADVANCE MANUFACTURING PROCESSES

- INTRODUCTION: Unconventional Machining Process, Need – clarification – Brief overview of all techniques.
- MECHANICAL ENERGY BASED PROCESSES: Abrasive Water Jet Machining, Water Jet Machining, Ultrasonic Machining (AJM / WJM/ USM). Working principles – equipments used – process parameters – MRR – Variation in techniques used – Applications.
- ELECTRICAL ENERGY BASED PROCESSES: Electro Discharge Machining, Working principles – Equipments – Process parameters – MRR – electrodes/ tools / power circuits – tool wear – Dielectric- flushing- Wire cut EDM – Applications.
- CHEMICAL AND ELECTRO-CHEMICAL ENERGY BASED PROCESSES: Chemical Machining, Electro- Chemical Machining – Etchants- maskant-Techniques of applying maskants – Process parameters – MRR –Applications. Principles of ECM-MRR-Electrical circuit – process parameters – ECG and ECH applications.
- THERMAL ENERGY BASED PROCESSES: Laser Beam Machining, Plasma Arc Machining and Electron Beam Machining. Principles – equipments – types – beam control techniques applications.

ADVANCED MATERIALS JOINING AND TESTING

- INTRODUCTION: Classification – heat sources – metallurgical effect of weld – residual stresses: formation and relieving – capillary and welding action – temperature range – filler material and fluxes – types of joints and welding positions – weldability: design, process and metallurgical consideration – testing and improvement.
- JOINING TECHNIQUES: Bolting – riveting – soldering – blazing – adhesive bonding – diffusion bonding – mechanical joining. Fusion welding: Oxyacetylene welding – SMAW – GTAW – GMAW – FCAW – SAW – ESW – High energy beam welding: EBW, LBW, PAW – friction stir welding. Output parameter variation – advantages and disadvantages – applications.
- RESPONSES OF MATERIALS TO WELDING: Microstructural changes – distortion – defects: undercuts –overlaps – grain growth – blowholes – inclusions – segregation – lamellar tearing – porosity. Remedies: Edge preparation – alignment – control of heat input – preheating – peening – heat treatment – jigs and fixtures – number of passes.
- DESTRUCTIVE AND NON-DESTRUCTIVE TESTS FOR WELDS: Introduction – need – principles – applications –destructive tests: tensile, bend, impact, hardness, fatigue, cracking,

etching. Non-destructive tests: Visual, dye penetrants, magnetic particle, acoustics, pressure, radiographic, ultrasonic, eddy current.

ME5 - Advanced Heat Transfer and Cryogenics (60 Lectures)

Computational Fluid Dynamics

- Basics of fluid flow and heat transfer, Mathematical description of fluid flow, conservation equations for mass and momentum, Classification of partial differential equations, discretization techniques using finite difference and Finite volume methods, Taylor's series and control volume formulations, stability, consistency and Convergence of numerical schemes, application of numerical methods to model equations.
- Natural convention and Forced convection heat transfer and calculation heat transfer coefficient for different geometrical configurations and analytical approximations relations
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and adiabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio.

Heat Transfer

Conduction:

- Derivation of energy equation for conduction in three dimensions – Initial and boundary conditions. Solution of simple problems in steady state conduction with analytical solutions – Concept of electrical analogy – fin heat transfer and concept of fin efficiency and fin effectiveness.
- Concept of Biot number – Lumped capacitance formulation – simple problems – unsteady conduction from a semi-infinite solid- solution by similarity transformation method. Solutionof the general 1D unsteady problem by separation of variables and charts- example problems.
- Laplace equation – solution by variable separable method – concept of superposition and homogeneous boundary conditions. Phase change problems – The Stefan and Neumannproblems – analytical solutions.

Convection:

- Natural Convection heat transfer: Governing equations for natural convection, Bossiness approximation, Dimensional Analysis, Similarity solutions for Laminar flow past a vertical plate with constant wall temperature and heat flux conditions, Integral method for natural convection flow past vertical plate, effects of inclination, Natural convection in enclosures, mixed convection heat transfer past vertical plate and in enclosures.
- Laminar External flow and heat transfer:
  Similarity solutions for flat plate (Blasius solution), flows with pressure gradient(Falkner-Skan and Eckert solutions), and flow with transpiration,

Integral method solutions for flow over an isothermal flat plate, flat plate with constant heat flux and with varying surface temperature (Duhamel's method), flows with pressure gradient (von Karman-Pohlhausen method).

- Laminar internal flow and heat transfer:

  Exact solutions to N-S equations for flow through channels and circular pipe, Fully developed forced convection in pipes with different wall boundary conditions, Forced convection in the thermal entrance region of ducts and channels (Graetz solution), heat transfer in the combined entrance region,

  Integral method for internal flows with different wall boundary conditions.

Radiation:

- Fundamental of thermal radiation and electromagnetic wave theory
- View factors.
- Radiative exchange between grey and diffuse surfaces.
- Radiation between non-ideal surfaces.
- Surface radiative exchange in the presence of conduction and convection.
- The equations of radiative transfer in participating media.
- Radiative properties of molecular gases.
- Introduction to monte Carlo method for thermal radiation.
- Governing Equations: Continuity, Momentum and Energy Equations and their derivations indifferent coordinate systems, Boundary layer Approximations to momentum and energy.

Cryogenics

- **Basic Principles of Cryogenics:**

Thermodynamics, Heat Transfer, Heat Leak, Pressure drop, Cool down, Applications of cryogenics, Properties of cryogenic fluids, Properties of materials (Structural & thermal) at cryogenic temperature, Material selection criteria

Gas-Liquefaction and Refrigeration Systems:
Refrigeration and Liquefaction, Recuperative cycles, Liquefaction of gases, Inversion temperature, Expansion processes, Refrigerator efficiency, Refrigeration and Liquefaction Methods, Regenerative cycles, Ultra low temperature refrigerators, Cryo-coolers.

Cryogenic Insulations:
Types of insulations, Vacuum Insulation, Evacuated Porous Insulation, Gas-filled Powders and fibrous materials, Solid foams, Multilayer Insulations, Liquid and vapor shields, Composite insulations, Placement of insulation systems, Comparison of insulations

Instrumentation in Cryogenics:
Measurement: Strain, Displacement and position, Pressure, Temperature, Flow, Liquid level, Density

Cryogenic Equipment and Cryogenic System Analysis:
Introduction, Compressors, Pumps, Expansion Engines, Valves, Heat Exchangers, Storage, Transfer of liquefied gas

Safety with Cryogenic Systems:
Physiological Hazards, Suitability of materials and construction techniques, Explosions and Flammability, Excessive pressure gas, Special considerations for Hydrogen and Oxygen, General Safety Principles, Safety Checklist

Electrical/Electronics/Instrumentation

EE1 - Advanced Data Acquisition System (30 Lectures)

- **Theory of Quantization**
  Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, antialiasing filters.

- **Advanced Data Acquisition Systems**

  Modular Data Acquisition Systems in Nuclear Instrumentation: CAMAC, VME, PXI, PXIe. DAQ system architecture and major components. Data Archival and Retrieval. DAQ Data server architecture and interface, Data plotting and analysis tools

- **Data Acquisition Interface**

  Sensor – DAQ interface: Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for accurate measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems, Graphical/command based programming for the acquisition, processing, and presentation of data: MATLAB, LabVIEW Application development environment.

- **Analog Input/output**
  Analog Input Circuitry, Anti-aliasing Filters, sampling and DAQ device architecture, Analog Output Architecture, Analog Output Circuitry, Update rate and output interface.

- **DAQ Clock and Trigger**
  Theory and concepts of analog and digital triggering, Continuous and event-based acquisition, Clock and trigger input and output to DAQ device for timing and synchronization, Counter I/O: Edge Counting, Pulse Generation, Pulse Measurement, Frequency Measurements.

- **Synchronization**
  Single Device Synchronization: Simultaneous sampling, Multiple Device Synchronization: Clock and trigger synchronization, Introduction to Timing system.

- **SST-1 Data Acquisition System**

  Architecture of SST-1 Data Acquisition System: overview and major components, System requirements, Various DAQ interfaces: CAMAC, PXI, PXIe, digitization requirements, Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, DAQ Software: LabVIEW based GUI for remote operation, Networking requirements and TCP/IP based communication with subsystems, distributed system, DAQ NAS server, Central Data storage server, server management, data plotting utilities.

EE2 - Advanced Tokamak Controls (30 Lectures)

- **Fundamentals of Control System**

  Systems and their representation: Terminology and basic structure of control system, Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems and their models, transfer function, Block diagram representation of physical systems, Block diagram algebra, Signal Flow graph. Systems in state space: Concept of states and state model, State equation from transfer function, modelling of dynamical systems, State space representation of multivariable systems, Building blocks of state space models. Advanced control system: Cascade control, ratio control, feed forward control. Over-ride, split range and selective control. Multivariable process control, interaction of control loops Process Control System: Terms and objectives, piping and Instrumentation diagram, instrument terms and symbols. Regulator and servo control, classification of variables. Process characteristics: Process equation, degrees of freedom, modelling of simple systems – thermal, gas, liquid systems. Process lag, load disturbance and their effect on processes. Self-regulating processes, interacting and non-interacting processes.

- **Different types of Control Systems**

  Feedback control system, Real-time control system, Nonlinear and Adaptive Control, Robust control system, Embedded Systems: Hardware and software architecture, Neural Networks, Fuzzy Logic Systems

- **Introduction to Plasma Control**

  Plasma Position Control, Shape Control, Density Control, modelling aspect, simulations, Plasma Control case studies: D-III-D, JT-60, JET, SST-1, EAST, ITER.

- **ITER Instrumentation & Control**

  CODAC (Control, Data Access and Communication) System, Central Interlock System (CIS), Central Safety Systems (CSS), Plant Control System, Plant Interlock System, Plant Safety System, CODAC Core Systems, EPICS, SNL, CSS, MDS Plus, LabVIEW, Matlab Simulink, Python, Grid Computing, Parallel Processing, Diagnostic Data Analysis Tools and Codes, Real-Time OS.

- **SST-1 Operation &Control**

Architecture of SST-1 Operation &Control System, System requirements, system overview and major components. Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, GUI based remote operation, TCP/IP based communication with subsystems, distributed system. Data Acquisition System: System overview, various interfaces, CAMAC, PXI, PXIe based technology; LabVIEW based GUI, digitization requirements, system architecture, technical requirements, network storage server, server management, data plotting utilities. Operation and Control System: Timing system, Central Data storage server, Interlock system, Tokamak operation and subsystem control, VME based control system

- **Monitoring and Control of Auxiliary Systems**

Monitoring& Control for ICRH, ECRH, NBI. Vacuum System, RHVPS and Switching scheme, Cryogenic Cooling Plant, CWS, BMS, Access Control, Super conducting Magnet Quench detection and protection.

EE3 - High Voltage DC & AC/ Power Supplies (60 Lectures)

- **Overview of Electrical systems in Fusion machines**

Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement – Magnet power supplies, Electrical systems for plasma acceleration – Accelerator power supplies for charged particles. Use of other HV equipment in Fusion Technology: Capacitor bank, Van-de-graf generator, Pulse forming lines, Marx generator, Power supply systems applications in fusion machines.

- **High Voltage DC & AC**

High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. High Voltage Circuit Breakers: Air break, SF6 and vacuum circuit breakers. Gas Insulated Substation (GIS): Advantages of GIS, comparison of GIS and air insulated substations, design and layout of GIS, description of various components of GIS. High Voltage Measurement: CVT, Peak voltmeters, sphere gaps, impulse recording, Over-voltage and protection, Insulation coordination, High voltage testing methods using Partial discharge (PD), Causes and effects of PD, PD diagnostic techniques. HV and UHV systems: Fusion Technology Applications. Basic Overview of Pulse Power Technology.

- **Power Supplies**

- DC Power Supplies: Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Magnetic component behavior and

selection. Control pulse generation and control techniques, Feedback isolation techniques, Auxiliary power supply generation, Parallel operation.

- AC Power Supplies: Linear mode AC power supplies. Switching mode Inverters, Sine wave inverters, Parallel operation, AC voltage regulators, UPS systems.
- Special Power Supplies: Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive: Power Supply for Neutral beams, Power Supply for Ion cyclotron & Electron Cyclotron heating.
- Power supplies required for RF amplifiers or Oscillators. HV supplies, their interconnections for RF applications. Specific requirements of power supply protections etc., General topologies with emphasis on conventional and modular topologies, Performance requirements, Critical protections, Remote control and Monitoring requirements.
- Requirement for arc fault protection, Protection by crowbar, Deices used for crowbar applications, Importance of fault energy and techniques to limit the fault energy, wire-burn test.
- Auxiliary supplies: Screen grid, Control Grid, Filament and ion pump power supplies, General topologies for each of the supply. Performance requirements, important performance requirements, Critical protections, monitoring and remote control requirements.
- Safety and System Grounding: Power supplies inter connection at load end. Issues related to system grounding, choices available for system grounding. Safety of system and personnel for RF system.
- Integrated operation, Protection and Monitoring: HV isolation for input power of auxiliary supplies. Monitoring power supplies' status and performance. Remote and local control of power supplies. Fast and slow interlocks.

- **Power Electronics and design through modelling & simulation**

Junction Transistors (BJT, HBT), Field Effect Transistors (JEFT, MESFET, MOSFET, HEMT), Power semiconductor devices, IGBT, GTO and MCT: AC-DC Converters; Forced commutation; synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines; simulation of transients; Simulation tools: SABER, PSPICE, and MATLAB-SIMULINK; Simulations of converters, inverters and cyclo-converters etc.

EE4 - Analog Signal Conditioning and EMI/EMC Aspects (30 Lectures)

- **Analog Signal Conditioning**

Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation, Signal Conditioning for Plasma Diagnostics, Operational Amplifiers, Op-amps/ integrated circuits in instrumentation, Phase-sensitive rectifiers, Industrial Electronics.

- **Signal Processing and Applications**

Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters, Introduction to Infinite Impulse Response Filters and Finite Impulse Response Filters, Applications of digital signal processing in measurement and control systems.

- **EMI/EMC**

Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Fusion Devices, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards, Testing Standards for Emissivity & Susceptance.

- **EMI Modelling**

Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling &Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EE5 - Computer Based System Design (30 Lectures)

- **Computer Fundamentals**

Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications, Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL).

- **Communication**

Asynchronous and synchronous communication, Standards like RS232, RS422, RS485, USB, Encoding schemes.

- **Networking**

Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. Role of fibre optics in communication, Fieldbus standards, Deterministic communication techniques, Case study: various techniques used in Tokamak/Fusion devices for communication and networking.

- **Real-time systems**

Real-time Systems, their characteristics and applications, Real-time Operating Systems, Concepts of Process and threads, Concurrency, Latency, context switching, Scheduling policies, Inter process communication, Semaphores, Priority inversion, Shared memory, Common systems calls, Communication features in RTOS, Comparative study of various RTOS, Integrated software development environment

EE6 - Digital Signal Processing & Image Processing (30 Lectures)

Digital Signal Processing

- **Introduction**
  Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**
  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT

- **Fast Fourier Transform**
  Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- **Digital filters**
  FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- **DSP Applications**
  Applications of digital signal processing in fusion and other fields.

Image Processing

- **Introduction**
  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.

- **Image Enhancement**
  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing.

- **Image Segmentation and Analysis**
  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.

- **Morphological operations**
  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

FOUNDATION COURSES

CY 501: Mathematics, Quantum Chemistry and Computational Methods (40/10/10)

Differential Equations & Integral Transforms

Introduction to differential equations: order and degree; Different methods of solution; Overview of Legendre, Lagurre and Hermite differential equations;
Introduction to Fourier series, Fourier transform and Laplace transform.

Vector Calculus

Vector differentiation and integration: Concepts of gradient, divergence and curl; Laplacian operator.

Matrix Algebra
Elementary operations and elementary matrices. Solution of linear equations; Similarity transformations; Eigenvalues and eigenvectors; Diagonalization and inversion of matrices.

Group Theory and Symmetry in Chemistry
Concepts of groups, sub groups and classes; Symmetry elements, and symmetry operations; Point groups and matrix representations; Great orthogonality theorem and its importance in chemistry, Reducible and irreducible representations; Character Tables and their applications to spectroscopy, molecular geometry and chemical reactions.

Quantum Chemistry

Postulates of quantum mechanics, Classes of operator: Linear and Hermitian, Physical significance of eigen value in quantum mechanics; Boundary value problem in quantum mechanics; Exactly solvable problems: Particle in a box and ring; simple harmonic oscillator; rigid rotor and hydrogen atom; Approximation methods: Variation method; perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules; Extended systems: From bonds to bands; Applications to few simple molecules.

Computer Programing and Numerical Methods
Computers and modeling in chemistry; Basics of computer programming: Variables, constants, input/output and control statements, arrays, functions, and subroutines. Computer oriented numerical methods: Newton-Raphson method for finding roots, differentiation, integrations by quadrature techniques, solutions of differential equations, diagonalisation and inversion of matrices. Curve fitting. Basics of computer simulation: Monte Carlo and molecular dynamics simulations.

CY 502: Analytical Chemistry (40/8/5)

Introduction
Relevance of Analytical Chemistry in Atomic Energy Programme, Terminologies in Analytical Chemistry, Quality Assurance in Analytical Chemistry, Accreditation and its importance

Separation Technique
Solvent extraction: Principles and Applications, Conventional solvent extraction, Liquid membranes, Bulk membranes, Supported and Emulsified liquid membrane, Super critical fluid extraction (SFE).
Ion Exchange: Principles and Applications, Conventional ion exchange, Solid Phase Extraction (SPE)
Chromatography: Principles and Applications, Gas chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion chromatography (IC), Supercritical fluid Chromatography(SFC),Capillary electrophoresis.

Electrochemical Techniques
Introduction to the oxidation and reduction process, equilibrium electrochemistry, Activity, Nernst equation, Butler-Volmer equation, Tafel treatment. Potentiometry/potentiometric titration and ion Selective Electrodes (ISE), Modified electrodes.
Electrochemical double layer, Mass transfer processes, Fick's law of diffusion, Polarisation, Voltammetry & Polarography, working electrode, reference electrode and counter electrodes, Votammetric techniques like; Linear sweep voltammetry, Cyclic voltammetry, Pulse and Stripping Voltammetry, Coulometry and Amperometry, Hydrodynamic voltammetry.
Electrochemical Impedance spectroscopy and modelling of the electrochemical interface. Electrochemistry at ultramicro electrode, Scanning Electrochemical Microscopy, electrochemistry at confined geometry and detection at single molecule level, Hyphenated in-situ spectro-electrochemical techniques.

Spectrochemical Techniques
An introduction to spectrometric methods, Performance Characteristics of instruments, Calibration of instrumental methods, Quantitative aspects of spectrochemical measurements.
Atomic Absorption spectrometry(AAS), Sources of radiation(Hollow Cathode lamp, Continuum Source), Atom cell, Flame Atomic Absorption Spectrometry (FAAS), Electrothermal Atomic Absorption Spectrometry (ETAAS), Cold vapor Atomic Absorption Spectrometry (CVAAS), Hydride generation Atomic Absorption Spectrometry (HGAAS), Types of Interferences in AAS and Background correction methods.
Optical Emission Spectrometry, Emission sources: Flame, Inductively Coupled plasma, Glow Discharge, DC-Arc, Inductively Coupled Plasma Optical Emission Spectrometry(ICP-OES), Types of interference in ICP-OES and background correction methods, Laser Induced Fluorescence(LIF).

Mass Spectrometry
Basic principle, Ion sources: Thermal Ionisation (TI), Electron Impact(EI), Inductively Coupled Plasma(ICP), Glow Discharge(GD), Laser Ablation (LA), Secondary Ionisation (SI), Resonance Ionisation (RI), Matrix Assisted Laser Desorption and Ionisation (MALDI), mass analysers: Magnetic Sector, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance(ICR),detectors: Faraday Cup, Channeltron and Daly detector, resolution, abundance sensitivity, Laser Induced Breakdown Spectroscopy (LIBS), Resonance Ionization Mass Spectroscopy (RIMS) Hyphenated Technique - IC-MS, HPLC-MS, GC-MS.

Thermal Methods
Principle and applications, Thermogravimetric Analysis (TGA), Derivative Thermogravimetric Analysis (DTG), Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Evolved Gas Analysis (EGA)

Nuclear Methods
Principle of Activation Analysis – Neutron Activation Analysis (NAA), Charged Particle Activation Analysis (CPAA), X-ray fluorescence (XRF) spectrometry: Principles, methodology and matrix effect.

Statistics in Chemical Analysis
Accuracy, Precision, Errors in quantitative analysis, Classification of errors, Propagation of errors, treatment of errors, Normal distribution, Tests of Significance and Confidence Limits, Reporting of analytical results

Laboratory Experiments (Any Five)
1. Determination of trace impurities in high purity materials by AAS.
2. Application of electroanalytical methods to trace analysis.
3. Anion analysis by ion selective electrode.
4. TGA and DTA study of inorganic compounds
5. Neutron Activation Analysis of trace constituents in a complex matrix
6. Analysis of an alloy sample by EDXRF
7. Chromatographic separation and measurement of the components in a mixture
8. Isotopic Analysis by Mass Spectrometry

CY 503: Material Science (20/5/2)

Crystal Structure
Different types of unit cells, Space lattices, Miller indices, atomic packings, radius ratio, structures of NaCl, CsCl. ZnS, diamond, CaF_2, perovskite, double pervoskites, pyrochlores, spinels, garnet structure and framework solids, aperiodic systems, symmetry, relevance of crystal structures to nuclear materials (glass, ceramics, intermetallics and alloys).

Powder X-ray Diffraction Technique for Phase Identification
Concept of X-ray diffraction, reciprocal space, Ewald construction, structural and scattering factors, grain/particle size effects, different techniques of recording diffraction patterns, indexing of diffraction patterns, Diffraction data files and their utility, Neutron diffraction, electron diffraction.

Types of Bonding in Solids
Van der Waals interactions, Lennard-Jones potential, crystals of inert gases, ionic bonding, Madelung energy and its calculation in the case of NaCl/CsCl, covalent bonding, hydrogen bonding.

Defects in Solids
Defects and defect concentration, dependence on temperature, 0- D, 1- D, 2-D defects, Experimental methods for their characterisation, color centres, phase transitions, classification with examples, dependence of phase transition on T and P, thermodynamic classification of phase transitions, order- disorder phase transitions, austenite- martensite phase transitions in alloys. Solid solutions, their significance, simple and complex solid solutions, methods to characterize solid solutions.

Transport Properties of Solids
Ionic conductivity, electronic conductivity, dielectric, ferro, piezo and pyro electric materials. structural basis and applications, superconductivity, thermal conductivity with examples.

Basic techniques for characterization
Concept of various characterization techniques based on X-rays and electrons: XRF, EPMA, XPS, AES, EELS and their application with examples

Methods of material preparation and processing
Solid state reactions and soft chemical routes, concepts of annealing, sintering and calcination, processing techniques like spin coating, powder coating, screen printing etc.

Laboratory Experiments: (Any two)
1. XRD characterization, indexing and cell parameter determination
2. Micro structure of metal/alloy by metallography and SEM
3. Electrical resistivity and its temperature dependence

CY 504: Radiation Detection and Measurement (20)

Interaction of Radiation with Matter
Interaction of Heavy Charged Particle with matter
Ionization in gaseous medium, Bragg's curve, stopping power, Bethe Equation for stopping power, Range of heavy charged particle and straggling, Range energy relationship.

Interaction of Fast Electrons with Matter
Comparison with heavy charged particle, LET for electron, Bremsstrahlung radiation, Cerenkov radiation, Bethe Equation, path length and range of electrons, Attenuation and absorption of β particles, Backscattering of β- and Positron annihilation.

Interaction of Electromagnetic Radiations (γ, X-Rays) with Matter
Photoelectric Effect, Compton Scattering, Pair Production, .Variation of cross section for different process with γ energy and Z of the medium, Attenuation and Absorption of gamma rays

Interaction of neutrons with matter
Elastic and Inelastic Scattering of neutrons and slowing down, nuclear reactions

Radiation Detectors
Principle of Radiation Detectors: Pulse height spectrum, Counting Characteristics, plateaus, Detection efficiency, Energy resolution, Dead time, Counting Statistics

Gas filled Detectors
Ionization Chamber, Proportional counter, GM counter

Scintillation Detectors
Organic and Inorganic scintillators, Liquid scintillation counter, Pulse shape discriminator, Solid state scintillation detectors: NaI(TI), CsI and $LaBr_3$ detectors

Semiconductor Detectors
p-n junction, HPGe detector for gamma ray spectroscopy, Clover detectors, Si(Li) for x-ray spectroscopy, Silicon detectors for charged particle spectroscopy

Neutron Detectors
BF3, 3He gas filled counters.

Solid State Nuclear Track Detectors (SSNTD)
Basic principle and applications

Application of Radiation Detectors in Nuclear Probes

References
[1] Radiation detection and measurement, G.F. Knoll, John Wiley & Sons

---

CY 505: Nuclear and Radiochemistry (40/8/5)

Radioactivity
Radioactivity, Radioactive decay laws, Half-life and radioactive equilibria.

Nuclear Stability
Concept of nucleus, Nuclear mass and Binding energy, Nuclear force.

Nuclear Models
Liquid drop model, Shell model, Concept of spin, Parity electric and magnetic moments, Isomerism.

Modes of Decay
α decay, β decay, Electron captures, γ de-excitation, Internal conversion.

Nuclear reaction and fission

Q value equation, Reaction threshold, Centre of mass system, Cross-section for neutron and charged particle induced reactions , Nuclear Temperature, Compound nucleus mechanism, Nuclear fission: observables and models, Synthesis and separation of heavy and trans-actinides, Accelerators, Application of accelerators in ion beam analysis

Techniques in Nuclear Chemistry
Target preparation and target chemistry, Radiochemical separations, Concept of tracer and carrier, Chemical yield, Radiochemical purity, Application of radiotracers in chemical sciences, Determination of half-life.

Laboratory Experiments (Any Five)
1. GM Counter: plateau, statistics and dead time
2. Gamma-ray spectrometry using NaI(Tl) and HPGe detector: Energy Calibration, Resolution, Efficiency
3. Separation of actinides using solvent extraction technique
4. Alpha spectrometry

5. Determination of half-life of a radioisotope
6. Solid State Nuclear Track Detector
7. Separation of fission products / Transient equilibrium

CY 506: Thermodynamics (20/4)

Introduction to Chemical and Statistical Thermodynamics

Laws of thermodynamics, Fundamental equations and thermodynamic potentials, Introduction to statistical thermodynamics, Einstein and Debye theories of specific heats of solids, Phase transitions, Thermodynamics of solutions, ideal and regular solution models.

Chemical Equilibrium

Solid-gas equilibrium, Ellingham diagram.

Relation between Thermodynamics and Phase Diagrams

Binary and ternary phase diagrams, CALPHAD definition of phases, Degree of freedom rule and lever-rule, Calculation of simple binary phase diagrams from thermodynamic properties, Chemical potential variations across phase diagrams

Phase Diagram and Thermodynamics of Nuclear Fuels

Relevant phases for nuclear fuel applications, Change in chemical potentials with compositions of virgin fuels, Change in chemical potentials with burn-up, Thermodynamics of Fuel-Clad and Coolant-Clad interactions, Thermodynamics of molten fluorides, Concepts of metastable materials.

Experimental Thermodynamics

Calorimetric measurements, Vapor pressure measurements, Estimation of thermodynamic quantities

CORE COURSES

CY 601: Lasers (10/0/1)

Basic principles - Spontaneous & stimulated emission, population inversion, laser components, Einstein coefficients, optical amplification, optical & electrical pumping, rate equations (two, three and four level laser systems)

Properties of laser beams - coherence (spatial and temporal), monochromaticity, intensity, polarization

Optical resonators – Types, properties, spatial field distribution in resonators, stable & unstable resonators, gain and losses in the cavity, Q-factor, threshold condition, laser modes (longitudinal and transverse),
Types & some laser systems - Solid state lasers, gas lasers, dye lasers, diode lasers, fiber lasers, free electron laser and quantum cascade lasers, tunable lasers

Generation of short and ultrashort pulses - Q-switching and mode locking, chirp pulse amplification

Non-linear optical techniques – Phase matching, harmonic generation, optical parametric oscillator & amplifier

Modulation in laser pulses-amplitude, wavelength, temporal

Characterization of laser pulses - Measurement of the pulse temporal profile (electronic & optical), spectral measurements (interferometric), amplitude - phase measurements (FROG)

Laser applications & laser safety.

[5] Laser Safety- Roy Henderson and Karl Schulmeister

Laboratory experiment: Time-frequency bandwidth relationship for laser pulses-Checking the Heisenberg uncertainty principle

---

CY 602: Electronics and Chemical Instrumentation (20/4/5)

Electronics
DC & AC Fundamentals: Concept of charge, current, voltage, power, Ohms law, AC –Sinusoidal, Peak & RMS values, Frequency.
Electronic components: Resistors, capacitors, diodes, transformer
Power Supply, Rectification, Filter, Line/Load Regulation, Regulator Chips, Low Voltage & High Voltage power supplies, SMPS.

Analogue Electronics
Operational Amplifiers, Ideal Characteristics, Inverting, Non-invertingAmplifier, Integrator, Comparator, Summer, Pulse Amplifier and Instrumentation Amplifier.

Digital Electronics
Number system and Logic gates - Decimal, Binary and Hexadecimal number systems, Logic gates, Flip Flop, Counter, Decoder, Display Device.
Analog to Digital Converters and Digital to Analog Converters

Instrumentation
Concept of Instrumentation, Order of instruments, concept of broad specifications (accuracy, precision etc), Voltmeter and Current meter, concept of Multimeter & concept of loading.
Signal & Noise: Concept of Noise & Signal, dB, S/N ratio and improvement techniques.
Transducers: Transducers and their applications (temperature sensors, PMT, photo diode and vacuum gauges)
Signal analysis & Processing: Selective signal amplification, filter, Lock-in-amplification, Boxcar Averager, Fast Fourier Transform.

Computer in Labs
PCs & interfacing concepts, RS232, USB ports, Embedded systems, Lab View programming.

CY 603: Production and Applications of Radioisotopes (20/4)

Introduction to the course
Relevance and contribution of the isotope program in DAE.

Production of Radioisotopes
Need for radioisotope production, Basic principles and different routes of radioisotope production using nuclear reactors and charged particle accelerators. Szilard-Chalmers effect and its utility in radioisotope production. Derivation of equation to calculate production yields in nuclear reactors and charged particle accelerators, Calculations of production yields; Bateman's equation and its utility in production yield calculations.

Production of some important radioisotopes in nuclear reactor and in cyclotron, Selection of target material, Methods of target preparation, Methods of processing of irradiated targets, Methods of production of some important radioisotopes (such as, $^{32/33}P$, ^{60}Co, ^{82}Br, ^{99}Mo, ^{99m}Tc, ^{125}I, ^{131}I, ^{137}Cs, ^{153}Sm, ^{166}Ho, ^{177}Lu, $^{186/188}Re$, ^{192}Ir, and ^{11}C, ^{13}N, ^{15}O, ^{18}F, ^{44}Sc, ^{64}Cu, ^{67}Ga, ^{68}Ge, ^{89}Zr, $^{123/124}I$, ^{201}Tl etc.).

Concept of radionuclide generators; Growth and decay of activity in a radionuclide generator; Different types radionuclide generators with special emphasis to ^{99}Mo-^{99m}Tc generators along with their relative advantages and disadvantages; Few other important generator systems such as, ^{68}Ge-^{68}Ga, ^{90}Sr-^{90}Y, ^{188}W-^{188}Re etc.

Applications of Radioisotopes in Medicine
Concept of nuclear medicine and radiopharmaceuticals, Classification of radiopharmaceuticals, Characteristics of diagnostic (SPECT and PET) and therapeutic radiopharmaceuticals. Basis of designing radiopharmaceuticals, Preparation of radiopharmaceuticals and Methods of radiolabeling.

New approaches in radiopharmaceuticals chemistry - ^{99m}Tc-tricarbonyl method, ^{99m}Tc-nitrido method, ^{99m}Tc-HYNIC method etc., Advantages of new approaches.

Some important organ-specific diagnostic radiopharmaceuticals (myocardial imaging, brain imaging, renal imaging, tumor and inflammation imaging, receptor-specific imaging agents etc.). Radioimmunoscintigraphy (RIS), PET radiopharmaceuticals - Principle and applications.

Concepts of brachytherapy and teletherapy.

Therapeutic radiopharmaceuticals for some specific applications [Metastatic Bone Pain Palliation (MBPP), Radiation Synovectomy (RSV), Peptide Receptor Radionuclide Therapy (PRRT), Radioimmunotherapy (RIT) etc.]

Quality control of radiopharmaceuticals - physicochemical and biological quality control tests.

Industrial Applications of Radiation Technology
Fundamental aspects of radiation processing and radiation technology, Radiation sources and effects of ionizing radiation on materials, Comparison of different radiation sources for different applications, Radiation dosimetry for industrial radiation sources.

Radiation polymerization vis-à-vis conventional polymerization, Polymerization kinetics and polymer characterization, Radiation effects on Polymers under different conditions, Theories of radiation crosslinking.

Radiation induced modification of polymers for industrial and environmental applications, wire and cable crosslinking, surface curing and grafting, heat-shrinkable materials, radiation cured polymer coatings and radiation grafted functional polymers for various applications, radiation degradation of polymers and applications, etc..

Radiation processed polymers for healthcare applications, Introduction to radiation sterilization of medical products (process, D_{10} value, SAL, inactivation factor and safety factor), hydrogels and their property standardization using radiation for wound dressings, radiation processed drug delivery devices.

Radiation processing of food, Objectives and dose limits for different food items

Radiation chemistry aspects of radiation hygienization of sewage sludge process and process control

Radiation processing of flue gases and radiolysis of flue gas components

Radiation induced enhancement in the functional attribute of blends and composites, Introduction to rheology of polymers, crosslinking and degradation behavior of multi-phase system, microscopic and mechanical characterization of blends and composites.

Application of radioisotopes as tracers in process optimization, trouble shooting in industries and sediment transport in harbours.

Application of Radioisotopes as Tracers
Principle and industrial applications of radiotracers, Process optimization and trouble shooting in industries-blockage location in buried pipelines, Leak detection in buried pipelines & industrial systems, Wear rate of anti-fungal paints, Flow rate determination in industrial processes.
Environmental isotopes and artificial radioisotopes in hydrology. Application of environmental isotopes in studying ground water salinity, pollution, recharge etc., Artificial radioisotopes in studying dam seepage, effluent dispersion etc.

CY 604: Reactor Physics and Reactor Chemistry (20)

Fission, Energy from fission, Burn-up, Spontaneous and induced fission, Chain reaction, Fissile-Fissionable-fertile materials, Prompt and delayed neutrons, Four factor formula, Neutron interaction with matter, Fission products, Critical mass, Neutron Diffusion Theory, Multiplication factor, Reactor kinetics and control.

Different types of homogeneous and heterogeneous reactors, Components of reactors.

Introduction to the types of water cooled power reactors & their process systems. Schemes of preparation of dimineralized water, Variation in properties of water and heavy water as a function of temperature and pressure. An overview of types of corrosion, methods of evaluation of corrosion and its prevention. An overview of materials of construction for the different components of reactor systems. Hot Conditioning of PHT circuit in PHWR. An overview of water chemistry regimes in BWR, PWR & PHWR.

Principles and processes relevant to chemistry control in primary heat transport systems. Radioactivities in reactor waters & their control. CRUD generation and activity transport in the primary heat transport system of reactors its control. Radiolysis of water, related hazard, and its control, Reactivity control through chemistry: Use of soluble neutron poisons- for chemical shim and for emergency shutdown. Purification of reactor cover gas by Catalytic recombination and adsorption techniques.

Chemistry control in secondary heat transport system, pH control methodologies of secondary system, Scaling and methodology of its control in secondary system.

Chemistry control in the tertiary heat transport system, Bio-fouling and its control methodologies.

CY 605: Molecular Structure and Spectroscopy (30/6/4)

Coordination Chemistry
Werner's Coordination theory, Valence Bond Theory, Crystal Field Theory, splitting of "d" orbital in different geometry, Jahn Teller effect, Thermodynamic effects of crystal field, Coordination chemistry of lanthanide and actinide ions, Brief introduction to group theory, Application of group theory for d-d transition, Racah parameters, electronic spectra of complex ions, Tanabe Sugano diagram, nephelauxetic effect, ligand metal orbital overlaps, magnetic properties and susceptibility measurements of complex ions, drawbacks of CFT, f-f transitions in lanthanides.

Molecular orbital theory and construction of molecular orbital diagram from concepts of group theory, MO's for Sigma bonding in AB_6 molecules, tetrahedral AB_4 case, MO's for pi bonding in AB_6 molecules, Metal organic framework materials. Dissociative & associative reaction mechanism of ligand replacement in octahedral and square planar complexes, trans effect and its implications.

Characterization Techniques of Complexes

NMR: Basic Principles of NMR Spectroscopy, Chemical Shift, Spin-Spin Coupling, Decoupling Experiments, Pulse NMR, Relaxation Effects, Two-Pulse Experiment, T1-Measurment, T-2 measurement, solid state NMR, ESR: Basic Principles of ESR Spectroscopy, The g-value, Hyperfine Coupling, Electron Nuclear Double Resonance (ENDOR), Mossbauer spectroscopy

Electronic, Vibrational and Rotational Spectroscopy

Classification of molecules, their characteristic spectral features and selection rules, pure microwave, Rotational Raman, Vibrational and rotational vibrational spectroscopy, IR and Raman spectroscopy.
Basic principles of Fourier transform spectroscopy (FTIR, FT-RAMAN).
Surface enhanced Raman spectroscopy (SERS), Terahertz spectroscopy, Nonlinear optical methods, sum & difference frequency generation (SFG & DFG).
Synchrotron radiation and its application in spectroscopy, X ray absorption based techniques (XANES, EXAFS)
X ray Photoelectron Spectroscopy.
Doppler-free high-resolution spectroscopy

CY 606: Radiation and PhotoChemistry (30/6/4)

Radiation Chemistry

Interaction of High-energy Radiation with Matter

Chemical consequences, absorption coefficients, G-values, track entities and LET effects, radiation sources.
Diffusion kinetics and homogeneous reaction stages, time scales of events in radiation chemistry, ion-pairs, ion-molecule reactions

Radiation Chemistry of Water and Nonpolar Liquids

Radiolysis of water & heavy water, radical and molecular yields, material balance, chemical dosimetry
Radiolysis of non-polar solvents, geminate recombination, electron salvation
Radiation chemistry of micro heterogeneous systems and ionic liquids
Comparative aspects of radiolysis of liquids, solids and gases

Experimental Techniques

Detection of primary species and free radicals using pulse radiolysis coupled with optical absorption

spectroscopy, ESR, conductivity, resonance Raman spectroscopy
Evaluation of absolute rate constants, pK values of transient species, one-electron redox potentials, picoseconds pulse radiolysis

Application
Radiolytic synthesis of nanoparticles
Radiation chemistry of water at high temperature and high pressure
Radiation chemistry of antioxidants and radioprotectors.

Photochemistry
Photophysical Processes
Electronic transitions, oscillator strength, selection rules
Franck-Condon principle, absorption, emission and fluorescence excitation spectra, charge-transfer spectra.
Deexcitation processes - fluorescence, phosphorescence, delayed emission, triplet-triplet annihilation, heavy atom effect, kinetics of excited state processes, quantum yields of photo-processes
Fluorescence anisotropy
Photophysical processes in semiconductors, multiphoton processes
Environment effect- polarity, viscosity (anisotropy), temperature

Photochemical Processes
Excited state acid-base properties, redox potentials, geometry, dipole moments
Kinetics and mechanism of processes like photo-dissociation, photo-ionization, electron transfer, energy transfer, proton transfer, supra-molecular interactions

Experimental Techniques
Steady-state absorption and fluorescence techniques
Time-resolved absorption and fluorescence techniques like time-correlated single photon counting, fluorescence up-conversion, nanosecond laser flash photolysis and ultrafast pump-probe spectroscopy; single molecule spectroscopy, fluorescence correlation spectroscopy

Applications
Photosynthesis, vision, solar energy conversion, photocatalysis, fluorescence sensors.

Laboratory Experiments
Radiation Chemistry
[1] Fricke dosimetry and estimation of G-values.
[2] Study of free radical reactions using pulse radiolysis technique.
Photochemistry
[1] Fluorescence quenching studies: determination of quenching rate constant.
[2] Excited state properties: determination of acid dissociation constant using absorption & fluorescence techniques.

CY 607: Chemistry in Nuclear Fuel Cycle (40)

Separation and purification of uranium and thorium from their ores, Principles of isotope separation, enrichment of uranium, systematics and processes.

Conversion processes for preparation of UO_2, $(U,Pu)O_2$, UC, (U,Pu)C, UN (U,Pu)N, metals and alloys.

Separation and purification of zirconium from its ore, Principle and process for heavy water production.

Fuel fabrication processes and chemical quality control

Behavior of nuclear fuels (thermal/fast) during irradiation

Post irradiation studies, fuel clad chemical interaction, Burn-up etc.

Thermo-physical and themo-chemical aspects of fuel, Properties of oxide, carbide, nitride and metallic fuel materials, Coated particle based fuels.

Cladding, moderator, coolant materials and their properties, Liquid metal coolants like sodium and lead-bismuth, Chemical aspects of corrosion, Monitoring and maintenance of the purity of coolant.

Reprocessing of thermal and fast reactor fuels, chemistry of various process PUREX, THOREX etc., Systematic and process of pilot plant CORAL, Challenges in reprocessing of fast reactor fuel.

Waste processing and management, classification of waste and treatment practices of gaseous, liquid and solid waste.

Vitrification of high level liquid waste, Partitioning of actinides from high level liquids waste, Decontamination process.

Nuclear safety, Management of H_2, Xe, Kr, I_2 and tritium in operating nuclear power plants

CY 608: Advanced Chemical Kinetics and Dynamics (20/4)

Intermolecular interaction potential, Collision theory, Potential energy surfaces, Activated complex theory, adiabatic and non-adiabatic reactions, Landau-Zener crossing, Lindemann's theory of unimolecular reactions, energy transfer, fall-off region and its limitations, Hinshelwood's Treatment. Rice-Ramsperger and Kassel (RRK) model, and Marcus refinement of RRK model (RRKM) for the calculation of rate constants of simple unimolecular reactions.

Molecular beam experiments, types & characteristics of molecular beams, scattering as a probe; differential cross-section; quantum mechanical approach to elastic scattering; conservation of angular momentum – Newton diagram, lab–to-centre of mass transformation, reaction cross section - reaction probability; opacity function – steric factor; reactive asymmetry – angular distribution in reactive collisions – direct reaction versus collision complex; forward, backward, and forward–backward scattering; potential energy contour diagram, reactions with early & late barrier. Different molecular energy transfer processes. Laser based spectroscopic techniques- LIF, REMPI, CRDS, detection and measurement of trace constituents and free radicals, rate coefficient measurement, chemical kinetics and dynamics studies, atmospheric chemistry.

IR laser chemistry, laser isotope separation, mode and bond selective chemistry, intramolecular vibrational energy redistribution (IVR), coherent control of chemical reaction,

CY 609: Health Physics and Radiation Biology (20)

Health Physics
Fundamentals of Radiation Protection
Radioactivity, Ionizing radiation, Radiation quantities and units**,** Basis and structure of the system for radiation protection, System of radiological protection for human, natural radiation.

Basic Radiation Physics and Radiation Dosimetry Aspects
Interaction of radiation with matter, External and internal radiation hazards in nuclear and radiation facilities, Radiation dosimetery: basics, concepts and definitions, External radiation dosimetry and dosimetry of internally deposited radio nuclides, Radiation detection principles, Monitoring instruments and Personnel monitoring devices

Operational Monitoring and Safety Aspects of Facility Design
Exposure situations as per ICRP-103 recommendations, Control of external and internal radiation hazards, Radiation dose limits and its basis, General principles and techniques of radiation monitoring, air activity and area contamination, Assessment and control of radiation hazards in nuclear fuel cycle facilities with special reference to metallurgical, radiochemical and radioisotope facilities and fuel reprocessing plants, Criticality safety aspects, Environmental safety aspects during operation of nuclear and radiation facilities, Industrial hygiene and safety aspects during operation of nuclear and radiation facilities.

Radiological Safety Aspects in Design of Radio-Chemical Laboratories
Safety aspects of design of radiochemical laboratory, its types and operational aspects, Partial containment/confinement systems and ventilation system in a laboratory.

Emergency Preparedness and Response System at Nuclear and Radiation Facilities
Classification of radiation emergency, Emergency preparedness and response system, Reference levels and guidance values for emergency workers.

Basic Radiation Radiobiology
Water radiolysis, Free radicals and its reactions with biological systems, Oxygen effect.

Radiation damage at bio-molecular level, Damage to DNA and chromosomes (single and double structural breaks, chromosomal aberrations) and its biological consequences, Radiation damage to membrane and its biological consequences, Major health effects of radiation exposure.

Mode of interaction of different types of radiation with biological systems, Track structure, Concept of LET, Radiobiological effectiveness (RBE), Radiation dose units with reference to radiobiology, Direct and indirect effect of radiation.

Molecular and Cellular Effects of Radiation
Assay for radiation damage in human cells (survival curve), Physical and biological factors affecting the cellular radio-sensitivity, Dose and dose rate effect, Dose fractionation, Inverse dose rate effect, Oxygen enhancement ratio and Optimum LET, Radio-protectors and radio-sensitizers.
Cell cycle arrest and radiation damage repair, Cancer and its induction by radiation, Radiobiology of cancer radiotherapy approaches

CY 610: Research Methodology (20)

Objectives and types of research: Motivation and objectives - Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem - Literature review – Primary and secondary sources - reviews, treatise, monographs-patents - web as a source - searching the web - Critical literature review - Identifying gap areas from literature review - Development of working hypothesis.

Research design and methods - Research design – Basic Principles - Need of research design - Features of good design – Important concepts relating to research design - Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Value of Statistics; Errors and Statistics - Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results - students's t test; F-test; Chi Square test; propagation of errors.

Reporting and thesis writing – Structure and components of scientific reports - Types of report - Technical reports and thesis - Significance - Different steps in the preparation – Layout, structure and Language of typical reports - Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation - Planning - Preparation - Practice - Making presentation - Use of visual aids - Importance of effective communication - Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on 'Experimental data and Literature Survey'.

Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation - Copy right - Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights - Reproduction of published material - Plagiarism - Citation and acknowledgement - Reproducibility and accountability.

CY 611 Safety in Chemical and Radiochemical labs (10)

Chemical labs

Definition of chemical safety and its assessment, general chemical safety awareness, Classification of chemicals: Corrosive, Flammables, explosives, toxics, pyrophoric, carcinogen. Chemical which create lachrymation and smoke, Entry of such chemicals into human/biological system and its consequences, precautionary and safe methods for handling such chemicals, Compatibility issues with chemicals, Understanding the Safety Data Sheets (Material Safety Data Sheets) for different chemicals. Storing different chemicals, incompatible chemicals, making inventory of chemicals, labelling chemicals depending upon its nature, safe disposal of chemicals, precautions and safe operating procedures (SOP) to be taken into consideration for chemical spills, chemical protective clothing, chemical accidents and their classification and consequences, Emergency Procedures during chemical accidents, Personal Protective equipment from chemical exposure, precautions to be taken with chemical which need to be refrigerated. Safe practices while using vacuum lines and laser. Fire safety and different types of fire extinguishers.

Radiochemical labs

Classification of laboratories, classification of radioactive zones in the laboratory, ventilation, Shielding and dosimetry requirements for handling different types of radioactivity, Radioactivity handling in fume-hoods and glove boxes, Movement of radioactivity within the lab, Washing of radioactive glass wares, Disposal of radioactive aqueous and organic waste, Disposal of compressible and non-compressible radioactive waste, fire safety in radioactive labs, Personnel radiation monitors, Managing personnel and laboratory contamination, Precautions in a radioactive lab and emergency procedures.

ELECTIVE COURSES

CY 701: Nanomaterials and Chemical Sensors (20)

An overview of the course

Physics of nanomaterials
Finite size systems, cluster science, bulk versus nanomaterials, quantum confinement effects in nano-regime, evolution of electronic structure from atoms to bulk, density of states, dimensionality and its effect on electronic structure, surface effects, calculation of surface-to-volume ratio for different structural arrangements, size dependent physico-chemical properties, carbon based materials (0D, 1D, 2D and 3D).

Chemistry of nanomaterials
Top down and bottom up approaches for synthesis of nanomaterials, such as laser ablation, ball-milling, sputtering, combustion, metathesis, sol-gel etc.

Common characterization techniques for nanomaterials
Characterization techniques at different length scales, application of XRD, TEM, SEM, AFM and DLS for characterization of nanomaterials.

Properties of nanomaterials
Fundamentals of Semiconductors, direct and indirect band gaps, semicounductor in nano-dimesnions (quantum dots, core-shell nano-particles of semiconductors), metallic nanoparticles and surface plasmon, an overview of magnetic, optical and catalytic properties of nanomaterials.

Applications of nanomaterials
Nanomaterials in energy conversion (solar cell, rechargable batteries, supercapacitors and materials for hydrogen energy), nanomaterials for bio-applications (drug delivery), environmental applications (sorbents) and DAE application.

Chemical sensors and their applications
Threshold limit values (TLV) of common toxic species, selection of sensor materials mechanism of sensing action, features of sensors (selectivity, response time, reproducibility and regeneration), typical examples of nanomaterials based sensors for H_2S, NH_3, SO_2, and heavy metal ions, common bio-sensors, sensors for DAE applications.

[5] Functional Materials: Preparation, Processing and Applications, Eds. S. Banerjee and A. K. Tyagi, Elsevier Publishers (2012)

CY 702: Soft Condensed Matter (20)

Introduction to Soft Matter
Forces, energies, length and time scales in soft matter. Soft matter systems (colloids, surfactant / micellar systems, gels, polymer solutions, polymers, polyelectrolytes, microemulsions, membrances, biological macromolecules), Interactions (electrostatic, van der Walls, hydrophilic and hydrophobic interactions, depletion interaction). Viscous, elastic and viscoelastic behavior, Liquids and Glasses, Soft matter in nature:

Experimental techniques to investigate structure and dynamics in soft matter
Scattering techniques (Small-angle X-ray scattering (SAXS), Ultra-small-angle-X-ray scattering (USAXS), Small-angle (SANS) Static and Dynamic light scattering (SLS & DLS)

Colloids
Introduction, Brownian motion of colloidal particles. Sterically stabilized and Charge stabilized colloids, Colloidal interactions, Liquid phase synthesis of colloidal particles, Structural ordering, Dynamics, Phase Transitions [Gas-liquid, Melting /freezing, Glass Transition, Crystal-amorphous]

Surfactants
Types of surfactants, Micellization, Langmuir- Blodgett films, Monolayer, Bilayers and Vesicles, Lyotropic liquid crystalline phases, Micro emulsions.

Polymers and Polyelectrolytes
A single ideal chain, mean-squared end to-end distance, radius of gyration. Gaussian chain, Freely joined chain. Excluded volume, solvent quality, theta-temperature. Polymer solutions : Flory-Huggins theory, osmotic pressure, scaling laws for good solvents, Size of a polymer in semi-dilute solutions : osmotic pressure, light scattering, intrinsic viscosity, Classes of gels : physical gels, chemical gels and photo-polymerized gels, Sol-Gel transition, Swelling and shrinking of gels, theory of gelation. Polyelectrolytes : Debye-Huckle theory, Donnan equilibrium, manning condensation. Dynamics of polymeric liquids : Maxwell model. Rouse theory, Zimm theory, Reptation theory : tube model, reptation dynamics, self –assembly and order-disorder transitions of diblock copolymers

Applications of Soft Matter
Nanoparticle suspensions as heat transfer fluids. Colloidal assemblies in liquid-liquid extraction systems. Ionic liquids as extractants. Foams and Gels for decontamination. Foamability of surfactants. Dynamic interfacial tension and foamability. Defoamers, Soft matter in drug delivery and diagnostics.

CY 703: Nuclear Probes for Material Characterization (20)

Positron Annihilation Spectroscopy
Introduction to positron, positronium, formation and its systematic, Experimental techniques, applications in molecular solids, defect studies in metals, alloys and semiconductors, Slow positron accelerators and associated developments in materials characterization.

Ion beam analysis

Introduction to ion beam analysis, Rutherford backscattering spectrometry, elastic recoil detection analysis, nuclear reactions analysis, particle induced gamma ray emission, particle induced X-ray emission-Theory and applications.

Neutron Scattering Techniques
Neutron Sources, Properties of Neutron, Neutron Scattering Lengths and Cross-sections, Coherent and Incoherent Neutron Scattering

Small-Angle Neutron Scattering
Scattering from General Two Phase Systems, Scattering from Fractal Aggregates, Nuclear vs. Magnetic Scattering

Small-Angle Neutron Scattering Instrumentation
Experimental Aspects, Data Treatment

Analysis of Small-Angle Neutron Scattering Data
Model Independent Analysis, Model Dependent Analysis, Contrast Variation

Applications
Nanomaterials, Colloids, Biological Systems, Porous and Fractal Structures)

X-ray absorption Spectroscopy
Introduction of X-ray absorption spectroscopy including different processes of absorption of X-rays in materials, Theoretical formalism of EXAFS, Derivation of the EXAFS equation with physical interpretation, Experimental techniques with some introduction to Synchrotron radiation, Data analysis (EXAFS & XANES), Usefulness of the EXAFS technique in material characterization- with few case studies.

CY 704: Molecular Bioorganics (20)

New paradigm in synthesis
Rational synthetic design, convergent and divergent strategies, multi-component and domino reactions, sequential reactions, high-throughput synthesis, organocatalysis, substrate and reagent controlled asymmetric synthesis
New paradigm in synthetic approaches
Green strategies, atom economy, bio-catalysis and solvent engineering, microwave and sono-chemistry, non-conventional reaction media (room temperature ionic liquids, super critical fluids, florous phase, super-heated steam), template-driven synthesis.

New paradigm in functional targets
Design and synthesis of functional molecules/ molecular assemblies, non-covalent interactions, electro-magnetic radiation active organics, organic-inorganic hybrids, organics in nuclear fuel cycles.

CY 705: Laser Spectroscopy (20)

Coherence properties of radiation fields
Temporal and spatial coherence, coherence volume, degree of coherence, coherence of atomic systems.

Widths and profiles of spectral lines
Natural line width, Doppler width, collisional broadening of spectral lines, transit time broadening, homogeneous and inhomogeneous line broadening, spectral line profiles in liquids and solids.

Nonlinear optical mixing techniques
Phase matching, second harmonic generation, sum frequency and higher harmonic generation, difference frequency generation, optical parametric oscillator and amplifier, tunable Raman laser, Gaussian beams.

Spectrometers, interferometers, wavemeters and detectors
Basic concepts of spectrometers and interferometers, different kinds of interferometers - Michelson interferometer, Mac-Zhender interferometer, Fabry - Perot interferometer, multilayer dielectric coatings, interference filters, tunable interferometers. Webmeters - Michelson, Sigmameter, Fabry - perot and Feazeu. Detectors – photoconductive and photovoltaic detectors, fast and avalanche photodiodes, photodiode arrays, photomultipliers, multichannel platesand image intensifiers.

Absorption and emission spectroscopic techniques
High sensitivity methods of absorption spectroscopy - cavity ring down spectroscopy. Laser induced fluorescence spectroscopy, photoacoustic spectroscopy, optothermal spectroscopy, ionization spectroscopy, optogalvanic spectroscopy.

Nonlinear spectroscopy
Nonlinear absorption, saturation of inhomogeneous line profiles, hole burning spectroscopy, lamb dip spectroscopy, saturation spectroscopy, polarization spectroscopy, multiphoton spectroscopy, Doppler free two photon spectroscopy, saturated interference spectroscopy.

Laser Raman spectroscopy
Stimulated Raman, coherent anti-Stokes Raman spectroscopy (CARS), Resonance Raman and surface enhanced Raman scattering.

Applications of laser spectroscopic techniques in physics, chemistry and biology

CY 706: Actinide Chemistry (20)

Position in Periodic Table: Electronic configuration, The Actinide Concept, Transuranium elements.

Actinide Spectroscopy: Electronic states, Atomic properties, UV-visible absorption and emission spectroscopy. Time resolved fluorescence spectroscopy (TRFS).
Electronic structure and bonding: Introduction to *'f'* orbitals and their splitting in the ligand field. Relativistic effect and its consequences. Modern techniques for understanding the bonding in actinide compounds.

Co-ordination Chemistry: Ionic radii, Coordination number, Hydration Energy.

Redox Behavior: Redox potentials, Eh-pH diagrams, Variable oxidation states, Ionic species, unusual oxidation states in actinides and their stabilization, Thermodynamic/ kinetics of redox reactions, Disproportionation.

Hydrolysis of Actinides: Hydrolysis, Polymerization / Depolymerization.

Auto-radiolysis: Auto-radiolytic effects in aqueous solutions, Auto-radiolysis effects in solid compounds of actinides.

Complexation behaviour with inorganic/organic ligands: Ion-exchange, Solvent extraction methods for actinides (inter and intra-group separations), Complexation reactions relevant in CQC of nuclear fuels, Analytical chemistry of transplutonium elements, Lanthanides-actinide separation, SANEX process.
Actinides in the Environment: Natural abundance of actinides, Oklo phenomenon, Actinide speciation in aquatic environment, Complexation with naturally occurring organics such as humic acid and fulvic acid, Sorption and Migration, Interaction with rock, clay, mica etc. Formation and migration of radiocolloids.

Biochemistry of Actinides: Actinide-microbe interaction, Actinide migration in the food chain, Fixation in human, Pu in blood, Intra-cellular uptake of Pu, Sequestering using chelation therapy, Bioremediation of nuclear wastes.

Transactinides: Production, Rapid separation techniques, Atom-at-a-time chemistry. Aqueous chemistry of elements 104, 105 and 106

CY 707: Computational Chemistry (20)

Introduction: Revision to Classical Mechanics, Revision to Quantum Mechanics
Force Field Methods: Force Field Energy , Stretching, Bending, Out-of-plane bending, Torsion, van der Waals, Electrostatic, cross terms, Validation of Force Fields, Advantage & Limitations.
Optimization Techniques: Finding Minima-Steepest descent, Conjugate gradient methods, Newton–Raphson methods; Finding Saddle Points-linear and quadratic synchronous transit, gradient norm minimization, Newton–Raphson; Conformational Sampling and the Global Minimum Problem; Stochastic and Monte Carlo methods; Simulated annealing.
Electronic Structure Methods: Self Consistent Field Theory, Restricted & unrestricted HF, Semi-empirical Methods.
Electron Correlation Methods: Configuration Interaction Methods, Multi Configuration Self-Consistent Field, Many Body Perturbation Theory, Couple Cluster Method.
Basis Sets: Slater and Gaussian Type Orbitals, Pople style basis sets, Dunning–Huzinaga basis sets, Correlation consistent basis sets, Plane Wave Basis Functions, Basis Set Superposition Errors.
Density Functional Methods: Kohn–Sham Theory, Reduced Density Matrix Methods, Exchange–Correlation Functionals-Local Density Approximation, Hybrid or hyper-GGA methods, DFT Problems.
Wave Functional analysis: Population Analysis Based on Basis Functions, Population Analysis Based on the

Electrostatic Potential, Population Analysis Based on the Electron Density, Localized Orbitals, Natural Atomic Orbital and Natural Bond Orbital Analysis.
Molecular Properties: Perturbation Methods, Derivative Techniques, Electric Field Perturbation, Magnetic Field Perturbation.
Simulation Techniques: Monte Carlo Methods, Molecular dynamics methods.
Computer Laboratory Work: Ab initio electronic structure calculation of small systems-designing of input using a visualization program, running an electronic staructure calculation applying GAMESS program, analyzing output manually and using visualization program.

CY 708: Advanced NMR Spectroscopy (20)

The basics of NMR experiment
Basics of NMR spectroscopy, Pulse NMR, The mechanisms of relaxation, The components of a modern NMR instrument, Basic data acquisition and processing

The NMR of Important Nuclei
Chemical shifts for ^{1}H, ^{13}C and ^{31}P nuclei, Homolnuclear and heteronuclear couplings (J), Factors that influence the sign and magnitude of J

Double Resonance Techniques and Complex pulse sequences
Decoupling experiments (homonuclear and heteronuclear), Nuclear Overhauser Effect (NOE), Distortionless Enhancement by Polarization Transfer (DEPT) Experiments

The study of dynamic processes by NMR
Reversible and irreversible dynamic processes, Reversible complexation and chemical shift reagents, Variable temperature NMR, Determination of activation parameters

Two-Dimensional NMR Spectroscopy
Basics of 2D NMR experiments, ^{1}H-^{1}H Correlation Spectroscopy, ^{1}H-^{13}CCorrelaion Spectroscopy,

Nuclear magnetic resonance in solids
Basic NMR interactions in the solid state and their relative magnitudes, Chemical shift tensors and their orientation, Dipolar and quadrupolar couplings, Electron Paramagnetic effects in solid state NMR, Differences in the solid state NMR spectra from spin ½ and quadruple nuclei, Detection of NMR signals in solids, Wide line and zero field NMR experiments

High resolution Solid State NMR experiments
Magic Angle Spinning (MAS) NMR experiments, Side band manipulations and line shape analysis in MAS NMR experiments, Evaluation of chemical shift anisotropy parameters form side band intensity analysis, Cross Polarization Magic Angle Spinning (CP MAS) NMR experiments with suitable examples, Probing the local environmentaround nuclei and measurement of inter-nuclear distances by different solid state NMR techniques, Variable temperature MAS NMR experiments, Multi Quantum (MQ) MAS NMR experiments, Application of solid state NMR techniquesfor characterization of glasses, porous and amorphous materials, polymers, biomaterials, nano-materials, hybrid-materials, catalysts etc.,

Principle of NMR imaging.

CY 709: Atmospheric Chemistry (20)

Structure of Atmosphere
Physical characteristics, Chemical Composition, Carbon, Hydrogen and oxygen cycle.

Atmospheric Radiation
Terrestrial and solar radiation, Energy balance for Earth and Atmosphere, Radiative flux, Actinic flux; Spectroscopy, Absorption of radiation by atmospheric gases and aerosols, Absorption by O_2 and O_3, Radiative forcing, Photolysis rate as a function of altitude.

Chemistry of Troposphere and Stratosphere
Stratosphere - Chapman mechanism - HO_x, NOx cycle
Troposphere - Hydroxyl radicals and other tropospheric oxidants, Photochemical cycles of NO_2, NO and O_3 , Chemistry of NO_x, carbon monoxide, Methane, Definition of tropospheric lifetimes, Importance of gas phase kinetics.

Atmosphere Pollutants
Oxides of nitrogen, Volatile Organic Compounds (VOCs), Halogenated compounds, Sulfur compounds and particulate matter.

Effects of pollution
Photochemical smog - production of ozone and NOx; trends in trophospheric ozone concentration, relationship of VOCs and NOx to O_3, atmospheric chemistry of ozone and its precursors, chemistry of sulfur and nitrogen compounds, Acid Deposition.

Global effects of pollutio
Green House Effect, Global Warming Potential, Stratospheric Ozone Depletion, Ozone depletion Potential, Montreal / Kyoto protocol.

Laboratory and field measurements
Techniques for species identification and quantification, Aerosoles - formation, sampling and characterization. Experimental methods to study reactions of importance in the atmosphere (Laser Induced Fluorescence, Chemiluminescence, Cavity Ring Down Spectroscopy).

NON-SUBJECT ASSIGNMENTS

CY 591: Viva Voce

In addition to the formal assessment carried out by the method of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

CY 592: Mini-Project

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the Mini-Project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provide useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.
The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.

CY 593: Seminar

As a part of the course curriculum, all trainees have to make a seminar presentation. For this purpose, the trainee is asked to choose a topic of presentation based upon his/her aptitude and area of research interest. The objective of this exercise is to inculcate skills in the trainee on aspects such as analysis of the experimental data, details discussion on the results and hypothesis presented and drawing of meaningful conclusions. A Seminar Committee constituted for this purpose evaluates the presentation based upon attributes such as scientific content, quality of presentation and ability of the trainee to defend the subject of presentation. A maximum of 100 marks have been allocated for the seminar.

Homi Bhabha National Institute
(A university established under Section 3 of the UGC Act. 1956)
Indira Gandhi Centre for Atomic Research
Kalpakkam – 603 102 Tamil Nadu, India

M.Phil. in Chemical Sciences Courses under IGCAR (Program Code: CHEM02)

Homi Bhabha National Institute
(A university established under Section 3 of the UGC Act. 1956)
Indira Gandhi Centre for Atomic Research
Kalpakkam – 603 102 Tamil Nadu, India

Chemical Sciences Courses offered in HBNI & Course coordinators

CH-1 : Mathematics and Computational methods (6 credits)

CH-2 : Chemical Thermodynamics (6 credits)

CH-3 : Electrochemistry and Corrosion Science (4 credits)

CH-4 : Introduction to Materials Science and Engineering (6 credits)

CH-5 : Analytical Chemistry for Nuclear Fuel Cycle (6 credits)

CH-6 : Chemical Instrumentation and Laboratory Techniques (6 credits)

CH-7 : Health Physics and Radiation Sciences (6 credits)

CH-9 : Chemistry of Fuel Cycle-I(6 credits)

CH-10 : Chemistry of Fuel Cycle-II: Actinide chemistry and separation science (6 credits)

CH-11 : Materials for Nuclear Reactors and Fuel Cycle Processing Systems (6 credits)

CH-12 : Nuclear and Radiochemistry (6 credits)

CH13 : Corrosion Science and Engineering (6 credits)

CH-14 Quantum Chemistry & Group Theory (6 credits)

CH-15 : Molecular Spectroscopy (6 credits)

CH-16 : Lasers and Application (6 credits)

CH-17 : Nanomaterials and Advanced Chemical Sensors (6 credits)

CH-RM: Course on Research Methodology (3 credits)

CH-1: Mathematics, computational methods, numerical analysis and computer programming

Course content

1. **Differential Equations & Integral Transforms:** Linear differential equations: Series method of solution; Legendre, Lagurre and Hermite differential equations. Use of ladder operators for solutions to differential equations; applications to quantum chemistry.

Orthogonal Polynomials and Special functions – Dirac Delta function, gamma function, error function. Introduction to Fourier series, Fourier transform and Laplace transform – applications in quantum chemistry and spectroscopic techniques – FT-NMR, FT-IR.

Convolutions of functions, use of Fourier transforms in convolution, Applications in chemistry.

2. **Vectors:** Vector differentiation and integration: Concepts of gradient, divergence and curl and their physical significance. Orthogonal vectors, Gram-Schmidt process – applications in quantum chemistry. Vector fields in space – Gauss and Stokes theorem with applications.

3. **Matrix Algebra:** Elementary operations and elementary matrices. Rotation matrices, Similarity transformations; Applications of numerical techniques in matrix algebra to evaluate eigenvalues and eigenvectors; Diagonalization and inversion of matrices. Applications in chemistry.

4. **Numerical Methods:** Newton-Raphson method for finding roots, differentiation, integrations by quadrature techniques, solutions of differential equations.

Book suggested

1. Advanced Mathematics for Engineers and Scientists, M.R. Spiegel, Schaum's Outline Series(1983).
2. Mathematical Methods for Physics Engineering, K.F. Riley, M.P. Hobson and S.J. Bence, Cambridge University Press (1998).
3. Theory and Problems of Vector Analysis, M.R. Spiegel, Schaum's Outline Series (1981).
4. Computer Oriented Numerical Analysis, V. RajaRaman, Prentice Halls India, 3rd ed. (1999)
5. Mathematical Physics, E. Butkov, Addison-Wesley Publishing Company, California (1968).

CH-2: Chemical Thermodynamics

Course content

1. **Laws of Chemical Thermodynamics:** Thermodynamic laws, thermodynamic properties of the system, criterion for equilibrium, Heat engines, Helmholtz energy, Gibbs energy, Closed system, Maxwell's equations, Gibbs-Helmholtz equation.

2. **Behaviour of Gases:** Gas laws, ideal gas and deviations from ideality, Vander Waal's equation, equation of state, critical phenomena,Thermodynamic treatment of non-ideal gases, gas mixtures.

3. **Solutions:** Raoult's and Henry's laws, activity of a component in solution, Gibbs-Duhem equation, Properties of Raoultian ideal solutions, Colligative properties, Non ideal and regular solutions, Partial and Integral thermodynamic property evaluation, alpha function, Gibbs free energy of formation of regular solutions, Criteria for stability of regular solutions, Miedema's model, associated solution model, sub-regular solutions, Models for ternary systems such as Colinet's model.

4. **Phase Equilibria:** Phase rule, Gibbs Free energy as a function of temperature and pressure, Equilibrium between a vapor and a condensed phase in a single component system, Graphical representation of phase equilibria in a single component system, Gibbs energy and thermodynamic activity, phase diagrams- single component, binary and ternary diagrams, simple calculation of thermodynamic properties from phase diagram, pressure-composition diagrams, CALPHAD and models for optimization of phase diagrams.

5. **Reactions in Gases and Condensed Phases:** Reaction equilibria in homogeneous and heterogeneous media, effect of temperature and pressure on equilibrium constant, Le Chatlier's principle, Reaction equilibria in H2/ H2O, CO/CO2 systems, Ellingham diagrams, Effect of phase transformation, use of different standard states for representing reactions in condensed phases, phase stability diagrams, application of phase diagrams in material systems.

6. **Statistical Thermodynamics:** Entropy and disorder in an atomic scale, concept of microstate, most probable microstate, influence of temperature, Boltzmann equation, partition functions, configurational entropy and thermal entropy.

7. **Experimental Thermodynamics:** Calorimetry - classification of calorimeters, different types of calorimeters, heat capacity measurements, thermochemical calorimetry, estimation of thermodynamic quantities.

Vapor pressure measurements- static methods, transpiration, boiling point method, isopiestic method, Knudsen effusion method , Langmuir evaporation method, role of mass spectrometry for study of vaporization reactions, second and third law methods, Gibbs energy functions from spectroscopy data, measurements at very high temperatures.

Galvanic cell EMF methods for activity measurements, - solid electrolyte and molten salt EMF methods.

Measurement of oxygen and carbon potentials – gas equilibration/ EMF methods

Determination of phase diagrams- spot technique, thermal analysis, enthalpies of transformations, transformation temperature, order of transformation, DTA, TGA, thermal expansion, resistivity- as a function of temperature , thermal diffusivity, measurement of thermal diffusivity and thermal conductivity.

Books Suggested:

1. Physical Chemistry, G W Castellan, Addison Wesley, 1971
2. Introduction to Metallurgical Thermodynamics, David R Gaskell, McGraw Hill, 1973.
3. Physical Chemistry, P W Atkins, 7th Ed, Cambridge University Press, 2004.
4. Principles of Chemical Equilibrium with Applications in Chemistry and Chemical Engineering, K Denbigh, Cambridge University Press, 1981.
5. Chemical and Process Thermodynamics, 2nd Ed, B G Kyle, Prentice Hall, 1992.
6. Thermodynamics, G N Lewis, M Randall, revised by K S Pitzer and L Brewer, McGraw Hill, 1961.
7. Differential Scanning Calorimetry: An Introduction for Practitioners, G W H Hohne, Springer Verlag, 1996.
8. Characterisation of high temperature vapours, Ed by J L Margrave, John Wiley, New York, 1967.
9. Physicochemical Measurements in Metal Research, Ed by R F Bunshah, Wiley Interscience, New York, 1970.

