14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232.
    MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Introduction to Materials Science & Engineering (MS12/CH4-40 hours)

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger's vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt's factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith's law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2
7.	FRE7	Seismic Design of Nuclear Reactors and Facilities	30	4
8.	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**210**	**26**

MODULE III- OPERATIONS

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.
12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No **Course content**

1. **Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2. **Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3. **Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4. **Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5. **Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6. **Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single - phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies
8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

AHMT

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974.
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.
3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No. **Course content**

1. **Momentum Transport:**

   1.1 Viscosity and Mechanisms of Momentum Transport: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends.

2. **Energy Transport:**

   Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

   3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

   3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

   3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

   3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

   3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

   3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.
3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

1. Chopra, A.K., “Dynamics of Structures, Theory and applications to Earthquake Engineering”, Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures”, New York, McGraw-Hill Book Company.
3. Mariopaz, “Structural Dynamic (Theory and Computation)”, CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., “Numerical Methods in Finite Element Analysis”, Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. **Class room Training**
   a. Reactor System

      Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

   b. Sodium system

      Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

   c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

   d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

2. **Field training**
   a. Reactor Operation
   b. Maintenance Activities
   c. Technical Service Activities
   d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical’s	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. El-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No. **Course content**

1. **Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.
Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**
Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**
Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.
Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors
Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection

4. **Radiation protection and measurement (External and Internal):**
Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.
Routes of intake of radioactive material,
Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**
Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**
Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**
Radiological aspects of Fuel Cycle Facilities

8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No. **Course content**

1. Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2. Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3. Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4. Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5. Introduction to various reactor instrumentation and radiation monitors:
6. Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
   Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
   Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
   Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
    - Fault tolerance concept for electronic and Computer based C&I systems.
    - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
    - Series, parallel, active, passive, and voting redundancy
    - Redundancy and other fault tolerance methods for software
    - FMEA, FMECA concepts for C&I and Examples to solve
    - Concepts for the analysis of System Reliability, availability, and maintainability.
    - System reliability and availability analysis methods
    - Boolean logic
    - Digraph, cutest-tie set method
    - Fault tree model, and consideration of CCF, CMF, software errors
    - Markov Model

    Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
    - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
    - Environmental qualification, testing of the C&I systems
    - Effects of various environments on the electrical/ electronic components
    - Climatic Qualification tests: Temperature, Humidity
    - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
    - Reliability Testing of the electronic components, equipment and C&I systems
    - Reliability screening tests for electronic components
    - Accelerated environmental tests
    - Failure terminated and time terminated tests
    - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
    - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
    - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
    - Explain Event Tree
    - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
    - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001),
('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position
6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.
7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

BACK TO MAIN

Ph.D. in Engineering Science
(Program Code: ENGG04)

Syllabus
for
Doctoral Course

Variable Energy Cyclotron Centre

Department of Atomic Energy
1/AF Bidhan Nagar, Kolkata 700 064

Total credit: 60. Duration: one year. The 40 credit basic courses tabulated serially in I to XII are common to all. After completion of this 40m credit, a student may either choose: [2 advance courses from XIII to XIX (2×4=8 credit)] or [one advance course (4 credit) + Self Study Course(equivalent to 4 credit)] and finally a project equivalent to 12 credit.

04ENGG04-001-C Mathematical Physics: Credit: 3

Linear vector spaces, Linear operators and matrices, Systems of linear equations. Eigen values and eigen vectors, infinite-dimensional vector spaces: Hilbert space & Hermitian operators. Linear ordinary differential equations, Special functions. Linear partial differential equations in physics, Separation of variables method of solution. Complex variable theory; Analytic functions. Taylor and Laurent expansions, Classification of singularities, Analytic continuation, Contour integration, Method of steepest descent. Integral equations and Green functions, Ideas about nonlinear equations, Approximation methods : WKB approximation, Fourier and Laplace transforms.

Introduction to finite and continuous groups. Group representations and operations, Permutation group and its representations, Lie group and Lie algebras. SU(2), SU(3) and SU(N) groups, Poincare groups. Introduction to manifolds, Tangent Vectors and tangent spaces, Vector fields, Differential geometry, Riemannian manifolds and Gauge theories.

Suggested *Books :*

1. A Course in modern Mathematical Physics : Groups, Hilbert Space and Differential Geometry, *Peter Szekeres*
2. Mathematical Methods for Physics and Engineering: A Comprehensive Guide, *K.F. Riley, M. P. Hobson, S. I. Bence*
3. Complex Variables: Introductions and Applications, *M. J. Ablowitz* and *A. S. Focas*
4. Geometrical Methods of Mathematical Physics, *Bernard Shutz*
5. Lectures on Advanced Mathematical Methods for Physicists, *S. Mukhi & N. Mukunda.*

04ENGG04-002-C Quantum Mechanics: Credit: 3

Approximation methods in quantum mechanics : W. K. B. and variational methods and applications. Time independent perturbation theory (for non degenerate and degenerate cases) and its application to helium atom, Stark and Zeeman effects, Time dependent perturbation theory and Fermi golden rule, its applications to beta decay theory and principle of detailed balance.

Collision theory : Born series and interaction pictures : Propagator in quantum mechanics. Measurements in Quantum Mechanics, EPR paradox, Hidden variables and Bell's inequality.

Relativistic quantum mechanics : Klein-Gordon and Dirac equations and their solutions, Gamma matrices Non relativistic limit of Dirac equation; Parity inversion and time reversal, Bilinear covariants, Charge conjugation.

Lagrangian formulation : Symmetries of Lagrangian density, Noether's theorem, Energy-momentum tensor T^{uv}-its origin & physical meaning of different components.

Path integral formulation of quantum mechanics and its Applications.

Suggested Books :

6. Quantum Mechanics, *Leonard I. Schiff*
7. Quantum Mechanics, *Eugen Merzbacher*
8. Quantum Mechanics, *A. S. Davydov*
9. Principle of Quantum Mechanics, *R. Shankar*
10. Relativistic Quantum Mechanics, *James D. Bjorken and Sidney D. Drell*
11. (i) Quantum Mechanics : Non-Relativistic Theory & (ii) Classical Theory of Fields, *L.D. Landau and E.M. Lifshitz*
12. Quantum Mechanics and Path Integrals, *P. Feynman and A.R. Hibbs*

04ENGG04-003-C Classical Mechanics: Credit: 2

Newton’s Laws (Definition of inertial frames, Galilean group)

Lagrangian formulation: Lagrangian and its properties, Minimum action principle, Euler-Lagrange’s equations, Constrained motion, Cyclic coordinates, Noether’s theorem. Application: Two body problem, Restricted three body problem.

Hamiltonian formulation: Legendre transformation, Generalized momentum, Phase Space, Hamilton’s equations of motion, Liouville’s theorem, Fixed points and Linear Stability analysis, Phase portraits, Symplectic nature of Phase Space, Poisson Brackets, Canonical Transformations, Generating functions, Action-Angle variables, Hamilton-Jacobi equation, Singular Lagrangian and examples like time crystal/ Gauge field theory.

Connection of classical mechanics with quantum mechanics

Generic Scattering crosssection, crosssection with 1/r potential. Secular perturbation theory

Integrability, Kolmogorov-Arnold-Moser theorem, Elements of Chaos theory.

Suggested Books:

1. Mathematical Methods of Classical Mechanics, V I Arnold
2. Classical Mechanics, T W B Kibble and F H Berkshire
3. Classical Mechanics, H Goldstein
4. Classical Mechanics, L D Landau and L M Lifshitz

04ENGG04-004-C Statistical Mechanics Credit: 3

Distribution functions: Mean Values and standard deviations; Gaussian limit of the binomial distribution, distribution of several random variables. Gibbsian statistical ensembles: Micro-canonical, Canonical and Grand Canonical ensembles. Gibb's theorem: Information entropy: Fluctuations: Quantum statistics: Bose-Einstein statistics, Fermi-Dirac statistic and passage to the classical limit. Ising Model: Theory of phase transitions and critical phenomena-Critical exponents and universality, Phase transformation kinetics: Homogeneous and Heterogeneous nucleation, Spinodal decomposition

Non-equilibrium statistical mechanic: Liouville's equation, BBGKY hierarchy, Boltzmann equation, Fokker-Planck Equation and Brownian motion.

04ENGG04-005-C Classical Electrodynamics: Credit: 3

Maxwell equations, Macroscopic electromagnetism, conservation laws: Maxwell’s displacement current, Vector and scalar potential, Gauge transformations, Lorentz gauge and Coulomb gauge, Green’s theorem of the wave equation, Poynting’s theorem and conservation of energy and momentum, Boundary value problems and numerical techniques.

Plane electromagnetic wave and wave propagation, Wave guides and resonant cavities: Place wave in a non-conducting medium, Linear and circular polarization, Fields at the surface and within conductor, Cylindrical cavities and Wave-guides, Modes in a rectangular Wave-guide, Energy flow and attenuation in a Wave-guide.

Radiating systems, Multiple fields and radiation: Fields and radiation of a localized oscillating source, Electric dipole field and radiation, Multipole expansion and electromagnetic fields, Properties of multipole fields, energy and angular momentum of multipole radiation, Sources of multipole radiation : Multipole moments.

Relativistic electrodynamics: The special theory of relativity, The Lorentz transformation and basic kinematic results of special relativistic, Invariance of electric charge, Covariance of electrodynamics, Transformation of electromagnetic fields, Relativistic charged particles in an electromagnetic field.

Radiation by moving charges: The Lienard-Wiechert potentials and field for appoint charge, Total power radiated by an accelerated.

Suggested Books:

1. Classical electrodynamics, *I. D. Jackson.*
2. Modern Electrodynamics, A Zangwill, Cambridge University Press, 2016

04ENGG04-006-C
a. Research Methodology: Credit: 0

1. Research – meaning, characteristics and types, steps of research, research ethics and plagiarism.

2. Introduction to patent laws – patent laws, process of patenting a research finding, copy right, cyber laws.

3. Scientific presentation procedure

4. Scientific seminars by faculties'.

Suggested books:

a. Research Methodology: Methods and Techniques, C.R. Kothari

b. Computational Methods and Programming: Credit: 3

1. Scientific programming- Procedural programming and Object oriented programming (examples in Fortran and C++)

2a. Simulation techniques - Random variables, discrete and continuous, Montecarlo techniquesand application of Montecarlo tecniques, Techniques of dynamical simulations.

2b. Statistics and treatment of Statistical analysis of data: - estimation and propagation of error, curve fitting, least square methods, Confidence limit.

3. Numerical techniques – Integration, differentiation, diagonalization of matrices, root finding (bisection and Newton-Raphson method); Interpolation techniques; ODE, PDE, Runge-Kutta method, Solution of numerical problem using different numerical technique.

Suggested books:

1. Numerical Mathematical Analysis by James Blaine Scarborough, Oxford and IBH Publishing
2. Computer oriented numerical methods , V. Rajaraman
3. Data reduction and error analysis for the physical sciences, By Philip R. Bevington and D. Keith Robinson
4. An Introduction to Error Analysis (University Science Books, Mill Valley,California, 1982) by J.R. Taylor.

04ENGG04-007-C Experimental techniques and methods: Credit: 5

1. Philosophy of experimental science - laboratory safety, measurement of various physical properties with appropriate transducers, Vacuum - production methods and measurement techniques, Cryogenics - production and measurement, Workshop practice and basics of engineering drawing.

2. Material Characterization techniques – Electrical, Magnetic, and Optical property measurements, X-ray diffraction, neutron scattering and electron scattering techniques, Surface structure and topography (Scanning Electron Microscopy) and surface property measurements (Scanning Probe Microscopy), Phase changes.

(Differential Scanning Calorimeter), Mechanical property measurement: Tension and compression testing, Micro and Nano-indendation techniques, Characterization of defects and their detection (Positron Annihilation Spectroscopy, Transmission Electron Microscopy)

Suggested books:

a. Materials Characterization: Introduction to Microscopic and Spectroscopic Methods, Yang Leng
b. Characterization of materials, Elton Kaufmann

Detectors and Techniques for Nuclear and High Energy Physics

(a) Interaction of Radiations with matter: Interaction of charged particles, Electrons, photons, Neutrons, Muons and neutrinos with matter.

Radiation exposure and Dose

(b)Basics of detectors: General properties of radiation detectors, Simplified detector model, Modes of detector Operation, Pulse height spectra, Energy resolution, Detector efficiency, Working principle and properties of different types of detectors - Gas detectors, Scintillation Detectors, Semiconductor Detectors

(c) Basics of nuclear electronics: Pre-amplifier, amplifier, discriminators, gate and delay generators, Analog to Digital Converter, Time to Amplitude Converter and the basics of data acquisition systems.

(d) Experimental Nuclear physics techniques and detectors: Charged particle spectroscopy and particle identifications, Gamma ray spectroscopy, Fast neutron spectroscopy and detectors related to the different techniques

(e) Experimental High Energy Physics techniques and detectors: General concept of building a HEP experiment, coverage and options, tracking detectors, calorimeters, vertex detectors, muon chambers, neutrino detectors, particle identification detectors in HEP. Data analysis in HEP: General approach of data cleanup, calibration, track reconstruction, reconstruction of events, challenges in each stage.

Suggested books:

a. Radiation Detection and Measurement, Glenn F. Knoll
b. Nuclear Radiation Detectors, S.S. Kapoor and V. Ramamurthy
c. Techniques for Nuclear and Particle Physics Experiments: A How-To Approach, William R. Leo
d. Experimental Techniques in High-energy Nuclear and Particle Physics, edited by Thomas Ferbel
e. Introduction to Experimental Particle Physics, Richard Clinton Fernow

f. Data Reduction and Error Analysis for the Physical Sciences, Philip Raymond Bevington, D. Keith Robinson
g. Data Analysis Techniques for High-Energy Physics, edited by R. Frühwirth, M. Regler

04ENGG04-008-C Basic Field Theory: Credit: 3

Lorentz invariance and Relativistic kinematics. A preview of fundamental particles and their interactions. Review of classical field theory : Principle of least action, Lagrangian formulations for continuous system and fields.

Symmetries and conservations lows, Noether's theorem, Introduction to field quantization: Canonical quantizations of scalar, Spinor and gauge fields.

Principle of gauge invariance: Global and local gauge transformations, Abelian gauge fields.

Interaction fields : Perturbation expansion of correlation functions, Wick theorems, Feynman diagrams, S-matrix and cross section, Calculations of cross section and decay rates for elementary processes.

Suggested Books :

1. An introduction to Quantum Field Theory, *M. E. Peskin and D. V. Schroeder*
2. Quantum Field Theory, *L. H. Ryder*
3. Field Theory, *P. Ramond*
4. Gauge Field theory, *S. Pokoroski*
5. Quantum field theory, *L. S. Brown*

04ENGG04-009-C Basic Accelerator physics: Credit: 3

Introduction to accelerators: History of accelerators. Types of particle accelerators. Basic principle of Cockcroft-Walton, Van-de-graaff, Tandem, Linear accelerator, Cyclotron, Synchrotron, Storage rings and Betatron. Accelerators in India.

Transverse Beam Dynamics: Two dimensional field expansion, Field calculations of magnetic focusing and bending optics, Particle equations of motion, Thin-lens and Quadrupole focusing, Edge focusing, Solenoid focusing, Hill's equation, Phase advance in periodic focusing lattices, Transfer matrix technique, Transfer matrices for drift space, dipole, quadrupole, Stability criterion, Beta function, Courant-Snyder invariant and Twiss parameters, Beam emittance.

Longitudinal Beam Dynamics: Longitudinal Equation of Motion, Off-momentum orbits in synchrotrons, Transition and Momentum compaction, Phase stability, Synchrotron oscillation, Longitudinal emittance.

Cyclotron: Basic principle of cyclotron, Resonance condition, AVF cyclotron, Synchro-cyclotron, Betatron tunes, Shape of the cyclotron magnet, Injection, Extraction, Beam quality-time structure, energy resolution and emittance. Room temperature and Superconducting cyclotron.

RF Linear Accelerator: Principle of Linear accelerator, Wideroe and Alveraz linac, Transit time factor, Accelerating field and dispersion curve, Ion linac, Empty cavity and Loaded cavity, Travelling wave and standing wave structures.

Ion Sources: Principle of ionization, Ion sources for positive ions - Duoplasmatron, PIG, ECR, Ion sources for negative ions- surface, volume and charge exchange, Beam formation, ECR ion source and beam transport line.

Synchrotron and storage rings: Basic principle of Synchrotron, Electron and ion Synchrotron, Synchrotron radiation source, Total radiated power, Properties of Synchrotron radiation, Wiggler and undulator.

Application of accelerators: Research applications, Medicine, Industry etc.

04ENGG04-010-C Basic Condensed Matter Physics: Credit: 3

Crystal structure and crystallography : Bravais lattice – Primitive vectors, Primitive unit cell, Conventional unit cell, Reciprocal lattice and Brillouin zone, X-ray diffraction, Comparison with electron and neutron diffraction.

Electronic structure of solids : Band structure of solids, Introduction to many body problem, Single particle approximation, Hartree-Fock methods, Bloch theorem, Tight binding method, Introduction to Density functionalal theory.

Lattice vibrations : Phonons-Debye model for specific heat of solids-lattice dynamics-phonon spectrum. Electrical & thermal transport in solids, Role of electron-phonon interaction-Boltzmann transport equation.

Magnetism : Origin of magnetism, Quantum theory of diamagnetism and paramagnetism, Heisenberg's exchange interaction and ferromagnetism, Introduction to superexchange, Direct exchange and double exchange,

Superconductivity & Superfluidity : Phenomenological description of superconductivity, Interaction between electron and phonon, Cooper pair, Meaning of energy gap, Meissner effect, London theory, Classification of superconductors, High temperature superconductors, Outline of the microscopic BCS theory, Ginzburg-Landau theory. Superfluidity in liquid He. Landau's critical velocity, Two-fluid model.

Dielectric properties of solids : Static dielectric constant, Electronic and ionic polarization of molecules, Ferroelectricity- dipole theory, Inter-band transitions, Kramers-Kronig relations, Polarons, Excitons, Optical properties of metals and insulators.

Defects in solids: Classification of defects, Role of dislocations in material behavior. Irradiation effects in solids, Concept of DPA, Introduction to nuclear reactor.

04ENGG04-011-C Basic Nuclear physics: Credit 3

1. Nuclear structure: Chart of Nuclide, Nuclear Ground State Properties (Mass, binding energy, moments etc.), Introduction to nuclear models, liquid drop model, mean field concept and basic shell model, Nuclear shapes and Deformed shell model, Introduction to Gamma-ray spectroscopy, Gamma ray selection rule, single particle states, collective states, Methods of production of excited states in nuclei, Present day challenges.

2. Nuclear reactions: Nuclear reaction kinematics, Nuclear radius and methods of determination of nuclear radius, Scattering theory (partial wave analysis etc.), Statistical model (compound nucleus), Fusion-evaporation, Fusion-Fission, Concept of Level density and Temperature and methods of its experimental estimation, Resonances, Breit-Wigner formula.Introduction to different nuclear reactions: Coulomb excitation, Direct reactions, Multi-nucleon transfer, Deep inelastic collision, Multi-fragmentation and spallation. Introduction to the present day interest in nuclear reaction studies.

3. Radioactive Ion Beam (RIB): What is RIB and why it is important, Basics of the methods of production of RIB, Challenges in doing experiments using RIB, RIB facilities in the world.

04ENGG04-012-C Laboratory experiments: Credit 6 (Each student will carry out minimum of 6 experiments)

The experiments that will be carried out will make the students familiar with different types of detectors and nuclear electronics required for nuclear physics experiments and high energy physics experiments. The students will also carry out specific materials science experiments.

1. Operation of vacuum pumps and gauges
2. Thickness measurement of thin foils
3. Calibration and energy resolution of different types of radiation detectors (e.g, Si, CsI(Tl), HPGe, BaF_2 , etc.)
4. Thickness uniformity test of different detectors
5. Characterization of a neutron detector
6. Characterization of a gaseous detector (Gas electron multiplier/avalanche counter)
7. Efficiency measurement of different types of γ detectors
8. Characterisation of samples using XRD (X-ray diffractometer)
9. Measurement of stored energy in deformed samples using DSC (differential scanning calorimeter)
10. Measurement of mechanical strength of different materials using universal testing machine.
11. Characteristion of samples using Scanning Electron Microscope and Energy Dispersive X-ray Analysis.
12. Nanostructuring by ion beam.
13. Preparation and characterisation of Nanoparticles by sol-gel method.
14. Measurement of muon life time
15. Characteristic study of wavelength shifter fibres
16. Fabrication and characterization of a scintillator detector.

04ENGG04-013-C Advanced Nuclear Structure: Credit: 4

Nuclear Models (HF, HFB), Microscopic-macroscopic model and total energy Calculations (Strutinsky method), Introduction to Density Functional Theory, Electromagnetic moments, Different modes of excitation in nuclei, Giant resonances, Gamma ray spectroscopy and nuclear structure, Construction of level scheme, Spin and parity assignment of nuclear levels, Lifetime measurement of nuclear levels, Observables and deduced quantities, Nuclear Isomerism, Introduction to total Absorption Spectroscopy and beta-delayed neutron emission.

04ENGG04-014-C Advanced nuclear reaction: Credit: 4

Damped nuclear collision: General features, Kinetic energy loss, Angular distribution, Angular momentum dissipation, Time scale, Phenomenological and theoretical models for heavy ion collision, Dissipative forces: one-body, two-body dissipation. Fission dynamics: Dynamical models of fission, Quasi fission, Synthesis of super heavy elements (SHE), Heavy-ion physics at low and intermediate energies: Intermediate mass fragments emission, Reaction near Fermi energy domain, Hot nucleus, Multi-fragmentation, Liquid-gas phase transition, Theoretical models of multi-fragmentations, simulations and QMD model. Nuclear astrophysics: Nuclear resonances, Deep-sub-barrier fusion, Astrophysical S-factor, Gamow peak, Calculation of nuclear reaction rates and its use in calculating primordial and Stellar abundances; Equation of State for dense nuclear matter, β-equilibrium, Compact stars.

04ENGG04-015-C Advanced Accelerator physics: Credit: 4

Introduction: Sources of charged particle, Lorentz force and equation of motion, Hamiltonian of a charged particle, Charge particle motion in electromagnetic fields, Planer diode without and with space charge.

Basic beam parameters: Definition of beam parameters, Beam energy, Beam current, Time structure, Peak and average beam current, Beam size, Transverse beam dimensions, Bunch length, Energy spread, Beam emittances, Beam formation, Buncher, Beam chopper.

Beam optics and transport elements: Accelerator coordinate system, Paraxial ray equation for axially symmetric systems, Series representation of electric and magnetic fields, Paraxial ray equation, Solutions of the paraxial ray equations, Electrostatic lenses, Solenoidal magnetic lens, Larmor frame, Aberrations, Transfer matrix of transport elements, Stability condition, Beam envelope, Beam matrix, Transport notations, Basic focusing modules and different kinds of imaging, Telescopic system, Coupled systems, Transfer matrices of solenoid and Skew quadrupoles. Quadrupole doublet and Triplet.

Transverse and longitudinal beam dynamics: Beam envelope equation, Courant-Snyder invariant and emittance, Normalized emittance, Twiss parameters, Liouville’s Theorem, Periodic system, FODO and FOFO Cell. Magnet imperfections, Dipole field and Quadrupole gradient errors, Resonances in circular accelerators. Off momentum orbit, Dispersion function, Momentum compaction, Transition energy, Negative mass, Dispersion matching, Chromaticity and its corrections. Longitudinal equation of motion, Phase stability and synchrotron oscillations, Fixed points, Bucket, Separatrix.

Beam with space charge: Space charge effects, Uniform beam model with elliptical symmetry, Applied and self fields, Beam envelope equation with space charge, Pervience, Beam transport in a uniform and periodic focusing channel, Tune shift and current limits, Envelope oscillations, modes and instabilities, Linear beam model with charge neutralization, Space charge compensation. Vlasov model, K-V and Waterbag distribution, Stationary distributions in a uniform focusing channel, RMS emittance, Concept of equivalent beams, RMS envelope equations, Sources of emittance growth, Filamentation of phase space, Wake fields and image charge effects**.**

Linear accelerators: Particle Acceleration in an RF Field, Energy Gain in an RF Gap, Transit-Time-Factor, Shunt impedance, Quality factor, Phase and group velocities, Periodic Structures, Floquet Theorem and Space Harmonics, Traveling-Wave Linac Structures, Constant-Impedance and Constant-Gradient Structure, Independent-Cavity Linacs, Wider¨oe Linac, H-Mode Structures, Alvarez Drift-Tube Linac, Coupled-Cavity Linacs, Accelerating Structures for Superconducting Linacs, Transverse dynamics in a Linac, Transverse RF Focusing and Defocusing, Quadrupole Focusing in a Linac, Longitudinal dynamics in Linac, Longitudinal Focusing, Stability analysis, Separatrix, RF Bunching, Beam dynamics in RFQ accelerator.

Storage rings and synchrotron radiation: Radiation from moving charges, Coulomb regime, Radiation regime, Radiation sources, Bending magnet radiation, Wavelength shifter, Wiggler magnet radiation, Undulator radiation, Radiation power and angular distribution, Quantum fluctuation, Beam lifetime.

Advance accelerators: Free electron laser, Plasma accelerators, Spallation neutron sources, Rare ion beam (RIB) facilities. Accelerators driven subcritical systems (ADSS).

04ENGG04-016-C Advanced High Energy Physics Credit: 4

Renormalization in quantum field theory: One loop radiative corrections in quantum electrodynamics (OED), Power counting and the index of Divergence, dimensional regularizations and renormalizations. Calculations of one loop diagrams in QED.

Quantum Chromodynamics (QCD): Non-abelian guage theory, one loop diagrams and running coupling, Pertubative QCD.

Structure of hadrons: Proton form factor, Deep inelastic scattering of electron off proton, Parton evolutions.

Heavy Ion collisions at Ultra Relativistic Energies : Quark Gluon Plasma, Hadrons in thermal bath, Thermodynamics of strongly interacting matter, QCD phase transition in the laboratory, Space time evolution and signals of quark gluon plasma.

Space time evolution of Quark Gluon Plasma and relativistic hydrodynamics.

Suggested Books :

6. An introduction to Quantum Field Theory, *M. E. Peskin and D. V. Schroeder*
7. Quantum Field Theory, *L. H. Ryder*
8. Field Theory, *P. Ramond*
9. Gauge Field theory, *S. Pokoroski*
10. Quantum field theory, *L. S. Brown*
11. Introduction to High Energy Heavy Ion Collisions, *C. Y. Wong*
12. Quark Gluon Plasma from Big Bang to Little Bang, K. Yagi, T. Hatsuda ,and Y. Miake.

04ENGG04-017-C Advanced Materials Science – I (Effects of radiation in metals and alloys): Credit: 4

Interaction of radiation with matter: Interaction of electromagnetic radiation, neutrons and charged particles with matter, Concept of nuclear and electronic energy loss, Differential cross section in projectile target collision

Radiation Damage Event: Neutron-nucleus interactions, Interaction between ions and atoms, Ionization collisions.

The displacement of atoms: Elementary displacement theory, Modification to Kinchin-Pease displacement model, Displacement cross-section

Damage cascade: Displacement mean free path, Primary recoil spectrum, Cascade damage energy and cascade volume, stages of cascade development, behaviour of defects within the cascade

Radiation induced defect formation: Point defect formation, Thermodynamics of point defect formation, Diffusion of point defects, Dislocations.

Radiation enhanced diffusion and reaction rate theory: Point defect balance equation, Radiation enhanced diffusion, Defect reactions, Reaction-rate controlled processes.

Radiation induced segregation (RIS): RIS in concentrated binary alloys and ternary alloys, Effect of local composition changes on RIS.

Phase stability under irradiation: Radiation induced segregation, Radiation induced precipitation, Meta-stable phases, Amorphization.

Unique effects of ion irradiation: Ion irradiation techniques, Composition changes, Other effects of ion implantation like grain growth, Texture, Dislocation microstructure.

Simulation of neutron damage with ions : Aspects of radiation damage relevant to ion irradiation, Advantages and disadvantages of various particle types, Emulation of neutron irradiation damage with proton, Irradiation parameters for particle irradiation, Effects on mechanical properties due to irradiation hardening, Embrittlement, Irradiation creep and growth.

04ENGG04-018-C Advanced Material Science II Credit: 4

Multi-functional materials: Ferroelectricity, Multiferroic materials, Ferroelasticity, Magnetoelectric coupling, Conducting polymer and nanocomposites.

Nano-particle Physics: Introduction to nanoscale physics, nano mechanics, nano electronics, nano photonics, spintronics, various nano structured materials and their synthesis processes, probing of nano materials by advanced tools, applications of nano materials.

Advanced oxide materials: Crystal field splitting, John Teller distortion, Zener double exchange model, Mott insulator, Theory of superconductivity, Manganites, Density functional theory, Magnetic properties of solids, d0 ferromagnetism, Defect characterization in oxides by positron annihilation techniques, Mossbauer spectroscopy in oxides.

Suggested Books:

1. Solid State Physics, A J Dekker
2. Physics of Nanostructures, Dresselhaus and Dresselhauss
3. Transition Metals Oxides: An introduction to their electronic structure and properties, P A Cox.

04ENGG04-001-E Advanced High Energy Physics (Experiment) : Credit 4

Introduction to Relativistic Heavy-Ion Collisions-Experiments: Flow-chart from beam to Physics.

Relativistic Kinematics: Lorentz transformation; frequently used reference frames, Rapidity, pseudo-rapidity, invariant cross-section Collision and decays;

Distribution Functions: particle production and measurement in high energy collisions. ;

Detector Simulation in High Energy Physics: Requirement of detector simulation, Introduction to Geant4, Illustration with an example. ;

Physics of collisions: Synchrotron and Storage ring, Energy, Cross-section, Luminosity, Event rate, beam parameters.

Introduction to data analysis: hits, primary vertex, tracks, secondary vertex, trigger and pile-up.

Raw Data processing: Concept of detector and electronic noise, Detector calibration, Acceptance and Efficiency estimation, event and physics trigger selection, analysis for physics objectives.

Particle identification in high energy experiments: dE/dx, Range, TOF technique, Transition radiation.

Different techniques of Background and Error estimation.

Yield Calculations (Including Detector effects).

Global Observables: Multiplicity, (pseudo)rapidity distributions, invariant yields. ;

Centrality of events: Glauber Model, experimental methods.

Quarkonia suppression: Quarkonium spectroscopy, dynamics of quarkonium production in elementary collisions, cold nuclear matter effects, Debye screening, experimental observables and interpretation,

Correlations and Fluctuations: Concepts, BE correlations, Two particle angular correlation, physics interpretation**.**

Collective Flow: Radial flow, anisotropic flow: different flow harmonics and methods of extraction.

Physics of Jets: Formation, Energy loss, Jet reconstruction in high energy collisions (methodology), Importance.

Books:

1. Introduction to high energy Heavy-Ion Collisions, C. Y. Wong
2. Quark Gluon plasma from Big Bang to Little Bang, K. Yagi, T. Hatsuda and Y. Miake
3. Phenomenology of Ultra-Relativistic Heavy-Ion Collisions, Wojciech Florkowski
4. A Short Course on Relativistic Heavy Ion Collisions, Asis Kumar Chaudhuri
5. Ultrarelativistic Heavy-Ion Collisions, Ramona Vogt

04ENGG04-001-P **Project work equivalent to 12 credit.**

Ph.D. in
ENGINEERING SCIENCES

(PROGRAM CODE: ENGG04)

INSTITUTE for PLASMA RESEARCH
BHAT, Gandhinagar

Submitted to
HOMI BHABHA NATIONAL INSTITUTE
Anushaktinagar, Mumbai

Course CI – IPR, Gandhinagar: Degree to be awarded by HBNI, Mumbai

Starting time – 01 August 2015

Course pattern
1st year – 2 trimester courses, 1 trimester Mini Project
2nd year – Project thesis/Dissertation

IMPORTANT:
After 1st year, people who qualify will be given a job in IPR as per Scientist / Engineer SC – details to be mentioned in the Technical Training Programme (TTP) 2015 advt. IPR employees who have BTech/BE/AMIE/MSc degree can also take this course as per HBNI guidelines for employees.

Only BTech/ BE / AMIE in following disciplines are considered: Mechanical, Electrical/Electronics/Instrumentation. MSc – Physics is also considered.

Trimester 1:
All courses are common to all: 1 class (lecture) – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.)

Subject	Credits	Marks
Basic Plasma Physics (FC1)	3	100
Experimental Plasma Physics (FC2)	3	100
Tokamaks (FC3)	3	100
Fusion Plasma Diagnostics (FC4)	3	100
Measurement Techniques (FC5)	3	100
Numerical Methods (FC6)	3	100
Mathematical Methods (FC7)	3	100
Vacuum, Cryogenics and Magnets (FC8)	3	100
TOTAL	**24**	**800**

Trimester 2:
All courses in part (A) are common to all: 1 class – 60 minutes, 3 classes a day; 2 classes a week / faculty per subject; total number of classes/subject ~ 30 (including assignment, presentation, etc.). Courses in part (B) are subject/discipline specific.

Part (A): Advanced Subjects

Subject	Credit	Marks
Fusion Neutronics (AS1)	3	100
Plasma Facing Components: First Wall, Divertors, Blankets (AS2)	3	100
Fusion Materials (AS3)	3	100
RF, Current Drive and Neutral Beam Heating (AS4)	3	100
TOTAL	**12**	**400**

Part (B): All courses in part (B) consist of 4 classes a week; 1 class – 60 minutes, 2 classes a week / faculty per subject; total number of classes/subject ~ 60 (including assignment, presentation, etc.)
Subject Credit: 30 hours – 3 Credits
60 hours – 6 Credits

<table>
<tr><th>Subject</th><th>Hours</th><th>Total Credits</th><th>Marks</th><th>Remarks</th></tr>
<tr><td>Magneto Hydro Dynamics (PH1)</td><td>60</td><td rowspan="4">21</td><td rowspan="4">700</td><td rowspan="4">For Physics</td></tr>
<tr><td>Kinetic Theory and Statistical Mechanics (PH2)</td><td>60</td></tr>
<tr><td>Advanced Heat Transfer and Cryogenics (PH3/ME5)</td><td>60</td></tr>
<tr><td>Tokamak Related Code (PH4)</td><td>30</td></tr>

</table>

Trimester 3: Subject/Discipline specific project work

	Credit	Marks
Mini Project	**9**	**300**

TOTAL CREDITS IN 1ST YEAR: 24 + 12 + 21 + 9 = 66
TOTAL MARKS IN 1ST YEAR - 2200

2nd YEAR: M.Tech Thesis work

	Credit	Marks
1-year project/dissertation	**30**	**1000**

TOTAL CREDITS FOR 2 YEARS: 66 + 30 = 96
TOTAL MARKS for 2 YEARS – 3200

TRIMESTER 1

FC1 - Basic Plasma Physics (30 Lectures)

- **Introduction**

Definition of plasma, description of collective behaviour in contrast to single particle behaviour, derivation of plasma frequency (slab model), Debye length (description of Boltzmann distribution), conditions for collective behaviour (Physical basis for these conditions), binary collisions (derivation of Rutherford scattering), derivation of collision frequency ν_{ei} (large angle collisions, cumulative effect of many small angle collisions, Coulomb logarithm), discussion of collective behaviour revisited with relationship between various conditions (discussion of $k\lambda_D << 1$, plasma parameter).

- **Single Particle Motion**

Lorentz force equation, Nonrelativistic motion of a charged particle in constant electric and magnetic field: motion in constant **E** field, constant **B** field (derivation of cyclotron frequency, Larmor radius), motion in crossed **E** and **B** field, general solution for arbitrary angle between **E** and **B** field (Gantmakher formula), drift in a combined magnetic field and a general force field (non-magnetic), Motion in non-uniform **B** field (guiding centre approximation): Grad B drift ($\nabla\mathbf{B}\perp\mathbf{B}$), curvature drift, $\nabla\mathbf{B}||\mathbf{B}$ (magnetic mirrors, invariance of μ, concept of adiabatic invariance), Uniform **B** and spatially varying **E** field (Finite Larmor radius effects), Time and space varying **E** field (Ponderomotive force), Time varying magnetic field (adiabatic compression), Time varying **E** field (polarization drift)

- **Fluid Description of Plasma**

Fluid equations, Equation of state, Complete set of two fluid equations, Fluid drifts parallel and perpendicular to **B** (diamagnetic drift), Plasma Equilibrium, Transport and Stability

- **Waves in Plasma**

Notion of phase and group speeds, High frequency electrostatic waves in an unmagnetized plasma (Langmuir waves, Bohm-Gross waves), High frequency electrostatic waves in a magnetized plasma (upper hybrid oscillation), High frequency electromagnetic modes in an unmagnetized and magnetized plasma, Low frequency electrostatic waves in unmagnetized and magnetized plasma: ion-acoustic wave, ion cyclotron wave, lower hybrid oscillation, low frequency electromagnetic modes: Alfven wave, magnetosonic wave.

- **MHD Description**

Derivation of single fluid equations from two fluid equations, complete set of equations of Magneto Hydro Dynamics (MHD), MHD waves, MHD energy.

FC2 - Experimental Plasma Physics (30 Lectures)

- **Fundamental Gas Processes**

Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization, Thermal Ionization, De-ionization, Diffusion, Different Mechanisms of Electron-Ion Recombination, Electron Attachment and Detachment Processes, Ion-Ion Recombination Processes, Formation of Negative Ions, Electronic Properties of Solids, Surface Emission Processes, Thermionic Emission, Field Emission, Photoemission, Particle Interaction with Solids, Interaction of Electrons with Surfaces, Interaction of Ions with Surfaces, Interaction of Neutrals with Surfaces, Sputtering Phenomena.

- **Charged Particles in a Gas in Electric Field of Low and High E/p**

Diffusion and Drift in an Electric Field, Redistribution of Particles through Diffusion and Drift, Ion Mobility, Ambipolar Diffusion, Electron Drift Velocity, Concept of High E/p, Primary Ionization Processes, Electron Avalanche, First Ionization Coefficient.

- **Self-sustaining Discharge**

Over-exponential Carrier Multiplication, Ionization by Positive Ion Collision, Cathode Processes, Processes in the Gas, Secondary Ionization Processes, Second Townsend ionization Coefficient, Paschen's Law, Breakdown Criterion, Limitations of Townsend Mechanism.

- **Glow Discharge**

Structure of Glow Discharge, Current-Voltage Characteristics of Glow Discharges, Physical Interpretation and Theoretical Analysis of Cathode Zone, Negative and Faraday Dark Space, Positive Column and Anode Layer, Striations, Specific Glow Discharge Plasma Sources.

- **Breakdown under Special Conditions**

Breakdown under Alternating Fields, Microwave Controlled Breakdown, Mobility Controlled Breakdown, Inductively Coupled Discharge, Capacitive Coupled Discharge.

- **Arc Discharge**

Glow to Arc Transition, Current-Voltage Characteristics of Arc Discharges, Classification of Arc Discharges, Cathode and Anode Layers, Different Models of Positive Column, Different Configurations of Arc Discharges, Bennet Pinch and Electrode Jet Formation.

- **Plasma Sheath and Diagnostics**

Basic Concepts, Bohm Sheath Criterion, High Voltage Sheath, Generalized Criteria for Sheath Formation, Electrostatic Probe Diagnostics, Single Langmuir Probe, Double Probe and Emissive Probe.

- **Experimental Plasma Devices**

Large Volume Plasma Device, BETA machine, SMARTEX, Helicon Plasma Expt., Q-machine, SYMPLE, Linear Magnetized Plasma Beam Expt., Plasma Wakefield Expt., Plasma Torch.

FC3 - Tokamaks (30 Lectures)

- **Introduction to tokamaks**

Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor, Tokamak Research, Major constituents of Tokamaks, Indian Tokamaks, Tokamak Confinement, Confinement times, Ohmic Confinement, L-mode and H-mode Confinement, Confinement scaling, Radiation loses.

- **Equilibrium and Transport**

Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport, Neoclassical Transport.

- **Heating**

Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive
Ion Cyclotron Resonance Heating, Electron Cyclotron Resonance Heating.

- **MHD Stability**

Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios.

- **Tokamak Devices and Other Fusion Devices**

Operating Regimes, Tokamak Magnetic Systems, Power systems, Plasma Production, Measurements of major operational parameters, Plasma wall interaction, Runaway electrons, Impurities, Operational experience in Aditya and SST-1, Other Fusion Devices.

FC4 - Fusion Plasma Diagnostics (30Lectures)

- **Introduction to Tokomak diagnostics**
  Introduction to all the tokomak diagnostics and related measurements.

- **Electrical diagnostics**

Langmuir probe: Single probe characterisation, explanation and other issues, Probe configurations, Double and Triple probes, Emissive probes.

- **Magnetic diagnostics**

Rogowski, flux and diamagnetic loops, Configuration and other details, plasma position and shape measurements, Introduction to MHD instabilities and Mirnov oscillations.

- **Measurements of plasma density and electron temperature**

Thomson scattering diagnostics: General concepts of Thomson scattering. Principles of Thomson scattering diagnostics. Types of Thomson scattering diagnostics used in tokamaks, Description of a typical diagnostics set up, technical features of the diagnostics set-up. Advantages and limitations of the technique.

Reflectometery: General concepts of Reflectometery. Physics principles of diagnostics. Different types of Reflectometry techniques, description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

Interferometry: General concepts of Interferometry. Physics principles of diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis. Advantages and limitations of the techniques.

ECE diagnostics: Concepts of Electron Cyclotron Emission. Physics principles of the diagnostics. Description of the typical diagnostics set up, technical features of the diagnostics set-up. Data analysis, Advantages and limitations of the techniques.

- **Measurement of impurities**

Introduction to spectroscopy, basics of passive and active spectroscopy and introduction to Visible, VUV and X-ray spectroscopy. Measurements of impurities by Visible spectroscopy and VUV/X-ray spectroscopy Data analysis by using actual spectra.

- **Measurement of ion temperatures**

Charge exchange recombination spectroscopy (CXRS) : Physics principles of CXRS , typical diagnostic set up, technical features of set up and brief on analysis techniques. Estimation of ion temperature using actual data.

X –ray crystal spectroscopy : Physics principles of X-ray crystal spectroscopy diagnostics , typical diagnostic set up, technical features of set up and brief on analysis techniques.

Neutral particle analyser: Concept of charge exchange (CX) neutral flux escaping from the tokamak plasmas, introduction to the different techniques for measurement of CX flux and energy distribution, description of the diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of the techniques, presentation of data analysis and estimation of core-ion temperature, analysis of actual plasma discharge data and estimation of ion-temperature.

- **Measurements of Radiated power**

Bolometers: Concept of Bolometry, requirement of bolometric measurements for tokamak plasmas, introduction to the different Bolometry techniques available for measurement of total radiated power loss from toakamak plasma, description of the different bolometers namely: Metal foil, AXUV and Imaging Video Bolometers, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each Bolomters, presentation of data analysis and estimation of total radiated power loss, analysis of actual plasma discharge data and estimation of total radiated power loss from the plasma.

- **Measurements of operational parameters**

Soft X-ray diagnostics: Introduction to the Soft X-ray diagnostics, physics principles and measurement technique, description of the diagnostics set up, description of the technical features of the diagnostics set up, advantages and limitation of the SXR diagnostic for electron temperature measurements.

Imaging Diagnostics: Requirement of imaging diagnostics for tokamak plasma, concept of different imaging diagnostics namely: Infrared Imaging Diagnostics, Visible Imaging Diagnostics etc., physics principles involved, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each imaging diagnostics, presentation of data analysis and analysis of actual plasma discharge data available for the imaging diagnostics.

Hard X-ray monitors: Concept of runaway electrons production in tokamaks, different measurement techniques available for the runaway detections, requirements of HXR measurements on tokamaks, principles of Hard X-Ray (HXR) generation due to runaways, introduction to HXR monitors for confined and de-confined runaways, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of HXR monitors.

Motional Stark Effect diagnostics and Beam emission spectroscopy: Introduction to beam based diagnostics, description of various beam based techniques for different types of operational parameters (q profile, ne(edge),Te(edge) and neutral beam density). Description of the diagnostics setup and technical features of the diagnostics setup and data analysis techniques.

Dust and Erosion monitors and Tritium monitors : Introduction to the concept of the Dust, erosion in tokomaks. Importance of the measurement of Dust, Erosion and Tritium. Challenges involved in the measurements. Example schemes of the measurement techniques.

- **Measurement of fusion products**

Introduction to fusion product measurements and importance of the measurement and control of fusion product generation. Various techniques available for measuring fusion products.

Confined and Lost alphas: Requirements of lost alpha particle diagnostics on future fusion devices, different diagnostics techniques available for the lost alpha diagnostics, principle of detection techniques, diagnostics set up, description of the technical features of the diagnostics set-up, advantages and limitations of each techniques and future applicability to fusion devices.

Gamma ray spectroscopy: Requirements of gamma ray spectroscopy on future fusion devices, principle of detection technique, diagnostics set up, description of the technical features of the diagnostics set-up.

Neutron flux and neutron profiles: Introduction to neutron flux and neutron profile measurements, measurement principles, measurement schemes and typical diagnostics set ups and discussion on challenges involved.

- **Overview and summary of ITER Diagnostics**

Discussion on the challenges involved in diagnosing fusion grade plasmas, over view of ITER diagnostics.

FC5 - <u>Measurement Techniques</u> (30Lectures)

- **Measurement System**

Introduction, Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems.

- **Specifications parameters of Measurement Systems**

Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability.

- **Electrical Measurements and Disturbances in Measuring System**

Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power.
Disturbances in Measuring System, Leakage Current, Parasitic Capacitive Coupling, Parasitic Inductive Coupling, Disturbances caused by: Electromagnetic Field, Feeding Cables, Improper Grounding.

- **Sensors/Transducers and Their Applications to Physical Measurements**

Sensors and Transducers – Performance Parameters, Selection of Sensors/Transducers, Temperature measurements, Pressure measurements, Flow measurements, Measurement of Linear/Angular acceleration, Velocity and Displacement, Measurement of Force and Torque, Measurement of radiant energy/light with Photosensitive Devices, Physical parameters sensing with Plasma diagnostics.

- **Analog Electronics**

  Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Pre-amplifiers, Pulse Amplifier, Signal isolation, Filters, Attenuators.

- **Introduction to Data Acquisition**

  Data Acquisition (DAQ) overview, Major components in development of Data Acquisition System (DAS), PC based data acquisition system, Data plotting and analysis. DAQ Software: Overview of Graphical/command based programming for the acquisition, Data processing and presentation of data: MATLAB, LabVIEW Application development environment, Concept and importance of Data Storage System, Microprocessors/Microcontrollers based measurement system.

- **Noise in Measurement System**

  Introduction to EMI/EMC, Methods of Noise Coupling, Methods of eliminating interference, Grounding, Cabling, Shielding, Intrinsic Noise source, Digital Circuit Noise, Sensor – DAS interface, Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for measurement.

FC6 - Numerical Methods (30 Lectures)

- **Modeling, computation and error analysis:**
Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study.

- **Solutions of Linear Algebraic equations:**
Matrix algebra, Eigen value problems, Gauss elimination and LU factorization, Matrix inverse and conditions, Singular value decomposition, Iterative methods, Case study.

- **Numerical Differentiation and Integration**
Numerical differentiation, Numerical Integration, Case study.

- **Roots, optimization and nonlinear sets of Equations**
Bracketing methods, Open methods Optimization - Case study.

- **Application of Ordinary Differential equations**
Initial Value problems, Adaptive methods and stiff systems, Boundary value problems, Case study.

•**Application of Partial Differential equations**
Methods to solve PDEs, Case study.

•**Application of Curve fitting methods**
Linear Regression analysis, Fast Fourier Transform, Power spectral analysis, Bispectral analysis, Polynomial interpolation and extrapolation, Cubic spline interpolation, Nonlinear Least **Square** methods Case study.

FC7 - <u>Mathematical Methods</u> (30 Lectures)

- Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl. Gauss, Green's And Stokes Theorems. Laplacian Operator in Different Coordinate Systems.
- Matrix Algebra: Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors; Similarity transformation and diagonalisation of a matrix.
- Complex analysis: Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series, singularities(poles and essential singularity) , Residues, Cauchy Residue theorem, Contour integration, Conformal Mapping and its application to the solution of Laplace equation.
- Differential equations: First and second order differential equations with constant and variable coefficients; Linear differential equations: Approximate method for solving ODE's (Series method of solution; Legendre and Bessel's differential equations and their solutions); Orthogonal polynomials and Special functions - Bessel functions, Gamma functions and Beta functions.
- Partial differential equations: First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations. Method of charateristics, Separation of variables.
- Integral Transforms: Fourier, Laplace Transforms and the inverse transforms, connection to physical problems. Applications for obtaining solution of ordinary/partial differential equations.

FC8 - <u>Vacuum, Cryogenics and Magnets</u> (30 Lectures)

- **Fundamental of vacuum**
- The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pumpdown time, Outgassing and permeation. Exposure to pumps and gauges.

- **Design of a vacuum system**

Selection of materials, Pumps, Gauges, Valves, Rules for operating vacuum system. Permanent seals, Demountable seals, Vacuum components, Cleaning techniques.

- **Fundamental of cryogenics**

Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.

- **Design of cryogenics system**

Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
Basics of Cryogenic valves, sizing, leaks and heat load estimation, Instrumentation at cryogenic temperatures. Safety aspects in handling cryogens.

- **Applications of Cryogenics Engineering in Fusion machines**

SST-1 Magnets, Cryo pumps, pellet injectors.

- **Fundamentals of Magnet system**

Resistive and Superconducting Magnet Systems,LTS and HTS based conductors, Flux Jumps, Filament twisting, AC losses, Cryo-stability, Monolithic & Cable-in-conduit-conductor (CICC) concepts.

- **Design and fabrication of magnet system**

Magnetic field calculations (analytical & computational tools), Magnetic force calculations, Structural design for magnets, Conductor design & Magnet winding pack design. Magnet winding pack fabrication & engineering issues, Insulation systems in magnets manufacturing, Magnets winding pack consolidation, QA/QC in magnets manufacturing.

- **Magnet operation**

Sensors and Instrumentations in Superconducting Magnets, Superconducting Magnet Quench and Protection aspects, Superconducting Magnet Tests & auxiliary test facilities, SST-1 Magnet System.

TRIMESTER 2 – PART A

(Part A is common to all)

AS1 - Fusion Neutronics (30 Lectures)

- **Neutronics Basics**

Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes, nuclear reactions, cross section, and thermalisation, scattering & absorption processes.

- **Particle transport phenomena in matter**

Neutron & photon transport, mathematical transport problem-Boltzmann transport equation, - probabilistic particle transport simulation - MCNP Monte Carlo code, tools: MCNP, Attila, Validation of computational tools and data.

- **Basics of fusion neutronics & blanket neutronics**

Neutronics design optimization, nuclear design of reactor components (blankets, divertor, first wall, heating systems, diagnostics etc.), Nuclear design analysis – optimization, source modelling, nuclearresponsecalculations,neutronandgammafluxes,nuclearheating,tritiumproductionrates,gasproductionanddpa.Amountoftritiumrequiredforafusionreactor,TritiumBreedingRatio, activation products & decay heat assessments, radiation damage & transmutation

- **Principles of Neutron & Fusion product diagnostics**

Processes in the plasma leading to non-maxwellian fuel ion distribution, experimental neutron, gamma-ray & alpha particle detection techniques, computational techniques to extract relevant information about the velocity functions of fusing ions out of measured neutron signals. Concepts of integrated modelling to assess and analyze the neutron emission features.

- **Radiation and licensing**

Radiation units, Radiation protection standards, Biological & genetic effects of radiations, Radiation shielding principles, composite shielding materials. Concepts of licensing & decommissioning of nuclear installations.

- **Radiation damage & transmutation**

Activation & after-heat, tools for calculations EASY-2010, concept of direct one step (D1S) method and Rigorous 2 step (RS2) process (MCNP-FISPACT) in estimating the dose rate on components of a fusion reactor after reactor shut down. Generation & management of radioactivewastefromatypicalfusionreactor.Quantification&Categorizationofradioactivewaste

- **Nuclear Safety aspects**

Basic concepts in safety, reliability and RAMI analysis, loss of coolant accidents, conceptual design of safety systems, risk and reliability analysis of systems, operational safety procedures, regulatory process, introduction to safety related instrumentation, remote handling of irradiated components

- **Fusion Neutronic Activities Worldwide**

Overview &Latest neutron facilities being built all over the world and recent trends. 4th generation nuclear reactors (high temp & compact reactors), Accelerator Driven Systems (ADS), IFMIF & CTF, Spallation Neutron Source (SNS), Fus-Fis hybrid systems (breeders), Transmutation of radiation wastes

---

AS2 - Plasma Facing Components: First Wall, Divertors, Blankets (30 Lectures)

- **First Wall**

  - **Firstwall Concepts :** Basic Design of Firstwall.
  - **Loads on Firswtall: I**nertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Firstwall:** Material Challenges, Fabrication Challenges, Operational Challenges.

- **Divertors**

  - **Divertor Concepts:** Basic Design of Diveror, Toroidal & Poloidal Divertor, Single-Null Divertor, Double-Null Divertor.
  - **Loads on Divertor:** Inertial loads, Kinetic Pressure Loads, Electromagnetic loads, Thermal & Particle loads, Neutronic Loads.
  - **Challenges for Divertor:** Material Challenges, Fabrication Challenges, Operational Challenges.
  - **Divertor Testing:** Destructive Testing, Non-Destructive Testing, Metrology.
  - **Novel Divertor Concepts:** Helium Cooled Divertor, Liquid Divertor.

- **Blankets**

  - **Blanket Concept**: Requirement and essential features of Shield Blanket (SB) and Breeding Blanket (BB) in a fusion reactor.
  - **Shield Blanket:** Types of SB and SB material, SB Design Concept, Thermal-hydraulic and thermo-mechanical analysis of SB.
  - **Breeding Blanket:** Types of BB and blanket materials (solid and liquid), concept of Indian BB, Indian Lead Lithium cooled Ceramic Breeder (LLCB) Test Blanket Module (TBM) for ITER, concept of LLCB-TBM design, thermal-hydraulic and thermo-mechanical analysis of SB, LOCA and LOFA analysis of BB, Diagnostics of BB.
  - **Solid Ceramic Breeder (CB) Technology:** Development of Li CB, characterization of Li CB material, characterization of Li CB pebble bed, thermal and thermo-mechanical analysis of pebble bed.
  - **Liquid Metal (PbLi) Technology: C**omposition and developmental process of PbLi eutectic alloy, Study of basic (PbLi) loop and loop components, PbLi diagnostics. Liquid

metal MHD studies – basic analytical formulation (Velocity profile and Pressure drop studies), liquid metal MHD code development (Electric potential Method and Magnetic induction method), code benchmarking, Liquid Metal MHD experiments (Experimental set up, experimental results), liquid metal (Pb-Li) Corrosion studies (Corrosion experiments, experimental results, numerical formulation).

- **Fusion Fuel Cycle:** Requirement and essential features of fusion cycle of a fusion reactor, inner & outer fuel cycle of a fusion reactor, tritium handling technologies, tritium storage & delivery system, tritium extraction system, Tokamak exhaust processing system, tritium diagnostics.
- **Blanket Safety:** Gaseous and liquid releases during normal operation and maintenance, accidental conditions – Design Basis Accidents (DBA), Beyond Design Based Accidents (BDBA), Loss of Coolant Accidents (LOCA), Loss of Flow Accidents (LOFA), complete loss of active cooling.

AS3 - Fusion Materials (30 Lectures)

- **Fundamentals of Material Science**

  - Crystalline nature of matter - Structure and bonding of atoms, atomic arrangements in materials, Structural phase formation and transition, Types of materials (Metals, Alloys, ceramics, composites, glasses, polymers, Superconductors).
  - Defects in solids – Imperfections, Frenkel pairs, Dislocation theory, Grain-boundary, Stress Fields and Strain Energy
  - Metallurgical Aspects of materials – Solid solutions, solubility, Precipitation, Diffusion in solids (Diffusion Laws), ordering in alloys, Phase diagrams, strengthening and hardening Mechanisms, Annealing and heat treatment.
  - Physical Properties of materials – Electrical, Thermal, Magnetic, Dielectric, optical and other properties of materials
  - Mechanical Behaviour of materials – Elastic and Plastic deformation, metallic Creep and fatigue, Strengthening and toughening of steels and non-ferrous alloys, fracture and DBTT , toughness
  - Introduction & Survey of Computational Tools, Multi-scale Models

- **Fusion Materials Requirements & Issues**

  - High heat flux handling – HHF source types, parameters and effects.
  - Erosion & Corrosion – Sputtering, erosion due to heat and particle bombardment, erosion and corrosion due to liquid metals, Hydrogen embrittlement, Oxidation, Pitting and crevice corrosion

- **Material Development and Joining Technologies**

- Manufacturing Methods & Processes – Steels and alloys melting, Powder metallurgy route, Ceramics preparation methods, Composites developments, Superconducting materials manufacturing.
- Structural Materials – Austenite and Ferritic Martensitic (FM) steels, ODS alloys, Vanadium and Titanium alloys, Carbon and SiCf/SiC composites
- Functional Materials – Plasma facing Materials (Tungsten, graded and other materials), Tritium Breeding & Blanket materials, special ceramics, Superconducting materials, Heat sink Materials, shielding Materials, Diagnostics and window materials, coatings
- Joining Technologies – Methods and Issues (Welding, Brazing, Diffusion Bonding, Hiping)

- **Material Characterization & Qualification**

- Structural Characterization – Crystal and Microstructural Analysis, defect structure, Phase Transition (XRD, SEM, TEM, Neutron Diffraction, PAS)
- Compositional Characterization & Surface Techniques (EPMA, EDX, ICP-MS, XPS and AES, SIMS), Impurity limits
- Particle beam Techniques (ERDA, RBS, NRA, Synchrotron Source)
- Mechanical Property Testing- Hardness, Fatigue, Fracture, Tensile, Creep
- Thermal Property Testing – High Heat Flux test, Thermal conductivity, Thermal Expansion coefficient, Electrical Property Testing & NDT, codes and standards – Resistivity (AC &DC), Radiography, Ultrasonic techniques

AS4 - RF, Current Drive and Neutral Beam Heating (30Lectures)

- **Heating and current drive physics by neutral beam**

Basic process during beam-plasma interaction, Beam injection geometry and its implication, Energy transfer mechanism from energetic neutral beam particle to plasma, Energetic particles orbits in asymmetric field structure, Physics of current drive by NBI, Role of fast ions in Neutral Beam Current Drive efficiency.

- **Neutral beam injector system design and engineering**

Basic NBI configuration, Optimization procedure of beamline configuration, Pressure profile optimization, Beam transmission optimization.I on source design and engineering, Different Plasma production mechanism, Positive ion and negative ion production, Ion extractor and accelerator system, Beamline component design and engineering, Neutralizer, Residual Ion Dump (RID), Calorimeter or V – target, Vacuum system design and engineering, Vacuum vessel, NBI – tokamak interface duct, Cryopumps and cryogenic system, Auxiliary pumping system, Diagnostic system design and engineering, Ion source plasma diagnostics, Electrical Probe based, Spectroscopy based, Negative ion diagnostic, Laser photo-detachment, Cavity ring down method, Hairpin resonator based, Ion-acoustic wave based, Beam profile diagnostic, Doppler shift spectroscopy, Thermal imaging diagnostic, Calorimetric diagnostic, Power supply system design and engineering, RF Power supply, HV power supply for ion extraction and acceleration.

- **Introduction to RF heating**

Introduction to Fusion Reactor: Why RF and Microwave Power is required for Fusion? Interaction of electromagnetic waves with plasma.

- **Waves**

Theory of waves in unmagnetized plasma, EM waves, Longitudinal waves, Transverse wave, Ion acoustic waves. Theory of waves in magnetized plasma, EM waves, X-mode, O-mode, Hybrid waves. Classification of RF regimes. RF Requirements of Fusion Reactor, Different heating, pre-ionization and current drive mechanisms. Dispersion relations. Wave propagation in toroidal plasma geometry. Power absorption, Landau damping, Current drive mechanisms in different regime.

- **RF devices and Design tools**

Introduction to general type Waveguide, RF amplifier and Oscillators, Antennas, Engineering issues, RF design software.

- **ICRH**

Introduction to RF applications in ICRH, its design and issues. Introduction to RF transmitter, Power transmission, Antenna design, Auxiliary systems for ICRH. Diagnostic system, Impedance matching unit, Control system. Important results on different tokamaks about ICRH system. Introduction to Aditya and SST-1 ICRH Systems

- **ECRH**

Introduction to RF application in ECRH its design and issues. Introduction to Gyrotron source. Power transmission, Antenna design, Auxiliary systems for ECRH. Diagnostic system. Control system. Important results on different tokamaks about ECRH system. Introduction to Aditya and SST-1 ECRH Systems.

- **LHCD**

Introduction to LHCD system its design and issues. Introduction to Klystron source, Power transmission, Antenna design, Auxiliary systems for LHCD. Impedance matching unit, Diagnostic system, Control system. Important results on different tokamaks about LHCD system. Introduction to Aditya and SST-1 LHCD System.

- **Other types of wave heating**

Alfven wave heating, Bernstein wave heating, Design and its issues, Introduction to its sources, Power transmission, Antenna design, Impedance matching unit, Diagnostic system, Control system. Important results on different machines.

TRIMESTER II – PART B

Part –B contains the details of the core subjects.

PHYSICS

PH1 - Magnetohydrodynamics (60 Lectures)

- Physical description of electrically conducting fluids
- Derivation of basic MHD equations: Continuity, Equation of motion, Energy flow, Ohm's law, Validity of MHD equations
- The low frequency dynamics of the electromagnetic field
- Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of resistivity, Similarity scaling, The Wöltjer invariants and helicity
- Equilibrium: General considerations, The Virial Theorem, Examples of simple equilibria: -pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm ashape, etc.
- Comparison of fusion confinement systems: Spheromak, FRC, RFP, Spherical Tokamak
- Tokamak Equilibrium: In large aspect ratio limit with arbitrary choice of profile, Solovev equilibrium with finite aspect ratio and linear profile in poloidal flux, Solution with arbitrary aspect ratio and arbitrary choice of profiles (numerical)

PH2 - Kinetic theory and Statistical mechanics (60 Lectures)

- Gas dynamic way of describing an uncharged fluid – heuristic
- Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
- Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
- Using heuristic arguments in single particle phase space (x,v) to obtain "fluid equations" in phase space – namely – the Vlasov-Poisson Equations
- Introduce conservation of Energy and other physical quantities as constraints.
- Using constrained variation technique demonstrate how entropy extremization leads to Maxwell-Boltzmann distribution f_mb(x,v) and importance of Maxwell-Boltzmann distribution
- Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
- Linear Landau Damping – why is this not seen in fluid equations?
- Two stream instability and Phase Space structure formation
- Many stream interpretation of an equilibrium distribution f_mb(x,v)

- Stability – Newcomb-Gardner Theorems and Penrose Stability Criteria
- Nonlinear Landau damping and Theory of BGK modes – revisit Two stream instability.
- Stability of BGK modes.
- Particle correlations and need for two-body and higher order distributions
- Equations governing two body distrution f_2(x,v,t) and its relationship to f(x,v,t) the one-body or Vlasov distribution studied earlier – Introduction of pair correlations
- Construction of a N-body distribution function f_N and BBGKY Hierarchy issues.
- Klimontovich-Dupree (KD) procedure – Obtaining a "statistical N-body" distrituion from KD equation.
- Green-Kubo formalism – Transport and Correlations
- Examples of GK formalism and obtained transport
- Very cursory introduction to Onsager relationships

PH3 - Advanced Heat Transfer and Cryogencis (60 Lectures)

(PLEASE SEE ME5 – these are common courses for Physics and Mechanical disciplines)

PH4 - Tokamak related Code (30 Lectures)

- **Plasma core modelling:**

— Plasma equilibrium IPREQ

— Plasma transport TSC

— Plasma stability ERATO, PEST2

— ICRH heating TORIC

— NBI heating NUBEAMS

— Plasma start up model

— Reactor system code

— Eddy current analysis

— TF modelling EFFI

— Vertical instability analysis

- **Edge-SOL studies**

— 2D blob transport

— Divertor study SOLPS (B2+ERINE)

— 3D plasma study ERINE-3D

- **First principle simulations**
  - Low frequency (w/wc <<1) transport – what is Gyrokinetic method?
  - What are the transport processes neglected by gyrokinetic formalism?
  - What are global and local simulations – examples (flux tube modes and global models)?
  - Under what conditions do results from these two simulations are expected to match?
  - Gyrokinetic equations derived from Vlasov-Poisson equations using Bessel function procedure
  - How does Gyrokinetic formation capture the physics of Finite Larmor Radius to all orders at low frequencies?
  - Numerical Advantages of Gyrokinetic formalism – examples
  - Simulating very large scale systems (100s of larmor radii) using very large parallel computers – Issues and Advantages
  - Modelling energetic particle transport using Gyrokinetic formalism

MECHANICAL

ME1- Code Design for internal and external pressure vessel (30 Lectures)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive

Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1and Div.2.

- Difference between metallic pressure vessel and FRP pressure vessels.
- Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Failure modes of pressure vessels, Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and piping's.

ME2 - Finite element and volume methods (60 Lectures)

Finite Elements methods (30 Lectures):

- Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation, piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
- Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
- Bar element: Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss.
- Beam element: Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- 2D plane elements – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- 2D isoparametric formulation – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress.
- Introduction and Application to 3D elements: Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Shell element: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions.
- Introduction to Nonlinear problems: Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method.

- Finite element applications for design: Finite element modelling and discretization criterion,h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

Finite Volume Methods (30 Lectures):

Basics of Fluid Flow, Heat Transfer and Numerical Analysis

- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity',momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme

Laminar Boundary Layer and Forced Convective Heat

- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Convective heat transfer for internal and external flows.
- Low and high Prandtl number limits and different thermal boundary conditions.

Turbulent Flow and Heat Transfer

- Reynolds decomposition for turbulence.
- Prandtl's mixing length theory, Mixing length models.
- Structure of turbulent boundary layer over flat plate and through circular cylinder.
- Calculation of friction factor and drag coefficient.
- Analytical and semi-analytical correlations for calculating heat transfer coefficients.
- Reynolds analogy & Low Reynolds number models.
- Turbulence Modelling.
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model.
- Reynolds stress models: algebraic and differential models.

Natural Convection

- Basic Equations of natural convection.
- Derivation of Dimensionless groups from basic equations.
- Analytical approximations.
- Numerical solution of approximate equations.

Numerical Solution of Complete Fluid Flow and Energy Equation

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation.
- Primitive-Variable (P-V-T) formulation.
- Pressure velocity coupling for incompressible flow
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE, SIP and SIMPLEN family of Methods.
- Simple grid generation techniques for structured grid.
- Elliptic, parabolic and hyperbolic equation method.
- Domain decompositions in CFD and heat transfer.

ME3 - Mechanics of solid/vibration/ remote handling (30 Lectures)

Mechanics of solids

- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of stress

- Description / Notations of Forces & Stress.
- Component of stress.
- Reciprocity of shear stress in 3D.
- Stresses Transformation using direction cosines.
- Stress Traction Vectors or Traction Vectors.
- Stress component on an arbitrary plane.
- Principal stresses & Mohr's Diagram for 3D state of stress.
- Stress Invariants.
- Hydrostatic and Deviator components of stress.
- Principle planes and their orthogonally.
- Octahedral plane, Octahedral stresses.
- State of pure shear.

Analysis of strain

- Description / Notation of Strain in 3D.
- Components of strain.
- Strain Transformation using direction cosines.
- Principle Strains, Strain Invariants.
- Strain Deviator Tensor.

Principles and fundamental Equations of Elasticity

- Strain and displacement relations (Cauchy's equations).
- Compatibility equations (Saint-Venant's Equations).
- Generalized Hook's Law.
- Anisotropy and Isotropy of elastic behaviour.
- Stress and strain relationship.
- Equations of equilibrium (Navier's Equations, Lame's equations).
- Strain Energy.
- Uniqueness theorem.
- Bounds on elastic constants.
- Superposition Principles.
- Saint-Venant's Principle.
- General Solution Procedures for an elasticity problem.

Vibrations

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations underdamped, overdamped and critically damped systems; Response to harmonic loading -complementary solution and particular solution; Response to periodic loadings using Fourier Series
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems;Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration).

Remote handling

- Automation and introduction to remote handling.
- Industrial manipulators.
- Kinematics of manipulators specifying position and orientation of rigid bodies, Euler angles, homogeneous coordinate transformations, D-H representations of kinematic linkage, velocity analysis of manipulators.

ME4 - Advanced Manufacturing Technology (30 Lectures)

ADVANCE MANUFACTURING PROCESSES

- INTRODUCTION: Unconventional Machining Process, Need – clarification – Brief overview of all techniques.
- MECHANICAL ENERGY BASED PROCESSES: Abrasive Water Jet Machining, Water Jet Machining, Ultrasonic Machining (AJM / WJM/ USM). Working principles – equipments used – process parameters – MRR – Variation in techniques used – Applications.
- ELECTRICAL ENERGY BASED PROCESSES: Electro Discharge Machining, Working principles – Equipments – Process parameters – MRR – electrodes/ tools / power circuits – tool wear – Dielectric- flushing- Wire cut EDM – Applications.
- CHEMICAL AND ELECTRO-CHEMICAL ENERGY BASED PROCESSES: Chemical Machining, Electro- Chemical Machining – Etchants- maskant-Techniques of applying maskants – Process parameters – MRR –Applications. Principles of ECM-MRR-Electrical circuit – process parameters – ECG and ECH applications.
- THERMAL ENERGY BASED PROCESSES: Laser Beam Machining, Plasma Arc Machining and Electron Beam Machining. Principles – equipments – types – beam control techniques applications.

ADVANCED MATERIALS JOINING AND TESTING

- INTRODUCTION: Classification – heat sources – metallurgical effect of weld – residual stresses: formation and relieving – capillary and welding action – temperature range – filler material and fluxes – types of joints and welding positions – weldability: design, process and metallurgical consideration – testing and improvement.
- JOINING TECHNIQUES: Bolting – riveting – soldering – blazing – adhesive bonding – diffusion bonding – mechanical joining. Fusion welding: Oxyacetylene welding – SMAW – GTAW – GMAW – FCAW – SAW – ESW – High energy beam welding: EBW, LBW, PAW – friction stir welding. Output parameter variation – advantages and disadvantages – applications.
- RESPONSES OF MATERIALS TO WELDING: Microstructural changes – distortion – defects: undercuts –overlaps – grain growth – blowholes – inclusions – segregation – lamellar tearing – porosity. Remedies: Edge preparation – alignment – control of heat input – preheating – peening – heat treatment – jigs and fixtures – number of passes.
- DESTRUCTIVE AND NON-DESTRUCTIVE TESTS FOR WELDS: Introduction – need – principles – applications –destructive tests: tensile, bend, impact, hardness, fatigue, cracking,

etching. Non-destructive tests: Visual, dye penetrants, magnetic particle, acoustics, pressure, radiographic, ultrasonic, eddy current.

ME5 - Advanced Heat Transfer and Cryogenics (60 Lectures)

Computational Fluid Dynamics

- Basics of fluid flow and heat transfer, Mathematical description of fluid flow, conservation equations for mass and momentum, Classification of partial differential equations, discretization techniques using finite difference and Finite volume methods, Taylor's series and control volume formulations, stability, consistency and Convergence of numerical schemes, application of numerical methods to model equations.
- Natural convention and Forced convection heat transfer and calculation heat transfer coefficient for different geometrical configurations and analytical approximations relations
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and adiabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio.

Heat Transfer

Conduction:

- Derivation of energy equation for conduction in three dimensions – Initial and boundary conditions. Solution of simple problems in steady state conduction with analytical solutions – Concept of electrical analogy – fin heat transfer and concept of fin efficiency and fin effectiveness.
- Concept of Biot number – Lumped capacitance formulation – simple problems – unsteady conduction from a semi-infinite solid- solution by similarity transformation method. Solutionof the general 1D unsteady problem by separation of variables and charts- example problems.
- Laplace equation – solution by variable separable method – concept of superposition and homogeneous boundary conditions. Phase change problems – The Stefan and Neumannproblems – analytical solutions.

Convection:

- Natural Convection heat transfer: Governing equations for natural convection, Bossiness approximation, Dimensional Analysis, Similarity solutions for Laminar flow past a vertical plate with constant wall temperature and heat flux conditions, Integral method for natural convection flow past vertical plate, effects of inclination, Natural convection in enclosures, mixed convection heat transfer past vertical plate and in enclosures.
- Laminar External flow and heat transfer:
  Similarity solutions for flat plate (Blasius solution), flows with pressure gradient(Falkner-Skan and Eckert solutions), and flow with transpiration,

Integral method solutions for flow over an isothermal flat plate, flat plate with constant heat flux and with varying surface temperature (Duhamel's method), flows with pressure gradient (von Karman-Pohlhausen method).

- Laminar internal flow and heat transfer:
  Exact solutions to N-S equations for flow through channels and circular pipe, Fully developed forced convection in pipes with different wall boundary conditions, Forced convection in the thermal entrance region of ducts and channels (Graetz solution), heat transfer in the combined entrance region,
  Integral method for internal flows with different wall boundary conditions.

Radiation:

- Fundamental of thermal radiation and electromagnetic wave theory
- View factors.
- Radiative exchange between grey and diffuse surfaces.
- Radiation between non-ideal surfaces.
- Surface radiative exchange in the presence of conduction and convection.
- The equations of radiative transfer in participating media.
- Radiative properties of molecular gases.
- Introduction to monte Carlo method for thermal radiation.
- Governing Equations: Continuity, Momentum and Energy Equations and their derivations indifferent coordinate systems, Boundary layer Approximations to momentum and energy.

Cryogenics

- **Basic Principles of Cryogenics:**

Thermodynamics, Heat Transfer, Heat Leak, Pressure drop, Cool down, Applications of cryogenics, Properties of cryogenic fluids, Properties of materials (Structural & thermal) at cryogenic temperature, Material selection criteria

Gas-Liquefaction and Refrigeration Systems:
Refrigeration and Liquefaction, Recuperative cycles, Liquefaction of gases, Inversion temperature, Expansion processes, Refrigerator efficiency, Refrigeration and Liquefaction Methods, Regenerative cycles, Ultra low temperature refrigerators, Cryo-coolers.

Cryogenic Insulations:
Types of insulations, Vacuum Insulation, Evacuated Porous Insulation, Gas-filled Powders and fibrous materials, Solid foams, Multilayer Insulations, Liquid and vapor shields, Composite insulations, Placement of insulation systems, Comparison of insulations

Instrumentation in Cryogenics:
Measurement: Strain, Displacement and position, Pressure, Temperature, Flow, Liquid level, Density

Cryogenic Equipment and Cryogenic System Analysis:
Introduction, Compressors, Pumps, Expansion Engines, Valves, Heat Exchangers, Storage, Transfer of liquefied gas

Safety with Cryogenic Systems:
Physiological Hazards, Suitability of materials and construction techniques, Explosions and Flammability, Excessive pressure gas, Special considerations for Hydrogen and Oxygen, General Safety Principles, Safety Checklist

Electrical/Electronics/Instrumentation

EE1 - Advanced Data Acquisition System (30 Lectures)

- **Theory of Quantization**
  Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, antialiasing filters.

- **Advanced Data Acquisition Systems**

  Modular Data Acquisition Systems in Nuclear Instrumentation: CAMAC, VME, PXI, PXIe. DAQ system architecture and major components. Data Archival and Retrieval. DAQ Data server architecture and interface, Data plotting and analysis tools

- **Data Acquisition Interface**

  Sensor – DAQ interface: Grounded Signal Sources, Floating Signal Sources, Grounding Issues: Various Grounding schemes for accurate measurements, Types of Measurement Systems: Differential Measurement System, Referenced and Non-Referenced Single-Ended Measurement Systems, Graphical/command based programming for the acquisition, processing, and presentation of data: MATLAB, LabVIEW Application development environment.

- **Analog Input/output**
  Analog Input Circuitry, Anti-aliasing Filters, sampling and DAQ device architecture, Analog Output Architecture, Analog Output Circuitry, Update rate and output interface.

- **DAQ Clock and Trigger**
  Theory and concepts of analog and digital triggering, Continuous and event-based acquisition, Clock and trigger input and output to DAQ device for timing and synchronization, Counter I/O: Edge Counting, Pulse Generation, Pulse Measurement, Frequency Measurements.

- **Synchronization**
  Single Device Synchronization: Simultaneous sampling, Multiple Device Synchronization: Clock and trigger synchronization, Introduction to Timing system.

- **SST-1 Data Acquisition System**

  Architecture of SST-1 Data Acquisition System: overview and major components, System requirements, Various DAQ interfaces: CAMAC, PXI, PXIe, digitization requirements, Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, DAQ Software: LabVIEW based GUI for remote operation, Networking requirements and TCP/IP based communication with subsystems, distributed system, DAQ NAS server, Central Data storage server, server management, data plotting utilities.

EE2 - Advanced Tokamak Controls (30 Lectures)

- **Fundamentals of Control System**

  Systems and their representation: Terminology and basic structure of control system, Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems and their models, transfer function, Block diagram representation of physical systems, Block diagram algebra, Signal Flow graph. Systems in state space: Concept of states and state model, State equation from transfer function, modelling of dynamical systems, State space representation of multivariable systems, Building blocks of state space models. Advanced control system: Cascade control, ratio control, feed forward control. Over-ride, split range and selective control. Multivariable process control, interaction of control loops Process Control System: Terms and objectives, piping and Instrumentation diagram, instrument terms and symbols. Regulator and servo control, classification of variables. Process characteristics: Process equation, degrees of freedom, modelling of simple systems – thermal, gas, liquid systems. Process lag, load disturbance and their effect on processes. Self-regulating processes, interacting and non-interacting processes.

- **Different types of Control Systems**

  Feedback control system, Real-time control system, Nonlinear and Adaptive Control, Robust control system, Embedded Systems: Hardware and software architecture, Neural Networks, Fuzzy Logic Systems

- **Introduction to Plasma Control**

  Plasma Position Control, Shape Control, Density Control, modelling aspect, simulations, Plasma Control case studies: D-III-D, JT-60, JET, SST-1, EAST, ITER.

- **ITER Instrumentation & Control**

  CODAC (Control, Data Access and Communication) System, Central Interlock System (CIS), Central Safety Systems (CSS), Plant Control System, Plant Interlock System, Plant Safety System, CODAC Core Systems, EPICS, SNL, CSS, MDS Plus, LabVIEW, Matlab Simulink, Python, Grid Computing, Parallel Processing, Diagnostic Data Analysis Tools and Codes, Real-Time OS.

- **SST-1 Operation &Control**

Architecture of SST-1 Operation &Control System, System requirements, system overview and major components. Signal-conditioning system: Channel requirements, various stages in signal conditioning system, CAN bus interface, GUI based remote operation, TCP/IP based communication with subsystems, distributed system. Data Acquisition System: System overview, various interfaces, CAMAC, PXI, PXIe based technology; LabVIEW based GUI, digitization requirements, system architecture, technical requirements, network storage server, server management, data plotting utilities. Operation and Control System: Timing system, Central Data storage server, Interlock system, Tokamak operation and subsystem control, VME based control system

- **Monitoring and Control of Auxiliary Systems**

Monitoring& Control for ICRH, ECRH, NBI. Vacuum System, RHVPS and Switching scheme, Cryogenic Cooling Plant, CWS, BMS, Access Control, Super conducting Magnet Quench detection and protection.

EE3 - High Voltage DC & AC/ Power Supplies (60 Lectures)

- **Overview of Electrical systems in Fusion machines**

Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement – Magnet power supplies, Electrical systems for plasma acceleration – Accelerator power supplies for charged particles. Use of other HV equipment in Fusion Technology: Capacitor bank, Van-de-graf generator, Pulse forming lines, Marx generator, Power supply systems applications in fusion machines.

- **High Voltage DC & AC**

High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. High Voltage Circuit Breakers: Air break, SF6 and vacuum circuit breakers. Gas Insulated Substation (GIS): Advantages of GIS, comparison of GIS and air insulated substations, design and layout of GIS, description of various components of GIS. High Voltage Measurement: CVT, Peak voltmeters, sphere gaps, impulse recording, Over-voltage and protection, Insulation coordination, High voltage testing methods using Partial discharge (PD), Causes and effects of PD, PD diagnostic techniques. HV and UHV systems: Fusion Technology Applications. Basic Overview of Pulse Power Technology.

- **Power Supplies**

- DC Power Supplies: Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Magnetic component behavior and

selection. Control pulse generation and control techniques, Feedback isolation techniques, Auxiliary power supply generation, Parallel operation.

- AC Power Supplies: Linear mode AC power supplies. Switching mode Inverters, Sine wave inverters, Parallel operation, AC voltage regulators, UPS systems.
- Special Power Supplies: Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive: Power Supply for Neutral beams, Power Supply for Ion cyclotron & Electron Cyclotron heating.
- Power supplies required for RF amplifiers or Oscillators. HV supplies, their interconnections for RF applications. Specific requirements of power supply protections etc., General topologies with emphasis on conventional and modular topologies, Performance requirements, Critical protections, Remote control and Monitoring requirements.
- Requirement for arc fault protection, Protection by crowbar, Deices used for crowbar applications, Importance of fault energy and techniques to limit the fault energy, wire-burn test.
- Auxiliary supplies: Screen grid, Control Grid, Filament and ion pump power supplies, General topologies for each of the supply. Performance requirements, important performance requirements, Critical protections, monitoring and remote control requirements.
- Safety and System Grounding: Power supplies inter connection at load end. Issues related to system grounding, choices available for system grounding. Safety of system and personnel for RF system.
- Integrated operation, Protection and Monitoring: HV isolation for input power of auxiliary supplies. Monitoring power supplies' status and performance. Remote and local control of power supplies. Fast and slow interlocks.

- **Power Electronics and design through modelling & simulation**

Junction Transistors (BJT, HBT), Field Effect Transistors (JEFT, MESFET, MOSFET, HEMT), Power semiconductor devices, IGBT, GTO and MCT: AC-DC Converters; Forced commutation; synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines; simulation of transients; Simulation tools: SABER, PSPICE, and MATLAB-SIMULINK; Simulations of converters, inverters and cyclo-converters etc.

EE4 - <u>Analog Signal Conditioning and EMI/EMC Aspects</u> (30 Lectures)

- **Analog Signal Conditioning**

Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation, Signal Conditioning for Plasma Diagnostics, Operational Amplifiers, Op-amps/ integrated circuits in instrumentation, Phase-sensitive rectifiers, Industrial Electronics.

- **Signal Processing and Applications**

Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters, Introduction to Infinite Impulse Response Filters and Finite Impulse Response Filters, Applications of digital signal processing in measurement and control systems.

- **EMI/EMC**

Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Fusion Devices, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards, Testing Standards for Emissivity & Susceptance.

- **EMI Modelling**

Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling &Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EE5 - Computer Based System Design (30 Lectures)

- **Computer Fundamentals**

Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications, Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL).

- **Communication**

Asynchronous and synchronous communication, Standards like RS232, RS422, RS485, USB, Encoding schemes.

- **Networking**

Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. Role of fibre optics in communication, Fieldbus standards, Deterministic communication techniques, Case study: various techniques used in Tokamak/Fusion devices for communication and networking.

- **Real-time systems**

Real-time Systems, their characteristics and applications, Real-time Operating Systems, Concepts of Process and threads, Concurrency, Latency, context switching, Scheduling policies, Inter process communication, Semaphores, Priority inversion, Shared memory, Common systems calls, Communication features in RTOS, Comparative study of various RTOS, Integrated software development environment

EE6 - Digital Signal Processing & Image Processing (30 Lectures)

Digital Signal Processing

- **Introduction**
  Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**
  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT

- **Fast Fourier Transform**
  Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- **Digital filters**
  FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- **DSP Applications**
  Applications of digital signal processing in fusion and other fields.

Image Processing

- **Introduction**
  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.

- **Image Enhancement**
  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing.

- **Image Segmentation and Analysis**
  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.

- **Morphological operations**
  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

LIFE SCIENCES

Programme Code: LIFE04

Programme Outcome:

- At the end of the course work pursued, the Ph. D. student will be well versed in the recent advances in crucial areas of Life Sciences such as Immunology, Cell Biology, plant Sciences, Microbiology and Cancer biology, in addition to gaining hands on experience in several techniques related to these fields as well as structural Biology and Bioinformatics. This will help the student to have a broader outlook of their research work and be able to judge and use techniques for a superior outcome and higher impact publications.

List of Courses

Course Structure Under BARC:

Sr. No.	Old Course Code	New Course Code	Subject Title	Lectures (Hours)	Credits	Marks
CORE COURSES						
1	B-LS1	01-LIFE04-601-C	Biochemistry, Microbiology and Molecular Biology	44 L	6	
2	B-LS2	01-LIFE04-602-C	Genetics and Plant Sciences	42 L	6	
3	B-LS3	01-LIFE04-603-C	Animal Cell Biology, Immunology and Radiation Biology	42 L	6	
4	B-LS4	01-LIFE04-604-C	Biostatistics, Bioinformatics and Laboratory Techniques	42 L	6	
ELECTIVES						
5	E-LS1	01-LIFE04-601-E	Advanced Course in Genetic Engineering	20 L + 30 P	4	
6	E-LS2	01-LIFE04-602-E	Advanced Course in Plant Breeding	20 L + 30 P	4	
7	E-LS3	01-LIFE04-603-E	Advanced Course in Stem Cell Research and Therapy	20 L + 30 P	4	
8	E-LS4	01-LIFE04-604-E	Use of radioisotopes and molecular methods in diagnosis and therapy of infectious diseases, cancer and metabolic diseases	20 L + 30 P	4	
9	E-LS5	01-LIFE04-605-E	Advanced Course in Instrumentation	20 L + 30 P	4	
10	E-LS6	01-LIFE04-606-E	Structural Biology: Methods and Applications	20 L + 30 P	4	
11	E-LS7	01-LIFE04-607-E	Advances in Genome Biology	20 L + 30 P	4	
MANDATORY COURSE						
12	M-LS1	01-LIFE04-605-C	Research Methodology	15	0	
13	M-LS2	01-LIFE04-606-C	Safety in Life Science Research	10	0	

RESEARCH PROJECTS						
14		01-LIFE04-601-PR	Common projects at different divisions	8 weeks	8	
15		01-LIFE04-602-PR	Projects under thesis supervisor	8 weeks	8	
			TOTAL		**60**	

CORE COURSES

B-LS1: Biochemistry, Microbiology and Molecular Biology (01-LIFE04-601-C) (44 Lectures, 6 Credits)

Course Outcomes:

- The student will get to learn the basics followed by recent advances on biochemical pathways, food biochemistry, different fields of microbiology, DNA repair and both prokaryotic and eukaryotic molecular biology and genetic engineering. This would render them versatile to work in any of the three systems i.e. with microbes, plants or animals.

Course Details:

BIOCHEMISTRY

Basic Biochemistry

Proteins: post-translational modification and protein targeting – types of post translational modification and organelle targeting

Enzymology

Enzymes: Mechanism of action, kinetics (equation and modeling: Michaelis-Menten, Lineweaver-Burk, Eadie-Hofstee)

Inhibitors and types of inhibition and regulation: competitive, non-competitive and uncompetitive

Metabolism

Overview of linking of central metabolic pathways such as glucose, lipid and amino acid metabolism (anabolism and catabolism).

Plant Biochemistry

Overview of energy yielding metabolic pathways in microbes, chloroplast and mitochondria

Oxidative phosphorylation, Photosynthesis and photo phosphorylation

Food Biochemistry

Definition and scope of food chemistry, Major food constituents (carbohydrates, fats and proteins) and their functional properties with respect to food processing, Physical and chemical properties (water activity, pH, thermal conductivity, viscosity, color), Chemical changes in food farm to fork.

Food Processing: Standards and regulations, FSSAI regulations regarding food irradiation, Radiation processing of food products, applications, chemical changes and wholesomeness, Basic process of food irradiation, Isotopes and technologies used for food irradiation, Low medium and high dose applications of food irradiation, Effect of radiation on macro and micro nutrients in food products, Newer methods of food processing (high pressure processing, pulsed white light, ohmic heating, ultrasonic treatment, pulsed electric field) and their applications

MICROBIOLOGY

Basic Microbiology

Introduction to microbiology, classification of micro-organisms, microbial growth. Classical and molecular identification of prokaryotic and eukaryotic micro-organisms.

Mechanism of genetic exchange in microbes (vertical and horizontal gene transfer), Industrially important microbes

Microbial Survival in Natural Environments

Biofilms: structure and detection of biofilm, quorum sensing; persister cells; viable but non-culturable cells (VBNC)

Molecular Pathogenesis

Pathogenicity islands, virulence factors (cellular structures, degradative enzymes, toxins, secretion systems)

Microbiome and antimicrobial resistance

Overview of microbiome and its importance, plant and animal microbiome, human intestinal viriome

Antimicrobial resistance (definition, mechanism and current scenario), Antibiosis, Chromosome and plasmid coded resistance

Food Microbiology

Overview of food-borne pathogens, spoilage and fermentative organisms. Industrially relevant spoilage and fermentation process, Microbial death kinetics during processing, Concept of D10 value (during thermal and irradiation processing), Calculation of D_{10} value and its application during food processing.

MOLECULAR BIOLOGY

Genome organization

Organization of prokaryotic and eukaryotic genome: Comparative overview on genome architecture in prokaryotes and eukaryotes

Gene Expression and Genetic Engineering

Gene expression, epigenetics and regulation: An overview. Plasmids, different types of vectors, cloning, Genetic manipulation techniques: Mutagenesis, Overexpression, genomic integration, Experimental approaches to understanding DNA-protein and protein-protein interactions

DNA Repair Mechanisms

Different DNA repair pathways (Homologous, NHEJ, UV repair), Regulation, A comparative study in prokaryotes and eukaryotes

RNA Biology

Different types of RNA, role of RNAs. Structure-function aspects of tRNA. Regulatory roles of siRNA, snRNA, interference RNA

B-LS2: Genetics and Plant Sciences (01-LIFE04-602-C) (44 Lectures, 6 Credits)

Course Outcomes:

- This course is oriented towards introducing the concept of plant genetics, understanding linkages which is crucial in the development of plant varieties through different breeding forms. It also touches upon the plant infections and how to overcome them, which is crucial for having low wastages during the harvest season. For full understanding of plant science, recent advances in plant development are also dealt with.

Course Details:

GENETICS

Basic and quantitative genetics

Mendelian genetics, deviation from Mendel's findings: allelic variation and gene function, gene interactions and epistasis [multiple alleles, allelic series, testing gene mutations for allelism, incomplete dominance and co-dominance, pleiotrophy, Quantitative genetics [Theory of allele frequencies, the Hardy-Weinberg (H-W) principle, application of H-W principle, natural selection, random genetic drift, factors affecting H-W equilibrium]

Linkage and mapping

Concepts of linkage and crossing over, chromosomal mapping in eukaryotes [linkage, genetic test for linkage, chiasmata and crossing over, two point test cross, three point test cross, mapping functions, genetic mapping in plants], complementation test

Molecular markers

Concept of markers, development of genome-based markers, application of markers in plant breeding. Map position-based cloning of genes, marker assisted selection (MAS) in plant breeding, examples in specific crops, outcome of MAS breeding

GENETIC IMPROVEMENT OF PLANTS

Basic concepts in plant breeding

Plant introduction: procedure, types and important achievements. Cytoplasmic inheritance, male sterility and apomixis. Genetic nature of self- and cross-pollinated crops, pollination behaviour of different crops, self-incompatibility, homozygous and heterozygous balance, methods for improvement of self- and cross-pollinated crops: mass selection, pureline Selection, pedigree method, back-cross breeding, bulk method, recurrent selection

Plant host-pathogen interactions

Gene for gene concept, molecular basis of pathogenesis, mechanisms of host defence, approaches to developing disease resistant plants and gene pyramiding

Mutagenesis in plants

Molecular basis of mutagenesis [tautomerism, mode of action of different mutagen (physical and chemical mutagen), mutation induced by transposable elements, phenotypic effects of mutations], induced mutation breeding in crop plants: principles and methods, outcome: examples and impact of plant mutant varieties

PLANT DEVELOPMENTAL BIOLOGY

Plant developmental biology

Floral induction and development, photoperiodism and its significance, vernalization and hormonal control, inflorescence and floral determination

Plant tissue culture – fundamentals and applications

Plant tissue culture and differentiation: totipotency, micropropagation, direct and indirect regeneration pathways, zygotic & somatic embryogenesis, organogenesis, embryo and anther culture, somaclonal and gametoclonal variation, industrial application of plant tissue culture, hairy root cultures, large scale propagation of plants, bioreactors, secondary metabolite production

B-LS3: Animal Cell Biology, Immunology and Radiation Biology (01-LIFE04-603-C) (44 Lectures, 6 Credits)

Course Outcomes:

- The course deals with animal cell biology and cancer biology including recent advances, therapeutics and genetic manipulation of animal cells. Basic and advanced immunology with advances in applied and clinical immunology is included as part of this course work. Radiation biology is a new concept which is introduced to the students and they get insights in to the effect of different radiation doses on cellular matter and how the cells deal with it, with inputs from information available from regions which have high background radiation.

Course Details:

ANIMAL CELL BIOLOGY

Basic Animal Cell Biology

Fundamentals of cell structure and organization in plants and animals, Origin of cell, Cell Structure, Cell Membrane/Cell Wall, Cellular Components and their function, ECM

Cell communication, cell cycle and differentiation

Cell to cell communication, Types of signaling - Surface and intracellular receptors, Amplification of signal etc; Cell cycle, Cell cycle regulation, Phases, Check points, Latest techniques to detect cell cycle phases; Cell death – Apoptosis, Necrosis, Autophagy.

Differentiation and Development - Basic processes of development, Signals guiding development, Differentiation, Determination and Stem cells, Experimental approaches.

Cancer Biology

Cancer cell biology, causes (genetic and environmental), Tumor suppressors, Oncogenes, Hallmarks and enabling characteristics of a tumor, Metastasis, Targets for therapeutic interventions, Tumor microenvironment, Latest developments in diagnosis and treatment

Genetic manipulation techniques for animal cells and animals

Methods for genetic manipulation of mammalian cells and animals, Recent advances in transgenic, congenic and conditional knockout mice, Ethical issues related to genetic manipulation and research in experimental rodents and stem cells.

IMMUNOLOGY

Immune System

Introduction to immune system: Cells and Organs of the Immune system and systemic functions of immune system, Innate immunity, Non-specific host immunity, Cells of the innate immune system, Complement system, Pattern recognition by innate immune system, Antigen presentation, Major Histocompatibility complex, Antigen presenting cells, Endogenous and Exogenous antigen presenting pathways, Humoral immunity, Antibody structure and diversity, Antibody mediated effector functions, Antibody classes and biological activity.

Cell Mediated immunity

T-cell receptor, alloreactivity, T-cell maturation, and Thymic selection, T-cell activation and differentiation, dynamics of adaptive immunity, Properties of effector T-cells and T-cell mediated cytotoxicity

Advances in applied and clinical immunology

Immunotherapy for treatment of cancer- using inhibitors or antibodies; Vaccines and personalized therapy for immune disorders, Chimeric antigen receptor T cells for treatment of lymphoma

RADIATION BIOLOGY

Basics in radiation biology

Physics and Chemistry of radiation absorption, Radiation types, units, doses and measurements, Interaction of radiation with matter, Free radical biology, Radiation biology – Cell survival curves, Radiosensitivity and its factors, Oxygen effect, Radiomodulation, Linear Energy transfer and Radiobiological Effectiveness (LET and RBE)

Genetic effects of radiation

Genetic effects of radiation, Biological and clinical dosimetry, Cytogenetics and molecular biomarkers

Biological effects of radiation

Biological effects of radiation (Deterministic, stochastic), Radiation safety and protection: Personal Protective Equipment, regulatory guidelines and exposure limits, Adaptive response, Radiation hormesis, Application of different types of radiation in diagnosis and therapy, Fractionation in radiotherapy

International bodies related to radiation safety, High natural radiation areas and their significance.

5. Basic Clinical Radiobiology; Michael Joiner and Albert van der Kogel -Fourth Edition

B-LS4: Biostatistics, Bioinformatics and Laboratory Techniques (01-LIFE04-604-C) (44 Lectures, 6 Credits)

Course Outcomes:

- Biostatistics and bioinformatics are the backbone of most biology work. In this course the students are taught the different aspects and methods involved in biostatistics and bioinformatics along with a few insights into research tools and techniques.

Course Details:

Biostatistics

Standard statistical distribution (e.g., normal, binomial and Poisson) and their application in biology, Measure of central tendency; mean, median and mode, Measure of dispersion: range, variance, standard deviation, standard error,

Correlation and regression,

Graphical representation of data

Statistical test of significance: Design of experiments

t-test, ANOVA, chi-square test

Software program for statistical analysis

Tutorials

Bioinformatics

Sequence Analysis/Alignment techniques: Pair wise sequence alignment: local and global alignment, consensus sequence (sequence logo), frequency matrices (PAM, BLOSUM), log odds score, penalty.

Introduction to graphical, dynamic programming and heuristic methods, database similarity, searches-BLAST/FASTA algorithms.

Multiple sequence alignment: Clustering, Dendrogram/tree construction, Molecular phylogeny.

Introduction to the protein structural databases (PDB, CATH, SCOP etc.), structure prediction methods with particular focus on homology/comparative modeling

Structural validation approaches, protein structures in biotechnology (drug design/protein engineering etc.)

Big data, data analytics, machine learning, deep learning

Research Tools and Techniques

Microscopic techniques: Light, compound, phase-contrast

and Animal Tissue Culture

Image analysis

Chromatography, Electrophoresis

Spectroscopy: Fluorescence, FTIR, NMR, ESR,

Flow cytometry and high throughput screening

Proteomics

High throughput sequencing

Confocal laser scanning microscopy (CLSM)

ELECTIVE COURSES

E-LS1: Advanced Course in Genetic Engineering (01-LIFE04-601-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- Recent methodologies in genetic manipulation of microbes, plants and animal cells along with hands on experience. While imparting knowledge on these aspects the students are also given a brief on the ethics to be followed for genetic manipulation, which is an important aspect.

Course Details:

Plant Genetic Engineering

Ethics of Genetic Engineering: What is right and what is wrong? What is GMO and what is not? Approvals required for their release

Selectable marker and reporter genes: Antibiotic resistant marker genes, Herbicide marker genes, Reporter genes, removal of marker genes, alternate selectable marker systems

Methods of plant genetic transformation: Direct gene transfer methods, particle bombardment, electroporation, sonication, electrophoresis, liposome delivery, microinjection, whisker mediated transfer; Agrobacterium-mediated, strains, virulence genes, mechanism of T -DNA transfer and integration, different methods of Agro- transformation, vectors used in Agro transformation; Genome editing in plants

Enhancing and stabilizing transgene expression: Transgene silencing and activation – mechanism and results

Metabolic engineering of plants

Practical aspects of animal cell manipulation

Types of vectors for mammalian transfection

Methods of transfection / transduction

Generation of antibiotic kill curve in mammalian cells

Practical demonstration of transfection in mammalian cells

Visualization, identification and selection of transfected cells

Microbial genetic engineering

Essence of plasmid incompatibility, copy numbers, selectable markers, origin of replication: Its influence on designing of cloning strategies.

A practical guide for cloning: Choice of vectors, different ligation strategies and bacterial strains used for cloning and expression

Ways to get DNA inside cells - choosing the right method.

The CRISPR toolkit and how it can advances your research.

Lambda Red Recombineering system – what it can and cannot do.

Protein expression and purification – getting the fold right

Notable genetically engineered microbial strains: Applications for biotechnology

E-LS2: Advanced Course in Plant Breeding (01-LIFE04-602-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- Hands on experience with theoretical knowledge on the different plant breeding methods practiced and statistical evaluation of the results. The students gain experience on the importance of evaluation of field trials before release of different varieties.

Course Details:

Principles of Plant Breeding

History of Plant Breeding; Objectives of plant breeding, characteristics improved by plant breeding; Patterns of Evolution in Crop Plants- Centres of Origin-biodiversity and its significance. Plant introduction and role of plant genetic resources in plant breeding. germplasm collection, exchange and quarantine

Breeding for self pollinated crops- Pure line theory, pure line selection and mass selection methods; line breeding, pedigree, bulk, backcross, single seed descent method.

Breeding methods in cross pollinated crops- Population breeding-mass selection, progeny testing, progeny selection schemes, recurrent selection and development of synthetics and composites; Hybrid breeding - genetical and physiological basis of heterosis and inbreeding, production of inbreds, breeding approaches for improvement of inbreds.

Breeding methods in asexually/clonally propagated crops.

Malesterility in crop plants and their commercial exploitation; Concept of designer crop - plant ideotype and its role in crop improvement; Transgressive breeding.

Mutation breeding: Mutation and its history - Nature and classification of mutations: spontaneous and induced mutations, micro and macro mutations, pre and post adaptive mutations, mutagenic agents, Molecular basis of mutagenesis [automerism, mode of action of different mutagen (physical and chemical mutagen), mutation induced by transposable elements, phenotypic effects of mutations], Observing mutagen effects in M1 generation: plant injury, lethality, sterility, chimeras etc., - Observing mutagen effects in M2 generation - Estimation of mutagenic efficiency and effectiveness – spectrum of chlorophyll and viable mutations -– Mutations in traits with continuous variation. Mutation breeding in cereals, pulses and oilseeds – Achievements made

Principles of quantitative genetics: Genetic basis of breeding self- and cross - pollinated crops including mating systems and response to selection - nature of variability, components of variation; Heritability and genetic advance, genotype-environment interaction; General and specific combining ability; Types of gene actions and implications in plant breeding; Principles of Analysis of Variance (ANOVA) - Expected variance components, Comparison of means and variances for significance, Designs for plant breeding experiments – principles and applications; Genetic diversity analysis – metroglyph, cluster and D2 analyses - Association analysis - phenotypic and genotypic correlations; Path analysis and Parent - progeny regression analysis; Discriminant function and principal component analyses; Selection indices - selection of parents; Simultaneous selection models- concepts of selection - heritability and genetic advance.

Breeding for abiotic and biotic stresses.

Importance of plant breeding with special reference to biotic and abiotic stress resistance; **Classification of biotic stresses** – major pests and diseases of economically important crops - Concepts in insect and pathogen resistance; Analysis and inheritance of resistance variation; Host defence responses to pathogen invasions- Biochemical and molecular mechanisms; Acquired and induced immunity and systemic acquired resistance (SAR); Host-pathogen interaction, gene-for-gene hypothesis. Types and genetic mechanisms of resistance to biotic stresses –Horizontal and vertical resistance in crop plants. **Classification of abiotic stresses -** Stress inducing factors –moisture stress/drought and water logging & submergence; Acidity, salinity/alkalinity/sodicity; High/low temperature, wind, etc. Stress due to soil factors and mineral toxicity; Physiological and Phenological responses; Emphasis of abiotic stresses in developing breeding methodologies. Genetics of abiotic stress resistance

Breeding for quality trait

Developmental biochemistry and genetics of carbohydrates, proteins, fats, vitamins, aminoacids and anti-nutritional factors - Nutritional improvement. Molecular basis of quality traits and their manipulation. Breeding for quality improvement in cereals, pulses and oilseeds.

Biotechnology for crop improvement

Biotechnology and its relevance in agriculture; Definitions, terminologies and scope in plant breeding.

Tissue culture- History, callus, suspension cultures, cloning; Regeneration; Somatic embryogenesis; Anther culture; somatic hybridization techniques; Meristem, ovary and embryo culture; cryopreservation.

QTL mapping; Strategies for QTL mapping - desired populations for QTL mapping - statistical methods in QTL mapping - QTL mapping in Genetic analysis; Marker assisted selection (MAS) - Approaches to apply MAS in Plant breeding - selection based on marker - simultaneous selection based on marker and phenotype - factors influencing MAS. Use of mutagens in genomics, allele mining, TILLING

Maintenance breeding and concepts of variety release and seed production Cultivar development-testing, release and notification, maintenance breeding, Classes of seed, Participatory Plant Breeding, Plant breeders' rights and regulations for plant variety protection and farmers rights.

E-LS3: Advanced Course in Stem Cell Research and Therapy (01-LIFE04-603-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- The students are introduced into a new and upcoming area of research of stem cells with insight into its generation and uses in animals, plants and bacteria

Course Details:

Stem Cells: Introduction and estimation

General concepts in stem cell biology and their role in research and therapy

Surface marker analysis

Dye efflux and aldehyde dehydrogenase-based assays

In vitro differentiation and culture-based characterization

Embryonic, umbilical cord and adult stem cells

Embryonic stem cells

Umbilical cord blood stem cells

Wharton's Jelly Mesenchymal stem cells Adult tissue stem cells: intestinal stem cells, hematopoietic stem cells, neural stem cells, skeletal muscle stem cells, skin epithelial and hair follicle stem cells and heart stem cells

Isolation, identification and enumeration of hematopoietic stem cells

Isolation, identification and enumeration of skin epithelial and hair follicle stem cells

Enumeration of stem cells in human blood

Stem cells for tissue regeneration and therapy

In vitro expansion of stem cells Human induced pluripotent stem cell derivation, mouse and human embryonic stem cell derivation, and the mechanisms underlying ICM cells differentiation

Adoptive transfer and in vivo manipulation of stem cell differentiation

Mammalian gene transfer and genome engineering

In vivo manipulation of hematopoietic stem cells in mice

Gene expression pattern and genetic manipulation of stem cells

Stemness associated genes

Dedifferentiation and re-differentiation of stem cells

Genetic manipulation of stem cells for therapy

Use of stem cells for mitigation of radiation injury

Isolation, identification, enumeration and cryopreservation of Human Wharton's Jelly Mesenchymal Stem cells

In vitro culture, real time monitoring of cell growth, induced differentiation and genetic manipulation of stem cells

Organoids

Stem cell characteristics in T lymphocytes

Cancer stem cells

Enumeration of breast cancer stem cells by surface phenotyping and side population based high content screening

Stem cell applications

Ethics in stem cell research

Biofilm formation in bacteria, Similarities with malignant tumours

Plant stem cells, vitality and bioprocess engineering

Identification and characterization of plant stem cell

E-LS4: Use of radioisotopes and molecular methods in diagnosis and therapy of infectious diseases, cancer and metabolic diseases (01-LIFE04-604-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- In this course students are exposed to techniques used for detection of several important and highly prevalent disease such as tuberculosis and thyroid cancer with emphasis on easier, sensitive and reliable immunological techniques.

Course Details:

Molecular Biology methods in tuberculosis diagnosis and prevention

Introduction to TB, its evolution and comparison with other infectious diseases

Molecular biology techniques in diagnosis of tuberculosis

Understanding of molecular epidemiology in tuberculosis

Drug used in tuberculosis and molecular mechanisms of drug resistance in TB

Use of immune-modulators in TB treatment

Prevention of TB: new vaccines

Molecular Biology methods in thyroid cancer diagnosis and prevention

Introduction to thyroid cancer (TC)

Molecular Pathways in TC & their diagnostic importance, molecular mechanisms of resistance to treatment in thyroid cancers

Genetics & Transcriptomics & their relevance in TC

Post translational modifications & their role in TC prognosis

Metabolomics in cancer diagnosis

Molecular Mechanisms of Resistance to treatment &newer treatment options

Use of RIA and other immunological methods in detection of analytes in biological fluids

Introduction of Immunological methods: Ag-Ab interactions (RIA, IRMA, ELISA)

Production of polyclonal and monoclonal antibodies

Affinity calculation, titre estimation of antibodies

Immobilization of antibodies and their uses

SCFV antibodies, Abzymes and phage display libraries

Nanobody production

Radiopharmaceuticals in diagnosis and therapy of cancer and other metabolic diseases

Introduction to radiopharmaceuticals (sourcing of radioisotopes, types of radioisotopes, methods of radiolabelling, BFCA concept)

Quality control of radiopharmaceuticals, targeted use of radiopharmaceuticals.

BIO QC of Radiopharmaceuticals.

Diagnostic applications of radiopharmaceuticals (SPECT, PET)

Therapeutic applications of radiopharmaceuticals (use of β- emitting radioisotope-based therapy, α radionuclide therapy)

Types of therapy (Radio-immunotherapy, Receptor-based therapy, etc.) in various cancers

Radiological Safety regulations related to preparation, transport, storage, use and disposal of Radiopharmaceuticals and Radioisotopes used in Radionuclide therapy.

E-LS5: Advanced Course in Instrumentation (01-LIFE04-605-E)
(20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- In this course the students are exposed to several modern-day instruments used for studying cell surfaces, DNA-protein interactions and protein-protein interactions. The students are also exposed to several analytical instruments.

Course Details:

Overview of advanced Instrumentation in biological research

Principle, instrumentation and application of:

Inductively Coupled Plasma Spectrophotometer (ICP),

Fluorescence Microscopy

Gas Chromatography Mass Spectrometry (GCMS)

Biosensors

Scanning Electron Microscopy (SEM)-EDS

X-ray Diffraction (Powder)

Rheometer

Atomic Force Microscopy (AFM)

Transmission Electron Microscopy (TEM)

Surface Plasmon Resonance (SPR)

E-LS6: Structural Biology: Methods and Applications (01-LIFE04-606-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- In this course the students learn more about protein structure and different software available for predicting structures and protein-ligand interactions, which is very important in the field of drug discovery.

Course Details:

Overview of structural biology—structural features of biomolecules in three-dimensional space, structure determination methods and recent developments

Troubleshooting the recombinant protein expression and purification

Principles and methods of protein crystallization, Crystal symmetry

Theory of diffraction and Fourier synthesis, X-ray sources

Diffraction data collection and processing

Diffraction data to structure: Solving the crystallographic phase problem

Diffraction data to structure: Electron density map and model building

Diffraction data to structure: Refinement and validation

Structure-based drug design - a rational approach

Principles of CD and fluorescence spectroscopy in protein structure analysis

E-LS7: Advances in Genome Biology (01-LIFE04-607-E) (20 Lecture + 30 Practical, 4 Credits)

Course Outcomes:

- The take home message of this course is deeper understanding about genome organization, integrity, maintenance, segregation and sorting in microbial, plant and animal cells.

Course Details:

Genome structure with certain examples

Genome packaging in bacteria, plants and animals

Genome maintenance and integrity

Mechanisms of genome segregation

Factors affecting genome dynamics

Various approaches for creating genomic alteration in plant and bacterial systems, particularly ploidy

Usefulness of genomic perturbation in quality and strain improvements and harmful implication in mammalian cells

Pulsed field gel electrophoresis to analyse genome from plants, animals and multipartite genome harboring bacteria.

Visualisation of real time dynamics of genome segregation in bacterial and mammalian cells during stressed growth by fluorescence microscopy (Time lapse).

Isolation of protoplast of plants with different levels of ploidy and visualization of DNA organization in these crop plants by DNA staining and fluorescence microscopy.

MANDATORY COURSES

M-LS1: Research Methodology (01-LIFE04-605-C) (15 Lectures)

Course Outcomes:

- This deals with formulation and presentation of research projects, selection of appropriate research ideas, experimental design and statistical analysis for the same.

Course Details:

Objectives and types of research: Motivation and objectives - Research methods vs. Methodology. Types of research – Descriptive vs. Analytical; Applied vs. Fundamental; Quantitative vs. Qualitative; Conceptual vs. Empirical.

Research Formulation – Defining and formulating the research problem - Selecting the problem - Necessity of defining the problem - Importance of literature review in defining a problem - Literature review – Primary and secondary sources - reviews, treatise, monographs-patents - web as a source - searching the web - Critical literature review - Identifying gap areas from literature review - Development of working hypothesis.

Research design and methods - Research design – Basic Principles - Need of research design - Features of good design – Important concepts relating to research design - Observation and Facts, Laws and Theories, Prediction and explanation, Induction, Deduction, Development of Models. Developing a research plan - Exploration, Description, Diagnosis. Experimentation: Proper approach - Importance of recording observation, maintaining the records, sample history, transparency in data recording. Determining experimental and sample designs.

Value of Statistics; Errors and Statistics - Limitation of analytical methods; Accuracy; Precision; Classification of errors; Minimisation of errors; Significant figures and computations; Standard Deviation; Normal Distribution; Comparison of results - students' t test; F-test; Chi Square test; propagation of errors.

Reporting and thesis writing – Structure and components of scientific reports - Types of report - Technical reports and thesis - Significance - Different steps in the preparation – Layout, structure and Language of typical reports - Illustrations and tables - Bibliography, referencing and footnotes - Oral presentation - Planning - Preparation - Practice - Making presentation - Use of visual aids - Importance of effective communication, Usage of packages such as, Excel, AIM2000, etc. Manuscript drafting based on 'Experimental data and Literature Survey'.

Application of results and ethics - Environmental impacts - Ethical issues - ethical committees - Commercialization - Copy right - Royalty - Intellectual property rights and patent law – Trade Related aspects of Intellectual Property Rights - Reproduction of published material - Plagiarism - Citation and acknowledgement - Reproducibility and accountability.

M-LS2: Safety in Life Science Research (01-LIFE04-606-C) (10 Lectures)

Course Outcomes:

- To familiarize with various safety aspects while conducting life science related research.

Course Details:

1. Cyber Safety and Security (2 lectures)

<u>Cyber safety and security:</u>

Introduction to cyber safety, sources of threat and ways to prevent them: Web browsing, Email, Malware, Identity theft, Social networking, mobile phones, Passwords, online transaction frauds, cyber hacking, phishing attacks, bots, mobile hacking, cyber frauds, cyber terrorism, digital foot prints, National Cyber Safety & Security Standards (NCSSS)

2. Fire Safety (2 lectures)

Introduction, the fire triangle, major causes of fire, classification, prevention, protection and control of fire, types and use of fire extinguishers, fire hazards, fire emergency and preparedness

3. Radiation Safety (2 lectures)

<u>Radiation hazards:</u>

Introduction, types of radiation and its effect, general principles and techniques of monitoring, types of radiation dosimeters, assessment and control of radiation hazards

Environmental release, management of solid, liquid and gaseous wastes

<u>Radiation Emergency Preparedness:</u>

Discussion of type of incidents/accidents likely to be encountered, procedures for handling such events

4. Chemical Safety (2 Lecturers)

Introduction, routes of entry and its effect, types of hazardous chemicals, Material Data Sheets, labelling and storage, incompatible chemicals, hazard control-fume hood, local exhaust, personal equipment, chemical spill, emergency measures, precaution in handling hazardous chemicals

5. Biosafety and Animal Ethics (2 Lectures)

Introduction to biosafety, Institutional Bio-Safety Committee (IBSC)-scope and objectives, pathogenic organism, Genetically Modified Organisms (GMOs) - recombinant DNA technology, microorganisms, plants and animals, release to the environments, role of Genetic Engineering Approval Committee (GEAC)

Indian act for animal welfare and Prevention of Cruelty to Animal act (PCA, 1960), use of animals in research and animal care, Animal Ethics Committee (AEC), Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA)

BACK TO MAIN

SINP

SYLLABUS FOR
Ph.D. in LIFE SCIENCES
(PROGRAM CODE: LIFE04)

SemesterI

17 weeks during August–December, out of which 16 weeks are classes and 1 week for exams.

2weeks festival holidays

Sl No	Course code	Name of the courses	Credit
1	PBC	Principles of Biochemistry	6
2	PPC	Principles of Physical Chemistry	6
3	SCB	Structural and Computational Biology	6
4	ALP	Advanced Laboratory Practices	6

Calculation of credit

Each class credit (PBC/PPC/SCB/ALP): 1.5 hr x 2 classes + 2 hr tutorial + 7 hr assignment and self study = 12 hr. 12 hr x 16 weeks = 192 hr = 6 credit. Lab credit = 12 hr. 12 hr x 16 = 192 hr = 6 credit. Total credit = 6 x 4 = 24.

SemesterII

17 weeks during January–April, out of which 16 weeks are classes and one week for exams.

Sl No	Course code	Name of the courses	Credit
1	RM	Research Methodology	6
2	OPT1	Optional Course1	6
3	OPT1	Optional Course2	6
4	OPT1	Optional Course3	6

Calculation of credit

Each class credit: 1.5 hr x 2 classes + 2 hr tutorial + 7 hr assignment and self-study = 12 hr. 12 hr x 16 weeks = 192 hr = 6 credit. Total credit = 6 x 4 = 24

1st & 2nd weeks of May are Holidays

SummerSemester

11 weeks during mid May–July.

Sl No	Course code	Name of course	Credit
1	PRO	Project	12

Presentation of project thesis in the 3rd week of July.

Calculation of credit

Project work per week = 30 hr, Self-study = 4 hr, Total = 34 hr. In 11 weeks = 11 x 34 = 374 hr = 12 credit.

Syllabus

Semester I

1. Principles of Biochemistry (PBC)

Basic Biochemistry – Biomolecules in water, protein and carbohydrate (complex) solutions, pH, pK, shifts in pK, enzymes, co-enzymes, vitamins, glycolysis, ATP cycle, TCA cycle, oxidative phosphorylation, biosynthesis / degradation of amino acids & proteins, biosynthesis of lipids and carbohydrates, hormone and growth factors.
Cell as unit, identification, characterisation, function of cellular organelles, Golgi, ER, lysozome, mitochondria, cell-membrane, Cell-cell communication, cell-signalling, basics of immune system.
DNA as the Genetic material, Mutations in the genetic material, Mendelian inheritance, Chromosomal inheritance, Eukaryotic genome organization, Gene, Introns, Repetitive DNA seq, Gene duplication and Pseudogenes, Core Histones and Linker histones, Euchromatin vs. Heterochromatin, DNA methylation, Introduction to epigenetics.
Replication, Transcription and Translation.
Chemical Thermodynamics and its application in Biological Processes (biomolecular recognition, protein folding etc), Use of energy in cellular reactions, Chemical equilibrium and kinetics and its application in biological processes (gene regulation, kinetic proof reading, cancer pathways, enzyme kinetics, biological switch, circadian rhythm), Application of chemical tools in biology.
Diffusion, Osmosis, Osmotic pressure, osmoregulation, surface tension, dialysis, adsorption, viscosity, thermal conduction, colloids, sedimentation.

2. Principles of Physical Chemistry (PPC)

Definition of life from chemical and physical perspective, Basic thermodynamics, chemical equilibrium of reactions in gas & solution phase chemical reaction dynamics (Introduction to reaction kinetics, complex reaction, Steady-State, equilibrium, chain reaction, catalysis, etc.), and reaction rate theory (Transition State and Collision theory).
Introduction to quantum mechanics: Historical development of quantum theory, properties of particles and waves, wave mechanics and applications to simple systems—the particle in a box, the harmonic oscillator, the rigid rotor and the hydrogen atom.
Basic Principles of Spectroscopy: Absorption, Emission, and Scattering of light; Excited State Properties; Acidity; Basicity; Polarization; Anisotropy; Solvent Relaxation; Quenching; Energy Transfer, and Electron Transfer.
Nanoscience and Nanotechnology: What is nanoscience and nanomaterials? Historical background of the field nanoscience and nanotechnology; Optical, electrical, and magnetic properties of nanomaterials; different nanomaterials (organic vs. inorganic); common roots of nanomaterials synthesis; Surface modification for specific targeting, Principle of photon therapy, Surface Plasmon Resonance (SPR), Nanomaterials based optics and spectroscopy, applications in sensing, diagnostics, and remediation.
Recapitulation about radioactivity - classification of the nuclides, natural decay chain; Radioactive decay modes - secular and transient equilibrium; Introduction to Nuclear Reactions - Q-values, threshold energy, cross section, excitation functions; Different types of detectors, Nuclear Activation and its applications; Clinical and other applications of radionuclide, radiotracer technique.
Interaction of electromagnetic radiation with matter – Cross-sections –Attenuation and mass energy absorption coefficients
Radiation quantities and units –Particle & Energy flux and fluence–flux and fluence –Interaction of Radiation with Cells, LET – Biological Effects of Radiation, Dosimetry – Energy imparted – Absorbed dose – Kerma-Exposure –Dose equivalent – Charged particle equilibrium (CPE) –Ambient and directional dose equivalents [($H^*(d)$ and $H'(d)$)]

3. Structural and Computational Biology (SCB)

Nucleic acids, Watson-Crick and non-Watson Crick basepair, DNA double helical and multistranded structures, RNA structural features.

External and internal coordinate system, non-covalent interactions stabilizing biomolecules, amino acids, peptide, proteins, secondary, tertiary, quaternary structure of protein.

Structure determination: Basics of Crystallography, NMR, Site-directed spin labelling and EPR (SDSL-EPR)

Brief introduction to Bioinformatics and Biological databases, Sequence Alignment (Pair-wise and Multiple), Scoring matrices (BLOSUM62, PAM etc.), Database similarity searching by available tools like FASTA, BLAST etc., Phylogenetic Tree construction; Next Generation Sequencing. Introduction to biological databases.

Perl Programming Language and its application in Bioinformatics.

Molecular modelling software, basic statistics, regression and curve-fitting, some probability and statistical methods (such as Measures of central tendency, probability, probability distributions, Binomial distribution, Normal distribution, Poisson distribution, calculation of errors etc.). Introduction to Computation with Matlab. Matrix handling, plotting, statistical analysis.

4. Advanced Laboratory Practices (ALP)

i. Biochemical and Molecular Biology Techniques (BMBT)

Separation techniques: Electrokinetics methods: electrophoresis, electrophoretic mobility (EPM), factors affecting EPM, Paper, PAGE, Capillary, Iso-Electric focusing, applications in biology and medicine. HPLC: mobile phase systems, modes of operations, application, Hydrodynamics method: fundamental principles, Centrifugation, Ultracentrifugation and their applications in molecular weight, size determination. Viscosity and its application.

Technique in molecular biology: DNA detection, RNA detection, Protein detection, cloning, PCR, and related methods.

ii. Spectroscopy and Imaging Techniques (SIT)

Circular dichroism, Infrared spectroscopy including basic principles of FTIR, Raman spectroscopy.

Basic principles of imaging techniques: SEM, TEM, wide-field fluorescence microscopy, confocal scanning microscopy and fluorescence correlation spectroscopy.

iii. Radiological safety (Radiation Protection Standards, Principles of Monitoring and Protection).

iv. Biostatistics.

Semester II

1. Research Methodology (Compulosory)

What is a PhD thesis, psychological and social factors during PhD, student's role in thesis work, supervisor's role in thesis work, overview of research planning, time management, fair scientific practices.

Ethics in natural sciences, avoiding research that cause unjustified risk to people, jeopardizing the environment or convert public resources into private profits, striving for objectivity (in the research process and in presentation of results), handling uncertainties.

Literature survey, critical use of existing knowledge, finding out a research problem, scientific publishing, classification of conferences and journals, judging whether a material is publishable, refereeing process, criticizing own and others work.

How to give seminars, how to use various softwares, how to use various instruments, how to interact with people, how to apply for jobs, plagiarism in science – what to do and not to do.

As a concrete example, each student will be asked to produce a “prototype thesis” in a given area under a “prototype supervisor”. The student will apply the knowledge, ethics and best scientific practices to produce the thesis. Students will be evaluated based on the thesis and its defence.

2. Advanced Level Optional Courses (to choose any 2 from each Group - A, B and C)

A. Advanced Biophysical techniques (OPT1)

(i) Macromolecular crystallography
Structure factors, Atomic scattering factor, temperature factor, structure factor calculation, Phase problem and electron density calculation. Advanced phasing techniques (like MAD/SAD). Phasing by MR, Model building and refinement. Fiber Diffraction.
High throughput crystallography; Cryo-crystallography and its application in trapping reaction intermediates; X-ray crystallography to elucidate structure-function relationship for some important biological pathways; crystallography of large macromolecular assembly.
Crystallization techniques, handling protein crystals using cryo techniques, diffraction data collection, electron density map interpretation, crystallographic data analysis.

(ii) Chromatography and Mass Spectrometry
Chromatography: General principles of chromatography, common types of chromatography[1], factors affecting chromatographic separation and considerations for choosing mode of chromatography, applications.
Mass Spectrometry: General principles, ion source[2], types of mass analyzers[3], ion fragmentation and rearrangements, mass spectrometry of protein and peptides, mass spectrometry of small molecules, imaging mass spectrometry, applications.

[1]normal phase, reverse phase, HILIC, ion exchange, size exclusion, affinity, GC and chiral.
[2]ESI, APCI, MALDI, EI, DESI, LAESI, FAB, SIMS, NIIMS.
[3]quadrupole, TOF, ion trap, orbitrap, ICR.

(iii) Spectroscopic techniques
Nanosecond to Femtosecond Laser Spectroscopic Techniques and their application to the various prototype and diverse bio-molecules of different sizes related to Biophysical Sciences. The spectroscopic methods we will cover are the following: (i) Time Resolved Fluorescence and Absorption (ii) Circular Dichroism.

(iv) Imaging techniques
Concepts in Microscopy and imaging: Basic Principle of Optics, Family of Microscope , Optical Microscope Aberrations, Polarized light and its interaction with matter, Detection system image formation and image analysis, Point spread function, Principle of TEM &SEM: development, architecture, vacuum system, power supply, Sample preparation techniques and Application

Single molecule detection (SMD) by fluorescence: Single molecule fluorescence spectroscopy/Microscopy, Technical Challenges, Methods in single molecule detection, Total Internal reflection (TIR) spectroscopy, Types (PTIR, OTIR), Data Processing, analysis and interpretation. Principle of trapping, Design Considerations, Trapping force, Microscope, Objective, Position detection.

B. Topics in Cell Biology (OPT2)

(i) Cell cycle
Regulation of cell cycle by cyclin-Cdk, Regulation of Initiation of eukaryotic DNA replication, Replication Licensing, Cell cycle checkpoints, Protein degradation by ubiquitination during cell cycle progression.

(ii) Mechanobiology
Cytoskeleton and nucleoskeleton, mechanics of cell-cell adhesion and migration, gross cell mechanics, experimental set ups to study biomechanics, disease models.

(iii) Chromatin and epigenetics
Methods to study chromatin structure, Epigenetics and gene regulation, DNA repair mechanisms in chromatin context, Chromatin dynamics in Stem cell differentiation and cancer, Chromatin as drug target.

(iv) Intracellular trafficking
Protein translocation, protein trafficking (endocytosis, exocytosis, transcytosis), de novo organelle biogenesis, protein quality control (role of internal vesicles), lysosomal biogenesis and degradation.

(v) Neuroscience
Paring Back, Critical Periods, SENSATION AND PERCEPTION: Vision, Hearing, Taste and Smell, Touch and Pain, LEARNING AND MEMORY, MOVEMENT, SLEEP: The Stuff of Sleep, Sleep Disorders, How is Sleep Regulated? STRESS: The Immediate Response, Chronic Stress, AGING: Aging Neurons, Intellectual Capacity, CHALLENGES & ADVANCES: Pain, Epilepsy, Major Depression, Manic-Depressive Illness, Addiction, Learning Disorders, Stroke, Neurological Trauma, Anxiety Disorders, Neurological AIDS, Spinal Cord Injury.