CH-3: Electrochemistry

Course content

1. **Electrolytes** – Different electrolyte systems (aqueous, ionic melts and solid electrolytes) and their conductivities; Debye-Huckle theory, Techniques for measuring electrical conductivities - DC and AC techniques

2. Electrochemical cells - Electrochemical potentials, Nernst equation and electrochemical series, Molten salt and solid electrolyte based cells

3. Electrode processes and kinetics – Diffusion layers & characteristics of the diffusion layers, over potentials, Butler-Volmer and Tafel equations, polarisable and non-polarisable electrodes, reference electrodes, voltammetric techniques, polarography, Cyclic Voltammetry, rotating electrodes and micro-electrodes, chronpotentiometric and chronoamperometric techniques, elucidation of mechanisms of electrochemical reactions.

4. Applications of electrochemical principles - Electro-analytical techniques and electrochemical sensors; energy conversion and storage systems (fuel cells and batteries); thermochemical data measurements.

Reference Books:

1. "Electrochemical Methods: Fundamentals and Applications**"**, AJ Bard & LR Faulkner, Wiley, New York, 1987.
2. "Electrode Dynamics**"**, AC Fisher, Oxford University Press, Oxford, 1996.
3. "Electrochemistry", **P**.H. Reiger, Prentice-Hall International, Englewood Cliffs, 1995.
4. "Solid electrolytes and their Applications", (Ed) E.C.Subba Rao, Plenum, New York, 1980.
5. "Electrochemistry", C. M. A. Brett and A. M. O. Brett, Oxford University Press, 1993.
6. "Laboratory Techniques in Electroanalytical Chemistry", 2nd Ed., by P. T. Kissinger and W. R.Heineman, Marcel Dekker, 1996.
7. "Chemical Sensor Technology", Vol.2, (ed) T.Seiyama, Kodansha Ltd., Tokyo, 1989.
8. "Chemical Sensor Technology", Vol.3, (ed) N.Yamazoe, Elsevier, Amsterdam, 1991.
9. "Solid State Gas Sensors", P.T.Mosley and B.C.Toefield, Adam Hilger, Bristol, 1987.
10. "Advances in Electroanalytical Chemistry", Vol.2, A.J.Bard, Macel Dekker, New York, 1967.
11. "Fuel Cell Systems", L.J.M.J.Blowmen and M.N.Mugerwa, Plenum Press, New York, 1993.

CH-4: Introduction to Materials Science & Engineering

Course content

1. **Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.

2. **Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.

3. **Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams & Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley & Sons, N.Y., 2003.

7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

CH-5: Analytical Chemistry for Nuclear Fuel Cycle

Course content

1. **Instrumental Methods – Principles and Applications:**

Spectrochemical Methods: Detectors- Photomultiplier Tube (PMT), Charge Coupled Device (CCD), Charge Injection Device (CID), Spectrometers – Czerny Turner, Echelle, Sample Introduction Devices – Flame, Electrothermal, Laser Ablation, Direct Sample Insertion Devices, Interferences, detection limits, sensitivity, Absorption Spectrometry – Flame Atomic Absorption Spectrometry, (FAAS), Electrothermal Atomic Absorption Spectrometry (ETAAS), Optical Emission Spectrometry (OES) with Inductively Coupled Plasma (ICPOES), Glow Discharge (GDOES), Fluorescence Spectrometry – Laser Induced Fluorescence (LIF), Recent advances – Continuum Source (CS-AAS), Single Atom Detection.

Mass Spectrometry: Mass Analysers – Magnetic, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance, Features – Resolution, Dispersion, Abundance, Sensitivity, Detectors – Faraday Cup, Channeltron, Daly, Ion Sources –Thermal Ionisation (TI), Electron Impact, ICP, GD, Laser Ablation (LA-ICP), Secondary Ionisation (SI), Resonance Ionisation (RI), Matrix Assisted Laser Desorption and Ionisation (MALDI), Hyphenated Technique – ICP-MS, HPLC-MS, GC-MS.

Thermal Methods: Thermogravimetric Analysis (TGA), Derivative Thermogravimetric Analysis (DTG), Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Evolved Gas Analysis (EGA).

Nuclear Methods: Activation Analysis – Neutron Activation Analysis (NAA), Charged Particle Activation Analysis (CPAA), X-ray fluorescence (XRF) spectrometry, Ion Beam Analysis – Backscattering Spectrometry (BS), Particle Induced □-ray Emission (PIGE), Nuclear Reaction Analysis (NRA), Elastic Recoil Detection Analysis (ERDA), Particle Induced X-ray Emission (PIXE).

2. **Separation Techniques – Principles and Applications:**

Solvent Extraction Technique: Conventional, Liquid Membranes – Bulk, Supported and Emulsified, Solid Phase Extraction (SPE).

Ion Exchange: Conventional and Membranes.

Chromatography: Gas chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion chromatography (IC).

3. **Statistical Methods in Chemical Analysis:** Methods of sampling and associated errors, Classification of errors, Propagation of errors, treatment of errors, Normal distribution, Tests of Significance and Confidence Limits. Method of Least squares – linear and non-linear, weighted least squares formalism, constrained least squares fitting

4. **Laboratory Experiments (any 5):**

Determination of trace impurities in high purity materials by AAS.

Application of Electroanalytical Methods to trace analysis

TGA and DTA study of inorganic compounds

Neutron Activation Analysis of trace constituents in a complex matrix

Analysis of an alloy sample by EDXRF

Anion analysis by ion selective electrode.

Chromatographic separation and measurement of the components in a mixture

Isotopic Analysis by Mass Spectrometry

Books suggested:

1. Fundamentals of Analytical Chemistry, D.A. Skoog, D. M. West, F. J. Holler, S.R. Crouch, 8th Edition, Thomson (2004).
2. Principles of Instrumental Analysis, D.A. Skoog, F. J. Holler, T. A. Niemann, 5th Edition, Saunders College Publishing (1998).
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).
4. Statistics for Analytical Chemistry, J. C. Miller and J. N. Miller, 2nd Edition, Wiley (1998).

CH-6: Chemical Instrumentation and Laboratory Techniques

Course content

1. **Passive Circuit Elements and Configurations:** Circuit behaviour of resistors,inductors and capacitors; the potential divider and the wheatstone Bridge (resistive and capacitive), R-L-C-circuits as filters and resonance circuits.

2. **Electronic Devices and Their Role in Power Conversion and Amplification:** The junction diode, SCR, triacs and their role in rectification and AC power control; bipolar transistor and IGBT and their role in linear/switched mode power supplies and in amplification of signals; constant current power supplies Inverter circuits; issues in measurement of signals - Concept of input impedence and the role of J-FETs and MOSFETs.

3. **Operational Amplifiers and their Various Functionalities:** The basic OP-AMP and its desired characteristics; the inverting amplifier, the non-inverting amplifier, summing configuration;

The differentiator and integrator circuits; comparator; precision rectifier; waveform generation.

4. **Fundamental Issues Related to Chemical Instrumentation:** Role of chemical instrumentation in the nuclear fuel cycle, with relation to selectivity, sensitivity and automation amenability.

The basic anatomy of excitation with energy source-interaction with analyte-detection of the effect produced; issues related to selectivity; sensitivity and detection limits; sources of noise and measures to minimize the effect; boxcar integrator, lock-in-amplifier.

5. **UV-VIS-IR Instruments:** Phenomenon of resonant absorption and Beer's law of photometry; implementation of Beer's law in a spectrophotometer; compensation for spectral response of the detector; slit servo mechanism for compensation of optical emission.

Atomic absorption spectrophotometer-flame ionization, compensation for molecular absorption, hollow cathode lamp excitation for high specificity.

Atomic emission spectrometry-principles, instrumentation and data interpretation

Laser fluorescence spectrometry-laser basics, three stage power supply for flash lamp excitation.

Non dispersive spectrometer- FTIR - principle, data collection scheme.

6. **X-Ray Spectrometry:** Generation of X-Rays, The X-Ray tube, setting the energy and intensity; Bragg's law; X-Ray fluorescence, X-Ray diffraction, ESCA for surface analysis.

7. **Mass Spectrometry:** Ion sources-thermal ionization, Knudsen effusion and electron impact ionization, inductively coupled plasma source, Laser induced vapourisation, spark source.

Magnetic analysers, quadrupole analysers, time-of-flight analysers.

Detectors-faraday, SEM, Channeltron.

Mass scanning, peak centering, signal handling and digitization and counting.

8. **Thermal Analysis:** Thermal excitation - furnaces, temperature profiling and furnace power control.

Thermal effects - TGA, DTA, DSC, dilatometry.

Thermal measurements - thermocouples, RTDs, signal conditioning and handling.

9. **Additional Methods of Analysis:** Gas chromatography - mobile and stationary phases; separation on the basis of retention time; TCD and FID detectors.

Instrumentation for pH meters and conductivity meters; automated titro-processors and applications of coulometry.

Radioactive assay based on multi-channel gamma ray spectrometry.

10. **Digital Electronics:** Logic gates; flipflops, counters, astable and monostable multivibrators; decoders; logic families; data conversion-various types of ADCs and DACs.

Microprocessor systems-processor architecture, memory circuits, I/O subsystems; interfacing techniques; assembly language programming.

11. **Laboratory Techniques:** Machine Drawings Projections: orthographic – 1st & 3rd Angles

pictorial; Oblique: Perspective. Conventional representation of common features and sections;

Dimensioning and tolerancing; Scales, lines and lettering; Threads; Fastenings. Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Vacuum systems - equipment for vacuum generation - rotary pumps, diffusion pumps, ion pumps, turbo molecular pumps; Generation of high temperatures, measurement of vacuum and temperatures, centrifuges, chemicals and laboratory safety.

12. **Vacuum Generation and measurements:** Kinetic theory of gases – Velocity distribution – Mean free path – Monolayer formation – vacuum units – Viscous and molecular Flow regimes – Reynold's and Knudsen Numbers viscosity and thermal conductivity of gases – Gas release from solids – vaporization – out gassing – diffusion – permeation – Vacuum pumps – Titanium Sublimation pumps – Ion pumps – Cryogenic pumps and maters for construction of Vacuum chamber.

Gauges: Thermal conductivity, cold cathode, hot cathode ionization gauges and their Principle of operation.

Books suggested:

1. Principles of Instrumental Analysis, D. A. Skoog and J. Leary, McMillan Publishers,
2. Instrumental Methods of Analysis, H. H. Willard, L. L. Merritt, Jr., J. A. Dean, F. A. Settle, Jr. CBS Publishers and Distributors, New Delhi 1986.
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).

CH-7: Health Physics and Radiation Sciences

Course content

1. **Interaction of Radiation With Matter:** Ionization in gaseous medium, Bragg's curve, stopping power, Bethe equation, range of particles and straggling, LET, attenuation and absorption of beta particles, backscattering, photoelectric, compton and pair production processes for gamma radiation, variation with gamma energy and Z of medium, attenuation and absorption of gamma rays, elastic and inelastic scattering of neutrons.

2. **Radiation Detection and Measurement:** Principles of radiation detectors, counting characteristics, detection efficiency and energy resolution, dead time and counting statistics, Gas filled detectors, scintillation processes and detectors, organic and inorganic scintillators, NaI(Tl), LaBr3, semiconductor detectors, p-n junctions, germanium and silicon detectors, room temperature semiconductors, neutron detectors including bubble detectors, solid state nuclear track detectors, nuclear probes - positron annihilation, perturbed angular correlation, mossbauer effect.

3. **Shielding and Dose Calculations:** Shielding (beta, gamma and neutron sources).

Shielding from mixed sources; calculation of dose for point, line and volume sources.

4. **Dosimetry:** Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effective dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective half-life and their relation and the concept of the same and their importance. Concept of ALI and DAC.

5. **Radiation Protection Principles:** Radiation protection philosophy, objectives and principles of radiation protection, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types of exposure (natural, occupational, medical and public).

External and internal exposures; routes of intake of radioactive material. Use of personal dosimeters (Film badge, TLDs, pocket dosimeters). Calculation of internal dose, Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Bragg-Gray principle.

Fundamentals of ICRP respiratory model, entry through ingestion, GI track model, wholebody counting and bioassay techniques.

6. **Radiation Protection Procedures:** Procedures followed in radiation work places, supervised and controlled areas, work permits, contamination control methods (air-borne, surface and personnel), swipe samples, and rubber areas, spill pack (gloves + absorbing paper), decontamination and de-corporation techniques; bore wells and inspection chambers; precautions during radioactive source storage and handling.

Types of radiation monitors / radioactivity measurement methods adopted for radiation protection. Personnel monitoring, area monitoring and stack monitoring.

7. **Waste Management:** Radioactive waste classification and management – An overview.

8. **Emergency Preparedness:** Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, counter measures.

9. **Nuclear Fuel Cycle Applications:** Radiological aspects and environmental impact of FBRs. Criticality safety and Radiological aspects in nuclear cycle facilities.

10. **Regulatory Details:** Atomic Energy Act, National and International regulatory bodies, their role and responsibilities, Radiation Protection Rules, Nature of duties and responsibilities of Radiation Safety Officer / Health Physicist, radio toxicity and classification of laboratories, design of lab for radioactive work, Safe handling of radioisotopes, Transport of radioactive materials.

11. **Basic Radiobiology:** Interaction of ionizing radiation with living cells, Ionizing radiations, excitation and ionization process, basic structure and components of cell, chemical and biological consequences of radiation action, radicals and reactions in cell killing, direct and indirect effect and relevant biological damage.

12. **Molecular and Cellular Effects of Radiation:** Radiation action and organizational level in cell, Damage to DNA, single and double structural breaks in units membrane dose and survival curve, cellular radioactivity, radiobiological effectiveness and linear energy transfer Dzz dose, rate effect, dose fractionation, Mitotic delay, chromosome aberration and mutations by radiation action on cells.

13. **Modification of Biological Effects of Radiation:** Oxygen effect, OER, Chemical radio sensitizers, Chemical radio protectors, Mechanisms of action and importance in nuclear research programme.

14. **Radiobiology and Radiotherapy:** Radiation and cancer, cell cycle and radiosensitivity, rationale of using radiation for tumor cell kill, problems.

15. **Basics of Radiation Chemistry:** Interaction of high energy radiation with matter, G-values, radiation induced reactions in solids, liquids and gases.

Laboratory Experiments:

1. Plancheting, alpha counting and spectroscopy
2. Counting characteristics of gas detectors
3. Half life determination and attenuation coefficient determination
4. High resolution gamma spectrometry
5. Dose Measurements: Whole Body Counting laboratory, Bio-dosimetry laboratory, TLD personnel monitoring services laboratory.

Demonstrations:

1. **Use of Personnel Protective Equipment (PPE):** Proper checking and wearing of gloves, and other plant dresses (shoe covers, boiler suits, overcoats etc).

Respirators (dust, gas mask, self contained breathing apparatus, and fresh air-line) TLD, Film badge, neutron film, criticality badge and bubble detector

2. **Use of Radiation Monitoring Equipment: Installed and Portable Radiation Monitors:** AGM (audio and visual alarm, setting up of alarm limits); staplex air sampler (estimation of air-borne activity-both alpha and beta-gamma), different types of survey meters (low to high range), ALSCIN and GM based contamination monitors (side window and end window, hand and foot monitor, cloth monitor), continuous air monitor, criticality alarm system.

Books suggested:

1. Introduction to Health Physics by Herman Camber
2. Biological Effects of Radiation by J. E. Coggle
3. Radiobiology for Radiologist by Eris J. Hall
4. Detection and Measurement of Radiation - Glenn T Knoll.

CH-9: Chemistry of Fuel Cycle-I

Course content

1. Recovery of the starting compounds bearing U, Pu or Th from their primary and secondary sources. Mining, beneficiation, pre-concentration, purification and recovery.

2. **Oxide Fuels:** Preparation of UO2, PuO2, MOX and ThO2. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

3. **Advanced Ceramic Fuels:** Carbides U-C, Pu-C, U-Pu-C, U-Pu-C-O and U-Pu-C-O-N, Nitrides U-N, Pu-N, U-Pu-N. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

4. **Advanced Fuel Fabrication Techniques:** Oxides, Methods based on sol-gel and novel techniques. Carbides; sol-gel method, direct pressing and arc casting.

5. Preparation of U, Pu and Th.

6. **Alloy Fuels:** Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-RM, U-Pu- MA), dispersions and composites – Salient physical and chemical properties, relevant phase diagrams, fabrication and quality control.

7. **Inert Matrix Fuels for Partitioning and Transmutation:** A brief account on the current developments.

8. **Fuel – Clad Interaction:** Significance of FCCI and FCMI. Specifics pertaining to oxide, carbide and metallic fuels. Role of chemical thermodynamics in the prediction and understanding of Fuel clad chemical compatibility.

9. **In Pile Behaviour of Fuels:** Chemistry and redistribution of fission products, role of chemical potentials of the constituents in the breach of clad in oxide, carbide and alloy fuel pins and detection mechanisms.

Books suggested:

1. Donald R. Olander, Fundamental aspects of nuclear reactor foel elements fundamental aspects of nuclear reactor foel elements, Springfield, BTIS, 1985.
2. H. J. Matzke, Science of Advanced LMFBR fuels, North Holland, Amsterdam, 1986.
3. M. Benedict and T.H. Pigford, Nuclear Chemical Engineering, Mc Graw Hill, New York, 1957. (Specific journal articles and other references will be cited during the lectures)

CH-10: Chemistry of Fuel Cycle–II

Course content

1. **Actinide Chemistry:** Discovery of actinide elements, electronic structure, oxidation states, inter-conversion of oxidation states, complexes of actinide ions, actinide contraction, comparison of actinides with lanthanides. Actinides in environment.

Purification of actinides using techniques such as ion-exchange, Solvent Extraction, Liquid membranes and Chromatographic Methods.

Hydrolysis, colour, spectroscopy and magnetic properties of actinides, nuclear properties of actinides, decay modes.

Thorium: isotopes, occurrence and production; Uranium: isotopes, occurrence, resour0ces and production.

Transuranium Elements: production of transuranic elements, Neptunium, Plutonium, Americium and Curium; Actinide synthesis by heavy ion reactions.

Fission Product Chemistry.

2. **Aqueous Reprocessing:** Introduction to nuclear fuel reprocessing; Need for reprocessing; PUREX, TRUEX, THOREX.

Latest developments. Solvent extraction for actinide purification; basic principles, introduction to extractants, classification of extractants.

Purification of uranium, plutonium; lanthanide actinide separations.

3. **Pyrochemical Reprocessing:** Introduction to non aqueous reprocessing: Objectives and advantages of non aqueous reprocessing in fast reactor fuel cycle, Advanced fuel cycle flowsheets involving non aqueous reprocessing, Recent trends in pyrochemical reprocessing of oxide and metallic fuels.

Oxide electrowinning flowsheet, Pyrochemical reprocessing of metallic fuels (IFR process) - Integral Fast Reactor Concept, Differences in electrorefining and electrowinning.

4. **NUMAC:** Importance of Nuclear Material Accounting; techniques used for analysis of nuclear materials.

NUMAC with techniques such as Potentiometry, Coulometry, Amperometry.

Mass Spectrometry, Calorimetry, Gamma counting, neutron counting etc. Advantages and drawbacks of individual methods.

5. **Post Irradiation Techniques:** Introduction to post-irradiation examination methods of nuclear reactor fuels; importance of PIE methods, burn-up measurements; NDE testing of fresh fuel pins.

Non-destructive evaluation of irradiated fuels (X-ray and neutron radiographic examination of fuel pins, Fission gas analysis, Metallographic examinations).

6. **Nuclear Waste Management:** Introduction - industrial waste, nuclear waste & its speciality, generation of radioactive wastes, radioactivity in the environment, Solid, liquid & gaseous wastes, international classification. Basic philosophy & methods of radioactive waste management, environmental monitoring. HLW & spent fuel waste. Radioactive waste immobilization matrices & their ultimate disposal.

CH-11: Materials for Nuclear Reactors and Fuel Cycle Processing Systems

1. Fundamentals of reactor physics and different reactor systems

a) Fission reactors: Thermal reactor, fast reactor, advanced reactor, b) Fusion reactors: Thermonuclear reactor

2. Health Physics and Radiation Sciences

Interaction of radiation with matter, Radiation detection and measurement – use of gas filled detectors, scintillators, semi-conductor detectors, neutron detectors, Radiation Units and Limits.

Hazards Control and Evaluation, Biological effects of radiation, Dose and dose limits for occupational workers and members of public, Radiation Protection Procedures, Dosimeters.

Transport and release, Classification of nuclear waste and their management –Emergency Preparedness, Radiation Chemistry, G-values, radiation induced reactions in solids, liquids and solids.

3. Introduction to Reactor Materials

Moderators (Requirements, properties of D_2O and graphite), C**ontrol rod materials (**Requirements, properties), **Coolants** (Requirements, properties and handling - water, liquid sodium, lead-bismuth alloys, helium, CO_2), **Cover gas (**Cover gas purification, monitoring for hydrogen, fission gases)

4. Introduction to Coolant chemistry:

Na, Pb-Bi and Pb-Li chemistry: Monitoring and maintaining purity of coolants, on-line monitoring using EC monitors, sampling and analysis.

Water chemistry (Introduction to fast reactor water chemistry, condenser cooling and process water chemistry, de-mineralising plant and condensate polishing unit chemistry, on-line monitoring, biological shield cooling water chemistry, related analytical techniques, Chemical aspects of corrosion in liquid metal coolant systems

5. Fuel reprocessing: Chemistry of Actinides with respect to reprocessing, Aqueous methods - Purex, Thorex, use of novel extractants, Non-aqueous methods - pyrochemical processes.

Books Suggested:

1. S. Glasstone, Source Book on Atomic Energy, Allied East-West Press Pvt. Ltd., NewDelhi.
2. S. Glasstone and Sesonske, Nuclear Reactor Engineering, Chapman Hall, London, 1994.
3. H.U. Borgstedt and C.K. Mathews, Applied Chemistry of the Alkali Metals, Plenum Press, 1987.
4. C.C. Addison, The Chemistry of the Liquid Alkali Metals, John Wiley and Sons, 1984.
5. Power Plant Chemistry: A practical guide, Buecher Braid, Penwell, Oklahoma, 1997.
6. Modern Power Station Practice, III Edition, Pergamon, NY, 1992.

CH-12: Nuclear and Radiochemistry (CH12)

Course content

1. **Nuclear Properties:** Concept of nucleus, nuclear spin, parity, electric and magnetic moments, isomerism, nuclear mass and binding energy, elemental abundance, radioactive decay laws, radioactive equilibria, Bateman's equation, liquid drop and shell models.
2. **Nuclear Structure and Decay Modes:** Nuclear force, structure of complex nuclei, liquid drop, shell and collective models, nucleon emission, beta decay, gamma de-excitation and internal conversion, selection rules.
3. **Nuclear Reactions and Accelerators:** Basic principles and energetics, cross sections, nuclear fission, charge and mass distribution in fission, compound nucleus reactions, direct reactions, types and details of accelerators.
4. **Radiochemical Separations:** Concepts of traces, chemical yields, radiochemical purity, applications.
5. **Nuclear Techniques:** Nuclear probes, PAC, NDA and on-line monitoring.
6. **Radio-isotope Production:** Basic principles of isotope production in both reactors and accelerators, Szilard - Chalmers effect and its utility, concept of generators, Moly generators.

7. Applications of Radioisotopes: Concepts of nuclear medicine and radio-pharmaceuticals, SPECT, PET, brachytherapy and and teletherapy Radio-immuno assay, industrial, agricultural and biological applications.

Laboratory Experiments:

1. Fission product separation and transient equilibrium.
2. Separation of actinides using ion-exchange or solvent extraction
3. Neutron activation analysis.

Books Suggested:

1. Nuclear and Radiochemistry (1981) - G. Friedlander, J. Kennedy, J.M. Miller and J.W. Macias
2. Atomic Nuclear (1955) - R.D. Evans
3. Source book of atomic energy (1969) - S. Glasstone
4. Essentials of Nuclear Chemistry (1982) - H.J. Arnikar
5. The chemistry of Transuranium Elements (1971) - J. Keller
6. G.R. Chopin and Rydberg: Nuclear Chemistry, Theory and Applications, Pergamon Press, Great Transuranium elements and transactinides.
7. Manual for reactor produced isotopes, IAEA-TECDOC-1340 (1999)
8. Radionuclides in therapy - R.P. Spencer, R.H. Sievers, A.M. Friedman. CRC Press (1987
9. Radioimmunoassay: Principles and Practice, M.R.A. Pillai and S.D. Bhandarkar, 2nd Edition, BARC, 1998
10. Industrial applications of radioisotopes - G. Foldiak

CH-13: Corrosion Science and Engineering (CH13)

Course content

1. **Thermodynamics of Aqueous Corrosion:** Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.

2. **Kinetics of Aqueous Corrosion:** Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.

3. **Forms of Corrosion:** General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion.

Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.

4. **Corrosion in Reactor and Reprocessing Plants:** Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.

5. **Prevention and Control of Corrosion:** Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.

6. **Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.

7. **Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, "Corrosion and corrosion control – An introduction to corrosion science and engineering", Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, "Corrosion Engineering", Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.
4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

CH-14: Quantum Chemistry and Group Theory

1. Fundamental principles

Brief review of the fundamentals of quantum mechanics – postulates, measurements, operators, de Broglie equation, Heisenberg principle, Schrodinger Equation.

2. Exactly solvable problems

Particle in a box with walls at infitine and finite potential; Double box potential, tunneling, effect of barrier height on splitting of degenerate energy levels and its application in understanding double well potential. Particle in a ring. Simple harmonic oscillator, rigid rotor, hydrogen atom problem solution using both the power series method and ladder operators.

3. Approximation methods

Variation method, perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules.

4. Group Theory

Symmetry elements and operations, point groups, matrix representation, reducible and irreducible representations, the Great Orthogonality theorem, direct product representation, projection operators.

5. Applications of Group Theory in Chemistry

Vibrational problem, hybridization, SALC, ligand field theory.

Reference Books

1. "Quantum Chemistry", I. N. Levine, Allyn & Bacon, Inc. (Boston) 5ed. (2000).
2. "Introduction to Quantum Chemistry", F. S. Levine, Cambridge Univ. Press (2002).
3. "Quantum Chemistry", W. Kauzmann, Academic Press (1957).
4. "Chemical Applications of Group Theory", F. A. Cotton, Wiley Eastern Limited, (1989).
5. "Group Theoretical Techniques in Quantum Chemistry", C. D. H. Chisholm, Academic Press (1976).

CH-15: Molecular Spectroscopy

1. Vibrations and rotations of diatomic molecules, selection rules, nuclear spin statistics.

2. Electronic spectroscopy of diatomic molecules, coupling of angular momentum, Hunds coupling cases, term states of molecules, potential energy functions – analytical and numerical (e.g. RKR), Dissociation energy, Franck Condon principle, numerical methods to evaluate Franck Condon factors.

3. Vibrations of polyatomic molecules – classical mechanics of vibrations, symmetry and normal vibrations – applications of group theory.

4. Experimental techniques in spectroscopy: Fourier transform spectroscopy (FTIR, FT-RAMAN), time resolved FTIR and its applications in absorption and emission studies. Laser based experimental methods, Introduction and application of Terahertz spectroscopy.

5. Studies on ultrafast processes: Nanosecond and picosecond laser flash photolysis, fluorescence time domain spectroscopy with special emphasis on energy transfer and electron transfer reactions and studies on excited state properties**.**

6. NMR & ESR: Basics of NMR and ESR, Multipulse techniques in NMR, FTNMR, 2D-NMR. Time domain ESR, Electron Nuclear Double Resonance (ENDOR)-principle and applications.

Reference Books:

1. "Introduction to Lasers Physics", K. Shimoda, Springer Verlag, 1984 Berlin
2. "Laser Spectroscopy basic concepts and Instrumentation", W. Demtroder, Springer 2003, Berlin.
3. "Molecular Spectroscopy", C. N. Banwell, 4 Edn, Tata McGraw Hill, Delhi.
4. "Infra red spectra of Inorganic and coordination compounds", K. Nakamoto, 5 Ed, John Wiley 1978, NewYork.

CH-16: Lasers and Their Applications

Introduction to Lasers

1. Rate equation for absorption, induced and spontaneous emission, Einstein's A and B coefficients – Concepts of laser action and population inversion – rate equations for two, three and four level systems.

2. Laser and its sub-systems – Optical amplifier – optical resonator – excited state pump – Properties of laser beams – Spatial and temporal coherence.

3. Different types of passive resonators, modes of a passive resonator – Active resonators – Gain & Threshold condition for lasing actions – laser modes – Gain saturation and mode competition – spatial and velocity hole burning.

4. Wavelength and Intensity stabilization of lasers – turning of wavelength of lasers – prisms, grating and elations – controlled wavelength turning – Selection of axial modes, Experimental realization of single mode.

5. Generation of short pulses – Q-switching and mode locking – active and passive methods

6. Principles of various types of lasers – UV, vis & IR lasers, metal vapour lasers, solid state lasers, Gas lasers, Dye lasers, Semiconductor-diode laser and free electron laser

Laser Spectroscopic Techniques:

Important features of lasers useful for spectroscopy – monochromaticity, directionality, high intensity, tunability, short pulses etc. Advantages of lasers for spectroscopy – high sensitivity and selectivity. Short review of spectral line broadening mechanisms.

Doppler-limited spectroscopy
a) High sensitivity methods of Absorption – frequency modulation, intracavity absorption.
b) Photoacoustic spectroscopy; c) Resonance ionization spectroscopy combined with mass spectrometry – multiphoton processes; d) Optogalvanic spectroscopy

Laser Induced Fluorescence: a) Molecular Spectroscopy by LIF; b) Experimental aspects and advantages of LIF (c) LIF in supersonic molecular beams

Laser Raman Spectroscopy: (a) Linear Raman Spectroscopy; (b) Non-linear Raman Spectroscopy – Stimulated Raman scattering (c) Coherent Anti-Stokes Raman Spectroscopy (CARS)

Analytical applications of lasers: a)Laser induced break down spectroscopy, cavity ring down spectroscopy; (b) Atmospheric measurements with LIDAR

Laser material interactions: a) Vaporization, desorption and ablation. b) Surface modification; c) Laser cooling (d) Laser Induced Chemical Reactions/ Laser Isotope Separation

3. “Principles of lasers”, O. Svelto and D. C. Hanna, Plenum, 1989, New York
4. “Chemical and biochemical applications of lasers-vol I & III”, C.B. Moore, (Ed) Academic Press, New York (1974)
5. “Lasers”, P.W. Milonni and J.H. Eberly, World Scientific, Singapore (1981)

CH 17 - Nano materials and advanced chemical sensors

Introduction

Nanoscale– its importance, definitions, nanomaterial science- One dimension, Two dimensions (carbon nanotubes, inorganic nanotubes, nanowires, biopolymers), Threee dimensions (nanoparticles, fullerenes C-60, dendrimers, quantum dots) properties (electrical, optical, mechanical & chemical)

Synthesis and characterization

Synthesis -Chemical methods (precipitation, sol-gel, CVD, ion-exchange, dispersion), Physical methods (milling, PVD, pyrolysis, ion-implantation). Consolidation of nanopowders – sintering introduction, theories of sintering, sintering of nanomaterials, novel methods for consolidation of nanopowders. Characterization – X-ray techniques, spectroscopic techniques, electron beam techniques, optical methods

Applications

Structural and functional ceramics, coatings, sensors, power sources, additives and catalysts, composites, lubricants, magnetic materials, medical implants & nuclear ceramics. Sintering – introduction, theories, methods for consolidation and sintering of nanostructured materials

Introduction to chemical sensors

Fundamental definitions and principles; rationale of sensor design and operation; basic theoretical considerations

Electrochemical Sensors

(Potentiometric sensors, Voltammetric and Amperometric sensors) Ion selective electrodes(ISEs) – principles, solid (glass and fast ion conductor based) and liquid membrane based electrodes, Electrochemical gas sensors, Semiconductor devices (ISFETs, MOSFETs), Conductance gas and vapour sensors based on metal oxides, semiconductors and conducting polymers. Biosensors- oxygen and glucose biosensors; mediated enzyme electrodes and enzyme field effect transistors (ENFETs).

Piezoelectric Sensors

Piezoelectricity and mechanical resonance: stress, strain and polarization; constitutive relationships; equations of wave motion and wave representation.

The transverse-shear mode sensor, or quartz crystal microbalance: application to gas- and liquid-phase sensing; applications to VOC sensing, immunosensing and biosensors.

Optical Sensors

IR and UV sensors - semiconductors - optical irradiation – recombination - Quantum efficiency - p-n junctions - IV characteristics - forward bias and reverse bias - applications.

Micro Electro Mechanical System (MEMS) based sensors and electronic noses

Cantilever based sensors – Sensing Principles, types of cantilevers, use of different detection techniques, examples and applications

Chemometrics as applied to chemical detection and identification; Olfaction and electronic noses; Salient features

Sensor fabrication methods

Sensor configurations and geometries, Use of nano-materials in sensors

Thin/thick film formation techniques (physical, chemical and LB film formation techniques), MEMs based sensor fabrication

Surface analysis and characterization

Practicals

Testing of a solid electrolyte based potentiometric oxygen sensor
Testing of an amperometric sensor for oxygen
Fabrication and testing of a thick-film hydrogen sensor

CH-RM: Course on Research Methodology

Unit-I - Objectives and types of research: Motivation and objectives – Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Unit-II - Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem – Literature review – Primary and secondary sources – reviews, treatise, monographs-patents – web as a source – searching the web - Critical literature review – Identifying gap areas from literature review - Development of working hypothesis.

Unit-III - Research design and methods – Research design – Basic Principles- Need of research design –– Features of good design – Important concepts relating to research design – Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Unit-IV – Value of Statistics; Errors and Statistics – Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results – students's t test; F-test; Chi Square test; propagation of errors.

Unit-V - Reporting and thesis writing – Structure and components of scientific reports - Types of report – Technical reports and thesis – Significance – Different steps in the preparation – Layout, structure and Language of typical reports – Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation – Planning – Preparation – Practice – Making presentation – Use of visual aids - Importance of effective communication –.Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on "Experimental data and Literature Survey". **Unit-VI** - Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation – Copy right – Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights – Reproduction of published material – Plagiarism - Citation and acknowledgement - Reproducibility and accountability. [7 hrs]

BARC

M.Phil. in Physical Science
(Program Code: PHYS02)

SYLLABUS

PHYSICAL SCIENCES

Course work for Training School Officers (OCES)

The course work structure is divided into 5 foundation courses (A1-A5), 9 core courses (B6-B14), 3 experimental and laboratory courses (C15-C17) and 2 elective courses (D18, D19), as given in Table-1. The topic 'Research methodology' is explicitly included as a part of the course work (C16) as per the requirement of UGC. Total lecture hours are 490 + 75 tutorials and 7 weeks duration for a mini project (C17). Total credits are 60 as per the requirement of HBNI. Detailed course structure for individual subjects is provided separately. Some specific issues are as follows:

Research Methodology and methods of Experimental Physics

The course work includes specific topics related to 'research methodology' that are not covered elsewhere in the syllabus. These include design, analysis and presentation of scientific projects, objectives and planning of research, literature survey, statistical methods, mathematical modeling, documentation and presentation, laboratory safety and research ethics. Other topics in are related to the experimental techniques in areas such as vacuum, low temperature, X-ray, neutrons, spectroscopy, lasers and accelerators.

Mini Project

As regards the Mini Project (C17), it is understood that the project will be carried out after the completion of the trimester and allotment of trainees to various units of the DAE. The mini project will run concurrently with the elective courses.

Elective Courses

The elective courses are organized under five broad groups as shown in Table-2, which also provides the list of Divisions of BARC involved in closely related R&D activities. This grouping has been done so as to help a TSO to select an elective course that will help him/her to obtain advanced training required for the R&D work to be carried out in the division where he/she is allotted. Such grouping will ensure minimum number of students opting for a given elective course.

It is recommended that the two elective courses in respect of a TSO will be chosen in the following manner:

Elective-1: This elective will be from the group to which the Division of joining of a TSO belongs to (*cf.* Table-2).

Elective-2: This elective can be chosen from any of the other groups depending on the interest of the TSO.

Training School Physics Committee will advise the TSOs on the selection of the elective courses.

Marks are calculated using the formula (As per BOS decision)

2*Hours + 20*Credits (Nearest multiple of 25)

Course work for Training School Officers (OCES)

The course work structure is divided into 5 foundation courses (A1-A5), 9 core courses (B6-B14), 3 experimental and laboratory courses (C15-C17) and 2 elective courses (D18, D19), as given in Table-1. The topic 'Research methodology' is explicitly included as a part of the course work (C16) as per the requirement of UGC. Total lecture hours are 490 + 75 tutorials and 11 weeks duration for a mini project (C17). Total credits are 60 as per the requirement of HBNI. Detailed course structure for individual subjects is provided separately. Some specific issues are as follows:

Research Methodology and methods of Experimental Physics

The course work includes specific topics related to 'research methodology' that are not covered elsewhere in the syllabus. These include design, analysis and presentation of scientific projects, objectives and planning of research, literature survey, statistical methods, mathematical modeling, documentation and presentation, laboratory safety and research ethics. Other topics in are related to the experimental techniques in areas such as vacuum, low temperature, X-ray, neutrons, spectroscopy, lasers and accelerators.

Mini Project

As regards the Mini Project (C17), it is understood that the project will be carried out after the completion of the second trimester and allotment of trainees to various units of the DAE. The mini project will run concurrently with the elective courses.

Elective Courses

The elective courses are organized under five broad groups as shown in Table-2, which also provides the list of Divisions of BARC involved in closely related R&D activities. This grouping has been done so as to help a TSO to select an elective course that will help him/her to obtain advanced training required for the R&D work to be carried out in the division where he/she is allotted. Such grouping will ensure minimum number of students opting for a given elective course.

It is recommended that the two elective courses in respect of a TSO will be chosen in the following manner:

Elective-1: This elective will be from the group to which the Division of joining of a TSO belongs to (*cf.* Table-2).

Elective-2: This elective can be chosen from any of the other groups depending on the interest of the TSO.

Training School Physics Committee will advise the TSOs on the selection of the elective courses.

FOUNDATION COURSES

PY 501: Mathematical Physics

Symmetries and groups: Point groups, abelian and non-abelian groups, characters, representations of simple groups, Lie groups, symmetric groups, braid group

Functions of a complex variable: Analytic and multi-valued functions, Cauchy residue theorem and complex integration, Riemann surfaces, applications to fluid mechanics and quantum mechanics.

Ordinary differential equations (ODE): Linear and nonlinear first-order equations, classification of ODEs, linear independence and Wronskian, singular points, Frobenius series solutions for second-order differential equations, Green function, system of ODEs, phase portraits, hypergeometric and confluent hypergeometric equations, relation with special functions

Partial differential equations: Classification, characteristics, method of integral transforms, Green functions for Poisson equation, diffusion equation, wave equation, Helmholtz equation

Integral equations: Fredholm, Volterra, Abel integral equations, solutions by Liouville-Neumann, Fredholm method, Hilbert-Schmidt theory, Sturm-Liouville problems

PY 502: Quantum Mechanics

Background: Recollection of the experimental facts exposing limitations of the classical theory; Bohr model: Quantization of angular momentum, Schrodinger's approach to building a new theory leading to Schrodinger equation; Wavefunction, Statistical Interpretation; Probability, Normalization.

Formalism: Postulates of quantum mechanics: Representation of a state as a vector in Hilbert space; Scalar products; Dirac's bra and ket notation, Schwarz's inequality and linear operations on Hilbert space; representation of observables as hermitian operators; adjoints, eigenvalues and eigenvectors; hypothesis of measurement; Uncertainty relation as a consequence of Schwarz's inequality and the concept of minimum uncertainty states. Quantum mechanics in coordinate and momentum space representations and their relationship.

Quantum mechanics in 1-dimension: Free particle and wave packet, phase and group velocities, completeness; Uncertainty principle, minimum uncertainty, Ehrenfest's theorem; Step potential, transmission and reflection coefficients, transfer matrix;Particle in a well/box, density of states; Simple Harmonic Oscillator potential, creation and annihilation operators.

Quantum mechanics in 2-dimensions; Simple harmonic Oscillator potential, isotropic and non-isotropic.

Quantum Mechanics in 3-dimension: Angular Momentum; Angular momentum algebra; Free particle in 3-d; Particle in central potential; Hydrogen atom; Virial theorem, Feynman-Hellmann theorem;

Identical Particles: Two particle systems; Pauli's principle, Fermions and Bosons; Spin of an electron

Approximation methods: Wentzel-Kramers-Brillouin (WKB) method, Time-independent perturbation theory for non-degenerate as well as degenerate Hamiltonians; Variational method; Time-dependent perturbation theory.

Scattering theory: Lippmann-Schwinger equation, Born approximation, optical theorem, Eikonal approximation, method of partial waves.

PY 503: Statistical Physics

Background: Revision of main results of thermodynamics

Formalism: Introduction to micro-canonical, canonical and grand canonical ensembles with examples for each, derivation of Fermi-Dirac and Bose-Einstein distribution for a quantum ideal gas, Specific heat of a degenerate Fermi gas, Blackbody radiation, Bose-Einstein Condensation.

Phase transitions: Introduction to phase transitions, notion of continuous and discontinuous transitions, Landau Theory-Mean field and Gaussian fluctuations.

Monte Carlo Techniques and applications: Introduction to Monte Carlo methods, Metropolis algorithm, Application to numerical integration, application to Ising Model.

Applications: BBKGY equations, Vlasov equation, Saha ionization formula, Statistical nuclear physics

Irreversible processes: Master equation, Brownian motion and Langevin equation, Fluctuation-Dissipation theorem and calculation of friction constant

PY504 : Electromagnetic Theory

Background: Overview of EM theory and revision of basic concepts. Role and scope of EM theory and its applications.Laws of induction.Induced fields.Displacement current.Maxwell's equations in vacuum and media.

Electrostatics and Magneto-statics: Boundary value problems. Separation of variables Numerical methods.Finite difference representation of Poisson's Equation. Relaxation methods and Successive Over Relaxation Method (SOR)

Maxwell's equations: General solutions of Maxwell's Equation and Electromagnetic radiation. Electromagnetic waves in free space. General time dependent solutions of Maxwell's Equation: Wave-guides and cavities. Microwaves.Dipole Radiation.Bremsstrahlung.Cyclotron.Radiation as a diagnostic tool.

Propagation of electromagnetic waves through matter: reflection of waves in bounded media. Phase velocity; group velocity; wave equation; continuity theorem; Brilliouin diagram for empty cavity, etc.; Generation of modes in a cavity/waveguide; TEM, TE, TM modes; mode creation and identification. Boundary conditions; Generation of an electric field in an empty cavity; dispersion relation; frequency mode evaluation, etc.

Potentials and Fields: Gauge transformations. Retarded potentials.Lienard-Wiechert potentials.

Relativistic electrodynamics: Lorentz Transformations. Four Vectors.Covariant and contravariant tensors.Electrodynamics in Tensor Notation.Relativistic Potentials.Invariance.

Dynamics of charged particles in Electromagnetic fields: Orbit theory. Drifts (ExB, grad B perpendicular and parallel to B).Adiabatic invariance.Magnet mirror.

PY 505: Computational Physics

Computer Programming: Introduction to Linux, Programming in Fortran, Introduction to C and Parallel Processing, Hands on experience at the computer, Data plotting using programs such as gnuplot.

Numerical Methods: Errors in Numerical Methods, Data Statistics & Curve Fitting, Interpolation and Extrapolation, Integration of Functions, Solution of System of Linear Equations, Solution of Nonlinear Equation or Root Finding, Solution of Ordinary Differential Equations, Solution of Partial Differential Equations, Solution of Integral Equations.

Project Assignments: various realistic physics problems to be solved using numerical algorithms coded into programs to be run on the computer.

CORE COURSES

PY 601: Nuclear Physics

Background: Basic properties of nuclei, systematic of nuclear ground states (low lying states) properties, size, shape, electric and magnetic moment, nuclei away from the line of stability, isomers, nuclear decay, symmetries.

Nuclear Forces: Phenomenological description of nuclear forces, deuteron problem, N-N scattering, microscopic description, meson theory of nuclear forces, N-B interaction with fundamental degrees of freedom, nuclear resonances, quarks and gluons, QCD and chiral symmetry, colour quantum number, standard model, GUT.

Nuclear structure: Multipole composition of radiation, transition matrix, selection rules for multipole transitions, collective and single particle excitations, shell and collective models, giant resonances, high spin states and shape deformations, relativistic mean field theory, Fermi gas model, weak interaction, beta decay, neutrino interaction and oscillations.

Nuclear reactions: Definition of cross-sections, phase shifts, low energy behavior and astrophysics, compound nucleus theory, optical model, statistical model, direct reactions, heavy ion reactions and fission, semiclassical description of nuclear reactions, impact parameter representation, Galuber model, relativistic heavy ion collisions, energy density and rapidity, equation of state of QGP and hadronic matter phase transition, QGP in RHIC, LHC, experimental signatures.

Applied nuclear physics: RBS, NRA, NAA, AMS etc.

PY 602: Atomic, Molecular and Laser Physics

Atomic and Molecular Physics

Background of atomic and molecular structure: Energy level structure, effect of external electric and magnetic fields, Rydberg and autoionizing levels, Nuclear effects: hyperfine structure and isotope shifts, Radiative and non-radiative

processes, Born-Oppenheimer approximation, Vibrational, rotational and electronic spectroscopy of diatomic molecules including selection rules and intensities. Frank-Condon principle, Rotational and vibrational, Raman spectroscopy.
Molecular symmetry and group theory: Groups, Symmetry operations, Point groups, Character tables, Application to molecular problems.

Polyatomic molecules: Rotational energy levels and nuclear spin statistical weight effect, Vibrational spectra of polyatomic molecules: normal modes, energy levels and selection rules, types of bands, group theoretical treatment, inversion, torsional vibrations, etc. Designation of electronic states of diatomic molecules, coupling cases, Molecular orbital theory.

Accelerator based atomic/molecular physics: Spectroscopy with Synchrotron radiation: VUV and soft X-ray spectroscopy of atoms and molecules, photo-ionization /dissociation/ fragmentation, inner shell processes, techniques of electron spectroscopy, Beam foil spectroscopy and Collinear fast beam spectroscopy with ion accelerators.

Laser spectroscopy: Atomic/molecular beam and vapour sources, Theory and practice of Doppler-limited spectroscopic techniques: absorption, fluorescence, opto-galvanic, opto-acoustic spectroscopy. Non-linear and Doppler-free laser spectroscopy: Saturated absorption, polarization and two-photon spectroscopy. Multi-photon and multi-step processes and spectroscopy: Multi-step Resonance excitation/ionization, Multi-photon absorption/ionization.

Applications of laser spectroscopy: Trace analysis, Laser isotope separation, Laser cooling and trapping, Ion traps.

Laser Physics

Theory of Optical Resonators: Resonator modes, Stability criterion, Gaussian beams and their propagation.
Principles of laser oscillation: Pumping mechanisms, Rate equation for three/four level laser systems, Population inversion, Gain coefficient and threshold population inversion, Gain clamping, Single mode and multimode oscillations, Spatial and spectral Hole burning.

Intense and ultra-intense lasers: Techniques for generation of short laser pulse, Q-switching and mode-locking including active/passive schemes, Chirped pulsed amplification.

Types of Lasers: Solid state lasers- Nd:YAG, Ti:S; Gas and metal vapour Laser, Dye lasers, Semiconductor lasers and Diode pumped solid state lasers.

Non-linear Optics: Classical theory of nonlinear response, Wave propagation in nonlinear media, General properties of polarizability tensor, Three wave mixing– Second harmonic generation, Phase matching condition, Sum and difference frequency generation, Optical parametric oscillator and amplifier, Four wave mixing: Third order non linearity, Intensity dependent refractive index, Third harmonic generation, Elementary treatment of stimulated Raman scattering, Stimulated Brillouin scattering, Self phase modulation, and Optical phase conjugation.

Laser Applications: Laser Fusion, Laser accelerators, Laser material processing

PY 603: Plasma Physics and Technology

Background: Introduction to Plasma, the fourth state of matter, collective behaviour, charge neutrality, space and time scales. Concept of plasma temperature, Debye length, plasma frequency, plasma parameters. Debye shielding, plasma sheath and dielectric properties, plasma in nature and laboratory: elementary concepts of thermal, nonthermal plasmas, laser produced plasmas, non-neutral plasmas.

Basic processes in plasmas: Collisions in plasmas, significance of small angle scatterings, ionisation, recombination, concepts of diffusion, mobility, ambipolar diffusion. Thermal ionisation and the Saha equation, LTE and equilibrium models.

Plasma Theory: Fluid theory of plasmas, single & multi fluid approximations, generalized Ohm's law. MHD equations, Waves and instabilities in plasmas.

Plasma production and diagnostics: Various plasma production techniques, Electrical breakdown in gases using dc, rf, microwave and high frequency fields, Glow and arc discharge. Langmuir probes, magnetic probes, spectroscopic diagnostics, active and passive techniques.

High temperature plasma applications: controlled thermonuclear fusion, Introduction to thermonuclear fusion, fusion reactions, cross sections, radiative processes in plasmas, energy loss, Lawson criterion, break even and ignition, magnetic and inertial confinement scheme and devices, emission of X rays and neutrons, fusion plasma diagnostics.

Low temperature plasma applications: plasma processing of materials, Physics of high and low pressure plasma sources and applications to materials processing, brief review of plasma based surface coatings in low pressure and high pressure plasmas Plasma applications to metal cutting, melting, spraying and waste processing in nuclear, space and semiconductor industries.

PY 604: Physics of Materials and Surfaces

Background: Symmetry, nature of bonding, crystalline structure and classification, 2D and 3D lattice types, symmetry tables, constraints on physical properties by symmetry, diffraction for structure studies, nuclear and magnetic scattering, small angle scattering.

Lattice vibrations and phonons: Debye model, dynamical matrix, acoustic and optical branches, outline of experimental techniques, like neutron inelastic scattering, Raman and Brillouin scattering; special features in phonon spectra like softening, Kohn anomaly, etc.

Molecular dynamics simulation technique: simulations as a function of pressure and temperature.

Electron states, independent particle picture and periodic boundary conditions, metal-insulator-semiconductor bands, Fermi surface, relation to many electron system and total energy, exchange-correlation terms, relation to experiments like photoemission, optical absorption, etc.

Magnetism: Magnetic materials, types of magnetic ordering and interactions, principles of adiabatic demagnetization and cooling, magnetic domains, linearized spin waves in ferromagnets.

Superconductivity: Meissner effect, energy gap, London equation, type-I and type-II superconductors, vortices, tunneling junctions, outline of modern superconductivity theories, new superconducting materials.

Semiconductors: Intrinsic and extrinsic semiconductors, p-n junction and its applications, heterostructures and semiconductor superlattices.

Dielectrics and Ferroelectrics: Dielectric relaxation and loss, ferroelectric and related materials, comparison with ferromagnets.;

Introduction to surface structures, stability and reactivity.Surface reconstructions and relaxation.Surface processes: Physisorption and chemisorptions.

Surface modification techniques: Physical vapor deposition (thermal evaporation, electron beam, laser ablation, sputtering, molecular beam epitaxy), chemical vapor deposition. Self-assembled monolayers, Langmuir-Blodgett techniques.

Surface characterization techniques: Morphology (optical, scanning electron, atomic force, scanning tunneling and tunneling electron microcopies); Structure (low energy electron diffraction, high energy reflected electron beam diffraction, grazing x-ray diffraction); composition (X-ray photoelectron spectroscopy, energy dispersive X-ray analysis, Rutherford back scattering, secondary ion mass spectrometry).

PY 605: Reactor Physics and Technology

Basics Neutron Physics Concepts: Fission process, Definition of flux, current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section. International Nuclear Data files & processing for reactor application.

Steady State Neutron Transport Equation: Transport equation : Differential & integral forms, Diffusion approximation, One speed neutron diffusion theory, Boundary conditions, Source-sink problem, Sub-critical reactors with flux independent source, K-infinity, four factor formula, Critical reactor and concept of K, Separation of space and energy.

Homogeneous Reactor: Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector savings.

Slowing Down and Energy Dependence: Elastic scattering, Inelastic scattering, Anisotropy, average energy loss per neutron, Concept of lethargy. Fermi age theory, age of neutron, Logarithmic energy decrement, Slowing down spectra, Slowing down in hydrogen, Definition of resonance integral, Shape of thermal neutron-Maxwell spectrum.

Resonance Absorption: Resonance cross sections, Resolved and unresolved region, Spatial and energy self shielding, Narrow resonance and intermediate resonance approximation, Concept of potential scattering cross section, Resonance integral in homogeneous media, Doppler broadening of resonance.

Multi-group Diffusion Theory: Energy group and group fluxes, Flux weighted group constants, One group theory for thermal neutrons, Two group theory, Two group two region model core with reflector.

Reactor Kinetics: Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, One group delayed neutrons, One dollar of reactivity, Prompt criticality.

Reactor Control: Cold start-up, Hot power operation, Temperature loads, Effects of burnup and fission products. Function of control rods. Theory of control rods, Xenon load during operation, Xenon iodine concentrations after shutdown, Xenon override, Xenon poison out condition, Samarium poisoning. Temperature coefficient of reactivity, Density temperature coefficient.

Experimental reactor physics aspects: Neutronic Instrumentation (source and power range monitors/detectors); Neutron Sources - requirement vis a vis reactor type (eg external localised sources in LWRs & Fast Reactors; internal distributed spontaneous fission/photo neutron sources in PHWRs) ; Approach to criticality in different reactors; different steps of initial start up in different reactors (research and power reactors); Low power experiments for validation of reactor physics evaluations - subcritical and critical experiments; experimental determination of reactivity coefficients; General methods of flux measurement - foil/wire activation methods; spectrum unfolding; differential measurements for reaction rates; Dynamic methods for reactivity evaluation - power run-down experiments and period measurements; Process parameter measurements using neutronics - eg., coolant flow measurement with N-16 gamma signals; Delayed neutron and noble gas fission

Nuclear Fuel Cycles: Uranium-Plutonium, Uranium-Thorium. Brief Description of Nuclear Reactors like PHWRs, AHWR,VVER, HTR and FBR. Brief discussion of Accelerated Driven Subcritical System (ADSS)

PY 606: Accelerator Physics and Technology

Basic Accelerator Physics

Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons; intersecting storage rings; ion sources.

General equations of motion in a combined electric and magnetic field, in Cartesian co-ordinate system; in cylindrical co-ordinate system; beam rigidity; relativistic expressions.

Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.

Expression for vertical betatron frequency; expression for horizontal betatron frequency; weak focusing principle; stop bands.

Tunes and Resonances in betatron oscillations; imperfection resonances; sum and difference resonances; non-linear resonances; tune diagram; working point of an accelerator; general design of a cyclic accelerator.

Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;

Matrix techniques in beam optics; first order transfer matrix of dipole/quadrupole, transfer matrix of a drift space; quadrupole doublet; condition for double focusing; other focusing conditions; aberrations; second order transfer matrix; matching and design of beam transport systems.

Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters

Strong focusing principle; analysis of betatron frequencies using matrix technique; condition for strong focusing; lattice design.

Momentum compaction; Longitudinal stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.

Physics of synchrotron radiation sources; spectrum of emitted radiation; Schwinger's expressions; brilliance of a source; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators, FEL; fundamental wavelength.

RF Linacs

Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.

Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac

Transit time factor and the energy gained in a linac.

Longitudinal stability; stability criteria; separatrix ; synchronous oscillation with small and large amplitudes; longitudinal wave vector; time period; phase damping; acceleration through v=c traveling wave linac and damping phenomena; acceleration conditions therein etc.

Transverse stability; stability criteria; impulse due to radial field; focal strength of a radial defocusing impulse.

Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.

General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature structures; superconducting structures (SC); general advantages of SC systems over room temperature ones; Breakdown mechanisms in SC cavities.

Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac

Introduction to space charge effects.Linear space charge and KV envelope equations.

Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Applications: Accelerator Driven Systems.

High power DC and pulsed electron accelerators

Electron emission processes; thermionic cathodes; field emission; explosive field emission.

Pulse power systems; Marx generators; Tesla transformer, transmission line spark gaps; induction linac.

Relativistic electron beam generation, propagation and applications in generation of microwaves, neutrons, ion beams and X-rays.

Industrial DC electron accelerators.

12. *The Principles of Circular Accelerators and Storage Rings*, Philip Byrant (Cambridge University Press, 2005)

PY 607: Astrophysics

Introduction to Astrophysics and Astronomy: Celestial sphere, coordinate system, time references, cosmic-rays, multi-wavelength observations.

Astrophysical Objects: Stars, clusters, galaxies, x-ray binaries, pulsars, supernova remnants, active galactic nuclei etc.

Non Thermal Universe: Cosmic-ray spectrum and composition, Cosmic emissions at keV-TeV energies, first order and second order Fermi acceleration, diffusive shock acceleration.

Experimental Techniques in Astronomy: Gas filled detectors, solid state detectors, satellite based experiments, ground based experiments, extensive air showers, simulation studies, atmospheric Cherenkov technique.

Fundamentals of Radiative Transfer: Electromagnetic spectrum, radiative flux, specific intensity and its moments, basic equations of radiative transfer, bremsstrahlung, synchrotron and inverse Compton process, proton-proton collision, neutral pion decay, proton-photon interaction.

Theory of Accretion: Spherical accretion, Eddington luminosity, disc accretion and its basic equations, equations for structure of discs and their standard solution.

Jets and Outflows: Microquasars, Blazars and Radio Galaxies, radiation emission from jets, Doppler boosting, Lorenz transformations, observed spectra and spectral models.

Note: First four topics (with first three references) constitute the regular 15 lecture course (See Table-1) while all the topics together constitute the 30 lecture course (see Table-3).

PY 608: Electronics

Digital Electronics

Overview of Digital Integrated Circuits: Boolean Algebra and Truth Tables, Integrated circuit Families and their applications, Digital Gates, Flip-Flops, Counters, Multiplexer, Memories.

Number system: Binary, Octal, Hexadecimal with examples. Conversion from one to the other.

Half Adder, Full Adder, 4 bit Adder/Subtractor.

Digital Computer Systems: Basics of Digital computers, 8085 microprocessor architecture and interfacing of memory and I/O peripheral devices.

Buses: Synchronous, Asynchronous. Basics of ISA and PCI buses

Interface standards: RS232, USB; basic protocol, voltage levels, data transfer rate, length etc.
SCADA – Overview

Analog Electronics

Overview of Electronic Devices and Circuits: Diodes, Zeners, Transistors and FETS. Switching Circuits.

Linear Integrated Circuits: Characteristics of OP AMP, Applications of OP AMP (Amplifier, Integrator, Differentiator etc) and Comparator.

Power Supplies: Linear and Switch Mode Power Supplies, High Voltage and Power supplies.

Data Converters: Sampling Theorem, Analog to Digital Converters, Digital to Analog Converters, Sample and Hold Circuits

3. *Electronic Principles,* A. P. Malvino, 7th Edition (Tata McGraw-Hill Publishing).

PY 609: Health Physics and Radiation Detectors

Part-I: Nuclear and Radiation Detectors

Interaction of radiation with matter: Energy loss of heavy charged particles in matter – Electronic stopping power (Bohr and Bethe-Bloch formulae), Cherenkov radiation.Energy loss of electrons and positrons: Electronic stopping and energy loss by bremsstrahlung radiation,Interaction of photons: Photoelectric absorption, Compton scattering, pair production, Electromagnetic shower in high energy photon and electron interaction with matter**,** Interaction of Neutrons: elastic scattering, radiative capture, positive Q-value reactions such as (n,p), (n,a), (n,fission) and hadron shower production at high energies.

Radiation detectors: General characteristics of detectors: efficiency, response in energy, time, position and corresponding resolutions, recovery time or count rate handling capability**,** Gas detectors: Basic processes, Q-V characteristics as a function of primary ionization, charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter. Large area MWPC, PPAC.Semiconductor detectors: Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium detectors (planar and cylindrical geometry). Photovoltaic cells, charged coupled devices.Scintillation detectors: Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes**,** Compton suppressed high purity germanium detectors for high-resolution gamma spectroscopy,Miscellaneous detectors:Cryogenic detectors, thermal detectors, channeltrons and microchannel plates, plastic track detectors, hybrid detectors.

Experimental techniques: Electronics modules for pulse processing: Preamplifiers(charge, voltage sensitive), amplifiers (spectroscopy or high resolution, fast and timing filter), timing discriminators(leading edge and constant fraction types), gate and delay generators, coincidence(fast and slow) units, linear gate and stretchers, scalers and rate dividers, SCA, TAC, ADC, QDC, TDC, MCA, computer based data acquisition systems (DAQ). Particle identification methods (dE-E telescope, pulse shape discrimination, Cerenkov radiation), time of flight technique, magnetic spectrometers including recoil mass separator.Monte Carlo simulation of detectors.

Part-II: Health Physics

Introduction: Radiation sources, quantities and units: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given). Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given), Exposure dose relationship, Bragg-Grayprinciple.

Biological effects, Radiation Protection and Regulation: Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell.Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Importance of radiation protection programme in DAE. Types of exposure (natural, occupational, medical and public).National and International regulatory bodies, their role and responsibilities. Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems).Latest recommendations of ICRP-103.Fundamentals of ICRP respiratory model (only basics), entry through ingestion, GI track model (only basics).Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Radiation protection and measurement (External and Internal): Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources.Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area monitoring, air monitoring. bioassay, whole body counting and Liquid Scintillation Spectrometry (LSS) techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures: Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation.

Nuclear Accidents, Emergency Preparedness and Management: Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

Industrial Safety (Non radioactive): Principles of industrial safety and industrial hygiene; legislation related to health and safety and major hazard control.

PY 610: Engineering Drawing and Workshop Practices

Overview of Engineering Drawing

Drawing Instruments, Standards and Codes: Introduction; Drafting Instruments-Drawing board, T-square, Set-square, Compass, Dividers, Scales, French curves and Drafting machines; Various Indian and International standards and codes related to drafting.

*Sheet Layout and Sketching***:** Sheet layout; Sheet sizes; Scales and scale drawing.

*Types of drawing***:** Assembly drawing- General assembly drawing, Schematic assembly drawing, Exploded assembly drawing; Sub assembly drawing; Part drawing; Production drawing; Drawing for manual and catalogue.

*Lines, Lettering and Dimensioning***:** Introduction; Types of lines; Types and sizes of letter; Dimensioning- Types, Terms and notations, Placing of dimensions, Unit of dimensioning, general rules and practical hints on dimensioning.

*Orthographic Projection***:** Introduction, principle of projection; Methods of projection, Orthographic projection, Planes of projection, First angle projection, Third angle projection, B.I.S. code of practice and conventions employed.

Sectional Views: Introduction; Cutting plane line; Types of sectional views- Full section, Half section, Partial or broken section, Revolved section, Removed section and Offset section; Sectioning conventions; Hatching or section lines and conventions of section lines.

*Tolerances, Limits and Fits:*Introduction;Linear and angular tolerances; Tolerance zone – limits and deviations; Tolerance sizes, Standard tolerance grades; Geometric tolerances; Classification of fits – Clearance, Transition and Interference; System of fits – Hole basis and Shaft basis.

Surface Parameters: Surface texture; Surface irregularities; Surface roughness assessment methods; Roughness grades – symbols, values and grade numbers; Principle reasons for controlling the surface texture; Factors affecting the surface roughness; Disadvantages of excessive roughness; surface roughness achievable from different manufacturing process.

Computer Aided Drafting: Introduction; Benefits and limitations of CAD; Hardware and software of CAD system; AutoCAD–Brief introduction; Drawing environment, layout and sketching; How to access commands;Getting help; Starting a drawing**-**Existing drawing & New drawing**;** Basic settings – Units, Scale, Limits**,** Grids, & Snap**;** Elements of drawing-Line, Multi-line, Rectangle, Polygon, Curve, Circle, Donut, Points, Sketch, Spline, Ellipse, Hatch & Fill;Object Properties - Line type, Colour and Layer; Undoing mistakes;Drawing accurately; Viewing and Editing commands– Zoom, PAN, Move, Align, Rotate, Copy, Mirror, Array, Offset, Trim, Extend, Chamfer, Fillet and Erase;Text; Dimensioning and Printing / Plotting of drawing. Brief introduction of Solid modeling software and its command.

Threads and fasteners: Introduction; Parts of threads; Forms of threads; Single and multiple start threads; LH & RH threads; Brief introduction of bolts, studs, screws, plain & spring washers, set screw and split pin.

Overview of Workshop Practices

Manufacturing Process: Introduction; Classification of manufacturing process- Machining, Joining and Forming.

Metal Cutting using machine tools: Introduction; Theory of metal cutting; Process of metal cutting; Single point and Multipoint cutting tools; Tool signature; Machine reference system; Commonly used metal cutting machines, its parts and related operations / processes viz. Turning, Drilling, Boring, Milling, Shapers, Planer, Grinding etc.

*Unconventional machining operations***:** Introduction; Various types of machines and its operations viz. AJM, USM, ECM, EDM, EBM, and LBM.

*Metal Cutting using hand tools***:** Introduction; Various types of hand tools, its parts and related machining operations viz. saws, Files, Hand drills, Taps, and Reamers.

*Metal Forming***:** Introduction; Various types of forming tools, its parts and related forming process viz. Rolling, Bending, Spinning and Drawing.

*Joining Methods***:** Introduction; Various metal joining tools and related processes viz. Soldering, Brazing and Welding; Various types of demountable joints, flanges and coupling.

PY 611. Research Methodology and Methods of Experimental Physics

Research Methodology: Definition and characteristics of research,Objectives, importance and planning of research, types and stages of research, scientific methods, accessing scientific literature, *Experimental design*: control of errors, calibration of instruments, data analysis,*Statistical methods*:Definition of precision, accuracy, systematic and random errors**,** propagation of errors in experimental data and their estimation, estimation of confidence level.*Mathematical modeling*: measurement of functional relationships, order of magnitude analysis, function fitting, *Documentation*: preparing scientific papers/reports and presentations, *Laboratory safety*: Safe practices, *Research ethics:* acknowledgment of the source of ideas, awareness of plagiarism and other scientific misconducts.

Vacuum Techniques: Definition of Vacuum, Basic theory of Gas dynamics**,** Importance of Vacuum for various experiments, Low temp, Accelerators etc.**,** Flow Regimes in vacuum systems**,** Line Conductance, Calculation of pump-down time**,** Pumps and their ranges: Rotary vane pumps, Diffusion pumps, Ion pumps, Cryo-pumps, Sorption pumps, Gettering pumps**,** Vacuum Gauges in various ranges: Thermal Conductivity gauges, Ionization gauges, Ultrahigh vacuum gauges**,** Vacuum valves**,** Design of vacuum systems**,** Leak detection

Low Temperature Techniques: Requirement of Low Temperature *techniques* for experiments, Heat transfer mechanisms at low *temp*: conduction, convection and radiation, Thermal properties of materials at low temp: Sp. Heat, Thermal conductance etc.Thermodynamic properties of liquid cryogens, Liq. $N_2$and Liq. He, Low *temp* thermometry, Design of small scale laboratory cryostats: Material selection, their properties, Vacuum components, type of measurements, Superconducting magnets, Various inserts, Experiments at low temp: Transport properties, Magnetic properties, Faraday balance, Vibrating Sample magnetometer, SQUID, A.C. Susceptibility, Torque magnetometry

X- ray and Neutron Techniques for Condensed matter studies: Neutrons and X-rays as probes for condensed matter. Complementarities of the techniques**,** Neutron and X-ray sources: Nuclear reactors, Spallation Neutron Sources, Laboratory X-ray sources, Synchrotron X-ray sources**,** Elastic scattering of neutrons and X-rays. Experiments and examples**,** Inelastic scattering of neutrons. Dynamics in solids**,** Possible inelastic experiments in synchrotron sources using X-rays

Laser-Raman and Infrared spectroscopy: Theory of Raman spectroscopy, Laser Raman spectrometer, Molecular symmetry and Raman active modes, Some typical examples, Theory Infrared spectroscopy, Fourier Transform IR (FTIR) Instrument, Typical examples. Comparison with Laser-Raman spectroscopy, IR experiments in synchrotron sources

Laser and Laser spectroscopy Techniques: *Laser diagnostic techniques*: measurement of energy/intensity/power, pulse width, bandwidth, polarization etc. Synchronization of laser pulses, optical alignment. *Laser spectroscopy*: Techniques of some laser spectroscopy experiments in brief i.e. Intracavity laser absorption spectroscopy, CRDS, fluorescence, Saturation absorption spectroscopy, optical pumping and double resonance techniques, Design and implementation, maximization of signal, calibration of frequency

Plasma Physics and Technology: Understanding operation of plasma torches: construction of plasma torches, I-V characteristics of arcs, requirement of I-V characteristics of power supplies for plasma torches, gases suitable to be used for production of plasma, method of ignition of plasma, water cooling systems, interlocks etc. Determination of temperature in thermal plasma jets by spectroscopy techniques.

Experiments in accelerator physics and nuclear physics.

ELECTIVE COURSES

Elective Courses in General Physics

PY 701: Special topics in Mathematical Physics

Difference equations: Homogeneous linear difference equations (constant-coefficient equations, linear independence, initial and boundary-value problems, Euler equations, generating functions, eigenvalue problems); Inhomogeneous linear and nonlinear difference equations

Local analysis: Singular points, local behaviour of solutions at irregular singular points of homogeneous linear equations, inhomogeneous linear equations, asymptotic relations, asymptotic series, approximate solutions of nonlinear differential equations, nonlinear autonomous systems, singular points of difference equations and local behaviour of solutions, regular and singular perturbation theory, perturbative eigenvalue problems

Global analysis: Boundary layer theory (examples, mathematical structure, simple boundary layer problems), Multiple-scale analysis (resonance and secular behaviour, formal theory, examples), Floquet theory of stability, Mathieu equation, Fermi-Pasta-Ulam problem

Reference

1. *Advanced Mathematical Methods for Scientists and Engineers,* C. M. Bender, S. A. Orszag (Springer, 2010).

PY 702: Selected Topics in Classical Mechanics

Basic concepts: Principle of least time, connection with Huygens principle, optics-mechanics analogy – the basic ideas of Hamilton's mechanics, Euler-Lagrange equations and Hamilton's equations, applications

Transformation theory of mechanics: Generating functions, contact transformations, canonical transformations, canonical group, motion in phase space, Poincaré-Cartan invariant, action-angle variables, adiabatic invariance, examples

Integrable systems: One degree of freedom, Liouville-Arnold theorem, dynamical systems, more than one freedom, noncanonical variables

Canonical perturbation theory: Resonances, classical perturbation theory, adiabatic perturbation theory, secular perturbation theory, applications

Near–integrable systems: KAM stability, three-body problem, applications to celestial mechanics, plasma physics

References

2. *Chaos in dynamical systems,* E. Ott (Cambridge University Press, 2001).
3. *Classical dynamics - a contemporary approach,* J. V. Jose, E. J. Saletan (Cambridge University Press, 2002).