C. Topics in Modern Biology (OPT3)

(i) Membrane Biophysics and Structural Dynamics of Membrane Proteins
Models of biomembranes, Hydrophobic effect, Membrane organization and dynamics, Phase transition of membranes, Model membranes: micelles, reverse micelles, liposomes and Nanodiscs, Membrane proteins & cell surface glycoconjugates, Membrane Dynamics: Edidin & Frye experiment, heterocaryons, Diffusion of membrane components, Membrane domains and lipid rafts: membrane biophysics to cell biology, Hydrophobic mismatch, Membrane asymmetry and lipid polymorphism, Membrane cholesterol and its relevance in health and disease
Techniques in membrane biology
Structures of membrane proteins, How membranes shape protein structures? Lipid-protein interactions, Ion channels and Transporters, G-protein coupled receptors (GPCR).
Books:
1. Biomembranes : A Molecular approach by R.B. Gennis, Springer-Verlag.
2. Membrane Structural Biology – with biochemical and biophysical foundations by Mary Luckey, 2^{nd} edition, 2014, Cambridge University Press.

(ii) Introduction to Space Bioengineering and Medicine
Manned and unmanned space missions; space as an extreme environment, microgravity, space radiation; physiological and biological effects of microgravity and space radiation on human, plants and microbes; Effect of microgravity at the level of genes and cells; Ground based facilities to simulate microgravity and cosmic radiation; space bioreactor, simulated microgravity reactor; space medicine: current status and future challenges; Bioengineering solution for long duration space flight

and international space station (ISS), biological hazards in ISS and its remediation; In-situ resource utilization; space agriculture, space as a solution for earth based biomedical and bioengineering challenges; Challenges in human MARS exploration and its bioengineering solutions, concepts of terraforming; concept of space synthetic biology; space medicine and biotechnology on Indian context.

(iii) Drug Discovery: Modern Day Approach

Pre 20th century drug discovery. Drug discovery pipeline, drug targets and target validation. Methods of lead identification and optimization. Early prediction of ADMET (Absorption, Distribution, Metabolism Excretion and Toxicity). QSAR (Quantitative Structure Activity Relationship) predictions. Lipinski rule of 5. Polar surface area. Blood brain barrier crossing model. Predicting toxicity. Introduction to drug docking and pharmacophore modeling.

(iv) Nanobiomaterials :

Principles of bio-inspired nanomaterials, common biologically active molecules as suitable ligand for nanomaterials synthesis, separation procedure of different biological components from organic-mass and bio-mass, principles and function of gel electrophoresis & qPCR, concept of antigen and antibody, antigen specific aptamers, what is cancer? Different pathogens, surface modification of nanomaterials for highly specific targeting, biomarker detection and quantification for early stage detection, different therapeutic methods: photon, photodynamic, micro pH and photothermal therapy and their advantages over chemo and radiation therapy. PET scan, Magnetic separation, complete blood count (CBC), blood protein testing, tumor marker testing along with spectroscopic (UV-vis, Fluorescence and Raman techniques) and imaging techniques (TEM and AFM). Bi-metallic nanomaterials with programmable crystal defects for bacterial cytoskeleton targeting.

Semester III (Summer Semester)

Project (PRO)

Each student chooses one topic from an offered list and carries out an extensive review of literature and experiments with specific scientific aims under the supervision of a faculty. The student submits a dissertation describing the literature survey and reporting the experimental findings which will be evaluated by two faculties. Finally, the student presents and defends the work in an open forum.

TMC

BACK TO MAIN

SYLLABUS FOR
Ph.D. in LIFE SCIENCES
(PROGRAM CODE: LIFE04)

Annexure - I

1. Salient features of core course and electives
Students at ACTREC are required to do a core course and take elective courses, which are determined by them in consultation with their thesis supervisor.

A] The core course is for 1000 marks which are equal to 500 Hrs (30 Credits) to and was re-configured at the beginning of the current academic year in the following manner:
a. There are two courses that cover Basic Cancer Biology and one course covering Tumor Immunology, Structural Biology and Biophysics.
b. The students are evaluated in a written exam for each course and have take-home assignments for each course.
c. The students also have to present two assigned papers over the period of the core course.
d. The courses also include lectures on advanced techniques that introduce the students to new methodology.

B] Eight electives are offered at ACTREC and the students have to pick 4 for a total of 400 marks which are equal to 200 Hrs (12 Credits) Each elective has a course co-ordinator/co-ordinators who designs the course and determines the process by which the students are examined over the course.

C] Core course includes Special lectures on Epidemiology and Bioinformatics (5 lectures), Intellectual Property rights (1 lecture) and Research Methodology (6 lectures). All these lectures have no separate credit points.

D] Research Methodology (6 lectures) is a separate module with no separate credit points. Laboratory Work all through the year carries 200 marks which are equal to 100 Hrs (6 Credit) Scientific writing assessed at the final seminar is for 100 marks which are equal to 50 Hrs (3 Credit)

E] Final Seminar presentation on the topic of Ph.D. dissertation carries 200 marks which are equal to 100 Hrs (6 Credit) and

F] Oral General Comprehensive Examination (OGCE) is for 100 marks which are equal to 50 Hrs (3 Credit)

Total course work is of 2000 marks which are equal to 1000 Hrs (60 Credits).

2. Choice based credit system
ACTREC follows the HBNI guidelines on how many academic hours correspond to how many marks. While the core course is mandatory for all students, the students do have a choice of electives. Similarly, the credits for the Final seminar, lab work and scientific writing are based on the choice of project that will be pursued by the student.

3. Modification in course work if any and when was it modified (after 2013) and modifications done.
The core course was last modified at the beginning of the academic year 2017-18. It was re-organized to divide the course into appropriate subject areas. The elective Angiogenesis and

Metastasis was discontinued in 2014 and a new elective in Biostatistics was added in 2014. As per HBNI guidelines a module on research methodology was added in 2014. Further, lectures on cancer metabolism have been added in 2017 as this is a new and interesting area in the field of cancer biology. A new elective on Metastasis was added in the academic year 2018-19 after approval by the BOS. All faculties keep revising their lectures so as to stay current given the constantly changing nature of the field while ensuring that the basics are taught to the graduate students.

HBNI Orientation Course on Basic and Cancer Biology for Junior Research Fellows, ACTREC

Proposed Lectures / Marks of Coursework: 1st year of the Ph.D. program
[Total: 2000 marks]

Orientation		No. of Lectures	Marks
1	Laboratory Safety Lectures	3	-
2	Visits to Library, Common Instrument Room and Laboratory Animal Facility	3	-
3	Orientation to the Cancer Clinic	4	-

A] Core Course 50 lectures / 200 academic hrs / 1000 marks
50 lectures / 200 academic hrs / 1000 marks

S. No.	Core Course Topics	No. of Lectures	Marks
09LIFE04-001-C	Cell Biology & Cancer Biology	8	Written Test 140 marks Home Assignments: 150 marks
09LIFE04-002-C	Cell Proliferation and Cell death	4	
09LIFE04-003-C	Oncogenes and Tumor Suppressors	5	
09LIFE04-004-C	Metastasis and Angiogenesis	4	Written Test 140 marks Home Assignments: 150 marks
09LIFE04-005-C	Cancer Epigenetics and Genetics	7	
09LIFE04-006-C	Carcinogenesis	5	
09LIFE04-007-C	Tumor Immunology	5	Written Test 120 marks Home Assignments: 100 marks
09LIFE04-008-C	Structural Biology and Biophysics	5	
	Presentations 1 & 2	7	200 marks
		50	**1000 marks = 500 Hrs = 30 credits**

B] Electives (Any 4) 40 lectures / 80 academic hrs / 400 marks
40 lectures /80 academic hrs / 400 marks

S. No.	Elective Topics	No. of Lectures	Marks
09LIFE04-001-E	Biostatistics	11	Exam 100 marks
09LIFE04-002-E	Animal Models in Cancer Research	10	Exam 100 marks
09LIFE04-003-E	Cancer Therapeutics	10	Presentations 100 marks
09LIFE04-004-E	Carcinogenesis, Chemoprevention and DNA Repair	10	Presentations 100 marks
09LIFE04-005-E	Deregulation of Cell Growth in Cancer	10	Presentations 50 marks Assignment 50 marks
09LIFE04-006-E	Structural Bioinformatics, Biophysics & Structural Biology	10	Exam 100 marks
09LIFE04-007-E	Tumor Immunology	10	Presentations 100 marks
09LIFE04-008-E	Metastasis	10	Presentations 100 marks
		40	**400 marks = 200 Hrs = 12 credits**

C] Special Lectures: a) Epidemiology & Bioinformatics — 5 lectures — No marks
b) Intellectual Property Rights (IPR) — 1 lecture — No marks

D] Research Methodology

	a) Lectures	6 lectures	No marks
	b) Laboratory work	All through the year	200 marks=100 hrs=6 Credits
	c) Scientific Writing	Assessed at final seminar	100 marks=50 hrs=3 Credits
E]	**Seminar Presentation on the topic of their Ph.D. dissertatic**	10	200 marks=100 hrs=6 Credits
F]	**First Thesis Committee Meeting / Comprehensive Examination**		100 marks=50 hrs=3 Credits
		Grand Total:	**2000 marks = 1000 Hrs = 60 credits**

Core Course

Research Methodology	
RM1	The flow and structure of a paragraph - case study. Grammar, common unscientific terms used in writing, the common pitfalls seen - direct translation of words from mother tongue to English
RM2	Literature review - where to get material, the quality and quantity of content. Establishing a background for a research project
RM3	Laboratory notebook maintenance - Do's and don'ts, Good research practice, ethics, plagiarism
RM4	The art and science behind manuscript writing and successful research proposal Ideas, their formulations, what are aims and objectives, What constitutes results and discussions
RM5	The fine art of power point presentation
RM6	Preparing figures for manuscripts and grants

Core Course	**09LIFE04-001-C: BASIC CANCER BIOLOGY – I**	**[Modules 1 – 3]**
	Module 1: Cell Biology and Cancer Cell Biology	
	Module 2: Cell Proliferation and Cell Death	
	Module 3: Oncogenes and Tumor Suppressors	
Core Course	**09LIFE04-002-C: BASIC CANCER BIOLOGY – II**	**[Modules 4 – 6]**
	Module 4: Metastasis and Angiogenesis	
	Module 5: Cancer Epigenetics and Genetics	
	Module 6: Carcinogenesis	
Core Course	**09LIFE04-003-C: TUMOUR IMMUNOLOGY, STRUCTURAL BIOLOGY & BIOPHYSICS**	**[Modules 7-8]**
	Module 7: Tumour Immunology	
	Module 8: Structural Biology and Biophysics	

Annexure - III

ELECTIVES OFFERED AT ACTREC: 2019

CODE	Elective Topics
09LIFE04-001-E	**Biostatistics** (*Compulsory)*
09LIFE04-002-E	**Animal Models in Cancer Research**
09LIFE04-003-E	**Cancer Therapeutics**
09LIFE04-004-E	**Carcinogenesis, Chemoprevention and DNA Repair**

IMSc

SYLLABUS FOR

Ph.D. in LIFE SCIENCES
(Program Code: LIFE04)

Syllabus

Candidates should take all core courses (exemptions can be granted on case-by-case basis but an assessment must be made), as well as at least two electives and experimental components (workshops or lab rotations at collaborating institutes.)

CORE COURSES (Semester 1)		
10-LIFE04-001-C Biology-1 (24 lectures), 100 marks		
1	Basic molecular biology	Biomolecules, DNA, RNA, proteins; genetic code; "central dogma"; gene transcription, translation; packaging of DNA in eukaryotes; introns/exons, splicing
2	Cell biology	Cellular metabolism, cell motility, cytoskeleton, intracellular transport, membrane transport, channels, receptors, signalling, cell cycle
3	Genetics	Mendelian genetics, definitions (genes, loci, alleles), dominance; replication, mitosis/meiosis, linkage/crossover
4	Gene regulation	Transcriptional regulation, miRNA and RNAi
5	Developmental biology	differentiation, early development of drosophila via gradients, gap and pair-rule genes, role of hox genes, Williston's "law", other organisms
6	Evolutionary biology	Molecular evolution, evolution of DNA, genes, proteins and regulation. Molecular mechanisms of evolution -- mutation, recombination, duplication, mobile elements
10-LIFE04-002-C Protein Structure (24 lectures, 100 marks)		
1	Taxonomy	Primary, Secondary and tertiary structure, fold types
2	Protein folding	The Anfinsen experiments, Protein database (PDB), Helix-helix packing in globular proteins, Beta-sheet packing, Folding pathways, thermal denaturation, partially folded intermediates, misfolding and aggregation
3	Membrane proteins	Cell membranes, simple and facilitated diffusion across membranes, membrane protein structural biology, ion channels and receptors, transport via membrane proteins, membrane channels:potassium channel, aquaporins, G-coupled protein receptors, ligand/voltage gated ion channels
4	Enzymes	Biological catalysts, Gibbs free energy, transition state complex, substrate, products, active sites, activation energy barrier, induced-fit hypothesis, cofactors, coenzymes, Michaelis-Menten enzyme kinetics
5	Electrostatics in biology	Continuum methods, solvation and ions, implicit solvent models, Poisson equation, Poisson-Boltzmann equation, solvation free energy
6	Structural characterization	x-ray crystallization, circular dichroism, spectroscopy, NMR, single molecule experiments

7	Homology modelling	Homology Modeling, Visualization
10-LIFE04-003-C Mathematics and statistics for biologists (30 lectures, 100 marks)		
1	Differential equations	introduction to ODEs and PDEs, linear and non-linear, properties, how to solve analytically and numerically; examples -- Hodgkin-Huxley, reaction-diffusion equations, Volterra equations
2	Essentials of linear algebra	vectors, matrices, eigenvalues and eigenvectors; orthogonal bases of functions, Sturm-Liouville theory and differential equations; Fourier series and Fourier transforms
3	Probability theory and statistics	basic concepts -- random variables, mean, variance, moments; conditional probabilities, hypothesis and data, likelihood, Bayes' theorem; probability distributions -- binomial, multinomial, Poisson, normal; the central limit theorem; hypothesis testing, significance testing (orthodox and Bayesian methods); parameter estimation
4	Simulations	Introduction to Markov Chain Monte Carlo for exploring space of hypotheses: ergodicity, detailed balance, convergence. Metropolis and Gibbs sampling
5	Machine learning	decision tree learning, artificial neural networks, support vector machines, Bayesian learning and Bayesian networks
6	Other topics	Game theory, applications to evolutionary biology, agent-based modelling of complex systems
10-LIFE04-004-C Physical Methods for Biologists (37 lectures, 100 marks)		
1	Basic physics of soft matter	What is soft matter, length scales and time scales, biological matter as soft matter, self-organization and self assembly, illustrative examples - DNA, microtubules and/or actin and lipid membranes, coarse-grained representations, interactions and bonding in soft matter systems (including van der Waals forces, hydrogen bonding, electrostatics and screening), what can be measured, energy scales
2	Thermodynamics and statistical mechanics	Thermal equilibrium, the idea of entropy, laws of thermodynamics, free energies, Legendre transformations, different ensembles and relation to computational biology examples, Boltzmann distribution, harmonic oscillator, equipartition theorem, virial theorem, thermodynamics of self assembly, simple ideas of phase transitions, Poisson-Boltzmann theory, dealing with electrostatics
3	Noise, diffusion and drift	Thermal fluctuations and noise, random walk, diffusion equation as continuum limit of the random walk, probability density, continuity equation, Fick’s law, drift-diffusion equation, Stokes-Einstein formula, example of receptor clustering
4	Mechanics of continuous media	Elasticity of isotropic solids, estimates for elastic constants of biological materials, fluids in biology, basics of fluid mechanics, Pascals law, Euler’s equation, viscosity, Reynolds number, Navier-Stokes equation, flow through narrow pipes, dimensionless groups, swimming of microorganisms, hydrodynamic interactions, rheology of biological matter, introduction to viscoelasticity, Maxwell model
5	Polymers, membranes and gels	Simple ideas of polymers and membranes, polymer elasticity, polymer dynamics (Rouse and Zimm model) qualitative discussion, scaling ideas in polymers, semi-flexibility, membrane elasticity, membrane fluctuations, passive gels

6	Out of equilibrium	Active matter, simple examples, what do we need to model them, polymerization forces, cell streaming, molecular motors and models, active gels
7	Other topics	Interfacial tension in biological systems, Laplace pressure, wetting and spreading, osmotic effects, capillary effects in biology, micro-rheology
		for biological systems

CORE COURSES (Semester 2)

10-LIFE04-005-C Biology-2 (25 lectures, 100 marks)

1	Epigenetics	DNA packaging, heterochromatin and euchromatin, methylation, histone tail modifications and gene regulation
2	Basics of neuroscience	Neurons, synapses, neural architecture in various organisms, action potential, Hodgkin-Hoxley equation, firing rates, plasticity, artificial neural networks
3	Introduction to ecology	Ecology and evolution, ecosystems, food webs, large-scale ecology
4	Experimental techniques	PCR, southern/northern/western blots, chromatin immunoprecipitation, microarrays, high-throughput sequencing, ChIP-chip and ChIP-seq, high-resolution microscopy (fluoroscence imaging, confocal, FRET, PALM etc), GFP and reporter gene assays
5	Other topics	Basics of: Intercellular communication, epidemiology, physiology, immunology

10-LIFE04-006-C Biological sequence analysis (30 lectures, 100 marks)

1	Biomolecules	Basics (DNA, RNA, proteins)
2	Probability theory	Basic laws -- joint probabilities, conditional probabilities, likelihood, Bayes' theorem
3	String algorithms	finding common substrings and subsequences: Boyer-Moore algorithm, suffix trees, finding strings with mismatches
4	Sequence alignment	algorithms for pairwise and multiple sequence alignment -- scoring model, Needleman-Wunsch and Smith-Waterman algorithms, BLAST and other heuristic algorithms, significance of scores, structural alignment
5	Sequence assembly	assembling short reads, with and without scaffold; ChIP-seq algorithms
6	Markov models	Markov chains, hidden Markov models, Baum-Welch and Viterbi algorithms, profile HMMs and software (HMMer, etc)
7	Transcriptional regulation	Transcription factor binding sites, position weight matrices, sequence logos, motif-finding via expectation maximisation (MEME) and Gibbs sampling
8	Phylogenetic trees	building a tree from pairwise distances, neighbour-joining, parsimony
9	Transformational grammars	regular grammars, context-free grammars; RNA structure analysis

10-LIFE04-007-C Systems Biology (30 lectures, 100 marks)

1	Networks in biology	The diversity of networks across space and time in biological systems Intra-cellular networks: The gene network and protein-protein interaction network Intra-cellular networks: The metabolic network Intra-cellular networks: signaling networks - pathways and	
		enzyme-substrate reaction cascades The signaling network coordination of immune response to infection Reconstructing biological networks from lab experiments Structural analysis of networks: Global properties Structural analysis of networks: Motifs and Modules Dynamics on biological networks: Modeling signaling pathways Inter-cellular networks: Neuronal networks Inter-organism networks: Contact structure and contagion propagation Inter-species networks: Stability-instability of food webs	
2	Patterns in Biology	Temporal patterns: Biological clocks and circadian rhythms Oscillatory activity in Pancreatic beta cells and insulin secretion Pattern formation during development Development in Drosophilia Development of the vertebrate body plan Modeling developmental patterns: Reaction-diffusion models and Turing Patterns Spatial patterns: Linear stability analysis and Fourier modes Autocatalysis and lateral inhibition: Gierer-Meinhardt and related pattern generation mechanisms in biosystems, center-surround principle in retina and cortex Modeling genesis of functional patterns: Ocular dominance columns Development of plants and L-systems modeling Cell differentiation and Random NK Boolean Networks Morphogenesis Fractals in biology: Examples (1/f noise, circulation system), characterization Fractals in biology: Generation mechanisms	
3	Waves in biology	Importance of waves in biology for communication and coordination Intra-cellular waves: Calcium waves, targets and spirals Inter-cellular waves: Waves in the brain, heart and uterus Excitable media models of physiological systems Ionic basis of excitation: Hodgkin-Huxley formalism Simple and complex models of excitability Excitability, Oscillatory and Bistability regimes of systems Wave propagation through inter-cellular gap junctions: Diffusion approximation Genesis and dynamics of spiral waves: kinematic approach Nonlinear dynamical aspects of spiral waves: Restitution and dispersion Excitation-contraction coupling and the role of organ structure in wave dynamics Bidomain models of biological electrical activity Waves in single populations: Fisher waves Waves in interacting populations: Propagating epidemics, spiral waves in host-parasite spatial dynamics	

ELECTIVE COURSES (semester flexible)

10-LIFE04-001-E Biophysics of Macromolecular Structures (32 lectures)

I. Structure and Biophysics of Biomolecules (10 lectures)

Introduction to macromolecular chemistry, building blocks for macromolecular structures, biophysical methods for structure analysis, nucleic acid structure, protein-nucleic acid interactions, membrane proteins, microtubules and other supramolecular assemblies, investigative methods from the atomic to cellular levels, including X-ray crystallography, NMR spectroscopy, molecular dynamics, electron and light microscopy, AFM, single molecule techniques and simulations

II. Kinetics (5 lectures)

Chemical kinetics and application to dynamical processes in proteins, self assembly processes, classical kinetics, transition state theory, unimolecular decomposition, potential energy surfaces, scattering processes and photodissociation processes, enzyme kinetics

III. Biophysical approaches to Biopolymers (6 lectures)

Basics of polymers, protein folding problem, protein aggregation, DNA, DNA electrostatics, DNA force extension relations, RNA folding, polymerization, polymerization forces, dynamic instability, tread-milling and their physical description

IV. Biophysical Approaches to Membranes (5 lectures)

Lipids and Membranes: Structure of various cell membranes, surface tension and curvature energies, Helfrich theory, clustering, phase separation, nanoscale structures i.e. rafts, multicomponent membranes.

SPECIAL TOPICS

V. Kinetics and statistical mechanics of helix coil transitions; physical approaches to the refolding and assembly of multi-subunit proteins; fluorescence spectroscopic studies of macromolecules, molecular basis of enzyme catalysis, antibody structure and function, virus structure and assembly (6 lectures)

10-LIFE04-002-E Simulation Techniques in Biology (32 lectures)

I. Molecular Dynamics (8 Lectures)

Introduction to MD and applications in biology and drug design; Basic Statistical mechanics: Basic thermodynamics, Ensembles (microcanonical, canonical, grand canonical, isothermal-isobaric), Virial theorem, Nose-Hoover chains; Forcefields and interaction potential: Many body potentials, Born-Oppenheimer approximation, electrostatic interactions including Ewald sum, interaction potential for organic molecules; popular forcefields: AMBER, CHARMM, OPLS etc.,;Integration methods and Liouville time operators Phase space concepts, Liouville theorem, Equilibrium solution of Louiville equation, Trotter factorization; Integration algorithms: Verlet, Velocity-Verlet, Gear-Predictor, multiple-time step algorithm, holonomic constraints (RATTLE/SHAKE)

II. Monte Carlo Simulations (6 lectures)

Importance Sampling, Random variables and stochastic processes,lattice models, Random walks, Gibbs sampling, sampling errors, configurational-bias Monte Carlo method, Markov chain Monte Carlo, Advanced Monte Carlo methods: Parallel tempering, simulated annealing

III. Reaction Diffusion (4 Lectures)

Predator Prey Models, Reaction Kinetics, diffusion-limited reactions, Population dynamics, Reaction-diffusion Equations

IV. Brownian/Stochastic simulations (8 lectures)

Stochastic reaction-diffusion models:Compartment-based reaction-diffusion algorithm, reaction-diffusion master equation, pattern formation; Diffusion:

Brownian motion, On/Off-Lattice models, diffusion to adsorbing surfaces, reactive boundary conditions, Einstein-Smoluchowski relation; Stochastic models of transport processes in cells: Fokker Planck Equations, Brownian rachet models, Chapman
-
Kolmogorov equation, Gillespie algorithm, chemical master equation

SPECIAL TOPICS

V. Free energy methods (3 lectures)

Potential of mean force, umbrella sampling, Adaptive bias force method,

thermodynamic integration

VI. Binding and Docking (3 lectures)

Enzyme-substrate recognition process, Search Algorithms (simulated annealing, steepest descent, genetic algorithms), Scoring Functions, Applications of Docking, Softwares for docking

10-LIFE04-003-E **Population Biology, Ecology and Evolution (30 lectures)**

1. Single species population (10 lectures)

Continuous and discrete-time models of population growth (Logistic and related models)
Models of age-structured populations
Population dynamics in the presence of noise
Time-series analysis of data
Flies: Model experimental organism for studying population dynamics
Modeling migration of populations
Territorial behavior
Fundamentals of game theory
Evolution of cooperation between individuals
Spatial dynamics of strategies (Example: Spatial Prisoners Dilemma)

2. Interaction between multiple populations (10 lectures)

Introduction to food webs and ecological interactions between species
Predator-prey interactions: Lotka-Volterra and related models
Functional response
Competition
Cooperation
Multiple prey and predators: Generalized Lotka-Volterra and related models
Stability vs complexity in ecosystems: Single trophic level
Stability vs complexity in ecosystems: Multiple trophic levels
Experimental techniques for studying impact of diversity on stability
The robustness of complex ecological networks

3. Evolution and population genetics (10 lectures)

Fundamentals of population genetics: Random mating and Hardy-Weinberg principle
Classical mathematical genetics: Single locus with multiple alleles
Classical mathematical genetics: Multiple loci
X-linked genes; Linkage and its distribution
The molecular basis of classical genetics
Fitness landscapes and mathematical models of evolution
The major transitions in evolution
Mutation and natural selection
Random genetic drift
Neutral theory of evolution
Coevolution and evolutionary game theory
Evolutionary ecology

10-LIFE04-004-E **Computational Neuroscience (30 lectures)**

1. Neurons, Synapses, Gap Junctions and Small Circuits (10 lectures)
   Introduction to the biological components of the nervous system
   Types of Neurons and Glial cells
   Neuronal activity: Action potential and Graded potential
   Ion channels and electrical activity of neurons
   Dynamics of graded potential neurons (Example: retina)
   Dynamics of action potential neurons, spikes and spike trains
   Dynamics of inter-neuron communication: Synaptic transmission
   Dynamics of inter-neuron communication: Gap junctions
   Introduction to GENESIS/NEURON simulation platforms
   Neuron-Glial interaction
   Small neuronal circuits and motifs

2. Systems Neuroscience (10 lectures)
   Introduction to the computational perspective for studying the brain
   Introduction to Neural Network Models: McCulloch-Pitts paradigm
   Associative Memory and the Hopfield Network
   Storage capacity and stability of memories in Hopfield Network: Mean-field theory
   Learning: Donald Hebb's Hypothesis, Long-Term Potentiation and STDP
   Perceptron and related models: learning to generalize
   Dynamics of Learning: Hebbian and Competitive principles
   Information theory and neuro-communication
   Development of the nervous system in a growing organism
   Evolution of the nervous system: from single cells to the brain
   Invertebrate neuroscience: C. elegans as a model organism
   Modeling the nervous system of invertebrates
   Sensory-motor integration in the nervous system

3. Vision and cognitive neuroscience (10 lectures)
   Introduction to Sensory Processing in the Nervous System
   Components of the Visual System
   Dynamics of Early Visual Processing at Retina
   Receptive fields and centre-surround principle (Mach bands, etc.)
   Processing at the Primary Visual Cortex and Higher Brain Areas
   Modeling edge detection, shape from texture and motion detection
   Visual binding: Synchronization of neuronal activity
   Optical illusions as tool for studying vision
   Information theory of vision
   Introduction to cognitive neuroscience
   Experimental tools of cognitive neuroscience: fMRI, PET, etc.
   Linguistic ability: A model system for cognitive neuroscience

10-LIFE04-005-E **Modeling of Infectious Diseases (28 lectures)**

1. Genomics & evolutionary biology of pathogens (8 lectures)

Dynamics of molecular evolution
Vertical and horizontal gene transfer
Genomic landscape of pathogens, vectors and humans (Example: malaria); Coevolution and Red queen hypothesis
Gene regulation, pathogenesis and immune response
Evolution of virulence

2. The biology and modeling of host-pathogen interactions (8 lectures)
The immune system: design, phylogeny and ontogeny
The functional anatomy of immune response
Analysis of idiotypic network interactions
Systems biology principles for intra-cellular sigaling in immune response
Systems-level modeling of Mycobacterium tuberculosis host-parasite protein-protein interactions
Micro-edipdemiology: population dynamics of viruses and host cells, May-Nowak and related models; application to HIV

3. Epidemiology: data analysis and mathematical modeling (12 lectures)
Epidemics: Dynamics and basic reproductive ratio R0
Estimation of R0 from data - statistical technqiues
Immunization and other public health intervention strategies
SIR model of epidemics: derivation and solution
Variants of SIR model: SEIR, SIS and SIRS
Modeling vector-borne diseases
Host-parasite models (example: Nicholson-Bailey model)
Cellular automata models
Eco-epidemiological models
Contact network: structure and dynamics
Agent-based models of infection propagation

Structure of Course Work

List of Compulsory Courses

Course No	Course Name	Credits
B601	BIOINFORMATICS AND COMPUTATIONAL BIOLOGY	6
B602	BIOTECHNIQUES	6
B701	ADVANCED MOLECULAR BIOLOGY	6

List of Elective Courses

Course No	Course Name	Credits
B651	ADVANCED CELL BIOLOGY	6
B652	GENETIC ENGINEERING	6
B653	ADVANCED BIOCHEMISTRY	6
B654	ADVANCED MICROBIOLOGY	6
B655	ENZYMOLOGY	6
B656	ADVANCED NEUROBIOLOGY	6
B657	CHEMICAL BIOLOGY	6
B658	VIROLOGY	6
B659	PLANT PHYSIOLOGY	6
B660	DEVELOPEMENTAL BIOLOGY	6
B751	ADVANCED IMMUNOLOGY	6
B752	INFECTIOUS DISEASE BIOLOGY	6
B753	CANCER BIOLOGY	6
B754	ADVANCED GENETICS	6
B755	IMMUNE REGULATION AND INFECTION	6
B756	MACROMOLECULAR CRYSTALLAGRAPHY	6
B757	QUANTITATIVE BIOLOGY	6
B758	ION CHANNELS	6
B759	CONCEPTS IN MECHANOBIOLOGY	6
B760	MOLECULAR ERRORS IN DIESEASE	6
B761	PLANT DEVELOPEMENTAL BIOLOGY	6

List of Research Project Assignments

Course No	Course Name	Credits
B699	*Research Project Assignment – 1	12
B799	*Research Project Assignment – 2	12

*Two research project assignments relevant to the Ph. D topic

Detailed Syllabus – Compulsory Courses

Bioinformatics (B601)

Course Title : **Bioinformatics**
Course Code : **B601**
Credits : **6 Credits**
Course Category : **Core**
Course Prerequisites : **Biochemistry, Molecular Biology, Genetics, Biostatistics**
Contact Hours (28/42/56) (including tutorials) : **56**

Outcome of the Course:

- Application of bioinformatics knowledge in understanding relationships at sequence, structure and network-level.
- Demonstration of popularly used bioinformatics tools for research work
- Help understand the patterns of life and rhythms

Course Contents:

1. Introduction to bio-informatics (2 Lectures)
   - Introduction,
   - History and importance
   - Field and scope

2. Databases and Database searching (2 Lecture + 1 demo)
   - Importance, classification
   - Annotation and File formats
   - Demo : NCBI, SWISS-PROT, PDB

3. Locating Coding regions and Gene prediction (3 Lecture)
   - 6-frame translation,
   - parameters governing prokaryotic and eukaryotic translation,
   - Concept, neural networks and its importance in gene prediction as example

4. Alignments (2 Lectures)
   - Significance and importance, types, classification
   - Dot-plot matrix

5. Substitution Matrices (3 Lectures + tutorial)
   - Significance, types,
   - derivation of BLOSUM and PAM

- Application of Substitution Matrices

6. Algorithms behind pairwise sequence alignments (6 Lecture + 1 demo + 1 tutorial)
   - Dynamic programming,
   - Smith-Watermann,
   - Needleman-Wunsch,
   - Heuristic, BLAST, FastA
   - applications, statistical parameters governing BLAST results
   - Demo : database searching using BLAST

7. Multiple sequence alignments (1 Lecture + 1 demo)
   - Importance, progressive sequence alignment, ClustalW, statistical parameters governing clustalW, applications
   - Demo : ClustalW

8. Phylogenetic tree construction and different approaches (5 Lecture + 1 demo)
   - Introduction, importance, classification and parts of tree,
   - predicting number of root and unrooted trees, orthologs and paralogs, transitions and transversions, susbstitutions matrices,
   - different methods to construct phylogenetic tree,
   - Neighbour-Joining (star decomposition method),
   - Bootstrapping
   - Demo : MEGA software

9. Pattern matching/position specific scoring matrices (1 Lecture + 1 demo)
   - Importance of patterns, motifs, deriving PSSM, sequence logo
   - Demo : Prosite, Pfam

10. Structural Bioinformatics (5 Lecture + 2 demo)
    - Introduction to structural bioinformatics and protein structure, Ramachandrean plot
    - Secondary structure prediction and methods
    - Hydropathy plot, helical wheel, signal peptide prediction, transmembrane prediction,
    - Demo :
    - Tertiary structure prediction : RMSD and Homology modelling
    - Demo : Swiss Model and evaluation
    - Concepts related to Drug design : Lipinski Rule of 5 and Molecular docking

11. Systems Biology (4 Lecture + 1 demo)
    - Introduction, need for computers in system biology
    - High-throughput and *omic* approaches, difference and application
    - Graph theory
    - Gene Ontology

- Demo: KEGG and gene ontology

Text Books (if any):

a) Introduction to bioinformatics – Arthur M. Lesk
b) Bioinformatics – David Mount
c) Essential bioinformatics – Jin Xiong

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Biotechniques (B602)

Course Title : **Biotechniques**
Course Code : **B602**
Credits : **6**
Course Category : **Core**
Course Prerequisite : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:
Basic principle behind the biophysical, and biochemical experiments. Troubleshoot the experiments, interpretation of results, plotting of graphs, design the experiments.

Course Contents (with both Lectures + Tutorials marked:

1. Techniques use in DNA characterization: Construction of genomic & cDNA library; Agarose gel electrophoresis; Northern blotting; Southern blotting; RFLP; AFLP; microarray.
   (6 Lectures + 2 Tutorials)
2. Techniques use in DNA manipulations: PCR and its application; Restriction digestion; Ligation; Site directed mutagenesis. (3 Lectures + 1 Tutorial)
3. Enzymes used in genetic engineering experiments: DNA polymerases; Ligase; Reverse transcriptase; Restriction endonucleases and other enzymes. (3 Lectures + 1 Tutorial)
4. Techniques use in protein characterization: SDS-Gel electrophoresis; Western blotting; IEF-2D gel electrophoresis; FRET; Co-Immunoprecipitation; CHIP; Protein-ligand interactions and affinity studies by Surface Plasmon resonance; Density gradient separation.
   (3 Lectures + 1 Tutorial)
5. Spectrophotometry (UV-Vis, CD, Fluorescence). (3 Lectures + 1 Tutorial)
6. Principles of Centrifugation. (3 Lectures + 1 Tutorial)
7. Uses of radioactive isotopes and autoradiography. (3 Lectures + 1 Tutorial)
8. Biophysical techniques: X-ray crystallography; NMR; ORD. (3 Lectures + 1 Tutorial)
9. Principals of chromatography: Ion exchange; Gel filtration; Affinity; Reverse flow; HPLC
   (6 Lectures + 2 Tutorial)
10. Immunological techniques: Generation of hybridoma and production of Ab; FACS; ELISA.

(3 Lectures + 1 Tutorial)

11. Microscopy (light, Fluorescence, UV, Atomic absorption; Confocal). (3 Lectures + 1 Tutorial)
12. Cell culture and developmental biology techniques (FISH); Genetic crosses in model organism. (3 Lectures + 1 Tutorial)

Text Books (if any):

a) "Immunology Laboratory Manual" by Myers and Richard L

b) "Molecular Cloning" by Sambrook and Russel

c) "Genetic Engineering" by Reece

d) "The tools of Biochemistry" by Terrance G. Cooper

e) "Biophysical Chemistry" by Alan Cooper

f) Wilson and Walker's Principles and Techniques of Biochemistry and Molecular Biology

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Molecular Biology (B701)

Course Title : Advanced Molecular Biology
Course Code : B701
Credits : 6 Credits
Course Category : Core
Course Prerequisites : NIL
Contact Hours (28/42/56) : 56
Outcome of the Course:
Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.
Course Contents:
1. Signaling pathways and regulation (8 Lectures + 2 Tutorials)

- Translation initiation, translation control in metabolic
- Genetic disorders and development.

2. Importance of cis regulatory elements (8 Lectures + 2 Tutorials)

- mRNA, CAP, 5'UTR, 3'UTR Poly A tail
- IRES structure and function
- trans-acting factors in protein expression, examples of Iron homeostasis.

3. General amino acid control mechanism, translation in developmental decision, GAIT mediated translational silencing, translation silencing by microRNA. (6 Lectures + 2 Tutorials)
4. Yeast mating type switch: Mating type locus, experimental evidence for cis regulatory elements, experimental evidence for transacting factors in mating type switch, donor preference, recombinant enhancers. (7 Lectures + 2 Tutorials)

5. Long term evolution experiment: Evolution of Cit+ function, potentitation of Cit+ function, actualization of Cit+ function, refinement of Cit+ function and molecular mechanism. (5 Lectures + 1Tutorials)

6. Molecular mechanism of PRK action and host-virus evolution. Role of dimerization domain, kinase domain activation independent of dimerization domain, substrate recognition motif, evolutionary pressure on PRK and pox virus pseudosubstrate. (5 Lectures + 1 Tutorials)

7. How do new protein arise: Minimal sequence code for switching protein structure-function, domain rearrangement give rise to new function, horizontal gene transfer between the genome, intergenic region as a potential site for new gene, gene duplication and refinement of its function.
(5 Lectures + 1 Tutorials)

Recommended Books:

a) “Molecular Cell Biology” 6th Edition By Lodish
b) “Gene X” By Lewin
c) “Translational Control in Biology and Medicine” By Michael B. Mathews, Nahum Sonenberg, John W.B. Hershey. CSH press
d) “Prokaryotic Gene Expression (Frontiers in Molecular Biology)” Oxford University Press, USA; First edition (July 29, 1999)
e) Class notes and research articles.

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Detailed Syllabus – Elective Courses

Advanced Cell Biology (B651)

Course Title : Advanced Cell Biology
Course Code : B651
Credits : 6
Course Category : Elective
Course Prerequisite :
Contact Hours (28/42/56): 56
(including tutorials)

Outcome of the Course:

* Understanding the basic principles governing cell structure and functions
* Biochemcial, biophysical, genetical basis of cell and its response
* Key concepts in maintenance of cell structure
* Evolution of cell organelles, importance in health and disease.
* Importance of ion channels in health and disease, pharmacology and applications
* Advanced knowledge of details of microscopy
* Bridging the gap between theory and research methodology

Course Contents (with both Lectures + Tutorials marked:

A: Understanding the cell (7 Lectures + 2 Tutorials)

1) Various cell types as model systems
2) Different sub-cellular structures and their function
3) Ultra structure of subcellular organelles
4) Others

B)Microscopy as tools for understanding cellular structure function (7 Lectures + 2 Tutorials)

1) Biological sample preparation. Difficulties and advancements
2) Various fluorescence proteins and their applications
3) Other fluorescence probes
4) Autofluorescence and its application
5) Others

C) Principle, uniqueness and application of different microscopes (7 Lectures + 2 Tutorials)

1) Fluorescence microscope
2) Phase contrast microscope,
3) DIC microscope
4) Confocal microscope, Spectral detection
5) Total internal reflection fluorescence microscope (TIRF),

6) Electron microscope,
7) Atomic force microscope,
8) Others

D) <u>Application of microscopes</u> (7 Lectures + 2 Tutorials)

1) Live cell imaging difficulties and advantages
2) FLIM application
3) FRET
4) FRAP
5) Photo-activation
6) Metal imaging
7) Others

E) <u>Understanding cellular dynamics</u> (10 Lectures + 3 Tutorials)

a) Cell division
b) Cytoskeletal reorganization, microtubule and actin cytoskeleton
c) Vesicle trafficking and recycling, endocytosis and exocytosis
d) Nuclear dynamics
e) Efflux and influx of ions and others
e) Others

F) <u>Super resolution</u> (4 Lectures + 1 Tutorials)

a) STED
b) PALM
c) STROM
d) Others

Text Books (if any):

Molecular Biology of the Cell: Alberts, Bruce; Johnson, Alexander; Lewis, Julian; Raff, Martin; Roberts, Keith; Walter, Peter, New York and London: Garland Science

Suggested References:

Important research articles and reviews as suggested in the class by the instructor. Nature cell biology, Journal of cell Biology, Journal of cell Science

Genetic Engineering (B652)

Course Title : Genetic Engineering
Course Code : B652
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : NIL
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding the basic principles of Recombinant DNA technology
- Knowledge of various tools and techniques used in genetic engineering
- Applications in the generation of transgenic models

Course Contents:

1. Growth and maintenance of bacterial cultures, bacteriophages plasmids (1 Lecture + 1 Tutorial)
2. Growth and maintenance of animal cells and viruses (2 Lectures)
3. Mutation, mutagenesis and mutant screening (3 Lectures + 1 Tutorial)
4. Enzymes used in genetic engineering experiments, DNA, polymerases, ligase, reverse transcriptase, restriction endonucleases and other enzymes (3 Lectures + 1 Tutorial)
5. Oligonucleotides synthesis & purification (1 Lecture)
6. Antisense DNA/RNA in genetic engineering (2 Lectures + 1 Tutorial)
7. Radiolabelling of nucleic acids (2 Lectures)
8. Transformation & transfection (1 Lecture + 1 Tutorial)
9. Construction of genomic & cDNA library (3 Lectures + 1 Tutorial)
10. Genomic DNA & cDNA cloning (3 Lectures + 1 Tutorial)
11. Analysis of DNA of cloned genes (3 Lectures + 1 Tutorial)
12. Analysis of protein sequencing products & cloned genes (3 Lectures + 1 Tutorial)

13. Nucleic acid & protein sequencing technology (3 Lectures + 1 Tutorial)
14. Protein nucleic interaction and the methods to study those (3 Lectures + 1 Tutorial)
15. Polymerase Chain Reactions, types of PCRs and analysis of PCR, products; Application of PCRs. (3 Lectures + 1 Tutorial)
16. Site directed mutagenesis (1 Lecture)
17. Recombination, site specific recombination (2 Lectures + 1 Tutorial)
18. Transgenic plants (1 Lecture)
19. Transgenic animals (1 Lecture + 1 Tutorial)
20. Other transgenic life forms (1 Lecture)
21. Ethics and economics of GM crops and GM organisms (2 Lectures + 1 Tutorial)

Recommended Books:-

a) "Genetic Engineering" by Reece

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Biochemistry (B653)

Course Title : **Advanced Biochemistry**
Course Code : **B653**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Understanding the mechanism of protein folding
- In depth knowledge about Post translational modifications of proteins
- Mechanisms and implications of protein turn over in cells

Course contents:

1. Protein secretion (8 Lectures + 3 Tutorials)
2. Protein folding: In vivo - In vitro (8 Lectures + 3 Tutorials)
3. Conditional enzyme kinetics (10 Lectures + 3 Tutorials)
4. Post translational modification (8 Lectures + 3 Tutorials)
5. Protein degradation (8 Lectures + 2 Tutorials)

Recommended Books:

a) Lehninger Principles of Biochemistry, Fourth Edition by David L. Nelson and Michael M. Cox

b) "Fundamentals of Biochemistry" *by Voet and Voet*

c) "Biochemistry" *by JM Berg, JL Tymoozko, L Stryer*

Suggested References:

Journals
Annual review of Biochemistry, Trends in Biochemical Sciences, Other suggested Journal.

Advanced Microbiology (B654)

Course Title : **Advanced Microbiology**
Course Code : **B654**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Develop understanding of bacterial responses to various stimuli
- Gain insights into bacterial biofilm formation and quorum sensing mechanisms

Course contents:

1. Molecular microbial genetics (10 Lectures + 4 Tutorials)
2. Molecular medical microbiology: microbial pathogenesis & infectious diseases, study of selected pathogenic organisms with emphasis on recent insights into their mechanism of pathogenesis (10 Lectures + 4 Tutorials)
3. Environmental microbiology (11 Lectures + 4 Tutorials)
4. Microbial interactions (11 Lectures + 4 Tutorials)

Recommended Books:

a) Brock's Biology of Microorganisms by Madigan et al.;
b) Fundamental bacterial genetics by Trun & Trumphy;
c) Molecular medical microbiology by Sussman M;
d) Microbiology: diversity, disease and the environment Salyers, AA;
e) Colonization of mucosal surfaces by Nataro JP;
f) Medical microbiology by Murray PR;
g) Environmental microbiology by Maier RM;
h) Environmental microbiology by Varnam, AH;
i) Annual review of microbiology by Gottesman, Susan,
j) Marine microbiology: ecology and applications by Munn, CB

Suggested References:

Journals

Nature Review's Microbiology, Trends in Microbiology, Critical Reviews in Microbiology, PNAS, Molecular Microbiology, ASM Journals and others

Enzymology (B655)

Course Title : **Enzymology**
Course Code : **B655**
Credits : **6 Credits**
Course Category : **elective**
Course Prerequisites : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Build comprehension on nature and functioning of enzymes.
- Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
- Develop basic understanding on enzyme engineering

Course Contents:

1. General properties of enzymes (3 Lectures + 1 Tutorial)
2. Enzyme nomenclature (3 Lectures + 1 Tutorial)
3. Activation energy and reaction coordinates (3 Lectures + 2 Tutorials)
4. Denaturation of Enzyme (3 Lectures + 1 Tutorial)
5. Enzyme purification (4 Lectures + 1 Tutorial)
6. Enzyme kinetics: Michaelis Menten Equation, Line-Weaver Burk plot (4 Lectures + 1 Tutorial)
7. Enzyme catalytic mechanism: Acid-Base catalysis, covalent catalysis, Metal ion catalysis (3 Lectures + 1 Tutorial)
8. Enzymes in food technology (3 Lectures + 1 Tutorial)
9. Immobilization of enzyme, biosensor, Bioreactor (3 Lectures + 1 Tutorial)
10. Structure and function of specific enzymes: Lysozyme, serine protease (3 Lectures + 1 Tutorial)
11. Enzyme inhibition: Competitive inhibition, non-competitive inhibition, uncompetitive inhibition (4 Lectures + 1 Tutorial)
12. Allosteric regulation of enzyme activity: Carbonic anhydrase, Chymotrypsin, ATCase (3 Lectures + 1 Tutorial)
13. Allosteric enzyme inhibition (3 Lectures + 1 Tutorial)

Recommended Books: -

a) "Fundamentals of Biochemistry" *by Voet and Voet*
b) "Biochemistry" *by JM Berg, JL Tymoozko, L Stryer*

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Neurobiology (B656)

Course Title : **Advanced Neurobiology**
Course Code : **B656**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **Nil**
Contact Hours : **56**
(including tutorials)

Course Outcome:

- Develop understanding about the central nervous system-controlled process and their mechanism of regulation.
- In-depth understanding of the neural circuits and behavior.
- Understand and analyze the recent updates in the field and significance.

Course Contents:

1. Autonomic nervous system and regulation of body functions (6 Lectures + 2 Tutorials)
2. Somatic sensory system and Neurobiology of pain (6 Lectures + 2 Tutorials)
3. Regulation of sleep and wakefulness (3 Lectures + 1 Tutorial)
4. Reproductive brain, sex difference and age-related changes in the brain and neural circuitry (9 Lectures + 3 Tutorials)
5. Neurodegenerative disorders (6 Lectures + 2 Tutorials)
6. Neural basis of learning and memory (3 Lectures + 1 Tutorial)
7. Basal ganglia and the neural control of movement (3 Lectures + 1 Tutorial)
8. Blood supply to the brain and cerebrovascular attack, ventricular system in the brain (3 Lectures + 1 Tutorial)
9. Neuro-immune interaction and nonthyroidal illness syndrome (3 Lectures + 1 Tutorial)

Text book (if any):

a) Zigmond, M.J., Bloom, F.E., Landis, S.C., Roberts, J.L., Squire L.R. (2008) Fundamental Neuroscience. Academic Press.

b) Kandel, E., Schwartz, J., Jessell, T. (2000) Principles of Neural Science. McGraw Hill.

c) Guyton, A. and Hall, J. (2006) Text book of medical physiology. Elsevier

Suggested References:

Relevant research/review articles as decided by the Instructor to update the knowledge in the field.

Chemical Biology (B657)

Course Title : Chemical Biology
Course Code : B657
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Introducing the concept of chemical biology
- Application of chemistry to advance the study of biological systems
- Understanding biology to do new chemistry?
- How is chemical biology used to advance science and human health?
- Understanding chemical structures of bio-molecules
- Comparative understanding of biosynthesis and laboratory synthesis
- Understanding energetics of biochemical pathways and processes
- Be competent in reading and interpreting primary literature in the areas of chemical biology

Course Contents:

- Introduction: (3 Lectures + 1 Tutorial)
    - Structure
    - Chemistry and the Synthesis of Life
    - Central Dogma
    - What is Chemical Biology?
- Proteins and protein folding (6 Lectures + 3 Tutorials)
    - Describe different strategies for the production and isolation of proteins
    - Experimentally determine the physicochemical and functional properties of proteins including laws of photochemistry
    - Analyse and interpret protein sequences and structures and use such information to predict protein function
    - Protein folding--an overview
- Peptide sequencing (6 Lectures + 3 Tutorials)
    - Peptide sequencing, principles and biological databases
    - Pairwise, motifs and domains
    - Mass spectrometric analysis
- Peptide synthesis (6 Lectures + 3 Tutorials)
    - peptide design, synthesis and execution
- Protein synthesis (6 Lectures + 2 Tutorials)
    - genetic code, amino acids, polypeptides

  - nucleotide sequence and mutations
- Natural product synthesis (6 Lectures + 2 Tutorials)
  - Intro, NRPS & PKS
- Nucleic acids and DNA synthesis (2 Lectures + 1 Tutorial)
  - Oligonucleotide synthesis
  - Bioconjugate synthesis
- Molecular Evolution & Chemical Genetics (2 Lectures + 1 Tutorial)
  - classical genetic and chemical genetic procedures, genotype-based and phenotype-based genetic methods
  - explain and contrast how gene expression is controlled by both proteins and small molecules, including regulatory RNA molecules
  - biology and chemistry of RNA
- Protein-protein interactions & proteomics (2 Lectures + 1 Tutorial)
  - introduction, databases
  - principles, methodologies and applications of proteomics and synthetic biology

Suggested reading:

- Blackburn, G.M. & Gait, M.J. Nucleic Acids in Chemistry and Biology. Oxford (1996)
- Branden, C. & Tooze, J. Introduction to Protein Structure.
- Garland (1999) Creighton, T.E. Proteins: Structures and Molecular Properties.
- Freeman (1993) Fersht, A. Structure and Mechanism in Protein Science. Freeman (1999)
- Miller and Tanner (2008). Essentials of Chemical Biology, Wiley

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Virology (B658)

Course Title : **Virology**
Course Code : **B658**
Credits : **6 Credits**
Course Category : **elective**
Course Prerequisites : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:
At completion of the course, student is expected to

- comprehend structural organization, and different biological processes of viruses
- Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
- Develop comprehension of tools and approaches to study viral biology.

Course Contents:

1. Scope and outline of the course, history and introduction to virology (1 lecture)
2. Virus structure and classification: viral genome, capsid and envelope; different classification schemes and ICTV database (4 lectures +1 tutorial)
3. Techniques in virology (2 lectures +1 tutorial)
4. Viral biology: entry to egress (4 lectures +1 tutorial)
5. Virus-host interactions: cell receptors for viral entry, host proteins for replication, translation and processing of viral proteins (3 lectures +1 tutorial)
6. Host cell response to virus infection (2 lectures +1 tutorial)
7. Pathogenesis of viral infection and epidemiology (2 lectures)
8. Cell transformation by viruses (2 lectures +1 tutorial)
9. Vaccines and antiviral drugs (2 lectures +1 tutorial)
10. Use of viruses in gene delivery, molecular biology & as oncolytic agents (2 lectures)
11. Plant viruses and important plant pathogens of relevance to India (1 lecture +1 tutorial)

12. Bacteriophages and insect viruses (2 lectures +1 tutorial)
13. Specific virus families of importance: (13 lectures + 5 tutorials)
    i. Orthomyxoviridae (Influenza virus)
    ii. Paramyxoviridae (Measles, Mumps, New Castle disease viruses and Respiratory syncytial virus)
    iii. Togaviridae/Alphavirus genus (Chikungunya virus)
    iv. Flaviviridae (Dengue, Japanese encephalitis, Tickborne encephalitis, West Nile and Hepatitis C viruses)
    v. Coronaviridae (SARS virus)
    vi. Retroviridae (HIV)
    vii. Papillomaviridae (Human Papilloma viruses)
    viii. Reoviridae (Rotavirus)
    ix. Picornoviridae (common cold and Polio viruses)
    x. Herpesviridae (Herpes Simplex, Chickenpox, Kaposi's sarcoma and Epstein-Barr viruses)
14. Emerging viruses: SARS, Chikungunya, Dengue, Hendra and Nipah viruses and Crimean-Congo hemorrhagic fever virus (2 lectures)

Reference books:

1. Basic Virology, 3rd edition by Edward K. Wagner, Martinez J. Hewlett, David C. Bloom, David Camerini. Year: 2007; Publisher: Wiley-Blackwell. ISBN: 978-1-4051-4715-6
2. Principles of virology, 3rd edition (vol.1) by S. Jane Flint, Lynn W. Enquist, Vincent R. Racaniello and Anna Marie Skalka. Year: 2008; Publisher:ASM press.ISBN: 978-1-55581-443-4
3. Virology: Molecular Biology and Pathogenesis by Leonard Norkin. Year: 2010; Publisher: ASM press. ISBN: 978-1-55581-453-3
4. Fields Virology, 5th edition. Edited by David. M. Knipe and Peter M. Howley. Year: 2007;Publisher: Lippincott Williams & Wilkins. ISBN/ISSN: 9780781760607

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Plant Physiology (B659)

Course Title : **Physiology II (Plant)**
Course Code : **B659**
Credits : **6 Credits**
Course Category : **Core**
Course Prerequisites : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Entrain the students with different hormone physiology and it's interaction.
- Learning light physiology, transformation and photosynthesis.

Course Contents:

1. Gross anatomy of plants and Plant Cell architecture (3 Lectures + 1 Tutorials)
2. Transpiration (1 Lecture)
3. Mendelian Genetics (1 Lecture)
4. Plant transformation (1 Lectures + 1 Tutorials)
5. Photosynthesis (2 Lectures + 1 Tutorials)
6. Respiration (2 Lectures + 1 Tutorial)
7. Protein trafficking in plants, (1 Lecture)
8. Macromolecular complexes in plants (1 Lecture)
9. Gene expression and transgene Silencing mechanisms in plant (3 Lectures + 1 Tutorial)
10. Phytochrome, Photomorphogenesis (3 Lectures + 2 Tutorials)
11. Cryptochromes, Phtotrophins and UV light responses (3 Lectures + 1 Tutorial)
12. Plant growth regulators: auxins, gibberellins, cytokinins, ethylene abscisic acid (7 Lectures + 2 Tutorials)
13. Plant photoreceptors and light signaling in plants (4 Lectures + 1 Tutorial)
14. Control of flowering time (4 Lectures + 2 Tutorials)
15. Ethylene signaling and fruit ripening (2 Lectures + 1 Tutorial)
16. Stress response in plants (1 Lecture)
17. Plant pathogen interaction, Symbiosis vs. Parasitic (1 Lecture)
18. Leaf Senescence (1 Lecture)
19. Medicinal plants and its importance (1 Lecture)

Recommended Books:

a) “Plant Physiology” by Taiz & Zeiger Sinaue,
b) “Plant Physiology” by Salisbury and Ross

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Developmental Biology (B660)

Course Title : **Developmental Biology**
Course Code : **B660**
Credits : **6 Credits**
Course Category : **Core**
Course Prerequisites : **Genetics, Cell Biology, Molecular Biology**
Contact Hours (28/42/56) (including tutorials) : **56**

Outcome of the Course:

- Understanding the principles governing development of an organism from conception to birth.
- Key concepts in maintenance of growth of an organism and aging.
- Implications in Evolution, Health and disease.

Course Contents:

1. Key concepts and techniques (6 Lectures + 2 Tutorials)
   - Principles and excitements of Developmental biology
   - Developmental events and differential gene expression
   - Developmental Genetics - approaches & techniques
   - Cell fate determination in *C. elegans*

2. Early embryonic development (9 Lectures + 3 Tutorials)
   - Gametogenesis
   - Fertilization
   - Cleavage
   - Gastrulation

3. Axial patterning (9 Lectures + 3 Tutorials)
   - Axis formation in Amphibian
   - Anterior posterior patterning in Amphibians
   - Anterior posterior patterning in Drosophila
   - Homeotic gene regulation
   - Early mammalian development
   - Left right patterning

4. Later embryonic development (9 Lectures + 3 Tutorials)
   - Patterning in Central nervous system
   - Ectoderm
   - Mesoderm

- Endoderm

5. Post embryonic development (6 Lectures + 2 Tutorials)
   - Sex determination in Drosophila, mammals and other species
   - Regeneration
   - Aging & Senescence

6. Implications of Developmental Biology (3 Lectures + 1 Tutorial)
   - Medical implications
   - Cancer as a developmental disease
   - Environmental regulation and development
   - Developmental mechanisms and evolutionary change

Text Books (if any):

a) "Developmental biology" by *Scott Gilbert*
b) "Principles of Development" by *Lewis Wolpert*

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Immunology (B751)

Course Title : Advanced Immunology
Course Code : B751
Credits : 06
Course Category : Elective
Course Prerequisite : NIL
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:
Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-regulatory states of altered host immune system.

Prerequisite: Basic understanding of cell biology, animal physiology, molecular biology, biochemistry, microbiology, immunology

Course Contents:

1. Basics of Immune system: Cells and organs of Immune system; Innate and Adaptive Immune Response (5 Lectures + 1 Tutorial)

2. Humoral and Cell Mediated immune response (6 Lectures + 2 Tutorials)

3. MHC and Antigen presentation (6 Lectures + 2 Tutorials)

4. Cellular interaction in immune system (6 Lectures + 3 Tutorials)

5. Signal transduction in immune system (4 Lectures + 2 Tutorials)

6. Cooperation of Innate and Adaptive immunity (6 Lectures + 2 Tutorials)

7. Immune-regulation (6 Lectures + 2 Tutorials)

8. Translational Immunology: Immuno-therapy and Vaccine strategy for Infection Immunity, Cancer Immunity and regulation of Autoimmunity.

(3 Lectures + 2 Tutorials)

Text Books (if any):

a) Kuby IMMUNOLGY 6th Edition by Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. Publisher: W.H. Freeman

b) Cellular and Molecular Immunology by Abul K. Abbas, Andrew H. Lichtman, Shiv Pillai. Publisher: Saunders/Elsevier

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor

Infectious Disease Biology (B752)

Course Title : **Infectious Disease Biology**
Course Code : **B752**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **Nil**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens

1. Introductory lectures to IDB – (**4 classes + 1 tutorial)**
What is infection, what is disease, Microbes Causing Infectious Diseases- bacteria, viruses, fungi, protozoa, helminthes, prions. Present scenario of IDs worldwide. (General lectures based on journals)

2. Host pathogen interactions **(6 classes, 2 tutorials)**
Host-pathogen relationship, Toxins, Disease establishment, Disease transmission- zoonotic, nosocomial, epidemiology, Molecular Aspects of *Host-Pathogen Interactions, Effect of nutrition on infectious diseases, Viruses and cancer*

3. Host defense & Immunopathology **(5 classes, 2 tutorials)**
Microbial Flora of the Healthy Human Host, Natural Resistance and Nonspecific Defense Mechanisms, Basic and Theoretical Aspects of the Immune Response

4. Evolutionary Biology of Infectious Diseases- **(6 classes + 2 tutorials)**
Emerging, Reemerging and Deliberately introduced infectious diseases, Factors that Contribute to the Emergence of a New Pathogens- role of evolution, ecology, genetics-HGT or LGT, clustered, regularly interspaced, short palindromic repeats (CRISPER), some EIDs and REIDs- malaria, Tb, influenza (SWINE flu), SARS, chikunguniya, HIV, west nile virus, marburg virus, bioterrorism, anthrax, CJD.

5. Bacterial infections- **(5 classes, 1 tutorial)**
This will focus on the major bacterial infections. The infections can be considered in groups related to the body systems infected.

6. Viral infections- (**5 classes, 2 tutorials)**
Molecular biology of the different types of virus, the different strategies that are involved in their replication and the ways in which they cause disease. Consideration is given to the prevention, treatment and control of virus infections.

7. Parasitic infections- (5 classes, 1 tutorial)

Biology of parasites and the ways that they can cause disease. The organisms responsible for the major parasitic diseases will provide the main focus for instruction as they have also been the main focus for research.

8. Molecular Epidemiology and control of infectious diseases (6 classes, 2 tutorials)

Topics include analytic methods, study design, outbreak investigations, surveillance, vaccine development and evaluations, screening, modeling, and infectious causes of cancer or chronic diseases. Background on important infectious diseases will be presented.

Books/Journals:

a) Alcamo's fundamentals of Microbiology by Jeffrey C. Pommerville,
b) General Microbiology by Roger E Stanier et al.,
c) Brock Biology of Microorganisms by Michael T Madigan
d) General Microbiology by Roger Y Stanier et al.
e) Microbiology 5th ed, Michael Z Pelczar Jr.
f) Other suggested Journals

Cancer Biology (B753)

Course Title : Cancer Biology
Course Code : B753
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : NIL
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding basic molecular and cellular mechanisms of carcinogenesis.
- Integrating knowledge to understand therapeutic approaches.
- Stimulate research interest.

Course Contents:

1. Cancer origin and terminology (3 lectures + 1 tutorial)
   - Molecular and cellular origin of cancer
   - Clonal vs. mutational origin of cancer
   - Stem cells and cancer

2. Different classes of cancers (3 lectures + 1 tutorial)
   - Carcinoma, Sarcoma
   - Leukemia, Lymphoma and myeloma
   - Central nervous system cancers

3. Malignant transformation of cells (6 lectures + 2 tutorials)

   - General causes of cancer, mechanisms
   - Characteristics and phenotypes of cancer cells
   - Process of metastasis and its significance

4. Cancer induction and oncogenes (6 lectures + 2 tutorials)

   - Stages in the development of tumorigenesis: initiation and promotion
   - Tumor-suppressor genes and oncogenes and their differences
   - The connection between oncogenes and proto-oncogenes
   - Cancer stem cells

5. Cellular response to Tumors (6 lectures + 2 tutorials)

- Signal transductions in cancer, G protein coupled-receptors and secondary messengers
- Receptor tyrosine kinases and SH2-containing proteins
- Ras protein and the MAP kinase cascade in the control of cell function and aberrations in cancer
- Convergence, divergence and crosstalk among different signaling pathways
- Concept of apoptosis and its role in cancer

6. Tumor Antigens and tumor immunity (6 lectures + 2 tutorials)

- Tumor-specific transplantation antigens (TSTAs) and tumor-associated transplantation antigens (TATAs)
- Tumor induced altered Immune response and immune-suppression.

7. Tumor Evasion mechanism (6 lectures + 2 tutorials)

- Changes in tumor cells
- Alteration in antigen presenting cells
- Dysfunction of host effector cells

8. Cancer Therapy (6 lectures + 2 tutorials)

- Chemotherapy
- Radiation therapy
- Surgery
- Cancer immuno-therapy
- Other treatment methods including targeted therapy

Text Books (if any):

1. "Molecular Biology of the Cell" by Alberts, Bruce; Johnson, Alexander; Lewis, Julian; Raff, Martin; Roberts, Keith; Walter, Peter
2. "Molecular Cell Biology" by Lodish, Harvey; Berk, Arnold; Zipursky, S. Lawrence; Matsudaira, Paul; Baltimore, David; Darnell, James E
3. "The Biology of Cancer" by Weinberg, Robert A

Suggested References:

Relevant articles from cancer journals.

Advanced Genetics (B754)

Course Title : Advanced Genetics
Course Code : B754
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : NIL
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
- Stimulate research interest.

Course Contents:

1. Overview of Genetics and terminology (3 lectures + 1 tutorial)
2. Human Genome- Structure, mapping and sequencing (6 lectures + 2 tutorials)
3. Advanced Principles of Inheritance: Genetic variation and heterogeneity, Gene interaction, Polygenic inheritance, Penetrance and expressivity, Epigenetic Inheritance, Genetic Imprinting, Cytoplasmic Inheritance and Maternal Effects (9 lectures + 2 tutorials)
4. Gene Discovery approaches using Model Organisms: Mutant screens and selections, Tools for testing gene function, Mutagenesis and Transgenics (9 lectures + 3 tutorials)
5. Molecular diagnosis of human diseases: Cytogenetics and Molecular cytogenetics, Molecular genetics (6 lectures + 2 tutorials)
6. Identification of genetic component of diseases: Molecular basis of human diseases, Identifying genes for Mendelian traits, Linkage disequilibrium and haplotype analysis, Identifying genes for complex traits (6 lectures + 3 tutorials)
7. Gene therapy (3 lectures + 1 Tutorial)

Text Books (if any):

a)*Concepts of Genetics* (8th Edition) By William S. *Klug*, Michael R. *Cummings*Publisher: Prentice Hall
b)*Human Molecular Genetics* (2nd edition) by Peter Sudbery, published by Pearson/Prentice Hall
c)*Human Genetics* (2nd edition) by A. Gardener and T. Davies Publisher: Scion

Suggested References:
Human Genetics, Clinical Genetics, Nature Genetics, Nature Reviews Genetics

Immune regulation and Infection immunity (B755)

Course Title : Immune Regulation and Infection Immunity
Course Code : B755
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : NIL
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
- Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases

Course Contents:

1. Introduction to Infectious Diseases and its worldwide scenario. (3 Lectures + 1 Tutorial)
2. Overview of Host cell immune response (3 Lectures + 1 Tutorial)
3. Outline of immuno- regulatory response and its role in infectious diseases (6 Lectures + 2 Tutorials)
4. Immuno-regulatory response to viral infection (6 Lectures + 2 Tutorials)
5. Immuno-regulatory response to bacterial infection (6 Lectures + 2 Tutorial)
6. Immuno-regulatory response to protozoan infection (6 Lectures + 2 Tutorial)
7. Immuno-regulatory response to helminth infection (6 Lectures + 2 Tutorial)
8. Immuno-therapeutic strategies targeting immuno-regulatory cells in Infectious diseases (6 Lectures + 2 Tutorials)

Suggested Books:

a) Kuby Immunology. Thomas J. Kindt, Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. W.H. Freeman, 2007
b) Infection and Immunity. Huw Davies, D. H. Davies. Taylor & Francis, 1999

<u>Suggested Journals</u>:

Infection Immunity, Journal of Experimental Medicine, Journal of Infectious Diseases, Immunology Immunotherapy, Nature Medicine, Nature Immunology, Journal of Immunology, Immunity, etc.

Macromolecular Crystallography (B756)

Course Title : **Macromolecular Crystallography**
Course Code : **B756**
Credits : **6**
Course Category : **Elective**
Course Prerequisite : **Nil**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:
Understand theory behind the X-ray diffraction to structure determination. Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.
Course Contents (with both Lectures + Tutorials marked:

Introduction to X-ray crystallography, highlights from 54 years of macromolecular crystallography, future directions [1]
Basics of crystals, symmetry and crystal growth: Crystals, Crystal Systems, Crystal Lattice, Symmetry Elements, Point groups, Space groups, Unit cells, asymmetric units, Matrix representation of Symmetry, physical and energetic principles, Strategies and approaches for growing crystals (protein, DNA) [4 lectures + 2 tutorial]
X-ray sources and detectors: Sealed Tube, Rotating Anode, Synchrotron, Point detector, Area detectors, [3 lectures + 1 tutorial]
Theory of X-ray diffraction: Scattering by an Atom, Diffraction from a Crystal: one dimensional, two-dimensional, and three-dimensional array of atoms, Structure Factor, Reciprocal Lattice, Bragg's law, Ewald Sphere, Resolution [6 lectures + tutorial 2]
Theory of Structure factor, Fourier Syntheses and Electron density: The structure factor in exponential, and vector forms, Temperature factor, Fourier series, Fourier transform, Fourier synthesis, electron density equation, Fridel's law, Anomalous scattering [6 lectures + 2 tutorial]
Data collection: Rotation and oscillation theory, Diffractometer theory, Goniometer, Data collection Strategy, Partial and fully recorded reflections, Wide and fine slicing, Blind region, Total range of data collection, interpretation of diffraction images, Cryo data, Single/Multiple wavelength anomalous dispersion data collection [6, lectures + 2 tutorial]
Data Indexing, integration, scaling (Data reduction), and statistics: Indexing,Integration, Theory of Lorentz and Polarization corrections, Scaling, R-factors, I/sigma (I), completeness, X-ray data quality indicators, Space Group determination [6, lectures + 2 tutorial]
Electron density maps, Refinement and Model building: Difference Fourier map, locating heavy atoms, and anomalous scatter, locating water, ligand molecules, Refinement at atomic resolution: Refinement by Fourier syntheses, Series termination, Locating Hydrogen atoms, Optimization methods, Least-square refinement, full matrix solution,

Maximum likelihood, Target function for refinement, Bulk solvent, A prior knowledge, Restrains and Constrains, Non-crystallographic symmetry, Cross-validation, R-factors (Rwork & Rfree) Density modification, Good practice for refinement [10 lectures + 4 tutorial]

Text Books (if any):

X-ray structure determination, a practical guide edited by G. H. Stout and L. H. Jensen ISBN-10: 0471607118
Internal tables for crystallography Vol. F Crystallography of biological macromolecules
Internal tables for crystallography Vol. A Space Group Symmetry
Crystallization of Biological Macromolecules by Alexander MacPherson ISBN-13: 978-0879695279
An introduction to X-ray Crystallography M.M. Woolfson
Biomolecular Crystallography by Bernard Rupp ISBN-13: 978-0815340812
Internal tables for crystallography Vol. F Crystallography of biological macromolecules
Original research articles and reviews for each topic will be provided in the classes
Fundamentals of crystallography" by Giacovazzo,

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Quantitative Biology (B757)

Course Title : Quantitative Biology
Course Code : B757
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : Nil
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Introducing the concepts of mathematics in biology
- Understanding the quantitative aspects of biology
- How is statistics and mathematics required and applied in the field of biology
- Understanding how mathematical models of biology are developed
- Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
- Understanding quantitative biology to do new and more insightful biology

Course Contents:

1. Recent Trends in Biology and Health Research (3 Lectures + 1 Tutorial)
    a. Modern tools of health research
    b. Existing and emerging health and biological problems
2. Modern Biotechnology (6 Lectures + 2 Tutorials)
    a. Recombinant technology and genetic engineering
    b. Application of biotechnology
3. Integrative and Systems Biology (10 Lectures + 2Tutorials)
    a. Comparative understanding of systems and integrative biology
    b. Concepts and high-throughput techniques of systems Biology
    c. Application of and advances in systems biology
4. Quantitative and Non-linear Biology (10 Lectures + 2Tutorials)
    a. Mathematical modelling and applications in Biology
    b. Lotka-Volterra Model
    c. B-Z reaction, population genetics
5. Statistics-Introduction (3 Lectures + 1 Tutorial)
    a. Simple and effect statistics
    b. Correlation and distribution
6. Univariate Analysis (6 Lectures + 2 Tutorials)
    a. Parametric and non-parametric analysis
    b. t-test, ANOVA, MANOVA
7. Multivariate Analysis (4 Lectures + 2 Tutorials)

    a. Classification and grouping
    b. Clustering, PCA, LDA, DCA
8. Sample size and power of calculation (3 Lectures + 1 Tutorial)

Recommended Books:-

a) Class notes, handouts

b) Systems Biology: A Textbook, Edda Klipp (Author), Wolfram Liebermeister (Author), Christoph Wierling (Author), Axel Kowald (Author), Hans Lehrach (Author), Ralf Herwig (Author)

c) Systems Biology: Properties of Reconstructed Networks by Bernhard O. Palsson, University of California, San Diego; ISBN: 9780521859035; DOI: 10.2277/0521859034

d) Statistics at the Bench: A Step-by-Step Handbook for Biologists by Martina Bremer

e) Nonlinear dynamics and chaos:with applications to physics, biology, chemistry, and engineering; Steven Henry Strogatz

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor

Ion Channels (B758)

Course Title : **Ion channels**
Course Code : **B758**
Credits : **6**
Course Category : **Elective**
Course Prerequisite : **Nil**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:
* Understanding the principles governing ion channel functions
* Biochemcial, biophysical, genetical basis of ion channel and its response
* Key concepts in maintenance of ion channel structure, function and ionic homeostasis of the cell
* Importance of ion channels in health and disease, pharmacology and applications
* Advanced knowledge of details of microscopy
* Bridging the gap between theory and research methodology

Course Contents (with both Lectures + Tutorials marked:

1. Introduction to different ion channels (3 Lectures +1 Tutorial)
(Difference between ion channels with pumps and carriers, ion channels in prokaryotes, Fungus, animal and plant systems, selective and non-selective ion channels)

2. Expression of different ion channels in different systems. (3 Lectures +1 Tutorial)
(Why channel expression are specific in certain tissues, Examples: neurons, sperm, bones, keratinocytes, immune cells, retina, pancreas, cardiac muscle, other specific tissues, Pharmacological advantages/disadvantages of expression, useful systems to study ion channels)

3. Importance of ion channels in evolution (3 Lectures +1 Tutorial)
(Evolution of different structural parts such as transmembrane regions, cytosolic domains, loop regions, ligand binding regions, voltage-sensor regions, selection pressure on the ion channels, ion channels and toxins: Pray predator relationship, ion channels and environmental cues, ion channels in reproduction)

4. Structural and functional uniqueness of ion channels (6 Lectures +2 Tutorials)
(Q10 values, thermodynamic properties behind channel opening and closing, conformational changes, ionic filter, voltage gating, ligand gating, voltage sensor, examples of high-resolution ion channel structures)

5. Organization in membranous environment, effect of lipid bilayer and specific lipids on ionic functions (3 Lectures +1 Tutorial)
(Need of specific lipid microenvironments for proper channel functions)

6. Different types of ion channels (6 Lectures +2 Tutorials)
(Different anion and cation channels, basics of Na+, K+, Cl-, Ca^{2+}, transport of other heavy metals)

7. Heteromeric and homomeric ion channels (3 Lectures +1 Tutorials)
(Organization of different polypeptides)

8. How natural and synthetic activators and inhibitors modulate ion channels. (3 Lectures + 1 Tutorials)
(Importance of different metabolites, Chemistry and pharmacology of different activators and inhibitors, effect on metabolism)

9. Measuring ionic conductivity by electrophysiology and imaging (3 Lectures + 1 Tutorial)
(Electrophysiological parameters and methods to analyze channel function, different types of channel recording, Cell biological parameters and methods to analyze channel function, metal imaging and different sensors)

10. Trafficking of ion channels (3 Lectures + 1 Tutorial)
(Different modes of trafficking of ion channels to ER to Golgi, Golgi to plasma membrane, to Lysosomes, Other organelles, prerequisites for such trafficking)

11. Channelopathy and human diseases, potential remedy (6 Lectures + 2 Tutorials)
(Genetic variations in ion channel sequences, information from recent genome sequencing data sets, penetrance effect of mutations)

Text Books (if any): Principles of biochemistry, Channels journal, other journals, distributed hand outs, notes, specific reviews and papers.

Suggested References: Important research articles and reviews as suggested in the class by the instructor

Concepts in Mechanobiology (B759)

Course Title : **Concepts in Mechanobiology**
Course Code : **B759**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Outcome of the Course:

- Comprehend the concept that cells are complex micron-sized machines/ nano-machines.
- Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
- Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
- Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation
- Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
- Enable students of disciplines other than biology to understand how principles of mechanics and engineering can be applied to biological systems and problems.

Course Contents:

Curriculum: (3 lectures [L] + 1 tutorial [T] per week)

Introduction
Mechanical framework for understanding biological systems
Cell mechanics in basic cellular and pathological processes.
[1 lecture]

Cell architecture
Cytoskeletal structure and dynamics
[2 lectures]
[Total = 3 lectures + 1 tutorial]

Cell mechanics
Basics of Mechanics

Viscoelasticity / basic rheology

[3 lectures + 1 tutorial]

Mechanics of cell membrane
Mechanics of cellular polymers
Controlling Cell and nuclear Morphology

[3 lectures + 1 tutorial]

Polymers Networks
Molecular motors
Tensegrity

[3 lectures + 1 tutorial]

Foams
Soft Glassy Material
Biphasic models of cells

[3 lectures + 1 tutorial]

[Total = 12 lectures + 4 tutorials]

Mechanosensing and Mechanotransduction
Mechanical Signals
Mechanosensing organelles and structures

[3 lectures + 1 tutorial]

Mechanics of receptor binding
Intracellular signaling
Mechano-chemical coupling

[3 lectures + 1 tutorial]

Cellular interactions with biomaterials
Mechanical regulation of cell fate

[3 lectures + 1 tutorial]
[Total = 9 lectures + 3 tutorials]

Mechanics of cell proliferation
Cytokinesis

[2 lectures]

Cancer cells and stem cells

[2 lectures]

Apoptosis

[2 lectures]
[Total = 6 lectures + 2 tutorials]

Mechanics of cell adhesion & migration
Adhesion proteins
Cytoskeletal structures & Forces

[3 lectures + 1 tutorial]

Molecular motors
Extracellular matrix mechanics

Mechanobiology in tissue engineering - Biomimetics and Cell-like Materials
[3 lectures + 1 tutorial]
[Total = 6 lectures + 2 tutorials]

Mechanical testing of cells
instrumentation tools used for mechanical characterization of cells – Microneedles, Micropipette Aspiration, Atomic Force Microscopy, Microrheology, Magnetic Twisting Cytometry, Optical Tweezers, Traction Force Microscopy, Nanofabrication – introduce to MEMS tools, Microfluidics & Lab-on-chip concepts.
[Total = 6 lectures + 2 tutorials]

Text Books (if any):

1. Jacobs, Huang, & Kwon. Introduction to Cell Mechanics and Mechanobiology. Garland Science, ISBN-10: 0815344252
2. Boal, Mechanics of the Cell. Cambridge University Press, ISBN-10: 0521796814; ISBN-13: 9780521130691
3. Ethier and Simmons, Introduction to Biomechanics: From Cells to Organisms. Cambridge University Press, ISBN: 0521841127
4. Mofrad & Kamm, Cytoskeletal Mechanics – Models and Measurements. Cambridge University Press, ISBN-10: 0521846374

Other relevant research articles and lecture material will be made available by the instructor during the course from time to time.

Molecular errors in disease pathogenesis (B760)

Course Title : Molecular errors in disease pathogenesis
Course Code : B760
Credits : 6 Credits
Course Category : Elective
Course Prerequisites : Basic knowledge of Biochemistry, Genetics, Molecular Biology and Cell biology. Having taken some of the biology core courses of SBS will be advantageous
Contact Hours (28/42/56) : 56 (including tutorials)

Outcome of the Course:

- Understanding the concepts of molecular pathogenesis.
- Basic understanding of the common pathologies of organ systems.
- Understanding of the recent advances in molecular explanation for such pathologies.

Course Contents:

1. General introduction to concepts of molecular pathogenesis (3 Lectures + 1 Tutorial)

2. Cardiovascular system (6 Lectures + 2 Tutorials)
    - Heart failure
    - Genetic cardiac diseases
    - Cholesterol metabolism and vascular diseases
    - Sudden cardiac death
    - Gender and cardiovascular system diseases

3. Respiratory system (3 Lectures + 1 Tutorial)
    - Novel pathways in pathogenesis of asthma
    - Cell signalling in asthma
    - Chronic Obstructive Pulmonary Disease
    - Lung matrix remodelling disorders

4. Infectious diseases (3 Lectures + 1 Tutorial)
    - Anti-malarial resistance
    - General vaccine strategies
    - Vaccine development against malaria
    - HIV, SARS, Dengue pathogenesis
    - Biofilms and chronic bacterial infections
    - Quorum sensing, its pharmacological inhibition and quorum sensing as an intervention target
    - Bacterial vaccines
    - Puzzles in sepsis pathogenesis

5. Oncology (3 Lectures + 1 Tutorial)
    - Oncogenes
    - Tumour suppressors
    - Specific example cancers
    - Receptor Tyrosine kinases in cancer
    - Cellular stress and cancer
    - Integrins, Cadherins, Catenins,
    - Polarity and cancer
    - Relationship between cellular senescence and cancer
    - Cancer vaccines

6. Neurological diseases (3 Lectures + 1 Tutorial)
    - Pathogenesis of neuro-degenerative disorders
    - Ageing
    - Mitochondrial dysfunction
    - Oxidative stress and neuro-degeneration
    - Genetics of psychiatric disorders eg. Schizophrenia

7. Genetics (3Lectures + 1Tutorial)
    - Complex genetic diseases
    - Gene therapy
    - Human embryonic stem cell applications, associated issues and debates

8. Ageing and Regeneration (6 Lectures + 2 Tutorials)
    - Pathophysiology of tissue ageing
    - Cellular reprogramming
    - Regeneration of □ cells

9. Haematology (3 Lectures + 1 Tutorial)

- Genomics and proteomics of blood cells in disease
- Platelets, inflammation and atherosclerosis, thromboses
- Issues associated with cord blood banking

10. Endocrinology (3 Lectures + 1 Tutorial)
    - Diabetes mellitus pathogenesis
    - Cell biology and signalling
    - Islet transplantation
    - Gestational diabetes
    - Metabolic syndrome.

11. Musculoskeletal system (3 Lectures + 1 Tutorial)
- Osteoporosis
- Menopause and bone metabolism
- Muscle dystrophies
- Stem cells in muscle degeneration

12. Summary discussions (3 Lectures + 1 Tutorial)
- Analyses and review of future perspectives in the field of molecular pathogenesis

Text Books (if any):

a) Introduction to Molecular Medicine, by Dennis W. Ross (ISBN 0-387-95372-8)
b) Principles of Molecular Medicine, by M. S. Runge and C. Patterson
c) Robbins and Cotran Pathologic basis of disease

Suggested References:

Instructor notes, additional reading suggestions and relevant URLs will be provided to the students during the course of the classes. Instructor will be available for individual meetings when required.

Plant Developmental Biology (B761)

Course Title : **Plant Developmental Biology**
Course Code : **B761**
Credits : **6 Credits**
Course Category : **Elective**
Course Prerequisites : **Nil**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Learning molecular genetics approaches to understand plant development.
- Understanding the interaction of biotic and abiotic component is major focus.
- Designing experimental strategies understanding plant development.

Course Contents:

1. Plant Development overview (1 Lecture)
2. Hormones influencing plant organogenesis and signaling (7-8 Lectures + 5 Tutorials)
3. Light and plant development and photomorphogenesis (10 Lectures + 2 Tutorials)
4. Leaf and flower development (10 Lectures + 2 Tutorials)
5. Circadian clock and plant development (7-8 Lectures + 2 Tutorials)
6. Epigenetics, siRNA world and plant development (8 Lecture + 2 Tutorials)

Recommended Books:

a) Plant Physiology Taiz and Zeiger: 5th Ed, 2010, Sinauer Associates Inc. Publishers

b) Plant Biology by Alison M. Smith et al., 2010, Garland Science, Taylor and Francis Gp. "Research articles"

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

UPCOMING COURSES

Translational Control in Biology (B762)

Course Title	**: Translational Control in Biology**
Course Code	**: B762**
Credits	**: 6 Credits**
Course Category	**: Elective**
Course Prerequisites	**: Nil**
Contact Hours (28/42/56)	**: 56**

Outcome of the Course:

This course is design to understand the recent advancements in the fundamentals of protein translation and its control. Translation is a fundamental step in the central dogma of molecular biology. The regulation of translation is key to all basic cellular processes. Metabolic pathways, signaling, developmental decisions are tightly linked with the regulation of translation. Any defects associated with this process and its repercussion in cancer, metabolic disorders and human diseases will be covered.

Course contents:

1) Recent advances in the general translation (structure-function and genetics). (6 lectures + 2 tutorial)
2) IRES elements and control of viral translation. (3 lectures)
3) IRES elements in cellular translation control. (3 lectures + 1 tutorial)
4) Cis-acting element and trans-activing factors in translation regulation (3 lectures + 1 tutorial)
5) Role of microRNA in translation control. (3 lectures)
6) Signaling in translation. (3 lectures + 1 tutorial)
7) Role of eIF2α kinase in translational control. (3 lectures + 1 tutorial)
8) Translational control in cancer development. (3 lectures + 1 tutorial)
9) Translational control during apoptosis. (3 lectures)
10) Translational control in metabolic disorder. (3 lectures + 1 tutorial)
11) Translational control in synaptic plasticity, memory and learning. (3 lectures)
12) Translational control in development. (3 lectures)
13) mRNA localization and turnover. (3 lectures + 1 tutorial)
14) Mitochondrial translation and human diseases. (3 lectures + 1 tutorial)

Recommended reading:

1) Translational control in Biology and Medicine (Mathews, Sonenberg, Hershey, CSHL press)
2) Translational control in gene expression (Sonenberg, Hershey, Mathews, CSHL press)
3) Class notes and research articles

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor

Macroevolutionary principles and patterns (B763)

Discipline	**: Biological Sciences**
Course Level	**: Ph.D**
Course Title	**: Macroevolutionary principles and patterns**
Course Code	**: B763**
Credits	**: 6**
Course Category	**: Elective**
Course Prerequisite	**: Evolutionary Biology, Molecular Biology**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by	**: Dr. Aniruddha Datta Roy** **Assistant professor, SBS, NISER**
Alternative faculty	**: Dr. Ramanujam Srinivasan,** **Reader – F, SBS, NISER**

Outcome of the Course:

- Understanding macroevolutionary principles with detailed module on tree building
- Working on real data using the latest phylogenetic approaches
- Understanding principles of biogeography and pattern created by dispersal and vicariance events

Course Contents (with both Lectures + Tutorials marked):

1. Evolution of life on Earth (3 lectures + 1 Tutorials)
2. Geological Eras and the five mass extinction events (3 lectures + 1 Tutorials)
3. Schools of systematics (3 lectures + 1 Tutorials)
4. Species concepts (3 lectures + 2 Tutorials)
5. Patterns of change in evolution (3 lectures + 2 Tutorials)
6. Phylogenetics and tree building (7 lectures + 6 Tutorials)
7. Adaptive radiations (3 lectures + 2 Tutorials)
8. Co-evolution (2 lectures)
9. Convergent evolution (3 lectures + 1 Tutorials)
10. Applications of phylogenetics (2 lectures + 1 Tutorial)
11. Introduction to biogeography (2 lectures)
12. Biogeographical patterns (3 lectures + 2 Tutorials)

Text Books (if any):

1. Lemey, P., Salemi, M. and Vandamme, A.M. eds., 2009. *The phylogenetic handbook: a practical approach to phylogenetic analysis and hypothesis testing*. Cambridge University Press.
2. Lomolino, M.V., Riddle, B.R., Whittaker, R.J. and Brown, J.H., 2010. Biogeography (Sinauer, Sunderland, MA).
3. Reece, J.B., Urry, L.A., Cain, M.L., Wasserman, S.A., Minorsky, P.V. and Jackson, R.B., 2014. *Campbell Biology* (No. s 1309). Boston: Pearson.
4. Stearns, S.C. and Hoekstra, R.F., 2000. *Evolution, an introduction*. Oxford University Press.

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor.

END OF DOCUMENT

Harish-Chandra Research Institute

SYLLABUS FOR

Ph.D. in Mathematical Science (Program Code: MATH04)

About the Ph. D. Programme

The Ph. D. Programme in mathematics at HRI consists of a rigorous course work and projects spanning the the first three semesters, followed by research work leading to a Ph.D. degree. The students are taught basic as well as advanced courses in mathematics during this period. They also get to work on a project in which they normally continue to work towards their Ph. D. Degree. A thesis advisor will be assigned to a student, only after successful completion of the course work - which also requires passing the Oral General Comprehensive Exam (OGCE), conducted after the completion of the course work.

Course Structure

The instructional part of the doctoral program consists of pedagogical lectures followed by a project during the span of first three semesters. There will be seven core courses in the first year of the programme, along with two seminar courses.

Semester I	Semester II
Algebra I	Algebra II
Analysis I	Analysis II
Topology I	Topology II
Differentiable Manifolds	Project I

In the third semseter, the student has to take a project course in one of the advanced topics given as electives below. The special topic will be chosen by the instructor and the text books will be announced well in advance.

Electives: A student can choose one from:

- Topics in Algebra
- Topics in Analysis
- Topics in Number Theory

- Topics in Algebraic Geometry
- Topics in Differential Geometry

  Credits information: Core Course: 6 credits, Seminar Course: 4 credits, Project course: 12 credits. Total 60 credits course work, in three semsters.

Curriculum and detailed course content

Semester I

08MATH04-001-C Algebra I

Group Theory: the JordanHolder Theorem; solvable groups; symmetric and alternating groups; nilpotent groups; groups acting on sets; the Sylow Theorems; free groups.

Rings and ModulesNoetherian and Artinian conditions; the Hilbert Basis Theorem; principal ideal domains; unique factorization domains; inductive and projective limits of rings and modules; bilinear maps and forms; the tensor product.

Field Theory: the Steinitz Theorem on algebraic closures; algebraic extensions; finite fields; Galois theory and applications.

Textbooks:

1. D. S. Dummit, and R. M. Foote, Abstract algebra, Third edition. John Wiley & Sons, Inc., Hoboken, NJ, 2004.
2. N. Jacobson, Basic algebra I, Second edition, W. H. Freeman and Company, New York, 1985.
3. N. Jacobson, Basic algebra II, Second edition, W. H. Freeman and Company, New York, 1989.
4. S. Lang, Algebra, Revised third edition, Graduate Texts in Mathematics, 211. Springer-Verlag, New York, 2002.

08MATH04-002-C Analysis I

Calculus: Summary of calculus of several real variables; the Stone-Weierstrass Theorem; Ascoli's Theorem.

Measure theory: Measure spaces; convergence theorems; product measure and Fubini's Theorem; Borel measures on locally compact spaces, and the Riesz Representation Theorem; the Lebesgue measure; regularity properties of Borel measures; complex measures, differentiation and decomposition of measures; the Radon-Nikodym Theorem.

Functional analysis: Topological vector spaces; Banach spaces; Hilbert spaces; the Hahn-Banach Theorem; the Open Mapping Theorem; The Banach-Steinhaus Theorem; bounded linear maps; linear functionals and dual spaces; L^p spaces; Hölder's inequality, Minkowski's inequality.

Textbooks:

1. S. Lang, Real and functional analysis, Third edition, Graduate Texts in Mathe- matics, 142. Springer-Verlag, New York, 1993.
2. H. L. Royden, Real analysis, Third edition, Macmillan Publishing Company, New York, 1988.
3. W. Rudin, Real and complex analysis, Third edition, McGraw-Hill Book Co., New York, 1987.
4. W. Rudin, Functional analysis, Second edition, International Series in Pure and Applied Mathematics, McGraw-Hill, Inc., New York, 1991.

08MATH04-003-C Topology I

Topological spaces: Topologies; bases; continuous maps; subspaces; quotient spaces; products; connectedness and compactness; proper maps.

Convergence: Nets; filters; limits of nets and filters; the relations between convergence and countability and separation axioms; relations with compactness and proper maps.

Topological groups: Topological groups; uniform structures; products of compact spaces; compactifications; actions; orbit spaces; proper actions; homogeneous spaces.

Metrisability: metrisability and paracompactness; complete metric spaces; function spaces.

Inductive and projective limits: Inductive and projective limits of topological spaces.

Homotopy theory: Homotopy; retraction and deformation; suspension; mapping cylinder; fundamental group; the Van Kampen Theorem; étale spaces; covering spaces; homotopy lifting property; relations with the fundamental group; lifting of maps; universal coverings; automorphisms of a covering; Galois coverings; the basic definitions regarding higher homotopy groups.

Textbooks:

1. N. Bourbaki, General topology, Chapters 1–4, Translated from the French. Reprint of the 1989 English translation. Elements of Mathematics (Berlin). Springer- Verlag, Berlin, 1998.
2. A. Hatcher, Algebraic topology, Cambridge University Press, Cambridge, 2002.
3. W. S. Massey, Algebraic topology: an introduction, Reprint of the 1967 edition. Graduate Texts in Mathematics, Vol. 56. Springer-Verlag, New York-Heidelberg, 1977.
4. E. H. Spanier, Algebraic topology, Corrected reprint of the 1966 original. Springer-Verlag, New York, 1995.

08MATH04-001-S Seminar Course I

A student can choose a topic of his interest, in consultation with a mathematics faculty member.

Semester II

08MATH04-004-C Algebra II

Multilinear algebra: tensor, symmetric, and exterior algebras; right ex- actness of tensoring, and flat and faithfully flat modules; left exactness of Hom, and injective and projective modules.

Commutative algebra: rings and modules of fractions; local rings; integral extensions; transcendence degree; Noether's Normalization Theorem; Hilbert's Nullstellensatz; discrete valuation rings; Dedekind domains; primary decomposition.

Linear algebra: modules over principal ideal domains; the minimal polynomial of an endomorphism; the Jordan canonical form; the characteristic polynomial of an endomorphism; the Cayley-Hamilton Theorem.

Textbooks:

1. D. S. Dummit, and R. M. Foote, Abstract algebra, Third edition. John Wiley & Sons, Inc., Hoboken, NJ, 2004.
2. N. Jacobson, Basic algebra I, Second edition, W. H. Freeman and Company, New York, 1985.
3. N. Jacobson, Basic algebra II, Second edition, W. H. Freeman and Company, New York, 1989.
4. S. Lang, Algebra, Revised third edition, Graduate Texts in Mathematics, 211. Springer-Verlag, New York, 2002.

08MATH04-005-C Analysis II

Distributions: The spaces D(U) and E(U) for an open subset U of R^n spacesn; basic operations on distributions; the support of a distribution; convolution; approximate identities; the Fourier transform on $L^p (R^n)$; the Schwartz space on R^n; the Inversion Theorem; Plancherel's Theorem; tempered distributions.

Functional analysis: Banach algebras; the Gelfand-Naimark Theorem; bounded op- erators on a Hilbert space; the Spectral Theorem for bounded normal operators ona Hilbert space; compact operators; Fredholm operators and the index.

Complex analysis: Basic properties of holomorphic functions; relations with the fundamental group and covering spaces; the Open Mapping Theorem; the Maximum Modulus Theorem; zeros of holomorphic functions; classification of singularities; meromorphic functions; the Weierstrass Factorization Theorem; brief account of the Riemann Mapping Theorem; the Little Picard Theorem.

Textbooks:

1. S. Lang, Real and functional analysis, Third edition, Graduate Texts in Mathematics, 142. Springer-Verlag, New York, 1993.
2. H. L. Royden, Real analysis, Third edition, Macmillan Publishing Company, New York, 1988.

3. W. Rudin, Real and complex analysis, Third edition, McGraw-Hill Book Co., New York, 1987
4. W. Rudin, Functional analysis, Second edition, International Series in Pure and Applied Mathematics, McGraw-Hill, Inc., New York, 1991

08MATH04-006-C Topology II

Simplicial topology: Simplicial complexes; triangulations; polyhedra; barycentric subdivision; the Simplicial Approximation Theorem with applications.

Homology: simplicial homology; singular homology; the Mayer-Vietoris sequence; The Jordan-Brouwer Separation Theorem; the Universal Coefficient Theorem; the Kunneth Formula; CW complexes; cellular homology and computations for projective spaces; the Lefschetz Fixed Point Theorem.

Cohomology: singular cohomology; the Universal Coefficient Theorem; the Kunneth Formula; cup and cap products; Poincare duality for a topological manifold.

Textbooks:

1. G. E. Bredon, Topology and geometry, Corrected third printing of the 1993 original, Graduate Texts in Mathematics, 139, Springer-Verlag, New York, 1997.
2. M. J. Greenberg, and J. R. Harper, Algebraic topology, A first course, Mathematics Lecture Note Series, 58. Benjamin/Cummings Publishing Co., Inc., Advanced Book Program, Reading, Mass., 1981.
3. A. Hatcher, Algebraic topology, Cambridge University Press, Cambridge, 2002.
4. E. H. Spanier, Algebraic topology, Corrected reprint of the 1966 original. Springer-Verlag, New York, 1995.

08MATH04-007-C Differential manifolds

Differentiable manifolds: basic notions; the effects of second countability and Hausdorffness; tangent and cotangent spaces; submanifolds; conse- quences of the Inverse Function Theorem; vector fields and their flows; the Frobenius Theorem; Sard's theorem.

Differential forms: recapitulation of multilinear algebra; tensors; differential forms; the de Rham complex and its behaviour under differentiable maps; the Lie derivative; differential ideals.

Lie groups: Lie groups; Lie algebras; homomorphisms; Lie subgroups; coverings of Lie groups; the exponential map; closed subgroups; the adjoint representation; homogeneous manifolds.

Integration on manifolds: orientation; the integral of differential forms on differentiable singular chains; integration of differential forms of top degree on an oriented differen- tiable manifold; the theorems of Stokes; the volume form on an oriented Riemannian manifold; the divergence theorem; integration on a Lie group.

de Rham cohomology: definition; real differentiable singular cohomology; statement of the de Rham theorem; the Poincar´e lemma.

Textbooks:

1. I. Madsen, and J. Tornehave, From calculus to cohomology: de Rham cohomology and characteristic classes, Cambridge University Press, Cambridge, 1997.
2. F. W. Warner, Foundations of differentiable manifolds and Lie groups, Corrected reprint of the 1971 edition, Graduate Texts in Mathematics, 94, Springer-Verlag, New York-Berlin, 1983.

08MATH04-002-S Seminar Course II

Student can choose a topic of interest in consultation with an HRI mathematics faculty member.

Semester III

By this time a student should have decided the area of specialisation. Based on the interest, a student can take a project in one of the following Topics: This may also involve lectures given by the prospective thesis advisor.

08MATH04-008-C Algebraic number theory

p-adic numbers, p-adic valuations, absolute values, completions, local fields, henselian fields, extensions of valuations, ramification, higher ramification groups.

Galoisian extensions, projective and inductive limits, abstract class field theory, the Herbrand quotient.

The local reciprocity law, the norm residue symbol, formal groups, cyclotomic extensions, compatibility with the ramification filtration.

Ideles and idele classes, ideles in extensions, global class field theory, power reciprocity laws.

Textbooks:

1. A. Fröhlich, and M. J. Taylor, Algebraic number theory, Cambridge Studies in Advanced Mathematics, 27, Cambridge University Press, Cambridge, 1993.
2. H. Hasse, Number theory, Translated from the third (1969) German edition, Reprint of the 1980 English edition, Classics in Mathematics, Springer-Verlag, Berlin, 2002.
3. J. Neukirch, Algebraic number theory, Translated from the 1992 German original, Grundlehren der Mathematischen Wissenschaften, 322. Springer-Verlag, Berlin, 1999
4. A. Weil, Basic number theory, Reprint of the second (1973) edition, Classics in Mathematics, Springer-Verlag, Berlin, 1995.

08MATH04-009-C Local fields

Discrete valuation rings and Dedekind domains, completions, discriminant and different, ramification groups, the norm, Artin representation, group cohomology, Galois cohomology, class formations, Brauer groups, local class field theory.

Textbooks:

1. J. W. S. Cassels, Local fields, London Mathematical Society Student Texts, 3, Cambridge University Press, Cambridge, 1986.
2. I. B. Fesenko, and S. V. Vostokov, Local fields and their extensions, Second edition, Translations of Mathematical Monographs, 121, American Mathematical Society, Providence, RI, 2002.
3. K. Iwasawa, Local class field theory, Oxford Science Publications, Oxford Mathematical Monographs, The Clarendon Press, Oxford University Press, New York, 1986.
4. J. P. Serre, Local fields. Translated from the French original, Graduate Texts in Mathematics, 67, Springer-Verlag, New York-Berlin, 1979.

08MATH04-010-C Fourier analysis

L^p spaces spaces, basic inequalities including Hö̇lder's, Chebyshev, and Minkowski, inequalities for integrals, weak Lp spaces, the Riesz-Thorin and Marcinkiewicz Interpolation Theorems.

Convolution, Young's inequality, the generalized inequality of Young, approximations to the identity, the Fourier transform, Hausdorf-Young inequality, the Riemann Lebesgue Lemma,

the Fourier Inversion Theorem, the Plancherel Theorem, summability theo- rems, including those of Cesaro and Fejer, Fourier inversion on the torus, the Riemann localisation principle.

Distributions, Sobolev spaces, Sobolev Embedding Theorem, Rellich's theorem, applications to basic linear PDE.

Textbooks:

1. G. B. Folland, Real analysis. Modern techniques and their applications, Second edition, Pure and Applied Mathematics (New York), A Wiley-Interscience Publication, John Wiley & Sons, Inc., New York, 1999.
2. W. Rudin, Functional analysis, Second edition, International Series in Pure and Applied Mathematics, McGraw-Hill, Inc., New York, 1991.

08MATH04-011-C Harmonic analysis

Maximal Function, the Riesz-Thorin Interpolation Theorem. Singular integrals, the Calderon-Zygmund Decomposition, Singular integral operators which commute with dilations, vector-valued analogues, Riesz transforms, Poisson in- tegrals, approximate identities, spherical harmonics.

The Littlewood-Paley g-function, multipliers, dyadic decomposition, the Hormander- Mihilin Multiplier Theorem, the Marcinkiewicz Multiplier Theorem.

Textbooks:

1. J. Duoandikoetxea, Fourier analysis, Translated and revised from the 1995 Spanish original, Graduate Studies in Mathematics, 29, American Mathematical Society, Providence, RI, 2001.
2. E. M. Stein, Singular integrals and differentiability properties of functions, Prince- ton Mathematical Series, No. 30, Princeton University Press, Princeton, N.J., 1970.

08MATH04-012-C Introduction to number theory

Divisibility, congruence, the Fundamental Theo- rem of Arithmetic, the Chinese Remainder Theorem.

Elementary proofs of the infinitude of primes in certain arithmetic progressions, the quadratic reciprocity law.

The Betrand postulate, the Euler and Abel summation formulas and applications, preparation for the Prime Number Theorem.

Combinatorial sieves including the Brun sieve and the Turan sieve, and their applications.

Rational approximations, the Dirichlet Theorem, the Liouviile Theorem, Siegel's Lemma, and their applications

Gaussian integers, sums of squares.

Textbooks:

1. D. M. Burton, Elementary number theory, Second edition, W. C. Brown Publish- ers, Dubuque, IA, 1989.
2. K. Chandrasekharan, Introduction to analytic number theory, Die Grundlehren der mathematischen Wissenschaften, Band 148, Springer-Verlag New York Inc., New York, 1968.
3. A. C. Cojocaru, and M. R. Murty, An introduction to sieve methods and their ap- plications, London Mathematical Society Student Texts, 66, Cambridge University Press, Cambridge, 2006.
4. G. H. Hardy, and E. M. Wright, An introduction to the theory of numbers, Sixth revised edition, Oxford University Press, Oxford, 2008.

08MATH04-013-C Analytic number theory

Arithmetical functions, Euler, Abel Summation formula and applications to summatory functions.

The Riemann Zeta function, and Dirichlet L-functions.

The Prime Number Theorem, and Dirichlet's Prime Number Theorem.

Sieve methods (Brun, Selberg, and Large), and their applications.

Fourier techniques and applications in number theory.

Textbooks:

1. K. Chandrasekharan, Introduction to analytic number theory, Die Grundlehren der mathematischen Wissenschaften, Band 148, Springer-Verlag New York Inc., New York, 1968
2. H. Iwaniec, and E. Kowalski, Analytic number theory, American Mathematical Society Colloquium Publications, 53, American Mathematical Society, Providence, RI, 2004.
3. H. Iwaniec, and E. Kowalski, Analytic number theory, American Mathematical Society Colloquium Publications, 53, American Mathematical Society, Providence, RI, 2004.

08MATH04-014-C Lie algebras

Linear Lie algebras, Lie algebras of derivations, homomorphisms of Lie algebras, representations of Lie algebras, solvable and nilpotent Lie algebras, Engel's Theorem, Lie's Theorem, the Jordan-Chevalley decomposition.

Cartan's criterion, the Killing form, criterion for semi-simplicity, inner derivations, the abstract Jordan decomposition, modules, the Casimir element, Weyl's Theorem, preservation of Jordan decomposition, Representations of sl(2, F), maximal toral subalgebras, and roots.

Orthogonality, integrality and rationality properties of roots, root systems, bases, Weyl chambers, the Weyl group, irreducible root systems, the Cartan matrix.

Coxeter graphs, Dynkin diagrams, the Classification Theorem, construction of root systems & automorphisms, the theory of weights, dominant weights, the Isomorphism Theorem, Cartan subalgebras, the universal enveloping algebra, the Poincare-Birkhoff- Witt Theorem.

Textbooks:

1. R. W. Carter, Lie algebras of finite and affine type, Cambridge Studies in Advanced Mathematics, 96, Cambridge University Press, Cambridge, 2005.
2. J. E. Humphreys, Introduction to Lie algebras and representation theory, Second printing, revised, Graduate Texts in Mathematics, 9, Springer-Verlag, New York-Berlin, 1978.
3. A. W. Knapp, Lie groups beyond an introduction, Second edition, Progress in Mathematics, 140, Birkh ̈auser Boston, Inc., Boston, MA, 2002.

08MATH04-015-C Representations of finite groups

Representations, irreducible and indecomposable representations, class functions, orthogonality relations for characters, character tables, Schur's lemma, unitary representations, duals and tensor products of representations, regular representations, canonical decompositions, examples, induced representations, Mackey's criterion, Frobenius reciprocity, group algebras, Maschke's theorem, applica- tions of the representation theory of finite groups. Artin's theorem, Brauer's theorem and applications.

Textbooks:

1. W. Fulton, and J. Harris, Representation theory. A first course, Graduate Texts in Mathematics, 129, Readings in Mathematics, Springer-Verlag, New York, 1991.
2. J-P. Serre, Linear representations of finite groups, Translated from the second French edition, Graduate Texts in Mathematics, 42, Springer-Verlag, New York- Heidelberg, 1977.

08MATH04-016-C Commutative algebra

Modules and tensor products, prime ideals, the Zariski topol- ogy, rings and modules of fractions, flatness, valuation theory, integral extensions, dis- crete valuation rings, Dedekind domains, Artinian and Noetherian rings and modules, the Hilbert basis theorem, primary decomposition, Noether normalization, Hilbert's Nullstellensatz, completions, the Krull dimension

Textbooks:

1. S. Bosch, Algebraic geometry and commutative algebra, Universitext, Springer, London, 2013.
2. D. Eisenbud, Commutative algebra. With a view toward algebraic geometry, Graduate Texts in Mathematics, 150, Springer-Verlag, New York, 1995.

08MATH04-017-C Algebraic varieties

Spaces with sheaves of functions, affine algebraic varieties over an algebraically closed field, the category of algebraic varieties, subvarieties, products, projective varieties, separation, normality, dimension, rational maps, tangent spaces, smoothness, completeness, finite morphisms, constructible sets, divisors, curves, and the Riemann-Roch theorem.

Textbooks:

1. G. R. Kempf, Algebraic varieties, London Mathematical Society Lecture Note Series, 172, Cambridge University Press, Cambridge, 19
2. D. Eisenbud, Commutative algebra. With a view toward algebraic geometry, Graduate Texts in Mathematics, 150, Springer-Verlag, New York, 1995.
3. J. S. Milne, Algebraic geometry, http://www.jmilne.org/math/ .

08MATH04-001-E Other elective courses

Apart from the list above, there may be elective courses in special Topics in Algebra/Analysis/Topology/ Algebraic Geometry/Differential Geometry based on the interest of students. If a faculty member opts to give such a course, the syllabus and text books will be announced well in advance.

IMSc

SYLLABUS FOR

Ph.D. in MATHEMATICAL SCIENCES
(Program Code: MATH04)

COURSEWORK AND SYLLABI FOR THE PH.D. AND INTEGRATED PH.D. PROGRAMS IN MATHEMATICS AT IMSC

All courses in mathematics carry 8 credits except for the seminar course which carries 4 credits and the research methodology course which is a pass/fail course with no credits earned.

The Ph.D. program requires a total of 9 courses including the seminar course and the research methodology course (for a total of 60 credits).

The I.Ph.D. program requires 13 courses including the seminar course and the research methodology course along with a 28 credit master's thesis (for a total of 120 credits).

The courses are chosen from among the courses listed below along with other courses offered from time to time either at IMSc or at other institutes with which HBNI has an MoU such as CMI. Topics courses in mathematics may be repeated for credit and will be shown on the transcript with suffixes such as I, II, III etc.

10MATH04-001-C ALgEBrA I - 8 crEDiTs

Group theory

- Group actions: Orbits, stabilisers, transitivity
- Lagrange, Cauchy, Sylow theorems in the language of group actions
- Direct and semidirect products
- symmetric and alternating groups

Matrices, determinants and linear maps

- Linear maps and matrices, dual = transpose
- determinants
- Equality of row, column and determinantal rank over a commutative ring

Representations of a single endomorphism

- Minimal and characteristic polynomials, eigenvalues and eigenvectors
- Rational and Jordan canonical forms
- S-N decomposition

Bilinear forms and spectral theorems

- Preliminaries and quadratic maps
- Symmetric forms, orthogonal basis, Sylvester's theorem
- Hermitian forms, polarization, Cauchy-Schwarz inequality
- Spectral theorems, polar decomposition

Basic category theory

- Categories and functors
- Universal properties
- Sums, products and limits

Rings and modules over a PID

- Finitely generated abelian groups
- PID $\Rightarrow$ UFD, R UFD $\Rightarrow$ $R[X]$ UFD, Gauss' lemma

- Irreducibility criteria
- Modules over a PID

Tensor products

- Of vector spaces, modules over a ring, basic properties
- connection with Hom, of algebras
- tensor, symmetric and exterior algebras and connection with the determinant

10MATH04-002-C ALGEBRA II - 8 CREDITS

Group theory

- simple, solvable and nilpotent groups
- Jordan-Holder theorem

Galois theory

- Finite extensions, algebraic extensions, algebraic closure
- Splitting fields and normal extensions
- separable extensions
- Finite fields
- Inseparable extensions
- Galois extensions
- Examples and applications
- Cyclotomic fields
- Independence of characters, norm and trace
- Cyclic extensions
- Solvable and radical extensions

Instructor's choice from among the following suggested topics or others.

Semisimplicity

- Schur's lemma and semisimple modules
- Jacobson density theorem, DCT
- Structure of semisimple rings
- Structure of simple rings

Representations of ftnite groups

- Maschke's theorem
- Characters
- Class functions
- Orthogonality relations

Commutative algebra and Dedekind domains

- Prime, maximal ideals, Zariski topology, CRT
- Localization and its properties
- Integral extensions
- Dedekind domains - characterizations
- Unique factorisation - failure and restoration

10MATH04-003-C ANALysis I - 8 crEDiTs

Measure Theory

- Measurable spaces, Caratheodory's theorem and construction of measures, Lebesgue measure, Riesz representation theorem for compact metric spaces
- Measurable mappings, various convergence concepts like almost sure, convergence in measure.
- Integration, MCT, DCT.
- Product measures, Fubini's theorem.
- Radon-Nikodym theorem, Lebesgue decomposition theorem.
- L^p spaces: Basic theory, Holder's inequality, Minkowsky inequality, completeness, their duality.
- (*) Analysis on R^n; convolutions; approximate identity; approximation theorems; Fourier transform; Fourier inversion formula; Plancherel theorem.

Note: Topics marked with asterisk are optional.

10MATH04-004-C ANALysis II - 8 crEDiTs

Elementary functional analysis

- Topological vector spaces; Banach spaces; Hilbert spaces.
- bounded linear transformation;linear functionals and dual spaces.
- Hahn Banach theorem and it's geometric meaning.
- Category theoem and it's applications like open mapping theorem, uniform boundedness principle, closed graph theorem.
- Weak and Weak-* topologies, Banach-Alaoglu's theorem.

Instructor's choice from among the following suggested topics or others.

Distribution Theory

- The spaces $D(\Omega)$, $E(\Omega)$, for Ω open in IR^n.
- $S(\mathsf{R}^n)$ and their duals, convolution, Fourier transform.
- Paley-Wiener theorems; fundamental solutions of constant coefficient partial differential operators.

Banach Algebras and Spectral Theory

- Banach algebras, spectrum of a Banach algebra element, Holomorphic functional calculus, Gelfand theory of commutative Banach algebras.
- Hilbert space operators, C*-algebras of operators, commutative C*-algebras.
- Spectral theorem for bounded self-adjoint and normal operators. formulation).
- Spectral theorem for compact operators,(*) application to Peter-Weyl theorem.

Note: Topics marked with asterisk are optional.

10MATH04-005-C Topology I - 8 credits

Point-set topology

- Quotient topology including the construction of standard topological spaces such as surfaces and real and complex projective spaces as quotient spaces
- The notion of attachment of a cell to a topological space
- Group actions and orbit spaces
- Topologies on function spaces
- Baire category theorem
- Arzelà-Ascoli theorem

Fundamental groups and covering spaces

- Fundamental groups, covering spaces and their relationship
- Free groups, free products of groups
- Seifert-van Kampen theorem - examples and applications

Introduction to homology

- Definition of homology groups
- Homotopy invariance of homology groups
- The first homology group as the abelianization of the fundamental group
- Review of homological algebra necessary to introduce the Mayer-Vietoris sequence
- Mayer-Vietoris sequence and its applications in computing homology groups of surfaces, complex projective spaces, real projective spaces etc.

Applications of fundamental groups and homology groups

Instructors choice among the following topics or other topics at this level.

- Jordan curve theorem
- Winding number of a closed curve
- Brouwer's fixed point theorem
- Fundamental theorem of algebra
- Nielsen-Schreier theorem

10MATH04-006-C Topology II - 8 credits

Instructors choice among the following topics. It is suggested that one topic from the first two and basic notions of differential topology be covered in addition to some of the advanced topics.

Homology theory

- Quick review of homology theory
- Relative homology and the associated long exact sequence
- Excision theorem and its applications
- Characterisation of homology theory by the Eilenberg-Steenrod axioms
- Homology with coefficients

Cohomology theory and introduction to homotopy groups

- Basic notions of cohomology
- Universal coefficient theorem
- Künneth formula
- Cup product and the cohomology ring, Borsuk-Ulam theorem

Basic notions of differential topology

- Differentiable manifolds, tangent bundle, vector fields, flows
- Differential forms and de Rham cohomology
- Integration on manifolds
- Stokes theorem
- Poincaré duality using differential forms.

Advanced topics

- Higher homotopy groups and the Hurewicz theorem
- H-spaces, suspensions, fibre bundles
- Cap product and various forms of duality with integral coefficients
- Bott periodicity theorem
- Topics in differential geometry such as:
  - Smooth vector bundles
  - Notions of connection, curvature and parallel transport
  - Definition of Riemannian manifold
  - Gauss-Bonnet formula
  - Notion of geodesic and Hopf-Rinow theorem
- Obstruction theory and introduction to characteristic classes:
- Topics in Morse theory such as:
  - Definition and genericity of Morse functions
  - Lemma of Morse
  - Cell structure associated to a Morse function and Morse homology
  - Morse-Smale-Witten complex

10MATH04-007-C Complex Analysis - 8 credits

- Analytic function, Cauchy-Riemann equations, power series, exponential and logarithmic function
- Cauchy theorem on a disc, Integral formula, power series and Laurent series expansion Product development, Weierstrass theorem, Homotopy version of Cauchy's theorem, Liouville's theorem, residue theorem, Argument principle
- Maximum modulus principle, Schwarz lemma, Phragmen-Lindelof method
- Conformal mapping, Mobius transformation, Automorphisms of the disc and upper half plane, Riemann mapping theorem
- Harmonic functions, Dirichlet problem, Mean value property
- Analytic continuation, Monodromy theorem
- (optional) Introduction to Hyperbolic geometry
- (optional) Elliptic functions, Gamma and Zeta functions

10MATH04-008-C Credit seminar - 4 credits

The topic of the seminar will be chosen by the student in consultation with an assigned faculty member. The student will read recent research papers as assigned by the faculty member, and present the results in a formal seminar.

10MATH04-009-C Research Methodology - Pass/Fail

An introduction to the methods and techniques of academic research through a project and presentations - both oral and written.

The following courses are advanced level research courses whose content will be decided by the instructor based on current research and the requirements of the individual students.

10MATH04-001-E Topics in analytic number theory - 8 credits

Course content varies according to instructor's choice. Possibilities for topics are: introduction to arithmetic functions, convolution and Mobius inversion for-mula, basic asymptotic formulas for arithmetic functions, characters and Fourier analysis on finite abelian groups, theory of Dirichlet series, primes in arithmetic progression, Riemann zeta function, Poisson summation and functional equation, The prime number theorem, error term in prime number theorem, its oscillation and the Riemann hypothesis, equivalent formulations of Riemann hypothesis, zero-free regions, explicit formula and Siegel's theorem, introduction to sieve methods, Brun and Selberg sieve, large sieve and the Bombieri-Vinogradov theorem and Vinogradov's three prime Theorem.

10MATH04-002-E Topics in algebraic number theory - 8 credits

Course content varies according to instructor's choice. Possibilities for topics are: Dedekind domains, ramification, different and discriminants, decomposition and inertia groups, quadratic fields and genus theory, classification of primitive quadratic characters, Gauss sums and quadratic reciprocity, geometry of numbers, finiteness of class number and explicit computations, regulators and Dirichlet's unit theorem, cyclotomic fields and inverse Galois problem for abelian number fields, Artin symbol and splitting in cyclotomic fields, Dedekind zeta function, the analytic class number formula and introduction to the Chebotarev density theorem

10MATH04-003-E Topics in commutative algebra - 8 credits

Course content varies according to instructor's choice. One possibility is a course covering the second half of Matsumura's text including topics such as: regular sequences, Koszul complex, Cohen-Macaulay rings, Gorenstein rings, regular rings, UFDs, complete intersections, local flatness criterion, generic freeness, derivations and differentials, separability, I-smoothness, Cohen's structure theorems and applications of complete local rings.

10MATH04-004-E Topics in modular forms - 8 credits

Course content varies according to instructor's choice. Possibilities include: Introduction to $SL_2(\mathbb{R})$ and its action on the Poincare upper half-plane $\mathcal{H}$, discrete subgroups Γ of $SL_2(\mathbb{R})$ and their cusps, the modular group $SL_2(\mathbb{Z})$, Topology, measure theory and complex structure on $\mathcal{H}/\Gamma$ and its compactification, Modular functions, modular forms and cusp forms on $SL_2(\mathbb{Z})$, examples : Eisenstein Series and the delta Function, finite dimensionality of space of modular forms, the Miller basis and the $\mathbb{Z}$-structure on the space of modular forms, growth of Fourier coefficients of cusp forms, introduction to Ramanujan's conjectures, theory of Hecke operators and Petersson inner-product on the space of cusp forms, application to Ramanujan's conjectures, the L-function of modular forms, congruence subgroups, modular forms and cusp forms on congruence subgroups, spectral theory of automorphic forms, introduction to Galois representations and Deligne's theorem, Lehmer's conjecture and the Atkin-Serre Conjecture.

10MATH04-005-E Topics in elliptic curves - 8 credits

Course content varies according to instructor's choice. Possibilities for material to be covered include selected topics from Elliptic functions by Lang, The arithmetic of Elliptic curves by Silverman, Elliptic curves by Milne or Elliptic curves by Husemoller. Another possibility would be to prove Mazur's theorem which is a well-known and important result covering elliptic curves and abelian varieties, and the moduli of elliptic curves.

10MATH04-006-E Topics in algebraic curves - 8 credits

Course content varies according to instructor's choice. Possibilities for material to be covered include selected topics from An invitation to arithmetic geometry by Lorenzini, Algebraic Curves by Fulton or lectures notes of Joseph Oesterle. Topics such as the basics of algebraic varieties over the complex numbers (with focus on dimension 1), singularities of curves (what are they and when is a curve nonsingular), desingularization of curves by normalization, the relationship between nonsingular algebraic curves and complex manifolds of dimension 1, nonsingular projective algebraic curves and function fields, the Riemann-Roch theorem, and also some of its applications.

10MATH04-007-E Topics in diophantine geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: introduction to Global fields, absolute values on global fields, theory of heights, rational points on conics. local-global principle and application to quadratic forms, affine and projective varieties, morphisms and rational maps, explicit arithmetic on function fields and their zeta-functions, divisors on curves, The Riemann-Roch theorem, elliptic curves over global fields, endomorphism rings of Elliptic curves, CM and non-CM curves, ehe Mordell-Weil group and rank of an elliptic curve and local-global principle on elliptic curves and the Tate-Shaferevich group.

10MATH04-008-E Topics in transcendental number theory - 8 credits

Course content varies according to instructor's choice. Possibilities are: Liouville's theorem and Liouville Numbers, elements of rational approximation, transcendence of e and π, irrationality of $\zeta(3)$, introduction to algebraic independence, Lindemann-Weierstrass theorem, Schanuel's conjecture and Ax's theorem for formal power series, the Schneider-Lang Theorem, Hilbert's seventh problem and the Gelfond-Schneider theorem, Baker's Theorem and applications, six exponential theorem, introduction to heights and Roth's Theorem, the p-adic Baker theorem (by Brumer) and introduction to Leopoldt's conjecture and the p-adic subspace theorem and applications.

10MATH04-009-E Topics in algebraic groups - 8 credits

Course content varies according to instructor's choice. One possibility is to cover the basic theory of linear algebraic groups over an algebraically closed field up to the classification of the reductive groups by means of root data, developing the necessary background from algebraic geometry as and when needed. Thus covering preliminaries from algebraic geometry, linear algebraic groups: definition and first properties, commutative algebraic groups, derivations, differentials, and Lie algebras, topological properties of morphisms applied to this context, Parabolic subgroups, Borel subgroups, and solvable subgroups, Weyl group, roots, and root datum and reductive groups and their classification: isomorphism and existence theorems.

10MATH04-010-E Topics in infinite dimensional Lie algebras - 8 credits

Course content varies according to instructor's choice. Some possibilities are: generalized Cartan matrices and their associated Lie algebras, symmetrizability, the invariant bilinear form, the Weyl group, classification of indecomposable GCMs, finite, affine and indefinite types, affine Kac-Moody algebras, roots, the affine Weyl group, realizations of untwisted and twisted affine Kac-Moody algebras in terms of loop algebras, representation theory: integrable representations, category $\mathcal{O}$, proof of the Weyl-Kac character formula, highest weight integrable representations, weights, representations of affine Kac-Moody algebras.

10MATH04-011-E Topics in functional analysis - 8 credits

Course content varies according to instructor's choice. Some possibilities are: analytic Fredholm theory, compact and Fredholm operators, Atkinson's theorem, Gelfand duality, properties of the analytic index, Toeplitz operators on Hardy spaces, Pseudo-differential operators and Elliptic regularity, Fourier transforms and Sobolev spaces on R^n, Symbol calculus and Pseudo-differential operators, Ellipticity and Pseudo-differential operators on smooth manifolds, construction of parametrices, Elliptic regularity theorem, Ellipticity and Fredholm property of Dirac operators on closed manifolds.

10MATH04-012-E Topics in non-commutative geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Vector bundles, K-theory for topological spaces, Serre Swan theorem, K_0 and $K_1$for a C*-algebra, homotopy invariance, split exactness, half-exactness, stability of K-theory, inductive limits and K-theory, Bott periodicity, Six term exact sequences, computations with them, Pimsner-Voiculescu exact sequence, Thom isomorphism, Hilbert C*-modules, KK groups, Geometric index theory, Vector bundles, connections and curvature on Riemannian manifolds, structure equations of Cartan, invariant forms and characteristic classes in de Rham cohomology, Chern-Gauss-Bonnet theorem and idea of proof, topological index and statement of the Atiyah-Singer index theorem

10MATH04-013-E Topics in Lie groups - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Introduction to Lie algebras, definitions, examples, abelian, nilpotent, solvable lie algebras, semisimple lie algebras, representation of Lie algebras, structure of general Lie algebras over characteristic zero field : statement of the Levi decomposition, statement of Ado's theorem, Introduction to real differentiable manifolds, and various standard objects associated with it, statement of the Frobenius theorem on integrability, definition of real Lie groups, examples, associated Lie algebra, the exponential map and its properties, closed subgroup theorem, continuous homomorphisms, definition of Lie subgroups and examples, association of lie subgroups and lie subalgebras, covering Lie groups, simply connected lie groups and association with real Lie algebras, the adjoint representation, the manifold structure of the left or right coset space with respect to a closed subgroup and the (subgroup)-principal bundle structure of the Lie group with respect to the projection to the coset space, Construction of left invariant Haar measure using left invariant differential forms, formula for modular function, compact Lie groups, Peter-Weyl theorem, embedding compact groups in linear Lie groups, Weyl group, conjugacy of maximal tori in connected compact Lie groups, Centralizers of tori, basic structure of semisimple Lie groups, existence of compact real forms of complex semi-simple Lie algebras, Cartan decomposition both at the Lie algebra and Lie group level, Iwasawa decomposition.

10MATH04-014-E Topics in algebraic geometry - 8 credits

Course content varies according to instructor's choice. One possibility is an introduction to the language of schemes, properties of morphisms, and sheaf cohomology. So that the students gain an understanding of the basic notions and techniques of modern algebraic geometry.

10MATH04-015-E Topics in differential geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Definition of smooth manifolds, atlas, examples, tangent spaces, inverse and implicit functon theorems for manifolds, vector fields, flow, completeness of the flow function, integrability and Frobenius theorem, differential forms, pullback by functions, exterior derivative, orientations, manifolds with boundary, Stokes theorem, DeRham cohomology, computations using Mayer Vietoris, Riemannian metrics and geodesics.

10MATH04-016-E Topics in partial differential equations - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Examples of partial differential equations, Strategies for studying PDE., Well posed problem, Brief introduction to classical solutions, weak solution and regularity, Transport equation, Laplace's equation, Heat equation and wave equation, Problems associated to these equations, notion of fundamental solution etc., Non-linear first order PDE, Hamilton Jacobi equations, calculus of variations, Hamilton's ode, Legendre transforms, etc., Theory of linear partial differential equations: Sobolev spaces, weak derivative, Sobolev inequalities, Elliptic equations, Weak solutions, the existence of weak solutions, regularity, maximum principles, eigenvalues and eigenfunctions of elliptic operators, compactness, etc.