PY 703: Chaos and Nonequilibrium Statistical Mechanics

Introduction: Laws of mechanics and the law of large numbers, Boltzmann ergodic hypothesis, Gibbs' mixing hypothesis, problems in modern nonequilibrium statistical mechanics

Boltzmann and Liouville equation: Derivation, H-theorem, Kac ring, diffusion, BBGKY heierarchy, Poincare recurrence theorem, Birkhoff ergodic theorem, mixing systems, distribution functions

Green-Kubo formulae: Linear response theory, van Kampen's objections, Green-Kubo formula for diffusion

Nonlinear maps: Baker map, Boltzmann equation for Baker map, Bernoulli sequences, irreversibility, Arnold cat map, Kolmogorov-Sinai entropy, Pesin's theorem, Markov partitions, Frobenius-Perron equation

Open systems: Smale horseshoe, escape-rate formalism, thermodynamic formalism for chaos, transport coefficients, deterministic diffusion, Sinai-Ruelle-Bowen measures, entropy, Gallavotti-Cohen fluctuation formula

Dynamical foundation of Boltzmann equation: Lorentz gas, Sinai formula, Lorentz-Boltzmann equation

References

PY 704: Nonlinear Dynamics

Introduction to Nonlinear Dynamics: Introduction to nonlinear dynamical systems (continuous-time): local and global bifurcations, Explanations of Feigenbaum sequence and other routes-to-chaos through standard maps. Characterization of chaos: fractal dimension and other measures; Feigenbaum universal constants. Nonintegrable Hamiltonian dynamics: KAM theorem, Transition from regular to chaotic state, KAM Torus Breakdown.

Instabilities and chaos of periodically forced nonlinear oscillators: Harmonic and various subharmonic resonances. Period doubling, tripling, quadrupling, n-tupling bifurcations, Synthesis of bifurcation structure: recurrent features. Multistability and basins of attraction; Crises of chaotic attractors.

Examples of bifurcations and chaos in laboratory-scale systems: Feigenbaum sequence, multistability and crises in lasers, Instabilities and chaos in electronic circuits, Fluid dynamical instabilities in natural circulation thermal hydraulics and in plasma. Dynamical diseases: cardiac and neurological. Introduction to soliton wave propagation.

Control and synchronization of nonlinear phenomena: Control of Chaos-theoretical concepts, Control of multistability and multi-state hopping intermittency, Coupled nonlinear dynamical systems: various modes of synchronization, secure communication.

Experiments and Numerical projects: Hands-on experience on analyzing various types of bifurcations, crises, chaos, multistability, noise-induced intermittency etc with nonlinear electronic circuits. Computations of subharmonic bifurcation curves of the periodically forced nonlinear systems.Analysis of nonlinear phenomena in the case of autonomous nonlinear systems.

Elective Courses in Nuclear and Accelerator Physics

PY 707: Selected Topics in Nuclear Physics

Brief introduction to heavy ion fusion reactions: General features, Energy dependence at low energy, Limitation at high energy

Decay of the compound nucleus and the statistical model analysis: Bohr hypothesis and Hauser-Feshbach evaporation model, Optical model, Transmission coefficients, Nuclear level densities (NLD)

Particle evaporation spectra and nuclear level densities: Evaporation spectra of neutron and charged particles, Experimental measurements, Extraction of NLD from evaporation spectra

Electromagnetic decay of excited nuclei: Electromagnetic interaction in nuclei – a brief introduction, Single particle and collective gamma transition

Brief introduction to giant resonances in nuclei: Giant resonances – definition, Energy and width systematic, Macroscopic and microscopic description – brief treatment, Giant Dipole Resonance (GDR) in deformed nuclei

Giant Dipole Resonance in excited nuclei: Brink-Axel hypothesis, GDR on excited states in proton capture reactions, GDR in hot nuclei formed in heavy ion reactions

Properties of GDR from high energy gamma spectra using statistical model: Inclusion of GDR emission in statistical model, Measurement of high energy gamma spectra – detectors, experimental procedures, Extraction of GDR information from measured spectra using statistical model, Shape evolution and fluctuation of hot rotating nuclei

Experiments with radioactive Ion Beams (RIB) and future directions: Production of RIB – different methods, GDR in exotic nuclei

4. *Theoretical Nuclear Physics*, A. de Shalit and H. Feshbach (Wiley, NY 1974)

PY 708: Advanced Accelerator Physics & Technology

Proton and Heavy Ion Accelerators:DC Accelerators, Linacs, Cyclotrons, Synchrotrons etc,Positive and negative ion sources, Ionization, Recombination, Charge transfer and other processes in ion sources, Beam extraction, Low energy beam transport - matching to an accelerator, Radio Frequency Quadrupole, DTL, CCDTL and CCL, High Current Accelerators, Introduction to ADS Systems, Linacs for ADS. Normal and Superconducting accelerator structures, Space charge effects, Waveguide resonators etc.

Gigawatt Pulsed Power and Industrial Electron Accelerators: Electron emission processes and technology of cathodes, Electron gun design and related areas. Gigawatt to Terrawatt power pulsed electron guns, beam transport, HPM generation, Flash X Ray generation and applications. DC and RF Industrial Electron Accelerators- sub systems and applications

Beam Dynamics and advanced accelerators: Beam emittance, Liouville's theorem, Beam transfer lines, FODO cells, quadropole triplet, phase space matching, emittance dilution, Synchrotrons & Storage Rings, Synchrotron Radiation (SR) Sources, Linac Based SR Sources.
New Accelerators: Free Electron Lasers, Laser Acceleration, Plasma Beat Wave Accelerators

5. *Free Electron Lasers*, C. A Brau, (Academic Press, Oxford, 1990)

PY 709: Introduction to Neutrino Physics

The course is intended to introduce the basics of neutrino physics. By the end of the course it is hoped that one will be able to appreciate the intense activity worldwide in thisfield. A brief exposition of a non-invasive method of monitoring fissile materials using neutrinos will also be given.

Present understanding of fundamental particles and their interactions: neutrinos and their properties. Weak decays such as nuclear beta decay, muon and pion decay. Higher order processes such as double beta decay in nuclei.

Neutrino sources: Stellar (including the sun and supernovae), atmospheric, natural radioactivity, reactors and particle accelerators

Interactions of neutrino with matter: charged and neutral current processes, quasielastic and deep inelastic scattering

Neutrino oscillations: two flavour oscillations in vacuum and matter, three flavor oscillations

Some key experiments in neutrino physics: discovery experiments of ν_e,ν_μ,$\nu_\tau$etc.; what has been learnt and what we do not yet know; ongoing and planned experiments

PY 710: High Energy Astrophysics

Introduction to Astrophysics and Astronomy: Celestial sphere, coordinate system, time references, cosmic-rays, multi-wavelength observations.

Astrophysical Objects: Stars, clusters, x-ray binaries, pulsars, supernova remnants, active galactic nuclei etc.

Non Thermal Universe: Cosmic-ray spectrum and composition, Cosmic emissions at keV-TeV energies, first order and second order Fermi acceleration, diffusive shock acceleration.

X- ray and Gamma-ray emission: Observed spectra from galactic and extragalactic sources, bremsstrahlung, synchrotron and inverse Compton scattering, IC spectra from optically thin and thick sources, electron-positron pair physics, thermal electrons and radiation, non-thermal electrons and radiation, gamma-rays from proton-proton and proton-photon interactions.

Theory of Accretion: Spherical accretion, Eddington luminosity, disc accretion and its basic equations, a alpha prescription of viscosity, equations for structure of discs and their standard solution.

Jets and Outflows: Microquasars, Blazars and Radio galaxies, radiation emission from jets, Doppler boosting, Lorenz transformations, observed spectra and spectral models.

Experimental Techniques in Astronomy: Satellite based experiments, ground based experiments, extensive air showers, simulation studies, atmospheric Cherenkov technique.

Elective Courses in Atomic, Molecular, Laser and Plasma Physics

PY711: Synchrotron Radiation and its Applications

Production and properties of SR: Physics of production of SR, general properties and advantages of SR, Storage rings, properties of bending magnet radiation, important relations/equations, Radiation from insertion devices (Wiggler, undulator), FELs, Historical development and current scenario, overview of Indus-1 & Indus-2.

Basics of Beamline Instrumentation: Considerations in optical design of beamlines, Special requirements in VUV, Soft-X-ray, Hard X-Ray, IR, types of monochromators, Mirrors, gratings, detectors, vacuum systems, electronics etc.

Experimental Techniques: Overview of typical experiments carried out at synchrotron facilities, brief introduction to various techniques, Spectroscopy (VUV, soft X-ray/hard X-ray spectroscopy, PES, ARPES, IR, THz), Scattering (Diffraction, crystallography, small angle scattering, Inelastic X-ray scattering, etc), Imaging (X-ray imaging, IR imaging, Microscopy, Lithography), Special techniques utilizing the polarization or time structure of SR

Atomic, Molecular & Cluster Physics using SR: Physics of autoionisation, Rydberg states, superexcited states, chemical dynamics, advantages of using SR to study these phenomena. Techniques: Photoabsorption, photoionization, fluorescence, PES (incl. ZEKE, MATI, etc.), Laser + SR, coincidence experiments, etc: Basic principles, design of experimental stations, information obtained. Recent developments & current status of the field internationally. Currently available facilities & ongoing research programs of AMPD at Indus-1(PPBL, HRVUV, photoabsorption studies of stable gases/free radicals, matrix isolation spectroscopy, etc.; Beamline & experimental stations planned at Indus-2.

PY 712: Selected Topics in Atomic and Molecular Physics

Coherent spectroscopy: Transition from Doppler to sub-Doppler to natural linewidth to sub-natural linewidth, theory and practice of sub-natural linewidth spectroscopy, atomic frequency stabilization techniques, error signals and stability, applications of coherent spectroscopy including slow light generation.

Physics with trapped ions and atoms: Techniques ofion-traps (Paul trap, linear quadrupole trap etc) and atom traps (magneto-optical trap, dipole trap), ultra-precision measurements of atomic parameters and fundamental constants, quantum jumps and parity violation in atoms/ions, quantum degenerate gases, ultra-cold molecules.

Atoms and molecules in intense fields: Multi-photon processes in atomic and molecular systems, cross-sections, Intense and super-intense laser-atom/molecule interaction, pondermotive force, Keldysh parameter, above threshold ionization, high harmonic generation, atomic stabilization, theoretical techniques involving Floquet and split operator methods, experimental techniques. Atoms in high magnetic fields.

PY 713: Advanced Photonics

Review of wave optics: wave-particle duality concepts and experiments, Maxwell's equations, wave equation for light. Light propagation in conducting and non conducting medium, sources of light, characteristics of light (coherence and polarization), light in bulk materials.

Basics of lasers: emission and absorption of light, Einstein coefficients, population inversion, threshold condition, laser beam characteristics and parameters.

Fiber and non-linear optics: Reflection and refraction at plane wave interface, total internal reflection, TE and TM polarization, Goos-Hanchen shift, modes in optical waveguides, step index and graded index fibers, fiber in optical communication, fiber amplifiers and fiber lasers. Non-linear optics of materials, when and how non-linear response arise, dispersion relations, phase matching conditions, second and third harmonic non- linear optical effects, frequency mixing, Kerr effect and electro-optics effect. Applications of non-linear optics

Introduction to nanophotonics: Optical materials from bulk to nano-scale, why nanophotonics, light scattering mechanism in nano-scale structures, optics of quantum dots, nano-plasmonic crystals, surface plasmons, Fermi-Golden rule, photon density of states, different approaches to fabricate nanophotonic structures, application of nanophotonics.

Meta-materials: What are meta-materials, classes of materials and their exotic properties, photonic band gaps, one, two and three-dimensional band gaps for light, wave equation in photonic crystals, different methods to calculate photonic band structure, origin of band gap, spontaneous emission in photonic band gap, nanophotonics switching, optics of cavities, experimental realization of photonic crystals, different characterization techniques.

PY 714: Quantum Optics and Information

Quantum theory of radiation: Quantum states of radiation field, non-classical states, squeezing, photon statistics, correlations, noise properties of light.

Quantum theory of light-atom interaction: Optical Bloch equations, quantum theory of damping and master equation, dressed atom approach, quantum theory of lasers, coherent control, electromagnetically induced transparency.

Ultra-cold atoms and quantum degenerate gases: Laser cooling and trapping of atoms, interactions involving ultra-cold atoms, ultra-cold quantum gases, Bose-Einstein condensation, Gross-Pietavskii equation.

Elements of Atom optics: Atom optical elements, atom interferometry, non-linear atom optics, quantum atom optics.

Elements of Quantum information: Entanglement and its measures, quantum measurement, quantum teleportation, quantum communication, physical realization of quantum computer.

PY 715: High Power Lasers and Applications

Basics: Coherence, Resonator modes, Gaussian & Non-Gaussian beams, propagation through optical systems, beam quality, focusing, atmospheric propagation effects and adaptive optics techniques.

Nonlinear optical processes: Second Harmonic Generation, Third Harmonic G with pulsed and cavity enhanced CWorking lasers, Parametric generation, SRS, Two-photon absorption, Self-focusing and Self phase modulation, Nonlinear optical effects in optical fibers.

Types of lasers: Excitation techniques & Laser properties in different media: Gas (He-Ne, CO_2, Excimer, Cu Vapor, Chemical), Solid state : (Nd:YAG, Nd:Glass, Yb:YAG), Semiconductor diode, Free Eelectron Laser. Tunable lasers: Dye, Diode, Ti:Sapphire, Optical Parametric Oscillator, Frequency selection & tuning techniques, frequency stabilization.

Laser dynamics & pulse generation: Brief recapitulation of Relaxation oscillations, Q-switching, cavity dumping

Ultrashort pulse generation: Mode locking, Group Velocity Dispersion compensation in Kerr Lens Modelocking cavities, Pulse compression.

Power scaling: Special resonators, Pulsed laser amplifiers (CO2, Nd:YAG/Glass, Dye, CVL, Master Oscillator Power Amplifier chains) – gain saturation, efficiency, spectral narrowing, Injection locking. Diode laser arrays & amplifiers, Diode Pumped Solid State Lasers, Fiber lasers

Ultrashort pulse amplification and compression: Chirped pulse amplification in Ti:S, Opt Para CPA, regenerative amplifier, multipass amplifier – typical system architectures.

Applications: Laser Ionization Spectroscopy – applications in science & technology. Laser requirements and system architecture. Material processing, Reflection, transmission & absorption of laser beams in materials, ultrafast material processing.

High intensity laser interaction with materials: Basic phenomenology of: High intensity effects, High order harmonic generation, production and acceleration of charged particles, laser induced nuclear reactions, X-ray lasers, Laser fusion.

PY 716: Laser-Matter Interactions and Applications to Advanced Material Processing

Introduction to Laser Matter Interaction; Basics ofPulsed, Ultrashort and CW lasers typically employed for Laser processing; Mode Locking, Kerr Lens Modelocking, Pulse Compression, Chirped Pulse Amplification

S**urface Characterization, Measurement & Diagnostic Techniques:** (i). SEM, Optical microscope, X-ray Diffraction Technique (XRD), Atomic Force Microscopy (AFM), X-ray photoelectron spectroscopy (XPS), Electron probe X-ray micro-analysis (EPMA), Auger electron Microscopy (AES) Energy Dispersive X-ray spectroscopy (EDX), Differential Thermal Analysis (DTA) Surface Profilometer Surface hardness, Micro-indentation test

Plasma and Vapour diagnostics: Time of Flight (TOF), Langmuir Probe, LIBS, TRLIF etc.

Laser diagnostics: Short pulse – autocorrelator, FROG (frequency resolved optical gating), SPIDER (spectral phase interferometry for direct electric field reconstruction), Spatial profilometer- array detector

Laser Matter Interaction: Excitation Mechanisms, and Relaxation Times, Multiphoton Excitation, Photochemical Process- Catalytic Effects, Photophysical & Thermal Processes ; Heating & Surface melting, Evaporation

PY 717: Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique

Basics: Necessity for plasma simulation. Approaches to plasma simulation, fluid and kinetic theory methods, examples of physical systems appropriate for each of the different approaches.

Introduction to the PIC method: The mathematical model. The physical model, Principles of finite differencing, Converting Maxwell’s equations into their finite difference form.

Solution of Maxwell’s equation: Interative methods for solving Poisson’s equation, Solution of curl equations using FDTD method, The concept of superparticles, Weighing methods, Shape factor, Realtion between particles and fields.

Self consistent charge and current density: Lorentz force integrator with and without magnetic fields. The computational cycle.Electrostatic programs.Electromagnetic programs.

Sources of errors and stability

PY 718: Nonlinear Plasma Theory

Basics: Revision of linear theory, including Langmuir waves, ion-acoustic waves, Alfven waves, waves from local pulsed source, Cerenkov emission and Kelvin wakes, wakes in ion-acoustic waves, Vlasov equation, Chandrasekhar equation, cold plasma waves, Landau damping.

Nonlinear waves: beams of non-interacting particles, ordinary progressive waves, waves in weakly dispersive media, Korteweg de Vries equation (KdV), solitons, Analytical solution of the KdV equation, Ion-acoustic wave overturn

Nonlinear wave-wave interaction: Three wave processes, dispersion laws and decay spectra, triads, Manley-Rowe conservation laws and nonlinear superposition, analogy with Euler equations for rigid bodies, resonant interactions between plasma waves, many-wave interaction in random phase approximation, nonlinear explosive instability, Interaction of low-frequency waves with high-frequency waves, plasma turbulence, kinetic equation and instabilities.

Wave-particle interaction: Statistical preliminaries, Random phase approximation, quasilinear diffusion equation in two and three dimensions, single and many waves, quasi-linear theory of some instabilities, non-resonant wave-particle interaction, effect of transverse waves on ions, quasilinear theory of Alfven wave turbulence.

Nonlinear wave-particle interaction: Electron plasma oscillation turbulence, nonlinear theory of the drift instability, and the effect of thermal fluctuations.

Elective Courses in Condensed Matter Physics

PY 719: Modeling and Simulations in Physics

Basics: Modeling in different domains: Continuum, Mesoscopic, Atomistic and Quantum descriptions, Setting up a computer experiment: Starting structure and dynamics length and time scales

Electronic structure Theory: Many-body Schroedinger Equation, Born-Oppenheimer approximation, Hartree-Fock theory and Slater Determinants, Density Functional theory(DFT)
Thomas-Fermi and Exchange and Correlation(and different xc types)

Methods of Solution: Basis sets: Gaussian and Plane Wave, Analytic gradients and Hessians, The potential surface, Geometry optimization, Transition state calculations.

Simulation Methods:***Monte Carlo (MC):***Monte Carlo integration, Averaging procedure in various ensembles, Importance sampling, Metropolis scheme, ***Classical Molecular Dynamics (MD):*** Newtonian, Lagrangean and Hamiltonian dynamics, Basic algorithms, Time averages and ensemble averages, Molecular Dynamics in various ensembles, Interatomic potentials (pair potentials and beyond), Force-fields and their parameterization, Handling long-range forces, Analysis of Simulation results, ***First Principles MD:*** Born-Oppenheimer Molecular Dynamics, Car-Parrinello Molecular Dynamics (CPMD), Mermin functional and Free Energy MD (FEMD), ***Hybrid schemes:*** Combined classical MD and DFT – hybrid QM/MM schemes, ***Reactive schemes:*** General problem in chemical reactions, Path sampling methods, Blue Moon ensemble approach, Metadynamics

Beyond DFT: Time dependent DFT, Dynamical Mean Field Theory, GW-Approximation

Quantum Chemistry Methods: Configuration interaction, Many-body perturbation theory, Moller-Plesset perturbation theory, Multi-Configuration self consistent field theory, Coupled cluster theory

PY 720: Selected topics in Condensed Matter Theory

The course will deal with the theory and application of quantum mechanical and atomistic lattice dynamics and computer simulations to model, understand, and predict the properties of real materials. It is designed for students in Physics, Chemistry, Engineering and Materials Science interested in (i) the modeling of the properties of materials with advanced quantum mechanical and atomistic techniques and (ii) experimentalists using theory for the interpretation and analysis of complex experimental data. The course will have a strong focus on applications. However a minimal background in quantum mechanics and solid state physics (or equivalent) will be required.

First principles calculations of the total energies, electronic structure and phonon spectra: Density functional theory, Electronic structure calculations, Lattice vibrations, Theoretical calculations for the interpretation and analysis of experimental Raman, infrared, neutron and synchrotron data.

Lattice dynamics calculations and molecular dynamics simulations of complex solids: Microscopic to Macroscopic: From phonon spectra to thermodynamic properties. Studies of phase transitions, thermodynamic properties and melting at extreme conditions of pressure and temperature.

Project work: First principles calculations of the total energies, Electronic structure Calculations, Calculations of crystal structure, long-wavelength phonons, elastic constants, Calculations of the Phonon density of states, Calculations of the thermodynamic properties

PY 721: Organic Semiconductor Devices

Introduction to organic semiconductors: Organic materials: bonding, hybridization, conjugation and origin of semiconducting properties, Comparison of inorganic and organic semiconductors, types of organic semiconductor: molecular and polymeric, donor and acceptor materials, molecular ordering, light absorption and emission, different charge carriers and excitations, charge carrier injection: organic metal contacts and interfaces, charge transport models: tunnelling, Schottky, Poole-Frankel, space charge limited conduction, variable range hopping etc.

Organic thin films and their characterization: ***Preparation techniques***:*Thin/thick film*: Drop casting, doctor blading, spin casting, screen printing, inkjet printing, chemical polymerization, electrochemical polymerization and interfacial polymerization, physical vapour deposition, *Monolayer/multilayer*: Self-assembly, Langmuir-Blodgett and electrografting. ***Characterization techniques***: *Spectroscopic techniques*: UV/Vis, Raman spectroscopy, Fourier transform infrared spectroscopy (FTIR), X-ray photoelectron spectroscopy, Auger electron spectroscopy, electron energy loss spectroscopy (EELS) etc. ***Structure and surface analysis techniques***: X-Ray diffraction (XRD), low-energy electron diffraction (LEED), SEM, TEM, AFM, NSOM, confocal microscopy and contact angle measurements. ***Thickness measurements***: x- ray reflectivity (XRR), ellipsometery and profilometer. ***Electrical characterization***: current-voltage measurement and impedance analysis.

Organic devices: ***Molecular electronics***: Basic concepts of molecular electronics, making contact to single molecule molecular and self-assembled monolayer, molecular rectifiers, molecular resonant tunnel diodes, molecular memory, molecular transistors. ***Organic electronics***: Fabrication and characterization of organic field effect transistors and organic light emitting diodes. ***Organic solar cells***:Solar spectrum, interaction of photons with materials, solar cell operational parameters, bulk hetrojunction polymer solar cells, small molecule based solar cells and dye sensitized solar cells. ***Organic gas sensors*:** Gas sensors and their necessity, interaction between toxic gases with organic films, fabrication and characterization of chemi-resistive gas sensors.

PY 723: Advanced Magnetism and Superconductivity

Magnetism: Types of phase transitions- first and second order; Examples of magnetic and superconducting phase transitions

Type of magnetic exchange interactions: Direct exchange, Indirect exchange, Superexchange, Double exchange, RKKY exchange, D-M interaction, Dipolar interaction, etc.

Classification of magnetic systems: Diamagnetism, paramagnetism, ferromagnetism, ferrimagnetism, antiferromagnetism, superparamagnetism, spin-glass, cluster spin-glass, metamagnetism, modulated spin structures, etc.; Magnetic ordering under external perturbations such as magnetic field, pressure, ion irradiation, quenched disorder, etc

Low dimensional magnetism: 1D, Quasi-1D, 2D, and Quasi-2D.

Spintronics; Magneto-caloric effect; Gaint magnetoresistance (GMR) and colossal magnetoresistance (CMR); Magnetic nanoparticles, molecular magnetism

Superconductivity: Thermodynamics of Superconductors; London Theory–A phenomenological approach to understand Superconductivity; Application of London theory – Electrodynamics of Superconductors; Ginzburg – Landau Theory - Origin of vortex state, vortex structure, flux pinning; Josephson effect

Co-existence of superconductivity and magnetism

Neutron scattering in magnetism and superconductivity

PY 724: Neutron as a Probe of Condensed Matter

The short-range strong interaction of neutron with matter and its inherent magnetic moment of neutron make neutron scattering a unique probe in condensed matter research. The other important advantage of neutrons over other forms of radiation in the study of structure and dynamics on a microscopic level are they are uncharged, which allows them to penetrate the bulk of materials. They interact via strong nuclear force with the nuclei of the material and the scattering cross section varies randomly between various elements and even between isotopes. This allows one to observe light atoms such as hydrogen in the presence of heavier ones and distinguish neighbouring elements in the periodic table easily. One can exploit isotopic substitution and contrast variation methods. Matching wavelength and energy of thermal neutron to the lattice spacing and excitations in condensed matter makes it an indispensable tool to both study structure and dynamics. Over and above neutron has a magnetic moment that suits to study magnetic structures and the fluctuations and excitations of spin systems.

Why neutron scattering? basic properties of neutron; Basics principles of Neutron Scattering, Neutron scattering cross-section, correlation functions, coherent and incoherent scattering, Principle of detailed balance, magnetic scattering, polarized neutron.

Neutron sources: Reactor and spallation, Moderation of neutrons.

Structural study by Diffraction: Cross section, structure factors, Scattering of neutrons by atoms, Diffraction by crystals and polycrystals, Extinction and absorption, Experimental technique for diffraction, Principles of magnetic scattering, Investigation of magnetic materials, Diffraction by gases, amorphous materials and liquids.

Small-Angle Neutron Scattering: Scattering from general Two Phase Systems, Scattering from Fractal Aggregates, Nuclear vs. Magnetic Scattering, Small-Angle Neutron Scattering Instrumentation (Experimental Aspects, Data Treatment), Analysis of Small-Angle Neutron Scattering Data (Model Independent Analysis, Model Dependent Analysis, Contrast Variation),
Applications (Nanomaterials, Colloids, Biological Systems, Porous and Fractal Structures)

Neutron Reflectometery: Theoretical aspects of neutron reflectivity from Stratified Media, specular reflectivity from thin films and multilayers, description of Rough Multilayers, Reflectivity on Non-Magnetic Systems, Neutron Reflectivity on Magnetic Systems, Polarized Neutron Reflectometry on Magnetic Systems, instrumental setup for neutron reflectivity, Off-Specular (diffuse) reflectivity

Dynamics in condensed matter: ***Deterministic*****:** Basic Lattice Dynamics and Neutron Inelastic Scattering**:** Theoretical lattice dynamics (LD): Debye model, dynamical matrix, acoustic and optical branches. One phonon scattering, phonon dispersion relations: monoatomic and diatomic crystals, Incoherent scattering: phonon density of states, Coherent scattering. ***Stochastic (Diffusion)*****:** Theoretical formalism of quasielastic neutron scattering (QENS), self and distinct van Hove correlation functions. Different kinds of motions and contributions to scattering law, different model for translation motion: continuous diffusion, jump diffusion and localized translational diffusion. Different models for rotational motions:continuous rotational diffusion on a circle, jump rotation among N equivalent sites on a circle and isotropic rotational diffusion on a surface of a sphere.Instruments and methods for quasielastic neutron scattering, general aspects of data analysis, examples of QENS studies.

PY 725: Structure and Crystallography of Biomolecules

1. Brief introduction to structure and functioning of a bacterial cell.
2. Introduction to important molecular components of the cell.
3. Methods of protein production, purification.
4. Introduction to three dimensional structures of proteins and nucleic acids.
5. Computational and experimental methods of determining 3D structures.
6. X-ray sources and diffraction.
7. Macromoleculer crystallisation and crystal characterization.
8. Methods of diffraction data collection, data processing
9. Phase problem.
10. Current status of the methods for solving the phase problem.
11. Crystallographic refinement.
12. Electron density maps.
13. Structure-based drug design.
14. Laboratory experiments: a) High-throughput crystallization, b) Crystal mounting, diffraction data collection and processing, and c) Interpretation of electron density maps.

Elective Courses in Condensed Matter Physics

PY 726: Advanced Reactor Physics

Neutron Transport theory: Various formulations of neutron transport theory: Integro-differential equation, Integral equation, surface integral equation, invariant imbedding theory; Transport equations for special geometries; Numerical methods for solution of transport equation: Energy groups and group cross sections, Pn method and diffusion theory, Discrete ordinates and discrete Sn methods, Collision probability and related methods and their applications, Method of characteristics; Adjoint equation, perturbation theory, variational method.

Numerical methods for solution of the Multi-group neutron diffusion equation: Finite difference method and nodal methods

The Monte Carlo method: Random numbers: methods of generation and properties tests for randomness; Methods for sampling distributions; Mechanics of particle transport; Source and criticality problems; Errors and variance reduction methods.

Methods for burnup and control rod worth calculation

Reactor Dynamics: Point kinetics: point kinetics equations, Stability Analysis, Linear Stability theory, Routh's stability criterion, Root-Locus method, Nyquist plot, Non linear stability analysis; Space dependent reactor Dynamics and related topics; Accident analysis for thermal and fast reactors

Reactor Noise and its applications: Stochastic kinetics and zero power Reactor Noise, Power reactor noise, Reactor Noise in Accelerator Driven Systems

8. *Particle Transport Simulation with the Monte Carlo Method* L.L.Carter and E.D.Cashwell, Report TID-26607 (1975).

PY727: High Energy Density Physics: Theory

This course is intended for those interested in acquiring basic knowledge in the physics of matter existing at very high temperatures and / or densities as occurring in inertial confinement fusion system, astrophysical objects etc.

Introduction to High Energy Density Physics (HEDP): Static and dynamic high pressures, parameters defining High Energy Density, Laboratory generation of HED matter using lasers and particle beams, Basic processes involved in HEDP.
Hydrodynamic and shock waves: Hydrodynamic flow of compressible fluids, Equations of gas-dynamics, Euler and Lagrange formulation, Rarefaction and Compression Waves, Rankine-Hugoniot Relation, Hugoniot curves, self similar solutions, artificial viscosity, numerical methods.
Equation of State and radiation opacities: Thermodynamic properties of Gases, Entropy, Thermodynamic Equilibrium and Equipartition, Specific Heats and Thermodynamic Exponent, Thermodynamics of Condensed Matter, Gamma-Law Equations of State, Matter At High Pressures, Thomas-Fermi Theory, Radiation opacities and emissivities, Rosseland and Planck means, models to calculate opacities.
Radiation Hydrodynamic: Radiation Transfer Equation, Equilibrium Diffusion Limit, Non-equilibrium Diffusion, Marshak Waves, Three-Temperature Model, Radiation matter coupling, Basic radiation hydrodynamic equations, approximate solutions, Numerical Methods
Hydrodynamic Instabilities: Rayleigh–Taylor, Richtmyer–Meskov & Kelvin–Helmholtz Instabilities, Fluid-Dynamics Description, R-T Instability with Two Uniform Fluids, Effects of Viscosity, Effect Density Gradients
Inertial Confinement Fusion: Fusion reaction, Thermonuclear burn and ignition schemes, central hot spot ignition, fusion Energy gain, direct and indirect ICF Schemes.

7. *Hydrodynamic and Hydromagnetic Stability*,S. Chandrasekhar (Oxford University Press 1968).

PY 728: High Energy Density Physics: Experimental

Physics of High Energy Density Effects in Matter: Tensor representation of strain and strain. Linear and nonlinear waves, ideal shock wave; Rankine Hugoniot relations, Shock representation in x-t and p-u_p plane, p-x and p-t plots, entropy and temperature under shock compression. Interaction of Shock waves, reflection of shock wave from rigid boundary etc. Development of rarefaction waves, interaction involving rarefactions, Negative pressures/ isentropic compression in materials.

Energy Storage Systems, Energetic Materials and Applications: Various Types of Energy Storage Systems and their Characteristics. Ideal detonation (ZND model); Chapman Jouget (CJ) pressure and density; detonation interaction.Concept of reaction zone; effect of diameter on detonation velocity, detonation failure diameter, effect of density/ temperature.Initiation, critical energy fluence, run distance versus pressure, impactor thickness and diameter effect on impact initiation. Wave shaping and lens design. Single stage gas gun, two stage light gas gun, propellant gun; electric gun and, rail gun. Ultra high magnetic field and magnetic pressures using flux compression generators. Pulse radiation, lasers and particle beams. Z-pinch, Gas-Puff and Plasma Focus devices for Thermonuclear Fusion.

Diagnostic Techniques and Data Interpretation: Measurement of shock velocity; particle velocity and stress history; shock temperature, sound velocity behind shock front; shock overtaking experiments. Velocity measurement using Displacement, VISAR, Fabry-Perot interferometers. Macroscopic measurements in shock compressed materials. Inductive Loops, Rogowski Coil, Voltage Dividers, Faraday Rotation. Visible and x-ray spectroscopy, Faraday cup, Thomson Parabola, X-ray, Ion and Neutron Imaging. Determination of equation of state, Hugoniot elastic limit, phase transition pressure and spall from experimental data. *Ab-initio* calculations for determination of isotherm, Hugoniot and phase transition pressures for interpreting the experimental shock wave data.

PY 729: Nuclear Data Physics for Advanced Nuclear Applications

Introduction to nuclear physics data: Types of Nuclear data, Variation of cross section with energy, Simple nuclear interactions theory, Measurement and model based predictions, Transmission experiment for total cross section, measurement of differential scattering cross section, Time-of-flight method, sources of errors in measurement, Optical model, Statistical model etc., exposition to SAMMY, EMPIRE. Training in online retrieval of data using Indian Mirror Website: www-nds.indcentre.org.in.

Representation of nuclear data : General purpose and special purpose ENDF libraries, Sub libraries for neutron, photon and charged particle interactions, Radioactive decay data, Fission product yields, formats and procedures, Tabulated and parametric representations in ENDF, Mathematical formalisms for Resonance representation viz. , single and multi-level resonance formalisms, Rieche-Moore, R-Matrix formalism, Breit- wigner formalism, interpolations schemes.

Nuclear data processing: Steps for processing evaluated data, linearization, resonance reconstruction, tolerances, Doppler broadening, , importance of target temperature for Thermal scattering data, Group averaging, PREPRO code systems, SIGACE package.

Multi-grouping: Multigrouping techniques, Energy groups and limits, considerations for grouping, , weighting functions: flux and current weighting, self-shielding, anisotropy and Legendre moments, group-to-group transfer cross sections, GROUPIE/GROUPR, transport cross section, group collapsing , Photon production cross section, Photo-atomic interaction cross sections, GAMINR, activation cross sections, coupled neutron-gamma cross section sets,
Continuous energy data for Monte Carlo codes (ACER), Nuclear data for ADSS applications (MATXSR).

Concept of critical facility; AHWR CF, Difference between critical facility and actual reactors, ICSBEP criticality benchmarking, Illustrati ons with benchmarking of KAMINI, PURNIMA-I and PURNIMA-II in the US-DOE ICSBEP International Handbook.

Exposure to Error Propagation and sensitivity studies, Variance-Covariance error matrix in nuclear data, Propagation of errors in assessment of uncertainty margins. Philosophy and mathematics of adjustment of cross sections to fit integral data from critical experiments.

PY 730: Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport

Solution of transport equation: P_N method (Plane and curved geometries)**,** Discrete ordinates method (Plane and curved geometries, Quadrature sets)**,** Collision probabilities methods Collision probability method in 1-D and 2-D geometries, Interface current method, Characteristics method. Discrete ordinates methods in 1-D, 2-D and 3-D geometries.Diamond differencing scheme.Solution procedures**.**

Neutron thermalization: Neutron scattering laws, Scattering from mono-atomic gas, bound-atom scattering, Liquid moderators, Nelkin model.

Treatment of resonances: NR, IR and WR approximations, Sub-group method

Solution of time dependent transport equation: Differencing of time dependent transport equation, Point kinetic equations, Space-time kinetics, Adiabatic approximation. IQS; explicit andimplicit time differencing methods

Solution of the fuel depletion equations: Formalism of the detailed burnup chain, Formulation of fuel depletion equations, production-destruction of actinides and fission products, branching ratios **,**Solution of the burnup equations, Constant flux and constant power approximations. Solution for decay heat and other potential reactor applications

Monte Carlo methods: Exposition to neutron and particle tracking principles

PY 731: Accelerator Driven Systems

Neutron Source: Various types of accelerator based neutron sources and their properties: Electron accelerator based source, spallation source and fusion source - advantages and limitations.

The spallation process: Theory and mechanism, various types of targets and projectiles. Neutron yield, energy spectrum, angular and spatial distribution in the target. Spallation products; Heat distribution; Codes in use.

Spallation target: Thermal hydraulics of spallation targets: heat removal and suitable coolants; Radiation damage in window and other structural materials; Windowless designs; Radioactivity of coolant / target.

Sub-critical Reactor: Neutron multiplication in sub-critical reactors, source importance, Ks, Keff and reactivity; Power and power distribution in ADS; Considerations in deciding the degree of sub-criticality of an ADS.

Theoretical Techniques and analysis: Transport theory and Monte Carlo methods: computer codes for ADS analysis; Nuclear data requirements and sources; Burnup and its effect on fuel and core properties; ADS kinetics and safety issues – comparison with critical reactors.

ADS related experiments: Measurements of parameters, Reactor noise in ADS.

Comparative study: Breeding in critical reactors and sub-critical ADS, Fuels and fuel cycles for ADS.

Waste transmutation: Issues in waste management, Waste transmutation in different types of reactor systems, Advantages of ADS.

ADS Types: Proposed ADS types for power generation, breeding and waste transmutation.

NON-SUBJECT ASSIGNMENTS

PY 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

PY 592:

Experiments

PY593: Mini

Project

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.

SYLLABUS FOR

M.Phil. in Physical Science
(Program Code: PHYS02)

SYLLABUS SUMMARY

Nuclear Reactor Physics

Course Code	Course Name	Hours	Credits
PY1	Mathematical Methods	45	6
PY2	Computational Methods	45	6
PY3	Introductory Reactor Physics and Engineering	35	4
PY4	Nuclear Physics and Nuclear Data	30	4
PY5	Engineering Drawing and Laboratory Practices and Experimental Methods	20	2
PY6	Reactor Materials	30	4
PY7	Radiation Detection and Measurements	20	2
PY8	Reactor Types and Advanced Reactor Concepts	20	2
PY9	Radiation Shielding Design and Protection	40	5
PY10	Reactor Dynamics and Safety Analysis	35	4
PY11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
PY12	Fluid Dynamics and Thermal Hydraulics	25	2
PY13	Advanced Computational Methods in Reactor Physics	35	4
PY14	Experimental and Operational Reactor Physics	35	4
PY15	Design Methods in Thermal and Fast Reactors and Computer codes	35	4
PY16	In Core of Fuel Management	25	2
Total		**505**	**59**

1. Mathematical Methods (PY1) : (45 lectures)

S.No	Course content
1.	Linear vector spaces, linear dependence and independence, basis and dimension. Linear transformations. Inner product, norm, continuity, convergence, completeness. Hilbert spaces.
2.	Fundamentals of matrices, eigenvalues, eigenfunctions, adjoints, inverse etc sparse matrices; diagonal dominance; non-positive and non-negative matrices; positivity theorems; large set of simultaneous equations.
3.	Functions of a complex variable. Rieman surfaces, Analytic functions Cauchy Rieman conditions and harmonic functions. Contour integration and Cauchy's integration formula. Residue theorem and evaluation of integrals.
4.	Ordinary differential equations - Order and degree of a differential equation, appearance and number of arbitrary constants in the solution of a n-th order differential equation, families of curves and orthogonal trajectories, first order homogeneous and exact equations, methods of reduction of order of some specific differential equations, second order linear homogeneous equations, superposition principle, method of finding second independent solution when one solution is known, qualitative properties of the solution, Sturm comparison theorem, operator methods for second order linear equation with constant coefficients, power series solution for second order linear equations, ordinary and regular singular points of a differential equation, indices corresponding to a regular singular points, hypergeometric and confluent hypergeometric equation, explicit example through solution of Bessel's equation.
5.	Partial differential equations – First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations, system of surfaces.
6.	Integral equations – Definition, homogeneous, inhomogeneous, linear, non-linear equations, Fredholm and Volterra equations, eigenfuctions, Schmidt-Hilbert method of solutions.
7.	Integral Transforms. Fourier, Laplace Transforms and the inverse transforms, connection to physical problems Other transforms such as Mellin and Hankel transforms, and transforms generated by Green's function. Applications for obtaining solution of ordinary/partial differential equations.

Books suggested

1. Mathematical Methods for Physicists, G. B. Arfkin and H. J. Weber, Academic Press(2001) Also Prism Books, Bangalore
2. Elements of Partial Differential Equations, I. Sneddon, McGraw Hill (1957)
3. Theory of Functions of a Complex Variable, E. T. Copson, Oxford University Press (1935)

2. Computational Methods in Physics (PY2): (35 lectures + 10 Tutorials)

S.No	Course content
1.	**Computers, Computational Physics and Scientific Programming**
	a) Introduction to Computational Physics
	b) Components of a high performance computer- memory hierarchy, CPU design, Vector processing, Virtual memory, Number representation- Arithmetic of Fixed and Floating

point numbers, Machine precision, Errors and uncertainties in computation Types of errors, Error propagation

c) Computing software basics

d) Computer languages, Programming concepts, Programme design, Structured programming, Introduction to Fortran and C, C & Unix, Dialects of C, Functions and Program structure, Basic Data Types, Arrays, Strings, Expressions and Operators, Precedence of C Operators, C Preprocessors, Control Statements, Pointers, Pointer arithmetic, Arrays handling with Pointers, Functions in detail, Input and Output Operations and C file handling Operations, Structures & Unions in C, Dynamic Memory allocation, Macro definitions, Compilation and Execution of C program, Fortran to C Linking procedures.

e) Introduction to Parallel processing, High performance computing, Profiling and tuning, Visualization of scientific data

f) Highlights of FORTRAN-90 programming language. Programming in MATLAB

2. **Numerical Methods**

Linear algebra

a) Matrices

b) Solution of Linear Algebraic Equations and Singular Value Decomposition

c) Eigenvalue problems, Computing Eigenvalues and Eigenvectors

d) Iterative methods for Linear systems

e) Software for linear systems- LINPACK and LAPACK

Solution of Nonlinear equations

a) Bracketing and Bisection

b) Secant Method, False Position Method, and Ridders' Method

c) Newton-Raphson method

d) Software for nonlinear equations

Interpolation, Extrapolation and Numerical Differentiation

a) Differentiation- Forward, backward and central differences

b) Polynomial Interpolation and Extrapolation

c) Rational Function Interpolation and Extrapolation

d) Interpolation using Splines

Optimization methods

a) Optimization in one dimension

b) Multivariate problems- Steepest descent, Newton and quasi-Newton methods, Conjugate gradient methods. Constrained optimization

c) Maximum entropy and Genetic methods

d) Least square fitting, Non-linear least square fitting, Goodness of fit

e) Software for optimization- energy minimization

Numerical Integration

a) Integration- Newton-Cotes integration formulae, Gaussian quadrature

b) Integral equations

Probability , Random numbers and Monte Carlo methods

a) Uniformly distributed Pseudo random numbers

b) Exponentially and Normally distributed Pseudo random numbers

c) Testing of pseudo random number sequences

d) Simulation of radioactive decay

e) Numerical Integration

f) Monte Carlo simulation techniques

Fourier and Wavelet transforms

a) Fast Fourier Transform- Convolution and deconvolution, Correlation, Filtering, Power spectrum estimation

b) Wavelet transforms- Wavelets, de-noising, de-trending, Texture analysis, Pattern recognition, Image compression

Ordinary Differential equations

a) Initial value problems for systems of ode's

b) Runge-Kutta Method, and adaptive step size control

c) Stiff differential equations

d) Boundary value problems

e) Galerkin method

Partial differential equations

a) Finite difference methods for Parabolic, Hyperbolic and Elliptic equations

b) Truncation errors, consistency, stability

c) Introduction to finite element methods.

Tutorials: Assignments of problems and computations based on these and other methods using FORTRAN-77 / FORTRAN-90/ C++

Books Suggested:

1. Computational physics- Problem solving with computers, Rubin H. Landau, Manuel J. Paez, John Wiley & sons 1997.
2. Numerical Recipes in Fortran-77 / F-90 / C, W.H. Press et. al., Cambridge Univ. Press.(1996)
3. A First Course in Computational Physics, P.L. DeVries, John Wiley and Sons (1994)
4. Numerical Methods for Engineering Application, J.H. Ferziger, John Wiley and Sons (1998)
5. Scientific Computing: An Introduction with Parallel Computing, G. Golub and J.M. Ortega, Academic Press, (1993)
6. Scientific Computing: An Introductory Survey, Michael T. Heath, McGraw-Hill, New York,

2002.
7. Computational Physics, J. M. Thijssen, Cambridge University Press, Cambridge, 1999.
8. Guide to Neural Computing Applications, L. Tarassenko, Arnold Publishers, 1998.
9. Genetic Algorithms in Search, Optimization, and Machine Learning, D. E. Goldberg, Addison Wesley, Reading, Massachusetts, 1989.

3. Introductory Reactor Physics and Engineering (PY3): (35 lectures)

S.No.	Course content
	Part I
1.	Basic nuclear physics concepts. Properties of nuclei. Nuclear forces. Nuclear models. Nuclear decay. Liquid drop model and nuclear stability. Nuclear reactions including fission. Compound nucleus formation. Microscopic cross-section. Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	Chain reaction; four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.
5.	**Reactor Kinetics**: Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.
	Part II
1.	Neutron distribution in a system; assumptions in setting up the neutron balance equation; applicability of Maxwell-Boltzmann statistics; Time dependent neutron balance (transport) equation, with delayed neutrons
2.	**Steady State Neutron Transport Equation:** Transport equation – differential & integral forms, Diffusion approximation, One speed neutron diffusion theory, Boundary conditions, Source-sink problem, Sub-critical reactors with flux independent source, Separation of space and energy.
3.	**Slowing Down and Energy Dependence:** Elastic scattering, Inelastic scattering, Anisotropy, average energy loss per neutron, Concept of lethargy. Fermi age theory, age of neutron, Logarithmic energy decrement, Slowing down spectra, Slowing down in hydrogen, Definition of resonance integral, Shape of thermal neutron-Maxwell spectrum.
4.	**Resonance Absorption:** Resonance cross sections, Resolved and unresolved region, Spatial and energy self shielding, Narrow resonance and intermediate resonance approximation, Concept of potential scattering cross section, Resonance integral in homogeneous media, Doppler broadening of resonance and importance for safety.
5.	**Multigroup Diffusion Theory:** Energy group and group fluxes, Flux weighted group constants, One group theory for thermal neutrons, Two group theory, Two group two region

model core with reflector. Adjoint equation.

6. **Reactor Control:** Cold start-up, Hot power operation, Temperature loads, Effects of burnup and fission products. Function of control rods. Theory of control rods, Xenon load during operation, Xenon iodine concentrations after shutdown, Xenon override, Xenon poison out condition, Samarium poisoning. Temperature coefficient of reactivity.

   Density temperature coefficient.

7. **Fast Reactors:** Fast reactors as breeders, comparison of fast and thermal reactors, role of fast reactors in Indian 3 stage nuclear power program

8. Neutron spectrum in FBR, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, delayed neutron fraction, fuel expansion and bowing, sodium void reactivity effect, Optimisation of blanket thickness. Effect of burnup on fuel composition and reactivity coefficients

9. General features of FBR core, specific power, linear rating, fluence, requirement and choice of core materials (fuel, coolant and structural materials), types of fast reactors – pool and loop type. Optimisation of core height and pin diameter. Salient physics aspects of FBTR and PFBR

Books suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C.Edlund. Van Nostrand, 1952.
2. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand, 1990
4. The Physical Theory of Neutron Chain Reactors, Weinberg A. M. and Wigner E.P.
5. Nuclear Reactor Theory, Bell and Glasstone, Van Nostrand, 1970
6. Physics of Nuclear Reactors, Jakeman D.
7. A. E. Walter and A. B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981
8. Weston M. Stacey, "Nuclear Reactor Physics", John Wiley & Sons, Inc., 2001

4. Nuclear Physics and Nuclear data (PY4): (30 lectures)

S.No	Course content
	Part I - Nuclear Physics
1.	Properties of Nuclei; Binding Energy Curve; Stability Curve – neutron rich isotopes; nuclear interactions: neutron scattering, isotropic and anisotropic scattering. neutron capture, (n,xn) reactions; reaction thresholds, fission; Variation of cross-section with respect to (nuclide) material, reaction and incident energy; Resonance (Resolved/Unresolved) and Continuum regions; Mathematical formalisms to represent these data.
2.	**Nuclear models:** Nuclear potential; liquid drop, shell and optical models. Fission process; Fission barrier; (n,f) - thermal and high energy neutron induced fissions; Fission products and decay; FP elemental mass/isotope chains and distribution; prompt fission and delayed fission neutron energy distributions; energy yield per fission; neutron yield in fission with neutron energy (nu-p); photo neutron.
3.	Important neutron reactions with fuel, control and structural materials in reactor systems.

4. High energy proton interactions with heavy metals; spallation process; spallation products; neutron source distribution from spallation.

Part II - Nuclear Data

1. Four major kinds of nuclear data, viz. nuclear constants data, nuclear structure data, nuclear decay data, and nuclear reaction data. Importance to application areas, like therapeutic treatments, agriculture, and nuclear energy. Kinds of data, like neutron interaction data, neutron/gamma production data, gamma-atom interaction data, etc., pertinent to reactor physics applications.

   Measurements and model based predictions; Transmission experiment for total cross-section, measurement of differential scattering cross-section; Time of flight method, sources of errors in measurement – energy resolution; Optical model, Statistical Model, etc.; Examples of model based computer codes.

2. **Nuclear data Evaluation:** Problems of scarcity and/or abundance of nuclear data, need of nuclear data evaluation; Evaluated nuclear data files (ENDF), ENDF/A, ENDF/B,JENDL and JEFF; General purpose and Special purpose libraries; Sublibraries for neutron, photon, and charged particle interactions, Fission product yields and decay data; Problems of multiple evaluations; Formats and procedures; MAT, MF, MT conventions; Representation of different kinds of data, tabulated and parametric representations, single/multi level resonance formalisms in the resolved/unresolved region, BW formulation, partial & total widths, negative resonance energies, interpolation schemes. IAEA-NDS; Related websites.

3. **Nuclear data Processing:** Need for processing of an evaluated data Steps of processing; Simplifying assumptions and tolerances; Precautions on consistency and accuracy. Popular processing cods: PREPRO and NJOY and their modules, Linearisation: Advantages of linearization; interval halving procedure, tolerance (error criterion), probable pitfall – position of maximum deviation; Program LINEAR.

   Resonance Reconstruction. Doppler broadening: Effect of target temperature on cross-sections – for low energies, for resonances and for threshold reactions; kernel broadening approach, submerging small resonances due to broadening. Validation of evaluated and processed cross-sections.

4. **Multigrouping:** Consideration for deciding the number of groups and group limits. Neutron cross-section averaging: conservation of reaction rate, transport cross-sections, flux and current weighting, self-shielding, dilution and temperature dependences, multigroup cross-section set, effective cross-sections, mixture cross-sections, collapsing of cross-sections, group-to-group transfer cross-sections; Anisotropy and Legendre moments. GROUPIE/GROUPR programs; Validation of multigroup cross-sections.

   Photon production cross-sections; photo-atomic interaction cross-sections; coupled multigroup cross-section set; GAMINR program.Activation cross-sections; relevance of residual nuclear levels. Displacement cross-sections; relevance to radiation damage in reactor materials.

Books suggested:

1. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen (Ed.) CRC Press, West PalmBeach, Florida (1986).
2. ENDF – 102, Data Formats and Procedures for the Evaluated Nuclear Data for ENDF – VI, M.Herman (Ed.) BNL-NCS-44945-05, (2005)
3. Special Issues on Evaluated Nuclear Data File ENDF/B-VII.0, J.K.Tuli, Nuclear Data Sheets, Vol-107 (2006)
4. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, (2002)

5. Engineering Drawing and Laboratory Practices (PY5 & PY5A): (20 lectures)

S.No	Course content
1.	**Machine Drawings Projections:** orthographic – 1st & 3rd Angles pictorial; Oblique: Perspective.
2.	Introduction; Indian and International standards for drafting and related subjects.
3.	**Line, lettering and dimensioning:** Outline hidden lines, Centre lines, Dimensional lines, Extension/Projection lines, Construction lines, Section lines, Leader/pointer lines, Cutting plane lines, Border lines, Short & long break lines, Representation of welded joints.
4.	**Dimensioning and tolerancing:** Definition and general principles, Arrangement of dimensions - Chain and parallel dimensioning, method of dimensioning common features; Rules for inscription of tolerancing. Limits fits. Tolerances and surface finish.
5.	**Scales, lines and lettering:** Recommended scales; Different type of lines, their illustration and application; Recommended size of letters and numerals.
6.	**Sections:** Full Section, Half section, Partial section, Revolved section.
7.	**Projections:** Orthographic – 1st & 3rd Angles; Pictorial – Oblique and Isometric
8.	**Conventional representation of common features and sections:** Conventional representation of gears and gear assembly, Threads, springs, bearing, welded joints. Hatching, sectioning, cutting planes.
9.	**Fastenings:** Bolts, studs, screw, washers, set screw, split pins.
10.	Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Laboratory Practices:

1. Errors in measurement. Accuracy and precision. Software, data analysis, filtering and plotting.

Electronic components of detector systems.Analog electronics, Electromagnetic interference, shieldind and grounding of electronic equipments. Measurement of temperature, pressure, mass, volume and flow. Instrument time constant and response time.
Production and measurement of (low pressures)vacuum and high pressures.
Production and measurement of high temperature and low temperatures.

Computer hardware. Intelligent systems, Computer control and automatic data acquisition. User friendly experimental automation with G (graphical) language.

Books suggested:

1. Indian Standard Code of Practice for General Engineering Drawings (Second Revision); Bureau of Indian Standards.
2. Geometrical and Machine Drawing by N.D. Bhatt; Charotar Publishing House, Anand (WR), India

6. Reactor Materials (PY6): (30 lectures)

S.No	Course content
1.	Properties of fuel materials. Uranium metal, Uranium dioxide, Carbide and nitride fuels. Plutonium fuel materials. MOX fuels. Thorium fuel materials. Fabrication of fuel pellets: sintered and vibropacked.
2.	Dispersion type fuels. Inert matrix fuels, Metallic fuels, sol-gel process. Fuel for HTRs – coated particle / TRISO/ spherical fuel balls for high powered systems.
3.	General requirements of structure and clad materials. (neutronic and physical) Aluminum and alloys. SS and low alloy steels. Nickel alloys. Zirconium and alloys. Properties of moderator and coolant materials. Graphite, Beryllium, water and heavy water. Liquid metals. Heat transfer coefficients.
4.	Mechanical properties of materials. Stress-train relationships. Ductile and brittle failure. Ductile to brittle transition, Fatigue failure, Creep and dilation.
5.	Stress analysis, Thermal stress in fuel clad. Thermal stress in hollow cylinder with no heat generation, Thermal stress in hollow cylinder with exponential heat source, Factors affecting thermal stress.
6.	Radiation effects in materials. Atomic displacements. Mechanisms in radiation damage, General irradiation effects in metals. Thermo-physical properties of fuel (pellet) materials; variations with burnup Temperature dependent swelling. Helium embrittlement. Typical limits of irradiation damage
7.	Corrosion of metals. Chemical corrosion, erosion and fretting corrosion, Stress- corrosion cracking, Hydrogen embrittlement. Fuel clad failure process.
8.	Advaced materials for future FBR, ADS and high temperature reactor. Ferritic steels, oxide dispersed steels and carbon based materials

Books suggested:

1. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand.
2. Fundamental Aspects of Nuclear Reactor Fuel Elements, D.R. Olander, ERDA report, TID 26711-P1 (1976).

7. Radiation Detection and Measurement (PY7): (20 lectures)

S.No	Course content
I	**Interaction of radiation with matter:**
1.	Energy loss of heavy charged particles in matter – Electronic stopping power (Bohr and Bethe-Bloch formulae), Cherenkov radiation. Energy loss of electrons and positrons – Electronic stopping and energy loss by Bremsstrahlung radiation.
2.	Interaction of photons – Photoelectric absorption, Compton scattering, pair production, Electromagnetic shower in high energy photon and electron interaction with matter.
3.	Interaction of Neutrons – elastic scattering, radiative capture, positive Q-value reactions such as (n,p), (n,gamma), (n,fission) and hadron shower production at high energies.

II **Radiation detectors:**

1. General characteristics of detectors – efficiency, response in energy, time, position and corresponding resolutions, recovery time or count rate handling capability.
2. Gas detectors Basic processes, Q-V characteristics as a function of primary ionization, charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter.
3. Semiconductor detectors Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium detectors (planar and cylindrical geometry). Photovoltaic cells, charged coupled devices.
4. Scintillation detectors. Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes.
5. Techniques and detectors for neutron and spectrum measurements. Fission ionization chambers. Boron filled and coated detectors. Gamma compensation. Self powered neutron detectors.
6. Pulse processing instrumentation, preamplifiers(charge, voltage sensitive), amplifiers (spectroscopy or high resolution, fast and timing filter), single channel analyzers, timing discriminators(leading edge and constant fraction types), gate and delay generators, coincidence(fast and slow) units, linear gate and stretchers, time to amplitude converter(TAC), scalers and rate dividers, analog to digital converter(ADC), charge to digital converter(QDC), time to digital converter(TDC), data acquisition systems (multichannel analysers and computer based multiparameter systems).
7. Experimental techniques and simulation - Particle identification methods (pulse shape discrimination, Cerenkov radiation), Compton suppressed high purity germanium detectors for high-resolution gamma spectroscopy, magnetic spectrometers including recoil mass separator. Monte Carlo simulation of detectors.

Books suggested:

1. Techniques for Nuclear and Particle Physics Experiments – W.R. Leo, 2nd Ed. (Springer International Student Edition published by Narosa Publishing House, New Delhi 1995).
2. Radiation Detection and Measurement – G.F. Knoll, 3rd edition (John Wiley, New York 2000)
3. Nuclear Radiation Detectors – S.S. Kapoor and V.S. Ramamurthy (Wiley Eastern Ltd, New Delhi 1986)
4. Radiation Detectors, C.F.G. Delaney and E.C. Finch (Clarendon Press 1992).

8. Reactor Types and Advanced Reactor Concepts (PY8): (20 lectures)

S.No	Course content
1.	**Thermal Reactors:**
	History. Development of Gas Cooled Reactors (GCR). Reactor types AGR and RBMK. Development of BWR. Development of PWR and VVER. Development of PHWR and SGHWR.
2.	**Fast Reactors:**

History. Development of LMFBR.

3. **Advanced Reactors:**

Different generation of nuclear reactors. Evolutionary improvements and revolutionary improvements. High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR).

Metal fuelled FBR and increased fuel breeding.

Accelerator driven systems (ADS)

Fusion Systems. JET and ITER. Concept and need for tritium breeding.

4. **Indian Reactors (Experimental and power producing):** For each type of reactor - brief principles of the reactor; typical Power/ Research reactor system; Fuel cluster/assembly; number of channels; core; coolant/moderator/reflector/blanket and shield as the case maybe; average neutron energy spectrum; control and shut down systems.

- APSARA/ CIRUS/ DHRUVA
- PHWR –India (220, 540 and 700 MWe)
- LWRs
- BWR (TAPS 1&2, modern BWRs,)
- VVER (KK)
- FBTR and PFBR

5. International Initiatives in Advanced Nuclear Systems: INPRO (IAEA) and GEN-IV. US proposal GNEP. International concerns. Nonproliferation, (proliferation indices), NPT, FMCT, CTBT.

Books Suggested:

1. W. Marshall ed. Nuclear Power Technology, Volumes I to IV, Clarendon Press, Oxford, (1984).

9. Radiation Shielding Design and Protection (PY9): (40 lectures)

S.No **Course content**

1. **Basics of radiation physics and dosimetry**

Radiation sources, its interaction with matter; natural and induced radioactive sources, half-life, decay constant, specific activity; basic interaction mechanisms of alpha, beta, gamma/x-rays and neutrons with matter (*summary only*).

Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effetive dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective halflife and their relation and their importance. Concept of ALI and DAC with suitable problems.

Human Body: cells, tissues and organs, structure of cell, cellular effects. Factors which influence the damage of cell. Interaction of radiation with biological matter. stochastic and deterministic effects. Acute and delayed effects. LD 50/60, Doubling dose. Radiation toxicity, Risk factor.

2. **Radiation Protection**

Radiation protection philosophy, objectives and principles of radiation protection ALARA, stochastic and deterministic effects, justification, optimization and dose limitation, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types

of exposure (natural, occupational, medical and public).

External and internal exposures; internal routes of intake of radioactive material. Use of personal dosimeters (TLDs, pocket dosimeters). Calculation of dose, Exposure measurement: Free air and air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Fundamentals of ICRP respiratory model, ingestion, Gastro intestinal track model, wholebody counting and bioassay techniques.

Atomic Energy Act, National and international regulatory bodies, their role and responsibilities, Radiation protection rules, Safety during transport of radioactive materials, Radioactive waste classification and management.

3. **Radiation Shielding**

Shielding concepts- gamma shielding- Attenuation factors. Buildup factor concept for homogeneous and multiple layers. Semi-analytical methods for gamma shield design. Dose rates of gamma rays for various source geometries. Gamma energy dependence of dose. Half layer thickness of different materials. Heat generation.

Neutron shielding. Shielding in thermal reactors. Importance of shielding in fast reactors. In-vessel shields and reduction of dose to components and operating personnel. Activation of structural material and heat generation. Shielding in accelerators and fusion systems.

Computational problems. Transport theory methods. Large problem size and large flux attenuation. Importance of anisotropy effects in scattering. Neutron slowing down and need for fine energy treatment. Monte Carlo methods. Streaming through gaps, voids and pipes. Analytical methods. Complementary shielding.

Selection of shield materials. Shielding from mixed sources. Life of shield materials.

4. **Nuclear Emergency management**

Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, countermeasures. Aerosol physics for core disruptive accidents, Atmospheric transport processes, environmental impact studies.

Books suggested:

1. Nuclear Radiation Detection - W.J. Price, McGraw Hill (1964)
2. Radiation Detection and Measurement - G.F. Knoll, John Wiley and Sons (1989)
3. Biological Effects of Radiation – J.E. Coggle, Taylor and Francis (1983)
4. Atoms,Radiation and Radiation Protection by James E.Turner, Wiley (2007)
5. Problems and Solutions in Radiation Protection by James E. Turner et al., Wiley, (1988)
6. Introduction to Health Physics – Herman Cember, McGraw Hill (1996)
7. Introduction to Radiation Protection –Alan Martin and Samuel Harbison, Chapman and Hall (1986)
8. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998.
9. Radiation Shielding- Three volumes of Compendium on Radiation Shielding, O.Sisman and J. Jaeger et.al., ed. (1975)
10. Radiation Shielding Manual T Rockwell et.al ed. AEC-US, (1958).

10. Reactor Dynamics and Safety Analysis (PY10): (35 Lectures)

S.No	Course content
1.	**Reactor Dynamics** Neutron kinetics and thermal effects. Feed back effects. Time constants. Loosely and strongly coupled reactor systems; Reactor size and eigenvalue separation; fundamental and higher modes. Description of main reactor systems. Coolant system behaviour. Plant dynamics (open loop and closed loop). Flow perturbations. Reactivity perturbations. Thermal perturbations. System stability. Linear and non-linear stability analysis; Nyquist critera; Liapunov methods. Xe dynamics equations; spatial and time dependent oscillations and stability. Safety concepts. Defence in Depth (5 levels) Accident Categories / classification: Design basis events (DBE) and Beyond DBE (BDBE). Loss of Regulation Accident(LORA), Transient Over Power Accident(TOPA), Loss of Coolant Accident(LOCA), Loss of Flow Accident(LOFA), cold coolant additions – with shut down action; Anticipated Transients with out SCRAM(ATWS)- Un protected Loss of Flow (ULOF) and Unprotected Transient over Power (UTOP). Accident scenarios in thermal and fast reactors. Brief description of accidents at Three Mile Island, Chernobyl and FERMI reactor. Computer codes for modeling accidents in thermal and fast reactors. RELAP and SAS4A. Kinetics of ADS.
2.	**Safety Systems** Engineered safety systems. Safety Critical Systems (SCS); Safety Groups, SCS, actuation systems, safety support systems. Shut down Systems. Different shut down states; Shut down margins (SDM). Guaranteed shutdown states (GSS). General safety criteria. Examples of safety analysis of PHWR, LWR and FBR.
3.	**Introduction to Reliability and Probabilistic Safety Analysis (PSA)** Probability, random variable, probability distributions used in Reliability Analysis; uniform, exponential, Weibull, Normal and χ^2 distributions, Central Limit Theorem. Basic component reliability models, definition and other measures of reliability such as Availability, failure frequency, dependability, fail safe design, safe failures/unsafe failures. Reliability Block Diagram, series and parallel systems, minimal cutsets, Combinatorial (Fault Tree / Event Tree) and State Space methods (Markov Models), Binary Decision Diagram. Common Cause Failures, Human Reliability Analysis: Models of Common Cause failures and Human Reliability Analysis, independence, redundancy, diversity. Probabilistic Safety Assessment of Nuclear reactor, measures of risk, core damage frequency, Level-1, Level-2, Level-3 PSA (introduction).

Books suggested:

1. Fast Reactor Safety, John Graham, Academic Press (1972).

2. The Technology of Nuclear Reactor Safety, Vol-I and II, T.J.Thompson and J.G.Beckerley, MIT Press (1971).
3. Reactivity Coefficients in Large Fast Power Reactors, H.H.Hummel and D.Okrent, ANS (1970).

11. Fuel Cycle Physics and Introduction to Fuel Cycle (PY11) : (30 lectures)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.
8.	Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9.	U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10.	Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11.	Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12.	Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13.	Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14.	Isotopic separation operation of bred uranium in thorium cycles to remove U-232. MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Fluid Mechanics and Thermal Hydraulics PY12 (25 lectures)

S.No	Course content
1.	**Fluid Mechanics** Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines, streak lines, path lines – equation of Continuity, Euler's equations of motion – Navier Stokes equations. Hydrostatics – Manometry – Fluid force on planes and curved surfaces, – Aerostatics – variation of pressure, temperature and density with altitude – stability of atmosphere – Fluids subjected to uniform linear acceleration and uniform rotation. Analysis of fluid motion in integral form – Concept of a system and a control volume – equations of continuity, energy, linear momentum and angular momentum as applied to a control volume in fluid flow and their applications to propellers, pumps and turbines. Dimensional analysis, similitude and model testing – Laminar and turbulent flows – Viscous effects – Boundary layer – Separation phenomena – Losses in pipes.
2.	**Thermal hydraulics** **Conduction:** Steady state conduction in one and two-dimensional systems – One dimensional unsteady state conduction; analytical and numerical methods. Heat generation in cylindrical and plate fuel elements; Steady state heat transfer from fuel to coolant; concept of $\int KdT$; Axial temperature distribution in the fuel element; Maximum clad surface temperature. **Convection:** Basic equations, Boundary layers; Forced convection: External and internal flows, correlations, Natural convection. Natural circulation cooling during pump trip transients; flow coastdown; decay heat removal; natural circulation in advanced reactor concepts, flow instabilities. **Radiation heat transfer:** Basic laws, Properties of surfaces, view factors, network method and enclosure analysis for gray – diffuse enclosures containing transparent media, Engineering treatment of gas radiation. **Boiling heat transfer:** bubble nucleation; transition and film boiling (a) pool boiling and (b) flow boiling; heat transfer coefficients in pool and flow boiling. Horizontal and vertical surfaces. Two-phase flow; flow regimes; mixture quality; void fraction; mixture density; pressure drop. **Concept of pressure drop in nuclear channels:** objectives and methods of flow orificing; orificing in BWRs and FBRs. Hot spot factors; classification; determination of subfactors; overall hot spot factor-statistical and multiplicative approaches. **Condensation:** Surface tension- bulk Condensation – Dropwise condensation on solid surfaces, Film condensation, Nusselt's theory. **Critical heat flux:** mechanism of dryout and Departure from Nucleate Boiling (DNB); thermal margin – MCHFR; MDNBR; critical power concept.

Books Suggested:

1. Thermal Hydraulic Fundamentals, Neil E. Todreas, Hemisphere (1990).
2. Fluid Mechanics, F. Dougles et al., Pearson Education, 2006.

3. Heat Transfer, J.P. Holman, Eighth Edition, McGraw Hill, 1997.
4. F.P. Incropera and D.P. Dewitt, “Fundamentals of Heat and Mass Transfer, John Wiley and Sons, Fourth Edition, 1998.
5. Fast Breeder Reactors, Waltar A.E. and Reynolds A.B, Pergamon Publishers, New York, 1981.

13. Advanced Computational Methods in Reactor Physics (PY13): (35 lectures)

S.No.	Course content
1.	**Methods of solving neutron Diffusion equation:** Finite differencing of diffusion equation. Centre and corner mesh differencing schemes. Rectangular and triangular (hexagonal) meshes; Inner and outer iteration schemes. Acceleration methods for inner iteration scheme. Spectral radius and determination of acceleration parameter. Acceleration methods for outer iteration scheme. Power iteration and dominance ratio.
2.	Modern nodal methods. General weighted residual methods. Finite element method- its advantages and disadvantages. Coarse mesh rebalancing.
3.	Estimation of fundamental and higher harmonics; subtraction methods
4.	**Methods of solving neutron transport equation**
	(i) Lattice: (a) P_N method (b) Discrete ordinates method (c) Collision probabilities methods Collision probability method in 1-D and 2-D geometries. Interface current method. (d) Characteristics method.
5.	**(ii) Core and Shield:** Discrete ordinates methods in 1-D, 2-D and 3-D geometries. Diamond differencing scheme. Computer code ATES-3.
	Monte Carlo methods for core calculation; deep penetration problems. Computer code MCNP.
6.	Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations. (ORIGIN
7.	Differencing of kinetic equations in time. Approximate solution of point kinetic equations. Space time kinetics. Adiabatic approximation. IQS; explicit and implicit time differencing methods.

Books suggested:

1. E.E.Lewis and W.F. Miller, Computational Methods of Neutron Transport, Wiley (1984) and ANS (1993).
2. G.I.Bell and S. Glasstone, Nuclear Reactor Theory, Van Nostrand (1970).
3. A.F. Henry, Nuclear Reactor Analysis, MIT Press (1975).
4. M. Clark and K.F. Hansen, Numerical Methods of Reactor Analysis, Academic Press (1964).

14. Experimental and Operational Reactor Physics (PY14): (35 lectures)

S.No	Course content
	I. Experimental Reactor Physics (10 hrs)
1.	Source and power range neutron detectors; Neutron sources- requirement vis-à-vis reactor type-External localised sources in LWRs and FBRs - internal distributed spontaneous fission / photo-neutron sources in PHWRs. Different steps of initial start-up in different research and power reactors.

2. Moderator experiments-measurement of diffusion length, age, migration length. Exponential experiment-Alpha dieaway (decay) experiment. Subcritical multiplication experiments-Critical mass measurements.
3. Low power experiments at criticality for validation of reactor physics evaluations-Measurement of neutron flux-Thermal and fast-Activation analysis-cadmium ratio-General methods of flux measurement- foil/wire activation methods, Measurement of buckling, power peaking and power distribution.
4. Neutron spectrum unfolding; differential measurements for reaction rates.
5. Dynamic methods of reactivity evaluation Reactor Period measurements-Measurement of reactivity-control Rod Calibration-power run-down experiments-reactivity coefficients measurements –Temperature and void coefficients measurements. Dose and shielding experiments-cross-section measurements.
6. Reactor noise methods- Process parameter measurements using neutronics-coolant flow measurement with N-16 gamma signals- failed fuel detection using delayed neutrons and noble gas fission products.
7. **Critical Facilities:**

   Thermal – ZERLINA, AHWR-CF, PURNIMA (1,2,3) ZED-2

   Fast – GODIVA (US), ZEBRA (UK), ZPPR (US), MASURCA (France), BFS (Russian).
8. **Subcritical Facilities with source:** MUSE, YELINA, PURNIMA-SCF, AHWR-C with source.

II. Operational Reactor Physics (20 hrs)

1. First Approach to Criticality; low power physics experiments; control requirements; general control schemes (auto or manual control as the case may be); spatial power control; nominal operation, power rise schemes; set-back and step back (as applicable); Reactivity balance in operating reactors.
2. Thermal power estimation using secondary and primary parameters – station heat balance. Assembly/ Bundle power, channel power, Linear Heat Rating (LHR): operational and safety limits; Bundle power envelops in PHWRs.
3. Failed fuel detection – delayed neutron monitoring; Fission Product (FP) gammas and volatile-gaseous FPs Back ground activities in the coolant.
4. Research Reactors: APSARA/CIRUS/DHRUVA – application. FBTR operation and applications. KAMINI operation and applications
5. Power Reactors: Operation of 220 and 540 MWe PHWRs : Incore flux mapping system BWR (TAPS- 1&2), PWR / VVER , PFBR

Books Suggested:

1. Experimental Reactor Physics, A.Edward Profio, John Wiley and Sons.

15. Design Methods in Thermal and Fast Reactors including Computer Codes (PY15): (35 lectures)

S.No **Course content**

I. Thermal Reactors

1. Popular multigroup nuclear data libraries and their group structure.
2. Spatial heterogeneity in different thermal reactors. Wigner-Seitz cell approximation. Self shielding effects in space and energy. Neutron transport treatment. Computer codes MURLI and CLUCOP.
3. Fuel assembly heterogeneity and supercell concept. Neutron transport treatment. Computer codes –SUPERB, CLUB, CASMO. Analysis of plate fuel assemblies. Special treatment of burnable absorbers and control rods.
4. Treatment of hexagonal lattices, EXCEL, TRIHEX.
5. WIMS Methodology ; HELIOS Computer code
6. Generation of cell and assembly parameters as a function of burnup and boron concentration in moderator.
7. Core computations. Core follow up and refueling. Computer codes DIF3D, VENTURE and COMESH. Core simulation codes TRIVENI and COMETG.

II. Fast Reactors

1. Popular multigroup libraries and their group structure.
2. Treatment of slowing down and energy self shielding. Heterogeneity effects in absorber rods. Computer code COHINT.
3. Breeding ratio and its variation with core material geometry. Radial and axial heterogeneous designs. Oxide, carbide and metal fuel and their effect on core safety parameters.
4. Hexagonal geometry effects. Optimisation of blanket thickness. Sodium void reactivity effects. Fuel burnup modeling.
5. Fuel management schemes in FBTR and PFBR. Effects on breeding ratio and power distribution. Computation of peak linear heat rating from measured outlet temperature distribution.
6. Computer code FARCOB. Code system ERANOS.

Books suggested:

1. R.J.J. Stammler and M.J.Abbate, Methods of Steady State Reactor Physics Nuclear Design, Academic Press (1983).
2. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen Ed. CRC Press, West Palm Beach, Florida (1986).

16. In Core Fuel Management (PY16): (25 lectures)

S.No **Course content**

1. General in-core fuel management schemes. Advantages and dis-advantages of on-line and batch fuelling. Initial and equilibrium core concepts.

   PHWR: Online fueling; refueling strategies; core burnup - power distribution optimization; time average and snap shot evaluations; theory of computer code TAQUIL. Average exit burnup. Core followup; theory of TRIVENI code. Channel Power Peaking Factor (CPPF). Rules of channel selection. Fuelling in PHWRs: (220 & 540) Discharged bundle data – Pu production & Pu-vector.

2. **BWR:** Initial fuel loading; equilibrium cycle Batch fueling concepts; different core loading concepts – checker board, out-in, sector symmetric. Cycle length and Haling principle. SDM demonstration. Control rod pattern. Power distribution optimization. Core followup computer code COMETG. Minimum Critical Heat Flux Ratio (MCHFR).
3. **PWR and VVER:** Initial loading, equilibrium loading. Boron poison management. Fuel enrichment change and use of burnable absorber. Departure from Nucleate Boiling Ratio (DNBR).
4. **AHWR:** Basic principles of fuelling
5. **HTR:** Basic principles of fuelling

suggested:

1. P. Silvennoinen, Reactor Core Fuel Management, Pergamon Press (1976).
2. R.G. Cochran and N. Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

Homi Bhabha National Institute, RRCAT, Indore

M.Phil. in PHYSICAL SCIENCES
(Program Code: PHYS02)

Raja Ramanna Centre for Advanced Technology, Indore

Courses offered at HBNI, RRCAT for
Ph. D. in Physics
M.Tech. in Engineering Physics
(Specialization in Accelerators and Lasers)

- Total credit requirement for Ph. D. (Physics) : 60

Core courses	28 credits
Elective courses	20 credits
Laboratory experiments	04 credits
Two reading courses	08 credits

- Total credit requirement for M.Tech. (Engineering Physics) : 60*

Core courses	38 credits
Elective courses	12 credits
Laboratory experiments	04 credits
Short term project	06 credits

* An additional course (Foundation course) of 5 credits is offered to M.Tech. students as a bridge course.

Contents

Page No.

Syllabus for Ph. D. (Physics) and M.Tech. (Engineering Physics) courses

A : Core Courses

03PHYS02-001-C: Engineering Mathematics Credit (3)

Complex Analysis: Analytic functions, Cauchy-Reimann conditions, Cauchy integral theorem, Laurent expansion, conformal mapping, singularities, calculus of residues, evaluation of definite integrals.

Vector Calculus: Gradient, divergence and curl operations and their physical interpretations, vector integrations, Gauss theorem, Stokes theorem.

Matrix: Basic concept of matrix algebra, symmetric, skew-symmetric and orthogonal matrices, eigenvalues and eigenvectors of a matrix, hermitian, skew-hermitian and unitary matrices, illustration of symplectic matrices in particle transporting accelerator.

Integral Transform: Fourier integral, Fourier transform and inversion theorem, Fourier transform of derivative, convolution theorem, transfer function, Laplace transform, Laplace transform of derivatives, convolution theorem, inverse Laplace theorem.

Ordinary and Partial Differential Equations: Review of ordinary differential equations, introductions to partial differential equations, classification of partial differential equations, boundary and types of partial differential equations, solutions of one dimensional diffusion equation, two-dimensional Laplace equation, use of integral transform in solving partial differential equations. Introduction to difference equations.

Probability and Statistics: Bayes' formula, random variables, expected value and variance, discrete and continuous distributions, location parameters, joint distributions, conditional distributions and independence, covariance and correlation, bivariate normal distribution, Poisson process, the central limit theorem, statistical inference (with an aim to better understand and analyze experimental data), point estimators, estimating variance, confidence intervals, comparing two samples, estimation methods, hypothesis testing, goodness of a fit.

References:

1. "Mathematical Methods for Physicist", G. Arfken
2. "Mathematical Methods for Scientists and Engineers", Donald A. McQuarrie
3. "An Introduction to Probability: Theory and its Applications- Vol.1 and Vol 2", William Feller
4. "Ordinary Differential Equations" V.I. Arnold
5. "Advance Engineering Mathematics", Erwin Kreyszig

03PHYS02-002-C: Magnet Physics and Technology: Credit (4)

Origin of Magnetism: Classical and quantum concepts, magnetic moments, angular momentum and quantization of angular momentum.

Classification of Magnetism: Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism, and ferrimagnetism.

Role of Magnets in Accelerators: Dipole, quadrupole, sextupole, and combined function magnets, DC and fast cyclic magnets, septum magnets, and kicker magnets.

Fundamentals of Magnet Design: Magnetic circuit, dipole, quadrupole, sextupole and higher order multipole magnets and coil design, B-H curve.

Application of Magnetic Materials in Accelerators: Materials for DC magnets: low field magnets, high field magnets, permanent magnets, and shielding.

Materials for AC Magnets: Silicon steels, laminated Ni-Fe alloys, and Ferrites. Numerical methods for magnet simulation: computer code and related mathematical formalism, methods of optimization, multipole expansion, Fourier representation of magnetic field.

Magnet Technology: Fabrication procedures, tolerances, and economic issues.
Methods of magnetic field measurements: magnetic induction, search Coil, Hall probe, and nuclear magnetic resonance.

Superconducting Magnets: Basic concept of superconducting magnets, magnet geometries for dipole magnets, superconducting materials, need for twisted composite conductors, hot spot temperature, current densities, quench, training of magnets and persistent switch.

Geodesy and Alignment of Accelerators: Introduction, survey and alignment as applicable to accelerators and its requirement. Position sensitive elements and their typical tolerances for alignment, fiducial references and adjustment system, fiducial posts and targets, and techniques of fiducialsation. Features of support elements and their adjustments during alignment.

Network and Alignment Procedure: Defining coordinate systems, control networks-types, survey procedure, data adjustment and error analysis.

Survey and Alignment Instruments and Toolings: Electronic theodolite, optical level, laser Interferometer, distinvar, inclinometer, offsetmeter etc. Different types of targets and sensors.

03PHYS02-003-C: Laser Physics and Technology: Credit (4)

Basic Formalism: Spontaneous and induced transitions, Einstein's approach, A and B coefficients, conditions for light amplification and oscillations, and characteristics of laser light. Homogeneous and inhomogeneous broadening of the transitions, spectral narrowing in a laser, gain saturation, spatial and spectral hole burning and their consequences, Lamb dip spectroscopy and its applications.

Propagation of optical beams in free space and in dielectric slab waveguides, Hermite-Gaussian beam modes, and ABCD law for Gaussian beam propagation.

Optical resonators, concept of cavity modes, resonators with spherical mirrors, resonance frequencies of optical resonators, losses in optical resonators, stable/ unstable resonators, Kirchoff's diffraction treatment for transverse modes.

Methods For Obtaining Population Inversion: Optical pumping, coherent and incoherent pumping, one- and two-photon processes, pumping geometries, pump sources, electrical pumping by discharge in gases, excitation mechanisms, self sustained and e-beam sustained operation, chemical pumping, and gas dynamic pumping.

Laser Dynamics: Laser oscillation, three and four level lasers, rate equation modeling, power in laser oscillators, optimum output coupling low- and high-loss regimes, multimode laser oscillation and mode locking. Different techniques of mode locking. Relaxation oscillations, cavity dumping and Q-switching. Techniques of Q-switching. Pulse compression techniques for ultrashort pulse generation. Spectral control of laser output, tunability of output frequency, single frequency operation, and frequency stabilization.

Physics and Technology of Specific Laser Systems: Solid state lasers, vibronic lasers, semiconductor diode lasers, diode pumped solid state lasers, fiber lasers, dye lasers, atomic and molecular gas lasers, chemical lasers, excimer lasers, free electron lasers. Measurement of parameters of a laser system.

Nonlinear Optics: Crystal optics, electro-optic effect, wave propagation in nonlinear media, phase matched second harmonic generation, optical parametric oscillator, two-photon absorption, stimulated Raman scattering, frequency mixing in gases and vapours, self-focusing, optical bistability and optical phase conjugation. Quantum optics: second quantization, non-classical effects.

03PHYS02-004-C: Electromagnetic Theory: Credit (3)

Electrostatics: Laplace equation and the uniqueness theorems, variational approach to solutions of the Laplace and Poisson equations. Formal solutions of electrostatic boundary value problems with Green function. Method of relaxation for 2D electrostatic problems, method of images, separation of variables and special functions, finite element method, and multipole expansions. Electrostatic field in matter.

Magnetostatics: Maxwell equations of magnetostatic, macroscopic Maxwell equations in magnetic material and boundary conditions on B and H, and solution of boundary value problems in magnetostatics.

Electromagnetic Wave: Wave equation, solutions in free space, plane waves, Gaussian beams, equations in material media, dispersion relations, Fresnel's laws of reflection and refraction, total internal reflection and evanescent waves. Lorentz transformation of electromagnetic fields.

Wave-guides, Resonant Cavities and Optical Fibers: Hollow metallic waveguides, dielectric waveguides, optical fibers, resonant cavities, and elements of microwave transport line.

Radiation by Moving Charges: Lienard-Wiechert potentials and fields, power radiated by an accelerated charge, Larmor's formula, and angular distribution of emitted radiation.

03PHYS02-005-C: Accelerator Physics and Beam Diagnostics: Credit (4)

Introduction: Motion under electric and magnetic fields. DC and RF acceleration. Relativistic kinematics, Brief history and review of particle accelerators.

Synchrotron/Storage Rings: Accelerator magnets - dipole, quadrupole and sextupole magnets. Multipole expansion method. Equation of motion, betatron oscillations, weak and strong focusing, transfer matrices, beam stability, twiss parameters, motion of particles with momentum deviation, momentum compaction, and chromaticity. Magnetic field errors, closed orbit distortion and its correction, resonances - integer and half integer, beam acceleration, synchrotron oscillations, phase stability, transition energy, beam emittance, Liouville's theorem, single turn injection, H-injection, and fast extraction.

Beam Transfer Lines: FODO cells, quadrupole triplet, phase space matching, emittance dilution.

Synchrotron Radiation Sources: Synchrotron radiation, Radiation damping, quantum excitations, equilibrium beam emittance, and beam lifetime.

Linear Accelerators: DC accelerators, various types of RF accelerators, EM mode in a simple structure, Q-factor, shunt impedance, transit time factor, filling time, energy gain, dispersion curve, TW and SW accelerators, and beam dynamics in LINACS.

Cyclotrons: Basic principle of cyclotron, resonance condition, orbit stability, limitations of classical cyclotrons, AVF cyclotrons, injection, central region, extraction, time structure, energy resolution, and beam emittance.

Microtrons: Classical microtrons, basic equations, and Racetrack microtrons.

Beam Diagnostics: Physical principles, charge collection, secondary emission, Ionization, fluorescence, scintillation, capacitive pick up, magnetic pick up, wall current, synchrotron radiation detection, and optical transition radiation.

Instrumentation: Faraday cup, secondary emission wire monitor, beam loss monitor, beam profile monitor, beam position monitor, DC beam current transformer, fast current transformer, wall current monitor, photomultiplier, photo diode, image dissector, and streak camera.

03PHYS02-006-C: Reactor Physics, Radiation Physics, and Safety Issues of Credit (3)

Health Physics: Radiation sources - radioisotopes, natural and manmade sources, radioactive series, reactors, accelerators, radiation facilities, solid, liquid and gaseous activity. Control measures - time, distance, decay, shielding, administrative control, radioactive discharge, waste disposal, and exposure control.

Interaction of Radiation with Matter: Interaction of light and heavy charged particles, photons, and neutrons. Interaction of high energy charged particles, electromagnetic cascade, and Hardronic cascade.

Radiation Quantities, Units, and Regulatory Recommendations: Dosimetric quantities, exposure, absorbed dose, equivalent and effective dose, committed dose, ALI, DAC, ICRP, AERB, and dose limits.

Biological Effects of Radiation: Somatic and genetic effects, stochastic and deterministic effects, and LD30/50.

Detection of Radiation: Ionisation chamber, proportional counters, GM tubes, scintillation detectors, semiconductor detectors, thermoluminiscent dosimeters, direct reading dosimeters neutron detectors, BF3 and He3 tubes, Rem-meters, CR-39-foils, pulsed radiation detection. Low and high energy radiation detection.

Reactor Physics: Introduction to nuclear energy - fission and fusion, interaction of neutrons with matter; fission process and energy release, fission cross-section, fissile and fertile materials. Chain reaction, neutron cycle and lifetime, criticality and classical four-factor formula. Thermal and fast systems, slowing down of neutrons, conversion and breeding of fissile materials, concept of neutron flux and current, neutron diffusion theory, critical size and mass, reflected systems and reflector saving, heterogeneous systems. Reactor kinetics, reactivity and importance of delayed neutrons, reactivity changes and coefficients, fission product poisoning, control devices, uranium and thorium fuel cycles and enrichment processes.

Accelerator Safety: Types of accelerators, prompt and residual radiation, source terms, radiation hazards, radiation safety systems, shielding, radiation monitoring, non-ionizing radiation safety, RF and MW safety, magnetic field safety; ozone safety, safety at synchrotron radiation beam lines, spallation neutron sources, and accelerator driven sub-critical systems.

03PHYS02-007-C: Numerical and Mathematical Techniques and Scientific — Credit (5)

Numerical Methods

System of Linear Algebraic Equations: Direct methods - Gauss elimination and Gauss Jordan methods. Iterative methods - Jacobi, Gauss-Seidel and Successive over relaxation (SOR) methods. Eigenvalue problem .

System of Nonlinear Equations: Newton-Raphson and Secant methods. Roots of polynomials, synthetic division of polynomials, and Baristow method.

Interpolation, Extrapolation, Error and Regression Analysis: Types of errors their analysis.

Numerical Integration: Newton-Cotes, Gauss quadratures, trapezoidal, Simpson's 1/3 and 3/8 rule. Numerical differentiation - forward, backward and central difference quotient.

Differential Equation: Solution of ordinary differential equations. Solution of partial differential equations. Fast Fourier transformation.

Statistical Distributions: Poisson and Gaussian distributions. Monte Carlo simulation, pseudo random numbers, and central limit theorem.

Finite Element Method (FEM)

Introduction: Basic concepts of finite element method, application of finite element method, finite element method versus classical methods, finite element method versus finite difference method, and advantage of finite element method.

Integral Formulations for Numerical Solutions: Variational method, collocation method; subdomain method, weighted residual methods, Rayleigh-Ritz method, Galarkin's method, and least square method

Elements, Nodes, and Co-ordinate Systems: Introduction, element shapes, nodes, nodal unknowns, and coordinate systems

Shape Functions: Introduction, polynomial shape functions, convergence requirement of shape function, and derivation of shape functions.

Introduction to Stiffness (Displacement) Method: Definition of the stiffness matrix, derivation of the stiffness, matrix, assembly of the total stiffness matrix, properties of the global stiffness matrix.

Application of Finite Element Method in Heat Transfer Problem: Fundamentals, one dimensional finite element formulation, and problems.

Fundamentals of Computers: Computer architecture, application of computers, input and output devices, latest processors, desktop PC and servers.

Networking Basic: TCP/IP, DNS, Internet, and Intranet.

Operating System Basic: Linux, windows, shell programming, and CLI, vi, multithreading, multiuser, multitasking, hyper threading, file permissions, and ssh.

Fundamentals of programming: Algorithm, flow charts, high-level languages like Fortran and C, and steps for creating a simple program.

Introduction to C Programming Language: Program structure, header files, basic data types, variables, and declarations.

Operators and Declarations in C: Relational, logical, increment, and decrement operators. Expressions and precedence of operators. Input and output operations, control statements, iterative loops, arrays, and pointer;

Overview of Scientific Computing: Languages and compilers and scientific libraries.

Overview of Trends and Techniques: Sequential, parallel computing, cluster and grid computing.

Architecture Taxonomy: Traditional architecture, Flynn's classical taxonomy, SISD, SIMD, MISD, and MIMD Models.

Steps for Creating a Parallel Program: Decomposition of the program, communication, computations, and composing the results. Parallel example-array processing.

03PHYS02-009-C: Applications of Lasers in Nuclear Science, Industry and Medicine Credit (3)

Laser Applications: High resolution spectroscopy, ultra-fast spectroscopy, laser cooling, laser metrology, holography and its applications in NDT, optical data storage information processing, and optical communication. Laser photochemistry, laser application in biology and medicine

Laser Isotope Separation: Principles of selective photonic action, selective photonic action on atoms or molecules, atomic and molecular schemes for laser isotope separation, lasers for isotope separation, and uranium isotope separation technology employing lasers.

Laser Material Processing: Laser material interaction, Laser cutting, welding, surface hardening, laser surface re-solidification, laser surface alloying, and cladding, laser shock-hardening, laser rapid manufacturing, laser application in decontamination and decommissioning of nuclear installations.

03PHYS02-010-C: Applications of Accelerators in Nuclear Science,Industry and Medicine Credit (3)

Synchrotron Radiation and its Applications: Properties of synchrotron radiation, various types of sources like BM, wavelength shifter, wiggler, and undulators. Beamline design and

synchrotron optics. Applications of synchrotron radiation to condense matter physics, surface physics, biology and Industries

Industrial and Medical Applications of Accelerators: Accelerators for industrial and medical applications. Beam characteristics for medical and industrial applications.

Radiation Processing Using Accelerators: Radiation cross-linking, radiation curing, polymerization, de-polymerization, and radiation grafting. Dose distribution in the irradiated products.

Typical applications: Treatment of wire and cables, viscose rayon sheets, rubber products, heat shrinkable tubes, and sheets. Flue-gas treatment, waste water treatment, electron beam applications in food irradiation and sterilization.

Accelerator Based Radiotherapy: Clinical requirements of an accelerator for radiotherapy. Various components of radiotherapy machine. Photon beam therapy and electron beam therapy. Quality assurance in radiotherapy accelerator.

Applications of Accelerators in Nuclear and Particle Physics: Evolution of nuclear physics with energy of the incident beam. Nuclear physics and related phenomena at incident beam energy less than 10 MeV/nucleon, between 10 and 100 MeV/nucleon, and more than 100 MeV/nucleon. Nuclear physics with radioactive ion beams (RIB).

Spallation Source: General introduction, applications to condense matter, and nuclear physics.

03PHYS02-011-C: Vacuum Physics and Technology: Credit (2)

Vacuum Theory: Definitions - throughput, conductance, pumping speed etc. Pressure equations, mean free path, monolayer formation time. Units of vacuum, pressure regions in vacuum.

Vacuum Systems and Components: Vacuum pumps - rotary pumps, dry pumps, turbomolecular pump, titanium sublimation pump, non-evaporable getters, and sputter ion pump. Vacuum gauges - capacitance gauge, Pirani, thermocouple gauges, BA gauge, penning gauge, partial pressure gauge. flanges and seals, vacuum valves and leed throughs.

Vacuum System Design and Development: Design considerations, sources of gas load (vaporization, thermal desorption, diffusion, permeation, electron and ion stimulated desorption etc). Materials, fabrication techniques and leak detection. Processing to achieve ultra high vacuum.

03PHYS02-012-C: Quantum Mechanics: Credit (6)

For Ph. D. (Physics) only

Mathematical Background and Postulates: Illustrations and application of postulates by using simple two-level systems and two-slit interference experiment.

Quantum Mechanics of Composite Systems: N-particle system, identical particles, symmetrization and antisymmetrization postulates, concept of density matrix, properties of density matrix, pure and mixed states.

Symmetry: Symmetries in quantum mechanics, space and time translation, time reversal symmetry and parity invariance. Rotational invariance, angular momentum, spin, and addition of angularmomenta.

Approximate Methods: Variational methods, Wentzel-Kramers-Brillouin (WKB) method, time-independent perturbation theory, time dependent perturbation theory, adiabatic and sudden approximations, Fermi-Golden rule.

Scattering Theory: Born approximation, partial wave analysis, two particle scattering.

Relativistic Quantum Mechanics: Klein-Gordon equation, Dirac equation, electron spin, and positron.

Advanced Topics: Quantization of electromagnetic field, coherent, and squeezed states, interaction of radiation with matter, spontaneous emission and Lamb shift, entangled state, EPR paradox and Bell's inequality.

03PHYS02-013-C: Research Methodology: Credit (0)

(Lecture: 20, Credit: 0)

Research Methodology: Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

Documentation: Preparing scientific papers/reports, scientific presentations.

Laboratory safety: Safe practices in laboratory.

Research ethics*:* Ethical conduct in science, ethical issues in scientific publication, awareness of plagiarism and other scientific misconducts.

Probability and Statistics: Bayes formula, random variable, expected value and variance, discrete and continuous distributions, joint distributions, conditional distributions, covariance and correlation, normal distribution, Poisson process, central limit theorem and its applications,
definition of precision, accuracy, systematic and random errors**,** propagation of errors in experimental data and their estimation, estimation of variance and confidence intervals.

Mathematical modeling: Measurement of functional relationships, order of magnitude analysis, dimensional analysis, goodness of a fit, linear regression and data fitting.

Data Security: Introduction to Data Security, Data security requirements, Different Cyber threats to Data & possible Solutions, Basic concepts of Cryptography & Data encryption algorithms, Research opportunities in Data Security.

Data management: Data planning, handling, modelling, analysis, visualization, Different Data Models, Data Management Software, Data Backup & Storage

B : Physics Based Elective Courses

03PHYS02-001-E: Statistical Physics: Credit (4)

Classical and Quantum Statistical Mechanics: Introduction, postulates, microcanonical, canonical and grand canonical ensembles, partition and grand partition functions and their properties.

Ideal Bose Gas: Introduction, chemical potential, equation of state and thermodynamic properties, system of phonons, system of photons, Bose-Einstein condensation, Bose-Einstein condensation in dilute atomic gases, and superfluidity.

Ideal Fermi Gas: Introduction, equation of state and thermodynamic properties of degenerate Fermi gas. Neutron stars, conduction electrons in metals, and cold Fermi atomic gases.

Phase Transition: Mean-field theories, symmetry, order parameters, break-down of mean-field theories, critical phenomena and renormalization group.

Non-equilibrium Phenomena: Elementary ideas, irreversibility, study of Brownian motion, random walk model, Langevin force equation, fluctuation-dissipation theorem, Fokker-Planck equation, Glauberdynamics.

03PHYS02-002-E: Modern Optics: Credit (4)

Geometrical and Physical Optics: Wave front, phase, image formation, resolution, optical path, monochromatic and chromatic aberrations, wave front aberrations, complex representation of EM wave.

Optical Elements: Lens, effective and back focal lengths, shape factor and controlling of aberrations by bending, centering errors. Autocollimator and its applications. Prisms, right angle, penta, dove, corner cube, rhomb, Parallel plate, beam splitters (plane, cube and penta). Polarizers (wire grid, sheet, glan, and Wollaston prisms), Polarization beam splitters, wave plates (quarter and half wave plates).

Interferometers and Optical Measurements: Two and multi-beam interference, Intensity equation for two beam interference, contrast/visibility of interference fringes, temporal and spatial coherences.

Important Interferometric Configurations: Fizeau, Twyman Green, Mach-Zehnder, Jamin, lateral shearing, and Sagnac/ cyclic path interferometers.

Surface Imperfections: Surface flatness, form/figure error, surface roughness, and scratches and digs

Interferometric Testing: Surface form, parallelism, inhomogeneity differential interference contrast. Working principle and applications of Nomarski microscope.

Phase Shifting Interferometry: Principle, phase shifting techniques, and phase unwrapping.

Measuring Micro-scale Devices: Scanning white light interferometers (SWLI).

Overcoming Diffraction Barriers: Scanning near field optical microscope (SNOM).

Metamaterials

Introduction: Maxwell's equations, dispersion, reflection refraction, phase group velocities, photonic band gap crystals, electromagnetic metamaterials.

Negative Refractive Index: Introduction, designing negative refractive index materials, periodic structures, negative refractive index for various frequency regions, anisotropic isotropic materials, double negative metamaterials, nonlinear metamaterials.

Applications: Subwavelength imaging, concept of perfect lens, Veselago-Pendry lens, plasmonic cloaking invisibility.

Optics of Metals Nanomaterials: Electromagnetic waves in metals, skin depth, plasma frequencies, local field enhancements, focusing light beyond diffraction limit.

Optics of Nanoparticles: Optics at subwavelength regimes, dispersion in nanocomposite materials, effective medium theories, Clausius-Mosotti Maxwell-Garnett theories, extraordinary transmission through very small apertures.

Plasmonics: Introduction, electronics versus plasmonics, plasmonic components, manipulating light with plasmonic nanostructures.

Fiber Optics: Basics, Components Systems

Optical Fiber Geometry: Step index fiber, graded index fiber, double-cladded fiber, microstructured fiber. Modes in optical fiber, dielectric slab wave guide, propagating modes of the symmetric slab waveguide, even odd TE modes, characteristic equations, mode cutoff conditions, TM modes, ray optics explanation of modes in a dielectric slab waveguide. Basic equations physical constraints in round optical fibers, the fields in the core cladding, boundary conditions characteristic equation, characterization of modes, mode cut-off conditions, TE, TM hybrid modes, single mode optical fiber, linearly polarized modes, power distribution in optical fiber.

Characteristics of Optical Fiber: Losses in optical fiber: intrinsic impurity absorption loss, waveguide scattering loss, microbending macrobending loss, coupling splicing loss. Dispersion in optical fiber, group velocity dispersion, material dispersion, waveguide dispersion, polarization mode dispersion, dispersion management in optical fiber. Birefringence in optical fiber.

Nonlinear Fiber Optics: Nonlinearities in optical fiber, Kerr nonlinearity, self phase modulation, self focusing, cross phase modulation, four wave mixing, stimulated Brillouin scattering, stimulated Raman scattering. Ultra short pulse propagation, derivation of nonlinear Schrödinger equation (NLSE), ultra-short pulse propagation through fiber, soliton, similariton Gaussian pulse. Effect of gain loss on pulse propagation, interplay of dispersion, nonlinearity gain.

Fiber Optic Components Devices: Directional couplers, coupled mode equations, power transfer characteristics, transfer matrix of a coupler, super modes of a coupler, effect of fiber dispersion. Fiber gratings, Bragg diffraction, photosensitivity, fabrication techniques, grating characteristics, grating as an optical filter, nonuniform (chirped) grating. Fiber interferometer, fiber-ring resonator, Febry-perot resonator, Sagnac interferometers, Mach-Zehndar interferometers. Isolators circulators, Faraday effect, optical isolator, optical circulators. Fiber based system, fiber based sensors, temperature pressure sensors. Fiber laser amplifier, doped fiber, gain in doped fiber, basic construction of fiber laser amplifier. Mode-locked fiber laser: basics of mode-locking dynamics, nonlinear polarization rotation, saturable absorber, basic construction of a mode-locked fiber laser with a highlight of different mode-locking regimes, all-fiber integration.

03PHYS02-003-E: Advanced Accelerator Physics: Credit (4)

Ion Sources: Emission processes and Child Langmuir Law, positive and negative ion sources, atomic and molecular phenomena in ion sources, beam extraction and transport.

Proton and Heavy Ion Accelerators: Introduction to acceleration of protons and heavy ions, RFQ, different type of cavities/accelerating structures, including SCRF, and introductory beam transport.

Instabilities in Linear Accelerators: Basics of beam instabilities, short and long range instabilities.

Other topics: FEL, Linac based synchrotron sources, laser plasma acceleration, and ADS.

03PHYS02-004-E: Plasma Physics and Technology: Credit (4)

Basic Plasma Physics: Definition of plasma, concept of temperature, Debye shielding, plasma parameter, criterion for plasma, variety of plasmas.

Plasma Behaviour: Single particle motion in electric and magnetic fields, collisions, plasma as fluid, kinetic approach.

Waves in Plasmas: Dielectric function, plasma oscillations, electromagnetic equations, dispersion relations.

Methods of Plasma Production: Electrical discharge, ohmic heating, RF heating, plasma production by lasers and particle beams, Tokamak plasma, Z-pinch, Theta pinch

Plasma Processes: Ionization, recombination, plasma equilibrium.

Radiation from Plasmas: Emission processes, spectral characteristics.

Plasma Diagnostic Methods: Density and temperature diagnostics using plasma radiation

Plasma Heating by Laser Beams: Propagation of laser beam in plasmas, inverse Bremsstrahlung, resonance absorption, parametric processes, second harmonic generation, filamentation, self-focusing.

Laser Plasma Interaction at Ultrahigh Intensities: Ultrahigh intensity parameters, multi-photon ionization, tunnel ionization, above threshold ionization, high harmonic generation.

Applications of Laser-plasma: Electron acceleration, x-ray lasing, inertial confinement fusion and fast ignition.

03PHYS02-006-E: Advanced Course on Atom-Photon Interactions:

Interaction of Light with Matter: Hamiltonian description, multipolar approximation, review of the time dependent perturbation theory, concept of transition amplitude, semiclassical theory of a two level atom coupled to a single mode radiation field, density matrix, optical Bloch equations, semi-classical laser theory.

Coherent Effects: Coherent population trapping (CPT), electromagnetically induced transparency, laser without population inversion, mechanical effects of light and its application in laser cooling and trapping.

Quantum Field: Quantization of electromagnetic field, interaction of quantized radiation with matter, Jaynes-Cummings model, quantum dissipative processes, atom in the vacuum field and spontaneous emission, resonance fluorescence.

Elementary of Theory of Coherence: Quasi-probability distribution functions, classical light and Non-classical light, coherent state, squeezed state and its experimental realization, atom-photon and atom-atom entanglement, multiparticle Entanglement, Entanglement in Quantum Information Processing.

Interaction of Atom with Intense Light Field: Virtual absorption and multiphoton ionization, generalized Fermi-Golden Rule, above threshold ionization, Volkov state and KFR theory, high harmonic generation, Floquet theory, many-body correlation effects and non-perturbative field effects, and S-Matrix theory.

03PHYS02-007-E: Advanced Beam Dynamics: Credit (4)

RMS envelope equation, beam matrix approach, concept of stationary states for beam distribution functions.

Transverse beam dynamics in a solenoid, Busch emittance, transverse and longitudinal beam dynamics in RF field, Panofsky-Wenzel theorem and its applications, wakefields and impedances in linear accelerators.

Emittance growth mechanisms and approximate techniques to estimate the emittance growth, beam halo. Bunch compressors and coherent synchrotron radiation (CSR), emittance growth due to CSR.

Beam dynamics with ion trapping and electron clouds

Coupling of electromagnetic power to RF cavities, beam loading and its implications, Slater perturbation theorem and its applications.

Computational methods in accelerator physics, symplectic integration, Lie Algebraic methods.

03PHYS02-008-E: Course on Bio-Photonics: Credit (4)

Introduction: Scope of bio-photonics, interaction of light with cells and tissues: absorption, scattering and depolarization of light .

Basics of Biology: Cell structure and organization, structure and function of biomolecules, metabolism and energetics. General methods for biophysical and biochemical analysis, mechanism of cell death.

Light Propagation in Tissues: Rayleigh and Mie scattering, multiple scattering and propagation of light in tissues, Radiative transport and diffusion approximation, effect of boundary conditions, numerical approaches for determining irradiance at surface and interior of scattering objects, techniques for determination of optical properties of biological samples.

Optical Imaging Through Turbid Medium: Trade-off between resolution and depth of imaging, use of spatial filtering, polarization gating and time-gating for optical imaging, high resolution imaging using coherence gating, Optical coherence tomography (OCT) and diffuse optical tomography.

Optical Spectroscopy for Biomedical Diagnosis: Elastic scattering spectroscopy for disease diagnosis, Fluorescence and Raman spectroscopy for diagnosis.

Optical Techniques for Micro-manipulation: Optical tweezers and micro-beams, radiation pressure and force on microscopic objects, gradient and scattering force, applications of optical tweezer.

Optical Microscopy: Recent Developments: Contrast methods in optical microscopy, techniques for single molecule imaging, scanning laser microscopy, multi-photon microscopy and near-field techniques.

Optical Methods for Bio-sensing Applications: Surface plasmon resonance based sensors, quantum dots and functionalized nanoparticles as biosensors approaches for label-free sensing, opto fluidics and lab-on-a-chip approach.

Effect of Light on Biological Tissue: Basic principals of photobiology, photo-acceptors, action spectra and light induced signaling mechanism, Ligh effect based on endogenous photosensitizers, use of exogenous photosensitizers for photodynamic therapy and photo anti-microbial therapy, biological effects of narrow bandwidth light.

03PHYS02-009-E: Concepts in X-Ray Physics: Credit (4)

X-ray and Their Interaction With Matter: X-ray waves and photons, sources of X-rays, X-ray scattering from an electron and atom, refractive index including absorption, coherence, Kramer-Kroning relationship.

Refraction and Reflection of X-rays: Refraction and phase shifting in scattering, Snell's law and Fresnel equation in X-ray region, reflection from homogeneous slab and multilayers, rough interfaces and surfaces, examples of refractive and reflective X-ray optics and curved mirrors.

Kinematical Diffraction and Resonant Scattering: Laue condition and reciprocal space, Ewald sphere, lattice vibration, the Debye-Waller factor, Lorenz factor, application of kinematical diffraction, structure factor and basics of structure solving, phase problem in crystallography, anomalous diffraction and some examples, introduction to Rietveld refinement method.

Diffraction by Perfect Crystals: Kinematical reflection from few layers, basics of dynamical theory, Darwin's theory of extinction depth, integrated intensity, standing waves, higher order reflection, effect of absorption, asymmetric Bragg geometry, DuMond diagrams, applications in synchrotron X-ray monochromators, X-ray Topography.

X-Ray Absorption: X-ray absorption from isolated atoms, extended X-ray absorption fine structure (EXAFS), near edge X-ray absorption (XANES), EXAFS equation, basics of EXAFS data acquisition and sample preparation, Transmission versus fluorescence modes of EXAFS.

X-Ray Fluorescence: Theoretical details and data analysis, details of the experimental technique, sample preparation, trace element quantification and related issues.

Photo Emission Spectroscopy and X-Ray Magnetic Circular Dichroism: Basics of photoemission and inverse photoemission, experimental setup, photoelectron and Auger electrons, core level binding energies, chemical shifts, lineshapes and background, valence band structure determination, resonant photoemission, angle resolved photoemission and band structure determination, spin polarized photoemission, basics of XMCD

03PHYS02-010-E: Physics of Semiconductor Quantum Structures:

For Ph. D. (Physics) only

Introduction to Semiconductor Nanostructures: Review of condensed matter and semiconductor physics, scientific and technological significance of nanostructures and mesoscopic structures, characteristic length scales for quantum phenomena, energy states of carriers in free space of different dimensionality, effect of quantum confinement on carrier energy states, density of states for semiconductors of reduced dimensionality, key ideas on effect of quantum confinement in electronic properties, transport phenomenon and interaction of photons with materials, and applications of nanostructured semiconductors.

Growth of Semiconductor Nanostructures: Homo and hetero epitaxial growth, nucleation and nucleation kinetics, strain in lattice mismatched systems, psudomorphic growth and critical thickness, growth modes: Volmer-Weber (VW) or planer growth, Frank-van der Merwe (FM) or island growth and Stranski-Krastinov (SK) nucleation and growth, fundamental and principle of physical and chemical vapor deposition methods: Pulsed laser deposition, molecular beam epitaxy, chemical vapor deposition, atomic layer deposition, sputtering. Bandgap engineering and growth of quantum well structures, key issues in growth of quantum wires, quantum dots and super lattices, Fundamental characteristics of semiconductor nanostructures.

Properties and Characterizations of Semiconductor nanostructures: Optical processes in low dimensional semiconductors: Excitons, free carriers and defect level induced optical transitions, optical phonons and polaritrons, Basic principles and key issues of optical spectroscopy techniques for nanostructured semiconductors; absorption, reflection, photoluminescence, photoluminescence excitation and surface photovoltage spectroscopy. Transport in semiconductor nanostructures: conductance, resonant tunneling, hot electrons; transport in magnetic field, semi-classical and quantum approach, Aharonov-Bohm effect, Shubnikov-de Haas effect, introduction to quantum Hall effect. Principles of application of devices based on Semiconductor nanostructures: photodetectors, lasers, resonant tunneling diodes and solar cells etc.

C : Engineering Based Elective Courses

for M.Tech (Engineering Physics) only

03ENGG01-001-E: Power Supplies: Credit (4)

AC-DC Converters: Single phase and three phase diode and controlled rectifiers, effect of source inductance, ripple and harmonic analysis, 12-pulse rectifier, firing angle control schemes, THD and power factor, filters - passive and active, passive and active damping of filters.

Power factor Correction: Effects and limiting standards for line current harmonics, Passive PFC techniques, ActivePFC.

DC-DC Converters: Principle of operation, steady-state analysis of buck, boost, buck-boost converters, Isolated dc-dc converters- forward, flyback and bridge converters, pulse width modulator and control of dc-dc converters.

Principles of Feedback Control System: Negative feedback, Stability criteria- gain and phase margin, steady state errors, transient response, current loop and voltage loop acting together.

Magnet power supplies in Accelerators: Requirements, Load characterisation, DC and ramping type power supplies, Pulsed power supplies.

High current magnet power supplies: Stability requirements, current cycling, Field stabilization.

Power supplies for superconducting magnets : Load requirements, quench detection, protection and training.

Laser and Plasma power supplies: Load characterisation, Gas discharge, Ballast requirements, CW/Pulsed operation, Current stabilisation, Power coupling schemes to gas discharges.

Thermal Management: Heat transfer, Heat sink design, Water- cooled heat sinks.

03ENGG01-002-E: Power Electronics: Credit (4)

Power Semiconductor Devices: Diode, SCR, MOSFET, IGBT, Static and switching characteristics, Safe operating areas, Drive requirements and circuits, Introduction to the properties of emerging materials and devices, High voltage switches, Turn-on and turn-off snubbers.

Modelling and Analysis : Introduction to modelling and analysis techniques for dc-dc converters, Averaged equivalent circuit modelling and analysis, small-signal analysis with an illustrative converter, Feedback control of power converters: Feedback controller design, voltage- mode control and current- mode control.

Soft-switching Converters: Concept of soft-switching, Load resonant converters: concept and

definition, ac analysis of converters and modes of operation, Full bridge zero voltage switching converter: Phase shifted PWM, Operation and analysis of converter in steady state.

High frequency Magnetics: Ferrites- characteristics and types, skin effect, proximity effect, parasitic components- origin, minimisation and characterisation, design of high frequency magnetic components, introduction to planar magnetics.

Electromagnetic Interference: Measurement techniques, LISN, separation of common mode and differential mode noise, limiting standards and mitigation techniques, design of high frequency filters.

03ENGG01-003-E: Advanced Course on RF and Microwaves: Credit (4)

Microwave Networks: S-parameters, Matrix representation of Microwave networks and its properties, cascade networks, periodic network system and application, mixed mode S parameters and their applications.

Generation of RF power for accelerators: Design requirements, RF power amplifiers using tetrode & triodes and solid state devices, klystrons, IOT, Gyrotron, Cooling and protection, Grounding and shielding.

High Power RF transmission: design aspect of high power RF transmission, directional couplers, dividers, combiners, high power waveguide and coaxial transmission lines, circulators, bends, magic-T, microwave windows, dummy loads, RF couplers.

Accelerator cavities: Characterizing RF cavity, determination of important cavity parameters, Fundamentals of beam-cavity interactions. RF power coupling to cavity.

Low level RF components and systems: Planar circuits, microstrips, substrate materials, lumped and distributed circuits, mixer circuits, phase shifters, filters, switches, couplers, dividers/combiners, Low level RF signal processing and RF feedback systems.

RF systems for accelerators: Design and configuration of typical RF system, Safety interlocks and operation of RF system.

RF/Microwave measurements: Specialty of high frequency measurements, Measurement of RF power, impedance, VSWR, frequency and phase. Measuring instruments used in RF/microwaves, passive and active detectors, spectrum analyzer, VNA calibration systems, Vector measurement with VNA, peak and average power meters, impedance analyzer, frequency counter.

03ENGG01-004-E: Advanced Data Acquisition and Control Systems:

Components of data acquisition system and their selection, signal conditioning modules, polling, hand-shaking, interrupt and event driven, DMA, data sampling methods.

Embedded system software concepts and development tools assembly and HLL, assembler,

compilers, linker, librarian, resident monitors, source level debuggers, in-circuit & in application programming (ICP/IAP) and logic analyzer. In circuit emulator (ICE), object code and HEX file formats, FPGA & CPLD architectures, logic cell structures, programmable interconnect and I/O ports, programming technologies and VHDL, implementation of combinational and sequential circuits, timing issues in FPGA synchronous circuits.

Centralized v/s distributed control system, PAC and PLCs, PC software issues and virtual instrumentation, VISA, image acquisition, data logging, online and offline data processing, data presentation and reporting, BUSES for digital data communication.

PC buses: PCI & PCI Express specifications mechanical, electrical functional.

Back plane buses: VME, CPCI, PXI, VXI mechanical electrical functional specification.

Buses for instrument network: Asynchronous & synchronous communication standards, bus, ring, net topologies, RS-232, RS-485, USB, LAN-Hub, GPIB, Ethernet, field bus serial port expansion cards on PCI, Converters: USB-GPIB, USB-Serial.

Real-time system concepts, timeliness vs speed, hard vs soft real time, scheduling method, concurrency, process & thread concepts, inter process communication and synchronization.

Software reliability: Software implemented fault tolerance, reliability and availability, safety issues. Software reliability standards and practice.

Process control elements, Set point, disturbance, servo system, regulatory system, analog vs digital control systems, Z - transform for digital control systems, feedback control system, continuous time domain PID controllers. Feed forward and cascade controls, digital controllers, digital form of PID controller, Z-transform based dead beat and Dahlin's algorithms, programmable logic controllers and applications, compensator design and stability criterion.

03ENGG01-005-E: Reliability Engineering: Credit (4)

Basic engineering statistics: Basic probability, random variables, probability density and cumulative distribution functions of engineering importance such as the binomial, poisson, normal, exponential, weibull, etc. Random sampling and sampling statistics and distribution of sampling statistics, such as the Chi-Square and Students test, point and interval parameter estimation, test of hypothesis, examples to solve on continuous and discrete distributions, mathematical equations relating to hazard rate, reliability, cumulative failure probability and

failure probability (density) function, Bath-tub curve - explanation of different parts of the life characteristic curve and corresponding failure distributions.

Quality and reliability, QA/QC concepts - Acceptance sampling plans, quality measurement, quality improvement and control methods with applications in design, development, and manufacturing, modern quality management philosophies, engineering/statistical methods including process control, control charts, process capability studies, loss functions, design of experiments, and total quality management (TQM) topics.

Reliability, availability and maintainability concepts and principles, reliability statistical analysis concept overview and application, accelerated life testing concepts, principles and application, qualitative and quantitative accelerated life testing principles, life-stress relationships and application to electronic components and semiconductor devices, software reliability issues, reliability prediction for electronic systems, system reliability concepts and case studies, role of redundancy in system reliability, design for reliability concepts and case studies, degradation analysis and case studies, reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software, hardware reliability analysis of electronic and computer based C&I systems based on MIL-STD-217, methods of measuring the reliability effectiveness of complex engineering systems, optimization theory, preventive maintenance models, and statistical analysis.

03ENGG01-006-E: Advanced Course in High Voltage Engineering: Credit (4)

High Voltage Technology: Introduction, classification of voltage levels, high voltage in electric supply network, major components of a high voltage network.

Electrostatic Fields and their Control: Electric field intensity, electric strength, classification of electric fields, degree of uniformity of electric fields, control of electric field intensity.

Dielectric Materials and their Behavior in Electric Fields:

a. Insulating Behavior of Air and other Gaseous Dielectrics: Generation of charge carriers: impact ionization, thermal ionization and photo-ionization, Negative ion formation, Breakdown by avalanche discharge (Townsend Mechanism); Breakdown voltage characteristics in uniform fields (Paschen's Law) Practical factors affecting the breakdown voltage: Corona, Fields non-uniform, high pressure and vacuum.
b. Liquid Dielectrics in High Voltage applications: Mineral insulating oils, Dielectric properties of insulating liquids, Dielectric power losses in insulating materials, Breakdown in liquid dielectrics, Aging of mineral insulating oils.
c. Solid Dielectrics and their Behavior in Electric Fields: Classification of solid insulating materials, Breakdown and pre-breakdown phenomena in solid dielectrics, Partial discharge and its effects on dielectrics.

Generation of High Voltages:

a. Alternating voltages: single step-up transformer, Transformers in cascade, Voltage control

of testing transformers, Series resonant circuits.

b. Direct Voltages: Half wave and full wave rectification, Voltage doublers and cascade circuits.

c. Impulse Voltages: Single stage impulse generator, Multistage Marx generator, Practical Impulse Generators.

High Voltage Test & Measurement: Types of tests, Power frequency tests, DC voltage test and Impulse withstand test, Peak voltage measurements by spark gaps, Sphere gaps and uniform field gaps, Voltage measurement using ammeter in series with high impedance, Voltage measurement using potential dividers, Generating voltmeter, Voltage and current transformers.

High Voltage Design and Applications: Design considerations of high voltage bushings, power cables, transformers and switchgears; high voltage applications and electrostatic hazards.

High Voltage Safety and Protection.

03ENGG01-007-E: Digital Signal, Image Processing and Applications:

Introduction: Digital image, steps of digital image processing systems, elements of visual perception, connectivity and relations between pixels. Image acquisition: Frame grabber, optics and illumination Simple Operations - Arithmetic, Logical, geometric operations.

Mathematical Preliminaries: 2D LTI systems, 2D convolution, correlation, 2D random sequence, 2D spectrum.

Image Transforms: 2D orthogonal and unitary transforms- properties and examples. 2D DFT, histogram, image smoothening, image filtering, Sharpening, thresholding.

Image Segmentation and Analysis: Edge detection, line detection, curve detection, Edge linking and boundary extraction, boundary representation, region representation and segmentation, morphology-dilation, erosion, opening and closing.

Image understanding and recognition: Matching by templates, classifiers models, statistical, matching shapes by contour and texture.

Review of LTI systems: Fourier transform for discrete-time signals and its properties, comparison with continuous-time Fourier transform. Discrete time signals, sequences, representation of signals on orthogonal basis, sampling and reconstruction of signals.

Signal analysis using the Fourier transform, impulse function and complex exponential signal, modulation and frequency translation, duality, Fourier transform of periodic signals,

correlation, energy and power spectral density, Hilbert transform, Fourier transform of finite-duration discrete - time sequences.

Z-transform, Discrete Fourier Transform (DFT), Fast Fourier Transform algorithm and applications. Design of FIR & IIR digital filters, effect of finite register length in FIR filter design. Overview of DSP processors, FPGAs.

Typical applications in Lasers and Accelerators.

D : Laboratory Experiments (Credit :4)

Experiments relating to lasers, accelerators and general electronics techniques will be offered. A student needs to carry out twelve experiments (4 each from laser, accelerator and electronics related areas) in two phases with a total working time of 72 hours which will carry 4 credits.

03PHYS02-001-L Lasers and Applications

1. Measurement of spectrum and spectral width of diode laser and their dependence on current.
2. Study of characteristics of a Q- switched Nd:YAG laser.
3. Second harmonic generation: phase matching and maker fringes.
4. Saturated absorption in atomic vapour: Doppler broadening, natural line width, power broadening.

5. Study of light propagation through fiber: coupling efficiency, bending losses, splicing and connecting fiber.
6. Studies on Nitrogen laser pumped dye laser.
7. Parametric study of a XeCl Excimer laser.
8. Output power characteristics of a diffusion-cooled CO_2 laser.
9. Determination of severance energy for cutting mild steel with CO_2 laser.
10. Determination of laser power coupling efficiency in Nd-YAG/CO_2 laser welding of stainless steel.

03PHYS02-002-L Accelerators Related Areas

1. Electrical resistivity measurement on metallic samples at low temperature.
2. Parametric studies of magnetic materials and operating point of magnets.
3. Outgassing of materials, discharge cleaning and ESD studies.
4. Estimation of radioactivity and shielding attenuation coefficient measurements.
5. Determination of cooling power of a cryocooler.
6. Electron gun: Operation and experimental studies.
7. Proton ion source: Operation and experimental studies.
8. X-ray fluorescence studies using radioactive source.
9. Calibration of cryogenic sensors.

03PHYS02-003-L Electronics

1. Study of stepper motor, dc motor drive and position feed-back.
2. Study of different transducers and their interfacing.
3. Communication buses and protocols, buses for distributed embedded processing.
4. G.U.I. software familiarization and applications.
5. Digital image processing and their applications.
6. Current and voltage regulated power supplies and change from one another.
7. Study of flash lamp and measurement of flash lamp current and K0 factor.
8. Characterization of RF components.
9. Fast current transformers: Study and measurement of response.

<u>03PHYS02-001-R</u> E : Reading Courses (Credit : 8)

Ph. D. scholars will work on two reading courses each of four credit worth. For each reading course, a Ph. D. scholar is expected to do self reading (under the guidance of his/her Ph. D. supervisor) of a review paper or book(s)/monograph(s) of specialized subjects related to the

area of his/her proposed area of research. Alternatively he/she may also work out and comprehend a research paper or a part of research paper relevant to his/her Ph. D. work. The topic and the structure/contents of the two reading courses should be decided by the guide in consultation with the respective doctoral committee and the Ph. D. scholar. The two reading courses should be approved by the respective doctoral committee.

The two reading courses will be evaluated on the basis of the detailed reports that will be prepared by the scholar and presentations, which will be held at the end of first year (in the month of August). The total marks for each reading course is 150 with 100 and 50 for report and presentation respectively.

BHABHA ATOMIC RESEARCH CENTRE

M.Sc in ENGINEERING SCIENCES (PROGRAM CODE: ENGG03)

SYLLABUS

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as “Radiological Safety Engineering’ course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

12. The Principles of Circular Accelerators and Storage Rings - Philip Byrant.
13. Introduction to Vacuum Technology-Compiled by K.G. Bhushan, BARC

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 503: Engineering Maths-II (20) (ME Group)

- Introduction to discretization methods and approximate solution of differential equations (FDM, FEM and FVM), Finite Difference Approximations in 1-D, Solution of steady and unsteady heat conduction equations, wave equation
- Formulation of the matrix methods by equilibrium concepts (1D-heat conduction, 2D-truss and 1D-hydraulic flow examples).
- Approximate solution of differential equations – Weighted residual method, collocation, least squares and Galerkin's methods, Piecewise approximations. Basis of Finite Element Method, energy principles in structural mechanics and principles of minimum potential energy, assembly concept.
- Solution of steady and unsteady heat conduction equations with finite element method, Implicit and explicit methods.
- Finite element formulations of convection dominated problems using classical Galerkin methodology and need for alternate trial functions and upwinding.
- Finite element formulation for laminar and turbulent flows.
- Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
- Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
- Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
- Response Surface Method 2K+1, factorial design, 3k factorial design
- Monte Carlo Method
- Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.
- Artificial Intelligence and Genetic Algorithm
- Artificial Neural Network
- Gram-Schmidtt Orthogonalization
- Transformation of matrix

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods, liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

2. Strosal and Vapet, "Power Plant Engineering & Economics".
3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
  - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
  - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
  - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

References:

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons
- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction
- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process
- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors
- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics
- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up
- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons
- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients
- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)
- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.
- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)
- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)
- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:
- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:
- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design
- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology
- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra
- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics
- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures
- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations
- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)
- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):
- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):
- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)
- Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

EN 612: Computer Based System Design- I (25)

Hardware Design

- Overview of microprocessors and peripherals: 8086, 68000, Digital Signal Processor (TMS320) DMA controller, serial communication controller and timer/counter.
- Personal computer architecture, memory organization, industrial PC
- Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications
- Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL)
- Case Study: Design of a single board computer with shared memory interface, I/O board design using ADC, DAC etc with emphasis on signal conditioning and isolation
- System design concepts: Fault tolerance, hot standby, live insertion, triple modular redundancy and safety issues

EN 613: Computer Graphics and Visualization (35)

- Introduction overview, Graphics software/hardware and types of graphics applications (1)
- 2D/3D Geometric Transformations, Affined transformations-Translation, Rotation, Scaling, Shear and reflection. (3)
- Homogeneous coordinates, composite transformations, rotation with qutenion, current transformations and matrix stacks. (3)
- Two dimensional viewing 2D viewing – window, viewport, viewport transformations, clipping operations, line clipping algorithms – Cohen-Sutherland, Liang-Barsky, polygon clippimg algorithm – Sutherland-Hodgman. (4)
- Three dimensional graphics – Planer geometric projections – parallel and perspective, Mathematics for projections, classical three-dimensional viewing, specifying views, viewing transformations, 3D clipping operations. (4)
- Hidden surface removal, object space and image space approach, back face culling, z-buffer algorithm, LOD.(2)
- Illumination and shading – Basic illumination models, light sources, material properties, polygon shading methods – flat, gouraud and phong shading, ray tracing methods. (2)
- Color - Color perception, color models – RGB,CMY,HSV (1)
- Visual Realism – Depth cuing, texture mapping, transparency, shadow, steropsis. (2)
- Curves and surfaces – Representation of curves and surfaces, Algebric and geometric form, Blending functions, interpolation, Hermite, Bezier, B-spline curves and surfaces, Rational polynomials, NURBS (5)
- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

EN 615: Corrosion (15)

- Definition and importance of corrosion, corrosion principles; thermodynamic and electrochemical aspects; electrode potentials; polarization and corrosion rates; passivity, mixed potential theory, environmental effects: Dissolved Oxygen, temperature, pH, Velocity bacteria, dissolved salts and metallurgical variables, composition and heat treatment. (3 Lectures)
- Forms of corrosion: uniform attack; corrosion rate measurements, Galvanic corrosion, pitting and crevice corrosion; selective leaching; erosion corrosion; intergranular corrosion, low temperature sensitization, corrosion of weldments; stress corrosion cracking (SCC), irradiation assisted SCC; hydrogen embrittlement, hydrogen attack, corrosion fatigue; oxidation; microbiological induced corrosion (MIC), Corrosion testing procedures, failure analysis, specification tests, advanced methods for on-line corrosion monitoring. (7 Lectures)
- General principles of corrosion control – anodic and cathodic protection, inhibitors and passivators, corrosion protection by alloying, surface treatment and surface modification. (1 Lecture)
- Corrosion in the nuclear industry – Corrosion in nuclear fuel reprocessing, waste management and heavy water plants. corrosion in fluoride and ammonia containing environments; liquid metal corrosion. low alloy steels, stainless steels and Ni and Cu base alloys, protective magnetite formation on carbon steel, stress corrosion cracking of stainless steels and nickel base alloys. high temperature oxidation and hydriding of zirconium alloys, materials for fast breeder reactor system. Effects of radiation on corrosion (4 Lectures).

EN 616: Distributed Computing (45)

Advanced Computer Architecture

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

  c. Approaches for improving interconnect performance
  d. Case studies – Ethernet, Infiniband, SCI
- Cache
  a. Associative, Direct mapped
  b. Write through, Write back
  c. MESI
  d. Shared caches
- Advances in storage systems
  a. Direct attached storage, Network attached storage, Storage Area Networks
  b. File level and block level accesses
  c. Storage protocols
  d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
  e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing
  a. Need for HPC
  b. Applications of HPC
  c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)
- Pipelining, Vector processing, SIMD
  a. Pipeline, Speedup and Efficiency of pipeline
  b. Pipeline stalls, out of order execution
  c. Techniques to improve pipeline efficiency
  d. Superscalar, Superpipelined, VLIW, EPIC architecture
  e. Vector processors, vector instruction sets, registers
- MIMD Architecture
  a. Classification of MIMD machines
  b. UMA, NUMA, CC-NUMA, COMA, NORMA
- Interconnection networks and topologies
  a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
  b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.
- Current Parallel Architectures
  a. Parallel Vector processor
  b. Symmetric Multiprocessors
  c. CC-NUMA
  d. Massively Parallel Computers
  e. Clusters of workstations
- Clusters
  a. Classification of clusters
  b. Cluster software
  c. File systems for clusters
- Software concepts of High Performance Computing
  a. Parallelism – Algorithmic, Geometric, Event, Data
  b. Granularity – Coarse and Fine grains
  c. Speedup, Efficiency, Amdahl's and Gustaffson's Laws
- Parallel Programming Models
  a. Shared Variable Model
  b. Message Passing Model
  c. Threads Model
  d. Data parallel Model
- Design of parallel algorithms
  a. Data dependencies
  b. Data partitioning
  c. Communication patterns
  d. Synchronization
  e. Load balancing
- Parallel Programming Environments
  a. Parallel Languages
  b. Parallel Extensions to Sequential Languages
  c. Parallel APIs – MPI, OpenMP
- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)
  a. Introduction to MPI
  b. MPI constructs
  c. Example programs in MPI
- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

EN 618: Electrical Systems for Nuclear Power Plants (30)

- Interaction of Nuclear Power Station With The Grid Number of evacuation lines; Optimum size of NPP in grid; Brief introduction to Power System Analysis - Short circuit, load-flow and stability studies, Tariff and Capacity factor.
- Ehv Switchyard Design Switching schemes; Clearances; Com parison between types of svvitchyards; Brief introduction to equipments in switchyard and their functions; Lightning arresters and insulation co-ordination; Lightning protection.

- Protection Line protection; Generator protection; Transformer protection; Motor protection.
- Selection of Transformers Accessories; Types; Specifications and testing; Voltage regulation calculations.
- Selection of MV & LV Switchgear Types; specifications and testing, MCCS; Distribution boards; Generator circuit breaker; ELCB.
- Motors In NPP Types of motors; Radiation withstand requirements; Performance requirements.
- Station Auxiliary Systems of NPP Class 1, 11, Ill and IV systems classifications; Nature of electrical loads and supply voltages; Effect of voltage variation on Electrical equipments and remedial measures; Emergency transfer system; Load shedding scheme; Auto transfer schemes; synchronizing schemes.
- Class 1 e requirements Cabling, lighting & grounding Specific requirements for safety related electrical equipments & systems in NPR Cabling, Lighting, Grounding systems in NPP; Bus ducts. Introduction to seismic qualification of electrical equipments., Electrical system control from Control Room. Introduction to []G sets, UPS & Batteries.
- Billing and metering scheme for a typical NPP. Introduction to brushiess and static excitation systems for Generators. Introduction to SCADA systems.

EN 619: Embedded & Computer Based System Design (45)

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 620: Extractive Metallurgy (40)

Principles of Metallurgical Thermodynamics (15)

- Thermodynamic Functions: Enthalpy, Entropy, Free Energy, Chemical Equilibria
- Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Phase Diagrams
- Solution Thermodynamics, Integral and Partial Molar Thermodynamic Properties
- Experimental Methods- Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.
- Computation of predominance area diagram and Phase diagrams

Kinetics(5)

- Principles of Chemical Kinetics, Homogeneous Reactions, Effect of Concentration, Effect of Temperature
- Theory of Reaction Rates, Heterogeneous Reactions, Reaction Models, Mass Transport Phenomena, Heat Transport Phenomena.

Process Metallurgy (25)

- Methods of attaining High Temperatures,Measurement of Temperature,
- Vacuum Metallurgy Principles and Equipments,
- Process Metallurgy of Rare and Refractory Metals,
- Resources of Special Metals, Beneficiation Methods, Physical, Chemical, Separation Methods, Halide Metallurgy, Vacuum Metallurgy, Electro Metallurgy, Reduction Processes, Refining Processes, Ultrapurification Processes,
- Preparative aspects of Special Materials and Alloys,
- Advanced Materials Processing Techniques,
- Reprocessing of irradiated nuclear fuels, Process Metallurgy of - Uranium, Thorium, Plutonium, Beryllium, Zirconium, Hafnium, Niobium, Tantalum, Rare Earths.

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)
- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)
- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)
- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity
- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:
- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour
- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys
- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics
- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:
- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

References:
1. Engineering Fracture Mechanics - S. A. Meguid.
2. Mechanical Metallurgy - G. E. Dieter

4. Elementary Dislocation Theory - J. Weertman & J. R. Weertman
5. Introduction to Dislocations - D. Hull
6. Mechanical Metallurgy : Principles and Applications - M. A. Meyers & K. K. Chawla
7. Deformation and Fracture Mechanics of Engineering Materials - R. W. Hertzberg

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)
- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)
- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

<u>Design Basis Hazards (Natural)</u>

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall
- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications
- FTP, DNS, Mail, application based attacks

Network Security
- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms
- Symmetric and Asymmetric.

Symmetric Algorithm
- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms
- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)
- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)
- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)
- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli's Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.

- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)

- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory

- Introduction to state-space controls, state & measurement equations, general solution **of** the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls

- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation

- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:

- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

EN 640: Software Engineering and Formal Methods (40)

Software Engineering (20)

- Importance of Software Engineering (1)
- Life cycle, Phases and Work-Products of different Phases, traditional models, agile models, Extreme programming (1)
- Project Management: Relationship to lifecycle, planning, control, Risk Management, Cost Models.(1)
- Requirements: Gathering, Categorization, Analysis, and Specification.(1)
- Software Architecture and Design: Architectural Styles, Design Notation, Design principles. (5)
- Object oriented Design: OOAD, Design Patterns (7)
- Testing: Principles of program Testing, Test Coverage, Static Analysis, and Tools for testing. (2)
- Support Activities: Configuration Management, Verification and Validation, Software Engineering Standards, Documentation formats, Tools and environments for Software Engineering (2)

Formal Methods (20)

- Introduction to Formal Methods, Role of Formal Methods in Software Life Cycle – development and Verification (1)
- Formal Specification and Modeling: Specifications & Proofs, Specification Techniques
- Behavioural Modeling: Concurrent & Reactive Systems. Asynchronous and Synchronous models, Synchronous languages, Example Specifications in CSP, Statecharts, Lustre and Esterel (8)
- Formal Verification: Propositional and Predicate Logic and proof system, Program testing - Assertions and their verification (dynamic and Static), Need of Formal Verification, Sequential Program Correctness, Safe-subset of Programming Languages (7)

- Verification by Model Checking: Concurrent and Reactive systems, System properties and their specification in logic,, Case study from hardware and software, model cheking tools (SPIN, NuSMV etc.) (4)

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 704: Computer Based System Design- II (25)

Communication, Networking, Realtime systems, RTOS and Software

- Asynchronous and synchronous communication
- Standards like RS232, RS422, RS485
- USB
- Encoding schemes
- Local Area Networks
- OSI 7 layer model and TCP/IP reference model
- Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth
- Networking hardware – cables, hub, switch, router, etc
- Role of fibre optics in communication
- Fieldbus standards
- Deterministic communication techniques
- Case study: various techniques used in NPP for communication and networking
- Realtime Systems, their characteristics and applications
- Realtime Operating Systems:
- Concepts of
- Process and threads
- Concurrency
- Latency, context switching
- Scheduling policies
- Inter process communication
- Semaphores
- Priority inversion
- Shared memory
- Common systems calls, Communication features in RTOS
- Comparative study of various RTOSs
- Integrated S/W development environment

EN 705: Data Base Management System and Web Technology(30)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to PostgreSQL and MySQL(3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(1)
- Content Management Systems(1)
- Web 2.0 / Semantic Web(2)

EN 706: Digital Signal Processing and Image Processing (30)

Digital Signal Processing

- **Introduction**

Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**

  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT.
- Fast Fourier Transform

Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- Digital filters

FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- DSP Applications

  Applications of digital signal processing in nuclear and other fields.

Image Processing

- **Introduction**

  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- **Image Enhancement**

  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- **Image Segmentation andAnalysis**

  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation; Boundary extraction and representation;
- **Morphological operations**

  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy- based methods;

  Image Compression Models, Error free compression, Lossy compression, Standards;

EN 708: Feedback Control Systems (25)

- Introduction: The control systems, Basic elements of FIB control systems, Types of FIB control systems.
- Transfer Function: Transfer function of linear systems, Impulse response, Block diagrams, Signal flow graphs, Mason's gain formula, Polar plots, Bode plot.
- State Variable Characterization: State concept, State equation, Standard representation, State transition matrix and solution of state equations, relationship between state equations and transfer functions, Characteristic equation, Illus- trative examples of some electrical, mechanical, electromechanical systems.
- Time Domain Analysis: Test input signals, Time domain perform- ance characteristics, Transient response of a typical second order system, PID controllers
- Stability: Definition, Routh-Hurwitz criterion, Nyquist criterion. Relative stability, Gain and Phase margins.

EN 709:Fluid Power Technology (25)

Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics

- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal’s Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli’s theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air

- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors

- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.

- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.
- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design
- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:
- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:
- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :
1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing
- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;
- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision
- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:
- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices
- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods
- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric 'O' rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques
- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:
- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
    - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
    - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
    - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
    - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

- Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
- Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
- Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, llllcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
o Scheduling in a project by critical path method, CPM
o Scheduling in a project by Precedence Diagram Method.
o Use of Project Management Software for project planning, scheduling & monitoring.
o Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
o Constraints of project and its effective management o
Development of Six Monthly Plan and its review process o Resource
based planning
o Physical & Financial Monitoring of project, Use of S-curve
o Capital Budgeting & expenditure control in a project
o Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 718: Reliability Engineering (ME) (25)

- Reliability Mathematics – Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations,
Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
- Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
- Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
- Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
- System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
- Application of Reliability - PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
- Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.

Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control. Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5
Final control element - Linear pneumatic control valve.
Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.
Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.
The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , ‘Pressure vessel design’ CBS publication
2. Brownell. L. E & Young. E. D , ‘Process equipment design’, Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single - phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9^{th} Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No. **Course content**

Curriculum for Metal Forming

1. **Uniaxial tensile test**:
   a. Engineering stress, engineering stain, true stress, true strain;
   b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations;
   c. Tensile instability and significance of strain harkening exponent;
   d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2. Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3. Small strain matrix and rotation matrix obtained from the displacement functions;
4. **Elements of the theory of plasticity**:
   a. Decomposition of stress matrix to hydrostatic and deviatoric matrices;
   b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess;
   c. Normality flow rule and convexity of the yield surface; concept of equivalent strain

Curriculum for Materials Joining

1. **Welding Processes**
   a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding
   b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding
   c. Resistance Welding Processes
2. **Thermal Cycle during welding**
   a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3. **Residual Stress and Distortion**
   a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses
   b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No. **Course content**

1. Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2. Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber’s rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O’ rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson’s ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.
4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.
5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.
6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No. **Course content**

1.

Introduction: Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.

Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**

Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**

Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.

Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.

Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.

Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.

4. **Radiation protection and measurement (External and Internal):**

Control of external exposures (with problems in each case).

Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.
Routes of intake of radioactive material

Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No. **Course content**

12. **Introduction: Reliability Engg. Applied to C&I Systems**

Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.

Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.

Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

13. **Reliability Maths/Statistics:**

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye’s theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

14. **Fault Tolerance and Systems Reliability:**

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**

- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), (‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:

1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart
and Winston, 1984.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4. Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.

5. DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. **Fault Tolerant and Distributed Architectures**

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. **Real-Time System Design**

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.
2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	Course content
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.

   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type-Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
    Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.
    Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
Total		**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
Total		**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

Book suggested

16. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
17. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
18. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
19. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
20. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.

Course content

1. **Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.

   Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**

   Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**

   Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.

   Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.

   Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.

   Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.

4. **Radiation protection and measurement (External and Internal):**

   Control of external exposures (with problems in each case).

   Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.

   Routes of intake of radioactive material,

   Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. **Thermal Power Reactors :**

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. **Fast Power Reactors :**

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology**

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2. Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	**Course content**
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.

7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.

8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.

9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.