10MATH04-017-E Topics in mathematical physics - 8 credits

Course content varies according to instructor's choice. One possibility is to cover classical and quantum mechanics covering topics such as: review of Galilean group, mechanical system with one degree of freedom, mechanical system consisting of motion of a point in three dimensional space and motion of system of n points, review of calculus of variation, Lagrange's equation, Hamilton's equations, Liouville's theorem, Symplectic structures on phase spaces and Noether's theorem, D'Alembert's principle, Symplectic manifolds, Hamiltonian mechanics on symplectic manifolds, moment map, postulates of quantum mechanics, mathematical aspects of Schrödinger's equation, review of Lie group, Lie algebra and their representations with main focus on groups like $U(1)$, $SO(3)$, $SU(2)$, Spin groups in 3 and 4 dimensions, Spin $\frac{1}{2}$ particle in magnetic field, review of Fourier transforms, position and momentum space, Dirac notation, Heisenberg's uncertainty principle, Hydrogen atom, quantization, canonical quantization, The Groenewold-van Hove no-go theorem, canonical quantization in n–dimensions, quantization and symmetries.

10MATH04-018-E Topics in algebra - 8 credits

Course content varies according to instructor's choice. One possibility is a course in commutative algebra covering prime ideals and maximal ideals, nilradical and jacobson radical, prime avoidance and the Chinese remainder theorem, extension and contraction of ideals, modules, submodules and quotient modules, direct sum and direct product, finitely generated modules and Nakayama lemma, exact sequences, tensor products, restriction and extension of scalars, exactness properties of the tensor product, algebras, tensor product of algebras, localization, local properties, extended and contracted ideals in rings of fractions, primary decomposition, integral extensions, lying over, going-up theorems, integrally closed domains and the going-down theorem, valuation rings, Noetherian and Artinian modules, Noetherian rings, Hilbert basis theorem, primary decomposition in Noetherian rings, Artinian rings and their structure, discrete valuation rings and Dedekind domains, fractional ideals, completions, filtrations, topologies, and completions, graded rings and modules, associated graded ring, dimension theory, Hilbert functions, dimension theory of Noetherian local rings, regular local rings, transcendental dimension, relation to algebraic varieties and algebraic geometry.

10MATH04-019-E Topics in operator algebras - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Banach algebras, spectrum, spectral radius formula, C*-algebras, Gelfand Naimark theorem, continuous functional calculus, GNS construction, positivity, measurable functional calculus, von Neumann algebras, Kaplansky density theorem, double commutant theorem, finite-dimensional C*-algebras, representation theory of the C*-algebra of compact operators, Toeplitz algebra, Coburn's theorem, group C*-algebras, crossed products, amenability, groupoid C*-algebras.

10MATH04-020-E Topics in representation theory - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Lie algebras: definition and basic properties, ideals, subalgebras, homomorphisms, nilpotent and solvable Lie algebras, Lie's and Engel's theorems, semisimple Lie algebras, the Killing form, Cartan's criterion, abstract Jordan decomposition, classification of finite dimensional semisimple Lie algebras, Dynkin diagrams, the Weyl group, isomorphism and conjugacy theorems, representations, Verma modules, category $\mathcal{O}$, irreducible highest weight modules, complete reducibility, Weyl character formula, Freudenthal weight multiplicity formula, Kostant and Steinberg formulas.

10MATH04-021-E Topics in algebraic combinatorics - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Partially ordered sets and Mobius inversion, generating functions, permutations and statistics, Robinson-Schensted correpondence, partitions, Young's lattice, hook-length formula, Representation theory of symmetric groups, similarity classes of matrices and orthogonal polynomials

10MATH04-022-E Topics in topology - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Definitions and basic construction of homotopy groups, Whitehead's theorem, Hurewicz's theorem, stable homotopy groups, fibrations and obstruction theory, Bott's periodicity theorem, H-cobordism theorem, construction and applications of characteristic classes.

10MATH04-023-E Topics in symplectic geometry - 8 credits

Course content varies according to instructor's choice. Possibilities include: Motivations of sympletic Geometry from Hamiltonian mechanics, neighbourhood theorems, compatible almost complex structure, and the contractibility of the space of almost complex structures, integrability of almost complex structures, Newlander-Nirenberg theorem, Hamiltonian circle actions on symplectic manifolds, moment maps, Fubini-Studi form on projective space, Kähler forms as Hessians of plurisubharmonic function on complex manifolds, introduction to pseudoholomorphic curves, outline of proof of Gromov's non-squeezing theorem.

10MATH04-024-E Programming for mathematicians - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Basic python syntax, Iterables and generators, Object oriented programming, introduction to Sage, the Numpy library, the Networkx library, graphics with Sage and Matplotlib and a Programming project.

Course Curriculum

Doctoral program in School of Mathematical Sciences

Applicable from the Academic Year

2018-19

SYLLABUS FOR

Ph.D. in Mathematical Science (Program Code: MATH04)

NATIONAL INSTITUTE OF SCIENCE EDUCATION AND

RESEARCH BHUBANESWAR

SCHOOL OF MATHEMATICAL SCIENCES

COURSE STRUCTURE FOR DOCTORAL PROGRAM

School of mathematical sciences at NISER is engaged in research in diverse areas that includes, academic disciplines that are primarily mathematical in nature but may not be universally considered subfields of mathematics proper. To maintain this diversity, school provides two possible curriculum to a student. A student has to select one curriculum out of these two at the beginning of his/her doctoral program and is expected to finish it within one year. These curriculum are:

1. Mathematics - I: For students interested in algebra, analysis, cryptol- ogy, discrete mathematics, geometry, number theory, probability and topology.

2. Mathematics - II: For students interested in statistics.

Both curriculum will have 6 compulsory courses, 2 elective courses and 2 self study courses. In each of the two semesters a student will take 3 compulsory courses, 1 elective course and 1 self study course. Detailed list of courses in both the curriculum is provided in next section.

An instruction based course, consisting of three lectures and one tutorial, will be worth 6 credits. A self study course will be done under the supervision of a faculty member on an advanced topic in broad research area of interest to student. It will be worth 6 credits. Therefore total credits earned by a student in first year will be $6 \times 8 + 6 \times 2 = 60$.

Having completed the course work successfully, a student will appear for Oral General Comprehensive Examination (OGCE) conducted by the monitoring committee. OGCE will be based on all the 8 courses that a student has taken and will be conducted before the registration of third semester. The process of choosing Ph.D. advisor starts only after the successful completion of OGCE and it has to be done within a month from the date of completion of comprehensive examination.

A doctoral committee is then constituted by the Dean Academic as per HBNI guidelines once a guide and topic has been decided. If the doctoral committee so desires, the student can take more courses related to the topic of research. The doctoral committee should meet at least once in year to monitor the progress of a student. The student has to give one seminar every year before the doctoral committee. Guide, who is the convener of doctoral committee, should send the annual progress report of student to the dean academic every year before registration of odd/even semester depending upon the joining date of the student and a copy may be sent to PGCS convener for further reference.

COURSES IN CURRICULUM

Courses in Mathematics - I

Course No.	Credits	Course Name	Semester
M601	6	Algebra I	1
M603	6	Analysis I	1
M659	6	Topology and Complex Analysis	1
M***	6	Elective I	1
M***	6	Self study course I	1
M602	6	Algebra II	2
M604	6	Analysis II	2
M632	6	Advanced Probability	2
M***	6	Elective II	2
M***	6	Self study course II	2

Courses in Mathematics - II

Course No.	Credits	Course Name	Semester
M615	6	Introduction to Stochastic Processes	1
M641	6	Statistical Inference I	1
M644	6	Regression Analysis	1
M***	6	Elective I	1
M***	6	Self study course I	1
M632	6	Advanced Probability	2
M645	6	Time Series Analysis	2
M767	6	Statistical Inference II	2
M***	6	Elective II	2
M***	6	Self study course II	2

LIST OF ELECTIVE COURSES

Course No.	Credits	Course Name
M605	6	Functional Analysis
M606	6	Representations of Finite Groups
M607	6	Commutative Algebra
M608	6	Algebraic Topology
M611	6	Advanced Complex Analysis
M612	6	Advanced Functional Analysis
M613	6	Advanced Linear Algebra
M614	6	Partial Differential Equations
M616	6	Algebraic Geometry
M617	6	Algebraic Graph Theory
M618	6	Algebraic Number Theory
M620	6	Algorithm
M623	6	Finite Fields
M624	6	Information and Coding Theory
M625	6	Mathematical Logic
M626	6	Measure Theory
M627	6	Nonlinear Analysis
M628	6	Operator Theory
M630	6	Abstract Harmonic Analysis
M631	6	Advanced Number Theory
M633	6	Algebraic Combinatorics

M635	6	Incidence Geometry
M636	6	Lie Algebras
M637	6	Optimization Theory
M638	6	Advanced Partial Differential Equations
M639	6	Random Graphs
M640	6	Randomized Algorithms and Probabilistic Methods
M642	6	Multivariate Statistical Analysis
M643	6	Introduction to Manifolds
M652	6	Complex Analysis
M653	6	Differential Equations
M654	6	Discrete Mathematics
M655	6	Graph Theory
M656	6	Introduction to Number Theory
M657	6	Probability Theory-I
M658	6	Probability Theory-II

LIST OF ELECTIVE COURSES CONTD.

Course No.	Credits	Course Name
M751	6	Algebraic Computation
M752	6	Analytic Number Theory
M753	6	Classical Groups
M754	6	Ergodic Theory
M755	6	Harmonic Analysis
M756	6	Lie Groups and Lie Algebras-I
M757	6	Operator Algebras
M758	6	Representations of Linear Lie Groups
M759	6	Harmonic Analysis on Compact Groups
M760	6	Modular Forms of One Variable
M761	6	Elliptic Curves
M762	6	Brownian Motion and Stochastic Calculus
M763	6	Differentiable Manifolds and Lie Groups
M764	6	Lie Groups and Lie Algebras-II
M765	6	Mathematical Foundations for Finance

DETAILED SYLLABUS

(M601): (Algebra-I), Credits - 6
(3 Lectures + 1 Tutorial)

Group Theory: Dihedral groups, Permutation groups, Group actions, Sy- low' s theorems, Simplicity of the alternating groups, Direct and semidirect products, Solvable groups, Nilpotent groups, Jordan Holder Theorem, free groups.
Ring Theory: Properties of Ideals, Chinese remainder theorem, Field of fractions, Euclidean domains, Principal ideal domains, Unique factorization domains, Polynomial Rings, Irreducibility criteria, Matrix rings.
Module Theory: Examples, quotient modules, isomorphism theorems, Gen- eration of modules, free modules, tensor products of modules, Exact se- quences - Projective, Injective and Flat modules.

Reference reading materials:

1. D. S. Dummit and R. M. Foote, Abstract Algebra. John Wiley & Sons, 2004.
2. T. W. Hungerford, Algebra, Graduate Texts in Mathematics, 73, Springer, 1980.
3. M. Artin, Algebra, Prentice Hall, 1991.

(M602): (Algebra-II), Credits - 6
(3 Lectures + 1 Tutorial)

Linear Algebra: Matrix of a Linear transformation, dual vector spaces, de- terminants, Tensor algebras, Symmetric algebras, Exterior algebras, Modules over PIDs: Basic theory, Structure theorem for finitely generated abelian groups, Rational and Jordan canonical forms.
Field Theory: Algebraic extensions, Splitting fields, Algebraic closures, Sep- arable and Inseparable extensions, Cyclotomic polynomials and extensions, Galois extensions, Fundamental Theorem of Galois theory, Finite fields, Composite extensions, Simple extensions, Cyclotomic extensions and Abelian extensions over rational field, Galois groups of polynomials, Fundamental theorem of algebra, Solvable and Radical extensions, Computation of Ga- lois groups over rational field.

Reference reading materials:

1. D. S. Dummit and R. M. Foote, Abstract Algebra. John Wiley & Sons, 2004.

2. T. W. Hungerford, Algebra, Graduate Texts in Mathematics, 73, Springer, 1980.
3. M. Artin, Algebra, Prentice Hall, 1991.

(M603): (Analysis-I), Credits - 6
(3 Lectures + 1 Tutorial)

Spaces of functions: Continuous functions on locally compact spaces, Stone- Weierstrass theorems, Ascoli-Arzela Theorem. Review of Measure theory: Sigma-algebras, measures, construction and properties of the Lebesgue measure, non-measurable sets, measurable functions and their properties. Inte- gration: Lebesgue Integration, various limit theorems, comparison with the

Riemann Integral, Functions of bounded variation and absolute continu- ity. Measure spaces: Signed-measures, Radon-Nikodym theorem, Product spaces, Fubini' s thoerem (without proof) and its applications. Lp-spaces: Holder and Minkowski inequalities, completeness, Convolutions, Approxi- mation by smooth functions. Fourier analysis: Fourier Transform, Inverse Fourier transform, Plancherel Theorem for Real numbers.

Reference reading materials:

1. D. S. Bridges, Foundations of Real and Abstract Analysis, GTM series, Springer Verlag 1997.

5. W. Rudin, Real and Complex Analysis, TMH Edition, Second Edition, New-York, 1962.

(M604): (Analysis-II), Credits - 6

(3 Lectures + 1 Tutorial)

Banach spaces: Review of Banach spaces, Hahn-Banach Theorem and its applications, Baire Category theorem and its applications like Closed graph theorem, Open mapping theorem. Topological Vector spaces: Weak and weak* topologies, locally convex topological vector spaces. Hilbert spaces: Review of Hilbert spaces and operator Theory, Compact operators, Schauder' s theorem on the spectral theory of compact operators. Banach algebras: Ele- mentary properties, Resolvent and spectrum, Spectral radius formula, Ideals and homomorphisms, Gelfand transforms, Gelfand theorem for commutative Banach algebras.

Reference reading materials:

1. D. S. Bridges, Foundations of Real and Abstract Analysis, GTM series, Springer Verlag 1997.
2. G. B. Foland, Real Analysis: Modern Techniques and Their Applications (2nd ed.), Wiley-Interscience/John Wiley Sons, Inc., 1999.
3. G. K. Pederson, Analysis NOW, GTM series, Springer-Verlag, 1991.
4. W. Rudin, Real and Complex Analysis, TMH Edition, Second Edition, New-York, 1962.

6. K. Yosida, Functional Analysis, Springer-Verlag 1968.

(M615): (Introduction to Stochastic Processes), Credits - 6
(3 Lectures + 1 Tutorial)

Discrete Markov chains with countable state space; Classification of states: recurrences, transience, periodicity. Stationary distributions, reversible chains, Several illustrations including the Gambler's Ruin problem, queuing chains, birth and death chains etc. Poisson process, continuous time Markov chain with countable state space, continuous time birth and death chains.

Reference reading materials:

1. P.G.Hoel,S.C.Port,C.J.Stone, "IntroductiontoStochastic Processes" ,Houghton Mifflin Co., 1972.
2. R. Durrett, "Essentials of Stochastic Processes" , Springer Texts in Statistics, Springer,
2012.
3. G. R. Grimmett, D. R. Stirzaker, "Probability and Random Processes" , Oxford University Press, 2001.
4. S. M. Ross, "Stochastic Processes" , Wiley Series in Probability and Statistics:
Probability and Statistics, John Wiley & Sons, 1996

(M622): (Cryptology), Credits - 6
(3 Lectures + 1 Tutorial)

Overview: Cryptography and cryptanalysis, some simple cryptosystems (e.g., shift, substitution, affine, knapsack) and their cryptanalysis, classification of cryptosystems, classification of attacks; Information Theoretic Ideas: Per- fect secrecy, entropy; Secret key cryptosystem: stream cipher, LFSR based stream ciphers, cryptanalysis of stream cipher (e.g., correlation attack, alge- braic attacks), block cipher, DES, linear and differential cryptanalysis, AES; Public-key cryptosystem: Implementation and cryptanalysis of RSA, El- Gamal public-key cryptosystem, Discrete logarithm problem, elliptic curve cryptography; Data integrity and authentication: Hash functions, message authentication code, digital signature scheme, ElGamal signature scheme; Secret sharing: Shamir' s threshold scheme, general access structure and se- cret sharing.

Reference reading materials:

1. D. R. Stinson, "Cryptography: Theory And Practice" , Chapman & Hall/CRC, 2006.
2. A. J. Menezes, P. C. van Oorschot, S. A. Vanstone, "Handbook of Applied Cryp-
tography" , CRC Press, 1997.

(M629): (Theory of Computation), Credits - 6
(3 Lectures + 1 Tutorial)

Automata and Language Theory: Finite automata, regular expression, pump- ing lemma, context free grammar, context free languages, Chomsky normal form, push down automata, pumping lemma for CFL; Computability: Tur- ing machines, Churh-Turing thesis, decidability, halting problem, reducibil- ity, recursion theorem; Complexity: Time complexity of Turing machines, Classes P and NP, NP completeness, other time classes, the time hierarchy.

Reference reading materials:

1. J. E. Hopcroft, R. Motwani, J. D. Ullman, "Introduction to Automata Theory, Languages, and Computation", Addison-Wesley, 2006.
2. H. Lewis, C. H. Papadimitriou, "Elements of the Theory of Computation", Prentice-Hall, 1997.
3. M. Sipser, "Introduction to the Theory of Computation", PWS Publishing, 1997.

(M632): (Advanced Probability), Credits - 6

(3 Lectures + 1 Tutorial)

Probability spaces, Random Variables, Independence, Zero-One Laws, Ex- pectation, Product spaces and Fubini's theorem, Convergence concepts, Law of large numbers, Kolmogorov three-series theorem, Levy-Cramer Continu- ity theorem, CLT for i.i.d. components, Infinite Products of probability mea- sures, Kolmogorov’ s Consistency theorem, Conditional expectation, Discrete parameter martingales with applications.

Reference reading materials:

1. A. Gut, “Probability: A Graduate Course”, Springer Texts in Statistics, Springer, 2013.
2. K. L. Chung, “A Course in Probability Theory”, Academic Press, 2001.
3. S. I. Resnick, “A Probability Path”, Birkhäuser, 1999.
4. P. Billingsley, “Probability and Measure”, Wiley Series in Probability and Statis- tics, John Wiley & Sons, 2012.
5. J. Jacod, P. Protter, “Probability Essentials”, Universitext, Springer-Verlag, 2003.

(M641): (Statistical Inference I), Credits - 6

(3 Lectures + 1 Tutorial)

Review: joint and conditional distributions, order statistics, group family, exponential family. Introduction to parametric inference, sufficiency princi- ple and data reduction, factorization theorem, minimal sufficient statistics, Fisher information, ancillary statistics, complete statistics, Basu’ s theorem. Unbiasedness, best unbiased and linear unbiased estimator, Rao-Blackwell theorem, Lehmann- Scheffe theorem and UMVUE, Cramer-Rao lower bound and UMVUE, multi-parameter cases. Location and scale invariance, princi- ple of equivarience. Methods of estimation: method of moments, likelihood principle and maximum likelihood estimation, properties of MLE: invari- ance, consistency, asymptotic normality. Hypothesis testing: error prob- abilities and power, most powerful tests, Neyman-Pearson lemma and its applications, p-value, uniformly most powerful (UMP) test via Neyman- Pearson lemma, UMP test via monotone likelihood ratio property, exis- tence and nonexistence of UMP test for two sided alternative, unbiased and UMP unbiased tests. Likelihood (generalized) ratio tests and its properties, invariance and most powerful invariant tests. Introduction to confidence interval estimation, methods of fining confidence intervals: pivotal quantity, inversion of a test, examples such as confidence interval for mean, variance, difference in means, optimal interval estimators, uniformly most accurate confidence bound, large sample confidence intervals.

Reference reading materials:

4. G. Casella and R. L. Berger, “Statistical Inference”, 2nd edition, Cengage Learning, 2001.
5. A. M. Mood, F. A. Graybill and D. C. Boes, “Introduction to the theory of Statis- tics”, 3rd edition, McGraw Hill, 1974.

(M659): (Topology and Complex Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

• **Topology:** Topological spaces, Continuous maps between topological spaces, product topology, Quotient spaces, Connectedness, Compactness, Winding Numbers of Closed Curves, Brouwer Fixed Point Theorem (state- ment only), Borsuk-Ulam Theorem (Statement Only).

• **Complex Analysis :** Complex line integrals, Goursat' s theorem; Local existence of primitives and Cauchy' s theorem in a disc , Cauchy' s integral formula , Applications of Cauchy' s integral, Singularities and their classi- fications, zeros, poles and residue theorem. Applications of residue theo- rem. Argument principle and applications. Maximum Modulus principle, Schwarz lemma. Biholomorphic between between complex plane, Disc to itself, Statement of Riemann Mapping theorem

Reference reading materials:

1. Armstrong, *Basic Topology,* Springer, 1983
2. Munkres, *Topology,* Pearson Education, 2005.
3. Greene and Krantz, *Function Theory of One Complex Variable,* gsm 40, University Press, 2006
4. Stein and Shakarchi, *Complex Analysis (Princeton Lectures in Analysis, No. 2)*, Princeton University Press, 2003.
5. Gamelin, *Complex Analysis (Undergraduate Texts in Mathematics),* Springer, 2003.
6. Rudin, *Real and Complex Analysis*, McGraw-Hill, New York, 1966.

(M660): (Advanced Topology), Credits - 6
(3 Lectures + 1 Tutorial)

•**Homotopy Theory:** Fundamental groups and its functorial properties, examples, Van- Kampen Theorem,

•**Covering spaces :** Covering spaces, Computation of fundamental groups using cover- ings. The classification of covering spaces. Deck transforma- tions.

•**Simply connected spaces:** Simply connected spaces-Universal covering spaces of locally simply connected and pathwise connected spaces. - Uni- versal covering group of connected subgroups of General Linear groups.

•**Homology groups :** Affine spaces, simplexes and chains - Homology groups - Properties of Homology groups. - Chain Complexes, Relation Be- tween one dimensional Homotopy and Homology groups. - (As in sections 8 - 12 of Part II of Greenberg and Harper.)

Reference reading materials:

1. Armstrong, Basic Topology, Springer, 1983
2. Greenberg & Harper, Algebraic Topology: A First Course, Addition Wesley, 1984.
3. Munkres, Topology, Pearson Education, 2005. 1974

(M661): (Combinatorics and Graph Theory), Credits - 6
(3 Lectures + 1 Tutorial)

Pigeonhole principle, Counting principles, Binomial coefficients, Principles of inclusion and exclusion, recurrence relations, generating functions, Cata- lan numbers, Stirling numbers, Partition numbers, Schroder numbers.[25 lectures]

Graphs, subgraphs, graph isomorphisms, Hamilton cycles, Euler tours, di- rected graphs, matching, Tutte’ s theorem, Menger’ s theorem, planar graphs, Kuratowski’ s theorem, graph colourings, network flows, max-flow min-cut theorem, Ramsey theory for graphs, Matrices associated with graphs: Inci- dence matrix, Adjacency matrix, Laplacian matrix.[25 lectures]

Reference reading materials:

1. R. A. Brualdi, Introductory Combinatorics, Pearson Prentice Hall, 2010.
2. J. H. van Lint, R. M. Wilson, A Course in Combinatorics, Cambridge University Press, 2001.
3. R. P. Stanley, Enumerative Combinatorics Vol. 1, Cambridge Studies in Advanced Mathematics, 49, Cambridge University Press, 2012.
4. R. Diestel, Graph Theory, Graduate Texts in Mathematics, 173, Springer, 2010.
5. B. Bollobas, Modern Graph Theory, Graduate Texts in Mathematics, 184, Springer- Verlag, 1998.
6. J. A. Bondy, U. S. R. Murty, Graph Theory, Graduate Texts in Mathematics, 244, Springer, 2008.

(M766): (Designs and Codes), Credits - 6

(3 Lectures + 1 Tutorial)

Incidence structures, affine planes, translation plane, projective planes, con- ics and ovals, blocking sets. Introduction to Balanced Incomplete Block De- signs (BIBD), Symmetric BIBDs, Difference sets, Hadamard matrices and designs, Resolvable BIBDs, Latin squares. Basic concepts of Linear Codes, Hamming codes, Golay codes, Reed-Muller codes, Bounds on the size of codes, Cyclic codes, BCH codes, Reed-Solomon codes.

Reference reading materials:

1. G. Eric Moorhouse, “Incidence Geometry”, 2007 (available online).
2. Douglas R. Stinson, “Combinatorial Designs”, Springer-Verlag, New York, 2004.
3. W. Cary Huffman, V. Pless, “Fundamentals of Error-correcting Codes”, Cambridge Uinversity Press, Cambridge, 2003.

(M767): (Statistical Inference II), Credits -6

(3 Lectures + 1 Tutorial) *Prerequisites: M641 or equivalent*

General decision problem, loss and risk function, minimax estimation, min- imaxity and admissibility in exponential family. Introduction to Bayesian estimation, Bayes rule as average risk optimality, prior and posterior, conju- gate families, generalized Bayes rules. Bayesian intervals and construction of credible sets, Bayesian hypothesis testing. Empirical and nonparametric empirical Bayes analysis, admissibility of Bayes and generalized Bayes rules, discussion on Bayes versus non-Bayes approaches. Large sample theory: re- view of modes of convergences, Slutsky' s theorem, Berry-Essen bound, delta method, CLT for iid and non iid cases, multivariate extensions. Asymptotic level α tests, asymptotic equivalence, comparison of tests: relative efficiency, asymptotic comparison of estimators, efficient estimators and tests, local asymptotic optimality. Bootstrap sampling: estimation and testing.

Reference reading materials:

1. E. L. Lehmann and G. Casella, “Theory of Point Estimation”, 2nd edition, Springer, New York, 1998.
2. E. L. Lehmann, “Elements of Large-Sample Theory”, Springer-Verlag, 1999.
3. E. L. Lehmann and J. P. Romano, “Testing Statistical Hypothesis”, 3rd edition, Springer, 2005.
4. James O Berger, “Statistical Decision Theory and Bayesian Analysis”, 2nd edition, Springer, New York, 1985.

Syllabus of Elective Courses

(M606): (Representations of Finite Groups), Credits - 6
(3 Lectures + 1 Tutorial)

Group representations, Maschke' s theorem and completely reducibility, Char- acters, Inner product of Characters, Orthogonality relations, Burnside' s the- orem, induced characters, Frobenius reciprocity, induced representations, Mackey' s Irreducibility Criterion, Character table of some well-known groups, Representation theory of the symmetric group: partitions and tableaux, con- structing the irreducible representations.

Text Book:

1. G. James, M. Liebeck, "Representations and Characters of Groups", Cambridge University Press, 2010.

Reference reading materials:

1. J. L. Alperin, R. B. Bell, "Groups and Representations", Graduate Texts in Math- ematics 162, Springer, 1995.
2. B. Steinberg, "Representation Theory of Finite Groups", Universitext, Springer, 2012.
3. J-P. Serre, "Linear Representations of Finite Groups", Graduate Texts in Mathe- matics 42, Springer-Verlag, 1977.
4. B. Simon, "Representations of Finite and Compact Groups", Graduate Studies in Mathematics 10, American Mathematical Society, 2009.

(M607): (Commutative Algebra), Credits - 6
(3 Lectures + 1 Tutorial)

Commutative rings, ideals, operations on ideals, prime and maximal ideals, nilradicals, Jacobson radicals, extension and contraction of ideals, Mod- ules, free modules, projective modules, exact sequences, tensor product of modules, Restriction and extension of scalars, localization and local rings, extended and contracted ideals in rings of fractions, Noetherian modules, Artinian modules, Primary decompositions and associate primes, Integral extensions, Valuation rings, Discrete valuation rings, Dedekind domains, Fractional ideals, Completion, Dimension theory.

Text Book:

1. M. F. Atiyah, I. G. Macdonald, "Introduction to Commutative

Algebra" , Addison- Wesley Publishing Co., 1969.

Reference reading materials:

1. R. Y. Sharp, "Steps in Commutative Algebra" , London Mathematical Society Stu- dent Texts, 51. Cambridge University Press, 2000.
2. D. S. Dummit, R. M. Foote, "Abstract Algebra" , Wiley-India edition, 2013.

(M608): (Algebraic Topology), Credits - 6
(3 Lectures + 1 Tutorial)

Homotopy Theory: Simply Connected Spaces, Covering Spaces, Univer- sal Covering Spaces, Deck Transformations, Path lifting lemma, Homotopy lifting lemma, Group Actions, Properly discontinuous action, free groups, free product with amalgamation, Seifert-Van Kampen Theorem, Borsuk- Ulam Theorem for sphere, Jordan Separation Theorem. Homology Theory: Simplexes, Simplicial Complexes, Triangulation of spaces, Simplicial Chain Complexes, Simplicial Homology, Singular Chain Complexes, Cycles and Boundary, Singular Homology, Relative Homology, Short Exact Sequences, Long Exact Sequences, Mayer-Vietoris sequence, Excision Theorem, Invari- ance of Domain.

Text Books:

1. J. R. Munkres, "Topology", Prentice-Hall of India, 2013.
2. A. Hatcher, "Algebraic Topology", Cambridge University Press, 2009.

Reference reading materials:

1. G. E. Bredon, "Topology and Geometry", Graduates Texts in Mathematics 139, Springer, 2009.

(M611): (Advanced Complex Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

Review of basic Complex Analysis: Cauchy-Riemann equations, Cauchy's theorem and estimates, power series expansions, maximum modulus prin- ciple, Classification of singularities and calculus of residues. Space of con- tinuous functions, Arzela's theorem, Spaces of analytic functions, Spaces of meromorphic functions, Riemann mapping theorem, Weierstrass Factoriza- tion theorem, Runge's theorem, Simple connectedness, Mittag-Leffler's the- orem, Analytic continuation, Schwarz reflection principle, Mondromy the- orem, Jensen's formula, Genus and order of an entire function, Hadamard factorization theorem, Little Picard theorem, Great Picard theorem, Har- monic functions.

Reference reading materials:

1. L. V. Ahlfors, "Complex Analysis", Tata McGraw-Hill, 2013.
2. J. B. Conway, "Functions of One Complex Variable II", Graduate Texts in Math- ematics 159, Springer-Verlag, 1996.
3. W. Rudin, "Real and Complex Analysis", Tata McGraw-Hill, 2013.
4. R. Remmert, "Theory of Complex Functions", Graduate Texts in Mathematics 122, Springer, 2008.

(M612): (Advanced Functional Analysis), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M605 or equivalent*

Definition and examples of topological vector spaces (TVS) and locally con- vex spaces (LCS); Linear operators; Hahn-Banach Theorems for TVS/ LCS (analytic and geometric forms); Uniform boundedness principle; Open map- ping theorem; Closed graph thoerem; Weak and weak* vector topologies; Bipolar theorem; dual of LCS spaces; Krein-Milman theorem for TVS; Krien-Smulyan theorem for Banach spaces; Inductive and projective limit of LCS.

Reference reading materials:

1. W. Rudin, “Functional Analysis”, Tata McGraw-Hill, 2007.
2. A. P. Robertson, W. Robertson, “Topological Vector Spaces”, Cambridge Tracts in Mathematics 53, Cambridge University Press, 1980.

3. J. B. Conway, “A Course in Functional Analysis”, Graduates Texts in Mathematics 96, Springer, 2006.

(M613): (Advanced Linear Algebra), Credits - 6
(3 Lectures + 1 Tutorial)

Rational and Jordan canonical forms, Inner product spaces, Unitary and Normal operators, Forms on inner product spaces, Spectral theorems, Bilin- ear forms, Matrix decomposition theorems, Courant- Fischer minimax and related theorems, Nonnegative matrices, Perron-Frobenius theory, General- ized inverse, Matrix Norm, Perturbation of eigenvalues.

Reference reading materials:

1. R. A. Horn, C. R. Johnson, “Matrix Analysis”, Cambridge University Press, 2010.
2. K. Hoffman, R. Kunze, “Linear Algebra”, Prentice-Hall of India, 2012.
3. S. Roman, “Advanced Linear Algebra”, Graduate Texts in Mathematics 135, Springer, 2008.

(M614): (Partial Differential Equations), Credits - 6
(3 Lectures + 1 Tutorial)

Classification of Partial Differential Equations, Cauchy Problem, Cauchy- Kowalevski Theorem, Lagrange-Green identity, The uniquness theorem of Holmgren, Transport equation: Initial value problem, nonhomogeneous prob- lem. Laplace equation: Fundamental solution, Mean Value formula, proper- ties of Harmonic functions, Green’s function, Energy methods, Harnack’s inequality. Heat Equation: Fundamental solution, Mean value formula, properties of solutions. Wave equation: Solution by spherical means, Non- homogeneous problem, properties of solutions.

Reference reading materials:

1. L. C. Evans, “Partial Differential Equations”, Graduate Studies in Mathematics 19, American Mathematical Society, 2010.
2. F. John, “Partial Differential Equations”, Springer International Edition, 2009.
3. G. B. Folland, “Introduction to Partial Differential Equations”, Princeton Univer- sity Press, 1995.
4. S. Kesavan, “Topics in Functional Analysis and Applications”, John Wiley & Sons, 1989.

(M616): (Algebraic Geometry), Credits - 6
(3 Lectures + 1 Tutorial)

Prime ideals and primary decompositions, Ideals in polynomial rings, Hilbert Basis theorem, Noether normalisation lemma, Hilbert’ s Nullstellensatz, Affine and Projective varieties, Zariski Topology, Rational functions and mor- phisms, Elementary dimension theory, Smoothness, Curves, Divisors on curves, Bezout’ s theorem, Riemann-Roch for curves, Line bundles on Pro- jective spaces.

Reference reading materials:

1. K. Hulek, “Elementary Algebraic Geometry”, Student Mathematical Library 20, American Mathematical Society, 2003.
2. I. R. Shafarevich, “Basic Algebraic Geometry 1: Varieties in Projective Space”, Springer, 2013.

3. J. Harris, “Algebraic geometry”, Graduate Texts in Mathematics 133, Springer- Verlag, 1995.
4. M. Reid, “Undergraduate Algebraic Geometry”, London Mathematical Society Stu- dent Texts 12, Cambridge University Press, 1988.
5. K. E. Smith et. al., "An Invitation to Algebraic Geometry", Universitext, Springer- Verlag, 2000.
6. R. Hartshorne, “Algebraic Geometry”, Graduate Texts in Mathematics 52, Springer- Verlag, 1977.

(M617): (Algebraic Graph Theory), Credits - 6

(3 Lectures + 1 Tutorial)

Adjacency matrix of a graph and its eigenvalues, Spectral radius of graphs, Regular graphs and Line graphs, Strongly regular graphs, Cycles and Cuts, Laplacian matrix of a graph, Algebraic connectivity, Laplacian spectral ra- dius of graphs, Distance matrix of a graph, General properties of graph automorphisms, Transitive and Arc-tranisitve graphs, Symmetric graphs.

Reference reading materials:

1. N. Biggs, “Algebraic Graph Theory”, Cambridge University Press, 1993.
2. C. Godsil, G. Royle, “Algebraic Graph Theory”, Graduate Texts in Mathematics 207, Springer-Verlag, 2001.
3. R. B. Bapat, “Graphs and Matrices”, Universitext, Springer, Hindustan Book Agency, New Delhi, 2010.

(M618): (Algebraic Number Theory), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M607*

Number Fields and Number rings, prime decomposition in number rings, Dedekind domains, Ideal class group, Galois theory applied to prime decom- position, Gauss reciprocity law, Cyclotomic fields and their ring of integers, finiteness of ideal class group, Dirichlet unit theorem, valuations and com- pletions of number fields, Dedekind zeta function and distribution of ideal in a number ring.

Reference reading materials:

1. D. A. Marcus, “Number Fields”, Universitext, Springer-Verlag, 1977.
2. G. J. Janusz, “Algebraic Number Fields”, Graduate Studies in Mathematics 7, American Mathematical Society, 1996.
3. S. Alaca, K. S. Williams, “Introductory Algebraic Number Theory”, Cambridge University Press, 2004.
4. S. Lang, “Algebraic Number Theory”, Graduate Texts in Mathematics 110, Springer- Verlag, 1994.
5. A. Frohlich, M. J. Taylor, “Algebraic Number Theory”, Cambridge

Studies in Ad- vanced Mathematics 27, Cambridge University Press, 1993.
6. J. Neukirch, "Algebraic Number Theory", Springer-Verlag, 1999.

(M620): (Algorithm), Credits - 6

(3 Lectures + 1 Tutorial)

Algorithm analysis: asymptotic notation, probabilistic analysis; Data Struc- ture: stack, queues, linked list, hash table, binary search tree, red-black tree; Sorting: heap sort, quick sort, sorting in linear time; Algorithm de- sign: divide and conquer, greedy algorithms, dynamic programming; Al- gebraic algorithms: Winograd’s and Strassen’s matrix multiplication algo- rithm, evaluation of polynomials, DFT, FFT, efficient FFT implementation; Graph algorithms: breadth-first and depth-first search, minimum spanning trees, single-source shortest paths, all-pair shortest paths, maximum flow; NP-completeness and approximation algorithms.

Reference reading materials:

1. A. V. Aho, J. E. Hopcroft, J. D. Ullman, “The Design and Analysis of Computer Algorithms”, Addison-Wesley Publishing Co., 1975.
2. T. H. Cormen, C. E. Leiserson, R. L. Rivest, C. Stein, “Introduction to Algorithms”, MIT Press, Cambridge, 2009.
3. E. Horowitz, S. Sahni, “Fundamental of Computer Algorithms”, Galgotia Publica- tion, 1987.
4. D. E. Knuth, “The Art of Computer Programming Vol. 1, Vol. 2, Vol 3”, Addison- Wesley Publishing Co., 1997, 1998, 1998.

(M623): (Finite Fields), Credits - 6

(3 Lectures + 1 Tutorial)

Structure of finite fields: characterization, roots of irreducible polynomials, traces, norms and bases, roots of unity, cyclotomic polynomial, represen- tation of elements of finite fields, Wedderburn’s theorem; Polynomials over finite field: order of polynomials, primitive polynomials, construction of irre- ducible polynomials, binomials and trinomials, factorization of polynomials over small and large finite fields, calculation of roots of polynomials; Linear recurring sequences: LFSR, characteristic polynomial, minimal polynomial, characterization of linear recurring sequences, Berlekamp-Massey algorithm; Applications of finite fields: Applications in cryptography, coding theory, fi- nite geometry, combinatorics.

Reference reading materials:

1. R. Lidl, H. Neiderreiter, “Finite Fields”, Cambridge university press, 2000.
2. G. L. Mullen, C. Mummert, “Finite Fields and Applications”, American Mathe- matical Society, 2007.
3. A. J. Menezes et. al., “Applications of Finite Fields”, Kluwer Academic Publishers, 1993.
4. Z-X. Wan, “Finite Fields and Galois Rings”, World Scientific Publishing Co., 2012.

(M624): (Information and Coding Theory), Credits - 6

(3 Lectures + 1 Tutorial)

Information Theory: Entropy, Huffman coding, Shannon-Fano coding, en- tropy of Markov process, channel and mutual information, channel capacity; Error correcting codes: Maximum likelihood decoding, nearest neighbour decoding, linear codes, generator matrix and parity-check matrix, Ham- ming bound, Gilbert-Varshamov bound, binary Hamming codes, Plotkin bound, nonlinear codes, Reed-Muller codes, Cyclic codes, BCH codes, Reed- Solomon codes, Algebraic codes.

Reference reading materials:

1. R. W. Hamming, "Coding and Information Theory", Prentice-Hall, 1986.

2. N. J. A. Sloane, F. J. MacWilliams, "Theory of Error Correcting Codes", North- Holland Mathematical Library 16, North-Holland, 2007.
3. S. Ling, C. Xing, "Coding Theory: A First Course", Cambridge University Press, 2004.
4. V. Pless, "Introduction to the Theory of Error-Correcting Codes", Wiley-Interscience Publication, John Wiley & Sons, 1998.
5. S. Lin, "An Introduction to Error-Correcting Codes", Prentice-Hall, 1970.

(M625): (Mathematical Logic), Credits - 6

(3 Lectures + 1 Tutorial)

Propositional Logic, Tautologies and Theorems of propositional Logic, Tau- tology Theorem. First Order Logic: First order languages and their struc- tures, Proofs in a first order theory, Model of a first order theory, validity theorems, Metatheorems of a first order theory, e. g., theorems on constants, equivalence theorem, deduction and variant theorems etc. Completeness theorem, Compactness theorem, Extensions by definition of first order the- ories, Interpretations theorem, Recursive functions, Arithmatization of first order theories, Godels first Incompleteness theorem, Rudiments of model theory including Lowenheim-Skolem theorem and categoricity.

Reference reading materials:

1. J. R. Shoenfield, "Mathematical logic", Addison-Wesley Publishing Co., 1967.
2. E. Mendelson, "Introduction to Mathematical Logic", Chapman & Hall, 1997.

(M626): (Measure Theory), Credits - 6

(3 Lectures + 1 Tutorial)

$\sigma-$algebras of sets, measurable sets and measures, extension of measures, construction of Lebesgue measure, integration, convergence theorems, Radon- Nikodym theorem, product measures, Fubini's theorem, differentiation of integrals, absolutely continuous functions, L_p-spaces, Riesz representation theorem for the space $C[0,1]$.

Reference reading materials:

1. G. De Barra, "Measure theory and integration".
2. J. Nevue, "Mathematical foundations of the calculus of probability", Holden-Day, Inc., 1965.
3. I. K. Rana, "An introduction to measure and integration", Narosa Publishing House.
4. P. Billingsley, "Probability and measure", John Wiley & Sons, Inc., 1995.
5. W. Rudin, "Real and complex analysis", McGraw-Hill Book Co., 1987.

6. K. R. Parthasarathy, "Introduction to probability and measure" , The Macmillan Co. of India, Ltd., 1977.

(M627): (Nonlinear Analysis), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M605 or equivalent*

Calculus in Banach spaces, inverse and multiplicit function theorems, fixed point theorems of Brouwer, Schauder and Tychonoff, fixed point theorems for nonexpansive and set-valued maps, predegree results, compact vector fields, homotopy, homotopy extension, invariance theorems and applications.

Reference reading materials:

1. S. Kesavan, "Nonlinear Functional Analysis", Texts and Readings in Mathematics 28, Hindustan Book Agency, 2004.

(M628): (Operator Theory), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M605 or equivalent*

Compact operators on Hilbert Spaces. (a) Fredholm Theory (b) Index, C*- algebras - noncommutative states and representations, Gelfand-Neumark representation theorem, Von-Neumann Algebras; Projections, Double Com- mutant theorem, L^∞ functionalCalculus, Toeplitz operators.

Reference reading materials:

1. W. Arveson, "An invitation to C*-algebras", Graduate Texts in Mathematics, No.
   39. Springer-Verlag, 1976.

(M630): (Abstract Harmonic Analysis), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M605*

Topological Groups: Basic properties of topological groups, subgroups, quo- tient groups. Examples of various matrix groups. Connected groups. Haar measure: Discussion of Haar measure without proof on R, T, Z and simple matrix groups, Convolution, the Banach algebra $L^1(tt)$ and convolution with special emphasis on L^1(R), L^1(T) and L^1(Z). Basic Representation Theory: Unitary representation of groups, Examples and General properties, The representations of Group and Group algebras, $C*$-algebra of a group, GNS construction, Positive definite functions, Schur's Lemma. Abelian Groups: Fourier transform and its properties, Approximate identities in $L^1(tt)$, Clas- sical Kernels on R, The Fourier inversion Theorem, Plancherel theorem on R, Plancherel measure on R, T, Z. Dual Group of an Abelian Group: The Dual group of a locally compact abelian group, Computation of dual groups for R, T, Z, Pontryagin's Duality theorem.

6. W. Rudin, “Real and Complex Analysis”, Tata McGraw-Hill, 2013.

(M631): (Advanced Number Theory), Credits - 6

(3 Lectures + 1 Tutorial)

Review of Finite fields, Gauss Sums and Jacobi Sums, Cubic and biquadratic reciprocity, Polynomial equations over finite fields, Theorems of Chevally and Warning, Quadratic forms over prime fields. Ring of p-adic integers, Field of p-adic numbers, completion, p-adic equations, Hensel's lemma, Hilbert symbol, Quadratic forms with p-adic coefficients. Dirichlet series: Abscissa of convergence and absolute convergence, Riemann Zeta function and Dirichlet L-functions. Dirichlet's theorem on primes in arithmetic progression. Functional equation and Euler product for L-functions. Modular Forms and the Modular Group, Eisenstein series, Zeros and poles of mod- ular functions, Dimensions of the spaces of modular forms, The j-invariant L-function associated to modular forms, Ramanujan τ function.

Reference reading materials:

5. F. Q. Gouvêa, "p-adic Numbers", Universitext, Springer-Verlag, 1997.

(M633): (Algebraic Combinatorics), Credits - 6

(3 Lectures + 1 Tutorial)

Catalan Matrices and Orthogonal Polynomials, Catalan Numbers and Lat- tice Paths, Combinatorial Interpretation of Catalan Numbers, Symmetric Polynomials and Functions, Schur Functions, Jacobi-Trudi identity, RSK Al- gorithm, Standard Tableaux, Young diagrams and q-binomial coefficients, Plane Partitions, Group actions on boolean algebras, Enumeration under group action, Walks in graphs, Cubes and the Radon transform, Sperner property, Matrix-Tree Theorem.

Reference reading materials:

1. R. P. Stanley, "Algebraic Combinatorics", Undergraduate Texts in Mathematics, Springer, 2013.
2. M. Aigner, "A Course in Enumeration", Graduate Texts in Mathematics 238, Springer, 2007.

3. R. P. Stanley, “Enumerative Combinatorics Vol. 2”, Cambridge Studies in Ad- vanced Mathematics 62, Cambridge University Press, 1999.

(M634): (Foundations of Cryptography), Credits - 6
(3 Lectures + 1 Tutorial)

Introduction to cryptography and computational model, computational diffi- culty, pseudorandom generators, zero-knowledge proofs, encryption schemes, digital signature and message authentication schemes, cryptographic proto- col.

Reference reading materials:

1. O. Goldreich, “Foundations of Cryptography - Vol. I and Vol. II”, Cambridge University Press, 2001, 2004.
2. S. Goldwasser, Mihir Bellare, "Lecture Notes on Cryptography", 2008, available online from http://cseweb.ucsd.edu/ mihir/papers/gb.html

(M635): (Incidence Geometry), Credits - 6

(3 Lectures + 1 Tutorial)

Definitions and Exampleas, projective planes, affine planes, projective spaces, affine spaces, collineations of projective and affine spaces, fundamental the- orem of projective and affine spaces, polar spaces, generalized quadrangles, quadrics and quadratic sets.

Reference reading materials:

1. J. Ueberberg, "Foundations of Incidence Geometry", Springer Monographs in Math- ematics, Springer, 2011.
2. L. M. Batten, "Combinatorics of Finite Geometries", Cambridge University Press, 1997.
3. E. E. Shult, "Points and Lines", Universitext, Springer, 2011.
4. L. M. Batten, A. Beutelspacher, "The Theory of Finite Linear Spaces: Combina- torics of points and lines", Cambridge University Press, 1993.
5. G. E. Moorhouse, "Incidence Geometry", 2007, available online from http://www.uwyo.edu/moorhouse/handouts/incidence geometry.pdf

(M636): (Lie Algebras), Credits - 6

(3 Lectures + 1 Tutorial)

Definitions and Examples, Derivations, Ideals, Homomorphisms, Nilpotent Lie Algebras and Engel's theorem, Solvable Lie Algebras and Lie's theo- rem, Jordan decomposition and Cartan's criterion, Semisimple Lie algebras, Casimir operator and Weyl's theorem, Representations of $sl(2, F)$, Root space decomposition, Abstract root systems, Weyl group and Weyl cham- bers, Classification of irreducible root systems, Abstract theory of weights, Isomorphism and conjugacy theorems, Universal enveloping algebras and PBW theorem, Representation theory of semi-simple Lie algebras, Verma modules and Weyl character formula.

Reference reading materials:

1. J. E. Humphreys, "Introduction to Lie Algebras and Representation Theory", Graduate Texts in Mathematics 9, Springer-Verlag, 1978.
2. K. Erdmann, M. J. Wildon, "Introduction to Lie Algebras", Springer Undergradu- ate Mathematics Series, Springer-Verlag, 2006.
3. J.-P. Serre, "Complex Semisimple Lie Algebras", Springer Monographs in Mathe- matics, Springer-Verlag, 2001.
4. N. Jacobson, "Lie Algebras", Dover Publications, 1979.

(M637): (Optimization Theory), Credits - 6
(3 Lectures + 1 Tutorial)

Linear programming problem and its formulation, convex sets and their properties, Graphical method, Simplex method, Duality in linear program- ming, Revised simplex method, Integer programming, Transportation prob- lems, Assignment problems, Games and strategies, Two-person (non) zero- sum games, Introduction to non-linear programming and techniques.

Reference reading materials:

1. J. K. Strayer, "Linear Programming and its Applications", Undergraduate Texts in Mathematics, Springer-Verlag, 1989.

2. P. R. Thie, G. E. Keough, “An Introduction to Linear Programming and Game Theory”, John Wiley & Sons, 2008.
3. L. Brickman, “Mathematical Introduction to Linear Programming and Game The- ory”, Undergraduate Texts in Mathematics, Springer-Verlag, 1989.
4. D. G. Luenberger, Y. Ye, “Linear and Nonlinear Programming”, International Se- ries in Operations Research & Management Science 116, Springer, 2008.

(M638): (Advanced Partial Differential Equations), Credits - 6
(3 Lectures + 1 Tutorial) *Prerequisites: M605, M614 or equivalent*

Distribution Theory, Sobolev Spaces, Embedding theorems, Trace theorem. Dirichlet, Neumann and Oblique derivative problem, Weak formulation, Lax–Milgram, Maximum Principles– Weak and Strong Maximum Princi- ples, Hopf Maximum Principle, Alexandroff-Bakelmann-Pucci Estimate.

Reference reading materials:

1. L. C. Evans, “Partial Differential Equations”, Graduate Studies in Mathematics 19, American Mathematical Society, 2010.
2. H. Brezis, “Functional Analysis, Sobolev Spaces and Partial Differential Equa- tions”, Universitext, Springer, 2011.
3. R. A. Adams, J. J. F. Fournier, “Sobolev Spces”, Pure and Applied Mathematics 140, Elsevier/Academic Press, 2003.
4. S. Kesavan, “Topics in Functional Analysis and Applications”, John Wiley & Sons, 1989.
5. M. Renardy, R. C. Rogers, “An Introduction to Partial Differential Equations”, Springer, 2008.

(M639): (Random Graphs), Credits - 6
(3 Lectures + 1 Tutorial)

Models of random graphs and of random graph processes; illustrative ex- amples; random regular graphs, configuration model; appearance of the giant component small subgraphs; long paths and Hamiltonicity; coloring problems; eigenvalues of random graphs and their algorithmic applications; pseudo-random graphs.

Reference reading materials:

1. N. Alon, J. H. Spencer, “The Probabilistic Method”, John Wiley & Sons, 2008
2. B. Bollobas, “Random Graphs”, Cambridge Studies in Advanced Mathematics 73, Cambridge University Press, 2001.
3. S. Janson, T. Luczak, A. Rucinski, “Random Graphs”, Wiley-Interscience, 2000.
4. R. Durrett, “Random Graph Dynamics”, Cambridge University Press, 2010.
5. J. H. Spencer, “The Strange Logic of Random Graphs”, Springer-Verlag, 2001.

(M640): (Randomized Algorithms and Probabilistic Methods), Credits - 6
(3 Lectures + 1 Tutorial)

Inequalities of Markov and Chebyshev (median algorithm), first and sec- ond moment method (balanced allocation), inequalities of Chernoff (per- mutation routing) and Azuma (chromatic number), rapidly mixing Markov chains (random walk in hypercubes, card shuffling), probabilistic generating functions (random walk in d-dimensional lattice)

Reference reading materials:

1. R. Motwani, P. Raghavan, "Randomized Algorithms", Cambridge University Press, 2004.
2. M. Mitzenmacher, E. Upfal, "Probability and Computing: Randomized algorithms and probabilistic analysis", Cambridge University Press, 2005.

(M642): (Multivariate Statistical Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

Review of matrix algebra (optional), data matrix, summary statistics, graph- ical representations. Distribution of random vectors, moments and charac- teristic functions, transformations, some multivariate distributions: multi- variate normal, multinomial, Dirichlet distribution, limit theorems. Multi- variate normal distribution: properties, geometry, characteristics function, moments, distributions of linear combinations, conditional distribution and multiple correlation. Estimation of mean and variance of multivariate nor- mal, theoretical properties, James-Stein estimator (optional), distribution of sample mean and variance, the Wishart distribution, large sample behavior of sample mean and variance, assessing normality. Inference about mean vector: testing for normal mean, Hotelling T^2 and likelihood ratio test, con- fidence regions and simultaneous comparisons of component means, paired comparisons and a repeated measures design, comparing mean vectors from two populations, MANOVA. Techniques of dimension reduction, principle component analysis: definition of principle components and their estimation, introductory factor analysis, multidimensional scaling. Classification prob- lem: linear and quadratic discriminant analysis, logistic regression, support vector machine. Cluster analysis: non-hierarchical and hierarchical methods of clustering.

Reference reading materials:

5. Brian Everitt and Torsten Hothorn, "An Introduction to Applied Multivariate Analysis with R", Springer, 2011.
6. M. L. Eaton, "Multivariate Statistics", John Wiley, 1983.

(M643): (Introduction to Manifolds), Credits - 6
(3 Lectures + 1 Tutorial)

Differentiable manifolds and maps: Definition and examples, Inverse and implicit function theorem, Submanifolds, immersions and submersions. The tangent and cotangent bundle: Vector bundles, (co)tangent bundle as a vector bundle, Vector fields, flows, Lie derivative. Differential forms and Integration: Exterior differential, closed and exact forms, Poincaré lemma, Integration on manifolds, Stokes theorem, De Rham cohomology.

Reference reading materials:

1. Michael Spivak, "A comprehensive introduction to differential geometry", Vol. 1, 3rd edition, 1999.

2. Frank Warner, “Foundations of differentiable manifolds and Lie groups”, Springer- Verlag, 2nd edition, 1983.
3. John Lee, “Introduction to smooth manifolds”, Springer Verlag, 2nd edition, 2013.
4. Louis Auslander and Robert E. MacKenzie, “Introduction to differentiable mani- folds”, Dover, 2nd edition, 2009.

(M644): (Regression Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

Introduction to simple linear regression, least square estimation and hypoth- esis testing of model parameters, prediction, interval estimation in simple linear regression, Coefficient of determination, estimation by maximum like- lihood, multiple linear regression, matrix representation of the regression model, estimation and testing of model parameters and prediction, model adequacy checking- residual analysis, PRESS statistics, outlier detection, lack of fit test, serial correlation and Durbin-Watson test, transformation and weighting to correct model inadequacies-variance-stabilizing transfor- mation, generalized and weighted least squares, diagnostics for influential observations, Cooks D test, multicollinearity- sources and effects, diagnosis and treatment for multicollinearity, ridge regression and LASSO, bootstrap estimation, dummy variable model, variable selection and model building- stepwise methods, polynomial regression and interaction regression models, nonlinear regression, generalized linear models-logistic regression and Pois- son regression.

Reference reading materials:

5. N. H. Bingham, John M. Fry, Regression: Linear Models in Statistics, Springer Undergraduate Mathematics Series, 2010.

(M645): (Time Series Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

Examples and objectives of time series, stationary time series and autocor- relation function, estimation and elimination of trend and seasonal compo- nents, testing for noise sequence, moving average process, autoregressive pro- cesses and ARMA processes, estimation of autocorrelation function, meth- ods of forecasting-Durbin-Levinson algorithm and Innovations algorithm, the Wold decomposition, ARMA models-the auto-covariance and partial auto-covariance function, forecasting ARMA processes, spectral analysis- spectral densities, periodogram, modeling with ARMA processes, Yule-Walker estimation, maximum likelihood estimation, diagnostic checking, non-stationary time series-ARIMA models, identification techniques, forecasting ARIMA models, seasonal ARIMA models, multivariate time series, ARCH and GARCH models.

Reference reading materials:

5. R. H. Shumway and D. S. Stoffer, Time series analysis and its applications with R examples, 3rd edition, Springer, 2011.

(M652): (Complex Analysis), Credits - 6
(3 Lectures + 1 Tutorial)

Cauchy-Riemann equations, Cauchy’ s theorem and estimates, Zeros, Poles and Singularities, The open mapping theorem, The argument principle, Maximum modulus principle, Schwarz lemma, Residues and the residue cal- culus.Normal families, Arzela’ s theorem, Product developments, functions with prescribed zeroes and poles, Hadamard’ s theorem, Conformal map- pings, Riemann mapping theorem, the linear fractional transformations.

Reference reading materials:

1. L. V. Ahlfors: Complex analysis (McGraw-Hill), 1978.
2. J. B. Conway: Functions of one complex variable II (Springer), 1995.
3. W. Rudin: Real and Complex Analysis (McGraw-Hill), 1987.
4. R. Remmert: Theory of Complex Functions, Springer 1998.

(M653): (Differential Equations), Credits - 6
(3 Lectures + 1 Tutorial)

Ordinary Differential Equations: Initial and boundary value problems, Ba- sic existence, Uniqueness theorems for a system of ODE, Gronwalls lemma, Continuous dependence on initial data, Linear systems with variable coef- ficients, Variation of parameter formula, Floquet theory, Systems of linear equations with constant coefficients, Stability of equilibrium positions.Partial Differential Equations: Single and systems of PDE, First order PDE, Semi- linear and nonlinear equations (Monges method), Four important linear PDE, Transport equations, Laplace equations, Fundamental solution, Mean value formulas, Greens functions, Energy methods, Heat equation, funda- mental solution, Mean value formula, Energy methods, Wave equations, So- lutions by spherical mean, Energy method, Maximum principle for elliptic and parabolic equations with applications.

Reference reading materials:

5. M. Renardy and R. C. Rogers, An Introduction to Partial Differential Equations, Springer International Edition.
6. L. C. Evans, Partial Differential Equations, AMS Graduate Studies in Mathematics, Vol 19.

(M654): (Discrete Mathematics), Credits - 6
(3 Lectures + 1 Tutorial)

Combinatorics:Counting principles, Generating functions, Recurrence rela- tion, Polyas enumeration theory, partially ordered sets.
Graph Theory:Graphs, Trees, Blocks, Connectivity, Eulerian and Hamilto- nian graphs, Planer graphs, Graph colouring.
Design Theory: Block Designs, Balanced incomplete block design, Differ- ence sets and Automorphism, Latin squares, Hadamard matrices, Projective planes, Generalized quadrangles.
Algorithm:Algorithm, Asymptotic analysis, Complexity hierarchy, NP-complete problems.

Reference reading materials:

1. F. Roberts and B. Tesman: Applied Combinatorics. Pearson Education, 2005.
2. M. Aigner, A course in Enumeration, Springer.
3. R. P. Stanley, Enumerative Combinatorics, Cambridge University Press.
4. F. Harary, Graph Theory, Narosa Publishing House.

7. D. R. Stinson and D. Stinson, Combinatorial Designs: Construction and Analysis, Springer.
8. Thomas Cormen, Charles Leiserson, Ronald Rivest: Introduction to Algorithms. PHI, 1998.

(M655): (Graph Theory), Credits - 6
(3 Lectures + 1 Tutorial)

Basic definitions, Eulerian and Hamiltonian graphs, Planarity, Colourabil- ity, Four colour problem, Matching and Halls marriage theorem, Max-flow Min-cut theorem, Ramsey theory, Line graphs, Enumeration, Digraphs. Ma- troids, Groups and Graphs, Matrices and graphs, Eigenvalues of graphs, The Laplacian of a graph, Strongly regular graphs.

Reference reading materials:

1. D. B. West, Introduction to Graph Theory, Prentice Hall of India.
2. F. Harary, Graph Theory, Narosa Publishing House.
3. B. Bollobas, Extremal Graph Theory , Dover Publications.
4. R. Diestel, Graph Theory, Springer International Edition.
5. G. A. Bondy and U. S. R. Murty, Graph Theory, Springer
6. C. Godsil and G. Royle, Algebraic Graph Theory, Springer International Edition.

(M656): (Introduction to Number Theory), Credits - 6
(3 Lectures + 1 Tutorial)

The Fundamental Theorem of Arithmetic, Distribution of prime numbers, Congruences, Chinese remainder theorem, Congruences with prime-power modulus, Fermat' s little theorem, Wilson' s theorem, Euler function and its applications, Group of units, Primitive roots, Quadratic residues and Quadratic reciprocity law, Arithmetic functions, Mobius Inversion formula, Dirichlet product, Sum of squares, Introduction to Zeta function and Dirich- let Series.

Reference reading materials:

1. G. H. Hardy & E. M. Wright: An Introduction to the Theory of Numbers (Oxford).
2. J. A. Jones and J. M. Jones: Elementary Number Theory (Springer).
3. I. Niven, H. S. Zuckerman & H. L. Montgomery: The Theory of Numbers (Wiley)
4. T. M. Apostol: Introduction to Analytic Number Theory (Springer)

(M657): (Probability Theory-I), Credits - 6

(3 Lectures + 1 Tutorial)

Review of Basic undergraduate probability: Random variables, Standard discrete and continuous distributions, Expectation, Variance, Conditional Probability.

Discrete time Markov chains: countable state space, classification of states Characteristic functions, modes of convergences, Borel-Cantelli Lemma, Cen- tral Limit Theorem, Law of Large numbers, Convergence Theorems in Markov Chains.

Reference reading materials:

1. W. Feller: Introduction to Probability Theory and ins Applications Vol.I & Vol. II (Wiley)
2. S. M. Ross: Introduction to Probability Models (AP)
3. Hoel, Port & Stone: Introduction to Stochastic Processes (HMC)
4. S. M. Ross: Stochastic Processes (Wiley)

(M658): (Probability Theory - II), Credits - 6

(3 Lectures + 1 Tutorial)

Martingale Theory: Radon-Nikoydm Theorem, Doob-Meyer decomposition. Weak convergence of probability measures, Brownian motion, Markov processes and Stationary processes.

Reference reading materials:

1. O. Kallenberg: Foundation of Modern Probability (Springer)
2. P. Billingsley: Convergence of probability measures.(John Wiley & Sons, Inc.)
3. D. Revuz & M. Yor: Continuous martingales and Brownian motion (Springer- Verlag)
4. S. M. Ross: Stochastic Processes (Wiley)
5. J. L. Doob: Stochastic Processes (Wiley)

(M751): (Algebraic Computation), Credits - 6

(3 Lectures + 1 Tutorial)

Linear algebra and lattices: Asymptotically fast matrix multiplication algo- rithms, linear algebra algorithms, normal forms over fields, Lattice reduc- tion; Solving system of non-linear equations: Gröbner basis, Buchberger's algorithms, Complexity of Gröbner basis computation; Algorithms on poly- nomials: GCD, Barlekamp-Massey algorithm, factorization of polynomials over finite field, factorization of polynomials over Z and Q; Algorithms for algebraic number theory: Representation and operations on algebraic num- bers, trace, norm, characteristic polynomial, discriminant, integral bases, polynomial reduction, computing maximal order, algorithms for quadratic fields; Elliptic curves: Implementation of elliptic curve, algorithms for ellip- tic curves.

Reference reading materials:

1. A. V. Aho, J. E. Hopcroft, J. D. Ullman, "The Design and Analysis of Computer Algorithms", Addison-Wesley Publishing Co., 1975.
2. H. Cohen, "A Course in Computational Algebraic Number Theory", Graduate Texts in Mathematics 138, Springer-Verlag, 1993.
3. D. Cox, J. Little, D. O' shea, "Ideals, Varieties and Algorithms: An introduction to computational algebraic geometry and commutative algebra", Undergraduate Texts in Mathematics, Springer-verlag, 2007.

(M752): (Analytic Number Theory), Credits - 6
(3 Lectures + 1 Tutorial)

Arithmetic functions, Averages of arithmetical functions, Distribution of primes, finite abelian groups and characters, Gauss sums, Dirichlet series and Euler products, Reimann Zeta function, Dirichlet L-functions, Analytic proof of the prime number theorem, Dirichlet Theorem on primes in arith- metic progression.