10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , ‘Pressure vessel design’ CBS publication
2. Brownell. L. E & Young. E. D , ‘Process equipment design’, Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

<u>Syllabus for CE610 : Heat Transfer (10 hrs.)</u>

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi's model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)

Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.
Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.
5. Piquet, J. (1999): Turbulent Flows: Models and Physics, Springer-Verlag: Berlin.
6. Holman, J.P. (1997): Heat Transfer, 8"" ed., McGraw-Hill : NY.
7. Kays, W.M. and Crawford, M.E. (1993); Convective Heat Transfer, McGraw-Hill: NY.
8. Gebhart, B., et al. (1988): Buoyancy-Induced Flows and Transport, Hemisphere.
9. Barret, K. (1982): Numerical Modelling in Diffusion-Convection, Pentach Press : London, Polymouth.
10. Hussaini, M.Y. et al. (1997): Up-wind and High Resolution Schemes, Springer-Verlag : Berlin.
11. Warsi, Z.U.A. (1998): Fluid Dynamics: Theoretical and Computational Approaches, 2"" Ed., CRC Press.
12. Cebeci, T. and Bradshaw, P. (1984): Physical and Computational'Aspects of Heat Transfer, Springer-Verlag.
13. Quartepelle, L. (1993): Numerical Solution of the Incompressible Navier-Stokes Equations, Birkhauser Verlag.
14. Patankar, S.V. (1982): Numerical Heat Transfer and Fluid Flow, Hemisphere.
15. Versteeg, H.K. and Malalasekera, (1996): An Introduction to Computational Fluid Dynamics: the Finite
16. Volume Method, Addison-Weslev.
17. Gresho, P.M. et al.. (1999): Incompressible Flow and the Finite Element Method, John Wiley & Sons.
18. Comini, G., et al. (1994): Finite Element Analysis of Heat Transfer, Taylor & Francis : Washington DC.
19. Canuto, C., et al. (1988): Spectral Methods in Fluid dynamics, Springer-Verlag :NY, 557pp.
20. Thompson, J.F., Soni, B. and Weatherill, N.P. (1998): Handbook of Grid Generation, CRC Press.
21. Glowinski. R., et al. (Eds.) (1997): Domain Decomposition Methods in Science and Engineering, Wiley.
22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Fromment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO's).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2nd edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2nd edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2

Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:**Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:**Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, “Fast Breeder Reactors”, Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods
1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;
1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):
Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation-bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM
2.2. Scanning electron microscopy:
Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;
EPMA Electron probe micro-analyzer
2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species
3.1. Ion beams – production-ion guns; manipulation- ion, filters
3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):
High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy
3.3. Nuclear reaction analysis – elemental specificity – depth profiling
3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis
3.5. Surface Mass Spectriscopy-SIMS:
Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons
4.1 Photoelectron spectroscopy:
Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin
4.2 Auger Electron Sepctroscopy:
Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.
4.3 Experimental methods;
Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. VIBRATIONAL SPECTROSCOPIES

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. 8.RESONANCE ABSORPTION SPECTROSCOPIES

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.
2. Williams (D B), Carter (C B), Transmission Electron Microscopy: A Textbook For Materials Science, New York, Plenum, 1996
3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

<u>8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)</u>

S.No.	**<u>Course Content</u>**
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

9. NDE Science and Technology (MS9 - 30 hours)

S.No.	Course Content
1.	**Introduction to NDE:** Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:** Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:** Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:** Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:** Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:** NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys. Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition.
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation.

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232.
MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Introduction to Materials Science & Engineering (MS12/CH4-40 hours)

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.
5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.
6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.
7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger's vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt's factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith's law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	***HOURS***	***CREDITS***
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick’s law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.

12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No **Course content**

1. **Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2. **Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3. **Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4. **Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5. **Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6. **Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single - phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies

8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

AHMT

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974.
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.
3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No. **Course content**

1. **Momentum Transport:**

1.1 Viscosity and Mechanisms of Momentum Transport: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends.

2. **Energy Transport:**

Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.
3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

1. Chopra, A.K., “Dynamics of Structures, Theory and applications to Earthquake Engineering”, Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures”, New York, McGraw-Hill Book Company.
3. Mariopaz, “Structural Dynamic (Theory and Computation)”, CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., “Numerical Methods in Finite Element Analysis”, Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. **Class room Training**
    a. Reactor System

        Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

    b. Sodium system

        Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

    c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*
    d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

2. **Field training**
    a. Reactor Operation
    b. Maintenance Activities
    c. Technical Service Activities
    d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical’s	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018

MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No. **Course content**

1. **Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.
Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**
Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**
Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.
Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors
Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection

4. **Radiation protection and measurement (External and Internal):**
Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.
Routes of intake of radioactive material,
Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**
Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**
Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**
Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No. **Course content**

1. Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2. Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3. Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4. Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5. Introduction to various reactor instrumentation and radiation monitors:
6. Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
   Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
   Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
   Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
   - Fault tolerance concept for electronic and Computer based C&I systems.
   - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
   - Series, parallel, active, passive, and voting redundancy
   - Redundancy and other fault tolerance methods for software
   - FMEA, FMECA concepts for C&I and Examples to solve
   - Concepts for the analysis of System Reliability, availability, and maintainability.
   - System reliability and availability analysis methods
   - Boolean logic
   - Digraph, cutest-tie set method
   - Fault tree model, and consideration of CCF, CMF, software errors
   - Markov Model

   Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
   - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
   - Environmental qualification, testing of the C&I systems
   - Effects of various environments on the electrical/ electronic components
   - Climatic Qualification tests: Temperature, Humidity
   - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
   - Reliability Testing of the electronic components, equipment and C&I systems
   - Reliability screening tests for electronic components
   - Accelerated environmental tests
   - Failure terminated and time terminated tests
   - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
   - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
   - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
   - Explain Event Tree
   - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
   - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment
(1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher
(2001),
('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions-grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry-Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

MTech in Fusion Science and Technology (for BTech, BE, AMIE, MSc Physics)

Course CI – IPR, Gandhinagar: Degree to be awarded by HBNI, Mumbai

Starting time – 01 August 2015

Course pattern
1st year – 2 trimester courses, 1 trimester Mini Project
2nd year – Project thesis/Dissertation

IMPORTANT:
After 1st year, people who qualify will be given a job in IPR as per Scientist / Engineer SC – details to be mentioned in the Technical Training Programme (TTP) 2015 advt. IPR employees who have BTech/BE/AMIE/MSc degree can also take this course as per HBNI guidelines for employees.

Only BTech/ BE / AMIE in following disciplines are considered: Mechanical, Electrical/Electronics/Instrumentation. MSc – Physics is also considered.

Trimester 1:
All courses are common to all: 1 class (lecture) – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.)

Subject	Credits	Marks
Basic Plasma Physics (FC1)	3	100
Experimental Plasma Physics (FC2)	3	100
Tokamaks (FC3)	3	100
Fusion Plasma Diagnostics (FC4)	3	100
Measurement Techniques (FC5)	3	100
Numerical Methods (FC6)	3	100
Mathematical Methods (FC7)	3	100
Vacuum, Cryogenics and Magnets (FC8)	3	100
TOTAL	**24**	**800**

Trimester 2:
All courses in part (A) are common to all: 1 class – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.). Courses in part (B) are subject/discipline specific.

Part (A): Advanced Subjects

Subject	Credit	Marks
Fusion Neutronics (AS1)	3	100
Plasma Facing Components: First Wall, Divertors, Blankets (AS2)	3	100
Fusion Materials (AS3)	3	100
RF, Current Drive and Neutral Beam Heating (AS4)	3	100
TOTAL	**12**	**400**

Part (B): All courses in part (B) consist of 4 classes a week; 1 class – 60 minutes, 2 classes a week / faculty per subject; total number of classes/subject ~ 60 (including assignment, presentation, etc.)
Subject Credit: 30 hours – 3 Credits
60 hours – 6 Credits

Subject	Hours	Total Credits	Marks	Remarks
Magneto Hydro Dynamics (PH1)	60	21	700	For Physics
Kinetic Theory and Statistical Mechanics (PH2)	60			
Advanced Heat Transfer and Cryogenics (PH3/ME5)	60			
Tokamak Related Code (PH4)	30			
Code Design for Internal and External Pressure Vessel (ME1)	30	21	700	Mechanical Engineering
Finite Element and Volume Methods (ME2)	60			
Mechanics of Solid/Vibration/Remote Handling (ME3)	30			
Advanced Manufacturing Technologies (ME4)	30			
Advanced Heat Transfer and Cryogenics (ME5)	60			
Advanced Data Acquisition System (EE1)	30	21	700	Electrical/Electronics/ Instrumentation Engineering
Advanced Tokamak controls (EE2)	30			
High Voltage, DC& AC/ Power Supplies (EE3)	60			
Signal Conditioning and EMI/EMC Aspects (EE4)	30			
Computer Based System Design (EE5)	30			
Digital Signal Processing and Image Processing (EE6)	30			

Trimester 3: Subject/Discipline specific project work

	Credit	Marks
Mini Project	**9**	**300**

TOTAL CREDITS IN 1ST YEAR: 24 + 12 + 21 + 9 = 66
TOTAL MARKS IN 1ST YEAR - 2200

2nd YEAR: M.Tech Thesis work

	Credit	Marks
1-year project/dissertation	**30**	**1000**

TOTAL CREDITS FOR 2 YEARS: 66 + 30 = 96
TOTAL MARKS for 2 YEARS – 3200

TRIMESTER 1

FC1 - Basic Plasma Physics (30 Lectures)

- **Introduction**

Definition of plasma, description of collective behaviour in contrast to single particle behaviour, derivation of plasma frequency (slab model), Debye length (description of Boltzmann distribution), conditions for collective behaviour (Physical basis for these conditions), binary collisions (derivation of Rutherford scattering), derivation of collision frequency ν_{ei} (large angle collisions, cumulative effect of many small angle collisions, Coulomb logarithm), discussion of collective behaviour revisited with relationship between various conditions (discussion of $k\lambda_D << 1$, plasma parameter).

- **Single Particle Motion**

Lorentz force equation, Nonrelativistic motion of a charged particle in constant electric and magnetic field: motion in constant **E** field, constant **B** field (derivation of cyclotron frequency, Larmor radius), motion in crossed **E** and **B** field, general solution for arbitrary angle between **E** and **B** field (Gantmakher formula), drift in a combined magnetic field and a general force field (non-magnetic), Motion in non-uniform **B** field (guiding centre approximation): Grad B drift ($\nabla \mathbf{B} \perp \mathbf{B}$), curvature drift, $\nabla \mathbf{B} \| \mathbf{B}$ (magnetic mirrors, invariance of μ, concept of adiabatic invariance), Uniform **B** and spatially varying **E** field (Finite Larmor radius effects), Time and space varying **E** field (Ponderomotive force), Time varying magnetic field (adiabatic compression), Time varying **E** field (polarization drift)

- **Fluid Description of Plasma**

Fluid equations, Equation of state, Complete set of two fluid equations, Fluid drifts parallel and perpendicular to **B** (diamagnetic drift), Plasma Equilibrium, Transport and Stability

- **Waves in Plasma**

Notion of phase and group speeds, High frequency electrostatic waves in an unmagnetized plasma (Langmuir waves, Bohm-Gross waves), High frequency electrostatic waves in a magnetized plasma (upper hybrid oscillation), High frequency electromagnetic modes in an unmagnetized and magnetized plasma, Low frequency electrostatic waves in unmagnetized and magnetized plasma: ion-acoustic wave, ion cyclotron wave, lower hybrid oscillation, low frequency electromagnetic modes: Alfven wave, magnetosonic wave.

- **MHD Description**

Derivation of single fluid equations from two fluid equations, complete set of equations of Magneto Hydro Dynamics (MHD), MHD waves, MHD energy.

FC2 - Experimental Plasma Physics (30 Lectures)

- **Fundamental Gas Processes**

Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization, Thermal Ionization, De-ionization, Diffusion, Different Mechanisms of Electron-Ion Recombination, Electron Attachment and Detachment Processes, Ion-Ion Recombination Processes, Formation of Negative Ions, Electronic Properties of Solids, Surface Emission Processes, Thermionic Emission, Field Emission, Photoemission, Particle Interaction with Solids, Interaction of Electrons with Surfaces, Interaction of Ions with Surfaces, Interaction of Neutrals with Surfaces, Sputtering Phenomena.

- **Charged Particles in a Gas in Electric Field of Low and High E/p**

Diffusion and Drift in an Electric Field, Redistribution of Particles through Diffusion and Drift, Ion Mobility, Ambipolar Diffusion, Electron Drift Velocity, Concept of High E/p, Primary Ionization Processes, Electron Avalanche, First Ionization Coefficient.

- **Self-sustaining Discharge**

Over-exponential Carrier Multiplication, Ionization by Positive Ion Collision, Cathode Processes, Processes in the Gas, Secondary Ionization Processes, Second Townsend ionization Coefficient, Paschen's Law, Breakdown Criterion, Limitations of Townsend Mechanism.

- **Glow Discharge**

Structure of Glow Discharge, Current-Voltage Characteristics of Glow Discharges, Physical Interpretation and Theoretical Analysis of Cathode Zone, Negative and Faraday Dark Space, Positive Column and Anode Layer, Striations, Specific Glow Discharge Plasma Sources.

- **Breakdown under Special Conditions**

Breakdown under Alternating Fields, Microwave Controlled Breakdown, Mobility Controlled Breakdown, Inductively Coupled Discharge, Capacitive Coupled Discharge.

- **Arc Discharge**

Glow to Arc Transition, Current-Voltage Characteristics of Arc Discharges, Classification of Arc Discharges, Cathode and Anode Layers, Different Models of Positive Column, Different Configurations of Arc Discharges, Bennet Pinch and Electrode Jet Formation.

- **Plasma Sheath and Diagnostics**

Basic Concepts, Bohm Sheath Criterion, High Voltage Sheath, Generalized Criteria for Sheath Formation, Electrostatic Probe Diagnostics, Single Langmuir Probe, Double Probe and Emissive Probe.

- **Experimental Plasma Devices**

Large Volume Plasma Device, BETA machine, SMARTEX, Helicon Plasma Expt., Q-machine, SYMPLE, Linear Magnetized Plasma Beam Expt., Plasma Wakefield Expt., Plasma Torch.

FC3 - Tokamaks (30 Lectures)

- **Introduction to tokamaks**

Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor, Tokamak Research, Major constituents of Tokamaks, Indian Tokamaks, Tokamak Confinement, Confinement times, Ohmic Confinement, L-mode and H-mode Confinement, Confinement scaling, Radiation loses.

- **Equilibrium and Transport**

Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport, Neoclassical Transport.

- **Heating**

Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive
Ion Cyclotron Resonance Heating, Electron Cyclotron Resonance Heating.

- **MHD Stability**

Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios.

- **Tokamak Devices and Other Fusion Devices**

Operating Regimes, Tokamak Magnetic Systems, Power systems, Plasma Production, Measurements of major operational parameters, Plasma wall interaction, Runaway electrons, Impurities, Operational experience in Aditya and SST-1, Other Fusion Devices.

FC4 - Fusion Plasma Diagnostics (30Lectures)

- **Introduction to Tokomak diagnostics**
  Introduction to all the tokomak diagnostics and related measurements.

- **Electrical diagnostics**

Langmuir probe: Single probe characterisation, explanation and other issues, Probe configurations, Double and Triple probes, Emissive probes.

- **Magnetic diagnostics**

Rogowski, flux and diamagnetic loops, Configuration and other details, plasma position and shape measurements, Introduction to MHD instabilities and Mirnov oscillations.

- **Measurements of plasma density and electron temperature**

Thomson scattering diagnostics: General concepts of Thomson scattering. Principles of Thomson scattering diagnostics. Types of Thomson scattering diagnostics used in tokamaks, Description of a typical diagnostics set up, technical features of the diagnostics set-up. Advantages and limitations of the technique.

Reflectometery: General concepts of Reflectometery. Physics principles of diagnostics. Different types of Reflectometry techniques, description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

Interferometry: General concepts of Interferometry. Physics principles of diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

ECE diagnostics: Concepts of Electron Cyclotron Emission. Physics principles of the diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis, Advantages and limitations of the techniques.

- **Measurement of impurities**

Introduction to spectroscopy, basics of passive and active spectroscopy and introduction to Visible, VUV and X-ray spectroscopy. Measurements of impurities by Visible spectroscopy and VUV/X-ray spectroscopy Data analysis by using actual spectra.

- **Measurement of ion temperatures**

Charge exchange recombination spectroscopy (CXRS) : Physics principles of CXRS , typical diagnostic set up, technical features of set up and brief on analysis techniques. Estimation of ion temperature using actual data.

X –ray crystal spectroscopy : Physics principles of X-ray crystal spectroscopy diagnostics , typical diagnostic set up, technical features of set up and brief on analysis techniques.

Neutral particle analyser: Concept of charge exchange (CX) neutral flux escaping from the tokamak plasmas, introduction to the different techniques for measurement of CX flux and energy distribution, description of the diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of the techniques, presentation of data analysis and estimation of core-ion temperature, analysis of actual plasma discharge data and estimation of ion-temperature.

- **Measurements of Radiated power**

Bolometers: Concept of Bolometry, requirement of bolometric measurements for tokamak plasmas, introduction to the different Bolometry techniques available for measurement of total radiated power loss from toakamak plasma, description of the different bolometers namely: Metal foil, AXUV and Imaging Video Bolometers, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each Bolomters, presentation of data analysis and estimation of total radiated power loss, analysis of actual plasma discharge data and estimation of total radiated power loss from the plasma.

- **Measurements of operational parameters**

Soft X-ray diagnostics: Introduction to the Soft X-ray diagnostics, physics principles and measurement technique, description of the diagnostics set up, description of the technical features of the diagnostics set up, advantages and limitation of the SXR diagnostic for electron temperature measurements.

Imaging Diagnostics: Requirement of imaging diagnostics for tokamak plasma, concept of different imaging diagnostics namely: Infrared Imaging Diagnostics, Visible Imaging Diagnostics etc., physics principles involved, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each imaging diagnostics, presentation of data analysis and analysis of actual plasma discharge data available for the imaging diagnostics.

Hard X-ray monitors: Concept of runaway electrons production in tokamaks, different measurement techniques available for the runaway detections, requirements of HXR measurements on tokamaks, principles of Hard X-Ray (HXR) generation due to runaways, introduction to HXR monitors for confined and de-confined runaways, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of HXR monitors.

Motional Stark Effect diagnostics and Beam emission spectroscopy: Introduction to beam based diagnostics, description of various beam based techniques for different types of operational parameters (q profile, ne(edge),Te(edge) and neutral beam density). Description of the diagnostics setup and technical features of the diagnostics setup and data analysis techniques.

Dust and Erosion monitors and Tritium monitors : Introduction to the concept of the Dust, erosion in tokomaks. Importance of the measurement of Dust, Erosion and Tritium. Challenges involved in the measurements. Example schemes of the measurement techniques.

- **Measurement of fusion products**

Introduction to fusion product measurements and importance of the measurement and control of fusion product generation. Various techniques available for measuring fusion products.

Confined and Lost alphas: Requirements of lost alpha particle diagnostics on future fusion devices, different diagnostics techniques available for the lost alpha diagnostics, principle of detection techniques, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each techniques and future applicability to fusion devices.

Gamma ray spectroscopy: Requirements of gamma ray spectroscopy on future fusion devices, principle of detection technique, diagnostics set up, description of the technical features of the diagnostics set-up.

Neutron flux and neutron profiles: Introduction to neutron flux and neutron profile measurements, measurement principles, measurement schemes and typical diagnostics set ups and discussion on challenges involved.

- **Overview and summary of ITER Diagnostics**

Discussion on the challenges involved in diagnosing fusion grade plasmas, over view of ITER diagnostics.

FC5 - Measurement Techniques (30Lectures)

- **Measurement System**

Introduction, Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems.

- **Specifications parameters of Measurement Systems**

Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability.

- **Electrical Measurements and Disturbances in Measuring System**

Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power.
Disturbances in Measuring System, Leakage Current, Parasitic Capacitive Coupling, Parasitic Inductive Coupling, Disturbances caused by: Electromagnetic Field, Feeding Cables, Improper Grounding.

- **Sensors/Transducers and Their Applications to Physical Measurements**

Sensors and Transducers – Performance Parameters, Selection of Sensors/Transducers, Temperature measurements, Pressure measurements, Flow measurements, Measurement of Linear/Angular acceleration, Velocity and Displacement, Measurement of Force and Torque, Measurement of radiant energy/light with Photosensitive Devices, Physical parameters sensing with Plasma diagnostics.

- **Analog Electronics**

  Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Pre-amplifiers, Pulse Amplifier, Signal isolation, Filters, Attenuators.

- **Introduction to Data Acquisition**

  Data Acquisition (DAQ) overview, Major components in development of Data Acquisition System (DAS), PC based data acquisition system, Data plotting and analysis. DAQ Software: Overview of Graphical/command based programming for the acquisition, Data processing and presentation of data: MATLAB, LabVIEW Application development environment, Concept and importance of Data Storage System, Microprocessors/Microcontrollers based measurement system.

- **Noise in Measurement System**

  Introduction to EMI/EMC, Methods of Noise Coupling, Methods of eliminating interference, Grounding, Cabling, Shielding, Intrinsic Noise source, Digital Circuit Noise, Sensor – DAS interface, Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for measurement.

FC6 - Numerical Methods (30 Lectures)

•Modeling, computation and error analysis:
Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study.

•Solutions of Linear Algebraic equations:
Matrix algebra, Eigen value problems, Gauss elimination and LU factorization, Matrix inverse and conditions, Singular value decomposition, Iterative methods, Case study.

• Numerical Differentiation and Integration
Numerical differentiation, Numerical Integration, Case study.

• Roots, optimization and nonlinear sets of Equations
Bracketing methods, Open methods Optimization - Case study.

• Application of Ordinary Differential equations
Initial Value problems, Adaptive methods and stiff systems, Boundary value problems, Case study.

•**Application of Partial Differential equations**
Methods to solve PDEs, Case study.

•**Application of Curve fitting methods**
Linear Regression analysis, Fast Fourier Transform, Power spectral analysis, Bispectral analysis, Polynomial interpolation and extrapolation, Cubic spline interpolation, Nonlinear Least **Square** methods Case study.

FC7 - Mathematical Methods (30 Lectures)

- Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl. Gauss, Green's And Stokes Theorems. Laplacian Operator in Different Coordinate Systems.
- Matrix Algebra: Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors; Similarity transformation and diagonalisation of a matrix.
- Complex analysis: Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series, singularities(poles and essential singularity) , Residues, Cauchy Residue theorem, Contour integration, Conformal Mapping and its application to the solution of Laplace equation.
- Differential equations: First and second order differential equations with constant and variable coefficients; Linear differential equations: Approximate method for solving ODE's (Series method of solution; Legendre and Bessel's differential equations and their solutions); Orthogonal polynomials and Special functions - Bessel functions, Gamma functions and Beta functions.
- Partial differential equations: First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations. Method of charateristics, Separation of variables.
- Integral Transforms: Fourier, Laplace Transforms and the inverse transforms, connection to physical problems. Applications for obtaining solution of ordinary/partial differential equations.

FC8 - Vacuum, Cryogenics and Magnets (30 Lectures)

- **Fundamental of vacuum**
- The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pumpdown time, Outgassing and permeation. Exposure to pumps and gauges.

- **Design of a vacuum system**

Selection of materials, Pumps, Gauges, Valves, Rules for operating vacuum system. Permanent seals, Demountable seals, Vacuum components, Cleaning techniques.

- **Fundamental of cryogenics**

Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.

- **Design of cryogenics system**

Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
Basics of Cryogenic valves, sizing, leaks and heat load estimation, Instrumentation at cryogenic temperatures. Safety aspects in handling cryogens.

- **Applications of Cryogenics Engineering in Fusion machines**

SST-1 Magnets, Cryo pumps, pellet injectors.

- **Fundamentals of Magnet system**

Resistive and Superconducting Magnet Systems,LTS and HTS based conductors, Flux Jumps, Filament twisting, AC losses, Cryo-stability, Monolithic & Cable-in-conduit-conductor (CICC) concepts.

- **Design and fabrication of magnet system**

Magnetic field calculations (analytical & computational tools), Magnetic force calculations, Structural design for magnets, Conductor design & Magnet winding pack design. Magnet winding pack fabrication & engineering issues, Insulation systems in magnets manufacturing, Magnets winding pack consolidation, QA/QC in magnets manufacturing.

- **Magnet operation**

Sensors and Instrumentations in Superconducting Magnets, Superconducting Magnet Quench and Protection aspects, Superconducting Magnet Tests & auxiliary test facilities, SST-1 Magnet System.

TRIMESTER 2 – PART A

(Part A is common to all)

AS1 - Fusion Neutronics (30 Lectures)

- **Neutronics Basics**

Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes, nuclear reactions, cross section, and thermalisation, scattering & absorption processes.

- **Particle transport phenomena in matter**

Neutron & photon transport, mathematical transport problem-Boltzmann transport equation, -probabilistic particle transport simulation - MCNP Monte Carlo code, tools: MCNP, Attila, Validation of computational tools and data.

- **Basics of fusion neutronics & blanket neutronics**

Neutronics design optimization, nuclear design of reactor components (blankets, divertor, first wall, heating systems, diagnostics etc.), Nuclear design analysis – optimization, source modelling, nuclearresponsecalculations,neutronandgammafluxes,nuclearheating,tritiumproductionrates,gasproductionanddpa.Amountoftritiumrequiredforafusionreactor,TritiumBreedingRatio, activation products & decay heat assessments, radiation damage & transmutation

- **Principles of Neutron & Fusion product diagnostics**

Processes in the plasma leading to non-maxwellian fuel ion distribution, experimental neutron, gamma-ray & alpha particle detection techniques, computational techniques to extract relevant information about the velocity functions of fusing ions out of measured neutron signals. Concepts of integrated modelling to assess and analyze the neutron emission features.

- **Radiation and licensing**

Radiation units, Radiation protection standards, Biological & genetic effects of radiations, Radiation shielding principles, composite shielding materials. Concepts of licensing & decommissioning of nuclear installations.

- **Radiation damage & transmutation**

Activation & after-heat, tools for calculations EASY-2010, concept of direct one step (D1S) method and Rigorous 2 step (RS2) process (MCNP-FISPACT) in estimating the dose rate on components of a fusion reactor after reactor shut down. Generation & management of radioactivewastefromatypicalfusionreactor.Quantification&Categorizationofradioactivewaste

- **Nuclear Safety aspects**

Basic concepts in safety, reliability and RAMI analysis, loss of coolant accidents, conceptual design of safety systems, risk and reliability analysis of systems, operational safety procedures, regulatory process, introduction to safety related instrumentation, remote handling of irradiated components

- **Fusion Neutronic Activities Worldwide**

Overview &Latest neutron facilities being built all over the world and recent trends. 4th generation nuclear reactors (high temp & compact reactors), Accelerator Driven Systems (ADS), IFMIF & CTF, Spallation Neutron Source (SNS), Fus-Fis hybrid systems (breeders), Transmutation of radiation wastes

---

AS2 - Plasma Facing Components: First Wall, Divertors, Blankets (30 Lectures)

- **First Wall**
  - **Firstwall Concepts :** Basic Design of Firstwall.
  - **Loads on Firswtall: I**nertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Firstwall:** Material Challenges, Fabrication Challenges, Operational Challenges.

- **Divertors**
  - **Divertor Concepts:** Basic Design of Diveror, Toroidal & Poloidal Divertor, Single-Null Divertor, Double-Null Divertor.
  - **Loads on Divertor:** Inertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Divertor:** Material Challenges, Fabrication Challenges, Operational Challenges.
  - **Divertor Testing:** Destructive Testing, Non-Destructive Testing, Metrology.
  - **Novel Divertor Concepts:** Helium Cooled Divertor, Liquid Divertor.

- **Blankets**
  - **Blanket Concept**: Requirement and essential features of Shield Blanket (SB) and Breeding Blanket (BB) in a fusion reactor.
  - **Shield Blanket:** Types of SB and SB material, SB Design Concept, Thermal-hydraulic and thermo-mechanical analysis of SB.
  - **Breeding Blanket:** Types of BB and blanket materials (solid and liquid), concept of Indian BB, Indian Lead Lithium cooled Ceramic Breeder (LLCB) Test Blanket Module (TBM) for ITER, concept of LLCB-TBM design, thermal-hydraulic and thermo-mechanical analysis of SB, LOCA and LOFA analysis of BB, Diagnostics of BB.
  - **Solid Ceramic Breeder (CB) Technology:** Development of Li CB, characterization of Li CB material, characterization of Li CB pebble bed, thermal and thermo-mechanical analysis of pebble bed.
  - **Liquid Metal (PbLi) Technology: C**omposition and developmental process of PbLi eutectic alloy, Study of basic (PbLi) loop and loop components, PbLi diagnostics. Liquid

metal MHD studies – basic analytical formulation (Velocity profile and Pressure drop studies), liquid metal MHD code development (Electric potential Method and Magnetic induction method), code benchmarking, Liquid Metal MHD experiments (Experimental set up, experimental results), liquid metal (Pb-Li) Corrosion studies (Corrosion experiments, experimental results, numerical formulation).

- **Fusion Fuel Cycle:** Requirement and essential features of fusion cycle of a fusion reactor, inner & outer fuel cycle of a fusion reactor, tritium handling technologies, tritium storage & delivery system, tritium extraction system, Tokamak exhaust processing system, tritium diagnostics.
- **Blanket Safety:** Gaseous and liquid releases during normal operation and maintenance, accidental conditions – Design Basis Accidents (DBA), Beyond Design Based Accidents (BDBA), Loss of Coolant Accidents (LOCA), Loss of Flow Accidents (LOFA), complete loss of active cooling.

AS3 - <u>Fusion Materials</u> (30 Lectures)

- **Fundamentals of Material Science**

  - Crystalline nature of matter - Structure and bonding of atoms, atomic arrangements in materials, Structural phase formation and transition, Types of materials (Metals, Alloys, ceramics, composites, glasses, polymers, Superconductors).
  - Defects in solids – Imperfections, Frenkel pairs, Dislocation theory, Grain-boundary, Stress Fields and Strain Energy
  - Metallurgical Aspects of materials – Solid solutions, solubility, Precipitation, Diffusion in solids (Diffusion Laws), ordering in alloys, Phase diagrams, strengthening and hardening Mechanisms, Annealing and heat treatment.
  - Physical Properties of materials – Electrical, Thermal, Magnetic, Dielectric, optical and other properties of materials
  - Mechanical Behaviour of materials – Elastic and Plastic deformation, metallic Creep and fatigue, Strengthening and toughening of steels and non-ferrous alloys, fracture and DBTT , toughness
  - Introduction & Survey of Computational Tools, Multi-scale Models

- **Fusion Materials Requirements & Issues**

  - High heat flux handling – HHF source types, parameters and effects.
  - Erosion & Corrosion – Sputtering, erosion due to heat and particle bombardment, erosion and corrosion due to liquid metals, Hydrogen embrittlement, Oxidation, Pitting and crevice corrosion

- **Material Development and Joining Technologies**

- Manufacturing Methods & Processes – Steels and alloys melting, Powder metallurgy route, Ceramics preparation methods, Composites developments, Superconducting materials manufacturing.
- Structural Materials – Austenite and Ferritic Martensitic (FM) steels, ODS alloys, Vanadium and Titanium alloys, Carbon and SiCf/SiC composites
- Functional Materials – Plasma facing Materials (Tungsten, graded and other materials), Tritium Breeding & Blanket materials, special ceramics, Superconducting materials, Heat sink Materials, shielding Materials, Diagnostics and window materials, coatings
- Joining Technologies – Methods and Issues (Welding, Brazing, Diffusion Bonding, Hiping)

- **Material Characterization & Qualification**

  - Structural Characterization – Crystal and Microstructural Analysis, defect structure, Phase Transition (XRD, SEM, TEM, Neutron Diffraction, PAS)
  - Compositional Characterization & Surface Techniques (EPMA, EDX, ICP-MS, XPS and AES, SIMS), Impurity limits
  - Particle beam Techniques (ERDA, RBS, NRA, Synchrotron Source)
  - Mechanical Property Testing- Hardness, Fatigue, Fracture, Tensile, Creep
  - Thermal Property Testing – High Heat Flux test, Thermal conductivity, Thermal Expansion coefficient, Electrical Property Testing & NDT, codes and standards – Resistivity (AC &DC), Radiography, Ultrasonic techniques

AS4 - RF, Current Drive and Neutral Beam Heating (30Lectures)

- **Heating and current drive physics by neutral beam**

Basic process during beam-plasma interaction, Beam injection geometry and its implication, Energy transfer mechanism from energetic neutral beam particle to plasma, Energetic particles orbits in asymmetric field structure, Physics of current drive by NBI, Role of fast ions in Neutral Beam Current Drive efficiency.

- **Neutral beam injector system design and engineering**

Basic NBI configuration, Optimization procedure of beamline configuration, Pressure profile optimization, Beam transmission optimization.I on source design and engineering, Different Plasma production mechanism, Positive ion and negative ion production, Ion extractor and accelerator system, Beamline component design and engineering, Neutralizer, Residual Ion Dump (RID), Calorimeter or V – target, Vacuum system design and engineering, Vacuum vessel, NBI – tokamak interface duct, Cryopumps and cryogenic system, Auxiliary pumping system, Diagnostic system design and engineering, Ion source plasma diagnostics, Electrical Probe based, Spectroscopy based, Negative ion diagnostic, Laser photo-detachment, Cavity ring down method, Hairpin resonator based, Ion-acoustic wave based, Beam profile diagnostic, Doppler shift spectroscopy, Thermal imaging diagnostic, Calorimetric diagnostic, Power supply system design and engineering, RF Power supply, HV power supply for ion extraction and acceleration.

- **Introduction to RF heating**

Introduction to Fusion Reactor: Why RF and Microwave Power is required for Fusion? Interaction of electromagnetic waves with plasma.

- **Waves**

Theory of waves in unmagnetized plasma, EM waves, Longitudinal waves, Transverse wave, Ion acoustic waves. Theory of waves in magnetized plasma, EM waves, X-mode, O-mode, Hybrid waves. Classification of RF regimes. RF Requirements of Fusion Reactor, Different heating, pre-ionization and current drive mechanisms. Dispersion relations. Wave propagation in toroidal plasma geometry. Power absorption, Landau damping, Current drive mechanisms in different regime.

- **RF devices and Design tools**

Introduction to general type Waveguide, RF amplifier and Oscillators, Antennas, Engineering issues, RF design software.

- **ICRH**

Introduction to RF applications in ICRH, its design and issues. Introduction to RF transmitter, Power transmission, Antenna design, Auxiliary systems for ICRH. Diagnostic system, Impedance matching unit, Control system. Important results on different tokamaks about ICRH system. Introduction to Aditya and SST-1 ICRH Systems

- **ECRH**

Introduction to RF application in ECRH its design and issues. Introduction to Gyrotron source. Power transmission, Antenna design, Auxiliary systems for ECRH. Diagnostic system. Control system. Important results on different tokamaks about ECRH system. Introduction to Aditya and SST-1 ECRH Systems.

- **LHCD**

Introduction to LHCD system its design and issues. Introduction to Klystron source, Power transmission, Antenna design, Auxiliary systems for LHCD. Impedance matching unit, Diagnostic system, Control system. Important results on different tokamaks about LHCD system. Introduction to Aditya and SST-1 LHCD System.

- **Other types of wave heating**

Alfven wave heating, Bernstein wave heating, Design and its issues, Introduction to its sources, Power transmission, Antenna design, Impedance matching unit, Diagnostic system, Control system. Important results on different machines.

TRIMESTER II – PART B

Part –B contains the details of the core subjects.

PHYSICS

PH1 - Magnetohydrodynamics (60 Lectures)

- Physical description of electrically conducting fluids
- Derivation of basic MHD equations: Continuity, Equation of motion, Energy flow, Ohm's law, Validity of MHD equations
- The low frequency dynamics of the electromagnetic field
- Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of resistivity, Similarity scaling, The Wöltjer invariants and helicity
- Equilibrium: General considerations, The Virial Theorem, Examples of simple equilibria: -pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm ashape, etc.
- Comparison of fusion confinement systems: Spheromak, FRC, RFP, Spherical Tokamak
- Tokamak Equilibrium: In large aspect ratio limit with arbitrary choice of profile, Solovev equilibrium with finite aspect ratio and linear profile in poloidal flux, Solution with arbitrary aspect ratio and arbitrary choice of profiles (numerical)

PH2 - Kinetic theory and Statistical mechanics (60 Lectures)

- Gas dynamic way of describing an uncharged fluid – heuristic
- Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
- Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
- Using heuristic arguments in single particle phase space (x,v) to obtain "fluid equations" in phase space – namely – the Vlasov-Poisson Equations
- Introduce conservation of Energy and other physical quantities as constraints.
- Using constrained variation technique demonstrate how entropy extremization leads to Maxwell-Boltzmann distribution f_mb(x,v) and importance of Maxwell-Boltzmann distribution
- Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
- Linear Landau Damping – why is this not seen in fluid equations?
- Two stream instability and Phase Space structure formation
- Many stream interpretation of an equilibrium distribution f_mb(x,v)

- Stability – Newcomb-Gardner Theorems and Penrose Stability Criteria
- Nonlinear Landau damping and Theory of BGK modes – revisit Two stream instability.
- Stability of BGK modes.
- Particle correlations and need for two-body and higher order distributions
- Equations governing two body distrution f_2(x,v,t) and its relationship to f(x,v,t) the one-body or Vlasov distribution studied earlier – Introduction of pair correlations
- Construction of a N-body distribution function f_N and BBGKY Hierarchy issues.
- Klimontovich-Dupree (KD) procedure – Obtaining a "statistical N-body" distrituion from KD equation.
- Green-Kubo formalism – Transport and Correlations
- Examples of GK formalism and obtained transport
- Very cursory introduction to Onsager relationships

PH3 - Advanced Heat Transfer and Cryogencis (60 Lectures)

(PLEASE SEE ME5 – these are common courses for Physics and Mechanical disciplines)

PH4 - Tokamak related Code (30 Lectures)

- **Plasma core modelling:**

— Plasma equilibrium IPREQ

— Plasma transport TSC

— Plasma stability ERATO, PEST2

— ICRH heating TORIC

— NBI heating NUBEAMS

— Plasma start up model

— Reactor system code

— Eddy current analysis

— TF modelling EFFI

— Vertical instability analysis

- **Edge-SOL studies**

— 2D blob transport

— Divertor study SOLPS (B2+ERINE)

— 3D plasma study ERINE-3D

- **First principle simulations**
  - Low frequency (w/wc <<1) transport – what is Gyrokinetic method?
  - What are the transport processes neglected by gyrokinetic formalism?
  - What are global and local simulations – examples (flux tube modes and global models)?
  - Under what conditions do results from these two simulations are expected to match?
  - Gyrokinetic equations derived from Vlasov-Poisson equations using Bessel function procedure
  - How does Gyrokinetic formation capture the physics of Finite Larmor Radius to all orders at low frequencies?
  - Numerical Advantages of Gyrokinetic formalism – examples
  - Simulating very large scale systems (100s of larmor radii) using very large parallel computers – Issues and Advantages
  - Modelling energetic particle transport using Gyrokinetic formalism

MECHANICAL

ME1- Code Design for internal and external pressure vessel (30 Lectures)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive

Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1and Div.2.

- Difference between metallic pressure vessel and FRP pressure vessels.
- Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Failure modes of pressure vessels, Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and piping's.

ME2 - Finite element and volume methods (60 Lectures)

Finite Elements methods (30 Lectures):

- Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation, piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
- Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
- Bar element: Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss.
- Beam element: Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- 2D plane elements – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- 2D isoparametric formulation – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress.
- Introduction and Application to 3D elements: Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Shell element: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions.
- Introduction to Nonlinear problems: Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method.

- Finite element applications for design: Finite element modelling and discretization criterion,h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

Finite Volume Methods (30 Lectures):

Basics of Fluid Flow, Heat Transfer and Numerical Analysis

- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity',momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme

Laminar Boundary Layer and Forced Convective Heat

- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Convective heat transfer for internal and external flows.
- Low and high Prandtl number limits and different thermal boundary conditions.

Turbulent Flow and Heat Transfer

- Reynolds decomposition for turbulence.
- Prandtl's mixing length theory, Mixing length models.
- Structure of turbulent boundary layer over flat plate and through circular cylinder.
- Calculation of friction factor and drag coefficient.
- Analytical and semi-analytical correlations for calculating heat transfer coefficients.
- Reynolds analogy & Low Reynolds number models.
- Turbulence Modelling.
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model.
- Reynolds stress models: algebraic and differential models.

Natural Convection

- Basic Equations of natural convection.
- Derivation of Dimensionless groups from basic equations.
- Analytical approximations.
- Numerical solution of approximate equations.

Numerical Solution of Complete Fluid Flow and Energy Equation

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation.
- Primitive-Variable (P-V-T) formulation.
- Pressure velocity coupling for incompressible flow
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE, SIP and SIMPLEN family of Methods.
- Simple grid generation techniques for structured grid.
- Elliptic, parabolic and hyperbolic equation method.
- Domain decompositions in CFD and heat transfer.

ME3 - Mechanics of solid/vibration/ remote handling (30 Lectures)

Mechanics of solids

- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of stress

- Description / Notations of Forces & Stress.
- Component of stress.
- Reciprocity of shear stress in 3D.
- Stresses Transformation using direction cosines.
- Stress Traction Vectors or Traction Vectors.
- Stress component on an arbitrary plane.
- Principal stresses & Mohr's Diagram for 3D state of stress.
- Stress Invariants.
- Hydrostatic and Deviator components of stress.
- Principle planes and their orthogonally.
- Octahedral plane, Octahedral stresses.
- State of pure shear.

Analysis of strain

- Description / Notation of Strain in 3D.
- Components of strain.
- Strain Transformation using direction cosines.
- Principle Strains, Strain Invariants.
- Strain Deviator Tensor.

Principles and fundamental Equations of Elasticity

- Strain and displacement relations (Cauchy's equations).
- Compatibility equations (Saint-Venant's Equations).
- Generalized Hook's Law.
- Anisotropy and Isotropy of elastic behaviour.
- Stress and strain relationship.
- Equations of equilibrium (Navier's Equations, Lame's equations).
- Strain Energy.
- Uniqueness theorem.
- Bounds on elastic constants.
- Superposition Principles.
- Saint-Venant's Principle.
- General Solution Procedures for an elasticity problem.

Vibrations

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations underdamped, overdamped and critically damped systems; Response to harmonic loading -complementary solution and particular solution; Response to periodic loadings using Fourier Series
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems;Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration).

Remote handling

- Automation and introduction to remote handling.
- Industrial manipulators.
- Kinematics of manipulators specifying position and orientation of rigid bodies, Euler angles, homogeneous coordinate transformations, D-H representations of kinematic linkage, velocity analysis of manipulators.

ME4 - Advanced Manufacturing Technology (30 Lectures)

ADVANCE MANUFACTURING PROCESSES

- INTRODUCTION: Unconventional Machining Process, Need – clarification – Brief overview of all techniques.
- MECHANICAL ENERGY BASED PROCESSES: Abrasive Water Jet Machining, Water Jet Machining, Ultrasonic Machining (AJM / WJM/ USM). Working principles – equipments used – process parameters – MRR – Variation in techniques used – Applications.
- ELECTRICAL ENERGY BASED PROCESSES: Electro Discharge Machining, Working principles – Equipments – Process parameters – MRR – electrodes/ tools / power circuits – tool wear – Dielectric- flushing- Wire cut EDM – Applications.
- CHEMICAL AND ELECTRO-CHEMICAL ENERGY BASED PROCESSES: Chemical Machining, Electro- Chemical Machining – Etchants- maskant-Techniques of applying maskants – Process parameters – MRR –Applications. Principles of ECM-MRR-Electrical circuit – process parameters – ECG and ECH applications.
- THERMAL ENERGY BASED PROCESSES: Laser Beam Machining, Plasma Arc Machining and Electron Beam Machining. Principles – equipments – types – beam control techniques applications.

ADVANCED MATERIALS JOINING AND TESTING

- INTRODUCTION: Classification – heat sources – metallurgical effect of weld – residual stresses: formation and relieving – capillary and welding action – temperature range – filler material and fluxes – types of joints and welding positions – weldability: design, process and metallurgical consideration – testing and improvement.
- JOINING TECHNIQUES: Bolting – riveting – soldering – blazing – adhesive bonding – diffusion bonding – mechanical joining. Fusion welding: Oxyacetylene welding – SMAW – GTAW – GMAW – FCAW – SAW – ESW – High energy beam welding: EBW, LBW, PAW – friction stir welding. Output parameter variation – advantages and disadvantages – applications.
- RESPONSES OF MATERIALS TO WELDING: Microstructural changes – distortion – defects: undercuts –overlaps – grain growth – blowholes – inclusions – segregation – lamellar tearing – porosity. Remedies: Edge preparation – alignment – control of heat input – preheating – peening – heat treatment – jigs and fixtures – number of passes.
- DESTRUCTIVE AND NON-DESTRUCTIVE TESTS FOR WELDS: Introduction – need – principles – applications –destructive tests: tensile, bend, impact, hardness, fatigue, cracking,

etching. Non-destructive tests: Visual, dye penetrants, magnetic particle, acoustics, pressure, radiographic, ultrasonic, eddy current.

ME5 - Advanced Heat Transfer and Cryogenics (60 Lectures)

Computational Fluid Dynamics

- Basics of fluid flow and heat transfer, Mathematical description of fluid flow, conservation equations for mass and momentum, Classification of partial differential equations, discretization techniques using finite difference and Finite volume methods, Taylor's series and control volume formulations, stability, consistency and Convergence of numerical schemes, application of numerical methods to model equations.
- Natural convention and Forced convection heat transfer and calculation heat transfer coefficient for different geometrical configurations and analytical approximations relations
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and adiabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio.

Heat Transfer

Conduction:

- Derivation of energy equation for conduction in three dimensions – Initial and boundary conditions. Solution of simple problems in steady state conduction with analytical solutions – Concept of electrical analogy – fin heat transfer and concept of fin efficiency and fin effectiveness.
- Concept of Biot number – Lumped capacitance formulation – simple problems – unsteady conduction from a semi-infinite solid- solution by similarity transformation method. Solutionof the general 1D unsteady problem by separation of variables and charts- example problems.
- Laplace equation – solution by variable separable method – concept of superposition and homogeneous boundary conditions. Phase change problems – The Stefan and Neumannproblems – analytical solutions.

Convection:

- Natural Convection heat transfer: Governing equations for natural convection, Bossiness approximation, Dimensional Analysis, Similarity solutions for Laminar flow past a vertical plate with constant wall temperature and heat flux conditions, Integral method for natural convection flow past vertical plate, effects of inclination, Natural convection in enclosures, mixed convection heat transfer past vertical plate and in enclosures.
- Laminar External flow and heat transfer:
  Similarity solutions for flat plate (Blasius solution), flows with pressure gradient(Falkner-Skan and Eckert solutions), and flow with transpiration,

Integral method solutions for flow over an isothermal flat plate, flat plate with constant heat flux and with varying surface temperature (Duhamel's method), flows with pressure gradient (von Karman-Pohlhausen method).

- Laminar internal flow and heat transfer:
  Exact solutions to N-S equations for flow through channels and circular pipe, Fully developed forced convection in pipes with different wall boundary conditions, Forced convection in the thermal entrance region of ducts and channels (Graetz solution), heat transfer in the combined entrance region,
  Integral method for internal flows with different wall boundary conditions.

Radiation:

- Fundamental of thermal radiation and electromagnetic wave theory
- View factors.
- Radiative exchange between grey and diffuse surfaces.
- Radiation between non-ideal surfaces.
- Surface radiative exchange in the presence of conduction and convection.
- The equations of radiative transfer in participating media.
- Radiative properties of molecular gases.
- Introduction to monte Carlo method for thermal radiation.
- Governing Equations: Continuity, Momentum and Energy Equations and their derivations indifferent coordinate systems, Boundary layer Approximations to momentum and energy.

Cryogenics

- **Basic Principles of Cryogenics:**

Thermodynamics, Heat Transfer, Heat Leak, Pressure drop, Cool down, Applications of cryogenics, Properties of cryogenic fluids, Properties of materials (Structural & thermal) at cryogenic temperature, Material selection criteria

Gas-Liquefaction and Refrigeration Systems:
Refrigeration and Liquefaction, Recuperative cycles, Liquefaction of gases, Inversion temperature, Expansion processes, Refrigerator efficiency, Refrigeration and Liquefaction Methods, Regenerative cycles, Ultra low temperature refrigerators, Cryo-coolers.

Cryogenic Insulations:
Types of insulations, Vacuum Insulation, Evacuated Porous Insulation, Gas-filled Powders and fibrous materials, Solid foams, Multilayer Insulations, Liquid and vapor shields, Composite insulations, Placement of insulation systems, Comparison of insulations

Instrumentation in Cryogenics:
Measurement: Strain, Displacement and position, Pressure, Temperature, Flow, Liquid level, Density

Cryogenic Equipment and Cryogenic System Analysis:
Introduction, Compressors, Pumps, Expansion Engines, Valves, Heat Exchangers, Storage, Transfer of liquefied gas

Safety with Cryogenic Systems:
Physiological Hazards, Suitability of materials and construction techniques, Explosions and Flammability, Excessive pressure gas, Special considerations for Hydrogen and Oxygen, General Safety Principles, Safety Checklist

---

Electrical/Electronics/Instrumentation

EE1 - Advanced Data Acquisition System (30 Lectures)

- **Theory of Quantization**
  Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, antialiasing filters.

- **Advanced Data Acquisition Systems**

  Modular Data Acquisition Systems in Nuclear Instrumentation: CAMAC, VME, PXI, PXIe. DAQ system architecture and major components. Data Archival and Retrieval. DAQ Data server architecture and interface, Data plotting and analysis tools

- **Data Acquisition Interface**

  Sensor – DAQ interface: Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for accurate measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems, Graphical/command based programming for the acquisition, processing, and presentation of data: MATLAB, LabVIEW Application development environment.

- **Analog Input/output**
  Analog Input Circuitry, Anti-aliasing Filters, sampling and DAQ device architecture, Analog Output Architecture, Analog Output Circuitry, Update rate and output interface.

- **DAQ Clock and Trigger**
  Theory and concepts of analog and digital triggering, Continuous and event-based acquisition, Clock and trigger input and output to DAQ device for timing and synchronization, Counter I/O: Edge Counting, Pulse Generation, Pulse Measurement, Frequency Measurements.

- **Synchronization**
  Single Device Synchronization: Simultaneous sampling, Multiple Device Synchronization: Clock and trigger synchronization, Introduction to Timing system.

- **SST-1 Data Acquisition System**

  Architecture of SST-1 Data Acquisition System: overview and major components, System requirements, Various DAQ interfaces: CAMAC, PXI, PXIe, digitization requirements, Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, DAQ Software: LabVIEW based GUI for remote operation, Networking requirements and TCP/IP based communication with subsystems, distributed system, DAQ NAS server, Central Data storage server, server management, data plotting utilities.

EE2 - Advanced Tokamak Controls (30 Lectures)

- **Fundamentals of Control System**

  Systems and their representation: Terminology and basic structure of control system, Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems and their models, transfer function, Block diagram representation of physical systems, Block diagram algebra, Signal Flow graph. Systems in state space: Concept of states and state model, State equation from transfer function, modelling of dynamical systems, State space representation of multivariable systems, Building blocks of state space models. Advanced control system: Cascade control, ratio control, feed forward control. Over-ride, split range and selective control. Multivariable process control, interaction of control loops Process Control System: Terms and objectives, piping and Instrumentation diagram, instrument terms and symbols. Regulator and servo control, classification of variables. Process characteristics: Process equation, degrees of freedom, modelling of simple systems – thermal, gas, liquid systems. Process lag, load disturbance and their effect on processes. Self-regulating processes, interacting and non-interacting processes.

- **Different types of Control Systems**

  Feedback control system, Real-time control system, Nonlinear and Adaptive Control, Robust control system, Embedded Systems: Hardware and software architecture, Neural Networks, Fuzzy Logic Systems

- **Introduction to Plasma Control**

  Plasma Position Control, Shape Control, Density Control, modelling aspect, simulations, Plasma Control case studies: D-III-D, JT-60, JET, SST-1, EAST, ITER.

- **ITER Instrumentation & Control**

  CODAC (Control, Data Access and Communication) System, Central Interlock System (CIS), Central Safety Systems (CSS), Plant Control System, Plant Interlock System, Plant Safety System, CODAC Core Systems, EPICS, SNL, CSS, MDS Plus, LabVIEW, Matlab Simulink, Python, Grid Computing, Parallel Processing, Diagnostic Data Analysis Tools and Codes, Real-Time OS.

- **SST-1 Operation &Control**

Architecture of SST-1 Operation &Control System, System requirements, system overview and major components. Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, GUI based remote operation, TCP/IP based communication with subsystems, distributed system. Data Acquisition System: System overview, various interfaces, CAMAC, PXI, PXIe based technology; LabVIEW based GUI, digitization requirements, system architecture, technical requirements, network storage server, server management, data plotting utilities. Operation and Control System: Timing system, Central Data storage server, Interlock system, Tokamak operation and subsystem control, VME based control system

- **Monitoring and Control of Auxiliary Systems**

Monitoring& Control for ICRH, ECRH, NBI. Vacuum System, RHVPS and Switching scheme, Cryogenic Cooling Plant, CWS, BMS, Access Control, Super conducting Magnet Quench detection and protection.

EE3 - High Voltage DC & AC/ Power Supplies (60 Lectures)

- **Overview of Electrical systems in Fusion machines**

Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement – Magnet power supplies, Electrical systems for plasma acceleration – Accelerator power supplies for charged particles. Use of other HV equipment in Fusion Technology: Capacitor bank, Van-de-graf generator, Pulse forming lines, Marx generator, Power supply systems applications in fusion machines.

- **High Voltage DC & AC**

High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. High Voltage Circuit Breakers: Air break, SF6 and vacuum circuit breakers. Gas Insulated Substation (GIS): Advantages of GIS, comparison of GIS and air insulated substations, design and layout of GIS, description of various components of GIS. High Voltage Measurement: CVT, Peak voltmeters, sphere gaps, impulse recording, Over-voltage and protection, Insulation coordination, High voltage testing methods using Partial discharge (PD), Causes and effects of PD, PD diagnostic techniques. HV and UHV systems: Fusion Technology Applications. Basic Overview of Pulse Power Technology.

- **Power Supplies**

- DC Power Supplies: Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Magnetic component behavior and

selection. Control pulse generation and control techniques, Feedback isolation techniques, Auxiliary power supply generation, Parallel operation.

- AC Power Supplies: Linear mode AC power supplies. Switching mode Inverters, Sine wave inverters, Parallel operation, AC voltage regulators, UPS systems.
- Special Power Supplies: Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive: Power Supply for Neutral beams, Power Supply for Ion cyclotron & Electron Cyclotron heating.
- Power supplies required for RF amplifiers or Oscillators. HV supplies, their interconnections for RF applications. Specific requirements of power supply protections etc., General topologies with emphasis on conventional and modular topologies, Performance requirements, Critical protections, Remote control and Monitoring requirements.
- Requirement for arc fault protection, Protection by crowbar, Deices used for crowbar applications, Importance of fault energy and techniques to limit the fault energy, wire-burn test.
- Auxiliary supplies: Screen grid, Control Grid, Filament and ion pump power supplies, General topologies for each of the supply. Performance requirements, important performance requirements, Critical protections, monitoring and remote control requirements.
- Safety and System Grounding: Power supplies inter connection at load end. Issues related to system grounding, choices available for system grounding. Safety of system and personnel for RF system.
- Integrated operation, Protection and Monitoring: HV isolation for input power of auxiliary supplies. Monitoring power supplies' status and performance. Remote and local control of power supplies. Fast and slow interlocks.

- **Power Electronics and design through modelling & simulation**

Junction Transistors (BJT, HBT), Field Effect Transistors (JEFT, MESFET, MOSFET, HEMT), Power semiconductor devices, IGBT, GTO and MCT: AC-DC Converters; Forced commutation; synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines; simulation of transients; Simulation tools: SABER, PSPICE, and MATLAB-SIMULINK; Simulations of converters, inverters and cyclo-converters etc.

EE4 - Analog Signal Conditioning and EMI/EMC Aspects (30 Lectures)

- **Analog Signal Conditioning**

Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation, Signal Conditioning for Plasma Diagnostics, Operational Amplifiers, Op-amps/ integrated circuits in instrumentation, Phase-sensitive rectifiers, Industrial Electronics.

- **Signal Processing and Applications**

Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters, Introduction to Infinite Impulse Response Filters and Finite Impulse Response Filters, Applications of digital signal processing in measurement and control systems.

- **EMI/EMC**

Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Fusion Devices, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards, Testing Standards for Emissivity & Susceptance.

- **EMI Modelling**

Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling &Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EE5 - Computer Based System Design (30 Lectures)

- **Computer Fundamentals**

Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications, Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL).

- **Communication**

Asynchronous and synchronous communication, Standards like RS232, RS422, RS485, USB, Encoding schemes.

- **Networking**

Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. Role of fibre optics in communication, Fieldbus standards, Deterministic communication techniques, Case study: various techniques used in Tokamak/Fusion devices for communication and networking.

- **Real-time systems**

Real-time Systems, their characteristics and applications, Real-time Operating Systems, Concepts of Process and threads, Concurrency, Latency, context switching, Scheduling policies, Inter process communication, Semaphores, Priority inversion, Shared memory, Common systems calls, Communication features in RTOS, Comparative study of various RTOS, Integrated software development environment

EE6 - Digital Signal Processing & Image Processing (30 Lectures)

Digital Signal Processing

- **Introduction**
  Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**
  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT

- **Fast Fourier Transform**
  Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- **Digital filters**
  FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- **DSP Applications**
  Applications of digital signal processing in fusion and other fields.

Image Processing

- **Introduction**
  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.

- **Image Enhancement**
  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing.

- **Image Segmentation and Analysis**
  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.

- **Morphological operations**
  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

Courses of Study

For PhD Program

SCHOOL OF HUMANITIES & SOCIAL SCIENCES

SYLLABUS FOR

Ph.D. in APPLIED SYSTEMS ANALYSIS

(Program Code: APSA04)

National Institute of Science Education and Research Bhubaneswar

(An Off-Campus Center of HomiBhabha National Institute– a deemed to be University, Anushakti Nagar, Mumbai)

With effect from the Academic Year 2018

PhD Programme in the School of Humanities and Social Sciences

(Economics, English, Psychology and Sociology)
National Institute of Science Education and Research Bhubaneswar

Duration of Course work : 1 year

Structure of the Course work:

	No of courses	Credits
Core	**2**	**12**
***Discipline Elective**	**4**	**24**
Open Elective	**2**	**12**
Self-study/online/predoctoral work	**2**	**12**
Total	**10**	**60**

** Discipline means Economics, English, Psychology and Sociology*

Core Courses

List of Core Courses

Course No	Credits	Course Name	Semester
H 601	6	Research Methods - I	I
H 602	6	Research Methods - II	II

Elective Courses

A student has to choose at least four elective courses on his/her area of interest for research from a list of courses offered by different disciplines during a particular semester. It may be noted that the courses offered will depend on the availability of faculty with expertise in a particular area as well as critical number of students opting for the course. In some cases students will be asked to obtain a few credits from other schools. Additionally, students are required to take two self-study and/or credit seminars and/or online courses from the NPTEL/SWAYAM portal or do 6/12 credits of pre-doctoral research work. The school retains the authority to make the final decisions in this regard depending upon the individual need of the student.

List of Elective Courses

Course No	Credits	Course Name	Discipline
H 611	6	Advanced Economic Theory	Economics
H 612	6	Econometric Theory and Applications	Economics
H613	6	Issues in Public Finance	Economics
H614	6	Development Economics	Economics
H615	6	Environmental and Ecological Economics	Economics

H616	6	Poverty, inequality and Development	Economics
H617	6	Project Evaluation	Economics
H618	6	Indian Industrial Development	Economics
H619	6	New Institutional Economics	Economics
H620	6	International Trade and Finance	Economics
H621	6	Topics in experimental and behavioural approaches to economic development	Economics
H 622	6	Environmental Economics and EIA	Economics
H631	6	Humanities and the Institutional Space	English
H632	6	The Modern European Novel	English
H633	6	The idea of the nation in Indian English Fiction	English
H634	6	Black Intellectual traditions and the Narratives of Race in America	English
H 635	6	Writings of the South Asian Diaspora	English
H 636	6	Translation and Culture: Issues and Perspectives	English
H 651	6	Organizational Behaviour	Psychology
H 652	6	Leadership	Psychology
H 653	6	Organizational Change and Development	Psychology
H 654	6	Positive Psychology	Psychology
H 655	6	Cross Cultural Psychology	Psychology
H 656	6	Business Ethics	Psychology
H 671	6	Classical Sociological Theory	Sociology
H 672	6	Information and Society (Theory)	Sociology
H 673	6	Sociology of Development	Sociology
H 674	6	Contemporary Social Theory	Sociology
H 675	6	Qualitative Research Methods	Sociology
H 676	6	Quantitative Research Method I	Sociology
H 677	6	Social Network Analysis I	Sociology

Details of the Course

COMMON CORE SYLLABUS (Compulsory for all incoming PG students)

Research Methods – I (H 601)

Core, Semester 1

(Teaching Faculty drawn from across the disciplines of the school)

1. Defining a research project (8 classes + 2 tutorials)

Asking questions, Big five: What,How,Why, What will it be and What should it be, Deciding a right methodology, Understanding the difference between qualitative and quantitative research, Sampling methods.

2. Methods of Studying Psychology (8 classes + 2 tutorials)

Experimental method, Observational study, Survey method, Interviews, Self report, Case Studies. Geneological, Managing perceptual biases in research.

3. Socio Economic data mining and computer applications (8 classes + 2 tutorials)

Mining of different data sets such as Census, NSS, RBI, Public Finance. Introduction to SPSS and STATA for data analysis.

4. Critical Theory and textual analysis (8 classes + 2 tutorials)

The notion of critique. Spatialization and context. Rigor and the idea of meaning. Text as narrative.

5. Historical Analysis (8 classes + 2 tutorials)

Why study history, Historical process, Discovery and analysis, Methodological framework, Historical evidence, Rules of evidence, Primary and secondary sources.

Research Methods – II (H 602)

Core, Semester II

(Teaching Faculty drawn from across the disciplines of the school)

1. **Ethical aspects of Research (8 classes + 2tutorials)**

Historical background, Fundamental ethical principles, Informed consent, Institutional review, Data safety monitoring, Adverse and serious adverse events

2. **Contextual aspects of research (8 classes + 2 tutorials)**

Environmental challenges, structure of organizations and its impact on behavior, understanding the culture from where information is gathered.

3. **Methods of Policy Analysis (8 classes + 2 tutorials)**

Introduce methods of policy analysis. Examine prescriptive methods; i.e. methods for weighing the "costs and benefits" of alternative courses of policy action. Which policy "option" represents the best--most effective, most efficient, most equitable choice for government action. Second, methods for evaluating policy and program performance *post*-implementation. How do we know when a policy or program is working? We consider both process evaluations (is the implementing agency actually carrying out its assigned tasks?) and outcome/impact evaluations (is the policy/program actually having the expected effect?). Third, consider methods for assessing policy outcomes–i.e. broad social impact. Our toolkit of methods will include both quantitative and qualitative models and techniques.

4. **Rhetoric and Research writing (8 classes + 2 tutorials)**

The argument. Dialectics. Visual narratives. Mechanics of writing.

5. **Logical system and causation (8 classes + 2 tutorials)**

Foundations of social science, Two logical systems, Cause and effect relationship, Different Causal claims, Statistical causality in social sciences

Elective Courses

<u>ECONOMICS</u>

H 611: Advanced Economic Theory

Proposed by/instructor: Amarendra Das

Prerequisite: None

Micro Economics

1. Choice under uncertainty **(3 classes, 1 tutorial)**

Theory and application in rural insurance market

2. Topics in interlinked markets **(6 classes, 2 tutorials)**

Imperfect competition and fragmented markets a. rural markets – land, labour and credit

3. Topics on asymmetric information **(4 classes , 2 tutorials)**

a. Principal agent problem b. Adverse selection

4. Externalities and public goods **(3 classes, 1 tutorials)**

5. Issues in rural urban interactions **(2 classes, 1 tutorial)**

Harris-Todaro model

6. Inequality, occupational choice and human capital **(4 classes, 2 tutorials)**

Access to credit market b. Choice of occupation

7. Poverty and intra-household resource allocation **(2 classes, 1 tutorial)**

Macro Economics

1. Inflation **(4 classes, 2 tutorials)**

Quantity Theory of Money, Natural rate hypothesis, Models of nominal rigidities, New Keynesian view on inflation, Structuralist view, Welfare costs of inflation

2. Unemployment **(2 classes, 1 tutorial)**

Demand failures and Keynesian unemployment, Search theoretic models of unemployment, Efficiency wage models

3. Debt and Deficits **(4 classes, 1 tutorial)**

Debt-deflation theory of depressions, Public debt sustainability, Ricardian Equivalence

4. Business Cycles **(4 classes, 1 tutorial)**

Keynesian models of endogenous cycles, Growth cycles, Real business cycles, Money and DSGE

5. Finance in Macroeconomics **(4 classes, 1 tutorial)**

Minskian instability hypotheses, Financial bubbles and crashes, the Efficient market hypothesis, Crises and policy responses

6. Crises **(4 classes, 1 tutorial)**

Financial, Fiscal and External: Models of crisis, Great recession, Lessons from the East Asian crisis and Global financial crisis

7. Stabilisation policy **(4 classes, 1 tutorial)**

Monetary and Fiscal Policies: Dynamic inconsistency and rules versus discretion, Policy ineffectiveness, Monetary policy transmission mechanisms, Optimal monetary policy rules, Inflation targeting, Fiscal policy, Coordination of fiscal and monetary policies

H 612: Econometrics Theory and Application

Proposed by/instructor: Amarendra Das

Prerequisite: Basic knowledge of statistics and econometrics

1. Sampling: (6 lectures, 4 tutorials)

i) Sample size and sampling error

ii) Probability sampling (Simple Random Sampling, Systematic Sampling, Stratified

Sampling, Probability Proportional to Size Sampling, and Cluster or Multistage Sampling) and

iii) Nonprobability sampling (Accidental Sampling, Quota Sampling and Purposive Sampling, Line-intercept sampling, Panel sampling, snowball (chain) sampling).

2. Multiple Regression with R (6 lectures, 4 tutorials)

(OLS estimation and interpretation; Violation of assumptions; Simultaneous equation model estimation; Binary and multi-nomial logit and probit models; Tobit model)

3. Multivariate Analysis with SPSS (8 lectures, 4 tutorials)

(ANOVA, ANCOVA and MANOVA; Principal components analysis/ Factor analysis

Multidimensional scaling; Clustering systems; Discriminant analysis)

4. Time Series Analysis with Gretl/Stata (8 lectures, 4 tutorials)

(ACF and PAF; Units roots tests; ARIMA model; ARCH/GARCH models; VAR models; Cointegration)

5. Panel data Analysis with Gretl/Stata (6 lectures, 4 tutorials)

(Fixed Effects and Random Effects method; Hypotheses testing; Dynamic Panel Data models)

Essential Readings

H 613: Issues in Public Finance

Proposed by/instructor: New Faculty

Prerequisite: None

1. Role of Government and Budgeting **(6 lectures, 4 tutorials)**

Measurement of deficits, Budgeting - Performance based budget; Outcome budget, Rule based budgeting.

2. Fiscal Policy & Monetary Policy **(4 lectures, 2 tutorials)**

Fiscal Accommodation/ accommodative monetary policy. Ricardian Equivalence Theorem (RET): A Critical perspective.

3. Fiscal Performances **(4 lectures, 2 tutorials)**

Of both Center and State governments in India - Expenditure, revenue and deficits trends.

4. Issues in Public Debt **(4 lectures, 2 tutorials)**

Assessment of sustainability of debt - (a) Accounting Approach and (b) Present Value Budget Constraint Approach.

5. Fiscal Transfer **(6 lectures, 4 tutorials)**

Evolution in the Federal Fiscal Mechanism of Transfers: some perspectives on various Finance Commissions' recommendation and policy design with a specific reference to 12^{th} , 13th and 14^{th} FCs.

6. Equity and Efficiency in Fiscal Transfer **(3 lectures, 1 tutorials)**

Assessment of equity aspect in transfer mechanism in Indian context. An International Comparison with other Federal Countries' Transfer mechanism.

7. Fiscal Decentralization Experience in India **(3 lectures, 1 tutorials)**

8. Taxation **(4 lectures, 2 tutorials)**

Optimality in Taxation, Elasticity and Buoyancy, Direct tax and Indirect taxes,

9. Major Tax reforms. **(6 lectures, 4 tutorials)**

Implementation of VAT and GST, Expenditure Reforms and Management, Government subsidy and its implication on the economy.

11. Fiscal Consolidation and its consequences (2 lectures, 1 tutorials)

21. Thirteenth FC (Dec. 2009) “Report of 13th FC - 20010-15”.

22. Fourteenth FC (Jan, 2015) Report of 14^{th} FC -2015-20

H 614: Development Economics

Proposed by/instructor: New Faculty

Prerequisites: None

1. Economic development (4 lectures, 2 tutorials)

1.1 Concepts and Dimensions

1.2 Methodologies and Disciplinarity

1.3 Development and Underdevelopment

1.4 Developmentalism, Alternatives

2. Dual Economy models of development (4 lectures, 4 tutorials)

2.1 Underlying theories: Lewis-Ranis- Fei Model, Harris-Todaro Model

3. Economic Inequality and Development (4 lectures, 2 tutorials)

3.1 Concepts and Measurement (Basics of measurement issues only to enable literature reading)

3.2 Economic inequality and access to credit market

3.3 Economic inequality and choice of occupation.

3.4 Economic inequality and Human capital formation

3.5 Economic inequality and conflict.

4. Poverty (4 lectures, 2 tutorials)

4.1 Concepts and measurement

4.2 Impact of poverty on intra-household allocation, and access to labour market and credit market.

4.3 Poverty and Social structure

4.4 Poverty, health and nutrition

5. Issues on Health and Nutrition (4 lectures, 2 tutorials)

5.1 Importance of Health in Development

5.2 Intrahousehold Allocation of Nutrients among the children

5.3 Window of opportunity

6. Issues in Education **(6 lectures, 4 tutorials)**

6.1 Access to Education

6.2 Public Provision and infrastructure

6.3 Incentivising education

7. Social Security and Public Policy **(6 lectures, 4 tutorials)**

7.1 Issues in Targeting, Measurement

7.2 Social security policies: Public works programme, food security programme, conditional cash transfers.

H 615: Environmental and Ecological Economics

Proposed by/instructor: New/Guest Faculty

Prerequisites: None

1. Measuring values (6 lectures, 4 tutorials)

Benefits and costs – overview; total value – use and non-use values of goods; Willingness-to-Pay versus Willingness-to-Accept; economic valuation of changes in human health – mortality and morbidity concepts; statistical value of life; economic valuation of biodiversity – existential value concept

2. Production Function Approaches to Economic Valuation (6 lectures, 4 tutorials)

Environmental valuation from market information including prices – dose response function, productivity change method, substitution cost method, illness costs, human capital; applications

3. Revealed Preference Approaches (6 lectures, 4 tutorials)

Revealed preference models of valuation – basic theory; Hedonic pricing method – property market and labour market; travel cost method – individual model and zonal model; defensive cost method – defensive costs of decreased drinking water quality; applications

4. Stated Preference Approaches and Benefit Transfer: (6 lectures, 4 tutorials)

Contingent valuation method – bias, experimental markets; choice modelling – choice experiment, contingent comparison, contingent scoring, pair comparison; applications; benefit transfer approaches – value transfer in theory and practice.