Reference reading materials:

1. T. M. Apostol, "Introduction to Analytic Number Theory", Springer International Student Edition, 2000.
2. K. Chandrasekharan, "Introduction to Analytic Number Theory", Springer-Verlag, 1968.
3. H. Iwaniec, E. Kowalski, "Analytic Number Theory", American Mathematical So- ciety Colloquium Publications 53, American Mathematical Society, 2004.

(M753): (Classical Groups), Credits - 6
(3 Lectures + 1 Tutorial)

General and special linear groups, bilinear forms, Symplectic groups, sym- metric forms, quadratic forms, Orthogonal geometry, orthogonal groups, Clifford algebras, Hermitian forms, Unitary spaces, Unitary groups.

Reference reading materials:

1. L. C. Grove, "Classical Groups and Geometric Algebra", Graduate Studies in Math- ematics 39, American Mathematical Society, 2002.
2. E. Artin, "Geometric Algebra", John Wiley & sons, 1988.

(M754): (Ergodic Theory), Credits - 6
(3 Lectures + 1 Tutorial)

Measure preserving systems; examples: Hamiltonian dynamics and Liou- villes theorem, Bernoulli shifts, Markov shifts, Rotations of the circle, Ro- tations of the torus, Automorphisms of the Torus, Gauss transformations, Skew-product, Poincare Recurrence lemma: Induced transformation: Kaku- tani towers: Rokhlins lemma. Recurrence in Topological Dynamics, Birkhoffs Recurrence theorem, Ergodicity, Weak-mixing and strong-mixing and their characterizations, Ergodic Theorems of Birkhoff and Von Neumann. Con- sequences of the Ergodic theorem. Invariant measures on compact systems, Unique ergodicity and equidistribution. Weyls theorem, The Isomorphism problem; conjugacy, spectral equivalence, Transformations with discrete spectrum, Halmosvon Neumann theorem, Entropy. The Kolmogorov-Sinai theorem. Calculation of Entropy. The Shannon Mc-MillanBreiman Theo- rem, Flows. Birkhoffs ergodic Theorem and Wieners ergodic theorem for flows. Flows built under a function.

Reference reading materials:

1. Peter Walters, “An introduction to ergodic theory”, Graduate Texts in Mathemat- ics, 79. Springer-Verlag, 1982.
2. Patrick Billingsley, “Ergodic theory and information”, Robert E. Krieger Publishing Co., 1978.

5. K. Petersen, “Ergodic theory”, Cambridge Studies in Advanced Mathematics, 2. Cambridge University Press, 1989.

(M755): (Harmonic Analysis), Credits - 6

(3 Lectures + 1 Tutorial)

Fourier series and its convergences, Dirichlet kernel, Frejer kernel, Parse- val formula and its applications. Fourier transforms,the Schwartz space, Distribution and tempered distribution, Fourier Inversion and Plancherel theorem. Fourier analysis on L_p-spaces. Maximal functions and bounded- ness of Hilbert transform. Paley-Wiener Theorem for distribution. Poisson summation formula, Heisenberg uncertainty Principle, Wiener’s Tauberian theorem.

Reference reading materials:

1. Y. Katznelson, “An Introduction to Harmonic Analysis”, Cambridge University Press, 2004.
2. E. M. Stein, G. Weiss, “Introduction to Fourier Analysis on Euclidean Spaces”, Princeton Mathematical Series 32, Princeton University Press, 1971.
3. G. B. Folland, “Fourier Analysis and its Applications”, Pure and Applied Under- graduate Texts 4, America Mathematical Society, 2010.

(M756): (Lie Groups and Lie Algebras - I), Credits - 6

(3 Lectures + 1 Tutorial)

General Properties: Definition of Lie groups, subgroups, cosets, group ac- tions on manifolds, homogeneous spaces, classical groups. Exponential and logarithmic maps, Adjoint representation, Lie bracket, Lie algebras, subal- gebras, ideals, stabilizers, center Baker-Campbell-Hausdorff formula, Lie’s Theorems. Structure

Theory of Lie Algebras: Solvable and nilpotent Lie algebras (with Lie/Engel theorems), semisimple and reductive algebras, invariant bilinear forms, Killing form, Cartan criteria, Jordan decomposition. Complex semisimple Lie algebras, Toral subalgebras, Cartan subalgebras, Root decomposition and root systems. Weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, BGG resolution, Weyl character formula.

Reference reading materials:

1. D. Bump, “Lie Groups”, Graduate Texts in Mathematics 225, Springer, 2013.

7. V. S. Varadharajan, "Lie Groups, Lie Algebras and their Representations", Springer- Verlag, 1984.

(M757): (Operator Algebras), Credits - 6
(3 Lectures + 1 Tutorial) *Prerequisites: M605 or equivalent*

Banach algebras/C*–algebras: Definition and examples; Spectrum of a Ba- nach algebra; Gelfand transform; Gelfand-Naimark theorem for commu- tative Banach algebras/ C*-algebras; Functional calculus for C*-algebras; Positive cone in a C*-algebra; Existance of an approximate identity in a C*-algebra; Ideals and Quotients of a C*-algebra; Positive linear functionals on a C*-algebra; GNS construction. Locally convex topologies on the alge- bras of bounded operators on a Hilbert space, von-Neumann' s bi-commutant theorem; Kaplansky' s density theorem. Ruan' s characterization of Operator Spaces (if time permites).

Reference reading materials:

(M758): (Representations of Linear Lie Groups), Credits - 6
(3 Lectures + 1 Tutorial)

Introduction to topological group, Haar measure on locally compact group, Representation theory of compact groups, Peter Weyl theorem, Linear Lie groups, Exponential map, Lie algebra, Invariant Differentail operators, Rep- resentation of the group and its Lie algebra. Fourier analysis on $SU(2)$ and

$SU(3)$. Representation theory of Heisenberg group . Representation of Eu- clidean motion group.

Reference reading materials:

(M759): (Harmonic Analysis on Compact Groups), Credits - 6
(3 Lectures + 1 Tutorial) *Prerequisites: M605*

Review of General Theory: Locally compact groups, Computation of Haar measure on R, T, $SU(2)$, $SO(3)$ and some simple matrix groups, Convolu- tion, the Banach algebra $L^1(tt)$. Representation Theory: General properties of representations of a locally compact group, Complete reducibility, Basic operations on representations, Irreducible representations. Representations of Compact groups: Unitarilzibality of representations, Matrix coefficients, Schur' s orthogonality relations, Finite dimensionality of irreducible represen- tations of compact groups. Various forms of Peter-Weyl theorem, Fourier analysis on Compact groups, Character of a representation. Schur' s orthog- onality relations among characters. Weyl' s Chracter formula, Computing the Unitary dual of $SU(2)$, $SO(3)$; Fourier analysis on $SO(n)$.

6. G. Shimura, "Introduction to the Arithmetic Theory of Automorphic Forms", Princeton University Press, 1994.

(M761): (Elliptic Curves), Credits - 6

(3 Lectures + 1 Tutorial)

Congruent numbers, Elliptic curves, Elliptic curves in Weierstrass form, Ad- dition law, Mordell–Weil Theorem, Points of finite order, Points over finite fields, Hasse-Weil L-function and its functional equation, Complex multipli- cation.

Reference reading materials:

1. J. H. Silverman, J. Tate, "Rational Points on Elliptic Curves", Undergraduate Texts in Mathematics, Springer-Verlag, 1992.
2. N. Koblitz, "Introduction to Elliptic Curves and Modular Forms", Graduate Texts in Mathematics 97, Springer-Verlag, 1993.

5. J. H. Silverman, "Advanced Topics in the Arithmetic of Elliptic Curves", Graduate Texts in Mathematics 151, Springer-Verlag, 1994.

(M762): (Brownian Motion and Stochastic Calculus), Credits - 6
(3 Lectures + 1 Tutorial) *Prerequisites: M632 or equivalent*

Brownian Motion, Martingale, Stochastic integrals, extension of stochastic integrals, stochastic integrals for martingales, Itô's formula, Application of Itô's formula, stochastic differential equations.

Reference reading materials:

1. H. H. Kuo, "Introduction to Stochastic Integration", Springer, 2006.
2. J. M Steele, "Stochastic Calculus and Financial Applications", Springer-Verlag, 2001.
3. F. C. Klebaner, "Introduction to Stochastic Calculus with Applications", Imperial College, 2005.

(M763): (Differentiable Manifolds and Lie Groups), Credits - 6
(3 Lectures + 1 Tutorial)

Review of Several variable calculus: Directional derivatives, Inverse Function Theorem, Implicit function Theorem, Level sets in R^n, Taylor's theorem, Smooth function with compact support. Manifolds: Differentiable manifold, Partition of Unity, Tangent vectors, Derivative, Lie groups, Immersions and submersions, Submanifolds. Vector Fields: Left invariant vector fields of Lie groups, Lie algebra of a Lie group, Computing the Lie algebra of various classical Lie groups. Flows: Flows of a vector field, Taylor's formula, Com- plete vector fields. Exponential Map: Exponential map of a Lie group, One parameter subgroups, Frobenius theorem (without proof). Lie Groups and Lie Algebras: Properties of Exponential function, product formula, Cartan's Theorem, Adjoint representation, Uniqueness of differential structure on Lie groups. Homogeneous Spaces: Various examples and Properties. Coverings: Covering spaces, Simply connected Lie groups, Universal covering group of a connected Lie group. Finite dimensional representations of Lie groups and Lie algebras.

(M764): (Lie Groups and Lie Algebras - II), Credits - 6

(3 Lectures + 1 Tutorial) *Prerequisites: M756 or equivalent*

General theory of representations, operations on representations, irreducible representations, Schur' s lemma, Unitary representations and complete re- ducibility. Compact Lie groups, Haar measure on compact Lie groups, Schur' s Theorem, characters, Peter-Weyl theorem, universal enveloping alge- bra, Poincare-Birkoff-Witt theorem, Representations of Lie($SL(2, \mathbb{C})$). Ab- stract root systems, Weyl group, rank 2 root systems, Positive roots, simple roots, weight lattice, root lattice, Weyl chambers, simple reflections, Dynkin diagrams, classification of root systems, Classification of semisimple Lie al- gebras. Representations of Semisimple Lie algebras, weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, Weyl Character formula, The representation theory of $SU(3)$, Frobenius Reciprocity theorem, Spherical Harmonics.

Reference reading materials:

IMSc

SYLLABUS FOR

Ph.D. in Computer Science (Program Code: MATH04)

Doctoral programmes in Theoretical Computer Science at IMSc

There are two streams leading to the Doctoral degree in TCS at IMSc: the Ph.D. programme and the Integrated Ph.D. programme.

The course credit requirement for the Ph.D. programme is 60 credits, fulfilled during two semesters of course work, typically comprising of 5 core courses, 3 elective courses, one credit seminar, and a research methodology course.

For the Integrated Ph.D. programme, the requirement is 120 credits, including a 32 credit Master's thesis. This typically involves three semesters of course work of 4 courses each, one credit seminar, a research methodology course, and a Master's thesis in the fourth semester.

TCS courses are generally of 7 credits each. The seminar is 4 credits. The research methodology course is a pass/fail course, with no credits earned.

The books suggested for reference are indicative rather than definitive: faculty teaching the course may follow other texts. Moreover, the references keep getting updated as newer and better books become available.

1 Core courses

10MATH04-001-C-CS Theory of computation (7 credits)

Finite automata Robustness of definition, right/left equivalences, non-regularity.

Properties Analysis and synthesis theorems, closure properties, Decision algorithms, Minimization, Syntactic monoid.

Trees, PDA Bottom up and top down tree automata, pushdown automata, algorithms on these.

Turing machines Basic constructions, Robustness, Universal TM, Church-Turing thesis.

Undecidability Undecidability of halting problem, Reductions.

Recursion Recursion theorem, definition of information.

Books for reference:

- J E Hopcroft, J D Ullman and R Motwani. Introduction to automata theory, languages and computation (3rd Ed. Pearson, 2013).
- M Sipser, Introduction to the theory of computation (PWS Publishing, 1997).

10MATH04-002-C-CS Algorithms (7 credits)

Definitions O, o, ω, Ω notations

Algorithmic Paradigms and Problems Divide and Conquer, Greedy, Dynamic Programming. Sorting, selection, searching and merging, master method for solving recurrence relations,

Data Structures and Applications to Graph Algorithms

- Queues and Stacks applied to BFS, DFS and applications.
- Variations of heaps applied to single source shortest paths and spanning tree algorithms
- Disjoint union-find applied to Kruskal's minimum spanning tree algorithm
- Balanced binary search trees (some sample of red-black trees, AVL, B-trees)

Network Flows MaxFlow and Mincut Algorithms.

Lower Bound Techniques Oracle, Adversary Techniques, Introduction to NP-completeness and coping strategies.

Books for reference:

1. T H Cormen, C E Leiserson, R L Rivest, C Stein. Introduction to algorithms, 3rd ed (MIT Press, 2001).
2. U Manber. Introduction to algorithms.
3. E Horowitz, S Sahni, S Rajasekaran. Fundamentals of computer algorithms (Galgotia, 1998).
4. Jon Kleinberg and Eva Tardos, Algorithm Design. 2005.

<u>10MATH04-003-C-CS</u> Discrete mathematics (7 credits)

Basic combinatorics Double counting, induction, subsets, partitions, permutations, Recurrence relations, generating functions, some formal power series.

Pigeon-hole principle Ramsey's theorem as generalization, Systems of Distinct Representatives, Hall's Theorem.

Compactness principle König's infinity lemma, applications to infinite graphs, Posets and lattices, Dilworth's theorem.

Inclusion exclusion principles Steiner triple systems, designs, Mobius inversion (including the poset form) and applications,.

Basic probability theory Distributions, Moments, Tail Inequalities, Martingales, Markov Chains, Probabilistic Method, Lovasz Local Lemma and applications.

Basic algebra Groups, rings, fields, applications of groups in combinatorics (Pólya's enumeration theorem), Applications to error-correcting codes.

Books for reference:

5. Peter Cameron. Combinatorics: topics, techniques, algorithms (CUP, 1998).
6. R.P. Stanley. Enumerative combinatorics (CUP, 1997), Volume 1.
7. C.L. Liu, Introduction to combinatorial mathematics (McGraw-Hill, 1968).
8. J.H. van Lint, R.M. Wilson. A course on combinatorics (CUP, 1992).

10MATH04-004-C-CS Logic (7 credits)

Propositional/zeroth order logic Syntax and semantics, Satisfaction in a structure, Consequence, Compactness, Deduction theorem, Natural deduction.

Basic theorems and extensions Compactness and Completeness theorems, Boolean algebras, Quantified boolean formulas.

First order logic Syntax and semantics, Truth checking, Completeness, Compactness and applications, Sequent calculus, Cut elimination, Monadic second order logic.

Modal logic Syntax and semantics, Correspondence theory, Decidability and complexity, Completeness of modal logics, Propositional dynamic logic.

Books for reference:

9. M Ben-Ari, Mathematical Logic for Computer Science, 2nd edition (Springer, 2001).
10. H-D Ebbinghaus, J Flum, W Thomas. Mathematical logic (Springer, 1994).

10MATH04-005-C-CS

Computational complexity (7 credits) **General results**

Space and time hierarchy theorems, diagonalization, speedup and compression theorems.

Complexity classes Many-one Reductions, completeness, Turing reductions, relativization, oracles. Decision, search, optimization, self-reducibility.

Space classes Halting, reachability, determinization, complementation.

Polynomial hierarchy Alternation, relativization.

Randomized computation Classes, resources, bounds.

Proofs and circuits Interactive Proof Systems, The Complexity of Boolean Functions, Uniform circuit families and branching programs, interactive proofs.

Extended models Counting classes, parsimonious reductions, isolation, counting vs alternation, overview of PCPs, connections to inapproximability.

Books for reference:

11. S Arora and B Barak. Computational Complexity: A Modern Approach (Cambridge Unviersity Press 2009).

12. C Papadimitriou. Computational complexity (Addison Wesley 1994).

13. J Balcazar, Diaz, Gabarro. Structural complexity I & II (Springer, 1990).

<u>10MATH04-006-C-CS</u> Credit Seminar (4 credits)

The topic of the seminar will be chosen by the student in consultation with an assigned faculty member. The student will read recent research papers as assigned by the faculty member, and present the results in a formal seminar.

2 Elective courses

The syllabi of elective courses which have been offered over the past several years follows. The composition of electives offered, as well as the syllabus for each elective, is decided each time by the Monitoring Committees according to the needs of individual students. Many take the form of seminar courses, or reading courses of assisted independent study.

10MATH04-001-E-CS Advanced Data Structures (7 credits)

Splay trees and related conjectures, link-cut trees, Perfect Hashing, Suffix Trees and Arrays and applications, Geometric data structures (interval trees, segment trees, ...), orthogonal range searching, van Emde Boas trees, Fusion trees, Dynamic Graph Algorithms, Space efficient data structures.

Books for reference:

- Multidimensional searching and Computational Geometry, Volume 3 of Data Structures and Algorithms, K. Mehlhorn, EATCS monograph, Springer 1984
- Sorting and searching, Volume 1 of Data Structures and Algorithms, K. Mehlhorn, EATCS monograph, Springer 1984
- Data Structures and Network Algorithms, R.E. Tarjan, SIAM 1983.
- Research papers and surveys

10MATH04-002-E-CS Algorithms for special classes of graphs (7 credits)

Core : Characterization, Polynomial Time Recognition and algorithms for some NP-hard problems on the following graph classes: Interval, Permutation, Chordal, Split, Permutation, Threshold, Perfect, Comparability, Superperfect

Advance : Minimal Triangulations, Minimal Separators, Potential Maximal Cliques based algorithms in designing polynomial time, parameterized algorithms and exact exponential time algorithms, geometric graphs.

Books for reference:

- Algorithmic graph theory and perfect graphs, Martin Charles Golumbic, Elsevier, 2004.
- Topics in Intersection Graph Theory, Terry A. McKee and F. R. McMorris, SIAM, 1999.
- Graph Classes: A Survey (Monographs on Discrete Mathematics and Applications), Andreas Brandstädt , Van Bang Le and Jeremy P. Spinrad, SIAM, 1987.
- Relevant papers.

10MATH04-003-E-CS Graph Theory (7 credits)

Core: Graphs, trees, forests, bipartite graphs, contractions, minors, directed graphs), König's theorem, Halls theorem, Tuttes theorem, Erdös-Pósa theorem on vertex disjoint cycles and feedback vertex set, Nash-Williams theorem, Gallai-Milgram theorem for path covering, Mengers theorem

Advance: Hadwiger's conjecture, Szemerédi's regularity lemma and its applications, a couple of ramsey theorems, Minors-Trees and WQO (graph minor theorem for tress, graphs of bounded treewidth, grid minor theorem, high level description of graph minor theorem

Books for reference:

- Reinhard Diestel, Graph Theory, Fourth edition, Springer, 2010.

10MATH04-004-E-CS Kernelization (7 credits)

Core: Definition of Kernel, Vertex Cover and Generlization, Crown Reduction, Expansion Lemma, Sunflower Lemma, Hypergraph Matching, Modular Decomposition, Inductive Priorities, Kernels on Planar Graphs, Machinery to show lower bound on the existence of polynomial kernels

Advance: Protrusions, Finite Integer Index, Representative Sets, Matroids, Lossy Kernels

Books for reference:

- Kernelization: Theory of Parameterized Preprocessing, Fedor V. Fomin, Daniel Lokshtanov, Saket Saurabh and Meirav Zehavi. To appear in Cambridge University Press, 2016.
- Relevant Papers.

10MATH04-005-E-CS Mathematical foundations of computer science (7 credits)

Probability: Events and Probability, Discrete Random Variables and Expectations, Moments and Deviations, Chernoff Bounds, Poisson Distribution, Probabilistic Method, Markov Chain and Random Walks, Monto Carlo Methods and Martingales

Linear Algebra: linear algebra background, orthogonality and rank arguments, eigenvalues and graph expansion, polynomial methods, exterior algebra based methods

Books for reference:

- Probability and Computing: Randomized Algorithms and Probabilistic Analysis by Michael Mitzenmacher and Eli Upfel, Cambridge University Press, 2005.
- Extremal Combinatorics, Second Edition, Stasys Jukna, Springer, 2011.
- Linear Algebra Methods in Combinatorics by Laszlo Babai and Peter Frankl.

10MATH04-006-E-CS Parameterized Complexity (7 credits)

Course Content: Kernelization, Bounded Search Trees, Iterative Compression, Randomized Methods in Parameterized algorithms, Finding cuts and separators, Treewidth, Fixed Parameter Intractability, Lower bounds for kernelization

Books for reference:

- Parameterized Complexity Theory, Jörg Flum and Martin Grohe, Springer, 2006.
- Invitation to fixed-parameter algorithms, Rolf Niedermeier, Oxford University Press, 2006.
- Fundamentals of parameterized complexity, Rodney G Downey and Michael R. Fellows, Springer, 2013.
- Parameterized algorithms, Marek Cygan, Fedor V. Fomin, Łukasz Kowalik, Daniel Lokshtanov, Dániel Marx, Marcin Pilipczuk, Michał Pilipczuk and Saket Saurabh, Springer, 2015.

10MATH04-007-E-CS Advanced Parameterized Complexity (7 credits)

Course Content: Advance Kernelization Algorithms, Algebraic techniques: sieves-convolutions-and-polynomials, Improving dynamic programming on tree decompositions, Matroids, Recursive Understanding, Bounded Treewidth Graph Isomorphism, Bisection Decomposition, Lossy Kernelization, Parameterized Complexity for problems solvable in polynomial time, Lower bounds based on the Exponential-Time Hypothesis

Books for reference:

- Parameterized Complexity Theory, Jörg Flum and Martin Grohe, Springer, 2006.
- Fundamentals of parameterized complexity, Rodney G Downey and Michael R. Fellows, Springer, 2013.
- Parameterized algorithms, Marek Cygan, Fedor V. Fomin, Łukasz Kowalik, Daniel Lokshtanov, Dániel Marx, Marcin Pilipczuk, Michał Pilipczuk and Saket Saurabh, Springer, 2015.
- Relevant Papers in the area.

10MATH04-008-E-CS Algorithmic Game Theory (7 credits)

Course Content: Introduction and examples, Mechanism design basics, Myerson's Lemma, Algorithmic mechanism design, Revenue-maximizing auctions, Simple near-optimal auctions, Multi-parameter mechanism design, Spectrum auctions, Mechanism design with payment constraints, Kidney exchange and stable matching, Selfish routing and the price of anarchy, Network over-provisioning and atomic selfish routing, Equilibria: definitions, examples, and existence, Robust price-of-anarchy bounds in smooth games, Best-case and strong Nash equilibria, Best-response dynamics, No-regret dynamics, Swap regret and the Minimax theorem, Pure Nash equilibria and PLS-completeness, Mixed Nash equilibria and PPAD-completeness.

Books for reference:

- Twenty Lectures on Algorithmic Game Theory, Tim Roughgarden, Cambridge University Press, 2016.
- Algorithmic game theory, Noam Nisan, Tim Roughgarden, Eva Tardos and Vijay Vazirani, Cambridge University Press, 2007.

10MATH04-009-E-CS Computational Social Choice Theory (7 credits)

Voting : Introduction to theory of Voting, (Weighted) Tournament Solutions, Dodgson's Rule and Young's Rule, Barriers to manipulation in voting, Control and bribery in voting, Rationalizations of voting rules, Voting in combinatorial domains, Incomplete information and communication in voting

Fair Allocation : Introduction to the theory of fair allocation, Fair allocation of indivisible goods, Cake cutting algorithms

Coalition Formation : Matching under preferences, Hedonic games, Weighted voting games

Additional Topics : Judgment aggregation, Axiomatic approach and the internet, Knockout tournaments

Books for reference:

- Handbook of Computational Social Choice, Felix Brandt, Vincent Conitzer, Ulle Endriss, Jérome Lang and Ariel D. Procaccia, Cambridge Univer- sity Press, 2016.
- Relevant papers in the area.

10MATH04-010-E-CS Algebraic Graph Theory (7 credits)

Course Content: Graphs, Groups, Transitive Groups, Generlized polygons and Morre graphs, Homomorphisms, Kneser graphs, Matrix theory, Interlacing, Strongly regular graphs, Line graphs and Eigenvalues, Laplacian of a graph, Cuts and Flows, Rank polynomial, Knots and Eulerian graphs

Books for reference:

- Spectra of Graphs, Andries E. Brouwer and Willem H. Haemers, Springer, 2012.
- Algebraic Graph Theory, Chris Godsil and Gordon Royle, Gordon, Graduate Texts in Mathematics 207, Springer, 2001.
- Algebraic Graph Theory (2nd ed.), Norman Biggs, Cambridge University Press, 1993.

10MATH04-011-E-CS Topological Graph Theory (7 credits)

Course Content: Basic graph terms, basics of topology, Jordan's curve theorem with a proof, Kuratowski's theorem, with a proof, The Four Colour Theorem with an outline of a proof, Planarity algorithms and complexity, Graphs embedded on higher surfaces, Graph minors, treewidth, and "forbidden" characterizations, The "Kuratowski" theorem for any surface, Graphs drawings with edge-crossings, The crossing number problem and its complexity, Crossing-critical graphs and their structure, Sparse graph classes and depth measures.

Books for reference:

- Graphs on Surfaces, Bojan Mohar and Carsten Thomassen , Johns Hopkins University Press, 2001.
- Graphs on Surfaces: Dualities, Polynomials, and Knots, oanna A. Ellis-Monaghan and Iain Moffatt, Springer, 2013.
- The Foundations of Topological Graph Theory, C. Paul Bonnington and Charles H. C. Little, Springer, 1995.

10MATH04-012-E-CS Machine Learning (7 credits)

Course Content: Prologue: A machine learning sampler, The ingredients of machine learning, Density Estimation, Optimization, Binary classification and related tasks, Beyond binary classification, Concept learning, Online Learning and Boosting, Conditional Densities, Kernels and Function Space, Tree models, Rule models, Linear models, Distance-based models, Probabilistic models, Features, Model ensembles, 12 Machine learning experiments

Books for reference:

- Introduction to Machine Learning, Alex Smola and S.V.N. Vishwanathan, Cambridge University Press, 2008.
- Machine Learning: The Art and Science of Algorithms that Make Sense of Data, Peter Flach, Cambridge University Press, 2012.

10MATH04-013-E-CS Algebraic Graph Algorithms (7 credits)

Course Content: Introduction to matrix multiplication, Equivalences with other linear algebraic operations, Four-Russians algorithms, Graph transitive closure is equivalent to Boolean matrix multiplication, Seidel's algorithm for All pair shortest paths (APSP), Zwick's algorithm for APSP, Yuster/Zwick's Distance oracle; APSP in node-weighted graphs, All pairs earliest arrivals, bottleneck paths and the dominance product, Successor and witness matrices; computing actual paths, Equivalences between APSP and other problems, Perfect matching: Rabin-Vazirani algorithm, Perfect matching: Harvey's algorithm, The Baur-Strassen theorem and graph algorithms, Algorithms for Matroid Intersection and Matroid Parity, Matrix multiplication algorithms, Coppersmith-Winograd and beyond

Books for reference:

- Relevant papers.

10MATH04-014-E-CS Algorithms for Genomics (7 credits)

Course Content: Introduction, Trees First, A deeper introduction to recombination and networks, exploiting recombination, first bounds, fundamental combinatorial structure and tools, Galled Trees, General AEG construction methods, Conditions to guarantee a fully decomposed MinARG, Tree and ARG-Based Haplotyping, Tree and ARG-Based Association Mapping

Suffix Trees and Applications

Books for reference:

- ReCombinatorics: The Algorithmics of Ancestral Recombination Graphs and Explicit Phylogenetic Networks, Dan Gusfeld, MIT Press, 2014.
- Algorithms on Strings, Trees and Sequences, Dan Gusfeld, Cambridge University Press, 1997.

10MATH04-015-E-CS Matroid Theory (7 credits)

Course Content: Graph Theory, Vector Spaces, Transversals, Definition of Matroids, Representability, Duality, Minors and Connectivity, Decomposition of Graphic Matroids, Signed Graphic Matroids, Higher Connectivity, Binary Matroids, Excluded minor theorems, Submodular functions and matroid union, Seymour's decomposition theorem

Books for reference:

- Topics in Matroid Theory, Leonidas S. Pitsoulis, Springer, 2014.
- Matroid Theory, James Oxley, Oxford University Press, 2011.

- Matroids: A geometric introduction, Gary Gordon and Jennifer McNulty, Cambridge University Press, 2012.

<u>10MATH04-016-E-CS</u> Probabilistic Method (7 credits)

Course Content: The basic method, Ramsey numbers, Dominating sets in graphs, Hypergraph 2-coloring, Sum-free subsets, Set pairs theorem, Linearity of expectation, Hamiltonian paths in tournaments and the conjecture of Szele, Minc Conjecture, The second moment method, Turan's proof of the Hardy Ramanujan theorem, distinct sums, random graphs and threshold functions, cliques in random graphs, Dependent Random Choice and its applications, The local lemma: the general lemma and its symmetric version, Straus' problem, directed cycles, Correlation inequalities: the four functions theorem and its applications, the FKG Inequality, Kleitman's Theorem, correlation between properties of random graphs, Martingales: the edge exposure and the vertex exposure martingales, Azuma's Inequality, Poisson approximation: The Janson Inequalities and their application for constructing Ramsey type graphs, Application in property testing

Books for reference:

- The Probabilistic Method, N. Alon and J. H. Spencer, Wiley, 1992. (Second Edition, 2000, Third Edition 2008).
- Relevant papers.

<u>10MATH04-017-E-CS</u> Exact Exponential Algorithms (7 credits)

Course Content: Branching, Dynamic Programming, Inclusion-Exclusion, Treewidth, Measure and Conquer, Subset Convolution, Local Search and SAT, Monotone Local Search, Split and List, Time-Space tradeoffs, Bandwidth, Subexponential time algorithms, ETH and SETH based on lower bounds

Books for reference:

- Exact Exponential Algorithms, Fedor V. Fomin and Dieter Kratsch, Springer, 2010.

- Relevant papers.

<u>10MATH04-018-E-CS</u> Randomized Algorithms (7 credits)

Tools and Techniques : Computation Model and Complexity classes, Probabilistic Recurrences, Game-Theoretic Techniques, Moments and Deviation, Tail Inequalities, Probabilistic Method, Markov Chain and Random Walks, Algebraic Techniques

Application : Data Structures, Geometric Algorithms and Linear Programming, Graph Algorithms, Approximate Counting, Online Algorithms, Number Theory and Algebra, Randomized Approximate Algorithms.

Books for reference:

- Randomized Algorithms, Rajeev Motwani and Prabhakar Raghavan, Cambridge University Press, 1995.
- Probability and Computing: Randomized Algorithms and Probabilistic Analysis by Michael Mitzenmacher and Eli Upfel, Cambridge University Press, 2005.
- Extremal Combinatorics, Second Edition, Stasys Jukna, Springer, 2011.
- Relevant papers.

<u>10MATH04-019-E-CS</u> Computational complexity - II (7 credits))

Course Content: Advanced topics in complexity theory — circuit lower bounds, hardness vs randomness, PCPs, etc.

References: S Arora and B Barak. Computational Complexity: A Modern Approach (Cambridge Unviersity Press 2009). Also, recent papers.

<u>10MATH04-020-E-CS</u> Algebraic Complexity Theory (7 credits)

Course Content: Algebraic computation models, reductions and completeness, complexity measures for polynomials, lower bounds, connections to polynomial identity testing,

References:

- Bürgisser, Clausen, Shokrollahi. Algebraic Complexity Theory (Springer 1997).
- Bürgisser. Completeness and Reductions in Algebraic Complexity Theory (Springer 2000).
- Shpilka and Yehudayoff. Arithmetic Circuits: A Survey of Recent Results and Open Questions (FTTCS, Now Publishers, 2010).

10MATH04-021-E-CS Analysis of Boolean functions (7 credits)

Course Content: The study of Boolean functions via their Fourier expansion and other analytic means. Applications to property testing, circuit complexity, learning theory, inapproximability, concrete complexity.

References: Ryan O' Donnell. Analysis of Boolean Functions (Cambridge University Press, 2012).

10MATH04-022-E-CS Circuit complexity (7 credits)

Course Content: Low level complexity questions: to understand how circuits compute, to develop mathematical machinery for the analysis of circuits, and to create a mathematical toolbox against our adversary – the circuit.

References:

- S Jukna. Boolean Function Complexity: Advances and Frontiers (Springer 2012).
- H. Vollmer. Introduction to Circuit Complexity: A Uniform Approach (Springer 1999).

10MATH04-023-E-CS Communication Complexity (7 credits)

Course Content: Models of communication complexity and inter-relationships; applications to streaming algorithms, games, circuit complexity; lower bound techniques.

References:

- Kushilevitz and Nisan. Communication Complexity (Cambridge University Press 1997).
- Tim Roughgarden. Communication Complexity (for Algorithm Designers) (FTTCS Vol 11, Now Publishers 2016).

10MATH04-024-E-CS Concrete Lower Bounds (7 credits)

Course Content: basic lower bounds techniques in various models: Boolean circuits (with various restrictions: formulas, branching programs, decision trees, monotone circuits, span programs, negation-limited circuits, bounded-depth circuits ...), communication complexity, proof complexity, algebraic complexity, extension complexity.

References:

- S Jukna. Boolean Function Complexity: Advances and Frontiers (Springer 2012).
- Tim Roughgarden. Communication Complexity (for Algorithm Designers) (FTTCS Vol 11, Now Publishers 2016).

10MATH04-025-E-CS Expanders, PCPs, and Derandomization (7 cred- its)

Course Content: Hardness amplification, derandomization, pseudo-randomness, probabilistically checkable proofs.

References: S Arora and B Barak. Computational Complexity: A Modern Approach (Cambridge Unviersity Press 2009).

10MATH04-026-E-CS Proof Complexity (7 credits)

Course Content: proof complexity and connections to SAT solving; resolution – size, width, space, pebbling; polynomial calculus, cutting planes, Frege proofs; proof systems for QBFs.

References: Survey papers –

- Paul Beame and Toniann Pitassi: Propositional Proof Complexity: Past, Present and Future. Bulleting of the EATCS Vol 65, 1998. Also on ECCC TR 1998-067.

- Jakob Nordström: Pebble Games, Proof Complexity, and Time-Space Trade-offs. Logical methods in CS Vol 9, 2013.

10MATH04-027-E-CS Small Space Computation (7 credits)

Course Content: Space-bounded computation models - TMs, width-bounded circuits and branching programs, auxiliary PDA, streaming model; complexity classes, relations, and completeness; arithmetization.

References:

- S Arora and B Barak. Computational Complexity: A Modern Approach (Cambridge Unviersity Press 2009).
- H. Vollmer. Introduction to Circuit Complexity: A Uniform Approach (Springer 1999).
- Recent Papers.

10MATH04-028-E-CS Incidence Theorems and their Applications (7 cred- its)

Course Content: Arrangements of lines, points, and other geometric objects in space. Counting incidences. Kakeya-type problems. Sylvester-Gallai type problems.

References: Zeev Dvir. Incidence Theorems and their Applications (FTTCS Vol 6, Now Publishers, 2012).

10MATH04-029-E-CS Randomness and Computation (7 credits)

Course Content: Probabilistic computation and complexity classes, examples of randomized algorithms, Interactive Proofs with variants and examples, perfect security and its limitations, computational security, secure psuedorandom generators, one-way functions and one-way permutations, PCP theorem and hardness of approximation, derandomization using pseudorandom generators, Nisan-Wigderson construction, expanders and extractors.

- Carl Ludwig Siegel's Lectures on the Geometry of Numbers.
- Chapters 8 and 9 of Yap's Fundamental Problems in Algorithmic Algebra.

10MATH04-031-E-CS Algorithms for solving polynomial equations (7 credits)

Course Content: Root Isolation for Univariate Polynomials, Resultants, Theory of Ideals, Gröbner basis, Elimination theory, Invariant Theory, Theory of Fewnomials, Sums of Squares, Tropical Algebraic Geometry.

References:

- Cox, Little, O'Shea: Ideals, Varieties and Algorithms; Sturmfels – Solving Polynomial Equations.
- Yap: Fundamental problems in Algorithmic Algebra; Sturmfels – Algorithms in Invariant Theory.
- Sturmfels: Grobner Basis and Convex Polytopes.

<u>10MATH04-032-E-CS</u> Computational geometry (7 credits)

Course Content: Convex hulls, Voronoi Diagram, Delaunay Triangulation, Polygon Triangulation, Point Location, Quadtrees, Orthogonal Range Searching, Line Segment Intersection, Incidence Geometry, Discrete geomtery, epsilon-nets, Set Traversals, Embedding Finite Metrics, Measure Concentration.

References:
- de Berg et al.: Computational Geometry; Matousek: Discrete Geometry.

<u>10MATH04-033-E-CS</u> Computational Topology (7 credits)

Course Content: Topological Spaces, Manifolds, Simplicial Complexes, Homology, Morse Theory, The Persistence algorithm, Topological simplification, Morse-Smale complex algorithm, Knot theory.

References:
- Edelsbrunner: Computational Topolgy; Zomordian: Computational Topology.
- Rote and Vegter: Computational Topology.

<u>10MATH04-034-E-CS</u> Convex Optimization (7 credits)

Course Content: Mathematical (nonlinear) programming, convex sets, convex functions, convex optimization problems, Duality, Applications to graph theory and statistics, Algorithms for unconstrained minimization, Algorithms for equality constrained minimization, interior point methods, multiplicative weights update method.

References:
- Boyd and Vandenberghe: Convex Optimization; Vishnoi: Fundamentals of Convex optimization.

<u>10MATH04-035-E-CS</u> Linear programming and combinatorial optimiza- tion (7 credits)

Course Content: Simplex method, Randomized algorithms, Polyhedral theory, Duality theory, Ellipsoid method, Primal-Dual methods, Interior point methods, Semidefinite programming, Combinatorial optimization problems, Extension complexity, Lovasz-Schrijver and Lasserre Hierarchies.

References:
- B. Gartner and J. Matousek: Understanding and using linear programming.
- Schrijver: Theory of Linear and Integer Programming.
- Recent Papers

<u>10MATH04-036-E-CS</u> Algebraic theory of automata (7 credits)

Course contents: Myhill-Nerode congruence, syntactic monoid, varieties, structure of D-classes, Schützenberger's theorem, Simon's theorem, concatenation hierarchies, monoid products, Krohn-Rhodes theorem, Omega-automata, omega-semigroups, Wilke algebras, Büchi's theorem, McNaughton's theorem.

Books for reference:

- J.-E. Pin. Varieties of formal languages (North Oxford, 1986).
- H. Straubing. Finite automata, formal logic and circuit complexity (Birkhauser, 1994).
- D. Perrin, J.-E. Pin. Infinite words (Elsevier, 2004).

<u>10MATH04-037-E-CS</u> Automata and concurrency (7 credits)

Course contents: Petri nets, boundedness, liveness, 1-safe nets, Mazurkiewicz traces, product systems, asynchronous automata, Zielonka's theorem, concurrent regular expressions.

Books for reference:

- D. D'Souza and Priti Shankar (eds), Modern applications of automata theory (IISc-World Scientific, 2012).

10MATH04-038-E-CS Concurrency theory (7 credits)

Course contents: Petri nets, basic situations, conflicts, free choice, S-invariants, T-invariants, Commoner's theorem, Hack's theorem, rank theorem, Communicating sequential processes, process calculi, pi-calculus.

Books for reference:

- J. Desel, J. Esparza. Free choice Petri nets (CUP, 1995).
- C.A.R. Hoare. Communicating sequential processes (Prentice-Hall, 1984).
- R. Milner. Communicating and mobile systems (CUP, 1999).
- M. Hennessy. A distributed pi-calculus (CUP, 2007).

10MATH04-039-E-CS Programming languages and correctness (7 cred- its)

Course contents: Reasoning about programs, assertions, invariants, predicate transformers, Semantics, fixed points, domains, operational semantics, structural induction, While programs, declarations, type checking, procedures, lazy and eager evaluation.

Books for reference:

- D Gries, The science of programming (Springer, 1984).
- J Loeckx and K Sieber, The foundations of program verification (Springer, 1987).

10MATH04-040-E-CS Programming language theory (7 credits)

Course contents: Denotational semantics, fixed points, domains, Structural operational semantics, While programs, declarations, types, procedures, lazy and eager evaluation, Lambda calculus, functional programming, Curry-Howard correspondence, type theory, polymorphism.

Books for reference:

- J Reynolds. Theories of programming languages (CUP, 1998).

10MATH04-041-E-CS Theory of computation: a second course (7cred- its)

Course contents: Regular expressions, star height, feedback number, matrices, semirings, Kleene algebras, inequations, completeness, formal power series, weighted automata, Kleene-Schützenberger theorem.

Books for reference:

- J R Büchi, Finite automata, their algebras and grammars, edited by D Siefkes (Springer, 1989).
- N Pippenger, Theories of computability (CUP, 1997).
- J Sakarovitch, Elements of automata theory (CUP, 2009).

10MATH04-042-E-CS Artificial intelligence (7 credits)

Course Content: Heuristic search, game playing, planning, logic for knowledge representation. Factor graphs and Bayesian networks. Markov decision processes and reinforcement learning, statistical learning. Constraint satisfaction problems.

References:

- Russell and Norvig. Artificial Intelligence: A Modern Approach.
- Koller and Friedman. Probabilistic Graphical Models.
- Sutton and Barto. Reinforcement Learning: An Introduction.
- Hastie, Tibshirani, and Friedman. The elements of statistical learning.
- Tsang. Foundations of constraint satisfaction.

10MATH04-043-E-CS Game theory (7 credits)

Course Content: Introduction to combinatorial games: nim games, sprague - grundy theorem. Extensive form games, backwards induction. Normal form games, iterated elimination of dominated strategies, Nash equilibrium. Brouwer fixed-point theorem, Nash's theorem, von Neumann's minmax theorem. Computation of equilibria, Linear Programming solutions, the complexity class FP. Introduction to co-operative game theory: core and nucleolus. Simple stochastic games and optimal values. Introduction to infinite games: lack of determinacy. Regular infinite games, memoryless determinacy, parity games and Zielonka's theorem. Imperfect information games, Bayesian equilibria.

References:

- Osborne and Rubinstein: A course in game theory.
- Rasmussen: Games and information.
- B Loewe: Lecture notes on infinite games.
- Graedel and Thomas: Lectures on automata, games and logic.

10MATH04-044-E-CS Automata and games (7 credits)

Course Content: Introduction to infinite games: lack of determinacy. Games on finite graphs, backwards induction for reachability. Regular infinite games, Büchi and Muller conditions, parity games. Decidability of logics on infinite words and trees, Rabin's theorem. Strategy improvement for parity games. Nash equilibria for games on graphs. Imperfect information games on graphs.

References:

- Graedel and Thomas: Lectures on automata, games and logic.
- Recent Papers.

10MATH04-045-E-CS Distributed algorithms (7 credits)

Course Content: Introduction to parallel algorithms: partial sums, Batcher merge. Leader election in asynchronous rings: upper and lower bounds. Distributed minimum spanning tree: message complexity. Constructing BFS tree, partition algorithm. Mutual exclusion in Read / Write registers. Fault tolerance: Fischer, Lynch and Paterson theorem. Byzantine agreement in synchronous systems: upper and lower bounds. Selfish agents: introduction to mechanism design.

References:
- Lynch: Distributed algorithms.
- Attiyah: Introduction to distributed algorithms.

10MATH04-046-E-CS Infinite discrete structures (7 credits)

Course Content: Basic set theory: ordinals and transfinite induction. Zorn's lemma and its applications. Well founded orderings.

Ramsey's theorem, infinite and finite versions; van der Waarden's theorem, Roth's theorem; idea of Szemeredi's theorem.

Partial orders: Well quasi orderings; Higman's Lemma, Kruskal's theorem; treewidth theorem. Applications to infinite state systems.

Complete partial orders: Knaster-Tarski theorem; Computing fixeedpoints, applications to program analysis.

References:
- Keith Devlin: The joy of sets, fundamentals of contemporary set theory.
- F Nielson and H R Nielson: Principles of program analysis.
- Schmidt and Schoebelen: Algorithmic theory of WQOs.

10MATH04-047-E-CS Mathematical Logic: a second course (7 credits)

Course Content: Basics of model theory: elementary classes, spectra; Compactness and applications; size of models; interpolation theorems.

Decision problem: Trakhtenbrot's theorem; sharpening undecidability; syntactic decidable fragments – prefix classes and finite variable logics.

Descriptive complexity: Fagin's theorem, LFP logics.

Modal μ-calculus, guarded logics, connection to games.

References:
- Ebbinghaus and Flum: Finite model theory.
- W Hodges: A shorter model theory.
- Recent Papers.

<u>10MATH04-048-E-CS</u> Logics of programs (7 credits)

Course Content: Propositional dynamic logic: completeness, decidability, extensions. Hennessy Milner logics, bisimulations. Process logics. Temporal logics: linear and branching time. Interval logics. Alternating temporal logic. Game logic. Game semantics of logic.

References:

- D Harel: Dynamic logic.
- R Goldblatt: Logics of time and computation.
- Recent Papers.

<u>10MATH04-049-E-CS</u> Verification (7 credits)

Course Content: Kripke structures, Linear time properties, Branching time, expressiveness. Model checking algorithms. Automata based algorithms. Binary decision diagrams, Symbolic model checking, SAT solvers. Craig interpolation, equivalences and abstractions.

References:

- Huth and Ryan: Logic in Computer Science: Modelling and reasoning about systems.

<u>10MATH04-050-E-CS</u> Topics in Algorithms (7 credits)

Course Content: This is an advanced level research course. The content will be decided by the instructor based on current research and the requirements of the individual students.

References: Current research papers and advanced lecture notes, as specified by the instructor.

<u>10MATH04-051-E-CS</u> Topics in Complexity Theory (7 credits)

Course Content: This is an advanced level research course. The content will be decided by the instructor based on current research and the requirements of the individual students.

References: Current research papers and advanced lecture notes, as specified by the instructor.

10MATH04-052-E-CS Algebra and Computation (7 credits)

Course Content: Permutation group algorithms and Graph Isomorphism. Construction of finite fields. Polynomial factorization over finite fields. Solving linear Diophantane equations. Integer Lattices and the LLL algorithm for approximating the shortest vector in integer lattices. Factorization of univariate and multivariate polynomials over rationals.

References:

Course Curriculum

for

Ph.D. in Computer Science

Ph.D. MATHEMATICAL SCIENCES COMPUTER SCIENCE (PROGRAM CODE: MATH04)

NATIONAL INSTITUTE OF SCIENCE EDUCATION AND RESEARCH

BHUBANESWAR

SCHOOL OF COMPUTER SCIENCES

Course structure for *PhD in Computer Science*

List 1: Core Courses

Course No.	Course Name	Credits (assigned by BoS)	Suggested credits
CS651	Modern Cryptology		8
CS652	Algorithmic Coding Theory		8
CS653	Complexity Theory		8
CS654	Linear Programming and Combinatorial Optimization		8
CS655	Distributed Network Algorithms		8
CS656	Cyber Forensics		8
CS657	Penetration Testing		8
CS658	Social and Information Network Analysis		8
CS659	Advanced Algorithms		8
CS660	Machine Learning		8
CS661	Randomized Algorithms and Probabilistic Analysis		8

List 2: Seminar Courses

Course No.	Course Name	Credits (assigned by BoS)	Suggested credits
CS791	Seminar Course-I		4
CS792	Seminar Course-II		4
CS793	Seminar Course-III		4

List 3: Pass/Fail Course

Course No.	Course Name	Credits (assigned by BoS)	Suggested credits
CS601	Research Methods		Pass/Fail

1. A student should meet 60 credit requirements as follows:
   (a) In the first semester, the student will do 3 courses from List 1, and CS791 Seminar Course-I.
   (b) In the second semester, the student will do 3 courses from List 1, and CS792 Seminar Course-II and CS793 Seminar Course-III.
   (c) The seminar courses can be on any advanced topic on Computer Science as suggested by the doctoral monitoring committee.
   (d) The performance in the courses will be assessed through assignments, student presentations, vivas, and /or written examinations. The contact hours for each course will be 4 hours per week.
2. A student has to compulsorily attend and pass a Research Methodology course. However no credit for the course will be counted.
3. Having completed the course work successfully, a student will appear for Oral General Comprehensive Examination (OGCE) conducted by the monitoring committee. OGCE will be based on all the courses that a student has taken and will be conducted before the registration of third semester. The process of choosing Ph.D. advisor starts only after the successful completion of OGCE and it has to be done within a month from the date of completion of comprehensive examination.
4. A doctoral committee is constituted by the Dean Academic as per HBNI guidelines after a guide and topic has been decided. The doctoral committee should meet at least once in a year to monitor the progress of a student. Guide, who is the convener of doctoral committee, will send the annual progress report of student to the Dean Academic every year before registration of odd/even semester depending upon the joining date of the student and a copy may be sent to PGCS for further reference.

Remarks

1. CS601 (Research Methods) course is in concurrance with H601 offered by the School of Humanities and Social Sciences.

DETAILED SYLLABUS

CS652: Algorithmic Coding Theory, Credits - 8

Course Outcome Students will be introduced to formalization of the notion of uncertainty of a random variable, Source coding for error-free reconstruction, channel coding and the fundamental theorem, introduction to some algebraic codes (Parity-check codes, Reed-Solomon codes).

Topics
Module 1: Entropy, Characterization and Properties. Application to Combinatorics. Mutual Information and KL Divergence.
Module 2: Source coding theorem, lossless compression of data, Lempel-Ziv Algorithm, Optimal lossless coding.
Module 3 Communication channels (binary symmetric, erasure) and channel capacity, channel coding theorem.
Module 3: Introduction to Error Correcting Codes. Hamming Codes and Hamming Bounds. BCH Codes, Maximum likelihood decoding and syndrome decoding; coding theory bounds.
Module 4: Reed-Solomon codes and the Berlekamp-Welch decoding algorithm with Analysis. List Decoding of Reed-Solomon Codes.
Module 5. Reed-Muller Code and Local decoding.
Module 6. (Optional) Algebraic Algorithm like Miller Rabin, Solvay-Strassen, Berlekamp Algorithm.

5. F.J. MacWilliams and N.J.A. Sloane, The Theory of Error-Correcting Codes, North-Holland ML, 1983.

CS653: Complexity Theory, Credits - 8

Course Outcome Students would be able to

- Understand P vs NP arguments and corresponding proofs.
- Learn about interactive proofs and randomized computation

Topics
Module 1 : Introduction, P and NP - Review of Turing machines, universal Turing machines, and uncomputable functions, P vs. NP, NP vs. co-NP, and NP-completeness, EXP, NEXP
Module 2: Cook Levin's Theorem
Module 3 : Diagonalization, Space complexity (Savitch's Theorem, Immerman-Szelepchenyi Theorem, and Reyngold's Theorem.), Polynomial Hierarchy

Module 4 : Interactive Proofs - PCP theorem and its application to approximability, Queery Complexity, Communication Complexity
Module 5 : Circuit complexity and lower bounds
Module 6 : Hardness vs. Randomness - Randomized Computation, derandomization, Pseudo-random generators
Module 7 : Polynomial identity testing vs Lower bounds for arithmetic circuits

5. P. Harsha, Graduate course on Computational Complexity, http://www.tcs.tifr.res.in/ prahladh/teaching/2013-14/complexity.

CS654: Linear Programming and Combinatorial Optimization, Credits - 8

Course Outcome Students will learn definition and properties of convex sets and functions, convex and affine hulls, recession cones and hyperplanes, constrained optimization, Duality, Minimax Theory
Topics
Module 1: Basic geoemetry and linear algebra related to Linear Programming. Simplex-method and Duality theorem (leading to Von Neumann's minmax principle) and complementary slackness.
Module 2: Ellipsoid algorithm. separation oracles.
Module 3: Semidefinite programming as an extension of linear programming.
Module 4: LP relaxation. Examples of problems where LP relaxation achieves optimum. Examples where LP/SDP relaxation achieves approximate solution. Integrality gaps.
Module 5: Rounding, probabilistic roundings, iterative rounding, primal dual methods.
Module 6 (Optional): Gale-Shapley algorithm, Connection of LP to Cooperative Game Theory core, nucleolus, combinatorial optimization games.

5. Matousek, Jiri, Gartner, Bernd, Understanding and Using Linear Programming, Springer.

CS659: Advanced Algorithms, Credits - 8

Course Outcome

- Augment their understanding of algorithms with hashing and online algorithms.
- Gain knowledge about parameterized algorithms and computational geometry.
- Learn to prove hardness and equivalences.

Topics
Module 1: Universal Hashing, Load Balancing, Locally Sensitive Hashing.
Module 2: String Algorithms
Module 3: Flow in Networks
Module 4: Online Algorithms
Module 5: Approximation Algorithms
Module 6: Fixed Parameter Algorithms. Parameterized Complexity, Kernelization, Vertex Cover, Connection to Approximation.
Module 7: Computational Geometry. Convex Hull, Line Segment Inersection, Sweep Lines, Voronoi Diagram.
Module 8: Graph Sparsification. Graph Spanners, Distance Oracles.
Module 9. Hardness and equivalences in P.

3. Lecture Notes and Research Papers.

CS660: Machine Learning, Credits - 8

Course Outcome Students would be able to

- Learn key concepts of machine learning.
- Understand and implement supervised, unsupervised learning algrithms as well as introduction to reinforcement learning.

Topics
Module 1: Introduction
Module 2: Supervised learning: Supervised learning setup. LMS , Logistic regression. Perceptron. Exponential family , Generative learning algorithms. Gaussian discriminant analysis. Naive Bayes, Support vector machines, Model selection and feature selection., Ensemble methods: Bagging, boosting, Evaluating and debugging learning algorithms.
Module 3: Learning theory: Bias/variance tradeoff. Union and Chernoff/Hoeffding bounds. VC dimension. Worst case (online) learning. Practical advice on how to use learning algorithms.
Module 4: Unsupervised learning: Clustering. K-means, EM. Mixture of Gaussians, Factor analysis, PCA (Principal components analysis), ICA (Independent components analysis).
Module 5: Reinforcement learning and control: MDPs. Bellman equations. , Value iteration and policy iteration, Linear quadratic regulation (LQR) LQG, Q-learning. Value function approximation., Policy search. Reinforce. POMDPs.

2. Tom Mitchell, Machine Learning. McGraw-Hill,.
3. Richard Sutton and Andrew Barto, Reinforcement Learning: An introduction. MIT Press,

CS661: Randomized Algorithms and Probabilistic Analysis, Credits - 8

Course Outcome

- Understand probabilistic analysis and the manners in which it can be used in designing efficient algorithms.
- Study key concepts in Probability Theory and learning about various applications to well-known problems in Computer Science.

Topics
Module 1: Review of discrete probability spaces – Basic probability theory (Events, Expectation, Variance, Markov, Chebyshev, and moment inequalities), Simple randomized algorithms analysis (Randomized Quicksort, polynomial identity, min-cut algorithm, median algorithm), Naïve Bayesian classifier
Module 2: Basic concentration bounds – Chernoff and Hoeffding, Applications (Set balancing, network packet routing, etc.)
Module 3: The occupancy problem – Balls Into Bins, Hashing, Fingerprinting and random graphs
Module 4: The Probabilistic Method – MAX-SAT, conditional expectations, Lovazs Local Lemma, explicit constructions
Module 5: Martingales and concentration bounds
Module 6: Markov Chains and the Monte Carlo method, Rapidly mixing chains and the coupling method
Module 7: Foundations of Machine Learning – Sample Complexity, PAC learning, VC-dimension, Rademacher complexity

CS651: Modern Cryptology, Credits - 8

Course Outcome

- Understanding basic concepts in Mathematical Cryptology
- Ability to design and analysis of security algorithms

Topics
Module 1: Introduction and Classical Cryptography, Perfect Secrecy, One Time Pad.
Module 2: Symmetric Key Encryption. Computational Security, Concrete vs Asymptotic Approach. Semantic Security. Pseudorandom generators and Stream ciphers, Pseudorandom Functions and Block Ciphers. Practical Constructions.
Module 3: Hash Functions and Message Authentication Codes. Notions of Security, Generic Attacks, Domain Extension techniques, CBC MAC, HMAC, PMAC, Idea of Authenticated Encryption.
Module 4: Review of Basic Number Theory. Hardness Assumptions. One-way functions, Trapdoor Permutations, RSA assumptions, Discrete Log and Diffie Hellman Assumptions, SIS and LWE Assumptions. Introduction to Elliptic Curves (Optional)
Module 5. Key Exchange Protocols and Key Management.
Module 6. Public Key Encryption, Semantic Security, El Gamal Encryption, Padded RSA PKCS#1 v1.5. Random Oracle Technique, OAEP.

Module 7. Digital Signatures, Hash and Sign paradigm, Schnorr Signature, Forking Lemma, DSA. SSL/TLS.
Module 8. (Optional) Idea of some of the following notions, Protocols and Zero Knowledge Proofs, Multiparty Computations and Oblivious Transfers, Secret Sharing. Algorithms for factoring and computing discrete logarithms, Linear and Differential Cryptanalysis, Crypto Currencies.

Reference

1. J. Katz and Y. Lindell, Introduction to Modern Cryptography. CRC, 2014.

CS655: Distributed Network Algorithms, Credits - 8

Course Outcome

- Understand basics of distributed network algorithms and systems.
- Gain knowledge on applications of distributed network algorithms to real-world networks and analysis of such algorithms.

Topics

Module 1: Foundations of distributed network algorithms - Broadcast, converge-cast, maximal independent set, coloring, leader election, spanning tree algorithms, shortest paths, and routing.
Module 2: Fundamental concepts in distributed algorithms - Symmetry breaking, locality, synchronizers
Module 3: Basics of distributed network systems - Communication, synchronization, fault-tolerance, and resource allocation
Module 4: Applications to real-world networks - Internet, peer-to-peer networks, wireless networks, sensor networks and dynamic networks
Module 5: Lower bounds using communication complexity, distributed computation of large-scale data, dynamic network algorithms.

CS656: Cyber Forensics, Credits - 8

Course Outcome

- Understand the key concepts in computer forensics across domains of systems (Windows, linux and Mac) as well as Internet artifacts.
- Investigate mobile systems and get a brief idea on intellectual property and cyber laws.

Topics

Module 1: Introduction to Computer Forensics: computer crimes, evidence, extraction, preservation, etc..

Module 2: Overview of hardware and operating systems: structure of storage media/devices; windows/Macintosh/ Linux – registry, boot process, file systems, file metadata.
Module 3: Data and File System Analysis: identifying hidden data, Encryption/Decryption, Steganography, recovering deleted files.
Module 4: Windows Systems and Artifacts: uncovering attacks that evade detection by Event Viewer, Task Manager, and other Windows GUI tools, data acquisition, disk imaging, recovering swap files, temporary & cache files
Module 5: Linux Systems and Artifacts: File system layers, linux boot process and services, system organization and artifacts, logs and task scheduling
Module 6: Mac Artifacts: File system, system artifacts, user artifacts
Module 7: Internet Artifacts: Browser artifacts, mail artifacts
Module 8: File Analysis: Images, audio, video, archives and documents
Module 9: Automating analysis and extending capabilities: Graphical investigation environments, automating artifact extraction, timelines.
Module 10: Mobile Network Forensic: Introduction, Mobile Network Technology, Investigations, Collecting Evidence, Where to seek Digital Data for further Investigations, Interpretation of Digital Evidence on Mobile Network.
Module 11: Computer crime and Legal issues: Intellectual property, privacy issues, Criminal Justice system for forensic, audit/investigative situations and digital crime scene, investigative procedure/standards for extraction, preservation, and deposition of legal evidence in a court of law.

CS657: Penetration Testing, Credits - 8
Course Outcome

- Understand the basics of penetration testing both passive and active.
- Able to test the system for exploits in system, network and web as well as run penetration test in vulnerable systems.

Topics
Module 1: Penetration Testing: What You Should Know, Getting Comfortable with Kali Linux
Module 2: The Essential Tools: Netcat, Ncat, Wireshark, Tcpdump
Module 3: Passive Information Gathering: Open Web information gathering, Email harvesting
Module 4: Active Information Gathering: DNS enumeration, port scanning, SMB enumeration, SNMP enumeration
Module 5: Vulnerability Scanning, Buffer Overflows, Win32 Buffer Overflow Exploitation, Linux Buffer Overflow Exploitation
Module 6: Working with Exploits, File Transfers, Privilege Escalation
Module 7: Client Side Attacks: Know Your Target, MS12-037- Internet Explorer 8 Fixed Col Span ID, Java Signed Applet Attack

Module 8: Web Application Attacks: Cross Site Scripting (XSS), File Inclusion Vulnerabilities, MySQL SQL Injection, Web Application Proxies
Module 9: Password Attacks: Preparing for Brute Force, Online Password Attacks, Password Hash Attacks
Module 10: Port Redirection and Tunneling: SSH Tunneling, Proxychains
Module 11: The Metasploit Framework: Metasploit Payloads, Building Your Own MSF Module, Post Exploitation with Metasploit, Bypassing Antivirus Software

2. Penetration Testing: A Hands-On Introduction to Hacking, Georgia Weidman, No Starch Press

CS658: Social and Information Network Analysis, Credits - 8

Course Outcome

- Learn the basics of social and information network and how to analyze them.
- Key concepts in information maximization and community detection in large graphs.

Topics
Module 1: Introduction and the Bowtie Structure of the Web
Module 2: Basic Network Properties and the Random Graph Model
Module 3: The Small World Phenomena, Decentralized search in small-world and P2P networks
Module 4: User Evaluations in Social Media
Module 5: Cascading Behavior: Decision Based Models of Cascades, Cascading Behavior: Probabilistic Models of Information Flow
Module 6: Influence Maximization, Outbreak Detection
Module 7: Power-laws and Preferential attachment
Module 8: Link Analysis: HITS and PageRank
Module 9: Strength of weak ties and Community structure in networks, Network community detection: Modularity optimization and Spectral Clustering, Overlapping communities in networks
Module 10: Link Prediction and Network Inference, Biological networks

Reference

PHYSICAL SCIENCES

Programme Code: PHYS04

Programme Outcome:

- Manpower development with the ability to apply basic concepts and methods in physics to research problems.
- Training of manpower to take up research in frontier areas of physics
- Building human resource in carrying out R&D in physical and nuclear sciences
- Training of manpower in working in interdisciplinary subjects with physics as one of the subjects

FOUNDATION COURSES

PHYS04.1: Mathematical Methods (22 Lectures / 3 Credits) (01-PHYS04-501-F)

Course Outcomes:

- Understand and apply mathematical techniques for describing and deeper understanding of physical systems.

Course Details:

Linear vector spaces, Linear operators and matrices, Systems of linear equations. Eigen values and eigen vectors, Infinite-dimensional vector spaces: Hilbert space & Hermitian operators. Linear ordinary differential equations, Special functions. Linear partial differential equations in physics, Separation of variables method of solution. Complex variable theory; Analytic functions. Taylor and Laurent expansions, Classification of singularities, Analytic continuation, Contour integration, Method of steepest descent. Integral equations and Green functions, Ideas about nonlinear equations, Approximation methods: WKB approximation, Fourier and Laplace transforms.

References:

1. Mathematical Methods for Physics and Engineering: A Comprehensive Guide, *K. F. Riley, M. P. Hobson, S. J. Bence*
2. Complex Variables: Introductions and Applications, *M. J. Ablowitz and A. S. Focas*
3. Lectures on Advanced Mathematical Methods for Physicists, *S. Mukhi & N. Mukunda*
4. Mathematical Methods for Physicists, *J Mathews and R L Walker*
5. Mathematical Methods for Physicist, *G. Arfken, H. Weber and F.E. Harris*

PHYS04.2: Quantum Mechanics (22 Lectures / 3 Credits) (01-PHYS04-502-F)

Course Outcomes:

- Understand and apply principles of Quantum mechanics for understanding the physical systems in quantum realm.