5. An introduction to ecological economics (6 lectures, 4 tutorials)

The economy in the environment – a conceptual framework, Economic accounting, Input–output accounting, National income accounting conventions, National income as the measure of economic performance, National income accounting and the environment, Environmental policy instruments, Choice of environmental policy instruments; Climate change; the nature and extent of the problem, Mitigation targets and instruments, what is being done about the problem?

6. Biodiversity loss (3 lectures, 1 tutorials)

The biodiversity-loss problem, why it is a difficult problem, Conservation policy

H 616: Poverty, Inequality and Human Development

Proposed by/instructor: New/Guest Faculty

Prerequisite: None

1. Poverty **(4 lectures , 2 tutorials)**

Concepts, Definitions, dimensions and analytical context

2. Measures of Poverty **(6 lectures, 4 tutorials)**

Headcount index, poverty gap and poverty severity indexes; FGT(Foster-Greer-Thorbecke) family of poverty measures; Sen and Sen-Shorrocks-Thon indexes of poverty and decomposition ; Watts index and exit measure.

3. Poverty in India **(6 lectures, 4 tutorials)**

Definition and measurement of Poverty in India: A Chronological Examination; The Great Indian Poverty Debate: A Snapshot; Identification of the Poor in India's Five year plans.

4. Poverty Profiles **(6 lectures, 4 tutorials)**

Rationale for poverty profile; Presentation of dimensions of poverty; Use of additive poverty measures and poverty comparisons; Poverty comparisons over time: sampling frame and method, adjustment for price differences; Poverty mapping and relative risk.

5. Inequality Measures **(4 lectures , 2 tutorials)**

Difference between inequality and poverty; Measures of Inequality : Lorenz Curve; Gini Coefficient; generalized entropy measures including Theil's T and Theil's L., Atkinson's inequality measure; Axioms of inequality and satisfying conditions of the measures of inequality; Decomposition of inequality measures.

6. Growth, inequality and Poverty **(4 lectures , 2 tutorials)**

Debates on Growth versus inequality and poverty growth linkages.

7. Multidimensional Poverty **(4 lectures , 2 tutorials)**

Properties of multidimensional poverty; Multidimensional poverty measures: issues of identification and aggregation; Multidimensional Poverty Measures.

8. Human Development **(4 lectures , 2 tutorials)**

Human Development Concepts and Approaches ; Introduction to HD Measurement Issues

9. Growth, inequality and Human Development **(4 lectures , 2 tutorials)**

10. Inequality Adjustment and inclusiveness of Human Development (4 lectures , 2 tutorials)

The need for inequality adjustment in HDI: HDI in India Patterns and Trends; Disaggregating human development: An assessment of inclusiveness; Inter-dimensional response across the three dimensions: the optimal evaluation

Readings

Readings for Topic 1

H 617: Project Evaluation

Introduction **(8 lectures , 3 tutorials)**

Meaning of a project and its basic characteristics, Role of Projects in a Development Planning Framework, Stages of Planning and Scope of Projects, Project Cycles:- Ex-Ante Analysis (i.e. conceptualization, identification, technical as well as economic feasibility analysis), Project Cycle:- Ex-Post Analysis (i.e., project selection, execution, action plan, monitoring, post-evaluation and reformulation)

Basic Tenets of Project Appraisal/ Evaluation: the Welfare foundations (6 lectures , 2 tutorials)

Classical welfare economic analysis, neo-classical economic analysis, new welfare economic analysis,

Approaches and Techniques **(8 lectures , 2 tutorials)**

Approaches and Steps in Appraisal/ Evaluation, General Criteria of Project Appraisal, Commercial Profitability Analysis / BCA of Projects, Capital Budgeting Decisions in terms of Methods of Investment Criteria, National Economic Profitability Analysis or SBCA of Projects,

Methods Project Appraisal / Evaluation **(8 lectures , 3 tutorials)**

Various Methods: the OECD Method, the UNIDO Guidelines Methods, the World Bank Method, the Effects Method, Significance of Externalities in Project Evaluation, Risk and Uncertainty Analysis,

Case Studies **(8 lectures , 2 tutorials)**

Water Resource Development Projects, Industrial Projects, Forestry Projects, and Non-conventional Energy Projects.

Project Assignments

H 618: Indian Industrial Development

Proposed by/instructor: New/Guest Faculty

Prerequisites: None

1. Industrial Development in India Since 1951: **(4 classes, 2 tutorials)**

An Overview Industrialization strategy: Import Substitution and State control. BoP crisis, SAP and Economic Reforms; Critical issues for discussion in the context of globalization;

2. New Industrial Policy and Institutional Changes: (4 classes, 2 tutorials)

Delicensing and de-reservation; Removal of FERA, MRTP etc; FEMA and Competition Policy Act; Debates on Competition.

3. Overall Industrial Performance under Liberalization: (6 classes, 2 tutorials)

Structural change; Growth strategies of Business Groups; M&As and market concentration; Growth pattern of Industrial output, value added and employment; Productivity & Technological change.

4. Small-scale Industries and their new challenges: (4 classes, 2 tutorials)

Growth and structure of MSMEs; Size distribution of Unorganized and Informal Sector

5. Disinvestment Strategies and Debates on Privatisation: (4 classes, 2 tutorials)

Experience of disinvestment; Performance of public sector Enterprises

6. Industrial finance and Corporate Governance (4 classes, 2 tutorials)

Foreign investment; Foreign Portfolio investment; Financial Derivates; Capital Market and Role of stock exchange

7. Challenges ahead for Strengthening Industrialisation in India under WTO regime. (6 classes, 2 tutorials)

Demand factors; Supply factors such as Infrastructure Development, Energy issues, Environmental issues/Standards on Pollution control, etc. Data base on Industrial Statistics and Methodological Issues.

H 619: The New Institutional Economics

Proposed by/instructor: New/Guest Faculty

Prerequisite: None

1. The NIE: **(4 classes, 2 tutorials)**

What is it?

2. Property Rights I **(6 classes, 2 tutorials)**

– Where it all began; Property Rights on Historical Frontiers; Property Rights on Current Frontiers:

3. Why Don't We Get It Right? **(6 classes, 2 tutorials)**

Why do firms exist? Insights from the NIE for Business Management and Strategy, Technology,

4. Transaction Costs **(6 classes, 2 tutorials)**

Transaction Costs and Contracts in Agriculture, Agricultural Contracts and the Growth of the Welfare State,

5. Norms and Contracts, **(6 classes, 2 tutorials)**

Understanding the Big Picture

H 620: International Trade and Finance

Proposed by/instructor: New/Guest Faculty

Prerequisites: None

1. Evolution of IT Theory **(4 Lectures, 2 tutorials)**

Evolution of international division of labour and economic transactions among countries

2. Review of theories of trade and trade flows: **(4 Lectures, 2 tutorials)**

Comparative advantage and its interpretations, economies of scale, imperfect competition, preference similarity

3. Arguments for and history of discriminatory commercial policy: **(4 Lectures, 2 tutorials)**

Theory of tariff, domestic distortions, strategic trade policies, discriminatory trading arrangements, new protectionism in the post war period, contemporary trade policy conflicts

4. International trade and underdevelopment: **(4 Lectures, 2 tutorials)**

Commodity question, unequal exchange and uneven development, accumulation on global scale, global value chain analysis

5. International Trading System: **(8 Lectures, 2 tutorials)**

From General Agreement on Tariff and Trade (GATT) to the World Trade Organisation (WTO); new areas brought under the trading system, GATS and TRIPS, the Doha Round conflicts

6. International Finance: **(4 Lectures, 2 tutorials)**

Capital account transactions, macro economic interdependence in open economies, the world of mobile finance, monetary integration and its consequences,

7. Issues in international financial architecture **(4 Lectures, 2 tutorials)**

Gold standard, Brettonwoods regime and postBrettonwoods arrangement; the development project in a world of mobile finance

Readings

2. Caprio, Gerard, Honohan, Patrick and Stiglitz, E Joseph (2001) Financial Liberalisatiojn: How Far, How Fast? Cambridge University Press

H 621: Topics in Experimental and Behavioural Approaches to Economic Development

Proposed by/instructor: New/Guest Faculty

Prerequisite: None

1. An overview of Concepts in Behavioural Economics (4 Lectures, 2 tutorials)

Cognition: Dual process of reasoning, judgment and decision making; Heuristics and Biases; Choice under Risk and Uncertainty ; Mental Accounting; Loss Aversion, Reference Dependence , Framing and Prospect Theory; Probabilistic Judgment; Time and Choice

2. An overview of Experimental Methods (4 Lectures, 2 tutorials)

Why experiments instead of field data? ; Natural experiments, quasi-experiments and controlled experiments; Methods and Methodological issues in experiments.

3. Behavioural and experimental methods for poverty and development (4 Lectures, 2 tutorials)

4. Applications in Labour Market Studies , (4 Lectures, 2 tutorials)

5. Applications in Caste and Gender Institutions , (4 Lectures, 2 tutorials)

6. Applications in Health and Education , (4 Lectures, 2 tutorials)

7. Applications in Micro Finance, Insurance and Credit market, (4 Lectures, 2 tutorials)

8. Applications in Public Policy , Governance and Corruption, (4 Lectures, 2 tutorials)

9. Applications in climate change , (4 Lectures, 2 tutorials)

H 656 - Business Ethics

Instructor/Proposed by: Rooplekha Khuntia

Prerequisite: none

1. **Introduction to Business Ethics: (10 lectures + 4 tutorials)**

Business ethics: an overview, Concepts and theories.

2. **Ethical theory and business: (10 lectures + 4 tutorials)**

Ethical Decision making in business- deontology and teleology, rights, fairness and justice. Ethical Dilemmas- sources and their resolution.

3. **Corporate Social Responsibility: (10 lectures + 4 tutorials)**

Business's environmental responsibilities, Employee responsibility, Moral rights in the workplace, Diversity and discrimination.

4. Managing Stakeholder Relations: (4 lectures + 1 tutorial)

Types of stakeholder relations, problems with stakeholder collaborations.

5. Globalization and business ethics: (5 lectures + 2 tutorials)

Doing business in a global marketplace, differing labor and environmental standards.

* Additional readings to be provided by the instructor as the course progresses.

SOCIOLOGY

H 671: Classical Sociological Theory

Instructor/Proposed by : Pranay Swain

Prerequisite: None

Course structure

1. **Theory and research** **(4 classes and 1 tutorial)**

Relation between theory and research, The nature and use of theory, Basic concepts

2. **Fundamental perspectives of society** **(4 classes and 1 tutorial)**

Conceptualization of social system, Social structure and culture, Various perspectives, Subjectivity vs Objectivity

3. **Comte, Spencer, and Marx** **(6 classes and 2 tutorials)**

Contending visions of a science of society

4. **Durkheim and his school** **(4 classes and 1 tutorials)**

Rules of Sociological Methods, Suicide, Division of Labour

5. **Conflict theory** **(8 classes and 3 tutorials)**

Marx: Dialectical Materialism; Frankfurt School and Critical Theory Jurgen :Habermas and Adono; Kant'sCritique of Pure Reason, Paul fayerabad

Modern Approaches: C Wright Mills; Postmodernism

6. **The theory of action** **(8 classes and 3 tutorials)**

structural-functionalism, and the course of American sociology

Talcott Parsons, The Structure of Social Action, Robert Merton, Social Theory and Social Structure

7. **Neo classical theories** **(8 classes and 3 tutorials)**

Exchange theory, Symbolic Interactionism, Phenomenology, Ethnomethodology, Structuration theory.

H 672: Information and society (Theory)

Instructor/Proposed by : Debashis Pattanaik

Prerequisite: Introductory course on sociology and sociological theory.

Course structure

1. **Information & the idea of information society**(5 classes+1 tutorial)

2. **Classical tradition** (6 classes+2 tutorial)

Functional analysis, Functions and dysfunction, Political economy, Hegemony and Dialectical materialism

3. **Modern theory** (6 classes+2 tutorial)

Critical theory and socio-cultural tradition

4. **Post industrialist and late modern tradition** (8 classes+2 tutorial)

Neo evolutionism, Post industrial society, Information, Structure and Agency, Paradoxes of modernity, Surveillance

5. **Debates on information and advanced capitalism** (8 classes+2 tutorial)

Political economy, market criteria, class inequalities, objections to critical theory, Theories of Information manipulation, The public sphere, Information change, Public service institutions

6. **Information and post modernism** (8 classes+2 tutorial)

Regulation school, Globalization, Post fordism, Flexible specialization, Theories of network society

H 673: Sociology of Development

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course structure

1. **Sociological perspectives** (4 classes + 1 Tutorial)

What is Development. Why does it matter?

Economic– human – social – sustainable – ecological notions of development

2. **Theories/models of development** (6 classes + 2 Tutorials)

Modernization theory (New modernization studies), Is development premised on underdevelopment? Dependence theory (New dependence studies), World system theory, Global system interdependence,

3. **Globalization and Modernization** (6 classes + 2 Tutorials)

What is Globalization, Role of Globalization in Economic Development. Can everyone catch up? Modernization Theory.

4. **Development- indicators** (4 classes + 1 Tutorial)

Human Development Index, Millennium Development Goals

5. **Sustainable Development** (6 classes + 2 Tutorials)

What is Sustainable Development? Factors of Sustainable Development, Participatory development. Environmental Issues and Ecological discourses

6. **Development reconsidered** (4 classes + 1 Tutorial)

Urbanization in Global system, Stakeholders approach

7. **Development induced social problems** (4 classes + 1 Tutorial)

Displacement, Regional Disparity, Social Eclusion, Unequal Distribution of Benefits

8. The Capabilities Approach (4 classes + 1 Tutorial)

Capabilities approach and its philosophical foundations and understanding of development, applications of capabilities approach to concrete social issues

9. Contemporary Issues in development (4 classes + 1 Tutorial)

Special reference to India: Health, Education and Livelihood . Case Studies and Contemporary debates. Rights of Future Generations, Reduce, Recycle and Reuse

H674: Contemporary Social Theory

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Introductory course on sociology and sociological theory.

Course structure

1. **Exchange and rational choice theory**(6 classes + 2 tutorial)

Introduction, Social behavior as exchange, Exchange and power, Collective action

2. **Critical theory** (6 classes + 2 tutorial)

Mass media and mass society, Power structure, Life world vs System, Public sphere

3. **Middle range functionalism and neo functionalism** (5 classes + 1 tutorial)

Middle range functional analysis, Social structure, Functionalism to neo functionalism, Social action and social order

4. **Theories of institutions and networks** (6 classes + 2 tutorial)

Economic embeddings and social structure, Collective rationality, Structural holes

5. **Theories of modernity & post modernity**(8 classes + 2 tutorial)

Modernity and its consequence, Critique of modernity, World System, Crisis in modern world system, Globalization and nation state, Mass media and the simulation of reality, Enchanted consumption

6. **Theories of human agency, structuration and social system** (10 classes + 2 tutorial)

Agency, Social structure and system, Structuration, Morphogenic process, Models of Social system, Self Creation and self organization of social system.

H675: Qualitative Research Methods

Instructor/Proposed by : Pranay Swain

Prerequisite: None

Course structure

a. The Scientific Method and Sociological Inquiry(4 classes and 1 tutorial)

Qualitative versus quantitative research in the social sciences, Approaches to qualitative research,

b. Action Research (4 classes and 1 tutorial)

Action research/Participatory action research: The how and why of Action Research, Community mapping as a tool, Participatory Rural Appraisal

c. Qualitative Research Design (4 classes and 1 tutorial)

Designing qualitative research, Review of Literature and composing research questions, Site selection & sampling,

d. **Ethics in Qualitative Research** **(4 classes and 1 tutorial)**

Ethics in qualitative research, Dangers in the field: positioning yourself as researcher & ethnographic field work,

e. **Role of Researcher** **(4 classes and 1 tutorial)**

Getting in & getting along: Positioning yourself as researcher, Issues of data quality and applicability,

f. **Tools of Collecting Qualitative Data (8 classes and 2 tutorials)**

Triangulation, Observation/participant observation, Ethnography and naturalistic methods, Observation debriefing: introduction to in-depth interviews, Writing interview questions & practicing probes, Focus group interviews, Case studies

g. **Qualitative Data Analysis** **(6 classes and 2 tutorials)**

Content analysis, Computers and qualitative analysis, Mixing qualitative and quantitative research: possibilities and pitfalls

h. **Report Writing** **(6 classes and 2 tutorials)**

Making sense of qualitative data, Writing up qualitative findings, writing workshop

9. Berg, B., and H. Lune. 2012. Qualitative Methods for the Social Sciences, pp. 196-216. Topics: Entering the field; doing observation.

H 676: Quantitative Research Methods –I

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Course on Research methodology 1

Course structure

1. **Introduction** (5 classes + 1 tutorial)

Research question and resources, Objectivity and Subjectivity: Debate on Values

2. **Measurement in social Science** (5 classes + 1 tutorial)

Operationalization, Variables, Measurement, Validity, Reliability

3. **Research design** (6 classes + 2 tutorial)

Survey research, Experimental design

4. **Introduction to statistical methodology & basic probability** (10 classes + 2 tutorial)

Frequency tables and histogram, Graphical methods, Measures of central tendency, Measures of dispersion, Coefficient of variation and Coefficient of dispersion, Probability, Probability rules, Permutation and combinations, Probability distribution, the binomial distribution, Normal distribution

5. **Sampling distribution of mean & estimation of population mean** (10 classes + 2 tutorial)

Population distribution, Central limit theorem, Standard error of the Mean, Z distribution, Student’s t distribution, Assumptions for t distribution, Estimation vs hypothesis testing, Point estimate, Confidence Intervals for a Single Population Mean, Z and t statistics for two independent samples, Confidence Intervals for the Difference between Means from Two Independent Samples: variance known- and variance unknown.

6. **Test of Hypotheses** (6 classes + 2 tutorial)

Terminology, Neyman–Pearson Test Formulation, Test of a Mean: Population Variance Known, est of a Mean : Population Variance Unknown, One-Tailed Versus Two-Tailed Tests, *p*-Values, Type I and Type II Errors.

H 677: Social Network Analysis I

Instructor/Proposed by : Debashis Pattanaik

Prerequisite: Prerequisite: Course on Research methodology 1 and social theory.

Course structure

1. **Introduction to social network analysis** (5 classes+1 tutorial)

History of social network research, General trends in the field of social network study, Patterns of networks, Basics of Graph theory

2. **Basic network concepts** (8 classes+2 tutorial)

Network terminology, Sociological questions and relationships, Patterns and distributions, Roles and positions

3. **Analysis I** (10 Classes+2 tutorial)-28

Complete network, Local network and Relations through associations

4. **Analysis II** (10classes+2 tutorial)-40

Sentiments and Friendship, Balance theory, Structural balance, Social capital, Small world problem

5. **Social frameworks I** (5classes + 1 tutorial)

Traditional network and kinship relationship, Reciprocity, Patron client network, Organizations and network, Dark network

6. **Social frameworks II** (5 Classes + 1 tutorial)

Information, Knowledge and network, Social media and network

CHEMICAL SCIENCES

Programme Code: CHEM04

Programme Outcome:

- Foundation in the fundamentals of core chemical sciences fields including those in Analytical, Inorganic, Nuclear and Physical Chemistry.
- Skill development in critical thinking and problem solving applied to scientific problems.
- Development of skills to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large.
- Development of skill set necessary for starting a research career in chemical sciences and allied areas
- Appreciate the central role of chemistry in DAE programmes and apply these to take up research in key issues such energy, health and medicine.

List of Courses

Course Structure Under BARC:

Sr. No.	Old Course Code	New Course Code	Subject Title	Hours	Credits	Marks
CORE COURSES						
1	CYJRF-101	01-CHEM04-601-C	Inorganic chemistry	30	4	
2	CYJRF-102	01-CHEM04-602-C	Physical chemistry	30	4	
3	CYJRF-103	01-CHEM04-603-C	Organic chemistry	30	4	
4	CYJRF-104	01-CHEM04-604-C	Radiochemistry	30	4	
5	CYJRF-105	01-CHEM04-605-C	Analytical chemistry	30	4	
6	CYJRF-106	01-CHEM04-606-C	Health physics and safety in chemical labs	20	2	
			CORE TOTAL	**185**	**24**	
ELECTIVES - *Any 5*						
Group A (Any one)						
7	CYJRF-201	01-CHEM04-701-E	Radioisotopes and radiations in industry	30	4	
8	CYJRF-202	01-CHEM04-702-E	Actinide chemistry	30	4	
9	CYJRF-203	01-CHEM04-703-E	Radiopharmaceuticals	30	4	
10	CYJRF-204	01-CHEM04-704-E	Radiation detection and measurements	30	4	
Group B (Any one)						
11	CYJRF-205	01-CHEM04-705-E	Advanced materials chemistry	30	4	
12	CYJRF-206	01-CHEM04-706-E	Polymers science and technology	30	4	
13	CYJRF-207	01-CHEM04-707-E	Renewable energy harvesting and storage	30	4	
14	CYJRF-208	01-CHEM04-708-E	Fundamentals of environmental chemistry	30	4	
Group C (Any one)						
15	CYJRF-209	01-CHEM04-709-E	Advanced spectroscopy	30	4	

16	CYJRF-210	01-CHEM04-710-E	Computational chemistry	30	4	
17	CYJRF-211	01-CHEM04-711-E	Radiation and photochemistry	30	4	
18	CYJRF-212	01-CHEM04-712-E	Materials for cancer therapeutics and diagnostics	30	4	
Mandatory

			NON-SUBJECT ASSIGNMENTS TOTAL		**16**	
			TOTAL	**335**	**60**	

CORE COURSES

CYJRF-101: Inorganic Chemistry (30 Hours / 4 Credits) (01-CHEM04-601-C)

Course Outcomes:

- Description of specific crystal structures by applying basic crystallographic concepts
- Understanding different types of defects and their effect on the functional properties
- Understand the general characteristics of the d and f block elements
- Thorough knowledge of the different theories to explain the bonding in coordination compounds
- Idea about different synthesis methods for nano-materials useful for research work

Course Details:

Co-ordination Chemistry:

Werner's Coordination theory, Valence Bond Theory, Crystal Field Theory, Jahn Teller effect, Thermodynamic effects of crystal field, Coordination chemistry of lanthanide and actinide ions, Application of group theory for d-d transition, Electronic spectra of complex ions, Absorption probability, Allowed transitions and selection rules, Tanabe Sugano diagram, Nephelauxetic effect, Ligand metal orbital overlaps, Magnetic properties of complex ions, f-f transitions in lanthanides. Molecular orbital theory, Molecular orbital diagram from concepts of group theory, MO's for Sigma bonding in AB_6 molecules, Tetrahedral AB_4 case, MO's for pi bonding in AB_6 molecules, Metal organic framework materials. Dissociative & associative reaction mechanism of ligand replacement in octahedral and square planar complexes, trans-effect and its implications.

Materials Science:

Basic solid-state chemistry: Crystalline and amorphous materials, Close packed structures, Basic structure types, Silicate structures, Perovskites, Pyrochlores, Spinels, Structure of common nuclear materials (oxides, metallic, carbides), Co-ordination number, Bonding, Radius ratio rules, Lattice energies, Bond energies
Defects in Solids: Defects and defect equilibria, Classifications of defects, point/line/surface/volume defects, Techniques to study defects, Solid solutions, Phase transitions and their classifications, Thermodynamic classification of phase transitions, Martensitic phase transitions, Equilibrium and metastable phases
Nanomaterials: General properties, Difference between nano and bulk materials, Gradation in properties with variation in particle size with examples
Electrical Materials: Ionic conductors, Solid electrolytes, Electronic conductors, Band structures of metals, Insulators and semi-conductors, Controlled valency semiconductors, Dielectrics and concept of polarizability, Ferroelectrics, piezo and pyroelectric materials (concept, examples, applications), Thermoelectric materials, Thomson, Peltier and Seeback effects, Thermocouples, Hall effect
Magnetic materials: Behaviour of materials in magnetic field, Diamagnetic, Ferromagnetic, Anti-ferromagnetic, Paramagnetic materials with examples, Effect of temperature on magnetic materials, Application of magnetic materials
Optical materials: Phosphors, Photoluminescence, Electroluminescence, Thermoluminescence, Characteristics of host matrix, Sensitizers, Activators, Excitation and emission spectra, Energy transfer, Defect-induced luminescence, Quantum yield, Application of phosphors, Materials for LASERS (examples: Ruby and Nd lasers)

Techniques for synthesis of materials

General concepts, Equipment/materials required with few typical examples, Scope and limitations of different synthesis techniques: Solid state synthesis, Hydrothermal synthesis, Ultrasonication and Microwave synthesis, Metathesis, *chimie douce* (polyol, co-precipitation, ion exchange), Gel combustion and sol-gel synthesis, High pressure synthesis, Techniques for growing single crystals and thin films

Diffraction Techniques for Phase Identification

Concept of diffraction techniques, X-ray diffraction, Reciprocal space, Structural and scattering factors, grain / particle size effects, Different techniques of recording diffraction patterns, Indexing of diffraction patterns, Neutron diffraction, Electron diffraction.

2. Material Science and Engineering by V. Raghavan
3. New Directions in Solid State Chemistry by C. N. Rao and J. Gopalakrishnan
4. Solid State Chemistry: An Introduction by Smart and Moore
5. Introduction to Solid State Physics by Charles Kittel
6. Advanced Techniques for Materials Characterization" Eds. A. K. Tyagi, M. Roy, S. K. Kulshreshta, S. Banerjee, Trans Tech Publications Ltd, Switzerland (2009)
7. Advanced Inorganic Chemistry, 6th Edition by F. A. Cotton, G. Wilkinson, C. A. Murillo, M. Bochmann
8. Inorganic chemistry by Shriver & Atkins, 5th edition
9. Inorganic Chemistry: Principles of Structure and Reactivity, 4th edition, by J. E. Huheey, E. A. Keifer, R. L. Keifer, O. K. Medhi

CYJRF-102: Physical Chemistry (30 Hours / 4 Credits) (01-CHEM04-602-C)

Course Outcomes:

- Analyze thermal effects on a chemical process
- Understanding the phase diagrams
- Understanding basics of quantum mechanics to understand the difference between classical and quantum phenomena
- Develop expertise in molecular orbital theory that helps in understanding structure of polyatomic molecules
- Understanding kinetics of chemical reactions and reaction dynamics
- Learn difference between chemical kinetics and dynamics, and their applications in real systems
- Expertise developed in carrying out research in relevant area of chemical physics with acquired knowledge

Course Details:

Thermodynamics:

Laws of thermodynamics, Carnot cycle, Concept of entropy, Fundamental equations and thermodynamic functions, Chemical potentials, Thermodynamics of solutions, ideal and regular solution models. Chemical Equilibrium**:** Solid-gas equilibrium, Ellingham diagram. Statistical mechanical interpretation of laws of thermodynamics, Entropy and probability, Partition function and equilibrium.

Chemical potential of an ion in solution; Activity and activity coefficients of ions in solution, Quantitative aspects of Faraday's laws of electrolysis, Nernst equation, Standard electrode (reduction) potential and its application to different kinds of half-cells. Binary and ternary phase diagrams, Degree of freedom rule and lever-rule, Calculation of simple binary phase diagrams from thermodynamic properties, Chemical potential variations across phase diagrams.

.

Chemical Kinetics:

Rates of chemical reaction, rate equation, methods of determination of rate and order of a chemical reaction, complex reaction, Collision and transition state theories of chemical reaction, Potential energy surfaces and reaction dynamics. Application to unimolecular and Bimolecular reactions, Chemical oscillations and nonlinear dynamics.

Quantum Chemistry:

Postulates of quantum mechanics, Classes of operator: Linear and Hermitian, Physical significance of eigen value in quantum mechanics; Boundary value problem in quantum mechanics; Exactly solvable problems: Particle in a box and ring; simple harmonic oscillator; rigid rotor and hydrogen atom; Approximation methods: Variation method; perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules; Extended systems: From bonds to bands; Applications to few simple molecules.

5. Quantum Chemistry by R. K. Prasad
6. Molecular Quantum Mechanics by Peter Atkins
7. Quantum Chemistry 7^{th} Ed, Levine

CYJRF-103: Organic Chemistry (30 Hours / 4 Credits) (01-CHEM04-603-C)

Course Outcomes:

- Knowledge about synthetic design, and to enable a student to devise a synthetic route for a target molecule
- Knowledge about the various strategies in organic synthesis
- Knowledge about the most recent advancements in organic synthesis
- Understanding of important spectroscopic methods and their application for structure elucidation of organic molecules

Course Details:

Strategy and Design of Organic Synthesis:

Brief history of organic synthesis, Retro-synthesis analysis and synthetic-strategy, Stepwise synthesis vs. domino synthesis, Linear and convergent synthesis, Practice of total synthesis, Enantio- and diastereo-selective synthesis, Concept of double diastereo-selection-matched and mismatched pair; Solid phase synthesis, Concepts in combinatorial synthesis, Diversity oriented synthesis and their applications in various fields in chemistry including drug development, Catalysis and materials development.

Carbon-Carbon and C-X Bond Formation:
Various C-C and C-X coupling methods including single, double and triple bonds viz. Heck reaction, Cross coupling reactions (Suzuki, Stille, Negishi, Kumada, Hiyama, Sonogashira, Buchwald-Hartwig), Fischer carbenes, Schrock carbenes, Olefin metathesis, Various types of metathesis and application to organic synthesis, Dotz benzoannulation, Pauson-Khand reaction and [2+2+2] cycloadditions, Organo-catalyzed organic reactions and enantio-selective organo-catalysis, Umpolung and N-heterocyclic carbene-application in catalyzed general and asymmetric synthesis, Functionalization by catalytic selective C-H activation and metal free hydrogenation equivalents.

Organic Spectroscopy:
Importance of spectroscopic methods in the structural elucidation of organic molecules**,** Organic absorption spectroscopy, Use of IR and UV in Organic Chemistry, examples of IR and UV spectra of simple organic molecules, nuclear spin and resonance, chemical shifts, factors that influence ^{1}H chemical shifts, spin-spin coupling, coupling patterns and resonance multiplicities, coupling to chemically equivalent spins, weak and strong coupling, chemical and magnetic equivalence, 1H spin couplings and chemical structure, geminal, vicinal and long-range couplings, chirality and NMR, chiral solvating agents, ^{13}C NMR spectroscopy, NMR instrumentation, Fourier transform NMR, interpretation, Concepts and applications of methods behind Mass Spectrometry and the interpretation of spectra

Reference books:
1. Organic Chemistry by Jonathan Clayden, Nick Greeves and Stuart Warren
2. Organic Chemistry by Jerry March
3. Modern Physical Organic Chemistry by Eric V. Anslyn and Dennis A. Dougherty
4. Organic Spectroscopy by William Kemp
5. Organic Synthesis: The Disconnection Approach by Stuart Warren

CYJRF-104: Radiochemistry (30 Hours / 4 Credits) (01-CHEM04-604-C)

Course Outcomes:
- Explain the different kinds of radioactive decay and interpret a radioactive decay series, apply radiotracer principles
- Understand the basic concepts in fission and the production yields of different radioactive isotopes during fission
- Expertise to choose a particular detector for a specific application
- Knowledge base to understand safety aspects while working with radioactivity
- Basic knowledge to develop need-based measurement systems

Course Details:

Fundamentals of Radiochemistry

Radioactivity: Nuclear stability, Binding energy, Natural radioactivity, Decay series, Induced radioactivity, Radioactive decay laws, Concept of half-life and radioactive equilibria
Radioactive decay modes: α-decay, β decay, γ - deexcitation – basics
Nuclear models: Liquid drop model, Shell model, Basic concept of spin, parity electric and magnetic moments, Isomerism
Artificial radioactivity: Transmutation – concept of cross section, Energy thresholds, Fission and radioactivity formed in fission, Nuclear fusion, Basics of reactors and accelerators

Production and chemical properties of transuranic elements – Variable oxidation states, Redox behavior, Production of trans-actinides and fast radiochemical separations

<u>Radiotracers, dating and basic principles of nuclear analytical techniques</u>

Radiation interaction and detection: Interaction of heavy charged particles and electrons with matter, Stopping power, Bethe equation, Braggs's curve, range, interaction of X-/γ-rays and neutrons,
Detectors: Ionization chamber, Proportional counter, GM counter, NaI(Tl) detector, HPGe detector, Silicon detectors for charged particles, Detection efficiency, Energy resolution, Dead time, Counting Statistics

6. Radiation detection and measurement, G.F. Knoll, John Wiley & Sons

CYJRF-105: Analytical Chemistry (30 Hours / 4 Credits) (01-CHEM04-605-C)

Course Outcomes:

- Acquaintance with various analytical techniques
- Idea on how to tackle an analytical problem, pertaining to DAE and other industries
- Acquaintance with theories of various matrix separation techniques
- Acquaintance with statistical treatment of analytical data
- The course gives sufficient expertise leading to enhanced employability

Course Details:

Separation/Purification and Detection Technique
Solvent extraction: - Conventional, Liquid membranes, Bulk, Supported and emulsified; Solid Phase Extraction (SPE); Ion Exchange: - Conventional, Membranes. Chromatography: **-**Gas Chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion Chromatography (IC), Super critical extraction chromatography, Capillary electrophoresis. Retention, Band spreading, resolution, Application of chromatographic techniques.

Electrochemical Methods
Potentiometry, Ion Selective Electrodes (ISE), Membrane ion selective electrodes, Voltammetry & Polarography, Cyclic, Pulse and Stripping Voltammetry, Electrochemical kinetics, Coulometry and Amperometry, AC voltammetric Techniques, Electrochemical impedance spectroscopy, Charge transfer and diffusivity, spectro-electrochemistry.

Spectrochemical Methods
Atomic Absorption Spectrometry: - Flame (FAAS), Electrothermal (ETAAS), Cold Vapor (CVAAS), Hydride Generation (HGAAS); Optical Emission Spectrometry (OES): - with Inductively Coupled Plasma (ICPOES), Glow Discharge (GDOES).

Mass Spectrometry
Mass Analysers:- Magnetic, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance; Detectors:- Faraday Cup, Channeltron, Daly; Ion Sources:- Thermal Ionization (TI), Electron Impact, ICP, GD, Laser Ablation (LA-ICP), Secondary Ionization (SI), Resonance Ionization (RI), Matrix Assisted Laser Desorption and Ionization (MALDI).

Thermal Methods
Thermogravimetric Analysis (TGA); Derivative Thermogravimetric Analysis (DTG); Differential Thermal Analysis (DTA); Differential Scanning Calorimetry (DSC); Evolved Gas Analysis (EGA); Dilatometry; applications in Polymers Catalysis, Cement, Coal, etc.

Nuclear Methods
Neutron Activation Analysis (NAA); Charged Particle Activation Analysis (CPAA); X-ray fluorescence (XRF) spectrometry; K_0 method of analysis.

Statistics in Chemical Analysis
Accuracy, Precision, Errors in quantitative analysis, Propagation of errors, Treatment of errors, Tests of Significance and Confidence Limits, Reporting of analytical results.

2. Fundamentals of Analytical Chemistry, D.A. Skoog, D. M. West, F. J. Holler, S.R. Crouch, 8th Edition, Thomson (2004).
3. Principles of Instrumental Analysis, D.A. Skoog, F. J. Holler, T. A. Niemann, 5th Edition, Saunders College Publishing (1998).
4. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).
5. Solvent Extraction of Metals, A. K. De, S. M. Khopkar and R. A. Chalmers, Van Nostrand, Reinhold (1970).

CYJRF-106: Health Physics and Safety in Chemical Labs (20 Hours / 2 Credits) (01-CHEM04-606-C)

Course Outcomes:
- Basic knowledge of handling hazards of various radioactive materials
- Knowledge of radiation protection aspects in nuclear and radiation facilities
- Develop an understanding of the principle of chemical/radiochemical safety
- Inculcate a culture of safety which shall benefit the organization
- Awareness about various emergencies and the need of emergency preparedness plans

Course Details:

<u>Health Physics</u>

Fundamentals of Radiation Protection:
Radioactivity, Ionizing radiation, Radiation quantities and units**,** Basis and structure of the system for radiation protection, System of radiological protection for human, natural radiation.

Basic Radiation Physics and Radiation Dosimetry Aspects
Interaction of radiation with matter, External and internal radiation hazards in nuclear and radiation facilities, Radiation dosimetery: basics, concepts and definitions, External radiation dosimetry and dosimetry of internally deposited radio nuclides, Radiation detection principles, Monitoring instruments and Personnel monitoring devices

Operational Monitoring and Safety Aspects of Facility Design
Exposure situations as per ICRP-103 recommendations, Control of external and internal radiation hazards, Radiation dose limits and its basis, General principles and techniques of radiation monitoring, air activity and area contamination, Assessment and control of radiation hazards in nuclear fuel cycle facilities with special reference to metallurgical, radiochemical and radioisotope facilities and fuel reprocessing plants, Criticality safety aspects, Environmental safety aspects during operation of nuclear and radiation facilities, Industrial hygiene and safety aspects during operation of nuclear and radiation facilities.

Radiological Safety Aspects in Design of Radio-Chemical Laboratories
Safety aspects of design of radiochemical laboratory, its types and operational aspects, Partial containment/confinement systems and ventilation system in a laboratory.

Safety in chemical labs
Definition of chemical safety and its assessment, general chemical safety awareness, Classification of chemicals: Corrosive, Flammables, explosives, toxics, pyrophoric, carcinogen. Chemical which create lachrymation and smoke, Entry of such chemicals into human/biological system and its consequences, precautionary and safe methods for handling such chemicals, Compatibility issues with chemicals, Understanding the Safety Data Sheets (Material Safety Data Sheets) for different chemicals. Storing different chemicals, incompatible chemicals, making inventory of chemicals, labelling chemicals depending upon its nature, safe disposal of chemicals, precautions and safe operating procedures (SOP) to be taken into consideration for chemical spills, chemical protective clothing, chemical accidents and their classification and consequences, Emergency Procedures during chemical accidents, Personal Protective equipment from chemical exposure, precautions to be taken with chemical which need to be refrigerated. Safe practices while using vacuum lines and laser. Fire safety and different types of fire extinguishers.

ELECTIVE COURSES

GROUP A

CYJRF-201: Radioisotopes and Radiations in Industry (30 Hours / 4 Credits) (01-CHEM04-701-E)

Course Outcomes:

- Knowledge of different processes employed for the production and radiochemical processing of important artificially produced radio-nuclides
- Understanding of emergence of the radiation and radioisotopes as an essential tool in various industries
- Applications of various radiotracers in industries
- Understand the concept of radionuclide generator with some relevant examples
- Understanding of various radiation processing techniques
- Appreciate that radiation and radioisotopes are boon for the development of nation and mankind

Course Details:

Production of Radioisotopes

General Introduction and Decay Schemes of Some Important Radioisotopes
Isotopes and radioisotopes, Naturally obtained and artificially produced radioisotopes, Need for radioisotope production, Basics of radioisotope production, Decay scheme, Simplified decay schemes of some important radioisotopes: ^{60}Co, ^{64}Cu, ^{68}Ge, ^{90}Y, ^{99}Mo, ^{131}I, ^{153}Sm, ^{177}Lu.

Production of Radioisotopes in a Nuclear Reactor
Production of radioisotopes in a nuclear reactor - Various processes, Calculation of activity of radioisotope produced, Concept of specific activity, 'No-carrier-added' and 'carrier-added' radioisotopes, Importance and methodologies for obtaining high specific activity radioisotopes, Preparation of targets for irradiation in a nuclear reactor - Chemical form, Encapsulation material, Quantity, Concept of flux depreciation and its impact on radioisotope production, Introduction to Szilard-Chalmer reaction and Bateman equation, Radiochemical processing of the irradiated targets - various techniques, Radioisotope production in Dhruva reactor - Tray rods, Positions available for target irradiation, Neutron flux, Power, Operation schedule, Production routes and radiochemical processing for some important reactor radioisotopes: ^{60}Co, ^{99}Mo, ^{125}I, ^{131}I, ^{153}Sm, ^{192}Ir and ^{177}Lu.

Production of Radioisotopes in a Cyclotron
Principles of production of radioisotopes in a cyclotron - Coulomb barrier, Q value, Nuclear reaction cross-section, Excitation function, Calculation of yield of radioisotopes produced in a cyclotron, Target preparation for production of radioisotopes in a cyclotron - Concept of internal and external targets, Methodologies for target preparation, Target temperature and need for cooling, Considerations for target window foil materials, Production and radiochemical separation of some important cyclotron produced radioisotopes: ^{18}F, ^{44}Sc, ^{64}Cu, ^{68}Ge, ^{89}Zr, ^{123}I, ^{124}I, ^{211}At and ^{225}Ac.

Radionuclide Generators
Concept and applications of radionuclide generators, Separation methodologies used in generators - Column chromatography, Solvent extraction, Electrochemical separation, 'Gel' based systems, Sublimation and Thermo-chromatography. Advantages and limitations of each separation methodology, Calculation of elution yield and t_{max}, Shelf-life of generator, Examples of some clinically relevant radionuclide generator systems: ^{99}Mo/^{99m}Tc, ^{68}Ge/^{68}Ga, ^{90}Sr/^{90}Y, ^{188}W/^{188}Re, ^{225}Ac/^{213}Bi generators.

Applications of Radioisotopes & Radiation in Industry

Radiotracer Applications
Basic principle of radiotracer technology, Advantages of radiotracers, Selection of a radiotracer for a particular study, Injection of radiotracers, Detection of radiotracer, Radiotracer data treatment and analysis.

Applications of Radiotracers in Industry with Case Studies
Leak detection using radiotracers, Flow rate measurements using radiotracers, Residence time distribution measurements, Sediment transport investigations, Radiotracer applications in oil fields, Wear and corrosion rate measurements, Adsorption studies.

Sealed Source Applications in Industry - Principle and Applications
Radiometric measurements, Radiography, Tomography, Nucleonic gauges.

Applications of Isotope Hydrology
General principle of hydrology, Measurement techniques, Source and mechanism of recharge, Interconnection between water bodies, Determination of age of ground waters, Pollution studies.

Radiation Processing Applications
Application of electron beam for processing of materials, Application of gamma radiations for processing of materials.

Reference Books:
1. Manual for Reactor Produced Isotopes. IAEA-TECDOC-1340, IAEA, 1999.
2. Dynamic Mechanical Analysis: A Practical Introduction. K.P. Menars, CRC Press, Boca Raton, 1999.
3. Industrial application of radioisotopes. G. Foldiak.
4. Guide Book on Radioisotope Tracers in Industry - Tech. Rep. Series 316, IAEA, Vienna, 1990.
5. Environmental Isotopes in Hydrogeology. Ian Clarke and Peter Fritz, Lewis Publishers, NY, 1997.

CYJRF-202: Actinide Chemistry (30 Hours / 4 Credits) (01-CHEM04-702-E)

Course Outcomes:
- Understanding of the fuel cycle operations including reprocessing and waste management
- Idea about environmental aspects of actinide migration in case of accident
- Pursue further areas of study such as transactinides and 'atom at a time chemistry'

Course Details:

Position in periodic table: Electronic configuration, The Actinide Concept, Transuranium elements

Actinide Spectroscopy: Electronic states, Atomic properties, UV-visible absorption and emission spectroscopy.
Time resolved fluorescence spectroscopy (TRFS), Photo-acoustic spectroscopy (PAS), X-ray absorption spectroscopy
(EXAFS/ XANES) and their application in actinide speciation.

Electronic structure and bonding: Introduction to '*f*' orbitals and their splitting in the ligand field. Relativistic effect and its consequences. Modern techniques for understanding the bonding in actinide compounds

Co-ordination chemistry: Ionic radii, Coordination number, Hydration Energy, Complexation with inorganic / organic igands, Complexation with crown ethers, cryptands, calixarenes.

Redox behaviour: Redox potentials, Eh-pH diagrams, Variable oxidation states, Ionic species, Unusual oxidation states in actinides and their stabilization, Thermodynamic/ kinetics of redox reactions, Disproportionation.

Hydrolysis of actinides: Hydrolysis, Polymerization / Depolymerization,

Auto-radiolysis: Auto-radiolytic effects in aqueous solutions, Auto-radiolysis effects in solid compounds of actinides.

Actinide separations relevant in nuclear fuel cycle: Ion-exchange, Solvent extraction methods for actinides (inter and intra-group separations), Actinide partitioning, Lanthanides-actinide separation, SANEX processes.

Analytical chemistry of actinides: CQC of nuclear fuels, Davies & Gray method for U analysis, Drummond & Grant method for Pu analysis, Analytical chemistry of transplutonium elements

Actinides in the environment: Natural abundance of actinides, Oklo phenomenon, Actinide speciation in aquatic environment, Complexation with naturally occurring organics such as humic acid and fulvic acid, Sorption and Migration, Interaction with rock, clay, mica etc. Formation and migration of radiocolloids.

Biochemistry of actinides: Actinide-microbe interaction, Actinide migration in the food chain, Fixation in human, Pu in blood, Intra-cellular uptake of Pu, Sequestering using chelation therapy, Bioremediation of nuclear wastes.

Transactinide: Production, Rapid separation techniques, Atom-at-a-time chemistry. Chemistry of elements 104, 105, 106, 108

CYJRF-203: Radiopharmaceuticals (30 Hours / 4 Credits) (01-CHEM04-703-E)

Course Outcomes:

- Understanding the importance of nuclear medicine in human healthcare
- Knowledge about application of radiation and radioisotopes for diagnosis and treatment of various human ailments specifically cancer
- Knowledge about theranostics
- Comprehension of various nuclear imaging techniques and their application in nuclear medicine
- Understanding of preparation and quality control of radiopharmaceuticals

Course Details:

Nuclear Medicine and Radiopharmaceuticals

Nuclear medicine and its importance in human healthcare, Concept of tracer and its application in nuclear medicine, Radiopharmaceuticals, Classification of radiopharmaceuticals, Characteristics of diagnostic and therapeutic radiopharmaceuticals, Metal essential and metal non-essential radiopharmaceuticals, Target-specific radiopharmaceuticals, Mechanism of uptake of radiopharmaceuticals.

Preparation of Radiopharmaceuticals

Design and preparation of radiopharmaceuticals, Characteristics of diagnostic and therapeutic radionuclides, Carrier moieties for radiopharmaceuticals, Methods of radiolabeling, Isotopic and non-isotopic labeling, Direct and indirect labeling, Labeling using BFCA (Bi-Functional Chelating Agent), Characteristics of an ideal BFCA, Concept of pre-labeling and post-labeling, Radiolabeling with Technetium and Rhenium, Various cores of Technetium, Radiolabeling using novel cores such as Tricarbonyl, HYNIC, Nitride and '4+1' chemistry, Radiolabeling with Lanthanides, Gallium, Yttrium, Copper etc., Concept of radio-protector and stabilizing agent.

Quality Control of Radiopharmaceuticals
Need for quality control of radiopharmaceuticals, Types of quality control tests, Physico-chemical quality control tests, Methods for determining Radiochemical Purity, Radionuclidic Purity and Chemical Purity of radiopharmaceuticals, Biological quality control tests, Sterility test, Bacterial Endotoxin Test (BET), Quality control methods for some important radiopharmaceuticals (SPECT as well as PET) followed in hospital radiopharmacy.

Formulation of Patient Dose of Radiopharmaceuticals
Concept of centralized nuclear pharmacy and hospital radiopharmacy, Formulation of patient dose in centralized nuclear pharmacy and hospital radiopharmacy, Concept of freeze-dried kit, Formulation of freeze-dried kits, Advantages and disadvantages of using freeze-dried kits for patient dose formulation.

Nuclear Imaging Techniques
Nuclear medicine imaging vs. other contemporary imaging techniques, Concept of tomography, Gamma camera, SPECT, PET and Hybrid imaging (SPECT-CT, PET-CT, SPECT-MRI, PET-MRI), SPECT vs. PET.

Some Important Radiopharmaceuticals
Some important organ-specific diagnostic (SPECT as well as PET radiopharmaceuticals) - Contemporary agents for Myocardial imaging, Brain imaging, Renal imaging, Hypoxia imaging, Tumor and inflammation imaging, Infection imaging, Receptor-specific imaging agents etc., Therapeutic radiopharmaceuticals for some specific applications - Bone pain palliation, Radiation synovectomy, Targeted radionuclide therapy, Peptide Receptor Radionuclidic Therapy (PRRT), Radioimmunotherapy (RIT), Targeted Alpha Therapy (TAT).

Concept of Thernostics and Personalized Medicine
Concept of theranostics, Applications and advantages of theranostics in nuclear medicine, Theranostic radionuclides, Types of theranostic agents, Concept of personalized medicine.

Reference Books:
1. Fundamentals of Nuclear Pharmacy, G.B. Saha, Springer-Verlag, 1984.
2. Radiopharmaceuticals: Chemistry and Pharmacology, Adrian D. Nunn. Marcel Dekker, 1992.
3. Radionuclides in Therapy, R.P. Spencer, R.H. Sievers, A.M. Friedman. CRC Press, Boca Raton, 1987.
4. PET in Oncology: Basics and Clinical Applications, J. Ruhlmann, P. Oehr, H.J. Biersack. Springer-Verlag, 1998.
5. Fundamentals of Radiochemistry. D.D. Sood, A.V.R. Reddy, N. Ramamoorthy. Indian Association of Nuclear Chemists and Allied Scientists, 2004.

CYJRF-204: Radiation Detection and Measurements (30 Hours / 4 Credits) (01-CHEM04-704-E)

Course Outcomes:
- Development of understanding of general interaction of radiation with matter
- Appreciate the difference in radiation-matter interaction based on characteristics of matter and radiation

- Understanding the functioning of various radiation detectors based on concepts of radiation-matter interaction
- Application of this knowledge to develop measurement systems as required

Course Details:

Interaction of Radiation with Matter

Interaction of Heavy Charged Particle with matter
Ionization in gaseous medium, Bragg curve, stopping power, Bethe Equation for stopping power, Range of heavy charged particles and straggling, Range energy relationship
Interaction of Fast Electrons with Matter
Comparison with heavy charged particle, LET for electron, Bremsstrahlung radiation, Bethe Equation, path length and range of electrons, Attenuation and absorption of β particles, Backscattering of β- particles
Interaction of Electromagnetic Radiations (γ, X-Rays) with Matter
Photoelectric Effect, Compton Scattering, Pair Production. Variation of cross section for different process with γ energy and Z of the medium, Attenuation and Absorption of gamma rays.
Interaction of neutrons with matter
Elastic and Inelastic Scattering of neutrons and slowing down, nuclear reactions
Radiation Detectors
Principle of Radiation Detectors: Pulse height spectrum, Counting Characteristics, plateaus, Detection efficiency, Energy resolution, Dead time, Counting Statistics.
Gas filled Detectors: Ionization Chamber, Proportional counter, GM counter,
Scintillation Detectors: Organic and Inorganic scintillators, Liquid scintillation counter, NaI(TI) detector
Semiconductor Detectors: p-n junction, HPGe detector for gamma ray spectroscopy, Si(Li) for x-ray spectroscopy, Si surface barrier detector for alpha spectroscopy
Neutron Detectors: BF_3, ^3He gas filled counters.

Solid State Nuclear Track Detectors (SSNTD)
Instrumentation for nuclear techniques
PMT and photo diodes, Single Channel Analyser, ADC, Multi-Channel Analyser, basic coincidence circuit, determination of life time using coincidence system, Positron Annihilation Spectroscopy: Instrumentation and Applications, Perturbed angular correlation measurement: Instrumentation and Applications

References:
1. Radiation detection and measurement, G.F.Knoll, John Wiley & Sons

GROUP B

CYJRF-205: Advanced Materials Chemistry (30 Hours / 4 Credits)

(01-CHEM04-705-E)

Course Outcomes:
- Appreciate the importance of developing advanced materials
- Knowledge about various classes of advanced materials such as carbon, carbides, nitrides essential for future research career
- Understanding of various characterisation techniques based on X-rays
- Knowledge about important DAE-relevant materials
- Knowledge of application of ion beams to characterise materials

Course Details:

Nuclear materials
Structure of common nuclear materials: Oxides (UO_2, PuO_2, ThO_2), metallic (U, Pu, Zr and its alloys, steel), carbides etc. Non-stoichiometry in nuclear materials and its significance, Concept of surrogates for nuclear materials, Materials relevant to back end of nuclear fuel cycle, Glasses and ceramics for waste immobilisation, Structure of components of SYNROC, Behavior of materials under irradiation (examples from front end and back end of nuclear cycle), dpa, Difference between effects of low and high energy irradiation.

Carbon-based materials
Classification: Diamond, Graphite, graphite oxide, fullerenes, Carbon nano-tubes, Graphene, Glassy carbon, Diamond like carbon; Structural and thermodynamic basis of classification; **Synthesis methods:** Natural diamond, Synthetic diamond (HPHT and CVD methods), Graphite (natural and lab-made graphite, nuclear-grade graphite), fullerenes and CNT, Graphene synthesis; **Properties:** Physical and chemical properties (Structural-basis of origin of these properties), Unique properties of each carbon-form, Property-application correlation; Current applications and futuristic technological potential

Thermoelectric Materials: Thermoelectric materials, Thomson, Peltier and Seeback effects, Thermocouples, Hall effect, Materials used for thermoelectric energy conversion, Thermal conductivity and factors affecting it, Concepts of thermoelectric energy conversion, Figure of merit and factors governing it, Applications of thermoelectric materials

Chemistry of Carbides, Borides, Nitrides: Synthesis, bonding, structure, properties and applications

Materials Characterisation Techniques:
(a) Diffraction Techniques for Structural Analysis: Brief description of diffraction techniques with some examples for indexing XRD patterns. Comparison of Powder and Single crystal X-ray diffraction, Neutron diffraction, Electron diffraction.

(b) Electron microscopic techniques: Electrons and their interactions with the specimen, Fundamentals of electron microscopy with emphasis on SEM and TEM, Overview of the instruments, Magnetic lenses and deflectors, Electron guns, Lens aberrations and basic operation modes: Bright field and dark field imaging, Diffraction modes, Different electron microscopy techniques and applications, Image analysis using SEM and TEM, Introduction to advanced microscopic techniques: EDX, HAADF-STEM, EELS, electron tomography etc.

(b) Advanced Techniques for Materials Characterisation: Different characterization techniques based on X-rays and electrons: XRF, EPMA, XPS, AES, EELS, EXAFS and their application with examples, Concept and examples of Characterisation Techniques based on Nuclear Reactions and Ion Beams: Rutherford Back Scattering Spectrometry (RBS), Elastic Recoil Detection Analysis (ERDA), Nuclear Reaction Analysis (NRA), Particle Induced X-ray Emission (PIXE) and Particle Induced Gamma-ray Emission (PIGE), Techniques employing Nuclear Probes: Positron annihilation spectroscopy (PAS): Lifetime spectroscopy, Doppler broadening spectroscopy, Age momentum correlation, Applications with examples, Perturbed angular correlation (PAC) techniques and their applications with examples.

Reference Books:
1. Solid State Chemistry and its Applications by A. R. West
2. Material Science and Engineering by V. Raghavan
3. New Directions in Solid State Chemistry by C. N. Rao and J. Gopalakrishnan
4. Solid State Chemistry: An Introduction by Smart and Moore
5. Introduction to Solid State Physics by Charles Kittel

CYJRF-206: Polymers Science and Technology (30 Hours / 4 Credits) (01-CHEM04-706-E)

Course Outcomes:

- Exhaustive understanding of chemistry of polymers and polymer processing
- Understanding of techniques required for polymer characterisation
- Application of radiation to polymer processing and its relative merits and demerits
- Introduction to special purpose polymers developed for specific applications

Course Details:

Fundamentals of Polymer Science

Historical background of macromolecules, Introduction to concepts such as monomer, functionality and physical state, Classification of polymers on the basis of source, Chemical structure, Composition and stereoregularity, Polymer nomenclature and classification of polymers as Thermoplastics, Thermoset, Fibers and Elastomers. Comparison of polymers with metals and ceramics and applications where polymers have significant advantages, Examples of common thermoplastics, fibers, thermoset and elastomers polymers.

Chemistry of Polymers

Chemistry of polymerization, Brief introduction to addition polymerization, Condensation polymerization, Ring opening polymerization, Redox polymerization, Living radical polymerization, Factors affecting polymerization, Emerging approaches of polymerization, High energy radiation, Plasma and photo polymerization, Electrochemical polymerization, MMP, RAFT and ATRP. Chemistry of copolymerization, Copolymerization kinetics and copolymer structures, Chemical modification of polymers, Cross-linking, Degradation, Grafting, Imprinted polymers and functionalization, Separation and purification of polymers.

Basics of Polymer Processing

Introduction to polymer synthesis: Bulk, Solution, Precipitation, Suspension, Emulsion, Condensation, Addition, Interfacial, Solid phase and Gas phase Polymerization, Introduction to polymer mixing and processing techniques, Effect of composition, Stabilization and coagulation in polymer compounding, Open mill mixing, Internal and continuous mixers and extruders, Compression molding, Injection molding, Blow molding, Melt spinning, Dry spinning, Wet spinning, Electro spinning and Drawing of fibers.

Polymer Characterization and Structure - Property Correlations

Basic concepts of polymer structure, Chain length, Branching, Copolymer arrangement (block, random or graft), Conformation, Degree of crystallinity and degree of orientation, Effect of polymer structure on functional properties, Effect of molecular weight and molecular weight distribution on crystallinity, Glass transition and mechanical properties, Functional group identification and characterization by UV-VIS, IR and NMR spectroscopy of polymers, Physical and mechanical properties of polymers (Impact strength, Tensile strength, Flexural strength, Hardness), Polymer viscoelasticity and principles of TMA and DMA, Thermal analysis of polymers, Heat of fusion, Heat capacity, Thermal conductivity, Glass transition temperature and Degree of crystallinity, Estimation of thermal stability of polymers from TGA and DSC, Polymer microstructure evaluation of by polarized light microscopy, TEM, SEM, AFM, WAXS and PALS.

Nanotechnology in Polymer Science

Introduction to nanoparticles and nanocomposites, Synthesis of nano-polymers, Types of nanofillers used in polymer nanocomposites, Synthesis of polymer nanocomposite by melt intercalation, Compounding and in-situ polymerization and surface modification of nanofillers, Factors affecting properties of polymer-filler composites, Dispersion of nanofillers in polymers, Polymer-nanoparticles interface, Role of filler geometry and size, Characterization of polymer nanocomposites: TEM, AFM, SEM and Optical microscopy, Mechanical properties, Dynamic mechanical analysis, Tensile properties, Flexural properties, Impact strength, Heat distortion temperature, Thermal stability, Fire retardant properties, Gas barrier properties, Conductivity, DMTA and Melt-rheology. Applications of nano-polymers and polymer nanocomposites.

Polymer Blends, Composites, Membranes and Emulsions
Introduction to polymer blends and composites, Classification of polymer blends and composites, Principle of polymer compatibility, Polymer-polymer interaction, Thermodynamics of polymer-polymer mixing, Solubility parameter and blend morphology, Types of polymer composites and reinforcement theory, Applications of polymer blends and composites, Classification of membranes, Polymer selection for development of membranes and common processes for making polymer membranes, Applications and uses of membranes, Chemistry of polymer emulsions, Emulsion types and applications.

Radiation Processing of Polymers
Basic radiation chemistry and physics of polymers, Time scale of energy deposition, Interaction of radiation with monomers and polymers, Energy transfer and radiolysis, Overall effect of radiation on properties of polymers and factors that can affect the overall radiochemical yield of a process, Theory of swelling in cross-linked polymers, Charlesby-Pinner and cross-linking density analysis of irradiated polymers, Polymer structure and cross-linking density correlations, Mechanical, Thermal and Spectroscopic evaluation of radiation processed polymers, Role of EPR and NMR in quantifying radical yield and radiolytic transformations, Radiation grafting; Types of radiation grafting, Kinetics and characterization of grafting yield, Factors affecting polymer degradation by radiation, Applications of radiation cross-linking, Grafting and Degradation, Comparison of radiation and chemical processes, Basic aspects of UV based process and a comparison with high-energy radiation based processes.

Specialty Polymers and Advanced Applications of Polymers
Brief introduction to special purpose polymers, Structure-property correlations in radiation resistant polymers, Heat and fire resistant polymers, Electro active polymers, Electro-chromic polymers and piezo-resistive polymers, Concepts and applications of Thermoplastic Elastomers, Gels, Micro-gels and hydrogels, Functionally graded polymer blends and smart adhesives, Key examples of emerging/established applications of polymers in areas such as Sensors, Radiation stability, EMI shielding, Catalysts, Electrostatic discharge devices, Solar cells, Drug delivery, Hydrogel, Biomaterials, Desalination and Environmental remediation.

Reference Books:

2. Polymer Science by Vasant R. Gowariker, N. V. Viswanathan, Jayadev Sreedhar New Age International, 1986-11030.
3. Applied Radiation Chemistry: Radiation Processing by Robert J. Woods, Alexei K. Pikaev Publisher: Wiley-Interscience; ISBN-10: 0471544523.
4. Radiation Processing of Polymer Materials and Its Industrial Applications by Keizo Makuuchi, Song Cheng ISBN: 978-1-118-16279.

CYJRF-207: Renewable Energy Harvesting and Storage (30 Hours / 4 Credits) (01-CHEM04-707-E)

Course Outcomes:
- Appreciation of renewable energy-based research
- Knowledge about alternative sources of energy
- Understanding relevance of energy storage and conversion

- Development of understanding of hydrogen energy and related research
- Knowledge base for carrying out research in energy materials and allied fields

Course Details:

Basic Definitions and Classification
Energy and development, Units, Dimensions and measurement systems, Conventional and non-Conventional Sources of energy, Energy from fossil fuels: Coal, Oil, Natural gas and Nuclear resources, Basics of Solar, Wind, Hydro, Tidal, Ocean thermal and Other renewable energy sources, Impact of energy on environment, Environmental pollution due to energy.

Energy Conversion Systems
Basics of photovoltaic (PV) and PV systems, Thermochemical conversion through pyrolysis, Gasification and esterification, Bio-oil, Basics of hydrogen fuel, Fundamentals of fuel cells, Energy storage technologies, Chemical storage and electrical storage, Details of Pb-acid battery, Ni-Cd-alkaline battery.

Generation of Hydrogen
Energy conversion and energy storage in photosynthetic organisms, Efficiency of photosynthesis, Thermochemical cycle for generation of hydrogen, Semiconductor materials, Metal oxide nano composites and their properties, Photochemical and Photoelectrochemical generation of hydrogen, Hydrogen storage materials.

Batteries, Supercapacitors and Fuel Cells
Cathode/anode materials, Electrolytes, Membranes, Chemical and Electrochemical processes in different batteries (Li ion, Na ion), Supercapacitors and fuel cells, Determination of fundamental parameters for characterization of the efficiency of batteries, Supercapacitors and fuel cells, Introduction to redox flow battery and different types of redox flow batteries, Hybridization of various energy storage systems such as battery-supercapacitors, Battery-fuel cell and Battery-supercapacitor-fuel cell for different applications.

Reference Books:

1. Sustainable Energy without the hot air by David J. C. MacKay.
2. Solar energy engineering, Processes and systems, S. A. Kalogirou, 2nd Edition.
3. Solar Energy handbook, Michael Boxwell, 2017 Edition.
4. Photoelectrochemical Water Splitting: Materials, Processes and Architectures (Energy and Environment Series) 1st Edition, Hans-Joachim Lewerenz, Laurie Peter.
5. Advances in Photoelectrochemical Water Splitting: Theory, Experiment and Systems Analysis, Editors S David Tilley, Stephan Lany, Roel van de Krol.
6. Lithium ion batteries: Basics and applications, Editor R. Korthauer, Springer.
7. Supercapacitor: Instrumentation, Measurement and Performance Evaluation Techniques, Satyajit Ratha, Aneeya K. Samantara and, Springer.
8. Nanomaterials in Advanced Batteries and Supercapacitors, David J. Lockwood, Springer.

CYJRF-208: Fundamentals of Environmental Chemistry (30 Hours / 4 Credits) (01-CHEM04-708-E)

Course Outcomes:

- Understanding of different types of pollution and related problems
- Understanding of technologies related to mitigation of water, air and terrestrial pollution
- Knowledge of green chemistry, green solvents and zero waste technologies
- Understanding of different types of wastes and their management

Course Details:

Basic Concepts of Environmental Chemistry
Environmental Segment, Natural cycle of environment, Composition of the atmosphere, Chemical and photochemical reaction in atmosphere, Hydrosphere, Lithosphere, Geo-sphere and Geochemistry, Soil property, Biosphere, Ecology and Ecosystem, Atmospheric aerosols, Chemical toxicology, Concept of Green Chemistry.

Water Pollution and Waste Water Treatment Chemistry
Aquatic environment, Water pollutant, Eutrophication, Water quality guidelines, Drinking water supplies, Water quality parameters and Standards, Sampling, Protocols for heavy metal analysis in potable water, Chemical speciation, Waste water and its treatment, Advance microbiological processes in waste water treatments, Use of sorbents for waste water remediation, Isotherm and kinetic modeling.

Air Pollution Control Technologies and Devices
Source and type of air pollutant, Fate and transportation of air pollutant, Global and regional air pollution issues, Control of gaseous pollutants by adsorptions and condensation, Air pollution sampling and analysis: Ambient and Stack sampling, Air quality standards, Noise pollution and its standards.

Terrestrial Environment
Soil formation, Soil composition, Soil organisms, Soil reactions, Macro and micro nutrients in soil, Soil properties, Sources of soil pollution, Type of soil pollutant, Soil sampling, Solid waste in soil, Speciation of metal ions in soil.

Toxic and Hazardous Waste Management
Classification and categorization of hazardous waste, Disposal methodologies of hazardous waste, International and national guidelines for solid waste disposal. Management of Radiation, Noise, Thermal, Oil and e-wastes: Recycling of waste. Biosorption - Biotechnology and heavy metal pollution in terrestrial environment.

Green Chemistry
Basic principle of green chemistry, Green reagent & reaction, Green methodologies & analysis, Zero waste technology, Designing of biodegradable products, Catalytic methods in green synthesis, Safer chemicals; Selection of auxiliary substances (solvents, separation agents), Green solvents, Solvent less processes.

Reference Books:
1. Environmental chemistry: A global perspective by Gary W. Vanloon and Stephen J. Duffy
2. Environmental chemistry by A. K. De
3. Essential of environmental studies by Kurien Joseph and R. Nagendran
4. A Textbook of Environmental Chemistry by V. Subramanian
5. Environmental particles by Jacuues Buffle and Herman P. Van Leeuwen

GROUP C

CYJRF-209: Advanced Spectroscopy (30 Hours / 4 Credits) (01-CHEM04-709-E)

Course Outcomes:

- Develop understanding of various advanced spectroscopic
- techniques for analyzing complex compounds

- Thorough knowledge of the fundamentals of microwave, infrared, Raman, electronic and magnetic resonance spectroscopy, X-ray photoelectron spectroscopy
- Thorough understanding of application of suitable spectroscopic techniques to various research problems
- Equipped with sufficient knowledge about spectroscopy for employability

Course Details:

Vibrational Spectroscopy

Infra-Red Spectroscopy
Harmonic oscillator and the rigid rotator spectroscopic model, Harmonic oscillator (Hooke's Law), Hermite polynomials, Anharmonic oscillator, Selection rules, Rigid rotator, Rotating diatomic model, Vibrating diatomic molecule, Diatomic vibrating rotator, Vibro-Rotational spectrum for simple molecules, Born-Oppenheimer approximation (BOA), Vibrations of polyatomic molecules, Symmetry of molecules and vibrational spectroscopy, Influence of rotation on polyatomic spectra, Techniques and instrumentation for FT-IR, Analysis of functional groups by IR, 2D-IR.

Raman Spectroscopy
Basic concept of Raman Spectroscopy, Quantum mechanical model of Raman scattering, Rayleigh scattering, Stokes and anti-Stokes scattering, Polarizability of the molecules, Selection rules for rotational Raman spectra of diatomic molecules, Rotational Raman spectra, Vibrational Raman spectra, Raman spectra of polyatomic molecules, FT-Raman, Instrumentation and techniques, Enhanced Raman Spectroscopy (SERS, TERS).

Spin Spectroscopies

Nuclear Magnetic Resonance (NMR)
Nuclei with intrinsic spin Angular momentum, Magnetic moments interaction with magnetic fields, P- NMR, (n+1) rule, First order spectra, Spin-spin coupling, Multiplets in NMR spectroscopy, Spin-Spin Coupling between chemically equivalent, Second order spectra and vibrational method, Nuclear OverHauser Effect, C13-NMR, 2D and Correlated 2D NMR spectroscopy, Chemical Shift Anisotropy (MAS-NMR), Solid state NMR- Si29-NMR, F19NMR etc.

Electron Paramagnetic Resonance (EPR)
A brief review of theory, Analysis of ESR spectra of systems in liquid phase, Radicals containing single set, Multiple sets of protons, Triplet ground states, Transition metal ions, Rare earth ions, Ion in solid state, Double resonance techniques: ENDOR in liquid solution, ENDOR in powers and non-oriented solids.

Mossbauer Spectroscopy
Basic physical concepts, Spectral line shape, Isomer shift, Quadrupole splitting, Magnetic hyperfine interaction, Interpretation of Mossbauer parameters of ^{57}Fe, ^{99}Ru, ^{101}Ru, ^{195}Pt, ^{193}Ir and ^{110}Sn, General applications of Mossbauer like - Solid state reactions, Thermal decomposition, Ligand exchange, Electron transfer, Isomerism, Surface studies and biological applications etc.

Photo Electron Spectroscopy
XPS, AES and UPS: Background to electron beam techniques, XPS and AES processes, UHV conditions, X-Ray Sources, Electron Sources, Ion Sources, Spectral Interpretation, Nomenclature (j-j & L-S coupling), Elemental detection, Electron-excited secondary electron spectrum-AES, XPS-Primary, Secondary Structure, Angular effects, Time dependent spectra, Depth profiling, Data analysis: Curve fitting, Co-ordination number, Surface states, Ultraviolet Photoelectron Spectroscopy (UPS).

Electronic Spectroscopy
Intensity of electronic transitions, Rules governing the transition between two states, Excited electronic states of atoms and molecules, Types of electronic transitions in organic molecules, Potential energy diagrams, Absorption band and Frank-Condon Principle, Emission spectra, Excited state-dipole moment, Photo physical pathways, Internal conversion and Interstate crossing, Emission property, Fluorescence, Phosphorescence, Photoluminescence Spectroscopy, UV-Vis spectra for solids, Band gap determination, Kubelka- Munk theorem.

Reference Books:
1. Organic Spectroscopy. William Kemp. McMillan Publications.
2. Spectrometric Identification of Organic Compounds. Francis X. Webster, Robert M. Silverstein. Wiley Publications.
3. Fundamentals of Molecular Spectroscopy. CN Banwell EB Mccash.
4. Physical Chemistry: A Molecular Approach. Donald A. McQuarrie. John D. Simon.