Course Details:

Review of basic concepts in Quantum Mechanics. Quantum mechanics in one dimension, Particle in a box, Tunneling through finite potential barrier, Harmonic oscillators. Approximation methods in quantum mechanics: W. K. B. and variational methods and their applications. Time independent perturbation theory (for non-degenerate and degenerate cases) and its application to helium atom, Stark and Zeeman effects, Time dependent perturbation theory and Fermi golden rule, its applications to beta decay theory and principle of detailed balance. Collision theory: Born series and approximations, Partial wave analysis, Need for complex potentials, Analytic properties of S-matrix and dispersion theory. Schrodinger, Heisenberg and interaction pictures: Propagator in quantum mechanics. Measurements in Quantum Mechanics, entanglement and uncertainty relations, EPR paradox, Hidden variables and Bell's inequality, spin correlation experiments & applications. Relativistic quantum mechanics: Klein-Gordon and Dirac equations and their solutions, Gamma matrices, Non relativistic limit of Dirac equation; continuous and discrete symmetries and conservation laws in quantum mechanics, Bilinear covariants, Charge conjugation. Lagrangian formulation: Symmetries of Lagrangian density, Noether's theorem, Energy-momentum tensor $T_{\mu\nu}$ – its origin & physical meaning of different components. Path integral formulation of quantum theory: applications.

6. (i) Quantum Mechanics: Non- Relativistic Theory & (ii) Classical Theory of Fields, *L.D. Landau and E.M. Lifshitz*
7. Quantum Mechanics and Path Integrals, *P. Feynman and A.R. Hibbs*

PHYS04.3: Classical mechanics & Statistical Mechanics (22 Lectures / 3 Credits) (01-PHYS04-503-F)

Course Outcomes:

- Understand and apply principles of physics for understanding the scientific phenomenon in classical domain. Understand and apply statistical methods for describing the classical and quantum particles in various physical systems and processes.

Course Details:

Classical mechanics: Hamilton's equations, Phase space, Principle of least action and Hamilton's principle, Canonical transformations, Contact transformations, Examples of canonical transformations, Poisson brackets and its identities, Liouville's theorem , Poincaré- Cartan integral and differential invariant, Symplectic structure of phase space, Jacobi theorem, Hamilton Jacobi equation, Action-angle variables, Adiabatic invariants, Small oscillations, Canonical perturbation theory, Secular perturbation theory, Nonlinear resonance, Applications in plasma physics, Kolmogorov-Arnold-Moser theorem, Application to understanding of Kirkwood gaps, Saturn's rings, Birkhoff-Poincaré theorem, Chaos in discrete dynamical systems.

Statistical mechanics: Distribution functions, Liouville's equation, Fokker-Planck Equation; Gibbsian statistical ensembles: Microcanonical, Canonical and Grand Canonical ensembles. Gibbs' theorem: Information entropy: Fluctuations: Passage to the classical limit of quantum statistics: Bose Einstein statistics, Fermi-Dirac statistics, properties of Bose and Fermi gases at low temperatures, Bose condensation; Ising Model: Theory of phase transition and critical phenomena- Critical exponents and universality: Statistical mechanics of finite system: Transport theory – BBGKY hierarchy to Boltzmann equation.

11. Statistical Mechanics (Frontiers in Physics), *R. P. Feynman*

PHYS04.4: Electrodynamics (22 Lectures / 3 Credits) (01-PHYS04-504-F)

Course Outcomes:

- Gain knowledge in understanding the principles and dynamic phenomena of electromagnetism that occur in the case of time-varying sources (local charges and currents). Equips the students with the necessary mathematical knowledge for a detailed and accurate description of these phenomena and for solving related problems.

Course Details:

Maxwell equations, Macroscopic electromagnetism, Conservation laws: Maxwell's displacement current, Vector and scalar potentials, Gauge transformations, Lorentz gauge and Coulomb gauge, Green's theorem for the wave equation, Poynting's theorem and conservation of energy and momentum, Boundary value problems and numerical techniques, Plane electromagnetic wave and wave propagation, Wave guides and resonant cavities: Plane waves in a non-conducting medium, Linear and circular polarization, Fields at the surface and within conductor, Cylindrical cavities and wave-guides, Modes in a rectangular waveguide,

Energy flow and attenuation in a wave-guide. Radiating systems, Multipole fields and radiation: Fields and radiation of a localized oscillating source, Electric dipole field and radiation, Multipole expansion and electromagnetic fields, Properties of multipole fields, Energy and angular momentum of multipole radiation, Sources of multipole radiation: Multipole moments. Relativistic electrodynamics: The special theory of relativity, The Lorentz transformation and basic kinematic results of special relativistic, Invariance of

electric charge, Covariance of electrodynamics, Transformation of electromagnetic fields, Relativistic charged particles in an electromagnetic field. Radiation by moving charges: The Liénard-Wiechert potentials and fields for a point charge, Total power radiated by an accelerated charge.

PHYS04.5: Accelerator Physics (22 Lectures / 3 Credits) (01-PHYS04-505-F)

Course Outcomes:

- Understand different types of accelerators and their applications in industry and research in basic and applied sciences

Course Details:

Introduction to accelerators: History of accelerators. Applications of accelerators. Relativistic kinematics. Guided electromagnetic fields in waveguides and cavities. Transverse beam dynamics: Accelerator coordinates; Guide field; Dipole and Quadrupole Magnets; Hills equation and solution; Betatron oscillations; Twiss parameters; Matrix formulation; stable oscillations; FODO lattice; Chromaticity; sextupole magnets and dynamics aperture.

Longitudinal beam dynamics: Fields and forces; acceleration by time varying fields; relativistic equations; transit time factor; main RF parameters; synchronous particle; synchrotron oscillations; principle of phase stability; RF acceleration for synchronous and for non-synchronous particle; small amplitude oscillations; Oscillations with Hamiltonian formalism.

Linear accelerators: Basic methods of linear acceleration; Fundamental parameters of accelerating structures; Energy gain in linear accelerating structures; Q, Shunt-impedance, transit-time factor; periodic accelerating structures; RFQ; DTL; advantages of superconducting cavities; TEM and TM superconducting cavities; spoke resonators and elliptic cavities.

Advanced topics: Introduction to space-charge effects, Envelope equation, Introduction to wakefields and collective instabilities, Non-linear dynamics in accelerators. Elements of microwave electronics for accelerators, Elements of magnet design.

8. Radio-frequency Quadrupole, *M. Weiss, CERN-PS/87-51.*
9. RF Superconductivity for Accelerators, *Hasan Padamsee*

PHYS04.6: Computational and Numerical Methods (22 Lectures / 3 Credits) (01-PHYS04-506-F)

Course Outcomes:

- Gain knowledge in basic concepts in computational & numerical skills and apply them for understanding and describing complex physical systems.

Course Details:

FORTRAN90 programming language: Overview and basic concepts, data types, flow control, functions, arrays inputs/outputs, make file, libraries.

Numerical methods: Introduction and sources of computational errors, solution of non-linear equations (Root finding), solution of system of linear equations, numerical interpolation, numerical differentiation and integration, solution of differential equations, solution of partial differential equations.

Data analysis: Classification of errors, error propagation, basics of Monte Carlo techniques, data interpretation using Bayesian approach.

5) Data Reduction and Error Analysis for the Physical Sciences, *P. R. Bevington and D. K. Robinson*
6) An Introduction to Error Analysis, *J.R. Taylor*

PHYS04.7: Reactor Physics (15 Lectures / 2 Credits) (01-PHYS04-507-F)

Course Outcomes:

- Understand the basic principle of nuclear power generation and physics design of a reactor.

Course Details:

Basics of reactor physics: Basic concepts of nuclear energy, classification of reactors, characteristics of research, test and power reactors with examples, brief overview of different reactor components,

Neutron induced reactions and their energy behavior: Concepts of binding energy Production of neutrons, Interaction of neutrons with matter, Microscopic cross-section, energy dependence of nuclear cross-sections, fast, resonance and thermal ranges, 1/v law of neuron cross-section, Geometrical limit of cross-section, Nuclear fission process, liquid drop model, Critical energy for fission, fissile, fertile and fissionable materials, Fission products yield, prompt and delayed fission neutrons, concept of ν and h, Macroscopic cross-section, mean free path, reaction rate density, energy release during nuclear fission, fission rate and reactor power, decay heat, fission gammas

Reaction rates and measurement of reaction cross sections: Measurement of cross-sections – Activation and transmission methods, overview of Measurement of partial cross-sections, Introduction to neutron time-of-flight experiments.

Neutron transport and solution to steady state neutron diffusion equation: Definition of neutron flux and current, Fick's law and its validity, neutron transport, Steady state neutron diffusion equation, interface conditions, diffusion coefficient, diffusion length and extrapolation distance. Solution of diffusion equation for point source and plane source in non- multiplying medium.

Neutron multiplication and bare homogeneous reactor: Nuclear chain reaction, multiplication factor, infinite and effective multiplication factor, reactivity, units of reactivity, concept of criticality, non-leakage probability, Bare homogeneous reactor - concepts of material and geometric buckling, conditions for criticality, four factor formula, heterogeneous reactors. Neutron slowing down, slowing down power/ moderating ratio of moderators, slowing down with spatial migration, fermi age concepts, migration length.

Time dependent neutron diffusion equation and reactor kinetics: Time dependent neutron diffusion equation, one group kinetic equation and its solution, role of delayed neutrons, prompt neutron life time, reactor period, one dollar of reactivity, prompt criticality. Xenon and samarium poisons, xenon loads, variation of xenon load with power, reactivity feedbacks of reactivity.

Reactor control and operation: Control rods, reactor safety and shut-down mechanisms, Principles of reactor operation**,** approach to criticality, control rod worth measurement, Concepts of irradiation, burn up, conversion and breeding.

5. Fundamentals of Nuclear Reactor Physics, *Elmer Lewis (Academic Press, 2008)*

PHYS04.8: Health Physics (15 Lectures / 2 Credits) (01-PHYS04-508-F)

Course Outcomes:

- Gain basic knowledge of different types of radiations, doses, shielding, health effects and safety

Course Details:

Introduction: Radiation sources, quantities and units: Natural and Induced radioactive sources, Units of radioactivity, Half-Life and Decay constant, Specific activity -Examples. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (with stress to use only SI units however old and new units relation can be given). Exposure dose relationship

Biological effects: Interaction of radiation with biological matter (DNA damages). Factors, which influence radiation damage of cell. Direct and indirect effects. Stochastic and Deterministic. Acute and Chronic doses -Examples. Radiation syndromes (Hematopoietic, GI and CNS) NVD, LD50/60 -Threshold doses for radiation syndromes.

Radiation detection and measurement: Brief introduction on Charged particle interaction, ionization and excitation, Interaction of gamma radiation with matter. Photoelectic, Compton and pair production (not detailed). Neutron interaction and dose. Ionisation chamber, proportional counter and GM counter working principle. HP instruments Alpha, Beta, Gamma and Neutrons. Buildup concept, shielding for alpha, beta, gamma and neutron sources. Shielding for mixed sources.

Luminescence (theory & materials), Radiation dose measurement (Basics of dose measurements, different methods of radiation dose measurements, Importance and requirement of radiation dose measurements).

Radiation protection program: Types of exposure (occupational, medical and public). National and International regulatory bodies, their role and responsibilities. Latest Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, Justification, Optimization and Dose Limits.

Occupational Radiation Protection: Radiation Safety Officer (RSO). Nature of duties and responsibilities of RSO/Health Physicist. Protection against internal and external exposure. Time, Distance and Shielding. Concept of ALI & DAC (with suitable problems). Modes of entry of radionuclides into the human body leading to internal exposure. Personnel monitoring, workplace monitoring, environmental monitoring. Surface contamination and air activity monitoring. Dosimeters, TLDs, DRD (pocket dosimeters), alarm dosimeters CR-39 etc. Bioassay, whole body counting and Liquid Scintillation Spectrometry (LSS) techniques (not in detail). Role of ESL in environmental monitoring.

Radiotoxicity and classification of laboratories, design of laboratory for radioactive work,

Radiation Protection procedures: Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, Safety during transportation of radioactive sources. Transport index, TREM card. Radioactive waste classification and management.

Emergency Preparedness: Types of emergency, emergency preparedness. Nuclear and radiological emergencies. RDD, IED. International Nuclear Events Scale (INES). Examples of nuclear and radiological accidents. Iodine Prophylaxis

Industrial Safety (Conventional): Basic Principles of industrial safety and industrial hygiene;

PHYS04.9: Atomic & Molecular Physics (15 Lectures / 2 Credits) (01-PHYS04-509-F)

Course Outcomes:

- Understand the role of atoms and molecules in the structure and properties of mater. Describe different types of atomic and molecular spectra with and without external field.

Course Details:

Atomic Physics: Revision of energy levels and structure of hydrogenic atoms, 2 electrons atoms, many electron atoms, fine structure, hyperfine structure. Quantum mechanical treatment of interaction of atoms with external fields, absorption and emission of radiation, electric dipole selection rules. Selection rules.

Molecular Physics: Born-Oppenheimer approximation and molecular energy levels; rotational, vibrational and electronic structure and spectra of molecules; molecular orbital theory. Molecular Symmetry and group theory (point groups): applications to vibrational and electronic spectroscopy of molecules. Selection rules, Mechanism of broadening of spectral lines.

Introduction to atomic and molecular structure calculations: Hartree-Fockself consistent field method, introduction to electron correlation methods like configuration interaction (CI) and DFT (density functional theory); Introduction to use of computational chemistry codes like GAMESS for basic molecular structure calculations.

CORE COURSES

ADVANCED COURSES (THEORY)

PHYS04.10: Advanced Nuclear and Astrophysics (15 Lectures / 2 Credits) (01-PHYS04-610-C)

Course Outcomes:

- Provide exposure in the specialized subjects of Nuclear & Particle Physics and Astrophysics.

Course Details:

A. Nuclear Physics:

Review of basic nuclear physics: Basic properties of nuclei, systematic of nuclear ground states (low lying states) properties, size, shape, electric and magnetic moment, nuclei away from the line of stability, isomers, nuclear decay, symmetries. Nuclear Forces: Phenomenological description of nuclear forces, deuteron problem, N-N scattering, microscopic description, meson theory of nuclear forces.

Nuclear structure: Multipole composition of radiation, transition matrix, selection rules for multipole transitions, collective and single particle excitations, shell and collective models, giant resonances, high spin states and shape deformations, relativistic mean field theory, Fermi gas model, weak interaction, beta decay, neutrino interaction and oscillations.

Heavy ion nuclear reaction studies around Coulomb barrier energies: Physical description of heavy ion interactions, heavy ion potentials, elastic scattering, optical potentials. Direct reactions: Inelastic scattering, theories on nuclear transfer reactions, Coupled channels effects. Fusion and fission reactions: Compound nucleus theory, statistical model analyses, Hauser-Feshbach analyses, fusion of heavy ions, fusion cross section around Coulomb barrier energies and channel coupling effects. Particle evaporation spectra and nuclear level densities, nuclear fusion-fission reactions, fission fragment mass and angular distribution, fission time scale.

Giant resonances in atomic nuclei: Definition, Energy and width systematic, Macroscopic and microscopic description, Giant Dipole Resonance (GDR) in deformed nuclei, GDR in excited nuclei, GDR in hot nuclei formed in heavy ion reactions, properties of GDR from high energy gamma spectra using statistical model.

Reactions involving weakly bound projectiles: Special features, comparison with reactions involving strongly bound projectiles. Projectile breakup reactions: direct, resonant and transfer breakup. Surrogate reactions. Nuclear astrophysics. Radioactive Ion Beam (RIB) - Production and applications: Production of RIB-different methods. Exotic properties and physics beyond beta stability. Nuclear reaction studies using RIBs.

High energy interactions: Deep Inelastic Scattering, Nuclear reaction at Relativistic Heavy Ion Collisions, Quark Gluon Plasma (QGP) - a deconfined state, Signatures of QGP: Quarkonia, Jets, Energy loss; Equation of State; High Energy QCD in proton-nucleus interaction and ultra-peripheral collisions, Critical point.

9. Quark Gluon Plasma 4: *Edited by R. C. Hwa and Xin-Nian Wang (World Scientific, Singapore, 2010.)*

B. Astrophysics:

Radiation Processes in Astrophysics: Concepts of Radiative Transfer, radiation from accelerated charge, bremsstrahlung, Thomson and Compton scattering, synchrotron radiation, thermal and nonthermal distribution of radiating particles, nonthermal synchrotron radiation, synchrotron-self-absorption, synchrotron and Compton cooling, hadronic process, neutral pion decay.

Basic definitions from Cosmology: Universe at large scales – Homogeneity and isotropy, distance ladder, Newtonian cosmology, expansion and redshift, Cosmological Principle, Hubble's law, Robertson-Walker metric, Observable quantities: luminosity and angular diameter distances, Horizon distance.

Particle Acceleration: First and second order Fermi acceleration, Particle acceleration in astrophysical shocks, evolution of particle distribution, kinetic equation, different cases.

Astrophysical sources: Description of various astrophysical source e.g. supernova remnants, pulsars, active galactic nuclei, gamma ray bursts etc. and their observational results. Astronomical techniques: Astronomical Coordinate system: Horizon, Equatorial and Galactic coordinate system. Magnitude of stars and different distance measurement techniques used in astronomy.

Cosmic rays and related experiments: Cosmic ray experiments: historical perspective, Cosmic ray spectrum, GZK cut, off, Hillas plot, cosmic ray and neutrino experiments.

PHYS04.11: Advanced Condensed Matter Physics (15 Lectures / 2 Credits) (01-PHYS04-611-C)

Course Outcomes:

- Provide exposure in the specialization of Condensed Matter Physics.

Course Details:

Crystal Structure: Crystal structure of materials, Space group and its application, Crystal structure determination, Powder diffraction, Single crystal growth (basics & methods) and characterization, Structure of disordered materials.

Phase Transitions and Critical Phenomenon: Equation of state, Phase transitions, Landau theory of phase transition, First and second order phase transitions, Critical exponent, Properties near critical points, Materials response under temperature, pressure and magnetic field.

Magnetism and Magnetic Materials: Fundamentals of magnetism, Multiferroics, Magnetoelectrics, Magnetostriction, Spintronics, Frustrated magnetism, Colossal magnetoresistance, Low dimensional quantum magnetism, Spin liquid.

Strongly Correlated Electron Systems: Metal-insulator transition, Charge and orbital ordering, Quantum phase transition, Quantum criticality.

Dynamics of Collective and Non-collective Excitations: Phonon dispersion. Stochastic Processes, Magnetic excitations.

Surfaces, Interfaces and Thin Films: Preparation and structure of thin films, Complex surfaces and interfaces, Thin film multilayer devices.

Soft Matter and Nanostructures: Constituents of soft mater, Structure and interaction, Soft Matter in Biology, Properties, synthesis and applications of nanomaterials.

Energy Materials: Types and sources of energy, Energy storage methods and devices, Solar cells, Fuel Cells, Thermoelectric power generation. Magnetic energy materials: Spin Seebeck effect, Magnetocaloric effect, and Permanent magnets.

PHYS04.12: Advanced Laser and Plasma Physics (15 Lectures / 2 Credits) (01-PHYS04-612-C)

Course Outcomes:

- Provide exposure in the specialization of Laser and Plasma Physics.

Course Details:

A. Basics of Laser Physics:

Introduction to Lasers, unique properties of lasers and their importance, coherence, laser spectrum and wavelengths, Wave nature of light, Heisenberg's uncertainty principle, concept of wave packet. Breif overview of energy levels and radiative properties of atoms, molecules, liquids and solids, Boltzmann distribution. Interaction of e-m radiation with materials – spontaneous and stimulated emission, Einstein's coefficients, population inversion. Two level system, three / four level system, rate equation model. Working principle of lasers, stable laser resonator and laser cavity modes, threshold gain and threshold population inversion. Homogeneous and inhomogeneous broadening, spectral hole burning, spatial hole burning. Different Types of Lasers and their properties, Non-linear optical processes and materials, high harmonic generation, Techniques to narrow down laser line widths / increase pulse powers

References:

1. Laser Fundamentals, *W.T. Silfvast,, Cambridge University Press 2004.*

B. Physics & Technology of Arcs:

Production of arcs and its characteristics: Ionization, Cathode processes, Penning effect, AC and DC break down, Paschen's law, Transition to Arc, Arc characteristics and required power supply features, Arc root movement and inherent instabilities.

Thermo-physical Properties of Arc Plasma: Partition function hierarchy, Specific energy and enthalpy from partition function, Non-equilibrium Saha equations, Determination of thermodynamic and transport properties from Chapman Enskog Approach.

Fluid Model of Arc Plasma: Fluid model from kinetic theory, Vlasov equation, Handling of collisional term, Conservation of charge, mass, momentum and energy from moments of Vlasov equation, Generalized Ohm's law, MHD equations, Application of fluid model.

Electromagnetic Interactions in Arcs: Arc root dynamics and instability, Modes and origin, Mutual interaction between arc current and magnetic field, Electromagnetic pumping, Retrograde motion, Skin depth, JxB thrust.

Applications of Arc Plasma Devices: Cutting, Plasma Spraying, Gasification, Nanosynthesis, EDM discharges, Pyrolysis and Extractive metallurgy, Thermo-chemical cathodes, Erosion scenario, Understanding arc plasma behavior in different torches.

Plasma Technology for Renewable Energy and Environment: Plasma for waste management, Waste to energy concept, Pyrolysis, gasification and incineration, Elements of plasma gasifier plants, Principles and operation.

ADVANCED EXPERIMENTAL TECHNIQUES

PHYS04.13: Advanced Experimental Techniques in Nuclear & Astrophysics Advanced (15 Lectures / 2 Credits) (01-PHYS04-613-C)

Course Outcomes:

- Expose to advanced nuclear & particle detectors, detection techniques, electronic setup, data acquisition and major experimental setups using detector arrays. Expose to experimental techniques using gamma ray telescopes and atmospheric Cherenkov telescopes.

Course Details:

A. **Nuclear Physics**: Interaction of radiation (heavy charged particles, electrons, gamma rays, neutron and neutrino) with matter, Radiation detectors, General characteristics of detectors: efficiency, resolution and timing properties.
Gas detectors: Basic processes, ionization and charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter. Multi-Wire Proportional Counter (MWPC), Parallel Plate Avalanche Counter (PPAC), Time Projection Chamber (TPC) and Resistive Plate Chamber (RPC), Gas Electron Multiplier (GEM). Semiconductor detectors: Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium (HPGe and Clover) detectors, Compton suppression. Scintillation detectors: Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes. Miscellaneous detectors: Cryogenic detectors, thermal detectors, channeltrons and microchannel plates, hybrid detectors.
Experimental techniques: Particle identification methods using (DE-E) telescope, pulse shape discrimination, Cerenkov radiation technique, time of flight technique, magnetic spectrometers including recoil mass separator. Analog signal processing. Electronics modules for pulse processing: Preamplifiers, amplifiers, timing discriminators. Coincidence (fast and slow) techniques. Data acquisition systems (DAQ). Monte Carlo simulation of detectors to obtain efficiency. Digital signal processing.
Typical experimental setups using Strip detector array, Neutron detector array and Indian National Gamma Array (INGA) and other national and international facilities. Applied nuclear physics: Rutherford Back Scattering (RBS), Nuclear Reaction Ananlysis (NRA), Neutron activation Analysis (NAA), Accelerator Mass Spectroscopy (AMS).
B. **Astrophysics:** Experimental techniques in various wavebands: History of telescopes, resolving power, angular resolution, energy resolution, current and future generation large optical telescopes, X-ray telescopes, gamma, ray telescopes.
Science with gamma, ray telescope: Hadronic and leptonic emissions in astrophysical sources: observational perspective, cosmic ray measurement using VHE experiments, indirect detections of dark matter, estimation of extra, galactic background light using VHE observations, test on photon-ALP oscillation and violation of Lorentz invariance.
Extensive Air Shower (EAS) and Cherenkov radiation: Radiation length, critical energy, development of gamma, ray and hadron generated EAS, Cherenkov radiation: spectral distribution, threshold energy, emission angle, Cherenkov light pool and pulse duration, lateral distribution of Cherekov light for gamma, ray and hadron.
Imaging atmospheric Cherenkov telescopes: Features of Cherenkov telescopes: trigger threshold, flux sensitivity and cosmic ray background rejection, imaging technique, data analysis techniques for Cherenkov telescopes.

PHYS04.14: Experimental Techniques in Condensed Matter Physics (15 Lectures / 2 Credits) (01-PHYS04-614-C)

Course Outcomes:

- Expose to advanced experimental methods on X-rays and neutron scattering, synchrotron radiation, spectroscopy, microscopy and imaging techniques for fundamental understanding of the problems in Condensed matter physics.

Course Details:

X-rays and Neutron Scattering: X-rays vs. neutron scattering, Neutron scattering facilities and instrumentation.

Synchrotron Radiation: Basics of synchrotron radiation, Beamlines and techniques.

Spectroscopy Techniques: Basics of atomic and molecular spectroscopy, Raman, FTIR, EPR, NMR, FMR, Mossbauer spectroscopy, Impedance spectroscopy, UV-Vis absorption techniques and applications.

Microscopy techniques: Optical microscopy, Scanning probe microscopy, Electron microscopy. Techniques for electronic, magnetic, electrical transport, thermal transport, and calorimetric properties.

Imaging Techniques: Overview of different imaging techniques, X-ray, neutron and synchrotron based imagining techniques.

Detectors and Sensors: Single crystal scintillators and applications, X-rays and neutron gas detectors, Development and application of gas sensors.

PHYS04.15: Advanced Experimental Techniques in Laser Physics (15 Lectures / 2 Credits) (01-PHYS04-615-C)

Course Outcomes:

- Expose to high resolution spectroscopic techniques on Emission, Absorption, RIS, LIBS, LIF, etc. and their applications in fundamental and applied areas of Laser spectroscopy

Course Details:

Significance of high-resolution laser spectroscopy. Designing an experiment: Different types of atomic/molecular sources, Laser-atom/molecule interaction, Detection Techniques – light/ions, detectors, Designing an experiment.

High resolution spectroscopic techniques - Emission, Absorption, RIS, LIBS, LIF, etc.

Applications in fundamental and applied areas: Nuclear investigations through atomic spectroscopy, Multi-photon ionization of atoms /molecules, selective excitation /ionization, isotope separation, trace analysis, etc., Manipulation of atoms/molecules using Lasers – laser cooling, optical tweezers. Other advanced topics (e.g. STIRAP, FEL-spectroscopy, Laseratom interaction in high intensity regime)

2. Atomic Physics, *C.J. Foot, Oxford Master Series in Atomic, Optical and Laser Physics (Oxford University Press 2008)*

ADVANCED EXPERIMENTAL TECHNIQUES

PHYS04.16: Research Methodology (01-PHYS04-616-C)

Course Outcomes:

- Understand the basic concepts of research, data collection and presentation, scientific report writing, and ethics in research

Course Details:

Basic concepts of research: Meaning and importance of Research – Types of Research – Selection and formulation of Research Problem – Research Design

Types and methods of research: Classification of research, basic and applied research – similarities and differences, interdisciplinary research, case study, field study, survey of research fields, and methods of research as applied to basic and applied sciences – a few examples.

Data Collection and Presentation: Objectives and classification of data, data organization, presentation and interpretation – general concepts and methods, use of computers and related software for data collection, analysis and interpretation.

Ethics in Research: General ideas on presentation of scientific research, dissemination of research findings different methods such as publishing reports, patents and patent rules, presentation of work in conferences, ethics and norms to be followed in presentation of research findings, plagiarism and its consequences, how to avoid plagiarism in scientific research – a few case study.

Scientific Report Writing: Basic motivation for writing scientific report, content of a research report – a few case studies, methods of preparing research reports, use of computers in preparing reports, quantification of quality of research disseminated through journals or patents.

Attending seminars, colloquia and interaction with the scientists.

PROJECTS

PHYS04.17: Common projects at different divisions (15 Lectures / 2 Credits) (01-PHYS04-617-PR)

Course Outcomes:

- Gain an overall practical experience to decide and apply the appropriate method in future experimental investigations.

PHYS04.18: Common projects at different divisions (30 Lectures / 4 Credits) (01-PHYS04-618-E)

Course Outcomes:

- Get the exposure to the steps needed towards completing a focused topic as well as the research areas of thesis supervisor.

(Program Code: PHYS04)

SYLLABUS SUMMARY

Nuclear Reactor Physics

Course Code	Course Name	Hours	Credits
PY1	Mathematical Methods	45	6
PY2	Computational Methods	45	6
PY3	Introductory Reactor Physics and Engineering	35	4
PY4	Nuclear Physics and Nuclear Data	30	4
PY5	Engineering Drawing and Laboratory Practices and Experimental Methods	20	2
PY6	Reactor Materials	30	4
PY7	Radiation Detection and Measurements	20	2
PY8	Reactor Types and Advanced Reactor Concepts	20	2
PY9	Radiation Shielding Design and Protection	40	5
PY10	Reactor Dynamics and Safety Analysis	35	4
PY11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
PY12	Fluid Dynamics and Thermal Hydraulics	25	2
PY13	Advanced Computational Methods in Reactor Physics	35	4
PY14	Experimental and Operational Reactor Physics	35	4
PY15	Design Methods in Thermal and Fast Reactors and Computer codes	35	4
PY16	In Core of Fuel Management	25	2
Total		**505**	**59**

1. Mathematical Methods (PY1) : (45 lectures)

S.No	Course content
1.	Linear vector spaces, linear dependence and independence, basis and dimension. Linear transformations. Inner product, norm, continuity, convergence, completeness. Hilbert spaces.
2.	Fundamentals of matrices, eigenvalues, eigenfunctions, adjoints, inverse etc sparse matrices; diagonal dominance; non-positive and non-negative matrices; positivity theorems; large set of simultaneous equations.
3.	Functions of a complex variable. Rieman surfaces, Analytic functions Cauchy Rieman conditions and harmonic functions. Contour integration and Cauchy's integration formula. Residue theorem and evaluation of integrals.
4.	Ordinary differential equations - Order and degree of a differential equation, appearance and number of arbitrary constants in the solution of a n-th order differential equation, families of curves and orthogonal trajectories, first order homogeneous and exact equations, methods of reduction of order of some specific differential equations, second order linear homogeneous equations, superposition principle, method of finding second independent solution when one solution is known, qualitative properties of the solution, Sturm comparison theorem, operator methods for second order linear equation with constant coefficients, power series solution for second order linear equations, ordinary and regular singular points of a differential equation, indices corresponding to a regular singular points, hypergeometric and confluent hypergeometric equation, explicit example through solution of Bessel's equation.
5.	Partial differential equations – First order partial differential equations, complete integral and general solution, methods of solution of a first order partial differential equation, second order partial differential equations, Laplace's equation, wave equation, diffusion equations, system of surfaces.
6.	Integral equations – Definition, homogeneous, inhomogeneous, linear, non-linear equations, Fredholm and Volterra equations, eigenfuctions, Schmidt-Hilbert method of solutions.
7.	Integral Transforms. Fourier, Laplace Transforms and the inverse transforms, connection to physical problems Other transforms such as Mellin and Hankel transforms, and transforms generated by Green's function. Applications for obtaining solution of ordinary/partial differential equations.

Books suggested

1. Mathematical Methods for Physicists, G. B. Arfkin and H. J. Weber, Academic Press(2001) Also Prism Books, Bangalore
2. Elements of Partial Differential Equations, I. Sneddon, McGraw Hill (1957)
3. Theory of Functions of a Complex Variable, E. T. Copson, Oxford University Press (1935)

2. Computational Methods in Physics (PY2): (35 lectures + 10 Tutorials)

S.No	Course content
1.	**Computers, Computational Physics and Scientific Programming** a) Introduction to Computational Physics b) Components of a high performance computer- memory hierarchy, CPU design, Vector processing, Virtual memory, Number representation- Arithmetic of Fixed and Floating

point numbers, Machine precision, Errors and uncertainties in computation Types of errors, Error propagation

c) Computing software basics

d) Computer languages, Programming concepts, Programme design, Structured programming, Introduction to Fortran and C, C & Unix, Dialects of C, Functions and Program structure, Basic Data Types, Arrays, Strings, Expressions and Operators, Precedence of C Operators, C Preprocessors, Control Statements, Pointers, Pointer arithmetic, Arrays handling with Pointers, Functions in detail, Input and Output Operations and C file handling Operations, Structures & Unions in C, Dynamic Memory allocation, Macro definitions, Compilation and Execution of C program, Fortran to C Linking procedures.

e) Introduction to Parallel processing, High performance computing, Profiling and tuning, Visualization of scientific data

f) Highlights of FORTRAN-90 programming language. Programming in MATLAB

2. **Numerical Methods**

Linear algebra

a) Matrices

b) Solution of Linear Algebraic Equations and Singular Value Decomposition

c) Eigenvalue problems, Computing Eigenvalues and Eigenvectors

d) Iterative methods for Linear systems

e) Software for linear systems- LINPACK and LAPACK

Solution of Nonlinear equations

a) Bracketing and Bisection

b) Secant Method, False Position Method, and Ridders' Method

c) Newton-Raphson method

d) Software for nonlinear equations

Interpolation, Extrapolation and Numerical Differentiation

a) Differentiation- Forward, backward and central differences

b) Polynomial Interpolation and Extrapolation

c) Rational Function Interpolation and Extrapolation

d) Interpolation using Splines

Optimization methods

a) Optimization in one dimension

b) Multivariate problems- Steepest descent, Newton and quasi-Newton methods, Conjugate gradient methods. Constrained optimization

c) Maximum entropy and Genetic methods

d) Least square fitting, Non-linear least square fitting, Goodness of fit

e) Software for optimization- energy minimization

Numerical Integration

a) Integration- Newton-Cotes integration formulae, Gaussian quadrature

b) Integral equations

Probability , Random numbers and Monte Carlo methods

a) Uniformly distributed Pseudo random numbers

b) Exponentially and Normally distributed Pseudo random numbers

c) Testing of pseudo random number sequences

d) Simulation of radioactive decay

e) Numerical Integration

f) Monte Carlo simulation techniques

Fourier and Wavelet transforms

a) Fast Fourier Transform- Convolution and deconvolution, Correlation, Filtering, Power spectrum estimation

b) Wavelet transforms- Wavelets, de-noising, de-trending, Texture analysis, Pattern recognition, Image compression

Ordinary Differential equations

a) Initial value problems for systems of ode's

b) Runge-Kutta Method, and adaptive step size control

c) Stiff differential equations

d) Boundary value problems

e) Galerkin method

Partial differential equations

a) Finite difference methods for Parabolic, Hyperbolic and Elliptic equations

b) Truncation errors, consistency, stability

c) Introduction to finite element methods.

Tutorials: Assignments of problems and computations based on these and other methods using FORTRAN-77 / FORTRAN-90/ C++

Books Suggested:

1. Computational physics- Problem solving with computers, Rubin H. Landau, Manuel J. Paez, John Wiley & sons 1997.
2. Numerical Recipes in Fortran-77 / F-90 / C, W.H. Press et. al., Cambridge Univ. Press.(1996)
3. A First Course in Computational Physics, P.L. DeVries, John Wiley and Sons (1994)
4. Numerical Methods for Engineering Application, J.H. Ferziger, John Wiley and Sons (1998)
5. Scientific Computing: An Introduction with Parallel Computing, G. Golub and J.M. Ortega, Academic Press, (1993)
6. Scientific Computing: An Introductory Survey, Michael T. Heath, McGraw-Hill, New York,

2002.
7. Computational Physics, J. M. Thijssen, Cambridge University Press, Cambridge, 1999.
8. Guide to Neural Computing Applications, L. Tarassenko, Arnold Publishers, 1998.
9. Genetic Algorithms in Search, Optimization, and Machine Learning, D. E. Goldberg, Addison Wesley, Reading, Massachusetts, 1989.

3. Introductory Reactor Physics and Engineering (PY3): (35 lectures)

S.No.	Course content
	Part I
1.	Basic nuclear physics concepts. Properties of nuclei. Nuclear forces. Nuclear models. Nuclear decay. Liquid drop model and nuclear stability. Nuclear reactions including fission. Compound nucleus formation. Microscopic cross-section. Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	Chain reaction; four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.
5.	**Reactor Kinetics**: Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.
	Part II
1.	Neutron distribution in a system; assumptions in setting up the neutron balance equation; applicability of Maxwell-Boltzmann statistics; Time dependent neutron balance (transport) equation, with delayed neutrons
2.	**Steady State Neutron Transport Equation:** Transport equation – differential & integral forms, Diffusion approximation, One speed neutron diffusion theory, Boundary conditions, Source-sink problem, Sub-critical reactors with flux independent source, Separation of space and energy.
3.	**Slowing Down and Energy Dependence:** Elastic scattering, Inelastic scattering, Anisotropy, average energy loss per neutron, Concept of lethargy. Fermi age theory, age of neutron, Logarithmic energy decrement, Slowing down spectra, Slowing down in hydrogen, Definition of resonance integral, Shape of thermal neutron-Maxwell spectrum.
4.	**Resonance Absorption:** Resonance cross sections, Resolved and unresolved region, Spatial and energy self shielding, Narrow resonance and intermediate resonance approximation, Concept of potential scattering cross section, Resonance integral in homogeneous media, Doppler broadening of resonance and importance for safety.
5.	**Multigroup Diffusion Theory:** Energy group and group fluxes, Flux weighted group constants, One group theory for thermal neutrons, Two group theory, Two group two region

model core with reflector. Adjoint equation.

6. **Reactor Control:** Cold start-up, Hot power operation, Temperature loads, Effects of burnup and fission products. Function of control rods. Theory of control rods, Xenon load during operation, Xenon iodine concentrations after shutdown, Xenon override, Xenon poison out condition, Samarium poisoning. Temperature coefficient of reactivity.

   Density temperature coefficient.

7. **Fast Reactors:** Fast reactors as breeders, comparison of fast and thermal reactors, role of fast reactors in Indian 3 stage nuclear power program

8. Neutron spectrum in FBR, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, delayed neutron fraction, fuel expansion and bowing, sodium void reactivity effect, Optimisation of blanket thickness. Effect of burnup on fuel composition and reactivity coefficients

9. General features of FBR core, specific power, linear rating, fluence, requirement and choice of core materials (fuel, coolant and structural materials), types of fast reactors – pool and loop type. Optimisation of core height and pin diameter. Salient physics aspects of FBTR and PFBR

Books suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C.Edlund. Van Nostrand, 1952.
2. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand, 1990
4. The Physical Theory of Neutron Chain Reactors, Weinberg A. M. and Wigner E.P.
5. Nuclear Reactor Theory, Bell and Glasstone, Van Nostrand, 1970
6. Physics of Nuclear Reactors, Jakeman D.
7. A. E. Walter and A. B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981
8. Weston M. Stacey, "Nuclear Reactor Physics", John Wiley & Sons, Inc., 2001

4. Nuclear Physics and Nuclear data (PY4): (30 lectures)

S.No	Course content
	Part I - Nuclear Physics
1.	Properties of Nuclei; Binding Energy Curve; Stability Curve – neutron rich isotopes; nuclear interactions: neutron scattering, isotropic and anisotropic scattering. neutron capture, (n,xn) reactions; reaction thresholds, fission; Variation of cross-section with respect to (nuclide) material, reaction and incident energy; Resonance (Resolved/Unresolved) and Continuum regions; Mathematical formalisms to represent these data.
2.	**Nuclear models:** Nuclear potential; liquid drop, shell and optical models. Fission process; Fission barrier; (n,f) - thermal and high energy neutron induced fissions; Fission products and decay; FP elemental mass/isotope chains and distribution; prompt fission and delayed fission neutron energy distributions; energy yield per fission; neutron yield in fission with neutron energy (nu-p); photo neutron.
3.	Important neutron reactions with fuel, control and structural materials in reactor systems.

4. High energy proton interactions with heavy metals; spallation process; spallation products; neutron source distribution from spallation.

Part II - Nuclear Data

1. Four major kinds of nuclear data, viz. nuclear constants data, nuclear structure data, nuclear decay data, and nuclear reaction data. Importance to application areas, like therapeutic treatments, agriculture, and nuclear energy. Kinds of data, like neutron interaction data, neutron/gamma production data, gamma-atom interaction data, etc., pertinent to reactor physics applications.

   Measurements and model based predictions; Transmission experiment for total cross-section, measurement of differential scattering cross-section; Time of flight method, sources of errors in measurement – energy resolution; Optical model, Statistical Model, etc.; Examples of model based computer codes.

2. **Nuclear data Evaluation:** Problems of scarcity and/or abundance of nuclear data, need of nuclear data evaluation; Evaluated nuclear data files (ENDF), ENDF/A, ENDF/B,JENDL and JEFF; General purpose and Special purpose libraries; Sublibraries for neutron, photon, and charged particle interactions, Fission product yields and decay data; Problems of multiple evaluations; Formats and procedures; MAT, MF, MT conventions; Representation of different kinds of data, tabulated and parametric representations, single/multi level resonance formalisms in the resolved/unresolved region, BW formulation, partial & total widths, negative resonance energies, interpolation schemes. IAEA-NDS; Related websites.

3. **Nuclear data Processing:** Need for processing of an evaluated data Steps of processing; Simplifying assumptions and tolerances; Precautions on consistency and accuracy. Popular processing cods: PREPRO and NJOY and their modules, Linearisation: Advantages of linearization; interval halving procedure, tolerance (error criterion), probable pitfall – position of maximum deviation; Program LINEAR.

   Resonance Reconstruction. Doppler broadening: Effect of target temperature on cross-sections – for low energies, for resonances and for threshold reactions; kernel broadening approach, submerging small resonances due to broadening. Validation of evaluated and processed cross-sections.

4. **Multigrouping:** Consideration for deciding the number of groups and group limits. Neutron cross-section averaging: conservation of reaction rate, transport cross-sections, flux and current weighting, self-shielding, dilution and temperature dependences, multigroup cross-section set, effective cross-sections, mixture cross-sections, collapsing of cross-sections, group-to-group transfer cross-sections; Anisotropy and Legendre moments. GROUPIE/GROUPR programs; Validation of multigroup cross-sections.

   Photon production cross-sections; photo-atomic interaction cross-sections; coupled multigroup cross-section set; GAMINR program.Activation cross-sections; relevance of residual nuclear levels. Displacement cross-sections; relevance to radiation damage in reactor materials.

Books suggested:

1. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen (Ed.) CRC Press, West PalmBeach, Florida (1986).
2. ENDF – 102, Data Formats and Procedures for the Evaluated Nuclear Data for ENDF – VI, M.Herman (Ed.) BNL-NCS-44945-05, (2005)
3. Special Issues on Evaluated Nuclear Data File ENDF/B-VII.0, J.K.Tuli, Nuclear Data Sheets, Vol-107 (2006)
4. Introduction to Nuclear Reactor Theory, Lamarsh J.R., ANS, (2002)

5. Engineering Drawing and Laboratory Practices (PY5 & PY5A): (20 lectures)

S.No	Course content
1.	**Machine Drawings Projections:** orthographic – 1st & 3rd Angles pictorial; Oblique: Perspective.
2.	Introduction; Indian and International standards for drafting and related subjects.
3.	**Line, lettering and dimensioning:** Outline hidden lines, Centre lines, Dimensional lines, Extension/Projection lines, Construction lines, Section lines, Leader/pointer lines, Cutting plane lines, Border lines, Short & long break lines, Representation of welded joints.
4.	**Dimensioning and tolerancing:** Definition and general principles, Arrangement of dimensions - Chain and parallel dimensioning, method of dimensioning common features; Rules for inscription of tolerancing. Limits fits. Tolerances and surface finish.
5.	**Scales, lines and lettering:** Recommended scales; Different type of lines, their illustration and application; Recommended size of letters and numerals.
6.	**Sections:** Full Section, Half section, Partial section, Revolved section.
7.	**Projections:** Orthographic – 1st & 3rd Angles; Pictorial – Oblique and Isometric
8.	**Conventional representation of common features and sections:** Conventional representation of gears and gear assembly, Threads, springs, bearing, welded joints. Hatching, sectioning, cutting planes.
9.	**Fastenings:** Bolts, studs, screw, washers, set screw, split pins.
10.	Brief Introduction of AutoCAD and its use, common drawing and edit commands.

Laboratory Practices:

1. Errors in measurement. Accuracy and precision. Software, data analysis, filtering and plotting.

   Electronic components of detector systems.Analog electronics, Electromagnetic interference, shieldind and grounding of electronic equipments. Measurement of temperature, pressure, mass, volume and flow. Instrument time constant and response time.
   Production and measurement of (low pressures)vacuum and high pressures.
   Production and measurement of high temperature and low temperatures.

   Computer hardware. Intelligent systems, Computer control and automatic data acquisition. User friendly experimental automation with G (graphical) language.

Books suggested:

1. Indian Standard Code of Practice for General Engineering Drawings (Second Revision); Bureau of Indian Standards.
2. Geometrical and Machine Drawing by N.D. Bhatt; Charotar Publishing House, Anand (WR), India

6. Reactor Materials (PY6): (30 lectures)

S.No	Course content
1.	Properties of fuel materials. Uranium metal, Uranium dioxide, Carbide and nitride fuels. Plutonium fuel materials. MOX fuels. Thorium fuel materials. Fabrication of fuel pellets: sintered and vibropacked.
2.	Dispersion type fuels. Inert matrix fuels, Metallic fuels, sol-gel process. Fuel for HTRs – coated particle / TRISO/ spherical fuel balls for high powered systems.
3.	General requirements of structure and clad materials. (neutronic and physical) Aluminum and alloys. SS and low alloy steels. Nickel alloys. Zirconium and alloys. Properties of moderator and coolant materials. Graphite, Beryllium, water and heavy water. Liquid metals. Heat transfer coefficients.
4.	Mechanical properties of materials. Stress-train relationships. Ductile and brittle failure. Ductile to brittle transition, Fatigue failure, Creep and dilation.
5.	Stress analysis, Thermal stress in fuel clad. Thermal stress in hollow cylinder with no heat generation, Thermal stress in hollow cylinder with exponential heat source, Factors affecting thermal stress.
6.	Radiation effects in materials. Atomic displacements. Mechanisms in radiation damage, General irradiation effects in metals. Thermo-physical properties of fuel (pellet) materials; variations with burnup Temperature dependent swelling. Helium embrittlement. Typical limits of irradiation damage
7.	Corrosion of metals. Chemical corrosion, erosion and fretting corrosion, Stress- corrosion cracking, Hydrogen embrittlement. Fuel clad failure process.
8.	Advaced materials for future FBR, ADS and high temperature reactor. Ferritic steels, oxide dispersed steels and carbon based materials

Books suggested:

1. Nuclear Reactor Engineering, Glasstone and Sesonske, Van Nostrand.
2. Fundamental Aspects of Nuclear Reactor Fuel Elements, D.R. Olander, ERDA report, TID 26711-P1 (1976).

7. Radiation Detection and Measurement (PY7): (20 lectures)

S.No	Course content
I	**Interaction of radiation with matter:**
1.	Energy loss of heavy charged particles in matter – Electronic stopping power (Bohr and Bethe-Bloch formulae), Cherenkov radiation. Energy loss of electrons and positrons – Electronic stopping and energy loss by Bremsstrahlung radiation.
2.	Interaction of photons – Photoelectric absorption, Compton scattering, pair production, Electromagnetic shower in high energy photon and electron interaction with matter.
3.	Interaction of Neutrons – elastic scattering, radiative capture, positive Q-value reactions such as (n,p), (n,gamma), (n,fission) and hadron shower production at high energies.

II **Radiation detectors:**

1. General characteristics of detectors – efficiency, response in energy, time, position and corresponding resolutions, recovery time or count rate handling capability.
2. Gas detectors Basic processes, Q-V characteristics as a function of primary ionization, charge multiplication. Ionization chamber, proportional counter, avalanche counter and Geiger Muller counter.
3. Semiconductor detectors Silicon detectors (surface barrier, PIN diodes, Li drifted silicon detectors). Germanium detectors (planar and cylindrical geometry). Photovoltaic cells, charged coupled devices.
4. Scintillation detectors. Inorganic and organic scintillators, photomultipliers, photodiodes, avalanche photodiodes.
5. Techniques and detectors for neutron and spectrum measurements. Fission ionization chambers. Boron filled and coated detectors. Gamma compensation. Self powered neutron detectors.
6. Pulse processing instrumentation, preamplifiers(charge, voltage sensitive), amplifiers (spectroscopy or high resolution, fast and timing filter), single channel analyzers, timing discriminators(leading edge and constant fraction types), gate and delay generators, coincidence(fast and slow) units, linear gate and stretchers, time to amplitude converter(TAC), scalers and rate dividers, analog to digital converter(ADC), charge to digital converter(QDC), time to digital converter(TDC), data acquisition systems (multichannel analysers and computer based multiparameter systems).
7. Experimental techniques and simulation - Particle identification methods (pulse shape discrimination, Cerenkov radiation), Compton suppressed high purity germanium detectors for high-resolution gamma spectroscopy, magnetic spectrometers including recoil mass separator. Monte Carlo simulation of detectors.

Books suggested:

1. Techniques for Nuclear and Particle Physics Experiments – W.R. Leo, 2nd Ed. (Springer International Student Edition published by Narosa Publishing House, New Delhi 1995).
2. Radiation Detection and Measurement – G.F. Knoll, 3rd edition (John Wiley, New York 2000)
3. Nuclear Radiation Detectors – S.S. Kapoor and V.S. Ramamurthy (Wiley Eastern Ltd, New Delhi 1986)
4. Radiation Detectors, C.F.G. Delaney and E.C. Finch (Clarendon Press 1992).

8. Reactor Types and Advanced Reactor Concepts (PY8): (20 lectures)

S.No	Course content
1.	**Thermal Reactors:** History. Development of Gas Cooled Reactors (GCR). Reactor types AGR and RBMK. Development of BWR. Development of PWR and VVER. Development of PHWR and SGHWR.
2.	**Fast Reactors:**

History. Development of LMFBR.

3. **Advanced Reactors:**

Different generation of nuclear reactors. Evolutionary improvements and revolutionary improvements. High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR).

Metal fuelled FBR and increased fuel breeding.

Accelerator driven systems (ADS)

Fusion Systems. JET and ITER. Concept and need for tritium breeding.

4. **Indian Reactors (Experimental and power producing):** For each type of reactor - brief principles of the reactor; typical Power/ Research reactor system; Fuel cluster/assembly; number of channels; core; coolant/moderator/reflector/blanket and shield as the case maybe; average neutron energy spectrum; control and shut down systems.

- APSARA/ CIRUS/ DHRUVA
- PHWR –India (220, 540 and 700 MWe)
- LWRs
- BWR (TAPS 1&2, modern BWRs,)
- VVER (KK)
- FBTR and PFBR

5. International Initiatives in Advanced Nuclear Systems: INPRO (IAEA) and GEN-IV. US proposal GNEP. International concerns. Nonproliferation, (proliferation indices), NPT, FMCT, CTBT.

Books Suggested:

1. W. Marshall ed. Nuclear Power Technology, Volumes I to IV, Clarendon Press, Oxford, (1984).

9. Radiation Shielding Design and Protection (PY9): (40 lectures)

S.No **Course content**

1. **Basics of radiation physics and dosimetry**

Radiation sources, its interaction with matter; natural and induced radioactive sources, half-life, decay constant, specific activity; basic interaction mechanisms of alpha, beta, gamma/x-rays and neutrons with matter (*summary only*).

Definition of various dosimetric terms (exposure, absorbed dose, equivalent dose, effetive dose, concept of radiation and tissue weighting factors and their importance, Activity, Specific activity (SI units and Old units), radiological, biological and effective halflife and their relation and their importance. Concept of ALI and DAC with suitable problems.

Human Body: cells, tissues and organs, structure of cell, cellular effects. Factors which influence the damage of cell. Interaction of radiation with biological matter. stochastic and deterministic effects. Acute and delayed effects. LD 50/60, Doubling dose. Radiation toxicity, Risk factor.

2. **Radiation Protection**

Radiation protection philosophy, objectives and principles of radiation protection ALARA, stochastic and deterministic effects, justification, optimization and dose limitation, Dose limits to occupational workers and members of public, Dose constraints, Investigation limits. Types

of exposure (natural, occupational, medical and public).

External and internal exposures; internal routes of intake of radioactive material. Use of personal dosimeters (TLDs, pocket dosimeters). Calculation of dose, Exposure measurement: Free air and air wall chambers (concept of wall thickness should be given), exposure-dose relationship, Fundamentals of ICRP respiratory model, ingestion, Gastro intestinal track model, wholebody counting and bioassay techniques.

Atomic Energy Act, National and international regulatory bodies, their role and responsibilities, Radiation protection rules, Safety during transport of radioactive materials, Radioactive waste classification and management.

3. **Radiation Shielding**

Shielding concepts- gamma shielding- Attenuation factors. Buildup factor concept for homogeneous and multiple layers. Semi-analytical methods for gamma shield design. Dose rates of gamma rays for various source geometries. Gamma energy dependence of dose. Half layer thickness of different materials. Heat generation.

Neutron shielding. Shielding in thermal reactors. Importance of shielding in fast reactors. In-vessel shields and reduction of dose to components and operating personnel. Activation of structural material and heat generation. Shielding in accelerators and fusion systems.

Computational problems. Transport theory methods. Large problem size and large flux attenuation. Importance of anisotropy effects in scattering. Neutron slowing down and need for fine energy treatment. Monte Carlo methods. Streaming through gaps, voids and pipes. Analytical methods. Complementary shielding.

Selection of shield materials. Shielding from mixed sources. Life of shield materials.

4. **Nuclear Emergency management**

Nuclear accidents, emergency preparedness and management: reasons for accidents, classification of accidents, International Nuclear Event Scale, types of emergency, emergency preparedness, countermeasures. Aerosol physics for core disruptive accidents, Atmospheric transport processes, environmental impact studies.

Books suggested:

1. Nuclear Radiation Detection - W.J. Price, McGraw Hill (1964)
2. Radiation Detection and Measurement - G.F. Knoll, John Wiley and Sons (1989)
3. Biological Effects of Radiation – J.E. Coggle, Taylor and Francis (1983)
4. Atoms,Radiation and Radiation Protection by James E.Turner, Wiley (2007)
5. Problems and Solutions in Radiation Protection by James E. Turner et al., Wiley, (1988)
6. Introduction to Health Physics – Herman Cember, McGraw Hill (1996)
7. Introduction to Radiation Protection –Alan Martin and Samuel Harbison, Chapman and Hall (1986)
8. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998.
9. Radiation Shielding- Three volumes of Compendium on Radiation Shielding, O.Sisman and J. Jaeger et.al., ed. (1975)
10. Radiation Shielding Manual T Rockwell et.al ed. AEC-US, (1958).

10. Reactor Dynamics and Safety Analysis (PY10): (35 Lectures)

S.No	Course content
1.	**Reactor Dynamics**
	Neutron kinetics and thermal effects. Feed back effects. Time constants. Loosely and strongly coupled reactor systems; Reactor size and eigenvalue separation; fundamental and higher modes.
	Description of main reactor systems. Coolant system behaviour. Plant dynamics (open loop and closed loop). Flow perturbations. Reactivity perturbations. Thermal perturbations. System stability. Linear and non-linear stability analysis; Nyquist critera; Liapunov methods.
	Xe dynamics equations; spatial and time dependent oscillations and stability.
	Safety concepts. Defence in Depth (5 levels)
	Accident Categories / classification: Design basis events (DBE) and Beyond DBE (BDBE). Loss of Regulation Accident(LORA), Transient Over Power Accident(TOPA), Loss of Coolant Accident(LOCA), Loss of Flow Accident(LOFA), cold coolant additions – with shut down action; Anticipated Transients with out SCRAM(ATWS)- Un protected Loss of Flow (ULOF) and Unprotected Transient over Power (UTOP).
	Accident scenarios in thermal and fast reactors. Brief description of accidents at Three Mile Island, Chernobyl and FERMI reactor.
	Computer codes for modeling accidents in thermal and fast reactors. RELAP and SAS4A.
	Kinetics of ADS.
2.	**Safety Systems**
	Engineered safety systems. Safety Critical Systems (SCS); Safety Groups, SCS, actuation systems, safety support systems.
	Shut down Systems. Different shut down states; Shut down margins (SDM). Guaranteed shutdown states (GSS).
	General safety criteria. Examples of safety analysis of PHWR, LWR and FBR.
3.	**Introduction to Reliability and Probabilistic Safety Analysis (PSA)**
	Probability, random variable, probability distributions used in Reliability Analysis; uniform, exponential, Weibull, Normal and χ^2 distributions, Central Limit Theorem.
	Basic component reliability models, definition and other measures of reliability such as Availability, failure frequency, dependability, fail safe design, safe failures/unsafe failures.
	Reliability Block Diagram, series and parallel systems, minimal cutsets, Combinatorial (Fault Tree / Event Tree) and State Space methods (Markov Models), Binary Decision Diagram.
	Common Cause Failures, Human Reliability Analysis: Models of Common Cause failures and Human Reliability Analysis, independence, redundancy, diversity.
	Probabilistic Safety Assessment of Nuclear reactor, measures of risk, core damage frequency, Level-1, Level-2, Level-3 PSA (introduction).

Books suggested:

1. Fast Reactor Safety, John Graham, Academic Press (1972).

2. The Technology of Nuclear Reactor Safety, Vol-I and II, T.J.Thompson and J.G.Beckerley, MIT Press (1971).
3. Reactivity Coefficients in Large Fast Power Reactors, H.H.Hummel and D.Okrent, ANS (1970).

11. Fuel Cycle Physics and Introduction to Fuel Cycle (PY11) : (30 lectures)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.
8.	Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9.	U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10.	Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11.	Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12.	Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13.	Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14.	Isotopic separation operation of bred uranium in thorium cycles to remove U-232. MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Fluid Mechanics and Thermal Hydraulics PY12 (25 lectures)

S.No	Course content
1.	**Fluid Mechanics**
	Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines, streak lines, path lines – equation of Continuity, Euler's equations of motion – Navier Stokes equations.
	Hydrostatics – Manometry – Fluid force on planes and curved surfaces, – Aerostatics – variation of pressure, temperature and density with altitude – stability of atmosphere – Fluids subjected to uniform linear acceleration and uniform rotation.
	Analysis of fluid motion in integral form – Concept of a system and a control volume – equations of continuity, energy, linear momentum and angular momentum as applied to a control volume in fluid flow and their applications to propellers, pumps and turbines.
	Dimensional analysis, similitude and model testing – Laminar and turbulent flows – Viscous effects – Boundary layer – Separation phenomena – Losses in pipes.
2.	**Thermal hydraulics**
	Conduction: Steady state conduction in one and two-dimensional systems – One dimensional unsteady state conduction; analytical and numerical methods. Heat generation in cylindrical and plate fuel elements; Steady state heat transfer from fuel to coolant; concept of $\int KdT$; Axial temperature distribution in the fuel element; Maximum clad surface temperature.
	Convection: Basic equations, Boundary layers; Forced convection: External and internal flows, correlations, Natural convection. Natural circulation cooling during pump trip transients; flow coastdown; decay heat removal; natural circulation in advanced reactor concepts, flow instabilities.
	Radiation heat transfer: Basic laws, Properties of surfaces, view factors, network method and enclosure analysis for gray – diffuse enclosures containing transparent media, Engineering treatment of gas radiation.
	Boiling heat transfer: bubble nucleation; transition and film boiling (a) pool boiling and (b) flow boiling; heat transfer coefficients in pool and flow boiling. Horizontal and vertical surfaces. Two-phase flow; flow regimes; mixture quality; void fraction; mixture density; pressure drop.
	Concept of pressure drop in nuclear channels: objectives and methods of flow orificing; orificing in BWRs and FBRs. Hot spot factors; classification; determination of subfactors; overall hot spot factor-statistical and multiplicative approaches.
	Condensation: Surface tension- bulk Condensation – Dropwise condensation on solid surfaces, Film condensation, Nusselt's theory.
	Critical heat flux: mechanism of dryout and Departure from Nucleate Boiling (DNB); thermal margin – MCHFR; MDNBR; critical power concept.

Books Suggested:

1. Thermal Hydraulic Fundamentals, Neil E. Todreas, Hemisphere (1990).
2. Fluid Mechanics, F. Dougles et al., Pearson Education, 2006.

3. Heat Transfer, J.P. Holman, Eighth Edition, McGraw Hill, 1997.
4. F.P. Incropera and D.P. Dewitt, "Fundamentals of Heat and Mass Transfer, John Wiley and Sons, Fourth Edition, 1998.
5. Fast Breeder Reactors, Waltar A.E. and Reynolds A.B, Pergamon Publishers, New York, 1981.

13. Advanced Computational Methods in Reactor Physics (PY13): (35 lectures)

S.No.	Course content
1.	**Methods of solving neutron Diffusion equation:** Finite differencing of diffusion equation. Centre and corner mesh differencing schemes. Rectangular and triangular (hexagonal) meshes; Inner and outer iteration schemes. Acceleration methods for inner iteration scheme. Spectral radius and determination of acceleration parameter. Acceleration methods for outer iteration scheme. Power iteration and dominance ratio.
2.	Modern nodal methods. General weighted residual methods. Finite element method- its advantages and disadvantages. Coarse mesh rebalancing.
3.	Estimation of fundamental and higher harmonics; subtraction methods
4.	**Methods of solving neutron transport equation** **(i) Lattice:** (a) P_N method (b) Discrete ordinates method (c) Collision probabilities methods Collision probability method in 1-D and 2-D geometries. Interface current method. (d) Characteristics method.
5.	**(ii) Core and Shield:** Discrete ordinates methods in 1-D, 2-D and 3-D geometries. Diamond differencing scheme. Computer code ATES-3. Monte Carlo methods for core calculation; deep penetration problems. Computer code MCNP.
6.	Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations. (ORIGIN
7.	Differencing of kinetic equations in time. Approximate solution of point kinetic equations. Space time kinetics. Adiabatic approximation. IQS; explicit and implicit time differencing methods.

Books suggested:

1. E.E.Lewis and W.F. Miller, Computational Methods of Neutron Transport, Wiley (1984) and ANS (1993).
2. G.I.Bell and S. Glasstone, Nuclear Reactor Theory, Van Nostrand (1970).
3. A.F. Henry, Nuclear Reactor Analysis, MIT Press (1975).
4. M. Clark and K.F. Hansen, Numerical Methods of Reactor Analysis, Academic Press (1964).

14. Experimental and Operational Reactor Physics (PY14): (35 lectures)

S.No	Course content
	I. Experimental Reactor Physics (10 hrs)
1.	Source and power range neutron detectors; Neutron sources- requirement vis-à-vis reactor type-External localised sources in LWRs and FBRs - internal distributed spontaneous fission / photo-neutron sources in PHWRs. Different steps of initial start-up in different research and power reactors.

2. Moderator experiments-measurement of diffusion length, age, migration length. Exponential experiment-Alpha dieaway (decay) experiment. Subcritical multiplication experiments-Critical mass measurements.

3. Low power experiments at criticality for validation of reactor physics evaluations-Measurement of neutron flux-Thermal and fast-Activation analysis-cadmium ratio-General methods of flux measurement- foil/wire activation methods, Measurement of buckling, power peaking and power distribution.

4. Neutron spectrum unfolding; differential measurements for reaction rates.

5. Dynamic methods of reactivity evaluation Reactor Period measurements-Measurement of reactivity-control Rod Calibration-power run-down experiments-reactivity coefficients measurements –Temperature and void coefficients measurements. Dose and shielding experiments-cross-section measurements.

6. Reactor noise methods- Process parameter measurements using neutronics-coolant flow measurement with N-16 gamma signals- failed fuel detection using delayed neutrons and noble gas fission products.