CYJRF-210: Computational Chemistry (30 Hours / 4 Credits) (01-CHEM04-710-E)

Course Outcomes:
- Calculation of transition state structure and understand reaction mechanism
- Interpretation of IR and UV-Vis spectra of a system
- MD simulation and analysis of simulation results
- Planning theoretical calculation to explain experimental results and predict molecular properties
- Band structure calculations of solids and analyze results

Course Details:

Electronic Structure Theory of Molecules
Introduction, Revision to classical mechanics and quantum mechanics, Optimization techniques, Electronic structure methods: Self Consistent Field Theory, Restricted & unrestricted HF, Semi-empirical methods, Electron correlation methods: Configuration interaction Methods, Multi Configuration Self-Consistent Field, Many body perturbation theory, Couple cluster method, Basis sets, Density functional methods, Wave functional analysis & Molecular properties

Theory of Solids
Geometry of crystal and symmetries in solids, Concept of reciprocal space and its use in solid state research and band structure, Introduction of energy bands in solids & Density of States, Determination of band structure (Kronig-Penny Model- analytical solution), Comparison of band structures (Metal (bcc, fcc, hcp), Insulators and Semi-conductors)

<u>Molecular Dynamics Simulation</u>

Multi-scale material modelling (MMM): Overview, Different length scales and associated timescales relevant to different computational methods, Atomistic modeling of materials: Why computer simulation of a many-body system at finite temperature, Born Oppenheimer (BO) approximation and the origin of different Molecular Dynamics (MD) methods such as B.O. MD, CPMD and classical MD.

Interatomic Potentials : Introduction to interatomic potentials, Expressing many-body potentials into suitable tractable form, Simplification due to homogeneous, isotropic approximation, Characteristics of potential, Obtaining potential function for a particular system, Different forms of Empirical potential functions such as Hard Sphere Potential, Lennard-Jones Potential, Morse Potential etc., Many-body potentials such as Embedded Atom Potential, Glue potential etc.

Molecular Dynamics Simulations: An algorithm, Initialization, Boundary Conditions: Periodic Boundary Condition and Minimum Image Condition, Force Calculation & force subroutine, Integrating the Equations of Motion: Verlet, Velocity-Verlet& Leap Frog Algorithm

Statistical Mechanics and Molecular Dynamics simulation: Multi-dimensional phase-space and time averaging, Ensemble and Ensemble averaging, Ergodicity and the equivalence of time and ensemble averages, Judging Equilibration

Application of Statistical Mechanics to get different average equilibrium properties from the microscopic quantities of the simulation: How to get different equilibrium properties, Temperature and Pressure, Radial Distribution functions and structure factor, Time Correlation function and different dynamical quantities from equilibrium simulations, How to calculate Diffusivity, Thermal conductivity, electrical conductivity, viscosity etc

Reference Books

1. An Introduction to computational chemistry by Frank Jensen (Wiley)
2. Quantum chemistry by I R Levine
3. Solid State Physics by M A Wahab
4. Computer simulation of liquids by Allen & Tildesley
6. Advanced Techniques for Materials Characterization"; Eds. A. K. Tyagi, M. Roy, S. K. Kulshreshta, S. Banerjee; Trans Tech Publications Ltd, Switzerland (2009)
7. Nuclear and Radiochemistry (3rd edition 2013) by G. Friedlander, J. Kennedy, J. M. Miller and J. W. Macias.
8. Ion Beam Analysis: Fundamentals and applications by Michael Nastasi, James W. Mayer, Yongqiang Wang.
9. Physical Principles of Electron Microscopy: An Introduction to TEM, SEM, and AEM, Springer, 1st ed. 2005
10. R. Haynes, Optical Microscopy of Materials, Springer, 1984

CYJRF-211: Radiation and Photochemistry (30 Hours / 4 Credits) (01-CHEM04-711-E)

Course Outcomes:

- Awareness of radiation induced reactions and its applications
- Expertise to analyse and quantify radiation/photochemical induced chemical reactions
- Trained man power for using various radiation and photochemical sources and state-of art experimental facilities
- Hands-on experience and research training during project work
- Knowledge development in the DAE relevant activities and planning for future R&D programs

Course Details:

Radiation Chemistry

Overview of interaction of high-energy radiation with matter (Photoelectric effect, Compton effect, Pair production, Photonuclear reactions, Coherent scattering), Attenuation and absorption coefficients, Electrons, Radiation sources, Spatial and temporal distribution of energy and primary products, G-values, Track entities, Time scales of events in radiation chemistry, Ion-pairs, Ion-molecule reactions.
Radiolysis of water, radical and molecular yields, Material balance, Dosimetry (Fricke), Radiolysis of non-polar solvents, Geminate recombination, Comparative aspects of radiolysis of liquids, Solids and gases.

Detection of primary species and free radicals using pulse radiolysis coupled with optical absorption and conductivity, Evaluation of absolute rate constants, One-electron redox potentials.
Radiation chemistry in polymer development.
Radiation chemistry of biological systems and use of radiation chemistry in development of antioxidants, Radioprotectors and nanoparticles.

Photochemistry
Laws of photochemistry, Electronic transitions, Properties of electronically excited molecules, Franck-Condon principle, Absorption, De-excitation processes - Fluorescence, phosphorescence, Delayed emission, Heavy atom effect, Quantum yields of photo-processes.
Kinetics and mechanism of collisional quenching, Stern-Volmer equation, Rate constants and lifetime of reactive energy states (Processes like electron transfer, Energy transfer, Proton transfer).
Steady-state absorption and fluorescence techniques, Time-resolved absorption and fluorescence techniques like time-correlated single photon counting, nanosecond laser flash photolysis.
Fundamentals of Lasers, Applications of optical probes in biology, Stimuli responsive supra-molecular complexes, Luminescent materials and sensors.

Reference Books:

CYJRF-212: Materials for Cancer Therapeutics and Diagnostics (30 Hours / 4 Credits) (01-CHEM04-712-E)

Course Outcomes:
- Concept behind methodologies adopted for cancer treatment and diagnosis
- Understanding of functioning mechanism of cancer drugs
- Understanding of application of nanoparticles in cancer therapy
- Knowledge about cancer therapeutics to enable to pursue research in cancer therapeutics and diagnostics.

Course Details:

Introduction
Types of cancer, Chemotherapeutic drugs, Limitations in current treatment, Personalized treatment of cancer, Nanodrugs and Nanocarriers - advantages, Challenges and Current status, Advanced nanomaterials for cancer therapy such as Magnetic nanoparticles, Noble metal nanoparticles, Up conversion nanoparticles, Quantum dots, Carbon based nanostructures, Polymeric nanoparticles, Lipid and amphiphile based carriers. General methods of preparation and characterization.

Magnetic Nanoparticles in Cancer Therapy

Magnetic properties of materials, Diamagnetism, Paramagnetism, Ferro and Ferrimagnetism, Hysteresis, Domain and domain walls, Superparamagnetism, Magnetic fluid hyperthermia, MRI contrast agents, Parameters to assess heating efficiency, Specific loss power and intrinsic loss power, Mechanism of heat dissipation, Synthesis and functionalization of MNPs. Structural characterization and coating strategies.

Photodynamic Therapy (PDT) and Radio sensitisation

Photosensitisers and light sources for PDT, Photophysics and photochemistry, Mechanism of PDT mediated cytotoxicity, Cytoprotective mechanism, Anti-vascular effect of PDT, PDT and immune response, Combination therapy. Nanomaterial based radio-sensitization, High Z materials, DNA damage mechanisms. ROS generation through photocatalysis and chemocatalysis, Depletion of intracellular GSH, Improving tumor oxygen level and cell cycle regulation, Combination with Chemotherapy and PDT.

Interfacial Phenomena in Colloidal Drug Delivery

Interfacial forces and energetics, Adhesion and Cohesion, Wetting, Capillarity, Pressure across curved surfaces, Adsorption, Surface active agents, Static and dynamic interfacial tension. Experimental methods, Data analysis, Colloids - Definition, Classification, Properties, Lyophilic and lyophobic colloids. Kinetics of particle formation, Stabilization of colloids, Association colloids, Micelles, Liposomes, Microemulsions and Emulsions, Types and means of detection, Settling and control of emulsion stability, emulsifying agents, Breakdown of droplets, Pickering emulsions, Colloid characterization, Microscopy, Light scattering, SAXS, SANS and Zeta potential, Pharmaceutical applications of colloids.

Rheology of Polymeric Drug Delivery Systems

Introduction, Elastic solids, Newtonian and Non-Newtonian fluids, Empirical equations and models, Rheological measurements, General viscometers and rheometers, Capillary viscometer, Falling ball viscometer, Rotational viscometry and rheometry, Non-Newtonian corrections, Dynamic rheological analysis of Gels, Overlap concentration and Cross-link density estimation. Viscoelastic parameters. Theory of gelation.

Targeted Drug Delivery

Routes of drug delivery, Comparison and transdermal permeability, Factors affecting permeability, Nucleic acid therapeutics, Aptamers, Gene delivery and viral vectors, Synthetic non-viral vectors, Passive targeting, Mononuclear Phagocyte System (MPS) and Enhanced Permeation and Retention (EPR) effect, Active targeting, Prodrugs and receptors, Folic acid directed targeting, Antibodies, Peptides and Other cell surface receptors, Gene directed enzyme prodrug therapy, Membrane transporters. Stimuli sensitive delivery systems.

Basic Pharmacokinetics and Pharmacodynamics

Concentration vs. time profile, Pharmacokinetic models, Rate equations, Multiple dose administration, Statistical moments, Pharmacokinetic parameters derived from statistical moments, Organ specific clearance, Bioavailability and bioequivalence assessment, Peak height concentration, Time of peak concentration and area under the curve, Criteria for bioequivalence.

Cellular & Molecular Biology of Cancer

Introduction of cells, Types of cells, Basic architecture of cells, Transformation of normal cell in to cancer cells (carcinogenesis), Classification and staging of cancer, Hallmarks of cancer, Cellular metabolism and cancer, Genomic instability/mutation and cancer, Tumor suppressor proteins, Cancer metastasis, Caner angiogenesis, Enhanced Permeation Retention (EPR), Mechanisms of cancer cell death, Mechanisms of acquired drug resistance in cancer cells, Cancer cell imaging, Tumor immunology.

Introduction to Cancer Diagnostics
Overview of the current methods, Histopathology, Cancer biomarker detection, Imaging techniques, Research on cancer diagnostics-approach, Cell line studies, Mice model studies, Validation in human subjects, Cancer biomarkers - Types of biomarkers, Clinical test for biomarkers, Novel methods for biomarker detection.

Biosensors and Sensor Materials
Electrochemical sensors: Classification based on bioreceptor, Aamperometry, Voltammetry, Impedance based methods, Sensor characteristics, Surface Plasmon Resonance (SPR) biosensors - SPR principle, biomolecular interaction using SPR, Nanoparticle for LSPR sensing, Surface modification strategies, Diagnostic applications, Sensor materials: Carbon based, Metal nanoparticles, Metal oxides, Organic-inorganic hybrids, Biopolymers, Conducting polymers (CP), CP-conduction mechanism, Doping, Synthesis of CPs, Properties of CPs, Application of CP for diagnostics.

Recent developments in Biosensors
Microfluidic devices, Nanopatterning, Lab-on-chip devices.

Reference Books:
1. Nanostructures for Cancer Therapy Edited by A. Ficai and A. M. Grumezescu. Elsevier (2017)
2. Remington Essentials of Pharmaceutics Edited by Linda A. Felton, Pharmaceutical Press (2012)
3. Colloids In Drug Delivery, Edited by Monzer Fanun, CRC Press, Taylor and Francis Group, LLC (2010)
4. The Biology of Cancer by Robert A. Weinberg, Norton & Co. (2013)
5. Biosensors and Molecular Technologies for Cancer Diagnostics Ed. Keith E. Herold, Avraham Rasooly. CRC Press Taylor and Francis Group, LLC (2012)

MANDATORY

CYJRF-301: Numerical Methods and Computer Programming (30 Hours / 4 Credits) (01-CHEM04-713-E)

Course Outcomes:
- Conceptualizing the basics of mathematical methods and the relevant modeling techniques
- Thorough understanding of FORTRAN and its usage
- Skill enhancement for solving the problems associated with physical and chemical sciences by developing computer algorithms through FORTRAN

Course Details:

Numerical Methods
Approximation and errors in numerical computation, Truncation and rounding errors; Fixed and floating-point arithmetic, Absolute and relative error, Error propagation.
Interpolation and polynomial approximation, Newton forward/backward interpolation, Lagrange's and Newton's divided difference interpolation, Cubic-spline interpolation, Gaussian quadrature.
Differentiation and integration, Differentiating continuous and tabulated functions, Higher order derivatives, Richardson's extrapolation, Integrations using Trapezoidal rule, Simpson's 1/3 rule, Euler-Maclaurin methods, Romberg's integration.
Solution of a system of linear equations, Gauss-Jordan elimination, Matrix inversion, LU decomposition, Gauss-Seidel Iterative method.
Solution of nonlinear systems of equations, Bisection method, Regula-Falsi method, Newton-Raphson method, Muller's method for complex and multiple roots.

Eigenvalues and Eigenvectors, Elementary similarity transformation, Inverse Iteration.
Solution of ordinary differential equation, Initial value problem, Runge-Kutta method, Gear algorithm, Stability analysis, Boundary value problem, Finite difference method.
Partial differential equation, Finite difference approximation, Relaxation methods, Stability analysis.
Modeling of data, Linear regression, Polynomial regression, Least squares, Nonlinear regression and Fourier Approximation Methods, Confidence limits.

II. Basics of Computer Programming

Introduction to computer programming, Computers and evolution of FORTRAN program, Program organization.
Arithmetic statements, Constants and variables, Arithmetic expressions, Computer arithmetic.
Logical variables and expressions, Hierarchy of operations.
Numerical Input/Output, Introduction to formatting, Fields.
Transfer of control, Conditional statements, Logical IF statement; Algorithms.
Implementing loops, Nested Do Loops, Exiting from a DO Loop.
Arrays, DIMENSION statements, Implied Do Loops;
Functions and subprograms, Arithmetic statement functions, Calling subprograms
Miscellaneous features of FORTRAN, Common, equivalence, DATA statements, External.
Design, Documentation, and Coding Style.

CYJRF-302: Chemistry of Nuclear Fuel Cycle (30 Hours / 4 Credits)

(01-CHEM04-714-E)

Course Outcomes:

- Knowledge of processes involved in recovery of nuclear material from ores
- Understanding of fabrication and quality control of nuclear fuel
- Understanding of reprocessing of spent fuel and waste management
- Knowledge in physico-chemical characterization of nuclear fuel, irradiation behaviour
- Understanding the chemistry involved in different stages of nuclear fuel cycle

Course Details:

Chemistry of Fuel Materials

Separation and purification of uranium, thorium and zirconium from their ores, Principles and processes of isotope separation and enrichment of ^{235}U and deuterium, Conversion processes for preparation of UO_2, $(U,Pu)O_2$, $(U,Th)O_2$, and advanced fuel materials like UC, (U,Pu)C, UN (U,Pu)N, metals and alloys.

Nuclear Reactors and Related concepts

Classification of reactors on the basis of neutron energy and reactor components, different reactors types like PHWR, BWR, PWR, AHWR, High Temperature Reactors, Molten salt reactor concept etc., Introduction of fusion reactor concept, Physico-chemical behaviour and properties of oxide, nitride and carbide fuels, Fuel fabrication processes & chemical quality control of fuel materials, Behaviour of nuclear fuels (thermal/fast) during irradiation, Post irradiation studies, fuel clad chemical interaction, Burn-up etc.

Chemistry of Back End of Nuclear Fuel Cycle

Reprocessing of thermal reactor fuel using PUREX process, THOREX process, reprocessing of fast reactor fuel, Classification of waste, Treatment practices of gaseous waste, low and intermediate level liquid waste, Partitioning of actinides from high level liquid waste, separation of valuable isotopes, vitrification, immobilization matrices and transmutation.

CYJRF-303: Research Methodologies (30 Hours / 4 Credits) (01-CHEM04-715-E)

Course Outcomes:

- Demonstrate knowledge of research processes (reading, evaluating, and developing)
- Perform literature reviews using print and online databases
- Identify, explain, compare, and prepare the key elements of a research proposal/report
- Knowledge of writing reports and thesis Idea about following ethical practices in research

Course Details:

Objectives and types of research: Motivation and objectives - Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem - Literature review – Primary and secondary sources - reviews, treatise, monographs-patents - web as a source - searching the web - Critical literature review - Identifying gap areas from literature review - Development of working hypothesis.

Research design and methods - Research design – Basic Principles - Need of research design - Features of good design – Important concepts relating to research design - Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Value of Statistics; Errors and Statistics - Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results - students's t test; F-test; Chi Square test; propagation of errors.

Reporting and thesis writing – Structure and components of scientific reports - Types of report - Technical reports and thesis - Significance - Different steps in the preparation – Layout, structure and Language of typical reports - Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation - Planning - Preparation - Practice - Making presentation - Use of visual aids - Importance of effective communication -Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on 'Experimental data and Literature Survey'.

Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation - Copy right - Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights - Reproduction of published material - Plagiarism - Citation and acknowledgement - Reproducibility and accountability.

7. Vogel's Text Book of Quantitative Inorganic Analysis, ELBS.

NON-SUBJECT ASSIGNMENTS

Mini Project 1 (18 credits) (01-CHEM04-601-PR)

Course Outcomes:

- To evaluate the understanding of subject
- To train the students on hands-on experience on a number of instrumental techniques

Mini Project 2 (18 credits) (01-CHEM04-602-PR)

Course Outcomes:

- Idea about how to do literature survey on a given topic
- Idea about planning and execution of an experiment
- Data analysis
- Writing project report
- Presentation of data and results

BACK TO MAIN

Homi Bhabha National Institute
(A university established under Section 3 of the UGC Act. 1956)
Indira Gandhi Centre for Atomic Research
Kalpakkam – 603 102 Tamil Nadu, India

Ph.D. in Chemical Sciences
Courses under IGCAR
(Program Code: CHEM04)

Homi Bhabha National Institute
(A university established under Section 3 of the UGC Act. 1956)
Indira Gandhi Centre for Atomic Research
Kalpakkam – 603 102 Tamil Nadu, India

Chemical Sciences Courses offered in HBNI & Course coordinators

CH-1 : Mathematics and Computational methods (6 credits)

CH-2 : Chemical Thermodynamics (6 credits)

CH-3 : Electrochemistry and Corrosion Science (4 credits)

CH-4 : Introduction to Materials Science and Engineering (6 credits)

CH-5 : Analytical Chemistry for Nuclear Fuel Cycle (6 credits)

CH-6 : Chemical Instrumentation and Laboratory Techniques (6 credits)

CH-7 : Health Physics and Radiation Sciences (6 credits)

CH-9 : Chemistry of Fuel Cycle-I(6 credits)

CH-10 : Chemistry of Fuel Cycle-II: Actinide chemistry and separation science (6 credits)

CH-11 : Materials for Nuclear Reactors and Fuel Cycle Processing Systems (6 credits)

CH-12 : Nuclear and Radiochemistry (6 credits)

CH13 : Corrosion Science and Engineering (6 credits)

CH-14 Quantum Chemistry & Group Theory (6 credits)

CH-15 : Molecular Spectroscopy (6 credits)

CH-16 : Lasers and Application (6 credits)

CH-17 : Nanomaterials and Advanced Chemical Sensors (6 credits)

CH-RM: Course on Research Methodology (3 credits)

CH-1: Mathematics, computational methods, numerical analysis and computer programming

Course content

1. **Differential Equations & Integral Transforms:** Linear differential equations: Series method of solution; Legendre, Lagurre and Hermite differential equations. Use of ladder operators for solutions to differential equations; applications to quantum chemistry.

Orthogonal Polynomials and Special functions – Dirac Delta function, gamma function, error function. Introduction to Fourier series, Fourier transform and Laplace transform – applications in quantum chemistry and spectroscopic techniques – FT-NMR, FT-IR.

Convolutions of functions, use of Fourier transforms in convolution, Applications in chemistry.

2. **Vectors:** Vector differentiation and integration: Concepts of gradient, divergence and curl and their physical significance. Orthogonal vectors, Gram-Schmidt process – applications in quantum chemistry. Vector fields in space – Gauss and Stokes theorem with applications.

3. **Matrix Algebra:** Elementary operations and elementary matrices. Rotation matrices, Similarity transformations; Applications of numerical techniques in matrix algebra to evaluate eigenvalues and eigenvectors; Diagonalization and inversion of matrices. Applications in chemistry.

4. **Numerical Methods:** Newton-Raphson method for finding roots, differentiation, integrations by quadrature techniques, solutions of differential equations.

Book suggested

1. Advanced Mathematics for Engineers and Scientists, M.R. Spiegel, Schaum's Outline Series(1983).
2. Mathematical Methods for Physics Engineering, K.F. Riley, M.P. Hobson and S.J. Bence, Cambridge University Press (1998).
3. Theory and Problems of Vector Analysis, M.R. Spiegel, Schaum's Outline Series (1981).
4. Computer Oriented Numerical Analysis, V. RajaRaman, Prentice Halls India, 3rd ed. (1999)
5. Mathematical Physics, E. Butkov, Addison-Wesley Publishing Company, California (1968).

CH-2: Chemical Thermodynamics

Course content

1. **Laws of Chemical Thermodynamics:** Thermodynamic laws, thermodynamic properties of the system, criterion for equilibrium, Heat engines, Helmholtz energy, Gibbs energy, Closed system, Maxwell's equations, Gibbs-Helmholtz equation.

2. **Behaviour of Gases:** Gas laws, ideal gas and deviations from ideality, Vander Waal's equation, equation of state, critical phenomena,Thermodynamic treatment of non-ideal gases, gas mixtures.

3. **Solutions:** Raoult's and Henry's laws, activity of a component in solution, Gibbs-Duhem equation, Properties of Raoultian ideal solutions, Colligative properties, Non ideal and regular solutions, Partial and Integral thermodynamic property evaluation, alpha function, Gibbs free energy of formation of regular solutions, Criteria for stability of regular solutions, Miedema's model, associated solution model, sub-regular solutions, Models for ternary systems such as Colinet's model.

4. **Phase Equilibria:** Phase rule, Gibbs Free energy as a function of temperature and pressure, Equilibrium between a vapor and a condensed phase in a single component system, Graphical representation of phase equilibria in a single component system, Gibbs energy and thermodynamic activity, phase diagrams- single component, binary and ternary diagrams, simple calculation of thermodynamic properties from phase diagram, pressure-composition diagrams, CALPHAD and models for optimization of phase diagrams.

5. **Reactions in Gases and Condensed Phases:** Reaction equilibria in homogeneous and heterogeneous media, effect of temperature and pressure on equilibrium constant, Le Chatlier's principle, Reaction equilibria in H2/ H2O, CO/CO2 systems, Ellingham diagrams, Effect of phase transformation, use of different standard states for representing reactions in condensed phases, phase stability diagrams, application of phase diagrams in material systems.

6. **Statistical Thermodynamics:** Entropy and disorder in an atomic scale, concept of microstate, most probable microstate, influence of temperature, Boltzmann equation, partition functions, configurational entropy and thermal entropy.

7. **Experimental Thermodynamics:** Calorimetry - classification of calorimeters, different types of calorimeters, heat capacity measurements, thermochemical calorimetry, estimation of thermodynamic quantities.

Vapor pressure measurements- static methods, transpiration, boiling point method, isopiestic method, Knudsen effusion method , Langmuir evaporation method, role of mass spectrometry for study of vaporization reactions, second and third law methods, Gibbs energy functions from spectroscopy data, measurements at very high temperatures.

Galvanic cell EMF methods for activity measurements, - solid electrolyte and molten salt EMF methods.

Measurement of oxygen and carbon potentials – gas equilibration/ EMF methods

Determination of phase diagrams- spot technique, thermal analysis, enthalpies of transformations, transformation temperature, order of transformation, DTA, TGA, thermal expansion, resistivity- as a function of temperature , thermal diffusivity, measurement of thermal diffusivity and thermal conductivity.

Books Suggested:

1. Physical Chemistry, G W Castellan, Addison Wesley, 1971
2. Introduction to Metallurgical Thermodynamics, David R Gaskell, McGraw Hill, 1973.
3. Physical Chemistry, P W Atkins, 7th Ed, Cambridge University Press, 2004.
4. Principles of Chemical Equilibrium with Applications in Chemistry and Chemical Engineering, K Denbigh, Cambridge University Press, 1981.
5. Chemical and Process Thermodynamics, 2nd Ed, B G Kyle, Prentice Hall, 1992.
6. Thermodynamics, G N Lewis, M Randall, revised by K S Pitzer and L Brewer, McGraw Hill, 1961.
7. Differential Scanning Calorimetry: An Introduction for Practitioners, G W H Hohne, Springer Verlag, 1996.
8. Characterisation of high temperature vapours, Ed by J L Margrave, John Wiley, New York, 1967.
9. Physicochemical Measurements in Metal Research, Ed by R F Bunshah, Wiley Interscience, New York, 1970.

CH-3: Electrochemistry

Course content

1. Electrolytes – Different electrolyte systems (aqueous, ionic melts and solid electrolytes) and their conductivities; Debye-Huckle theory, Techniques for measuring electrical conductivities - DC and AC techniques

2. Electrochemical cells - Electrochemical potentials, Nernst equation and electrochemical series, Molten salt and solid electrolyte based cells

3. Electrode processes and kinetics – Diffusion layers & characteristics of the diffusion layers, over potentials, Butler-Volmer and Tafel equations, polarisable and non-polarisable electrodes, reference electrodes, voltammetric techniques, polarography, Cyclic Voltammetry, rotating electrodes and micro-electrodes, chronpotentiometric and chronoamperometric techniques, elucidation of mechanisms of electrochemical reactions.

4. Applications of electrochemical principles - Electro-analytical techniques and electrochemical sensors; energy conversion and storage systems (fuel cells and batteries); thermochemical data measurements.

Reference Books:

1. "Electrochemical Methods: Fundamentals and Applications**",** AJ Bard & LR Faulkner, Wiley, New York, 1987.
2. "Electrode Dynamics**",** AC Fisher, Oxford University Press, Oxford, 1996.
3. "Electrochemistry", **P**.H. Reiger, Prentice-Hall International, Englewood Cliffs, 1995.
4. "Solid electrolytes and their Applications", (Ed) E.C.Subba Rao, Plenum, New York, 1980.
5. "Electrochemistry", C. M. A. Brett and A. M. O. Brett, Oxford University Press, 1993.
6. "Laboratory Techniques in Electroanalytical Chemistry", 2nd Ed., by P. T. Kissinger and W. R.Heineman, Marcel Dekker, 1996.
7. "Chemical Sensor Technology", Vol.2, (ed) T.Seiyama, Kodansha Ltd., Tokyo, 1989.
8. "Chemical Sensor Technology", Vol.3, (ed) N.Yamazoe, Elsevier, Amsterdam, 1991.
9. "Solid State Gas Sensors", P.T.Mosley and B.C.Toefield, Adam Hilger, Bristol, 1987.
10. "Advances in Electroanalytical Chemistry", Vol.2, A.J.Bard, Macel Dekker, New York, 1967.
11. "Fuel Cell Systems", L.J.M.J.Blowmen and M.N.Mugerwa, Plenum Press, New York, 1993.

CH-4: Introduction to Materials Science & Engineering

Course content

1. **Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.

2. **Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.

3. **Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams & Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley & Sons, N.Y., 2003.

7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

CH-5: Analytical Chemistry for Nuclear Fuel Cycle

Course content

1. **Instrumental Methods – Principles and Applications:**

Spectrochemical Methods: Detectors- Photomultiplier Tube (PMT), Charge Coupled Device (CCD), Charge Injection Device (CID), Spectrometers – Czerny Turner, Echelle, Sample Introduction Devices – Flame, Electrothermal, Laser Ablation, Direct Sample Insertion Devices, Interferences, detection limits, sensitivity, Absorption Spectrometry – Flame Atomic Absorption Spectrometry, (FAAS), Electrothermal Atomic Absorption Spectrometry (ETAAS), Optical Emission Spectrometry (OES) with Inductively Coupled Plasma (ICPOES), Glow Discharge (GDOES), Fluorescence Spectrometry – Laser Induced Fluorescence (LIF), Recent advances – Continuum Source (CS-AAS), Single Atom Detection.
Mass Spectrometry: Mass Analysers – Magnetic, Quadrupole, Time of Flight (TOF), Ion Cyclotron Resonance, Features – Resolution, Dispersion, Abundance, Sensitivity, Detectors – Faraday Cup, Channeltron, Daly, Ion Sources –Thermal Ionisation (TI), Electron Impact, ICP, GD, Laser Ablation (LA-ICP), Secondary Ionisation (SI), Resonance Ionisation (RI), Matrix Assisted Laser Desorption and Ionisation (MALDI), Hyphenated Technique – ICP-MS, HPLC-MS, GC-MS.

Thermal Methods: Thermogravimetric Analysis (TGA), Derivative Thermogravimetric Analysis (DTG), Differential Thermal Analysis (DTA), Differential Scanning Calorimetry (DSC), Evolved Gas Analysis (EGA).

Nuclear Methods: Activation Analysis – Neutron Activation Analysis (NAA), Charged Particle Activation Analysis (CPAA), X-ray fluorescence (XRF) spectrometry, Ion Beam Analysis – Backscattering Spectrometry (BS), Particle Induced γ-ray Emission (PIGE), Nuclear Reaction Analysis (NRA), Elastic Recoil Detection Analysis (ERDA), Particle Induced X-ray Emission (PIXE).

2. **Separation Techniques – Principles and Applications:**

Solvent Extraction Technique: Conventional, Liquid Membranes – Bulk, Supported and Emulsified, Solid Phase Extraction (SPE).

Ion Exchange: Conventional and Membranes.

Chromatography: Gas chromatography (GC), High Performance Liquid Chromatography (HPLC), Ion chromatography (IC).

3. **Statistical Methods in Chemical Analysis:** Methods of sampling and associated errors, Classification of errors, Propagation of errors, treatment of errors, Normal distribution, Tests of Significance and Confidence Limits. Method of Least squares – linear and non-linear, weighted least squares formalism, constrained least squares fitting

4. **Laboratory Experiments (any 5):**

Determination of trace impurities in high purity materials by AAS.

Application of Electroanalytical Methods to trace analysis

TGA and DTA study of inorganic compounds

Neutron Activation Analysis of trace constituents in a complex matrix

Analysis of an alloy sample by EDXRF

Anion analysis by ion selective electrode.

Chromatographic separation and measurement of the components in a mixture

Isotopic Analysis by Mass Spectrometry

Books suggested:

1. Fundamentals of Analytical Chemistry, D.A. Skoog, D. M. West, F. J. Holler, S.R. Crouch, 8th Edition, Thomson (2004).
2. Principles of Instrumental Analysis, D.A. Skoog, F. J. Holler, T. A. Niemann, 5th Edition, Saunders College Publishing (1998).
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).
4. Statistics for Analytical Chemistry, J. C. Miller and J. N. Miller, 2nd Edition, Wiley (1998).

CH-6: Chemical Instrumentation and Laboratory Techniques

Course content

1. **Passive Circuit Elements and Configurations:** Circuit behaviour of resistors,inductors and capacitors; the potential divider and the wheatstone Bridge (resistive and capacitive), R-L-C-circuits as filters and resonance circuits.

2. **Electronic Devices and Their Role in Power Conversion and Amplification:** The junction diode, SCR, triacs and their role in rectification and AC power control; bipolar transistor and IGBT and their role in linear/switched mode power supplies and in amplification of signals; constant current power supplies Inverter circuits; issues in measurement of signals - Concept of input impedence and the role of J-FETs and MOSFETs.

3. **Operational Amplifiers and their Various Functionalities:** The basic OP-AMP and its desired characteristics; the inverting amplifier, the non-inverting amplifier, summing configuration;

The differentiator and integrator circuits; comparator; precision rectifier; waveform generation.

4. **Fundamental Issues Related to Chemical Instrumentation:** Role of chemical instrumentation in the nuclear fuel cycle, with relation to selectivity, sensitivity and automation amenability.

The basic anatomy of excitation with energy source-interaction with analyte-detection of the effect produced; issues related to selectivity; sensitivity and detection limits; sources of noise and measures to minimize the effect; boxcar integrator, lock-in-amplifier.

5. **UV-VIS-IR Instruments:** Phenomenon of resonant absorption and Beer's law of photometry; implementation of Beer's law in a spectrophotometer; compensation for spectral response of the detector; slit servo mechanism for compensation of optical emission.

Atomic absorption spectrophotometer-flame ionization, compensation for molecular absorption, hollow cathode lamp excitation for high specificity.

Atomic emission spectrometry-principles, instrumentation and data interpretation

Laser fluorescence spectrometry-laser basics, three stage power supply for flash lamp excitation.

Non dispersive spectrometer- FTIR - principle, data collection scheme.

6. **X-Ray Spectrometry:** Generation of X-Rays, The X-Ray tube, setting the energy and intensity; Bragg's law; X-Ray fluorescence, X-Ray diffraction, ESCA for surface analysis.

7. **Mass Spectrometry:** Ion sources-thermal ionization, Knudsen effusion and electron impact ionization, inductively coupled plasma source, Laser induced vapourisation, spark source.

Magnetic analysers, quadrupole analysers, time-of-flight analysers.

Detectors-faraday, SEM, Channeltron.

Mass scanning, peak centering, signal handling and digitization and counting.

8. **Thermal Analysis:** Thermal excitation - furnaces, temperature profiling and furnace power control.

Thermal effects - TGA, DTA, DSC, dilatometry.

Thermal measurements - thermocouples, RTDs, signal conditioning and handling.

9. **Additional Methods of Analysis:** Gas chromatography - mobile and stationary phases; separation on the basis of retention time; TCD and FID detectors.

Instrumentation for pH meters and conductivity meters; automated titro-processors and applications of coulometry.

Radioactive assay based on multi-channel gamma ray spectrometry.

10. **Digital Electronics:** Logic gates; flipflops, counters, astable and monostable multivibrators; decoders; logic families; data conversion-various types of ADCs and DACs.

Microprocessor systems-processor architecture, memory circuits, I/O subsystems; interfacing techniques; assembly language programming.

11. **Laboratory Techniques:** Machine Drawings Projections: orthographic – 1st & 3rd Angles
pictorial; Oblique: Perspective. Conventional representation of common features and sections;
Dimensioning and tolerancing; Scales, lines and lettering; Threads; Fastenings. Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Vacuum systems - equipment for vacuum generation - rotary pumps, diffusion pumps, ion pumps, turbo molecular pumps; Generation of high temperatures, measurement of vacuum and temperatures, centrifuges, chemicals and laboratory safety.

12. **Vacuum Generation and measurements:** Kinetic theory of gases – Velocity distribution – Mean free path – Monolayer formation – vacuum units – Viscous and molecular Flow regimes – Reynold's and Knudsen Numbers viscosity and thermal conductivity of gases – Gas release from solids – vaporization – out gassing – diffusion – permeation – Vacuum pumps – Titanium Sublimation pumps – Ion pumps – Cryogenic pumps and maters for construction of Vacuum chamber.

Gauges: Thermal conductivity, cold cathode, hot cathode ionization gauges and their Principle of operation.

Books suggested:

1. Principles of Instrumental Analysis, D. A. Skoog and J. Leary, McMillan Publishers,
2. Instrumental Methods of Analysis, H. H. Willard, L. L. Merritt, Jr., J. A. Dean, F. A. Settle, Jr. CBS Publishers and Distributors, New Delhi 1986.
3. A text book of Quantitative Analysis, A.I. Vogel, 5th Edition Revised by G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denney, ELBS (1989).

CH-7: Health Physics and Radiation Sciences

Course content

1. **Interaction of Radiation With Matter:** Ionization in gaseous medium, Bragg's curve, stopping power, Bethe equation, range of particles and straggling, LET, attenuation and absorption of beta particles, backscattering, photoelectric, compton and pair production processes for gamma radiation, variation with gamma energy and Z of medium, attenuation and absorption of gamma rays, elastic and inelastic scattering of neutrons.

2. **Radiation Detection and Measurement:** Principles of radiation detectors, counting characteristics, detection efficiency and energy resolution, dead time and counting statistics, Gas filled detectors, scintillation processes and detectors, organic and inorganic scintillators, NaI(Tl), LaBr3, semiconductor detectors, p-n junctions, germanium and silicon detectors, room temperature semiconductors, neutron detectors including bubble detectors, solid state nuclear track detectors, nuclear probes - positron annihilation, perturbed angular correlation, mossbauer effect.

3. **Shielding and Dose Calculations:** Shielding (beta, gamma and neutron sources).

Shielding from mixed sources; calculation of dose for point, line and volume sources.

4. **Dosimetry:** Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effective dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective half-life and their relation and the concept of the same and their importance. Concept of ALI and DAC.

5. **Radiation Protection Principles:** Radiation protection philosophy, objectives and principles of radiation protection, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types of exposure (natural, occupational, medical and public).

External and internal exposures; routes of intake of radioactive material. Use of personal dosimeters (Film badge, TLDs, pocket dosimeters). Calculation of internal dose, Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Bragg-Gray principle.

Fundamentals of ICRP respiratory model, entry through ingestion, GI track model, wholebody counting and bioassay techniques.

6. **Radiation Protection Procedures:** Procedures followed in radiation work places, supervised and controlled areas, work permits, contamination control methods (air-borne, surface and personnel), swipe samples, and rubber areas, spill pack (gloves + absorbing paper), decontamination and de-corporation techniques; bore wells and inspection chambers; precautions during radioactive source storage and handling.

Types of radiation monitors / radioactivity measurement methods adopted for radiation protection. Personnel monitoring, area monitoring and stack monitoring.

7. **Waste Management:** Radioactive waste classification and management – An overview.

8. **Emergency Preparedness:** Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, counter measures.

9. **Nuclear Fuel Cycle Applications:** Radiological aspects and environmental impact of FBRs. Criticality safety and Radiological aspects in nuclear cycle facilities.

10. **Regulatory Details:** Atomic Energy Act, National and International regulatory bodies, their role and responsibilities, Radiation Protection Rules, Nature of duties and responsibilities of Radiation Safety Officer / Health Physicist, radio toxicity and classification of laboratories, design of lab for radioactive work, Safe handling of radioisotopes, Transport of radioactive materials.

11. **Basic Radiobiology:** Interaction of ionizing radiation with living cells, Ionizing radiations, excitation and ionization process, basic structure and components of cell, chemical and biological consequences of radiation action, radicals and reactions in cell killing, direct and indirect effect and relevant biological damage.

12. **Molecular and Cellular Effects of Radiation:** Radiation action and organizational level in cell, Damage to DNA, single and double structural breaks in units membrane dose and survival curve, cellular radioactivity, radiobiological effectiveness and linear energy transfer Dzz dose, rate effect, dose fractionation, Mitotic delay, chromosome aberration and mutations by radiation action on cells.

13. **Modification of Biological Effects of Radiation:** Oxygen effect, OER, Chemical radio sensitizers, Chemical radio protectors, Mechanisms of action and importance in nuclear research programme.

14. **Radiobiology and Radiotherapy:** Radiation and cancer, cell cycle and radiosensitivity, rationale of using radiation for tumor cell kill, problems.

15. **Basics of Radiation Chemistry:** Interaction of high energy radiation with matter, G-values, radiation induced reactions in solids, liquids and gases.

Laboratory Experiments:

1. Plancheting, alpha counting and spectroscopy
2. Counting characteristics of gas detectors
3. Half life determination and attenuation coefficient determination
4. High resolution gamma spectrometry
5. Dose Measurements: Whole Body Counting laboratory, Bio-dosimetry laboratory, TLD personnel monitoring services laboratory.

Demonstrations:

1. **Use of Personnel Protective Equipment (PPE):** Proper checking and wearing of gloves, and other plant dresses (shoe covers, boiler suits, overcoats etc).

Respirators (dust, gas mask, self contained breathing apparatus, and fresh air-line) TLD, Film badge, neutron film, criticality badge and bubble detector

2. **Use of Radiation Monitoring Equipment: Installed and Portable Radiation Monitors:** AGM (audio and visual alarm, setting up of alarm limits); staplex air sampler (estimation of air-borne activity-both alpha and beta-gamma), different types of survey meters (low to high range), ALSCIN and GM based contamination monitors (side window and end window, hand and foot monitor, cloth monitor), continuous air monitor, criticality alarm system.

Books suggested:

1. Introduction to Health Physics by Herman Camber
2. Biological Effects of Radiation by J. E. Coggle
3. Radiobiology for Radiologist by Eris J. Hall
4. Detection and Measurement of Radiation - Glenn T Knoll.

CH-9: Chemistry of Fuel Cycle-I

Course content

1. Recovery of the starting compounds bearing U, Pu or Th from their primary and secondary sources. Mining, beneficiation, pre-concentration, purification and recovery.

2. **Oxide Fuels:** Preparation of UO2, PuO2, MOX and ThO2. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

3. **Advanced Ceramic Fuels:** Carbides U-C, Pu-C, U-Pu-C, U-Pu-C-O and U-Pu-C-O-N, Nitrides U-N, Pu-N, U-Pu-N. Physical and chemical properties, phase diagrams of relevance, control of phase composition and stoichiometry, fuel fabrication flow sheet and quality control.

4. **Advanced Fuel Fabrication Techniques:** Oxides, Methods based on sol-gel and novel techniques. Carbides; sol-gel method, direct pressing and arc casting.

5. Preparation of U, Pu and Th.

6. **Alloy Fuels:** Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-RM, U-Pu- MA), dispersions and composites – Salient physical and chemical properties, relevant phase diagrams, fabrication and quality control.

7. **Inert Matrix Fuels for Partitioning and Transmutation:** A brief account on the current developments.

8. **Fuel – Clad Interaction:** Significance of FCCI and FCMI. Specifics pertaining to oxide, carbide and metallic fuels. Role of chemical thermodynamics in the prediction and understanding of Fuel clad chemical compatibility.

9. **In Pile Behaviour of Fuels:** Chemistry and redistribution of fission products, role of chemical potentials of the constituents in the breach of clad in oxide, carbide and alloy fuel pins and detection mechanisms.

Books suggested:

1. Donald R. Olander, Fundamental aspects of nuclear reactor foel elements fundamental aspects of nuclear reactor foel elements, Springfield, BTIS, 1985.
2. H. J. Matzke, Science of Advanced LMFBR fuels, North Holland, Amsterdam, 1986.
3. M. Benedict and T.H. Pigford, Nuclear Chemical Engineering, Mc Graw Hill, New York, 1957. (Specific journal articles and other references will be cited during the lectures)

CH-10: Chemistry of Fuel Cycle–II

Course content

1. **Actinide Chemistry:** Discovery of actinide elements, electronic structure, oxidation states, inter-conversion of oxidation states, complexes of actinide ions, actinide contraction, comparison of actinides with lanthanides. Actinides in environment.

Purification of actinides using techniques such as ion-exchange, Solvent Extraction, Liquid membranes and Chromatographic Methods.

Hydrolysis, colour, spectroscopy and magnetic properties of actinides, nuclear properties of actinides, decay modes.

Thorium: isotopes, occurrence and production; Uranium: isotopes, occurrence, resour0ces and production.

Transuranium Elements: production of transuranic elements, Neptunium, Plutonium, Americium and Curium; Actinide synthesis by heavy ion reactions.

Fission Product Chemistry.

2. **Aqueous Reprocessing:** Introduction to nuclear fuel reprocessing; Need for reprocessing; PUREX, TRUEX, THOREX.

Latest developments. Solvent extraction for actinide purification; basic principles, introduction to extractants, classification of extractants.

Purification of uranium, plutonium; lanthanide actinide separations.

3. **Pyrochemical Reprocessing:** Introduction to non aqueous reprocessing: Objectives and advantages of non aqueous reprocessing in fast reactor fuel cycle, Advanced fuel cycle flowsheets involving non aqueous reprocessing, Recent trends in pyrochemical reprocessing of oxide and metallic fuels.

Oxide electrowinning flowsheet, Pyrochemical reprocessing of metallic fuels (IFR process) - Integral Fast Reactor Concept, Differences in electrorefining and electrowinning.

4. **NUMAC:** Importance of Nuclear Material Accounting; techniques used for analysis of nuclear materials.

NUMAC with techniques such as Potentiometry, Coulometry, Amperometry.

Mass Spectrometry, Calorimetry, Gamma counting, neutron counting etc. Advantages and drawbacks of individual methods.

5. **Post Irradiation Techniques:** Introduction to post-irradiation examination methods of nuclear reactor fuels; importance of PIE methods, burn-up measurements; NDE testing of fresh fuel pins.

Non-destructive evaluation of irradiated fuels (X-ray and neutron radiographic examination of fuel pins, Fission gas analysis, Metallographic examinations).

6. **Nuclear Waste Management:** Introduction - industrial waste, nuclear waste & its speciality, generation of radioactive wastes, radioactivity in the environment, Solid, liquid & gaseous wastes, international classification. Basic philosophy & methods of radioactive waste management, environmental monitoring. HLW & spent fuel waste. Radioactive waste immobilization matrices & their ultimate disposal.

Reference Books

1. “**Handbook of Physics and Chemistry of Rare Earths: Lanthanides Actinides**” G.T. Seaborg, Vol.18,(Eds., K.A. Schneider, Jr., L. Eyring, G.R. Choppin and G.H. Lander), Elsevier Science, Amsterdam (1994).

CH-11: Materials for Nuclear Reactors and Fuel Cycle Processing Systems

1. Fundamentals of reactor physics and different reactor systems

a) Fission reactors: Thermal reactor, fast reactor, advanced reactor, b) Fusion reactors: Thermonuclear reactor

2. Health Physics and Radiation Sciences

Interaction of radiation with matter, Radiation detection and measurement – use of gas filled detectors, scintillators, semi-conductor detectors, neutron detectors, Radiation Units and Limits.

Hazards Control and Evaluation, Biological effects of radiation, Dose and dose limits for occupational workers and members of public, Radiation Protection Procedures, Dosimeters.

Transport and release, Classification of nuclear waste and their management –Emergency Preparedness, Radiation Chemistry, G-values, radiation induced reactions in solids, liquids and solids.

3. Introduction to Reactor Materials

Moderators (Requirements, properties of D_2O and graphite), C**ontrol rod materials (**Requirements, properties), **Coolants** (Requirements, properties and handling - water, liquid sodium, lead-bismuth alloys, helium, CO_2), **Cover gas (**Cover gas purification, monitoring for hydrogen, fission gases)

4. Introduction to Coolant chemistry:

Na, Pb-Bi and Pb-Li chemistry: Monitoring and maintaining purity of coolants, on-line monitoring using EC monitors, sampling and analysis.

Water chemistry (Introduction to fast reactor water chemistry, condenser cooling and process water chemistry, de-mineralising plant and condensate polishing unit chemistry, on-line monitoring, biological shield cooling water chemistry, related analytical techniques, Chemical aspects of corrosion in liquid metal coolant systems

5. Fuel reprocessing: Chemistry of Actinides with respect to reprocessing, Aqueous methods - Purex, Thorex, use of novel extractants, Non-aqueous methods - pyrochemical processes.

Books Suggested:

1. S. Glasstone, Source Book on Atomic Energy, Allied East-West Press Pvt. Ltd., NewDelhi.
2. S. Glasstone and Sesonske, Nuclear Reactor Engineering, Chapman Hall, London, 1994.
3. H.U. Borgstedt and C.K. Mathews, Applied Chemistry of the Alkali Metals, Plenum Press, 1987.
4. C.C. Addison, The Chemistry of the Liquid Alkali Metals, John Wiley and Sons, 1984.
5. Power Plant Chemistry: A practical guide, Buecher Braid, Penwell, Oklahoma, 1997.
6. Modern Power Station Practice, III Edition, Pergamon, NY, 1992.

CH-12: Nuclear and Radiochemistry (CH12)

Course content

1. **Nuclear Properties:** Concept of nucleus, nuclear spin, parity, electric and magnetic moments, isomerism, nuclear mass and binding energy, elemental abundance, radioactive decay laws, radioactive equilibria, Bateman's equation, liquid drop and shell models.
2. **Nuclear Structure and Decay Modes:** Nuclear force, structure of complex nuclei, liquid drop, shell and collective models, nucleon emission, beta decay, gamma de-excitation and internal conversion, selection rules.
3. **Nuclear Reactions and Accelerators:** Basic principles and energetics, cross sections, nuclear fission, charge and mass distribution in fission, compound nucleus reactions, direct reactions, types and details of accelerators.
4. **Radiochemical Separations:** Concepts of traces, chemical yields, radiochemical purity, applications.
5. **Nuclear Techniques:** Nuclear probes, PAC, NDA and on-line monitoring.
6. **Radio-isotope Production:** Basic principles of isotope production in both reactors and accelerators, Szilard - Chalmers effect and its utility, concept of generators, Moly generators.
7. **Applications of Radioisotopes:** Concepts of nuclear medicine and radio-pharmaceuticals, SPECT, PET, brachytherapy and and teletherapy Radio-immuno assay, industrial, agricultural and biological applications.

Laboratory Experiments:

1. Fission product separation and transient equilibrium.
2. Separation of actinides using ion-exchange or solvent extraction
3. Neutron activation analysis.

Books Suggested:

1. Nuclear and Radiochemistry (1981) - G. Friedlander, J. Kennedy, J.M. Miller and J.W. Macias
2. Atomic Nuclear (1955) - R.D. Evans
3. Source book of atomic energy (1969) - S. Glasstone
4. Essentials of Nuclear Chemistry (1982) - H.J. Arnikar
5. The chemistry of Transuranium Elements (1971) - J. Keller
6. G.R. Chopin and Rydberg: Nuclear Chemistry, Theory and Applications, Pergamon Press, Great Transuranium elements and transactinides.
7. Manual for reactor produced isotopes, IAEA-TECDOC-1340 (1999)
8. Radionuclides in therapy - R.P. Spencer, R.H. Sievers, A.M. Friedman. CRC Press (1987
9. Radioimmunoassay: Principles and Practice, M.R.A. Pillai and S.D. Bhandarkar, 2nd Edition, BARC, 1998
10. Industrial applications of radioisotopes - G. Foldiak

CH-13: Corrosion Science and Engineering (CH13)

Course content

1. **Thermodynamics of Aqueous Corrosion:** Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.

2. **Kinetics of Aqueous Corrosion:** Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.

3. **Forms of Corrosion:** General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion.

Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.

4. **Corrosion in Reactor and Reprocessing Plants:** Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.

5. **Prevention and Control of Corrosion:** Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.

6. **Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.

7. **Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.
4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, “Corrosion and corrosion protection handbook”, USA, 1983.

CH-14: Quantum Chemistry and Group Theory

1. Fundamental principles

Brief review of the fundamentals of quantum mechanics – postulates, measurements, operators, de Broglie equation, Heisenberg principle, Schrodinger Equation.

2. Exactly solvable problems

Particle in a box with walls at infitine and finite potential; Double box potential, tunneling, effect of barrier height on splitting of degenerate energy levels and its application in understanding double well potential. Particle in a ring. Simple harmonic oscillator, rigid rotor, hydrogen atom problem solution using both the power series method and ladder operators.

3. Approximation methods

Variation method, perturbation theory for time-independent and time dependent systems; Many-electron systems: Hartree-Fock theory and beyond; Chemical binding in simple molecular systems: Valence bond and molecular orbital theories; Concept of LCAO and introduction to ab-initio and semi-empirical molecular orbital calculations of molecules.

4. Group Theory

Symmetry elements and operations, point groups, matrix representation, reducible and irreducible representations, the Great Orthogonality theorem, direct product representation, projection operators.

5. Applications of Group Theory in Chemistry

Vibrational problem, hybridization, SALC, ligand field theory.

Reference Books

1. **"**Quantum Chemistry", I. N. Levine, Allyn & Bacon, Inc. (Boston) 5ed. (2000).
2. "Introduction to Quantum Chemistry", F. S. Levine, Cambridge Univ. Press (2002).
3. "Quantum Chemistry", W. Kauzmann, Academic Press (1957).
4. "Chemical Applications of Group Theory", F. A. Cotton, Wiley Eastern Limited, (1989).
5. "Group Theoretical Techniques in Quantum Chemistry", C. D. H. Chisholm, Academic Press (1976).

CH-15: Molecular Spectroscopy

1. Vibrations and rotations of diatomic molecules, selection rules, nuclear spin statistics.

2. Electronic spectroscopy of diatomic molecules, coupling of angular momentum, Hunds coupling cases, term states of molecules, potential energy functions – analytical and numerical (e.g. RKR), Dissociation energy, Franck Condon principle, numerical methods to evaluate Franck Condon factors.

3. Vibrations of polyatomic molecules – classical mechanics of vibrations, symmetry and normal vibrations – applications of group theory.

4. Experimental techniques in spectroscopy: Fourier transform spectroscopy (FTIR, FT-RAMAN), time resolved FTIR and its applications in absorption and emission studies. Laser based experimental methods, Introduction and application of Terahertz spectroscopy.

5. Studies on ultrafast processes: Nanosecond and picosecond laser flash photolysis, fluorescence time domain spectroscopy with special emphasis on energy transfer and electron transfer reactions and studies on excited state properties**.**

6. NMR & ESR: Basics of NMR and ESR, Multipulse techniques in NMR, FTNMR, 2D-NMR. Time domain ESR, Electron Nuclear Double Resonance (ENDOR)-principle and applications.

Reference Books:

1. “Introduction to Lasers Physics”, K. Shimoda, Springer Verlag, 1984 Berlin
2. “Laser Spectroscopy basic concepts and Instrumentation”, W. Demtroder, Springer 2003, Berlin.
3. “Molecular Spectroscopy”, C. N. Banwell, 4 Edn, Tata McGraw Hill, Delhi.
4. “Infra red spectra of Inorganic and coordination compounds”, K. Nakamoto, 5 Ed, John Wiley 1978, NewYork.

CH-16: Lasers and Their Applications

Introduction to Lasers

1. Rate equation for absorption, induced and spontaneous emission, Einstein's A and B coefficients – Concepts of laser action and population inversion – rate equations for two, three and four level systems.

2. Laser and its sub-systems – Optical amplifier – optical resonator – excited state pump – Properties of laser beams – Spatial and temporal coherence.

3. Different types of passive resonators, modes of a passive resonator – Active resonators – Gain & Threshold condition for lasing actions – laser modes – Gain saturation and mode competition – spatial and velocity hole burning.

4. Wavelength and Intensity stabilization of lasers – turning of wavelength of lasers – prisms, grating and elations – controlled wavelength turning – Selection of axial modes, Experimental realization of single mode.

5. Generation of short pulses – Q-switching and mode locking – active and passive methods

6. Principles of various types of lasers – UV, vis & IR lasers, metal vapour lasers, solid state lasers, Gas lasers, Dye lasers, Semiconductor-diode laser and free electron laser

Laser Spectroscopic Techniques:

Important features of lasers useful for spectroscopy – monochromaticity, directionality, high intensity, tunability, short pulses etc. Advantages of lasers for spectroscopy – high sensitivity and selectivity. Short review of spectral line broadening mechanisms.

Doppler-limited spectroscopy
a) High sensitivity methods of Absorption – frequency modulation, intracavity absorption.
b) Photoacoustic spectroscopy; c) Resonance ionization spectroscopy combined with mass spectrometry – multiphoton processes; d) Optogalvanic spectroscopy

Laser Induced Fluorescence: a) Molecular Spectroscopy by LIF; b) Experimental aspects and advantages of LIF (c) LIF in supersonic molecular beams

Laser Raman Spectroscopy: (a) Linear Raman Spectroscopy; (b) Non-linear Raman Spectroscopy – Stimulated Raman scattering (c) Coherent Anti-Stokes Raman Spectroscopy (CARS)

Analytical applications of lasers: a)Laser induced break down spectroscopy, cavity ring down spectroscopy; (b) Atmospheric measurements with LIDAR

Laser material interactions: a) Vaporization, desorption and ablation. b) Surface modification; c) Laser cooling (d) Laser Induced Chemical Reactions/ Laser Isotope Separation

Reference Books:

1. “Introduction to Lasers Physics”, K. Shimoda, Springer Verlag, 1984 Berlin
2. “Laser Spectroscopy basic concepts and Instrumentation”, W. Demtroder, Springer 2003, Berlin.
3. “Principles of lasers”, O. Svelto and D. C. Hanna, Plenum, 1989, New York
4. “Chemical and biochemical applications of lasers-vol I & III”, C.B. Moore, (Ed) Academic Press, New York (1974)
5. “Lasers”, P.W. Milonni and J.H. Eberly, World Scientific, Singapore (1981)

CH 17 - Nano materials and advanced chemical sensors

Introduction

Nanoscale– its importance, definitions, nanomaterial science- One dimension, Two dimensions (carbon nanotubes, inorganic nanotubes, nanowires, biopolymers), Threee dimensions (nanoparticles, fullerenes C-60, dendrimers, quantum dots) properties (electrical, optical, mechanical & chemical)

Synthesis and characterization

Synthesis -Chemical methods (precipitation, sol-gel, CVD, ion-exchange, dispersion), Physical methods (milling, PVD, pyrolysis, ion-implantation). Consolidation of nanopowders – sintering introduction, theories of sintering, sintering of nanomaterials, novel methods for consolidation of nanopowders. Characterization – X-ray techniques, spectroscopic techniques, electron beam techniques, optical methods

Applications

Structural and functional ceramics, coatings, sensors, power sources, additives and catalysts, composites, lubricants, magnetic materials, medical implants & nuclear ceramics. Sintering – introduction, theories, methods for consolidation and sintering of nanostructured materials

Introduction to chemical sensors

Fundamental definitions and principles; rationale of sensor design and operation; basic theoretical considerations

Electrochemical Sensors

(Potentiometric sensors, Voltammetric and Amperometric sensors)
Ion selective electrodes(ISEs) – principles, solid (glass and fast ion conductor based) and liquid membrane based electrodes, Electrochemical gas sensors, Semiconductor devices (ISFETs, MOSFETs), Conductance gas and vapour sensors based on metal oxides, semiconductors and conducting polymers. Biosensors- oxygen and glucose biosensors; mediated enzyme electrodes and enzyme field effect transistors (ENFETs).

Piezoelectric Sensors

Piezoelectricity and mechanical resonance: stress, strain and polarization; constitutive relationships; equations of wave motion and wave representation.

The transverse-shear mode sensor, or quartz crystal microbalance: application to gas- and liquid-phase sensing; applications to VOC sensing, immunosensing and biosensors.

Optical Sensors

IR and UV sensors - semiconductors - optical irradiation – recombination - Quantum efficiency - p-n junctions - IV characteristics - forward bias and reverse bias - applications.

Micro Electro Mechanical System (MEMS) based sensors and electronic noses

Cantilever based sensors – Sensing Principles, types of cantilevers, use of different detection techniques, examples and applications

Chemometrics as applied to chemical detection and identification; Olfaction and electronic noses; Salient features

Sensor fabrication methods

Sensor configurations and geometries, Use of nano-materials in sensors

Thin/thick film formation techniques (physical, chemical and LB film formation techniques), MEMs based sensor fabrication

Surface analysis and characterization

Practicals

Testing of a solid electrolyte based potentiometric oxygen sensor
Testing of an amperometric sensor for oxygen
Fabrication and testing of a thick-film hydrogen sensor

CH-RM: Course on Research Methodology

Unit-I - Objectives and types of research: Motivation and objectives – Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Unit-II - Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem – Literature review – Primary and secondary sources – reviews, treatise, monographs-patents – web as a source – searching the web - Critical literature review – Identifying gap areas from literature review - Development of working hypothesis.

Unit-III - Research design and methods – Research design – Basic Principles- Need of research design — Features of good design – Important concepts relating to research design – Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Unit-IV – Value of Statistics; Errors and Statistics – Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results – students's t test; F-test; Chi Square test; propagation of errors.

Unit-V - Reporting and thesis writing – Structure and components of scientific reports - Types of report – Technical reports and thesis – Significance – Different steps in the preparation – Layout, structure and Language of typical reports – Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation – Planning – Preparation – Practice – Making presentation – Use of visual aids - Importance of effective communication –.Computers in Chemistry, Usage of packages such as, Excel, AIM2000, ChemCraft, etc. Manuscript drafting based on "Experimental data and Literature Survey". **Unit-VI** - Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialisation – Copy right – Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights – Reproduction of published material – Plagiarism - Citation and acknowledgement - Reproducibility and accountability. Courses of Study

For PhD Program

SCHOOL OF CHEMICAL SCIENCES

SYLLABUS FOR

Ph.D. in Chemical Sciences

(Program Code: CHEM04)

National Institute of Science Education and Research Bhubaneswar

(An Off-Campus Center of Homi Bhabha National Institute – a deemed to be University, Anushkati Nagar, Mumbai)

With effect from the Academic Year 2018

Detailed course PhD program

Number of compulsory courses – Theory (Credit assigned)	Number of elective courses (Credits assigned)	Total credit/semester (Credits assigned)
03	03	36
12 (Research Project)	12 (Research Project)	24

List of Compulsory Courses

Course No	Credits	Course Name
C606	06	Physical Methods in Chemistry I
C601	06	Physical Methods in Chemistry II
C604	06	Coordination Chemistry
C605	06	Chemical Binding
C665	06	Advanced Organic Chemistry

List of Elective Courses

Course No	Credits	Course Name
C602	06	Chemical Rate Processes
C603	06	Chemistry of Heterocycles and Natural Products
C651	06	Molecular Modeling
C653	06	Classics in Molecules
C652	06	Solid State Chemistry
C654	06	Crystallography
C655	06	Principles of Drug action
C656	06	Advanced Bio-inorganic Chemistry
C657	06	Nuclear Magnetic Resonance
C658	06	Advanced Functional Materials
C659	06	Supramolecular Chemistry
C660	06	Chemistry of Nanomaterials
C662	06	Polymer Chemistry
C663	06	Molecular Reaction Dynamics
C664	06	Theory of Molecular Spectroscopy
C666	06	Catalysis: Reaction Mechanisms and Applications
C667	06	Advanced Main group Chemistry
C668	06	Advanced Fluorescence Spectroscopy
C669	06	Biomacromolecules
C670	06	Advanced Heterocyclic Chemistry
C671	06	Statistical Mechanics
C751	06	Photochemistry
C752	06	Pharmaceutical Chemistry
C753	06	Group Theory and Molecular Spectroscopy

List of Research Projects Courses

Course No	Credits	Course Name
C754	12	Organic Chemistry Project-1
C755	12	Organic Chemistry Project-2
C756	12	Inorganic Chemistry Project-1
C757	12	Inorganic Chemistry Project-2
C758	12	Physical Chemistry Project-1
C759	12	Physical Chemistry Project-2

Lab Course (Research Project) code: Course name), Credits
Organic Chemistry Project-1 (C754), Credit 12, (12h/week)
Organic Chemistry Project-II (C755), Credit 12, (12h/week)
Inorganic Chemistry Project-I (C756), Credit 12, (12h/week)
Inorganic Chemistry Project-II (C757), Credit 12, (12h/week)
Physical Chemistry Project-I (C758), Credit 12, (12h/week)
Physical Chemistry Project-I (C759), Credit 12, (12h/week)

DETAILED SYLLABUS

Compulsory Courses

C606: Physical methods in Chemistry I

General introduction to spectroscopy: Electromagnetic radiation and its interaction with atoms and molecules. Holistic view of spectroscopy. [2]

Ultraviolet Spectroscopy: Electronic Transition; definitions of related terms and designation of UV-absorption band.

Studies of conjugated and extended conjugated systems. WoodwardFieser rules. Analytical use of UV-spectroscopy. [8]

Infrared and Raman Spectroscopy: Molecular Vibrations, instrumentation of iR and Raman spectroscopic techniques. Interpretation of infrared and Raman spectra, Identification of functional groups, hydrogen bonding, Complexity of IR spectra, Utility of iR spectroscopy in structural elucidation. Raman spectroscopy in material science; SERS. [8]

Fluorescence spectroscopy: Phenomena of fluorescence. Photochemical laws, general characteristics, Quantum yield and its measurements. Radiationless transitions. Spin states and their interconversion. Kashas rule and solvent effect. Spin orbit coupling. Energy transfer processes. Donoracceptor complexes, excimers, exiplexes.

Fluorescence quenching (static and dynamic). SternVolmer analysis, Timescale of molecular processes in solution.

Steadystate and timeresolved fluorescence.

Fluorescence anisotropy. Biochemical fluorophores. New fluorescence technologies: Multiphoton Excitation, Fluorescence

correlation Spectroscopy, Single molecule detection. [12]

Photoelectron spectroscopy: Experimental methods, ionisation processesses and Koopmans theorem. Photoelectron spectra and their interpretation. Applications. [5]

Mass Spectrometry: Basic concepts. Instrumentation, Fragmentation and rearrangements (including McLafferty rearrangement) of different classes of organic molecules. Isotope effects. [5]

Recommended Books:

1. Modern Spectroscopy J. M. Hollas.Wiley, 2004.

2. Physical Methods in Chemistry, R. S. Drago, 2nd Ed., Saunders, 1992.

3. Essentials of Photochemistry, A. Gilbert and J. Baggot, Blackwell Scientific Publications, 1992.

4. Fundamentals of photochemistry, K. K. RohatgiMukherjee, Wiley Eastern Ltd., 1978.

5. Molecular Fluorescence, Bernard Valeur, WileyVCH, 2002.

6. principles of Molecular photochemistry: an introduction, p. Walsh, n. J. Turro, V. Ramamurthy, J. C. Scaiano, University Science Books, 2008.

7. Principles of Fluorescence Spectroscopy. Joseph R. Lakowicz, 3rd Edition, Springer, 2006.

8. Interpretation of Mass Spectra, F. W. McLafferty, 1980.

9. Spectrometric Identification of Organic Compounds, R. M. Silverstein, G. C. Bassler and T. C.Morrill, John Wiley, New York, 5th Ed., 1991.

C601: Physical methods in Chemistry II

Nuclear magnetic Resonance Spectroscoy: Basic principles, Chemical shifts, Spin-spin interactions. Application of 1H and 13C nMR spectroscopy including nOE, COSY, nOESY, and other 2D techniques in the structure determination of bioorganic compounds. Application in conformational analysis. Multinuclear (31p, 19F, 29Si) nMR of various inorganic and organo-metallic compounds. Instrumental aspects. nMR of paramagnetic sample: Contact shifts and pseudo contact shifts, shift reagents. Pulsed nMR: modern multiple-pulsed experiments including 2D nMR. [20]

Electron Spin Resonance Spectroscopy (eSR): a brief review of theory. analysis of ESR spectra of systems in liquid phase, radicals containing single set, multiple sets of protons, triplet ground states: Transition metal ions; Fe, Cu, Mo, Cr, Mn, VO2+ containing systems: g values, symmetry. The practical interpretation of ESR spectra, in solid state and solution states. Multiple electron systems; Triplet ground state, Zerofield splitting, Kramers degeneracy, Spectral line-shapes when D « hν, D ~ hν and D » hν. EPR of photoexcited triplet states. [7]

Doubleresonance Techniques (eNDOR): EnDOR in liquid solution, EnDOR in powders and nonoriented solids. EnDOR spectra of free-radicals coupled to multiple sets of nuclei with spin. EnDOR of paramagnetic metals and complexes. Biological Applications: Substrate free radical, Flavins and metal free flavin proteins, Photosynthesis, Heme proteins, Iron- Sulfur proteins, Spin labels. [7]

mossbauer Spectroscopy: Basic physical concepts, spectral line shape, isomer shift, quadrupole splitting, magnetic hyperfine interaction. Interpretation of Moss- bauer parameters of 57Fe, 99Ru, 101Ru, 195Pt, 193Ir and 110Sn. Some special applications: Solid state reactions, thermal decomposition, ligand exchange, electron transfer, isomerism, surface studies and biological applications. [7]

Recommended Books:

1. nMR Spectroscopy: Basic principles, Concepts and applications in Chemistry, H. gunther, 2nd Ed., John Wiley & Sons, 1995.
2. Spectrometric Identification of Organic Compounds, R. M. Silverstein, G. C. Bassler and T. C. Morrill, John Wiley, New

York, 5th Ed., 1991.

3. Basic 1 H and 13 C nMR Spectroscopy, M. Balci, Elsevier Science, 2005.
4. Electron paramagnetic Resonance: Elementary Theory and practical applications, J. a. Weil, J. R. Bolton and J. E. Wertz, Wiley interscience, new York, 1994.
5. Physical Methods in Chemistry, R. S. Drago, 2nd Ed., Saunders, 1992.
6. Mossbauer Spectroscopy: an introduction for inorganic Chemists and geochemists, Mcgraw Hill, UK, 1973.
7. Mossbauer Spectroscopy, n. n. greenwood and T. C. gibb, Chapman & Hall, 1971.
8. Electron Spin Resonance : Elementary Theory and practical applications, J. E. Wertz and J. R. Bolton, Mcgraw Hill, 1984.

C604: Coordination Chemistry

1. **Theories of bonding:** CFT (including Jahn-Teller). Effects of ligand field (spectrochemical series, enthalpies of hydration, spinel structures. Shortcomings of CFT. MO theory of coordination complexes. Electronic Spectra of complexes including Orgel diagrams and Tanabe Sugano diagrams. [10]
2. **Magnetism:** introduction to Magnetism. Origin of diamagnetism. paramagnetism: Van Vleck formula and its approximated forms, Curie law. Magnetic susceptibility, orbital quenching and spin-only moment. Magnetic exchange interactions in coordination compounds: ferrimagnetism and antiferromagnetism. Bulk magnetic properties and ferromagnetism. Molecule-based magnetic materials: organic magnets and single molecule magnets. [10]
3. **Mechanisms of reactions of transition metal complexes:** Substitution (Kinetic effects: labile vs inert) and electron- transfer reactions (Outer-sphere, Self-exchange; inner-sphere). [7]
4. **Bioinorganic Chemistry:** Basic principles (why specific metal ions are present in certain proteins/enzymes): Heme proteins, types, structure and function (including

mechanism of function): Hemoglobin, myoglobin, Cytochrome C, Cytochrome p450, Catalases, peroxidases. non-Heme proteins: Hemeerythrin, Ribonucleotide reductase, Methanol monooxygenase (a) iron-Sulfur proteins: Ruberodoxin, Ferredoxin; (b) Dna / Rna : Ribozymes. [10]

5. **Transition metal based supramolecular structures:** Ligand design and applications. [5]

Recommended Books:

1. Advanced inorganic Chemistry, F. a. Cotton, C. a. Murillo, and M. Bochmann, Wiley interscience, 2001.
2. Inorganic Chemistry, D. F. Shriver and p. W. atkins, Oxford University press, 1999.
3. Supramolecular Chemistry: Concepts and perspectives, J. M. Lehn, VCH, 1995.
4. Principles of Bioinorganic Chemistry, S. J. Lippard and J. M. Berg, panima publications, new Delhi, 1997.
5. Bioinorganic Chemistry; inorganic Elements in the Chemistry of Life. Kaim, B. Schwederski Wiley, 1994
6. Biological inorganic Chemistry: Structure and Reactivity Harry B. gray, Edward i. Stiefel, Joan Selverstone Valentine, ivano Bertini University Science Book; 2006
7. Reaction Mechanism of inorganic and Organometallic Systems, R B Jordan, 2nd Edn., Oxford University press, 1991.

References:

1. Bioinorganic Chemistry, asim K. Das, allied Books, Kolkata, 2004.
2. Molecular Symmetry and group Theory: a programmed introduction to Chemical applications, a. Vincent, John Wiley, 2001.
3. Mechanism of inorganic Reactions, F. Basolo and R. g. pearson, 2nd Edn. Wiley, 1967
4. Inorganic Reaction Mechanisms, M L Tobe and J Burgess, 1st Edn., Wesley Longmans Ltd. 1999.
5. inorganic Chemistry- principles of Structure and Reactivity, J.E. Huheey, E. a. Keiter, R.L. Keiter and O. K. Medhi, pearson Education, 2007.

C605: Chemical Binding

Introduction: Review of basic principles of quantum mechanics, atomic structure, variation and perturbation methods.[3]

Electronic structure of diatomic molecules: Born-Oppenheimer approximation, H+ ion, molecular orbitals of ground state and excited states of H+ (LCAO- 22 MO), homo and heteronuclear diatomic molecules, electronic term symbols, valence bond theory of diatomic molecules, comparison of valence bond and molecular orbital theories. Term Symbols for diatomic molecules. [12]

Self-consistent Field methods: Hartree-Fock theory of atoms and molecules, post-Hartree-Fock theories, configuration interaction wave functions.[8]

Electronic structure of polyatomic molecules: SCF-MO treatment of closed shell systems and applications to molecules (H_2O, NH_3, CH_4) ; potential energy surface and equilibrium geometry, molecular vibrational frequencies. Brief introduction to density functional theory. [9]

Virial theorem and chemical bonding. The Hellman-Feynman theorem. [4]

Semi-empirical and molecular mechanics treatment of molecules, Huckel molecular orbital theory for conjugated organic molecules and its applications to ethylene, butadiene, benzene; delocalization energy and stability. [6]

Recommended Books:

1. Modern Quantum Chemistry: introduction to advanced Electronic Structure, a. Szabo and n. S. Ostlund, Dover, 1996.
2. Molecular Quantum Mechanics, p.W. atkins and R.S. Friedman, OxfordUniversity press, 3rd Edn., 1997.
3. Quantum Chemistry, i. n. Levine, 5th Edn., pearson Education, 2000.

C665: Advanced Organic Chemistry

Review of Basic Bonding Concepts; Conformational analysis; Stereochemistry; Kinetics and Thermodynamics of Organic Reactions; Reaction Mechanisms and Con- formational Effects on Reactivity; Oxidation Reactions; Reductions Reactions; Enolate Chemistry; Metalation Reactions; Key Ring Forming Reactions; Olefin Synthesis; Conjugate Additions; Synthetic analysis and Design; Total Synthesis of natural products; asymmetric Synthesis; Combinatorial Chemistry.

Recommended Books:

1. E. V. anslyn, D. a. Dougherty “Modern physical Organic Chemistry” California University Science Books, 2006.

2. E. L. Eliel, S. H. Wilen "Stereochemistry of Organic Compounds" Wiley-interscience, 1994.

3. R. Bruckner "Organic Mechanisms: Reactions, Stereochemistry and Synthesis" Springer, 2010.

4. F. a. Carey, R. J. Sundberg "advanced Organic Chemistry parts a & B: Structure and Mechanisms" 5th Edition, Spring- er, 2007.

5. M. B. Smith, J. March "Marchs advanced Organic Chemistry" 6th Edition, Wiley-VCH, 2007.

6. E. J. Corey, X.-M. Cheng "The Logic of Chemical Synthesis" Wiley-interscience, 1995.

7. T. Hudlicky, J. W. Reed "The Way of Synthesis: Evolution of Design and Methods for natural products" Wiley-VCH, 2007.

8. p. Wyatt, S. Warren "Organic Synthesis: Strategy and Control" Wiley, 2007.

9. M. Christmann, S, Br¨ase Eds "asymmetric Synthesis- The Essentials" 2nd Edition, Wiley-VCH, 2008.

10.10. K. C. nicolaou, R. Hanko, W. Hartwig Eds. "Handbook of Combinatorial Chemistry", VCH-Wiley, Weinheim 2002.

Elective Courses

C602: Chemical Rate Processes

1. Kinetic Measurements: General features of fast reactions; study of fast reactions by flow techniques, relaxation methods (T-Jump, P-Jump, ultrasonic, pulse radiolysis, NMR); flash photolysis; salt and solvent effects on reactions in solutions. [5]

2. Chain Reactions: Features of chain reactions; thermal and photochemical reactions (hydrogen-bromine reaction, decomposition of aldehydes and ketones). [5]

3. Kinetics of oscillatory reactions: introduction to oscillatory reactions; Belousov-Zhabotinsky and Field-Koros-noyes models. [4]

4. Rate Theory: Concept of potential energy surfaces, transition state theory including its statistical mechanical treatment, phenomenological theories of unimolecular reactions (Lindemann, Hinshelwood), statistical mechanical theories of unimolecular reactions (RRKM). [10]

5. Chemical Dynamics: Collision theory and Reaction Dynamics, Reaction Cross section and rate constant, Brief idea of Molecular Beam Scattering, Dynamics in condensed phase. [10]

6. Femtochemistry : Concepts and perspectives; applications to studies of dynamics and control of chemical reactions.[6]

Recommended Books:

1. Physical Chemistry, i. Levine, Tata Mcgraw Hill, 5th Edn., 2007.
2. Physical Chemistry : a Molecular approach, D. a. McQuarrie and J. D. Simon, University Science Books, 1997.
3. Chemical Kinetics and Dynamics, J. i. Steinfeld, J. S. Francisco and W. L. Hase, prentice Hall, 1999.
4. Chemical Dynamics in Condensed phases: Relaxation, Transfer and Reactions in Condensed Molecular Systems, a. nitzan, Oxford Univ. press, 2006.

References:

1. Basic Chemical Kinetics, H. Eyring, S. H. Lin and S. M. Lin, John Wiley & Sons, new York, 1980.
2. The World of physical Chemistry, K. J. Laidler, Oxford University press, 1993.

C603: Chemistry of Heterocycles and Natural products

1. **Chemistry of Heterocycles:** introduction and application of Heterocycles; nomenclature of aromatic and non-aromatic Heterocycles; Synthesis and Reactivity of 5&6-membered aromatic Heterocycles with One or Two Hetero atoms. [12]
2. **Chemistry of Natural Products:** introduction and application of Carbohydrates; Steroids, Terpenoids, Fatty Lipids, prostaglandins and alkaloid; Biogenesis and Total Synthesis of Selected natural products. [20]
3. **Chemistry of Biomolecules:** Classification and Structures of Amino Acids; Pipe- tides, Proteins and Nucleic Acids; Solid phase Synthesis; nucleic acids Synthesizer. [10]

Recommended Books:

1. J. a. Joule, K. Mills “Heterocyclic Chemistry” 5th Edition, Blackwell, 2010.
2. T. Eicher, S. Hauptmann “The Chemistry of Heterocycles” 2nd Edition, Wiley-VCH, 2003.
3. R. J. Simmonds, “Chemistry of Biomolecules: an introduction” RSC, 1992.
4. i. L. Finar, “Organic Chemistry” Vol. ii, ELBS, 1990.
5. S. V. Bhat, B. a. nagasampagi, M. Sivakumar “Chemistry of natural products” Springer, 2005.

6. E. J. Corey, X.-M. Cheng "The Logic of Chemical Synthesis" Wiley-interscience, 1995.

7. T. Hudlicky, J. W. Reed "The Way of Synthesis: Evolution of Design and Methods for natural products" Wiley-VCH, 2007.

C651: molecular modeling

Introduction: What is molecular modeling? Computable quantities. [1]

Concept of Potential energy Surface: Stationary points, Born-Oppenheimer approximation, geometry optimization, normal modes of vibration. [3]

Molecular mechanics: Basic principles, properties that can be calculated, Strengths and weaknesses. [3]

Quantum mechanics: Hartree-Fock-Self-Consistent-Field theory, post-Hartree- Fock (Electron correlation) methods, Density functional theory, Semi-empirical methods. [7]

Chemical Dynamics: Unimolecular and Bimolecular reactions, Reaction path and transition states, Classical trajectories, direct dynamics, Quantum dynamics. [6]

Simulations of molecular ensembles: properties as ensemble and time averages, Molecular dynamics simulations, Monte Carlo simulations. [10]

Modeling Lab: Hands-on experience for using different simulations methods and algorithms pertaining to the course.[10]

Recommended Books:

1. C. J. Cramer, Essentials of Computational Chemistry, Wiley, 2004.
2. i. n. Levine, Quantum Chemistry, prentice-Hall of india, 2006.
3. p. W. atkins, Molecular Quantum Mechanics, Oxford, 2008.
4. M. p. allen and D. J. Tildesley, Computer Simulation of Liquids, Oxford, 1987.
5. a. R. Leach, Molecular Modelling, prentice Hall, 2001.
6. F. Jensen, introduction to Computational Chemistry, John Wiley & Sons, 2007.

C653: Classics in molecules

1. introduction, Understanding Structural Diagrams of Organic Molecules, protein and Three-Dimensional protein Structure, nucleic acids, Synthesis, Biosynthesis. [7]

2. Urea & acetic acid, glucose, aspirin, Camphor, Terpineol, Tropinone, Haemin, Quinine, Morphine, Steroids & the pill, Strychnine, penicillin, Longifolene, prostaglandins & Leukotrienes, Vitamin B12, Erythronolide B & Erythromycin a, Monensin, Avermectin, Amphotericin B, Ginkgolide B, Cyclosporin, FK506 & Rapamycin, Calicheamicin $\gamma 1$,

Palytoxin, Taxol, Mevacor, Zaragozic acids & Cp Molecules, Brevetoxin B, Ecteinascidin 743, Epothilones, Resiniferatoxin, Vancomycin, Thiostrepton. [20]

3. Modern Drug Discovery and Developments, Designed Small Drug Molecules for Mental illness, Viral infections, gastrointestinal Disorders, Heart diseases and Sexual Dysfunction. [12]

4. Dna Technologies, Vaccines, antibodies, Diabetes, anemia, Rheumatoid arthritis, Breast Cancer, Biologics. [7]

Recommended Books:

1. K.C. nicolaou and Tamsyn Montagnon, “Molecules that Changed the World”, VCH, 2008.

2. E.J. Corey, L´aszl´o Ku¨rti and Barbara Czak´o, “Molecules and Medicine”, VCH, 2008.

3. J. Block and J. M. Beale “Wilson and gisvold’s Textbook of Organic Medicinal and pharmaceutical Chemistry”, 11th Ed., Lippincott Williams & Wilkins, 2003.

C652: Solid State Chemistry

Crystal Chemistry: a brief introduction to crystallography, Lattices, unit cells, symmetry, point groups, space groups. Packing: CCp, HCp, voids, radius ratio rules. Bonding in crystals: ionic, covalent, metallic, van der Waals, hydrogen bonds. Description of crystal structures: metallic & nonmetallic structures, aB, aB2, aB3 (ReO3), spinels, pyrochlores, perovskites, K2niF4 etc. paulings rules for ionic crystal structures and the concept of bond valence. Methods of crystallography: powder, single crystals, X-ray, neutron and electron diffraction. [7]

Defects in solids: Origin of defects in crystals; perfect and imperfect crystals; thermodynamics of defect formation; types of defects : point defects, line defects, plane defects;Schottky and Frenkel defects; thermodynamics of Schottky and Frenkel defect formation; crystal classifications; Madelung constant and lattice energy.[7]

Electronic structure of solids: atoms to molecules to crystals; orbitals to bonds to bands; Electronic structure of crystalline solids, elementary band theory: metals, insulators and semi-conductors., Solid state ionics; intrinsic and extrinsic semiconductors. Transport property measurement techniques: electrical resistivity, thermopower, Hall effect Magnetism of d vs. f metal compounds.[8]

Critical Phenomena: phase transitions (Order-disorder, Martensite-austenite, Spinoidal decompositions); liquid crystals; structure-property relations (magnetic, electrical, superconductivity, optical and thermal). Powder synthesis by conventional and modern chemical methods, reactivity of solids, decomposition mechanisms, powder processing (sintering and diffusion processes), tailoring of solids, special methods for single crystal growth and thin film depositions. [10]

Synthesis of solids: Chemistry behind synthesis; intercalations; synthesis/preparation of single crystals; hydrothermal methods. Framework Solids; Zeolites, aluminophosphates and related structures; Metal-organic framework compounds - their structures and properties.[6]

Superconductivity: Superconductivity: General aspects of superconductivity; effects of magnetic field; BCS Theory; oxide Superconductors. [4]

Recommended Books:

1. Solid State Chemistry and its applications, a. R. West, John Wiley, 1987.
2. Solid State Chemistry, L. Smart and E. Moore, Chapman and Hall, 1992.
3. Principles of the Solid State, H. V. Keer, Wiley Eastern Ltd., 1994.
4. New directions in solid state chemistry, C.n.R. Rao and J. gopalakrishnan, Cambridge University press, 2008.
5. The Electronic Structure and Chemistry of Solids, p. a. Cox, Oxford University press, 2005.
6. Ionic crystal, lattice defect and non-stoichiometry, n.n. greenwood, Chemical pub. Co., New York, 1970.
7. An introduction to crystal chemistry, R.C. Evans, Cambridge University press, 1964.

C654: Crystallography

1. Origin of X-rays, Filters, monochromators, sealed tube, rotating anode synchroton radiation, safety considerations. [5]
2. Crystals and their properties- Concepts of symmetry, direct and reciprocal lattice, planes, indices, unit cell, Bragg's law in direct and reciprocal lattices. Primitive and non-primitive lattices, point and space groups, equivalent positions, systematic absences and space group determination, occupancy factors. [15]
3. Theory of structure factors, argand diagram and its use, Lorentz and polarization corrections, absorption corrections, absolute scale of intensities; unit cell determination, data collection parameters, data reduction, phase problem and structure solution by patterson and direct methods. [15]
4. Structure refinement techniques, presentation and interpretation of structural data, examination of CIF file and critical evaluation of a structure. Errors and pitfalls, twinning and disorder, Renninger effect, extinctions, anomalous scattering and its use. [10]

Recommended Books:

1. X-ray structure determination: a practical guide, g.H. Stout and L.H. Jensen, Springer, 1992.

2. Fundamentals of crystallography, C giacavazzo, Oxford University press

3. X-ray analysis and the structure of organic molecules, Jack. D. Dunitz, Wiley, 1996.

4. Crystal Structure Determination, Werner Massa, Springer.

5. Structural inorganic Chemistry, a. F. Wells, Clarendon press, 1986.

C655: Principles of Drug action

Pharmacodynamic Phase in Drug action: introduction to pharmacodynamics, Biochemical Basis of Drug action, Drug absorption, distribution and bioavailability, passive diffusion, active transport mechanisms, Excretion and reabsorption of drugs. [7]

Pharmacokinetic Phase in Drug action: General classification of pharmacokinetic properties, Pharmacokinetic models, intravascular administration, Extravascular administration, Estimation of pharmacokinetic parameters, The use of pharmacokinetics in drug design. [7]

Novel Therapeutic agents: Synaptic Pharmacology: Cholinergic- and adrenergic systems, CnS agents: antipsychotics, antidepressants, CVS Agents: Antihypertensives, Antineoplastic agents, Analgesic and anti-inflammatory agents, Drug toxicity. [12]

Concepts in Drug metabolism: Basic principles and factors affecting drug metabolism, Secondary pharmacological implications of metabolism, phase i metabolic reactions, phase ii metabolic reactions, Drug metabolism and drug design, prodrugs, Metabolic pathways for common drugs. [7]

Stability of Drugs and medicines: Oxidation and stability of free-radicals, prevention of oxidative deterioration, autoxidation of fats and oils, Examples of drugs susceptible to ageing and hydrolysis, Other mechanisms of degradation.

[6]

Drug Development: Clinical trials (phase-i to phase-iV), Formulation development, Quality control aspects (methods of assay). [6]

Recommended Books:

1. Thomas g. (2003) Fundamentals of Medicinal Chemistry, Wiley.

2. Cairns D. (2008) Essentials of pharmaceutical Chemistry (3rd Ed.), pharmaceutical press.

3. Block J and Beale JM. (2003) Wilson and gisvold's Textbook of Organic Medicinal and pharmaceutical Chemistry (11th Ed.), Lippincott Williams & Wilkins.

4. Rang Hp, Dale MM et al. (2007) Rang & Dale's pharmacology (6th Ed.), Churchill Livingstone.

5. Hardman Jg, Limbird LE et al. (2001) goodman & gilman's The pharmacological Basis of Therapeutics, Mcgraw-Hill professional.

C656: advanced Bio-inorganic Chemistry

Principles of bioinorganic chemistry (Justification of why certain protein/enzyme contains a particular metal ion) [3]

Heme Proteins: Types, function and mechanisms, Myoglobin, Hemoglobin, Cytochrome c, Cytochrome p450, peroxidases (Horseradish peroxidase, Chloroperoxidase), Catalase, Cytochrome c Oxidase, Synthetic porphyrins of biological relevance. [5]

Iron-Sulfur Proteins: Types, function and mechanisms, Rubredoxin, Ferredoxins, aconitase [3]

Non-Heme Proteins: Types, function and mechanisms, Mononuclear Systems (Catechol-1,2-Dioxygenases, Transferrin, Ferretin, Superoxide Dismutase, isopenicillinn- Synthase) Dinuclear Systems (Hemerythrin, Ribonucleotide Reductase, Methane Monooxygenase, purple acid phosphatases) [6]

Copper Proteins (Type i, ii, and iii): Types, function and mechanisms, Blue Copper proteins; Hemocyanin, Tyrosinase, Catechol Oxidase; Superoxide Dismutase; ascorbase Oxidase, Laccase; galactose oxidase [5]

Molybdenum enzymes: Types, function and mechanisms, Oxo-Transfer Enzymes; Xanthine Oxidase; nitrogenase.

[5]

Manganese: photosynthesis (photosystem i and photosystem ii); function and mechanisms. [4]

Zinc enzymes: function and mechanisms, Hydrolytic Enzymes (Carbonic anhydrase; Carboxy peptidase a; alkaline phosphatase). [5]

DNa/RNa: Types, function and mechanisms, Dna nicking enzymes; Dna polymerase; Ribozymes. [5]

Environmental & medicinal aspects: acid-rain; green-house Effect etc. Radiopharmaceuticals; photo-Dynamic Therapy; anti-Tumor Drugs (cis-platin, Carboplatins; Bleomycins); ion-pumps. [5]

Recommended Books:

1. principles of Bioinorganic Chemistry; S. J. Lippard and J. M. Berg, panima publications, new Delhi, 1997.

2. Bioinorganic Chemistry ; inorganic Elements in the Chemistry of Life; W. Kaim, B. Schwederski Wiley, 1994

3. Biological inorganic Chemistry: Structure and Reactivity; Harry B. gray, Edward i. Stiefel, Joan Selverstone Valentine, ivano Bertini, University Science Book; 2006

4. Specific Review Articles to be collected from Internet.

C657: Nuclear magnetic Resonance

Classical NmR Spectroscopy: nuclear magnetism, Bloch equations, chemical shift, linewidth, scalar coupling [4]

Theoretical description of NmR spectroscopy: Expectation value of magnetic moment, density matrix, pulses and rotation operator, chemical shift and coupling Hamiltonians, concept of coherence, one pulse experiment. [5]

Product Operator Formalism: Operator spaces, basis operators, free precision, pulses, single and multiple quantum coherences, application of pOF to study spin echo and standard polarization transfer protocols like inEpT. [6]

Practical aspects of NmR spectroscopy: Tuning, matching, shimming, temperature calibration, spectrum referencing, sampling theorem, quadrature detection, Fourier transformation, zero filling, apodization, phasing, signal to noise ratio, spin decoupling, pulse field gradients, water suppression, one dimensional experiments. [14]

Two dimensional NmR experiments: Two dimensional spectroscopy, coherence transfer, COSY, double quantum filtered

COSY, TOCSY, nOESY, HSQC, HMQC, sensitivity enhanced HSQC. [10]

Higher dimensional NmR experiments: need for higher dimensional experiments, HnCa, Hn(CO)Ca, introduction to the new trend of fast multidimensional experiments: gFT, spatially spatial encoding. [3]

Recommended Books:

1. protein nMR Spectroscopy, 2nd Ed, John Cavanagh, W. J. Fairbrother, a. g. palmer iii, M. Rance and n. J. Skelton, Elsevier academic press, 2007

2. Spin dynamics 2nd Ed., Malcolm H. Levitt, John Wiley and sons Ltd., 2008

C658: Advanced Functional Materials

Introduction to materials in modern Technology: Materials as an enabling element of technological progress. Functions that materials perform. The properties - structure - processing connection. [2]

Semiconductor materials: intrinsic semiconductors, Band Structure of Semi- conductors, impurity Semiconductors, ii-V and ii-Vi compounds, Hall Effect, SC devices. Charge carrier dynamics in semiconductor nanomaterials. [10]

Dielectric materials: Dielectric constant and polarizibility, insulating materials, Ferroelectrics, piezoelectrics, Measurement of Dielectric properties, applications. [6]

Nanosized magnetic materials: Basic concepts of magnetism. Types of magnetic behavior, Magnetic domains, soft and hard magnets, Classification Magnetic Nanomaterials, Ferrofluids, Single-domain particles, Physical Properties of Magnetic nanostructures, nanomagnetism for Biological applications. [6]

Polymer materials and nano-composites: Classification of Polymers, Structure- Property Correlation, Molecular weights, Conduction in polymers, natural composities, incorporation of nanomaterials into polymer Media, Organic polymer nanocomposites, Metal and Ceramic composites, Clay nanocomposite Materials, polymer- Clay nanocomposites, polymer/ graphite nanocomposites, polymer Composites with Carbonnanotubes. [10]

amorphous and Porous materials: Crystalline vs. amorphous Solids, glass Formation, Structural Models of amosphous Materials, properties of Metglasses, Evolution and Development of porous Materials, Chemistry of Microporous Materials, Mesoporous Materials, Semiconductor nanoparticles in Zeolites, polymers and Carbon Materials in Zeolites. [10]

Recommended Books:

1. Fundamental of nanotechnology, gabor L. Hornyak, John J. Moore, Harry F. Tibbals, Joydeep Dutta, CRC press, Taylor & Francis group, 2009

2. Optical Properties and Spectroscopy of Nanomaterials, Jin Zhng Zhang, World Scientific Publishing Co. Pte. Ltd, 2008.

3. Science of Engineering Materials and Carbon nanotubes, C. M. Srivastava, C. Srinivasan, new age international pub- lishers.

4. Optimization of polymer nanocomposite properties, Edited by Vikas Mittal, WiLEY-VCH Verlag gmbH & Co. Kgaa, Weinheim, 2009.

5. Chemistry of Zeolites and Related porous Materials: Synthesis and Structure RUREn XU, WEn- Qin pang, JiHOng YU, QiSHEng HUO, JiESHEng CHEn, John Wiley & Sons (asia) pte Ltd, 2007.

6. polymer nanocomposites Handbook Rakesh K. gupta Elliot Kennel Kwang-Jea Kim, CRC press, Taylor & Francis group, 2008.

C659: Supramolecular Chemistry

Introduction: Understanding of Supramolecular Chemistry (Multidisciplinary nature, Complementarities in biology); Selectivity; Supramolecular interactions; Chelate and Macrocyclic Effects; Characterizing Supramolecular Systems; Structural, Kinetic and Thermodynamic. [6]

molecular Self-assembly: Non-Covalent Interactions: Electrostatic, Hydrogen Bonding, π –π Stacking, Dispersion and Induction Forces, Hydrophobic or Solvophobic Effects, π-Electron Donor-Acceptor Systems, Catenanes and Rotaxanes, Tran-sition Metal Directed assemblies; Molecular Macrocycles and Boxes: Locked and Unlocked Molecular Boxes, Ladders and grids, Cages; Hydrogen Bond Directed assemblies: Rosettes and Ribbons, peptide nanotubes; Self- Replicating Molecular Systems. [12]

Synthesis of macrocycles: High Dilution Technique; Coordination Template Effects; Cation Binding and De-Metallation; porphyrins; Corrins; Crown Ethers; Cryptands; Spherands; Sepulchrates; Siderophores; Calixarenes. [4]

molecular Sensors of ions and molecules: anions, Cations and neutral Molecules Receptor Design principles: Recognition by Electrostatic and Hydrogen Bonding, Lewis acidic Hosts interactions etc.; introduction to Fluorescence probing Techniques and applications: Fluorescent Molecular Sensors of ions and Molecules, Logic gate etc.; Expanded porphyrins, amide Functionalized Metallo Compounds, Cyclophanes, Electrostatics and Hydrophobicity, Hydrogen Bond Receptors, Chiral Recognition; Hydrophobic Effect: Recognition in Water; Solvent Effect; Cyclodextrins; Calixarenes; Metallo Receptor For nucleic acid Bases; Boronic acid Receptors for Sugars. [20]

Recommended Books:

1. D. J. Cram and J. M. Cram, Container Molecules and their guest, Monographs in Supramolecular Chemistry, Ed. J. F. Stoddart, The Royal Society of Chemistry, Cambridge, 1994.
2. J. M. Lehn, Supramolecular Chemistry: Concepts and perspectives, VCH, Weinheim, 1995.
3. Comprehensive Supramolecular Chemistry, Ed. J. L. atwood, J. E. D. Davies, D. D. Macnicol, F. Vogtle, Volumes 2 and 3, Elsevier Science, Oxford, 1996.
4. Supramolecular Chemistry of anions, Ed. a. Bianchi, K. Bowman-James, E. garcia-Espana, John Wiley and Sons, new York, 1997.
5. Supramolecular Chemistry, p. D. Beer, p. a. gale and D. K. Smith, Oxford University press, 1999.

6. a practical guide to Supramolecular Chemistry, peter J. Cragg, John Wiley & Sons Ltd, England, 2005.

C660: Chemistry of Nanomaterials

Introduction: nano and nature, Fascination and Motivation of nanoparticle Research, Bottom-up and Top-down approaches [3]

Zero and One-Dimensional Nano structures: introduction, aqueous and non- aqueous Sol-gel Chemistry, Surfactant- assisted Synthesis, Solvent-Controlled nanoparticles, assembly: introduction, Oriented attachment and Mesocrystals, Superlattices, Core-Shell nanoparticles: introduction, Types of Systems, Characterization, properties. [10]

Carbon Nanomaterials: Fullerenes and their Derivatives, Carbon nanotubes: Structure and properties, nanocrystalline Diamond [8]

Self-assembled Monolayers: introduction, Monolayers on gold, growth process, phase transitions, patterning monolyers, Mixed Monolayers Structure, Electrochemistry and applications of Self-assembled Monolayers of Thiols [4]

nano and Micro-elumsion: Surface active agents, Micellization, Mechanism of emulsion, Characterization of Microemulsion [8]

Application of nanomaterials: Solar Energy Conversion, Molecular and nano- electronics, nanocatalyis, Biological applications and other applications. [12]

Recommended Books:

1. Nanoparticles: Synthesis, Stabilization, passivation, and Functionalization, Edited by R. nagarajan, T. alan Hatton, aCS SYMpOSiUM SERiES 996.

2. Metal Oxide nanoparticles in Organic Solvents, Markus niederberger and nicola pinna, Markus niederberger and nicola pinna, Springer-Verlag London Limited 2009 .

3. Fundamental of nanotechnology, gabor L. Hornyak, John J. Moore, Harry F. Tibbals, Joydeep Dutta, CRC press, Taylor & Francis group, 2009.

4. Carbon nanomaterials, advanced Materials Series, Edited by Yury gogotsi, Taylor and Francis group, LLC, 2006.

5. Carbon Nanotubes and Related Structures, Edited by Dirk M. Guldi and Nazario Mart´ın, WILEY- VCH Verlag GmbH

& Co. Kgaa, Weinheim, 2010.

6. nano: The essential, Understanding nanoscinece and nanotechnology, T. pradeep, Tata Mcgraw- Hill publishing Company Limited.

7. Applied Surfactants, Thrwat F. Tadros, WiLEY-VCH Verlag gmbH & Co. Kgaa, Weinheim, 2006.

C661: Advanced Bio-organic Chemistry

Enzymology: Mechanistic studies of enzymatic reactions. Studies of enzyme kinetic for substrate/inhibitors (reversible/ irreversible) and their future aspects in drug design. The role of cofactors and hormones in enzymatic reactions. Enzymes as Catalysts in organic chemistry reaction (group Transfer Reactions, Reduction and Oxidation; Monooxygenation; Dioxygenation Substitutions, addition/Elimination; Carboxylations; Decarboxylation; isomerizations; aldol and Claisen Reactions; and Retroreactions; Formylations, Hydroxymethylations, and Methylations; Rearrangements. [12]

Application of enzyme Kinetics: Substrate Kinetics; Kinetics of Enzyme inhibition; Substrate inhibition; nonproductive Binding; Competing Substrates; Multi- substrate Systems; allosterism and Cooperativity. [5]

Biosynthesis of secondary metabolites: polyketide Biosynthesis; Saccharide Biosynthesis; Shikimate pathway (pDF); Shikimate pathway Flavonoids; alkaloid Biosynthesis; alkaloid Bioynthesis: Tyrosine Derivatives; Terpene Biosynthesis with example-Taxol, vancomycine, penicillin and other recent discovered natural products. Design and synthesis of modified secondary metabolites analogues. Isotope labeling (radioactive/non-radioactive) and their application in biosynthetic pathways. [12]

Non-natural bio-active molecules: Synthesis and importance of these amino acids (β, γ&δ), non-ribosomal peptides and nucleotides (pna, Lna, Tna & other stable analogues). [5]

Introduction of vital bio-macromolecule secondary structures: g-Quadruplex, i-motif, Rnai (mi-Rna & si-Rna) & Collagen and their application in therapeutics. [5]

Recommended Books:

1. Organic Chemistry of Enzyme-Catalyzed Reactions, Revised Edition by Richard Silverman published: FEB-2002. iSBn 10: 0-12-643731-9. aCaDEMiC pRESS

2. Structure and Mechanism in protein Science: aguide to Enzyme Catalysis and protein Folding by alan Fersht, publisher:

W. H. Freeman; 1st edition (September 15, 1998)

3. Evaluation of Enzyme inhibitors in Drug Discovery: a guide for Medicinal Chemists and pharmacologists (Methods of Biochemical analysis); by Robert a. Copeland, publisher: Wiley-interscience; 1 edition (March 28, 2005).

4. Dewick, paul M. Medicinal natural products: a Biosynthetic approach. 2nd ed. new York, nY: John Wiley & Sons, inc., 2001. iSBn: 9780471496410 (paperback);

5. Structural Diversity of g-Quadruplex Scaffolds; Stephen neidle and Shankar Balasubramanian, CRC press Copyright Year-2006.

C662: Polymer Chemistry

Classification of polymers, Nomenclature of polymers, Synthesis of polymers using different methods, viz chain polymerization, step polymerization, ring-opening polymerization etc. polymerization techniques, viz Bulk polymerization, Solution polymerization, Suspension polymerization, Emulsion polymerization etc. [10]

Polymer characterization, Molecular weight-number average, weight average; significance of molecular weight; methods of characterizing molecular masses, gpC, Viscosity, Mass analysis, end-group analysis, Thermal properties - melting point, glass transition temperature (Tg), factors influencing Tg, relation between Tg and molecular weight. Crystallinity in polymers - degree of crystallinity in polymers, structural regularity and crystallinity. [15]

Kinetics of polymerization, free-radical, cationic and anionic polymerization and polycondensation. [5]

Copolymerization, free-radical and ionic copolymerization and copolycondensation [5]

Steriochemistry of polymerization, types of stereoisomerism in polymers, properties of stereoregular polymers, different methods for the synthesis of steroregular polymers. Less traditional approaches: aTRp, RaFT, ROMp, Surface functionalization of polymers [5]

Biodegradable polymers: Synthesis and challenges [3]

Recommended Books:

1. Odian, g. principles of polymerization. 4th ed. Hoboken, nJ: Wiley-interscience, 2004.

2. allcock, H. R., Lampe, F. W. in Contemporary polymer Chemistry; prentice-Hall: Engelwood Cliffs, nJ, 1990

3. Billmeyer Jr. F. W. Textbook of polymer Science Wiley - inter Science.

C663: molecular Reaction Dynamics

Introduction: The rate constant - History and current view. What is molecular reaction dynamics? [2]

Theoretical methods i: Transition State Thoery (TST), RRKM Theory. [5]

Theoretical Methods ii: Rate and cross-section, Classical scattering theory, Quantum scattering theory (reactive and non- reactive), Connection to TST and RRKM. [10]

Experimental methods: newton's diagrams, Molecular Beams, State-resolved spectroscopic techniques, imaging techniques. [8]

Applications: photoselective chemistry - photodissociation and photoisomerization dynamics, Dynamics in real time (ps, fs and attosecond regimes), Molecular energy transfer, Control of chemical reactions, Condensed phase dynamics, Dynamics of gas-surface reations. [15]

Recommended Books:

1. R. D. Levine, Molecular Reaction Dynamics Cambridge University press, nY 2005.
2. J. I. Steinfield, J. S. Fransisco and W. L. Hase, Chemical Kinetics and Dynamics, Prentice Hall Inc., NJ, 1999.
3. Journal articles.

C664: Theory of molecular Spectroscopy

Recap: introduction and review of basic quantum mechanics, molecular symmetry. [3]

Rovibronic Hamiltonian - Coordinates and momenta: Euler angles, axis systems, rotational and vibrational angular momentum, normal and internal coordinates, the g matrix, the gF matrix. [8]

Rovibronic wave functions: Classification of rotational, vibrational, rotation- vibration, and electronic wave functions, Hund's cases. [6]

Energy levels and interaction: Rotation-vibration interactions, vibronic and rovibronic interactions, Renner-Teller and Jahn-Teller effect, Rydberg states, spin effects. [8]

Transition intensities and Optical selection rules. Electric - magnetic dipole electric quadrapole transitions, multiphoton processes and Raman effect. [7]

Advanced topics Spectroscopy at high energies, intramolecular vibrational energy redistribution (iVR), and wave-packet approach to spectroscopy. [8]

Recommended Books:

1. P. R. Bunker and p. Jensen, Molecular Symmetry and Spectroscopy, nRC Research press, Ottawa.

2. J. D. graybeal, Molecular Spectroscopy, Mcgraw-Hill.
3. P. F. Bernath, Spectra of atoms and Molecules, Oxford University press, nY, 1995.
4. E. B. Wilson, J. C. Decius and p. C. Cross, Molecular Vibrations: The Theory of infrared and Raman Vibrational Spectra,Dover, nY, 1955.

C666: Catalysis: Reaction mechanisms and applications

Introduction to catalysis; fundamental concepts. [5]

Survey of ligands; Characteristics of the transition-metal in the complexes; Elementary steps. [10]

Reaction mechanisms and applications: Carbonylation, Hydroformylation, Hydrogenation, metathesis reactions, oxidation reactions, isomerization reactions, Cross-Coupling reactions, and C-H functionalization reactions.[20]

Examples of synthetic and industrial applications. [5]

Recommended Books:

1. The Organometallic Chemistry of the Transition Metals. R. H. Crabtree, John Wiley & Sons, 2005.
2. Industrial Catalysis. J. Hagen, Wiely-VCH, 2006.
3. Homogeneous Catalysis. p. W. n. M. van Leeuwen, Kluwer academic publishers, 2004.
4. Homogeneous Catalysis. S. Bhaduri, D. Mukesh, John Wiley & Sons, 2000.
5. Metal-Catalyzed Cross-Coupling Reactions a. de Meijere, F. Diederich (Eds.), 2004.
6. Catalysts for Fine Chemical Synthesis. S. M. Roberts, g. poignant, John Wiley & Sons, 2002.
7. Catalysis of Organic Reactions, S.R. Schmidt, CRC press, 2007

C667: Advanced main Group Chemistry

(a) Direct bonds between metal atoms: Mg and Ca compounds with metal-metal bonds
(b) Multiple bonded group 13, 14 and 15 elements: Synthesis, reactivity and bonding [12]

nHC stabilized low oxidation state main group metal complexes[4]

Low oxidation state main group metal hydrides: synthesis and reactivity [4]

NHCs analogues with low valent group 13 and 14 elements: Synthesis, structure and reactivity studies; (a) Boron(i), aluminum(i), gallium(i), indium(i) and Thallium(i) heterocycles (b) Silicon(ii), germanium(ii), Tin(ii), and Lead(ii) hetero cylces [8]

Role of main group compounds in catalysis, organic synthesis and medicinal chemistry [8]

Inorganic New materials: nanomaterials, polymers and chemical sensors [6]

Recommended Books:

1. Inorganic Chemistry-principles of Structure and Reactivity. 4th Edn. Huheey J. E.; Keiter, E. a.; and Keiter, R. L. Harper-Collins, nY, 1993
2. Concepts and Models of inorganic Chemsitry. 3rd Edn. Douglas, B.; McDaniel, D.; and alexander, J. John Wiley, New York. 1993
3. Chemistry of the Elements. 2nd Edn. greenwood, n. n.; and Earnshaw, a. pergamon, Oxford, 1989
4. Organometallics: a concise introduction, C. Elschenbroich and a. Salzer, 3rd Edn. 1999
5. Inorganic and Organometallic polymers. Chandrasekhar, V. Springer-Verlag, Heidelberg, 2005
6. Journal articles

C668: Advanced Fluorescence Spectroscopy

1. **Phenomena of Fluorescence and instrumentation for Fluorescence Spectroscopy:** introduction. Jablonski Diagram, Characteristics of Fluorescence Emission, Fluorescence Lifetimes and Quantum Yields. Spectro fluorometers, Light Sources, Monochromators, Optical Filters, photomultiplier Tubes, polarizers. [5]
2. **Fluorophores:** intrinsic or natural Fluorophores; Fluorescence Enzyme Cofactors, Extrinsic Fluorophores; protein- Labeling Reagents, Membrane probes, Red and near-infrared (niR) Dyes, Dna probes, Chemical Sensing probes, Viscosity probes, green Fluorescent proteins, Long-Lifetime probes. Quantum Dots. [4]
3. **Life-Time measurements:** Time-Domain and Frequency- Domain Measurements. Time-Correlated Single-photon Counting; principle and instrumentation, alternative Methods for Time-Resolved Measurements; Streak Cameras, Upconversion Methods. Data analysis. [6]
4. **Some important Photo-processes:** Dynamics of Solvent and Spectral Relaxation: Measurement of Time-Resolved Emission Spectra (TRES), Theory for Time-Dependent

Solvent Relaxation, Fluorescence Quenching: Theory, Fractional Accessibility to Quenchers, Applications of Quenching to Proteins; Fluorescence Anisotropy: Origin of the Definitions of polarization and anisotropy, Measurement of Fluorescence anisotropies, Causes of Depolarization, Biochemical applications. Energy Transfer: Theory of Energy Transfer for a Donoracceptor pair, Distance Measurements Using Resonance Energy Transfer (RET), Biochemical applications of RET. [12]

5. **Multiphoton excitation:** introduction to Multiphoton Excitation, Two-photon absorption Spectra, Cross Section for Multi-photon absorption. [3]

6. **Single-molecule Detection (SmD):** Delectability of Single Molecules, instrumentation for SMD, Single-Molecule photophysics, Biochemical applications of SMD. [3]

7. **Fluorescence Correlation Spectroscopy (FCS):** principles of Fluorescence Correlation Spectroscopy, Theory of FCS, Examples of FCS Experiments. [3]

8. **Fluorescence-Lifetime imaging microscopy (FLim):** Early Methods for Fluorescence-Lifetime imaging, Laser Scanning TCSpC FLiM, Lifetime imaging of Cellular Biomolecules. [3]

9. **Radiative Decay engineering:** introduction to Radiative Decay Engineering, Review of Metal Effects on Fluorescence,

Surface Plasmon-Coupled Emission(SPCE), Applications of Metal-Enhanced fluorescence, Application of SPCE. [3]

Recommended Books:

1. principles of Fluorescence Spectroscopy, Joseph R. Lakowicz, 3rd Edition, Springer, 2006

2. advanced Time-correlated Single photon Counting Techniques, W. Becker, Springer, 2005

3. Molecular Fluorescence principles and applications, B. Valeur, WiLEY-VCH, 2002

4. Single-Molecule Detection in Solution. Methods and applications, C. Zander, R. a. Keller, and J. Enderlein, WiLEY- VCH, 2001

C669: Biomacromolecules

1. Buffers (their use in study of biomolecules), pH, pKa of amino acids, D and L amino acid nomenclature [1]

2. Biophysical techniques to purify and study proteins: Dialysis, salting out and precipitation by organic solvents, ion exchange, gel filtration, reversed phase, affinity chromatography, ultracentrifugation, gel electrophoresis [3]

3. **Proteins:** protein sequencing by chemical and mass & nMR spectroscopic methods, Use of spectroscopic tools in studying biomolecules. primary (single letter amino acid codes), Ramachandran plot, secondary structures like helices, parallel and antiparallel -sheets, circular dichroism of secondary structures, tertiary (motifs and domains: some important motifs like Rossman fold, helix turn helix, 4 helix bundles, beta barrel), quaternary structure (Hemoglobin and Myoglobin) and Enzymes [21]

4. **Nucleic acids:** a, B and Z-Dna structures, Method of replication, sequencing of nucleic acids (Chemical, dideoxy and fluorescence), Transcription, Translation, genetic code, genomes, Genes, over expression of recombinant proteins, mutagenesis (random and site directed). polymerase chain reaction (pCR) [9]

5. Carbohydrates and glycoproteins, proteoglycans, Membranes and lipids, bacteial cell wall synthesis and mechanism of some important antibiotics like penicllin, antibiotic resistance [4]

6. **Metabolism:** photosynthesis, Calvins cycle, glycolysis, Krebs cycle, electron transport, cofactors. [4]

Recommended Books:

1. Voet, D, Voet, Jg, pratt, CW Fundamentals of biochemistry: life at the molecular level, 2nd Edition, 2006

2. Berg J.M, Tymoczko J.L. and Stryer L. Biochemistry, 6th Edition,2007

3. Creighton, TE, proteins: structure and molecular properties, 2nd edition, 1993

4. Lewin B. genes iX, 2008

5. Branden C and Tooze J., introduction to protein structure, 2nd Edition, 1999.

6. Fersht a., Structure and mechanism in protein science: a guide to enzyme catalysis and protein folding, 1999

C670: Advanced Heterocyclic Chemistry

1. Introduction: Heterocyclic Chemistry introduction to heterocycles: nomenclature, spectral characteristics, reactivity and aromaticity. [2]
2. Synthesis and reactivity of three and four membered heterocycles e.g., aziridine, azirine, azetidine, oxiranes, thiarines, oxetenes and thietanes. [4]
3. Synthesis and reactivity of five membered rings with two heteroatoms: pyrazole, imidazole, oxazole, thiazole, isothiazole and benzofused analogs; Benzofused five membered heterocycles with one heteroatom, e.g., indole, benzofuran, benzothiophene. [8]
4. Synthesis and reactivity of benzofused six membered rings with one, two and three heteroatoms: benzopyrans, quinolines, isoquinoline, quinoxazaline, acridine, phenoxazine, phenothiazine, benzotriazine, pteridines. [8]
5. Synthesis and reactivity of seven and large membered heterocycles: azepines, oxepines, thiepines; spiro heterocycles; bicyclic compounds containing one or more heteroatoms [4]
6. Recent methods of C-H functionalization/activations of heterocyclic derivatives. [16]

Recommended Books:

1. Carey, F.a. & Sundberg, R. J. advanced Organic Chemistry, parts a & B, plenum: U.S. 2004
2. Thomas. L. gilchrist, Heterocyclic chemistry, (3rd Edition) 1997
3. Joules, J. a; Mills, K.; Smith, g. F. Heterocyclic Chemistry, 3rd Ed.
4. advances in Heterocyclic Chemistry, Book series Elsevier Edited by alan Katritzky
5. Branden C and Tooze J., introduction to protein structure, 2nd Edition, 1999.Journal articles

C671: Statistical Mechanics

1. Basic assumptions, concept of microscopic and macroscopic states, ensembles and averages. Calculation of distribution functions in canonical ensemble and the canonical partition function. Relations between the canonical partition function and thermodynamic functions. Calculations in other ensembles like micronanonical and grand canonical ensembles. [12]
2. Calculations of partition functions and thermodynamic properties for ideal systems of monatomic and diatomic molecules.
3. Calculations of fluctuations and equivalence of ensembles. [7]

4. Calculation of heat capacity of solids, Einstein and Debye theories, and study of chemical equilibrium in terms of partition functions.[4]

5. **Quantum Statistics:** Maxwell-Boltzmann, Bose-Einstein, and Fermi-Dirac statistics. Systems of Fermions and Bosons in weak and strong degenerate limits. [7]

6. **Classical Statistical mechanics:** partition functions as integrals over phase space coordinates, Systems of interacting particles, imperfect gases, concept of radial distribution functions of liquids and applications to ionic solutions using Debye-Huckel theory.[6]

7. **Non-equilibrium Statistical mechanics:** Onsager regression hypothesis and fluctuation-dissipation theorem, calculations of transport coefficients like diffusion, conductivity. [6]

Recommended Books:

1. Physical Chemistry : a Molecular approach, D. a. McQuarrie and J. D. Simon, Viva Books, new Delhi, 1998.

2. Statistical Mechanics, D. a. McQuarrie, University Science Books, 2nd Edn., 2000.

3. Introduction to Modern Statistical Mechanics, D. Chandler, Oxford Univ. press, 1987.

4. Statistical Thermodynamics of non-Equilibrium processes, J. Kaizer, Springer, 1st Edn., 1987.

5. Statistical physics ii: non-Equilibrium Statistical Mechanics, R. Kubo, M. Toda and n. Hashitsume, Springer, 2003.

C751: Photochemistry

1. **Introduction:** importance of photochemistry; Electromagnetic Radiation; Colour perception and the Colour Circle; Beer- Lambert Law; Electronic Configurations: Multiplicity, S0, S1, T1 etc.; Electronic Transitions and Solvent Effects: π to π^*, n to π^* etc. Molecular Orbitals (FMO Approach). [6]

2. **Unimolecular Photophysical Processes:** Jablonski Diagram; Frank-Condon principle; Fluorescence; inter-System Crossing; phosphorescence; Delayed Fluorescence; Quantum Yield. [6]

3. **Bimolecular Photophysical Processes:** Thermodynamics and Kinetics of Excited State Bimolecular interactions; Excimer and Exciplex; photosensitization and Quenching; Heavy atom Effect; photoinduced Electron and Charge Transfer; Resonance Energy Transfer: Coulombic and Exchange mechanisms. [8]

4. **Fluorescence Spectroscopy:** Characteristics of Excitation and Emission Spectra; Basic Theories involving Various Fluorescence Spectral parameters; Fluorescence anisotropy; introduction to Fluorescence probing Techniques and applications; Fluorescent Molecular Sensors of ions and Molecules. [10]

5. **Photochemistry of Organic Compounds:** photochemistry of alkenes; pericyclic Reactions; photo-oxidation and photo-reduction; photochemistry of Carbonyl Compounds. [8]

6. **Applied Photochemistry:** Chemistry of Vision; photochemistry in nature; photochemistry in atmosphere; Supramolecular photochemistry; Solar Cell; Fuel cell. [4]

Recommended Books:

1. Fundamentals of photochemistry, K. K. Rohatgi Mukherjee, Wiley Eastern Ltd., 1978.
2. Modern Molecular photochemistry, n. J. Turro, University Science Books, 1991.
3. Molecular Fluorescence, B. Valeur, Wiley-VCH, 2002.
4. principles of Molecular photochemistry: an introduction, p. Walsh, n. J. Turro, V. Ramamurthy, J. C. Scaiano, University Science Books, 2008.
5. Organic photochemistry, J. M. Coxon and B. Halton, Cambridge University press, 1974.
6. Molecular Reactions and photochemistry, C. H. Depuy and O. L. Chapman, prentice Hall of india.
7. Photochemistry and pericyclic Reactions, J. Singh and J. Singh, new age international publishers, 2003.
8. Pericyclic Reactions, ian Fleming, Oxford Science publications 1998.

C752: Pharmaceutical Chemistry

1. **Drug discovery and development:** The why and wherefore of drugs; Stereochemistry and solubility factors; principles of drug design (molecular and biochemical); 'Lead' modification approach, SAR/QSAR; Computer-aided drug design; natural products drug discovery. [15]

2. **Basic Principles of medicinal chemistry:** Drug action at enzymes; Drug action at receptors; physio-chemical aspects of drug molecules; selected examples of drugs and natural products. [15]

3. **Pharmacodynamics and Pharmacokinetics:** Drug distribution and survival; Concept of prodrug; pharmacokinetic models; Drug metabolism. [10]

Recommended Books:

1. Essentials of pharmaceutical Chemistry, D. Cairns, pharmaceutical press, 2nd Edition 2003.

2. Fundamentals of Medicinal Chemistry, g. Thomas, Wiley-Blackwell, 1st Edition, 2003.

Group Theory and Molecular Spectroscopy (6 credits)

Group Theory

Symmetry Elements, Symmetry Operations, Point Groups, Symmetry Representations, Applications of symmetry to Molecular Orbital diagrams of simple molecules (examples: H_2O, BeH_2). Definition of a group and basic theorems, molecular symmetry groups and classes, Great orthogonality theorem, Matrix representation of groups, irreducible representations and Character Tables. Symmetry properties of wave functions, orbitals as basis sets for irreducible representations, symmetry adapted linear combinations. (12)

Introduction to Spectroscopy

Interaction of light with matter, Transition moments and transition probabilities, Einstein's coefficients, Oscillator strength. (2)

Diatomic Molecules

(a) Electronic Spectra: Born-Oppenheimer approximation, Potential energy curves of diatomic molecules, Frank-Condon principle, electronic transitions in homonuclear and heteronuclear diatomics.(4)

(b) Microwave and Infrared Spectroscopy:

Simple harmonic oscillator and rigid rotor model, Rotational spectra of diatomic molecules, Stark effect, vibrational spectra of diatomic molecules, anharmonic corrections, selection rules, fundamental and overtone bands, Isotope effects, vibrational rotational coupling. (6)

Polyatomic Molecules:

(a) Electronic spectra: Electronic structure, electronic spectra of polyatomic molecules - linear conjugated molecules, aromatic molecules, transition metal compounds, fluorescence, phosphorescence, internal conversion and charge transfer. (9)

(b) Rotational, Vibrational spectra of Polyatomic Molecules

Symmetric and asymmetric top molecules, normal modes of vibration and their classification by group theory, coupling between rotational and vibrational degrees of freedom, Symmetry and normal modes of vibration. Rovibrationic spectra, Concept of anisotropic polarizability and Raman spectra. (9)

Recommended Books

1. Chemical Applications of Group Theory, F. A. Cotton, John Wiley, 3rd Ed., 2003.
2. Symmetry and Spectroscopy: An Introduction to Vibrational and Electronic Spectroscopy, D. C. Harris and M. D. Bertolucci.
3. Fundamentals of Molecular Spectroscopy, C. N. Banwell and E. M. McCash, Tata McGraw Hill, 1995.
4. Molecular Spectroscopy, G. M. Barrow, McGraw Hill, 1985.
5. Spectra of Atoms and Molecules, P. F. Bernath, Oxford Univ. Press, 2005.
6. Modern Spectroscopy, J. M. Hollas, John Wiley, 4th Edn., 2004.
7. Molecular Symmetry and Group Theory, R. L. Carter, John Wiley and Sons, 1998.

C754. Organic Chemistry Project-1:

C755. Organic Chemistry Project-II

C756. Inorganic Chemistry Project-I

C757. Inorganic Chemistry Project-II

C758. Physical Chemistry Project-I

C759, Physical Chemistry Project-II

BHABHA ATOMIC RESEARCH CENTRE

Ph.D. IN ENGINEERING SCIENCE (PROGRAM CODE: ENGG04)

SYLLABUS

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as "Radiological Safety Engineering' course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

12. The Principles of Circular Accelerators and Storage Rings - Philip Byrant.
13. Introduction to Vacuum Technology-Compiled by K.G. Bhushan, BARC

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 503: Engineering Maths-II (20) (ME Group)

- Introduction to discretization methods and approximate solution of differential equations (FDM, FEM and FVM), Finite Difference Approximations in 1-D, Solution of steady and unsteady heat conduction equations, wave equation
- Formulation of the matrix methods by equilibrium concepts (1D-heat conduction, 2D-truss and 1D-hydraulic flow examples).
- Approximate solution of differential equations – Weighted residual method, collocation, least squares and Galerkin's methods, Piecewise approximations. Basis of Finite Element Method, energy principles in structural mechanics and principles of minimum potential energy, assembly concept.
- Solution of steady and unsteady heat conduction equations with finite element method, Implicit and explicit methods.
- Finite element formulations of convection dominated problems using classical Galerkin methodology and need for alternate trial functions and upwinding.
- Finite element formulation for laminar and turbulent flows.
- Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
- Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
- Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
- Response Surface Method 2K+1, factorial design, 3k factorial design
- Monte Carlo Method
- Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.
- Artificial Intelligence and Genetic Algorithm
- Artificial Neural Network
- Gram-Schmidtt Orthogonalization
- Transformation of matrix

EN 504:Engineering Maths-II (20) (MT)

Applications in Materials Science:

- Use of matrix in crystallography. Stereographic analysis, lattice correspondence, orientational relationship, applications to twinning and martensitic. transformations,
- Tensor analysis in phase transformation and deformation studies
- Analysis of diffusion data, Solutions of diffusion equations - error function and Eigen value analysis, Polynomial fitting of diffusion profiles.

Application in thermodynamics of metallurgical systems:

- Temperature dependence of thermodynamic quantities, graphical and analytical integration of Gibbs-Duhem equation. Introduction to database for thermodynamic tables
- Analysis and synthesis of phase diagrams, introduction to first principles calculations of phase diagrams with computer demonstration, cluster variation and Monte Carlo methods

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods, liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

References:

3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
  - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
  - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
  - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

References:

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons
- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction
- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process
- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors
- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics
- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up
- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons
- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients
- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)
- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.

- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)
- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)
- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:
- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:
- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design
- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology
- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra
- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics
- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures
- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations
- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame’s equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)
- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):
- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):
- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)
- Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

EN 612: Computer Based System Design- I (25)

Hardware Design

- Overview of microprocessors and peripherals: 8086, 68000, Digital Signal Processor (TMS320) DMA controller, serial communication controller and timer/counter.
- Personal computer architecture, memory organization, industrial PC
- Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications
- Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL)
- Case Study: Design of a single board computer with shared memory interface, I/O board design using ADC, DAC etc with emphasis on signal conditioning and isolation
- System design concepts: Fault tolerance, hot standby, live insertion, triple modular redundancy and safety issues

EN 613: Computer Graphics and Visualization (35)

- Introduction overview, Graphics software/hardware and types of graphics applications (1)
- 2D/3D Geometric Transformations, Affined transformations-Translation, Rotation, Scaling, Shear and reflection. (3)
- Homogeneous coordinates, composite transformations, rotation with qutenion, current transformations and matrix stacks. (3)
- Two dimensional viewing 2D viewing – window, viewport, viewport transformations, clipping operations, line clipping algorithms – Cohen-Sutherland, Liang-Barsky, polygon clippimg algorithm – Sutherland-Hodgman. (4)
- Three dimensional graphics – Planer geometric projections – parallel and perspective, Mathematics for projections, classical three-dimensional viewing, specifying views, viewing transformations, 3D clipping operations. (4)
- Hidden surface removal, object space and image space approach, back face culling, z-buffer algorithm, LOD.(2)
- Illumination and shading – Basic illumination models, light sources, material properties, polygon shading methods – flat, gouraud and phong shading, ray tracing methods. (2)
- Color - Color perception, color models – RGB,CMY,HSV (1)
- Visual Realism – Depth cuing, texture mapping, transparency, shadow, steropsis. (2)
- Curves and surfaces – Representation of curves and surfaces, Algebric and geometric form, Blending functions, interpolation, Hermite, Bezier, B-spline curves and surfaces, Rational polynomials, NURBS (5)
- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

  c. Approaches for improving interconnect performance
  d. Case studies – Ethernet, Infiniband, SCI
- Cache
  a. Associative, Direct mapped
  b. Write through, Write back
  c. MESI
  d. Shared caches
- Advances in storage systems
  a. Direct attached storage, Network attached storage, Storage Area Networks
  b. File level and block level accesses
  c. Storage protocols
  d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
  e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing
  a. Need for HPC
  b. Applications of HPC
  c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)
- Pipelining, Vector processing, SIMD
  a. Pipeline, Speedup and Efficiency of pipeline
  b. Pipeline stalls, out of order execution
  c. Techniques to improve pipeline efficiency
  d. Superscalar, Superpipelined, VLIW, EPIC architecture
  e. Vector processors, vector instruction sets, registers
- MIMD Architecture
  a. Classification of MIMD machines
  b. UMA, NUMA, CC-NUMA, COMA, NORMA
- Interconnection networks and topologies
  a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
  b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.
- Current Parallel Architectures
  a. Parallel Vector processor
  b. Symmetric Multiprocessors
  c. CC-NUMA
  d. Massively Parallel Computers
  e. Clusters of workstations
- Clusters
  a. Classification of clusters
  b. Cluster software
  c. File systems for clusters
- Software concepts of High Performance Computing
  a. Parallelism – Algorithmic, Geometric, Event, Data
  b. Granularity – Coarse and Fine grains
  c. Speedup, Efficiency, Amdahl's and Gustaffson's Laws
- Parallel Programming Models
  a. Shared Variable Model
  b. Message Passing Model
  c. Threads Model
  d. Data parallel Model
- Design of parallel algorithms
  a. Data dependencies
  b. Data partitioning
  c. Communication patterns
  d. Synchronization
  e. Load balancing
- Parallel Programming Environments
  a. Parallel Languages
  b. Parallel Extensions to Sequential Languages
  c. Parallel APIs – MPI, OpenMP
- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)
  a. Introduction to MPI
  b. MPI constructs
  c. Example programs in MPI
- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

EN 618: Electrical Systems for Nuclear Power Plants (30)

- Interaction of Nuclear Power Station With The Grid Number of evacuation lines; Optimum size of NPP in grid; Brief introduction to Power System Analysis - Short circuit, load-flow and stability studies, Tariff and Capacity factor.
- Ehv Switchyard Design Switching schemes; Clearances; Com parison between types of svvitchyards; Brief introduction to equipments in switchyard and their functions; Lightning arresters and insulation co-ordination; Lightning protection.

- Protection Line protection; Generator protection; Transformer protection; Motor protection.
- Selection of Transformers Accessories; Types; Specifications and testing; Voltage regulation calculations.
- Selection of MV & LV Switchgear Types; specifications and testing, MCCS; Distribution boards; Generator circuit breaker; ELCB.
- Motors In NPP Types of motors; Radiation withstand requirements; Performance requirements.
- Station Auxiliary Systems of NPP Class 1, 11, Ill and IV systems classifications; Nature of electrical loads and supply voltages; Effect of voltage variation on Electrical equipments and remedial measures; Emergency transfer system; Load shedding scheme; Auto transfer schemes; synchronizing schemes.
- Class 1 e requirements Cabling, lighting & grounding Specific requirements for safety related electrical equipments & systems in NPR Cabling, Lighting, Grounding systems in NPP; Bus ducts. Introduction to seismic qualification of electrical equipments., Electrical system control from Control Room. Introduction to []G sets, UPS & Batteries.
- Billing and metering scheme for a typical NPP. Introduction to brushiess and static excitation systems for Generators. Introduction to SCADA systems.

EN 619: Embedded & Computer Based System Design (45)

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 620: Extractive Metallurgy (40)

Principles of Metallurgical Thermodynamics (15)

- Thermodynamic Functions: Enthalpy, Entropy, Free Energy, Chemical Equilibria
- Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Phase Diagrams
- Solution Thermodynamics, Integral and Partial Molar Thermodynamic Properties
- Experimental Methods- Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.
- Computation of predominance area diagram and Phase diagrams

Kinetics(5)

- Principles of Chemical Kinetics, Homogeneous Reactions, Effect of Concentration, Effect of Temperature
- Theory of Reaction Rates, Heterogeneous Reactions, Reaction Models, Mass Transport Phenomena, Heat Transport Phenomena.

Process Metallurgy (25)

- Methods of attaining High Temperatures,Measurement of Temperature,
- Vacuum Metallurgy Principles and Equipments,
- Process Metallurgy of Rare and Refractory Metals,
- Resources of Special Metals, Beneficiation Methods, Physical, Chemical, Separation Methods, Halide Metallurgy, Vacuum Metallurgy, Electro Metallurgy, Reduction Processes, Refining Processes, Ultrapurification Processes,
- Preparative aspects of Special Materials and Alloys,
- Advanced Materials Processing Techniques,
- Reprocessing of irradiated nuclear fuels, Process Metallurgy of - Uranium, Thorium, Plutonium, Beryllium, Zirconium, Hafnium, Niobium, Tantalum, Rare Earths.

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)

- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)

- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)

- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity

- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:

- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour

- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys

- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics

- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:

- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

References:

7. Deformation and Fracture Mechanics of Engineering Materials - R. W. Hertzberg

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)

- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)

- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 625: Modern Control Systems Design and Simulation (35)

- Introduction, Examples of Dynamic Systems, Elementary definitions, Analyti- cal methods of modeling.
- State Space Characterization State 5PaCe representation, solution of state equation, state Transition matrix, properties of STM, computation methods, Companion form, Diagonal and Jordan form representation of linear models
- Controllability and Observability State transfer and Kaiman Controllability criterion, Algebraic controllability and Observability criteria, Gilbert's criterion, Eigenvalue controllability, Duality, Control- lability and observability of Discrete data systems.
- Stability liapunov,s stability criterion, Application to linear models, Extension to non-linear models.
- Control System Design Guillemin-Truxal design Procedure, pole placement by state feedback. H,' meth- od, Ackermann's formula, Bass and Gura formula, optimal control formulation, LQR theory, Matrix Riccati equation.
- Linear Observers Luenberger observers, Kaiman filter as OPtimum observer.
- Other Modeling Approaches Energy approach of modeling, Empirical modeling - impulse and frequency re- sponse methods, Recurise Least square Identification technique.
- Introduction to Adaptive and Robust control.

References:

(Reference materials will be provided during the course)

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

Design Basis Hazards (Natural)

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall
- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications
- FTP, DNS, Mail, application based attacks

Network Security
- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms
- Symmetric and Asymmetric.

Symmetric Algorithm
- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms
- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)
- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)
- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)
- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

3. Laser Isotope Separation, Ed. J.A Paisner, SPIE vol.1895 (1993)

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli's Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.
- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)

- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory

- Introduction to state-space controls, state & measurement equations, general solution **o**f the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls

- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation

- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:

- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 704: Computer Based System Design- II (25)

Communication, Networking, Realtime systems, RTOS and Software

- Asynchronous and synchronous communication
- Standards like RS232, RS422, RS485
- USB
- Encoding schemes
- Local Area Networks
- OSI 7 layer model and TCP/IP reference model
- Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth
- Networking hardware – cables, hub, switch, router, etc
- Role of fibre optics in communication
- Fieldbus standards
- Deterministic communication techniques
- Case study: various techniques used in NPP for communication and networking
- Realtime Systems, their characteristics and applications
- Realtime Operating Systems:
- Concepts of
- Process and threads
- Concurrency
- Latency, context switching
- Scheduling policies
- Inter process communication
- Semaphores
- Priority inversion
- Shared memory
- Common systems calls, Communication features in RTOS
- Comparative study of various RTOSs
- Integrated S/W development environment

EN 705: Data Base Management System and Web Technology(30)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to PostgreSQL and MySQL(3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(1)
- Content Management Systems(1)
- Web 2.0 / Semantic Web(2)

EN 706: Digital Signal Processing and Image Processing (30)

Digital Signal Processing

- **Introduction**

Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**

  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT.
- Fast Fourier Transform

Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- Digital filters

FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- DSP Applications

  Applications of digital signal processing in nuclear and other fields.

Image Processing

- **Introduction**

  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- **Image Enhancement**

  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- **Image Segmentation andAnalysis**

  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation; Boundary extraction and representation;
- **Morphological operations**

  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy- based methods;

  Image Compression Models, Error free compression, Lossy compression, Standards;

EN 708: Feedback Control Systems (25)
- Introduction: The control systems, Basic elements of FIB control systems, Types of FIB control systems.
- Transfer Function: Transfer function of linear systems, Impulse response, Block diagrams, Signal flow graphs, Mason's gain formula, Polar plots, Bode plot.
- State Variable Characterization: State concept, State equation, Standard representation, State transition matrix and solution of state equations, relationship between state equations and transfer functions, Characteristic equation, Illus- trative examples of some electrical, mechanical, electromechanical systems.
- Time Domain Analysis: Test input signals, Time domain perform- ance characteristics, Transient response of a typical second order system, PID controllers
- Stability: Definition, Routh-Hurwitz criterion, Nyquist criterion. Relative stability, Gain and Phase margins.

EN 709:Fluid Power Technology (25)
Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics
- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal’s Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli’s theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air
- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors
- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.

- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.
- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design
- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:
- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:
- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :
1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing
- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;
- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision
- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:
- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices
- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods
- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric 'O' rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques
- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:
- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
  - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
  - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
  - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
  - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

  - Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
  - Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
  - Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, Illlcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
 o Scheduling in a project by critical path method, CPM
 o Scheduling in a project by Precedence Diagram Method.
 o Use of Project Management Software for project planning, scheduling & monitoring.
 o Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
 o Constraints of project and its effective management o
 Development of Six Monthly Plan and its review process o Resource
 based planning
 o Physical & Financial Monitoring of project, Use of S-curve
 o Capital Budgeting & expenditure control in a project
 o Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 718: Reliability Engineering (ME) (25)

- Reliability Mathematics – Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations,

Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem

- Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
- Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
- Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
- System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.

- Application of Reliability - PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
- Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.

Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control.

Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5

Final control element - Linear pneumatic control valve.

Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.

Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

2.	02ENGG04-001-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , ‘Pressure vessel design’ CBS publication
2. Brownell. L. E & Young. E. D , ‘Process equipment design’, Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single - phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.

3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.

15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.

16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No. **Course content**

Curriculum for Metal Forming

1. **Uniaxial tensile test**:
   a. Engineering stress, engineering stain, true stress, true strain;
   b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations;
   c. Tensile instability and significance of strain harkening exponent;
   d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2. Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3. Small strain matrix and rotation matrix obtained from the displacement functions;
4. **Elements of the theory of plasticity**:
   a. Decomposition of stress matrix to hydrostatic and deviatoric matrices;
   b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess;
   c. Normality flow rule and convexity of the yield surface; concept of equivalent strain

Curriculum for Materials Joining

1. **Welding Processes**
   a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding
   b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding
   c. Resistance Welding Processes
2. **Thermal Cycle during welding**
   a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3. **Residual Stress and Distortion**
   a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses
   b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No. **Course content**

1. Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2. Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber's rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O' rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.

4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.

5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.

6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

8. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
9. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
10. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
11. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
12. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).

13. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
14. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No. **Course content**

1.

Introduction: Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.

Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**

Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**

Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.

Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.

Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.

Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.

4. **Radiation protection and measurement (External and Internal):**

Control of external exposures (with problems in each case).

Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.
Routes of intake of radioactive material

Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No.	Course content
12.	**Introduction: Reliability Engg. Applied to C&I Systems** Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors. Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems. Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
13.	**Reliability Maths/Statistics:** • Mathematical and statistical expressions required for reliability study. • Types of failures in electrical, electronic and computer components • Failure probability concept, statistical distribution models_ • Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions • Chi-square distribution and its use in confidence and risk factors • Baye’s theorem • Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software. • Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions. • Derivation of exponential reliability expression_ • R(t)=[exp-(lt)] for electronic components and systems. • Examples to solve

14. **Fault Tolerance and Systems Reliability:**

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**

- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), (‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:
1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2^{nd} Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart
and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2^{nd}., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4.	Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.
5.	DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. **Fault Tolerant and Distributed Architectures**

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. **Real-Time System Design**

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.
2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	Course content
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.

   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type-Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.
Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
	Total	**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
	Total	**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
	Total	**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

Book suggested

15. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
16. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
17. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
18. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
19. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
20. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.

Course content

1. **Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.

   Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**

   Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**

   Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.

   Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.

   Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.

   Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.

4. **Radiation protection and measurement (External and Internal):**

   Control of external exposures (with problems in each case).

   Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.

   Routes of intake of radioactive material,

   Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2.	Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.

7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.

8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.

9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.

10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

<u>Syllabus for CE610 : Heat Transfer (10 hrs.)</u>

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:
Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi's model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)

Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.
Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.
5. Piquet, J. (1999): Turbulent Flows: Models and Physics, Springer-Verlag: Berlin.
6. Holman, J.P. (1997): Heat Transfer, 8"" ed., McGraw-Hill : NY.
7. Kays, W.M. and Crawford, M.E. (1993); Convective Heat Transfer, McGraw-Hill: NY.
8. Gebhart, B., et al. (1988): Buoyancy-Induced Flows and Transport, Hemisphere.
9. Barret, K. (1982): Numerical Modelling in Diffusion-Convection, Pentach Press : London, Polymouth.
10. Hussaini, M.Y. et al. (1997): Up-wind and High Resolution Schemes, Springer-Verlag : Berlin.
11. Warsi, Z.U.A. (1998): Fluid Dynamics: Theoretical and Computational Approaches, 2"" Ed., CRC Press.
12. Cebeci, T. and Bradshaw, P. (1984): Physical and Computational'Aspects of Heat Transfer, Springer-Verlag.
13. Quartepelle, L. (1993): Numerical Solution of the Incompressible Navier-Stokes Equations, Birkhauser Verlag.
14. Patankar, S.V. (1982): Numerical Heat Transfer and Fluid Flow, Hemisphere.
15. Versteeg, H.K. and Malalasekera, (1996): An Introduction to Computational Fluid Dynamics: the Finite
16. Volume Method, Addison-Weslev.
17. Gresho, P.M. et al.. (1999): Incompressible Flow and the Finite Element Method, John Wiley & Sons.
18. Comini, G., et al. (1994): Finite Element Analysis of Heat Transfer, Taylor & Francis : Washington DC.
19. Canuto, C., et al. (1988): Spectral Methods in Fluid dynamics, Springer-Verlag :NY, 557pp.
20. Thompson, J.F., Soni, B. and Weatherill, N.P. (1998): Handbook of Grid Generation, CRC Press.
21. Glowinski. R., et al. (Eds.) (1997): Domain Decomposition Methods in Science and Engineering, Wiley.
22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Fromment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO’s).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2nd edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2nd edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2
MS6	Metallurgical Thermodynamics	30	4
MS7	Experimental Methods for Materials Research	45	6
MS8	Structural Materials for Nuclear Reactors	45	6
MS9	NDE Science and Technology	30	4
MS10	Physical Metallurgy	45	6
MS11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
MS12	Introduction to Materials Science and Engineering	45	6
MS13	Corrosion Science and Engineering	30	4
MS14	Mechanical Behavior of Engineering Materials	30	4
MS15	Manufacturing Technology	30	4
Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:**Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:** Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods

1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;

1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):

Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation-bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM

2.2. Scanning electron microscopy:

Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;

EPMA Electron probe micro-analyzer

2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species

3.1. Ion beams – production-ion guns; manipulation- ion, filters

3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):

High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy

3.3. Nuclear reaction analysis – elemental specificity – depth profiling

3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis

3.5. Surface Mass Spectriscopy-SIMS:

Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons

4.1 Photoelectron spectroscopy:

Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin

4.2 Auger Electron Sepctroscopy:

Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.

4.3 Experimental methods;

Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. VIBRATIONAL SPECTROSCOPIES

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. 8.RESONANCE ABSORPTION SPECTROSCOPIES

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.
2. Williams (D B), Carter (C B), Transmission Electron Microscopy: A Textbook For Materials Science, New York, Plenum, 1996
3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)

S.No.	Course Content
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

<u>9. NDE Science and Technology (MS9 - 30 hours)</u>

S.No.	Course Content
1.	**Introduction to NDE:**Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:**Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:**Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:**Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:**Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:**NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys**.** Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition**.**
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation**.**

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