7. **Critical Facilities:**

   Thermal – ZERLINA, AHWR-CF, PURNIMA (1,2,3) ZED-2

   Fast – GODIVA (US), ZEBRA (UK), ZPPR (US), MASURCA (France), BFS (Russian).

8. **Subcritical Facilities with source:** MUSE, YELINA, PURNIMA-SCF, AHWR-C with source.

II. Operational Reactor Physics (20 hrs)

1. First Approach to Criticality; low power physics experiments; control requirements; general control schemes (auto or manual control as the case may be); spatial power control; nominal operation, power rise schemes; set-back and step back (as applicable); Reactivity balance in operating reactors.

2. Thermal power estimation using secondary and primary parameters – station heat balance. Assembly/ Bundle power, channel power, Linear Heat Rating (LHR): operational and safety limits; Bundle power envelops in PHWRs.

3. Failed fuel detection – delayed neutron monitoring; Fission Product (FP) gammas and volatile-gaseous FPs Back ground activities in the coolant.

4. Research Reactors: APSARA/CIRUS/DHRUVA – application. FBTR operation and applications. KAMINI operation and applications

5. Power Reactors: Operation of 220 and 540 MWe PHWRs : Incore flux mapping system BWR (TAPS- 1&2), PWR / VVER , PFBR

Books Suggested:

1. Experimental Reactor Physics, A.Edward Profio, John Wiley and Sons.

15. Design Methods in Thermal and Fast Reactors including Computer Codes (PY15): (35 lectures)

S.No **Course content**

I. Thermal Reactors

1. Popular multigroup nuclear data libraries and their group structure.
2. Spatial heterogeneity in different thermal reactors. Wigner-Seitz cell approximation. Self shielding effects in space and energy. Neutron transport treatment. Computer codes MURLI and CLUCOP.
3. Fuel assembly heterogeneity and supercell concept. Neutron transport treatment. Computer codes –SUPERB, CLUB, CASMO. Analysis of plate fuel assemblies. Special treatment of burnable absorbers and control rods.
4. Treatment of hexagonal lattices, EXCEL, TRIHEX.
5. WIMS Methodology ; HELIOS Computer code
6. Generation of cell and assembly parameters as a function of burnup and boron concentration in moderator.
7. Core computations. Core follow up and refueling. Computer codes DIF3D, VENTURE and COMESH. Core simulation codes TRIVENI and COMETG.

II. Fast Reactors

1. Popular multigroup libraries and their group structure.
2. Treatment of slowing down and energy self shielding. Heterogeneity effects in absorber rods. Computer code COHINT.
3. Breeding ratio and its variation with core material geometry. Radial and axial heterogeneous designs. Oxide, carbide and metal fuel and their effect on core safety parameters.
4. Hexagonal geometry effects. Optimisation of blanket thickness. Sodium void reactivity effects. Fuel burnup modeling.
5. Fuel management schemes in FBTR and PFBR. Effects on breeding ratio and power distribution. Computation of peak linear heat rating from measured outlet temperature distribution.
6. Computer code FARCOB. Code system ERANOS.

Books suggested:

1. R.J.J. Stammler and M.J.Abbate, Methods of Steady State Reactor Physics Nuclear Design, Academic Press (1983).
2. Handbook of nuclear reactor calculations: Vols I-III, Yigel Ronen Ed. CRC Press, West Palm Beach, Florida (1986).

16. In Core Fuel Management (PY16): (25 lectures)

S.No **Course content**

1. General in-core fuel management schemes. Advantages and dis-advantages of on-line and batch fuelling. Initial and equilibrium core concepts.

   PHWR: Online fueling; refueling strategies; core burnup - power distribution optimization; time average and snap shot evaluations; theory of computer code TAQUIL. Average exit burnup. Core followup; theory of TRIVENI code. Channel Power Peaking Factor (CPPF). Rules of channel selection. Fuelling in PHWRs: (220 & 540) Discharged bundle data – Pu production & Pu-vector.

2. **BWR:** Initial fuel loading; equilibrium cycle Batch fueling concepts; different core loading concepts – checker board, out-in, sector symmetric. Cycle length and Haling principle. SDM demonstration. Control rod pattern. Power distribution optimization. Core followup computer code COMETG. Minimum Critical Heat Flux Ratio (MCHFR).
3. **PWR and VVER:** Initial loading, equilibrium loading. Boron poison management. Fuel enrichment change and use of burnable absorber. Departure from Nucleate Boiling Ratio (DNBR).
4. **AHWR:** Basic principles of fuelling
5. **HTR:** Basic principles of fuelling

suggested:

1. P. Silvennoinen, Reactor Core Fuel Management, Pergamon Press (1976).
2. R.G. Cochran and N. Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

Homi Bhabha National Institute, RRCAT, Indore

Ph.D. in Physical Science
(Program Code: PHYS04)

Raja Ramanna Centre for Advanced Technology, Indore

Courses offered at HBNI, RRCAT for
Ph. D. in Physics
M.Tech. in Engineering Physics
(Specialization in Accelerators and Lasers)

- Total credit requirement for Ph. D. (Physics) : 60

Core courses	28 credits
Elective courses	20 credits
Laboratory experiments	04 credits
Two reading courses	08 credits

- Total credit requirement for M.Tech. (Engineering Physics) : 60*

Core courses	38 credits
Elective courses	12 credits
Laboratory experiments	04 credits
Short term project	06 credits

* An additional course (Foundation course) of 5 credits is offered to M.Tech. students as a bridge course.

Contents

Page No.

Syllabus for Ph. D. (Physics)

A : Core Courses

03PHYS04-001-C: Engineering Mathematics Credit (3)

Complex Analysis: Analytic functions, Cauchy-Reimann conditions, Cauchy integral theorem, Laurent expansion, conformal mapping, singularities, calculus of residues, evaluation of definite integrals.

Vector Calculus: Gradient, divergence and curl operations and their physical interpretations, vector integrations, Gauss theorem, Stokes theorem.

Matrix: Basic concept of matrix algebra, symmetric, skew-symmetric and orthogonal matrices, eigenvalues and eigenvectors of a matrix, hermitian, skew-hermitian and unitary matrices, illustration of symplectic matrices in particle transporting accelerator.

Integral Transform: Fourier integral, Fourier transform and inversion theorem, Fourier transform of derivative, convolution theorem, transfer function, Laplace transform, Laplace transform of derivatives, convolution theorem, inverse Laplace theorem.

Ordinary and Partial Differential Equations: Review of ordinary differential equations, introductions to partial differential equations, classification of partial differential equations, boundary and types of partial differential equations, solutions of one dimensional diffusion equation, two-dimensional Laplace equation, use of integral transform in solving partial differential equations. Introduction to difference equations.

Probability and Statistics: Bayes' formula, random variables, expected value and variance, discrete and continuous distributions, location parameters, joint distributions, conditional distributions and independence, covariance and correlation, bivariate normal distribution, Poisson process, the central limit theorem, statistical inference (with an aim to better understand and analyze experimental data), point estimators, estimating variance, confidence intervals, comparing two samples, estimation methods, hypothesis testing, goodness of a fit.

2. "Mathematical Methods for Scientists and Engineers", Donald A. McQuarrie
3. "An Introduction to Probability: Theory and its Applications- Vol.1 and Vol 2", William Feller
4. "Ordinary Differential Equations" V.I. Arnold
5. "Advance Engineering Mathematics", Erwin Kreyszig

03PHYS04-002-C: Magnet Physics and Technology: Credit (4)

Origin of Magnetism: Classical and quantum concepts, magnetic moments, angular momentum and quantization of angular momentum.

Classification of Magnetism: Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism, and ferrimagnetism.

Role of Magnets in Accelerators: Dipole, quadrupole, sextupole, and combined function magnets, DC and fast cyclic magnets, septum magnets, and kicker magnets.

Fundamentals of Magnet Design: Magnetic circuit, dipole, quadrupole, sextupole and higher order multipole magnets and coil design, B-H curve.

Application of Magnetic Materials in Accelerators: Materials for DC magnets: low field magnets, high field magnets, permanent magnets, and shielding.

Materials for AC Magnets: Silicon steels, laminated Ni-Fe alloys, and Ferrites. Numerical methods for magnet simulation: computer code and related mathematical formalism, methods of optimization, multipole expansion, Fourier representation of magnetic field.

Magnet Technology: Fabrication procedures, tolerances, and economic issues.
Methods of magnetic field measurements: magnetic induction, search Coil, Hall probe, and nuclear magnetic resonance.

Superconducting Magnets: Basic concept of superconducting magnets, magnet geometries for dipole magnets, superconducting materials, need for twisted composite conductors, hot spot temperature, current densities, quench, training of magnets and persistent switch.

Geodesy and Alignment of Accelerators: Introduction, survey and alignment as applicable to accelerators and its requirement. Position sensitive elements and their typical tolerances for alignment, fiducial references and adjustment system, fiducial posts and targets, and techniques of fiducialsation. Features of support elements and their adjustments during alignment.

Network and Alignment Procedure: Defining coordinate systems, control networks-types, survey procedure, data adjustment and error analysis.

Survey and Alignment Instruments and Toolings: Electronic theodolite, optical level, laser Interferometer, distinvar, inclinometer, offsetmeter etc. Different types of targets and sensors.

03PHYS04-003-C: Laser Physics and Technology: Credit (4)

Basic Formalism: Spontaneous and induced transitions, Einstein's approach, A and B coefficients, conditions for light amplification and oscillations, and characteristics of laser light. Homogeneous and inhomogeneous broadening of the transitions, spectral narrowing in a laser, gain saturation, spatial and spectral hole burning and their consequences, Lamb dip spectroscopy and its applications.

Propagation of optical beams in free space and in dielectric slab waveguides, Hermite-Gaussian beam modes, and ABCD law for Gaussian beam propagation.

Optical resonators, concept of cavity modes, resonators with spherical mirrors, resonance frequencies of optical resonators, losses in optical resonators, stable/ unstable resonators, Kirchoff's diffraction treatment for transverse modes.

Methods For Obtaining Population Inversion: Optical pumping, coherent and incoherent pumping, one- and two-photon processes, pumping geometries, pump sources, electrical pumping by discharge in gases, excitation mechanisms, self sustained and e-beam sustained operation, chemical pumping, and gas dynamic pumping.

Laser Dynamics: Laser oscillation, three and four level lasers, rate equation modeling, power in laser oscillators, optimum output coupling low- and high-loss regimes, multimode laser oscillation and mode locking. Different techniques of mode locking. Relaxation oscillations, cavity dumping and Q-switching. Techniques of Q-switching. Pulse compression techniques for ultrashort pulse generation. Spectral control of laser output, tunability of output frequency, single frequency operation, and frequency stabilization.

Physics and Technology of Specific Laser Systems: Solid state lasers, vibronic lasers, semiconductor diode lasers, diode pumped solid state lasers, fiber lasers, dye lasers, atomic and molecular gas lasers, chemical lasers, excimer lasers, free electron lasers. Measurement of parameters of a laser system.

Nonlinear Optics: Crystal optics, electro-optic effect, wave propagation in nonlinear media, phase matched second harmonic generation, optical parametric oscillator, two-photon absorption, stimulated Raman scattering, frequency mixing in gases and vapours, self-focusing, optical bistability and optical phase conjugation. Quantum optics: second quantization, non-classical effects.

03PHYS04-004-C: Electromagnetic Theory: Credit (3)

Electrostatics: Laplace equation and the uniqueness theorems, variational approach to solutions of the Laplace and Poisson equations. Formal solutions of electrostatic boundary value problems with Green function. Method of relaxation for 2D electrostatic problems, method of images, separation of variables and special functions, finite element method, and multipole expansions. Electrostatic field in matter.

Magnetostatics: Maxwell equations of magnetostatic, macroscopic Maxwell equations in magnetic material and boundary conditions on B and H, and solution of boundary value problems in magnetostatics.

Electromagnetic Wave: Wave equation, solutions in free space, plane waves, Gaussian beams, equations in material media, dispersion relations, Fresnel's laws of reflection and refraction, total internal reflection and evanescent waves. Lorentz transformation of electromagnetic fields.

Wave-guides, Resonant Cavities and Optical Fibers: Hollow metallic waveguides, dielectric waveguides, optical fibers, resonant cavities, and elements of microwave transport line.

Radiation by Moving Charges: Lienard-Wiechert potentials and fields, power radiated by an accelerated charge, Larmor's formula, and angular distribution of emitted radiation.

03PHYS04-005-C: Accelerator Physics and Beam Diagnostics: Credit (4)

Introduction: Motion under electric and magnetic fields. DC and RF acceleration. Relativistic kinematics, Brief history and review of particle accelerators.

Synchrotron/Storage Rings: Accelerator magnets - dipole, quadrupole and sextupole magnets. Multipole expansion method. Equation of motion, betatron oscillations, weak and strong focusing, transfer matrices, beam stability, twiss parameters, motion of particles with momentum deviation, momentum compaction, and chromaticity. Magnetic field errors, closed orbit distortion and its correction, resonances - integer and half integer, beam acceleration, synchrotron oscillations, phase stability, transition energy, beam emittance, Liouville's theorem, single turn injection, H-injection, and fast extraction.

Beam Transfer Lines: FODO cells, quadrupole triplet, phase space matching, emittance dilution.

Synchrotron Radiation Sources: Synchrotron radiation, Radiation damping, quantum excitations, equilibrium beam emittance, and beam lifetime.

Linear Accelerators: DC accelerators, various types of RF accelerators, EM mode in a simple structure, Q-factor, shunt impedance, transit time factor, filling time, energy gain, dispersion curve, TW and SW accelerators, and beam dynamics in LINACS.

Cyclotrons: Basic principle of cyclotron, resonance condition, orbit stability, limitations of classical cyclotrons, AVF cyclotrons, injection, central region, extraction, time structure, energy resolution, and beam emittance.

Microtrons: Classical microtrons, basic equations, and Racetrack microtrons.

Beam Diagnostics: Physical principles, charge collection, secondary emission, Ionization, fluorescence, scintillation, capacitive pick up, magnetic pick up, wall current, synchrotron radiation detection, and optical transition radiation.

Instrumentation: Faraday cup, secondary emission wire monitor, beam loss monitor, beam profile monitor, beam position monitor, DC beam current transformer, fast current transformer, wall current monitor, photomultiplier, photo diode, image dissector, and streak camera.

03PHYS04-006-C: Reactor Physics, Radiation Physics, and Safety Issues of Credit (3)

Health Physics: Radiation sources - radioisotopes, natural and manmade sources, radioactive series, reactors, accelerators, radiation facilities, solid, liquid and gaseous activity. Control measures - time, distance, decay, shielding, administrative control, radioactive discharge, waste disposal, and exposure control.

Interaction of Radiation with Matter: Interaction of light and heavy charged particles, photons, and neutrons. Interaction of high energy charged particles, electromagnetic cascade, and Hardronic cascade.

Radiation Quantities, Units, and Regulatory Recommendations: Dosimetric quantities, exposure, absorbed dose, equivalent and effective dose, committed dose, ALI, DAC, ICRP, AERB, and dose limits.

Biological Effects of Radiation: Somatic and genetic effects, stochastic and deterministic effects, and LD30/50.

Detection of Radiation: Ionisation chamber, proportional counters, GM tubes, scintillation detectors, semiconductor detectors, thermoluminiscent dosimeters, direct reading dosimeters neutron detectors, BF3 and He3 tubes, Rem-meters, CR-39-foils, pulsed radiation detection. Low and high energy radiation detection.

Reactor Physics: Introduction to nuclear energy - fission and fusion, interaction of neutrons with matter; fission process and energy release, fission cross-section, fissile and fertile materials. Chain reaction, neutron cycle and lifetime, criticality and classical four-factor formula. Thermal and fast systems, slowing down of neutrons, conversion and breeding of fissile materials, concept of neutron flux and current, neutron diffusion theory, critical size and mass, reflected systems and reflector saving, heterogeneous systems. Reactor kinetics, reactivity and importance of delayed neutrons, reactivity changes and coefficients, fission product poisoning, control devices, uranium and thorium fuel cycles and enrichment processes.

Accelerator Safety: Types of accelerators, prompt and residual radiation, source terms, radiation hazards, radiation safety systems, shielding, radiation monitoring, non-ionizing radiation safety, RF and MW safety, magnetic field safety; ozone safety, safety at synchrotron radiation beam lines, spallation neutron sources, and accelerator driven sub-critical systems.

03PHYS04-007-C: Numerical and Mathematical Techniques and Scientific — Credit (5)

Numerical Methods

System of Linear Algebraic Equations: Direct methods - Gauss elimination and Gauss Jordan methods. Iterative methods - Jacobi, Gauss-Seidel and Successive over relaxation (SOR) methods. Eigenvalue problem .

System of Nonlinear Equations: Newton-Raphson and Secant methods. Roots of polynomials, synthetic division of polynomials, and Baristow method.

Interpolation, Extrapolation, Error and Regression Analysis: Types of errors their analysis.

Numerical Integration: Newton-Cotes, Gauss quadratures, trapezoidal, Simpson's 1/3 and 3/8 rule. Numerical differentiation - forward, backward and central difference quotient.

Differential Equation: Solution of ordinary differential equations. Solution of partial differential equations. Fast Fourier transformation.

Statistical Distributions: Poisson and Gaussian distributions. Monte Carlo simulation, pseudo random numbers, and central limit theorem.

Finite Element Method (FEM)

Introduction: Basic concepts of finite element method, application of finite element method, finite element method versus classical methods, finite element method versus finite difference method, and advantage of finite element method.

Integral Formulations for Numerical Solutions: Variational method, collocation method; subdomain method, weighted residual methods, Rayleigh-Ritz method, Galarkin's method, and least squaremethod

Elements, Nodes, and Co-ordinate Systems: Introduction, element shapes, nodes, nodal unknowns, and coordinate systems

Shape Functions: Introduction, polynomial shape functions, convergence requirement of shape function, and derivation of shape functions.

Introduction to Stiffness (Displacement) Method: Definition of the stiffness matrix, derivation of the stiffness, matrix, assembly of the total stiffness matrix, properties of the global stiffness matrix.

Application of Finite Element Method in Heat Transfer Problem: Fundamentals, one dimensional finite element formulation, and problems.

Fundamentals of Computers: Computer architecture, application of computers, input and output devices, latest processors, desktop PC and servers.

Networking Basic: TCP/IP, DNS, Internet, and Intranet.

Operating System Basic: Linux, windows, shell programming, and CLI, vi, multithreading, multiuser, multitasking, hyper threading, file permissions, and ssh.

Fundamentals of programming: Algorithm, flow charts, high-level languages like Fortran and C, and steps for creating a simple program.

Introduction to C Programming Language: Program structure, header files, basic data types, variables, and declarations.

Operators and Declarations in C: Relational, logical, increment, and decrement operators. Expressions and precedence of operators. Input and output operations, control statements, iterative loops, arrays, and pointer;

Overview of Scientific Computing: Languages and compilers and scientific libraries.

Overview of Trends and Techniques: Sequential, parallel computing, cluster and grid computing.

Architecture Taxonomy: Traditional architecture, Flynn's classical taxonomy, SISD, SIMD, MISD, and MIMD Models.

Steps for Creating a Parallel Program: Decomposition of the program, communication, computations, and composing the results. Parallel example-array processing.

03PHYS04-009-C: Applications of Lasers in Nuclear Science, Industry and Medicine Credit (3)

Laser Applications: High resolution spectroscopy, ultra-fast spectroscopy, laser cooling, laser metrology, holography and its applications in NDT, optical data storage information processing, and optical communication. Laser photochemistry, laser application in biology and medicine

Laser Isotope Separation: Principles of selective photonic action, selective photonic action on atoms or molecules, atomic and molecular schemes for laser isotope separation, lasers for isotope separation, and uranium isotope separation technology employing lasers.

Laser Material Processing: Laser material interaction, Laser cutting, welding, surface hardening, laser surface re-solidification, laser surface alloying, and cladding, laser shock-hardening, laser rapid manufacturing, laser application in decontamination and decommissioning of nuclear installations.

03PHYS04-010-C: Applications of Accelerators in Nuclear Science, Industry and Medicine Credit (3)

Synchrotron Radiation and its Applications: Properties of synchrotron radiation, various types of sources like BM, wavelength shifter, wiggler, and undulators. Beamline design and

synchrotron optics. Applications of synchrotron radiation to condense matter physics, surface physics, biology and Industries

Industrial and Medical Applications of Accelerators: Accelerators for industrial and medical applications. Beam characteristics for medical and industrial applications.

Radiation Processing Using Accelerators: Radiation cross-linking, radiation curing, polymerization, de-polymerization, and radiation grafting. Dose distribution in the irradiated products.

Typical applications: Treatment of wire and cables, viscose rayon sheets, rubber products, heat shrinkable tubes, and sheets. Flue-gas treatment, waste water treatment, electron beam applications in food irradiation and sterilization.

Accelerator Based Radiotherapy: Clinical requirements of an accelerator for radiotherapy. Various components of radiotherapy machine. Photon beam therapy and electron beam therapy. Quality assurance in radiotherapy accelerator.

Applications of Accelerators in Nuclear and Particle Physics: Evolution of nuclear physics with energy of the incident beam. Nuclear physics and related phenomena at incident beam energy less than 10 MeV/nucleon, between 10 and 100 MeV/nucleon, and more than 100 MeV/nucleon. Nuclear physics with radioactive ion beams (RIB).

Spallation Source: General introduction, applications to condense matter, and nuclear physics.

03PHYS04-011-C: Vacuum Physics and Technology: Credit (2)

Vacuum Theory: Definitions - throughput, conductance, pumping speed etc. Pressure equations, mean free path, monolayer formation time. Units of vacuum, pressure regions in vacuum.

Vacuum Systems and Components: Vacuum pumps - rotary pumps, dry pumps, turbomolecular pump, titanium sublimation pump, non-evaporable getters, and sputter ion pump. Vacuum gauges - capacitance gauge, Pirani, thermocouple gauges, BA gauge, penning gauge, partial pressure gauge. flanges and seals, vacuum valves and leed throughs.

Vacuum System Design and Development: Design considerations, sources of gas load (vaporization, thermal desorption, diffusion, permeation, electron and ion stimulated desorption etc). Materials, fabrication techniques and leak detection. Processing to achieve ultra high vacuum.

03PHYS04-012-C: Quantum Mechanics: Credit (6)

For Ph. D. (Physics) only

Mathematical Background and Postulates: Illustrations and application of postulates by using simple two-level systems and two-slit interference experiment.

Quantum Mechanics of Composite Systems: N-particle system, identical particles, symmetrization and antisymmetrization postulates, concept of density matrix, properties of density matrix, pure and mixed states.

Symmetry: Symmetries in quantum mechanics, space and time translation, time reversal symmetry and parity invariance. Rotational invariance, angular momentum, spin, and addition of angularmomenta.

Approximate Methods: Variational methods, Wentzel-Kramers-Brillouin (WKB) method, time-independent perturbation theory, time dependent perturbation theory, adiabatic and sudden approximations, Fermi-Golden rule.

Scattering Theory: Born approximation, partial wave analysis, two particle scattering.

Relativistic Quantum Mechanics: Klein-Gordon equation, Dirac equation, electron spin, and positron.

Advanced Topics: Quantization of electromagnetic field, coherent, and squeezed states, interaction of radiation with matter, spontaneous emission and Lamb shift, entangled state, EPR paradox and Bell's inequality.

03PHYS04-013-C: Research Methodology: Credit (0)

(Lecture: 20, Credit: 0)

Research Methodology: Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

Documentation: Preparing scientific papers/reports, scientific presentations.

Laboratory safety: Safe practices in laboratory.

Research ethics*:* Ethical conduct in science, ethical issues in scientific publication, awareness of plagiarism and other scientific misconducts.

Probability and Statistics: Bayes formula, random variable, expected value and variance, discrete and continuous distributions, joint distributions, conditional distributions, covariance and correlation, normal distribution, Poisson process, central limit theorem and its applications,
definition of precision, accuracy, systematic and random errors**,** propagation of errors in experimental data and their estimation, estimation of variance and confidence intervals.

Mathematical modeling: Measurement of functional relationships, order of magnitude analysis, dimensional analysis, goodness of a fit, linear regression and data fitting.

Data Security: Introduction to Data Security, Data security requirements, Different Cyber threats to Data & possible Solutions, Basic concepts of Cryptography & Data encryption algorithms, Research opportunities in Data Security.

Data management: Data planning, handling, modelling, analysis, visualization, Different Data Models, Data Management Software, Data Backup & Storage

B : Physics Based Elective Courses

03PHYS04-001-E: Statistical Physics: Credit (4)

Classical and Quantum Statistical Mechanics: Introduction, postulates, microcanonical, canonical and grand canonical ensembles, partition and grand partition functions and their properties.

Ideal Bose Gas: Introduction, chemical potential, equation of state and thermodynamic properties, system of phonons, system of photons, Bose-Einstein condensation, Bose-Einstein condensation in dilute atomic gases, and superfluidity.

Ideal Fermi Gas: Introduction, equation of state and thermodynamic properties of degenerate Fermi gas. Neutron stars, conduction electrons in metals, and cold Fermi atomic gases.

Phase Transition: Mean-field theories, symmetry, order parameters, break-down of mean-field theories, critical phenomena and renormalization group.

Non-equilibrium Phenomena: Elementary ideas, irreversibility, study of Brownian motion, random walk model, Langevin force equation, fluctuation-dissipation theorem, Fokker-Planck equation, Glauberdynamics.

1. "Fundamental of Statistical and Thermal Physics", F. Reif
2. "Statistical Mechanics", R. Pathria
3. "Statistical Mechanics", K. Huang

03PHYS04-002-E: Modern Optics: Credit (4)

Geometrical and Physical Optics: Wave front, phase, image formation, resolution, optical path, monochromatic and chromatic aberrations, wave front aberrations, complex representation of EM wave.

Optical Elements: Lens, effective and back focal lengths, shape factor and controlling of aberrations by bending, centering errors. Autocollimator and its applications. Prisms, right angle, penta, dove, corner cube, rhomb, Parallel plate, beam splitters (plane, cube and penta). Polarizers (wire grid, sheet, glan, and Wollaston prisms), Polarization beam splitters, wave plates (quarter and half wave plates).

Interferometers and Optical Measurements: Two and multi-beam interference, Intensity equation for two beam interference, contrast/visibility of interference fringes, temporal and spatial coherences.

Important Interferometric Configurations: Fizeau, Twyman Green, Mach-Zehnder, Jamin, lateral shearing, and Sagnac/ cyclic path interferometers.

Surface Imperfections: Surface flatness, form/figure error, surface roughness, and scratches and digs

Interferometric Testing: Surface form, parallelism, inhomogeneity differential interference contrast. Working principle and applications of Nomarski microscope.

Phase Shifting Interferometry: Principle, phase shifting techniques, and phase unwrapping.

Measuring Micro-scale Devices: Scanning white light interferometers (SWLI).

Overcoming Diffraction Barriers: Scanning near field optical microscope (SNOM).

Metamaterials

Introduction: Maxwell's equations, dispersion, reflection refraction, phase group velocities, photonic band gap crystals, electromagnetic metamaterials.

Negative Refractive Index: Introduction, designing negative refractive index materials, periodic structures, negative refractive index for various frequency regions, anisotropic isotropic materials, double negative metamaterials, nonlinear metamaterials.

Applications: Subwavelength imaging, concept of perfect lens, Veselago-Pendry lens, plasmonic cloaking invisibility.

Optics of Metals Nanomaterials: Electromagnetic waves in metals, skin depth, plasma frequencies, local field enhancements, focusing light beyond diffraction limit.

Optics of Nanoparticles: Optics at subwavelength regimes, dispersion in nanocomposite materials, effective medium theories, Clausius-Mosotti Maxwell-Garnett theories, extraordinary transmission through very small apertures.

Plasmonics: Introduction, electronics versus plasmonics, plasmonic components, manipulating light with plasmonic nanostructures.

Fiber Optics: Basics, Components Systems

Optical Fiber Geometry: Step index fiber, graded index fiber, double-cladded fiber, microstructured fiber. Modes in optical fiber, dielectric slab wave guide, propagating modes of the symmetric slab waveguide, even odd TE modes, characteristic equations, mode cutoff conditions, TM modes, ray optics explanation of modes in a dielectric slab waveguide. Basic equations physical constraints in round optical fibers, the fields in the core cladding, boundary conditions characteristic equation, characterization of modes, mode cut-off conditions, TE, TM hybrid modes, single mode optical fiber, linearly polarized modes, power distribution in optical fiber.

Characteristics of Optical Fiber: Losses in optical fiber: intrinsic impurity absorption loss, waveguide scattering loss, microbending macrobending loss, coupling splicing loss. Dispersion in optical fiber, group velocity dispersion, material dispersion, waveguide dispersion, polarization mode dispersion, dispersion management in optical fiber. Birefringence in optical fiber.

Nonlinear Fiber Optics: Nonlinearities in optical fiber, Kerr nonlinearity, self phase modulation, self focusing, cross phase modulation, four wave mixing, stimulated Brillouin scattering, stimulated Raman scattering. Ultra short pulse propagation, derivation of nonlinear Schrödinger equation (NLSE), ultra-short pulse propagation through fiber, soliton, similariton Gaussian pulse. Effect of gain loss on pulse propagation, interplay of dispersion, nonlinearity gain.

Fiber Optic Components Devices: Directional couplers, coupled mode equations, power transfer characteristics, transfer matrix of a coupler, super modes of a coupler, effect of fiber dispersion. Fiber gratings, Bragg diffraction, photosensitivity, fabrication techniques, grating characteristics, grating as an optical filter, nonuniform (chirped) grating. Fiber interferometer, fiber-ring resonator, Febry-perot resonator, Sagnac interferometers, Mach-Zehndar interferometers. Isolators circulators, Faraday effect, optical isolator, optical circulators. Fiber based system, fiber based sensors, temperature pressure sensors. Fiber laser amplifier, doped fiber, gain in doped fiber, basic construction of fiber laser amplifier. Mode-locked fiber laser: basics of mode-locking dynamics, nonlinear polarization rotation, saturable absorber, basic construction of a mode-locked fiber laser with a highlight of different mode-locking regimes, all-fiber integration.

03PHYS04-003-E: Advanced Accelerator Physics: Credit (4)

Ion Sources: Emission processes and Child Langmuir Law, positive and negative ion sources, atomic and molecular phenomena in ion sources, beam extraction and transport.

Proton and Heavy Ion Accelerators: Introduction to acceleration of protons and heavy ions, RFQ, different type of cavities/accelerating structures, including SCRF, and introductory beam transport.

Instabilities in Linear Accelerators: Basics of beam instabilities, short and long range instabilities.

Other topics: FEL, Linac based synchrotron sources, laser plasma acceleration, and ADS.

03PHYS04-004-E: Plasma Physics and Technology: Credit (4)

Basic Plasma Physics: Definition of plasma, concept of temperature, Debye shielding, plasma parameter, criterion for plasma, variety of plasmas.

Plasma Behaviour: Single particle motion in electric and magnetic fields, collisions, plasma as fluid, kinetic approach.

Waves in Plasmas: Dielectric function, plasma oscillations, electromagnetic equations, dispersion relations.

Methods of Plasma Production: Electrical discharge, ohmic heating, RF heating, plasma production by lasers and particle beams, Tokamak plasma, Z-pinch, Theta pinch

Plasma Processes: Ionization, recombination, plasma equilibrium.

Radiation from Plasmas: Emission processes, spectral characteristics.

Plasma Diagnostic Methods: Density and temperature diagnostics using plasma radiation

Plasma Heating by Laser Beams: Propagation of laser beam in plasmas, inverse Bremsstrahlung, resonance absorption, parametric processes, second harmonic generation, filamentation, self-focusing.

Laser Plasma Interaction at Ultrahigh Intensities: Ultrahigh intensity parameters, multi-photon ionization, tunnel ionization, above threshold ionization, high harmonic generation.

Applications of Laser-plasma: Electron acceleration, x-ray lasing, inertial confinement fusion and fast ignition.

03PHYS04-006-E: Advanced Course on Atom-Photon Interactions:

Interaction of Light with Matter: Hamiltonian description, multipolar approximation, review of the time dependent perturbation theory, concept of transition amplitude, semiclassical theory of a two level atom coupled to a single mode radiation field, density matrix, optical Bloch equations, semi-classical laser theory.

Coherent Effects: Coherent population trapping (CPT), electromagnetically induced transparency, laser without population inversion, mechanical effects of light and its application in laser cooling and trapping.

Quantum Field: Quantization of electromagnetic field, interaction of quantized radiation with matter, Jaynes-Cummings model, quantum dissipative processes, atom in the vacuum field and spontaneous emission, resonance fluorescence.

Elementary of Theory of Coherence: Quasi-probability distribution functions, classical light and Non-classical light, coherent state, squeezed state and its experimental realization, atom-photon and atom-atom entanglement, multiparticle Entanglement, Entanglement in Quantum Information Processing.

Interaction of Atom with Intense Light Field: Virtual absorption and multiphoton ionization, generalized Fermi-Golden Rule, above threshold ionization, Volkov state and KFR theory, high harmonic generation, Floquet theory, many-body correlation effects and non-perturbative field effects, and S-Matrix theory.

03PHYS04-008-E: Course on Bio-Photonics: Credit (4)

Introduction: Scope of bio-photonics, interaction of light with cells and tissues: absorption, scattering and depolarization of light .

Basics of Biology: Cell structure and organization, structure and function of biomolecules, metabolism and energetics. General methods for biophysical and biochemical analysis, mechanism of cell death.

Light Propagation in Tissues: Rayleigh and Mie scattering, multiple scattering and propagation of light in tissues, Radiative transport and diffusion approximation, effect of boundary conditions, numerical approaches for determining irradiance at surface and interior of scattering objects, techniques for determination of optical properties of biological samples.

Optical Imaging Through Turbid Medium: Trade-off between resolution and depth of imaging, use of spatial filtering, polarization gating and time-gating for optical imaging, high resolution imaging using coherence gating, Optical coherence tomography (OCT) and diffuse optical tomography.

Optical Spectroscopy for Biomedical Diagnosis: Elastic scattering spectroscopy for disease diagnosis, Fluorescence and Raman spectroscopy for diagnosis.

Optical Techniques for Micro-manipulation: Optical tweezers and micro-beams, radiation pressure and force on microscopic objects, gradient and scattering force, applications of optical tweezer.

Optical Microscopy: Recent Developments: Contrast methods in optical microscopy, techniques for single molecule imaging, scanning laser microscopy, multi-photon microscopy and near-field techniques.

Optical Methods for Bio-sensing Applications: Surface plasmon resonance based sensors, quantum dots and functionalized nanoparticles as biosensors approaches for label-free sensing, opto fluidics and lab-on-a-chip approach.

Effect of Light on Biological Tissue: Basic principals of photobiology, photo-acceptors, action spectra and light induced signaling mechanism, Ligh effect based on endogenous photosensitizers, use of exogenous photosensitizers for photodynamic therapy and photo anti-microbial therapy, biological effects of narrow bandwidth light.

03PHYS04-009-E: Concepts in X-Ray Physics: Credit (4)

X-ray and Their Interaction With Matter: X-ray waves and photons, sources of X-rays, X-ray scattering from an electron and atom, refractive index including absorption, coherence, Kramer-Kroning relationship.

Refraction and Reflection of X-rays: Refraction and phase shifting in scattering, Snell's law and Fresnel equation in X-ray region, reflection from homogeneous slab and multilayers, rough interfaces and surfaces, examples of refractive and reflective X-ray optics and curved mirrors.

Kinematical Diffraction and Resonant Scattering: Laue condition and reciprocal space, Ewald sphere, lattice vibration, the Debye-Waller factor, Lorenz factor, application of kinematical diffraction, structure factor and basics of structure solving, phase problem in crystallography, anomalous diffraction and some examples, introduction to Rietveld refinement method.

Diffraction by Perfect Crystals: Kinematical reflection from few layers, basics of dynamical theory, Darwin's theory of extinction depth, integrated intensity, standing waves, higher order reflection, effect of absorption, asymmetric Bragg geometry, DuMond diagrams, applications in synchrotron X-ray monochromators, X-ray Topography.

X-Ray Absorption: X-ray absorption from isolated atoms, extended X-ray absorption fine structure (EXAFS), near edge X-ray absorption (XANES), EXAFS equation, basics of EXAFS data acquisition and sample preparation, Transmission versus fluorescence modes of EXAFS.

X-Ray Fluorescence: Theoretical details and data analysis, details of the experimental technique, sample preparation, trace element quantification and related issues.

Photo Emission Spectroscopy and X-Ray Magnetic Circular Dichroism: Basics of photoemission and inverse photoemission, experimental setup, photoelectron and Auger electrons, core level binding energies, chemical shifts, lineshapes and background, valence band structure determination, resonant photoemission, angle resolved photoemission and band structure determination, spin polarized photoemission, basics of XMCD

03PHYS04-010-E: Physics of Semiconductor Quantum Structures:

For Ph. D. (Physics) only

Introduction to Semiconductor Nanostructures: Review of condensed matter and semiconductor physics, scientific and technological significance of nanostructures and mesoscopic structures, characteristic length scales for quantum phenomena, energy states of carriers in free space of different dimensionality, effect of quantum confinement on carrier energy states, density of states for semiconductors of reduced dimensionality, key ideas on effect of quantum confinement in electronic properties, transport phenomenon and interaction of photons with materials, and applications of nanostructured semiconductors.

Growth of Semiconductor Nanostructures: Homo and hetero epitaxial growth, nucleation and nucleation kinetics, strain in lattice mismatched systems, psudomorphic growth and critical thickness, growth modes: Volmer-Weber (VW) or planer growth, Frank-van der Merwe (FM) or island growth and Stranski-Krastinov (SK) nucleation and growth, fundamental and principle of physical and chemical vapor deposition methods: Pulsed laser deposition, molecular beam epitaxy, chemical vapor deposition, atomic layer deposition, sputtering. Bandgap engineering and growth of quantum well structures, key issues in growth of quantum wires, quantum dots and super lattices, Fundamental characteristics of semiconductor nanostructures.

Properties and Characterizations of Semiconductor nanostructures: Optical processes in low dimensional semiconductors: Excitons, free carriers and defect level induced optical transitions, optical phonons and polaritrons, Basic principles and key issues of optical spectroscopy techniques for nanostructured semiconductors; absorption, reflection, photoluminescence, photoluminescence excitation and surface photovoltage spectroscopy. Transport in semiconductor nanostructures: conductance, resonant tunneling, hot electrons; transport in magnetic field, semi-classical and quantum approach, Aharonov-Bohm effect, Shubnikov-de Haas effect, introduction to quantum Hall effect. Principles of application of devices based on Semiconductor nanostructures: photodetectors, lasers, resonant tunneling diodes and solar cells etc.

C : Engineering Based Elective Courses

for M.Tech (Engineering Physics) only

03ENGG01-001-E: Power Supplies: Credit (4)

AC-DC Converters: Single phase and three phase diode and controlled rectifiers, effect of source inductance, ripple and harmonic analysis, 12-pulse rectifier, firing angle control schemes, THD and power factor, filters - passive and active, passive and active damping of filters.

Power factor Correction: Effects and limiting standards for line current harmonics, Passive PFC techniques, ActivePFC.

DC-DC Converters: Principle of operation, steady-state analysis of buck, boost, buck-boost converters, Isolated dc-dc converters- forward, flyback and bridge converters, pulse width modulator and control of dc-dc converters.

Principles of Feedback Control System: Negative feedback, Stability criteria- gain and phase margin, steady state errors, transient response, current loop and voltage loop acting together.

Magnet power supplies in Accelerators: Requirements, Load characterisation, DC and ramping type power supplies, Pulsed power supplies.

High current magnet power supplies: Stability requirements, current cycling, Field stabilization.

Power supplies for superconducting magnets : Load requirements, quench detection, protection and training.

Laser and Plasma power supplies: Load characterisation, Gas discharge, Ballast requirements, CW/Pulsed operation, Current stabilisation, Power coupling schemes to gas discharges.

Thermal Management: Heat transfer, Heat sink design, Water- cooled heat sinks.

03ENGG01-002-E: Power Electronics: Credit (4)

Power Semiconductor Devices: Diode, SCR, MOSFET, IGBT, Static and switching characteristics, Safe operating areas, Drive requirements and circuits, Introduction to the properties of emerging materials and devices, High voltage switches, Turn-on and turn-off snubbers.

Modelling and Analysis : Introduction to modelling and analysis techniques for dc-dc converters, Averaged equivalent circuit modelling and analysis, small-signal analysis with an illustrative converter, Feedback control of power converters: Feedback controller design, voltage- mode control and current- mode control.

Soft-switching Converters: Concept of soft-switching, Load resonant converters: concept and

definition, ac analysis of converters and modes of operation, Full bridge zero voltage switching converter: Phase shifted PWM, Operation and analysis of converter in steady state.

High frequency Magnetics: Ferrites- characteristics and types, skin effect, proximity effect, parasitic components- origin, minimisation and characterisation, design of high frequency magnetic components, introduction to planar magnetics.

Electromagnetic Interference: Measurement techniques, LISN, separation of common mode and differential mode noise, limiting standards and mitigation techniques, design of high frequency filters.

03ENGG01-003-E: Advanced Course on RF and Microwaves: Credit (4)

Microwave Networks: S-parameters, Matrix representation of Microwave networks and its properties, cascade networks, periodic network system and application, mixed mode S parameters and their applications.

Generation of RF power for accelerators: Design requirements, RF power amplifiers using tetrode & triodes and solid state devices, klystrons, IOT, Gyrotron, Cooling and protection, Grounding and shielding.

High Power RF transmission: design aspect of high power RF transmission, directional couplers, dividers, combiners, high power waveguide and coaxial transmission lines, circulators, bends, magic-T, microwave windows, dummy loads, RF couplers.

Accelerator cavities: Characterizing RF cavity, determination of important cavity parameters, Fundamentals of beam-cavity interactions. RF power coupling to cavity.

Low level RF components and systems: Planar circuits, microstrips, substrate materials, lumped and distributed circuits, mixer circuits, phase shifters, filters, switches, couplers, dividers/combiners, Low level RF signal processing and RF feedback systems.

RF systems for accelerators: Design and configuration of typical RF system, Safety interlocks and operation of RF system.

RF/Microwave measurements: Specialty of high frequency measurements, Measurement of RF power, impedance, VSWR, frequency and phase. Measuring instruments used in RF/microwaves, passive and active detectors, spectrum analyzer, VNA calibration systems, Vector measurement with VNA, peak and average power meters, impedance analyzer, frequency counter.

03ENGG01-004-E: Advanced Data Acquisition and Control Systems:

Components of data acquisition system and their selection, signal conditioning modules, polling, hand-shaking, interrupt and event driven, DMA, data sampling methods.

Embedded system software concepts and development tools assembly and HLL, assembler,

compilers, linker, librarian, resident monitors, source level debuggers, in-circuit & in application programming (ICP/IAP) and logic analyzer. In circuit emulator (ICE), object code and HEX file formats, FPGA & CPLD architectures, logic cell structures, programmable interconnect and I/O ports, programming technologies and VHDL, implementation of combinational and sequential circuits, timing issues in FPGA synchronous circuits.

Centralized v/s distributed control system, PAC and PLCs, PC software issues and virtual instrumentation, VISA, image acquisition, data logging, online and offline data processing, data presentation and reporting, BUSES for digital data communication.

PC buses: PCI & PCI Express specifications mechanical, electrical functional.

Back plane buses: VME, CPCI, PXI, VXI mechanical electrical functional specification.

Buses for instrument network: Asynchronous & synchronous communication standards, bus, ring, net topologies, RS-232, RS-485, USB, LAN-Hub, GPIB, Ethernet, field bus serial port expansion cards on PCI, Converters: USB-GPIB, USB-Serial.

Real-time system concepts, timeliness vs speed, hard vs soft real time, scheduling method, concurrency, process & thread concepts, inter process communication and synchronization.

Software reliability: Software implemented fault tolerance, reliability and availability, safety issues. Software reliability standards and practice.

Process control elements, Set point, disturbance, servo system, regulatory system, analog vs digital control systems, Z - transform for digital control systems, feedback control system, continuous time domain PID controllers. Feed forward and cascade controls, digital controllers, digital form of PID controller, Z-transform based dead beat and Dahlin's algorithms, programmable logic controllers and applications, compensator design and stability criterion.

5. "Digital System Design and Prototyping Using Field Programmable Logic and Hardware Description Language", Zoran Salcic.
6. "VHDL Made Easy", David Pallerin.

03ENGG01-005-E: Reliability Engineering: Credit (4)

Basic engineering statistics: Basic probability, random variables, probability density and cumulative distribution functions of engineering importance such as the binomial, poisson, normal, exponential, weibull, etc. Random sampling and sampling statistics and distribution of sampling statistics, such as the Chi-Square and Students test, point and interval parameter estimation, test of hypothesis, examples to solve on continuous and discrete distributions, mathematical equations relating to hazard rate, reliability, cumulative failure probability and

failure probability (density) function, Bath-tub curve - explanation of different parts of the life characteristic curve and corresponding failure distributions.

Quality and reliability, QA/QC concepts - Acceptance sampling plans, quality measurement, quality improvement and control methods with applications in design, development, and manufacturing, modern quality management philosophies, engineering/statistical methods including process control, control charts, process capability studies, loss functions, design of experiments, and total quality management (TQM) topics.

Reliability, availability and maintainability concepts and principles, reliability statistical analysis concept overview and application, accelerated life testing concepts, principles and application, qualitative and quantitative accelerated life testing principles, life-stress relationships and application to electronic components and semiconductor devices, software reliability issues, reliability prediction for electronic systems, system reliability concepts and case studies, role of redundancy in system reliability, design for reliability concepts and case studies, degradation analysis and case studies, reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software, hardware reliability analysis of electronic and computer based C&I systems based on MIL-STD-217, methods of measuring the reliability effectiveness of complex engineering systems, optimization theory, preventive maintenance models, and statistical analysis.

03ENGG01-006-E: Advanced Course in High Voltage Engineering: Credit (4)

High Voltage Technology: Introduction, classification of voltage levels, high voltage in electric supply network, major components of a high voltage network.

Electrostatic Fields and their Control: Electric field intensity, electric strength, classification of electric fields, degree of uniformity of electric fields, control of electric field intensity.

Dielectric Materials and their Behavior in Electric Fields:

a. Insulating Behavior of Air and other Gaseous Dielectrics: Generation of charge carriers: impact ionization, thermal ionization and photo-ionization, Negative ion formation, Breakdown by avalanche discharge (Townsend Mechanism); Breakdown voltage characteristics in uniform fields (Paschen's Law) Practical factors affecting the breakdown voltage: Corona, Fields non-uniform, high pressure and vacuum.
b. Liquid Dielectrics in High Voltage applications: Mineral insulating oils, Dielectric properties of insulating liquids, Dielectric power losses in insulating materials, Breakdown in liquid dielectrics, Aging of mineral insulating oils.
c. Solid Dielectrics and their Behavior in Electric Fields: Classification of solid insulating materials, Breakdown and pre-breakdown phenomena in solid dielectrics, Partial discharge and its effects on dielectrics.

Generation of High Voltages:

a. Alternating voltages: single step-up transformer, Transformers in cascade, Voltage control

of testing transformers, Series resonant circuits.

b. Direct Voltages: Half wave and full wave rectification, Voltage doublers and cascade circuits.

c. Impulse Voltages: Single stage impulse generator, Multistage Marx generator, Practical Impulse Generators.

High Voltage Test & Measurement: Types of tests, Power frequency tests, DC voltage test and Impulse withstand test, Peak voltage measurements by spark gaps, Sphere gaps and uniform field gaps, Voltage measurement using ammeter in series with high impedance, Voltage measurement using potential dividers, Generating voltmeter, Voltage and current transformers.

High Voltage Design and Applications: Design considerations of high voltage bushings, power cables, transformers and switchgears; high voltage applications and electrostatic hazards.

High Voltage Safety and Protection.

03ENGG01-007-E: Digital Signal, Image Processing and Applications:

Introduction: Digital image, steps of digital image processing systems, elements of visual perception, connectivity and relations between pixels. Image acquisition: Frame grabber, optics and illumination Simple Operations - Arithmetic, Logical, geometric operations.

Mathematical Preliminaries: 2D LTI systems, 2D convolution, correlation, 2D random sequence, 2D spectrum.

Image Transforms: 2D orthogonal and unitary transforms- properties and examples. 2D DFT, histogram, image smoothening, image filtering, Sharpening, thresholding.

Image Segmentation and Analysis: Edge detection, line detection, curve detection, Edge linking and boundary extraction, boundary representation, region representation and segmentation, morphology-dilation, erosion, opening and closing.

Image understanding and recognition: Matching by templates, classifiers models, statistical, matching shapes by contour and texture.

Review of LTI systems: Fourier transform for discrete-time signals and its properties, comparison with continuous-time Fourier transform. Discrete time signals, sequences, representation of signals on orthogonal basis, sampling and reconstruction of signals.

Signal analysis using the Fourier transform, impulse function and complex exponential signal, modulation and frequency translation, duality, Fourier transform of periodic signals,

correlation, energy and power spectral density, Hilbert transform, Fourier transform of finite-duration discrete - time sequences.

Z-transform, Discrete Fourier Transform (DFT), Fast Fourier Transform algorithm and applications. Design of FIR & IIR digital filters, effect of finite register length in FIR filter design. Overview of DSP processors, FPGAs.

Typical applications in Lasers and Accelerators.

D : Laboratory Experiments (Credit :4)

Experiments relating to lasers, accelerators and general electronics techniques will be offered. A student needs to carry out twelve experiments (4 each from laser, accelerator and electronics related areas) in two phases with a total working time of 72 hours which will carry 4 credits.

03PHYS04-001-L Lasers and Applications

1. Measurement of spectrum and spectral width of diode laser and their dependence on current.
2. Study of characteristics of a Q- switched Nd:YAG laser.
3. Second harmonic generation: phase matching and maker fringes.
4. Saturated absorption in atomic vapour: Doppler broadening, natural line width, power broadening.

5. Study of light propagation through fiber: coupling efficiency, bending losses, splicing and connecting fiber.
6. Studies on Nitrogen laser pumped dye laser.
7. Parametric study of a XeCl Excimer laser.
8. Output power characteristics of a diffusion-cooled CO2 laser.
9. Determination of severance energy for cutting mild steel with CO2 laser.
10. Determination of laser power coupling efficiency in Nd-YAG/CO2 laser welding of stainless steel.

03PHYS04-002-L Accelerators Related Areas

1. Electrical resistivity measurement on metallic samples at low temperature.
2. Parametric studies of magnetic materials and operating point of magnets.
3. Outgassing of materials, discharge cleaning and ESD studies.
4. Estimation of radioactivity and shielding attenuation coefficient measurements.
5. Determination of cooling power of a cryocooler.
6. Electron gun: Operation and experimental studies.
7. Proton ion source: Operation and experimental studies.
8. X-ray fluorescence studies using radioactive source.
9. Calibration of cryogenic sensors.

03PHYS04-003-L Electronics

1. Study of stepper motor, dc motor drive and position feed-back.
2. Study of different transducers and their interfacing.
3. Communication buses and protocols, buses for distributed embedded processing.
4. G.U.I. software familiarization and applications.
5. Digital image processing and their applications.
6. Current and voltage regulated power supplies and change from one another.
7. Study of flash lamp and measurement of flash lamp current and K0 factor.
8. Characterization of RF components.
9. Fast current transformers: Study and measurement of response.

03PHYS04-001-R E : Reading Courses (Credit : 8)

Ph. D. scholars will work on two reading courses each of four credit worth. For each reading course, a Ph. D. scholar is expected to do self reading (under the guidance of his/her Ph. D. supervisor) of a review paper or book(s)/monograph(s) of specialized subjects related to the

area of his/her proposed area of research. Alternatively he/she may also work out and comprehend a research paper or a part of research paper relevant to his/her Ph. D. work. The topic and the structure/contents of the two reading courses should be decided by the guide in consultation with the respective doctoral committee and the Ph. D. scholar. The two reading courses should be approved by the respective doctoral committee.

The two reading courses will be evaluated on the basis of the detailed reports that will be prepared by the scholar and presentations, which will be held at the end of first year (in the month of August). The total marks for each reading course is 150 with 100 and 50 for report and presentation respectively.

BACK TO MAIN

Ph.D. in Physical Science
(Program Code: PHYS04)

Syllabus for
Doctoral Course

Variable Energy Cyclotron Centre

Department of Atomic Energy
1/AF Bidhan Nagar, Kolkata 700 064

Total credit: 60. Duration: one year. The 40 credit basic courses tabulated serially in I to XII are common to all. After completion of this 40m credit, a student may either choose: [2 advance courses from XIII to XIX (2×4=8 credit)] or [one advance course (4 credit) + Self Study Course(equivalent to 4 credit)] and finally a project equivalent to 12 credit.

04PHYS04-001-C Mathematical Physics: Credit: 3

Linear vector spaces, Linear operators and matrices, Systems of linear equations. Eigen values and eigen vectors, infinite-dimensional vector spaces: Hilbert space & Hermitian operators. Linear ordinary differential equations, Special functions. Linear partial differential equations in physics, Separation of variables method of solution. Complex variable theory; Analytic functions. Taylor and Laurent expansions, Classification of singularities, Analytic continuation, Contour integration, Method of steepest descent. Integral equations and Green functions, Ideas about nonlinear equations, Approximation methods : WKB approximation, Fourier and Laplace transforms.

Introduction to finite and continuous groups. Group representations and operations, Permutation group and its representations, Lie group and Lie algebras. SU(2), SU(3) and SU(N) groups, Poincare groups. Introduction to manifolds, Tangent Vectors and tangent spaces, Vector fields, Differential geometry, Riemannian manifolds and Gauge theories.

Suggested *Books :*

1. A Course in modern Mathematical Physics : Groups, Hilbert Space and Differential Geometry, *Peter Szekeres*
2. Mathematical Methods for Physics and Engineering: A Comprehensive Guide, *K.F. Riley, M. P. Hobson, S. I. Bence*
3. Complex Variables: Introductions and Applications, *M. J. Ablowitz* and *A. S. Focas*
4. Geometrical Methods of Mathematical Physics, *Bernard Shutz*
5. Lectures on Advanced Mathematical Methods for Physicists, *S. Mukhi & N. Mukunda.*

04PHYS04-002-C Quantum Mechanics: Credit: 3

Approximation methods in quantum mechanics : W. K. B. and variational methods and applications. Time independent perturbation theory (for non degenerate and degenerate cases) and its application to helium atom, Stark and Zeeman effects, Time dependent perturbation theory and Fermi golden rule, its applications to beta decay theory and principle of detailed balance.

Collision theory : Born series and interaction pictures : Propagator in quantum mechanics. Measurements in Quantum Mechanics, EPR paradox, Hidden variables and Bell's inequality.

Relativistic quantum mechanics : Klein-Gordon and Dirac equations and their solutions, Gamma matrices Non relativistic limit of Dirac equation; Parity inversion and time reversal, Bilinear covariants, Charge conjugation.

Lagrangian formulation : Symmetries of Lagrangian density, Noether's theorem, Energy-momentum tensor T^{uv}-its origin & physical meaning of different components.

Path integral formulation of quantum mechanics and its Applications.

Suggested Books :

6. Quantum Mechanics, *Leonard I. Schiff*
7. Quantum Mechanics, *Eugen Merzbacher*
8. Quantum Mechanics, *A. S. Davydov*
9. Principle of Quantum Mechanics, *R. Shankar*
10. Relativistic Quantum Mechanics, *James D. Bjorken and Sidney D. Drell*
11. (i) Quantum Mechanics : Non-Relativistic Theory & (ii) Classical Theory of Fields, *L.D. Landau and E.M. Lifshitz*
12. Quantum Mechanics and Path Integrals, *P. Feynman and A.R. Hibbs*

04PHYS04-003-C Classical Mechanics: Credit: 2

Newton's Laws (Definition of inertial frames, Galilean group)

Lagrangian formulation: Lagrangian and its properties, Minimum action principle, Euler-Lagrange's equations, Constrained motion, Cyclic coordinates, Noether's theorem. Application: Two body problem, Restricted three body problem.

Hamiltonian formulation: Legendre transformation, Generalized momentum, Phase Space, Hamilton's equations of motion, Liouville's theorem, Fixed points and Linear Stability analysis, Phase portraits, Symplectic nature of Phase Space, Poisson Brackets, Canonical Transformations, Generating functions, Action-Angle variables, Hamilton-Jacobi equation, Singular Lagrangian and examples like time crystal/ Gauge field theory.

Connection of classical mechanics with quantum mechanics

Generic Scattering crosssection, crosssection with 1/r potential. Secular perturbation theory

Integrability, Kolmogorov-Arnold-Moser theorem, Elements of Chaos theory.

Suggested Books:

1. Mathematical Methods of Classical Mechanics, V I Arnold
2. Classical Mechanics, T W B Kibble and F H Berkshire
3. Classical Mechanics, H Goldstein
4. Classical Mechanics, L D Landau and L M Lifshitz

04PHYS04-004-C Statistical Mechanics Credit: 3

Distribution functions: Mean Values and standard deviations; Gaussian limit of the binomial distribution, distribution of several random variables. Gibbsian statistical ensembles: Micro-canonical, Canonical and Grand Canonical ensembles. Gibb's theorem: Information entropy: Fluctuations: Quantum statistics: Bose-Einstein statistics, Fermi-Dirac statistic and passage to the classical limit. Ising Model: Theory of phase transitions and critical phenomena-Critical exponents and universality, Phase transformation kinetics: Homogeneous and Heterogeneous nucleation, Spinodal decomposition

Non-equilibrium statistical mechanic: Liouville's equation, BBGKY hierarchy, Boltzmann equation, Fokker-Planck Equation and Brownian motion.

04PHYS04-005-C Classical Electrodynamics: Credit: 3

Maxwell equations, Macroscopic electromagnetism, conservation laws: Maxwell's displacement current, Vector and scalar potential, Gauge transformations, Lorentz gauge and Coulomb gauge, Green's theorem of the wave equation, Poynting's theorem and conservation of energy and momentum, Boundary value problems and numerical techniques.

Plane electromagnetic wave and wave propagation, Wave guides and resonant cavities: Place wave in a non-conducting medium, Linear and circular polarization, Fields at the surface and within conductor, Cylindrical cavities and Wave-guides, Modes in a rectangular Wave-guide, Energy flow and attenuation in a Wave-guide.

Radiating systems, Multiple fields and radiation: Fields and radiation of a localized oscillating source, Electric dipole field and radiation, Multipole expansion and electromagnetic fields, Properties of multipole fields, energy and angular momentum of multipole radiation, Sources of multipole radiation : Multipole moments.

Relativistic electrodynamics: The special theory of relativity, The Lorentz transformation and basic kinematic results of special relativistic, Invariance of electric charge, Covariance of electrodynamics, Transformation of electromagnetic fields, Relativistic charged particles in an electromagnetic field.

Radiation by moving charges: The Lienard-Wiechert potentials and field for appoint charge, Total power radiated by an accelerated.

Suggested Books:

1. Classical electrodynamics, *I. D. Jackson.*
2. Modern Electrodynamics, A Zangwill, Cambridge University Press, 2016

04PHYS04-006-C

a. Research Methodology: Credit: 0

1. Research – meaning, characteristics and types, steps of research, research ethics and plagiarism.

2. Introduction to patent laws – patent laws, process of patenting a research finding, copy right, cyber laws.

3. Scientific presentation procedure

4. Scientific seminars by faculties'.

Suggested books:

a. Research Methodology: Methods and Techniques, C.R. Kothari

b. Computational Methods and Programming: Credit: 3

1. Scientific programming- Procedural programming and Object oriented programming (examples in Fortran and C++)

2a. Simulation techniques - Random variables, discrete and continuous, Montecarlo techniquesand application of Montecarlo tecniques, Techniques of dynamical simulations.

2b. Statistics and treatment of Statistical analysis of data: - estimation and propagation of error, curve fitting, least square methods, Confidence limit.

3. Numerical techniques – Integration, differentiation, diagonalization of matrices, root finding (bisection and Newton-Raphson method); Interpolation techniques; ODE, PDE, Runge-Kutta method, Solution of numerical problem using different numerical technique.

Suggested books:

1. Numerical Mathematical Analysis by James Blaine Scarborough, Oxford and IBH Publishing
2. Computer oriented numerical methods , V. Rajaraman
3. Data reduction and error analysis for the physical sciences, By Philip R. Bevington and D. Keith Robinson
4. An Introduction to Error Analysis (University Science Books, Mill Valley,California, 1982) by J.R. Taylor.

04PHYS04-007-C Experimental techniques and methods: Credit: 5

1. Philosophy of experimental science - laboratory safety, measurement of various physical properties with appropriate transducers, Vacuum - production methods and measurement techniques, Cryogenics - production and measurement, Workshop practice and basics of engineering drawing.

2. Material Characterization techniques – Electrical, Magnetic, and Optical property measurements, X-ray diffraction, neutron scattering and electron scattering techniques, Surface structure and topography (Scanning Electron Microscopy) and surface property measurements (Scanning Probe Microscopy), Phase changes.

(Differential Scanning Calorimeter), Mechanical property measurement: Tension and compression testing, Micro and Nano-indendation techniques, Characterization of defects and their detection (Positron Annihilation Spectroscopy, Transmission Electron Microscopy)

Suggested books:

a. Materials Characterization: Introduction to Microscopic and Spectroscopic Methods, Yang Leng
b. Characterization of materials, Elton Kaufmann

Detectors and Techniques for Nuclear and High Energy Physics

(a) Interaction of Radiations with matter: Interaction of charged particles, Electrons, photons, Neutrons, Muons and neutrinos with matter.

Radiation exposure and Dose

(b)Basics of detectors: General properties of radiation detectors, Simplified detector model, Modes of detector Operation, Pulse height spectra, Energy resolution, Detector efficiency, Working principle and properties of different types of detectors - Gas detectors, Scintillation Detectors, Semiconductor Detectors

(c) Basics of nuclear electronics: Pre-amplifier, amplifier, discriminators, gate and delay generators, Analog to Digital Converter, Time to Amplitude Converter and the basics of data acquisition systems.

(d) Experimental Nuclear physics techniques and detectors: Charged particle spectroscopy and particle identifications, Gamma ray spectroscopy, Fast neutron spectroscopy and detectors related to the different techniques

(e) Experimental High Energy Physics techniques and detectors: General concept of building a HEP experiment, coverage and options, tracking detectors, calorimeters, vertex detectors, muon chambers, neutrino detectors, particle identification detectors in HEP. Data analysis in HEP: General approach of data cleanup, calibration, track reconstruction, reconstruction of events, challenges in each stage.

Suggested books:

a. Radiation Detection and Measurement, Glenn F. Knoll
b. Nuclear Radiation Detectors, S.S. Kapoor and V. Ramamurthy
c. Techniques for Nuclear and Particle Physics Experiments: A How-To Approach, William R. Leo
d. Experimental Techniques in High-energy Nuclear and Particle Physics, edited by Thomas Ferbel
e. Introduction to Experimental Particle Physics, Richard Clinton Fernow

f. Data Reduction and Error Analysis for the Physical Sciences, Philip Raymond Bevington, D. Keith Robinson
g. Data Analysis Techniques for High-Energy Physics, edited by R. Frühwirth, M. Regler

04PHYS04-008-C Basic Field Theory: Credit: 3

Lorentz invariance and Relativistic kinematics. A preview of fundamental particles and their interactions. Review of classical field theory : Principle of least action, Lagrangian formulations for continuous system and fields.

Symmetries and conservations lows, Noether's theorem, Introduction to field quantization: Canonical quantizations of scalar, Spinor and gauge fields.

Principle of gauge invariance: Global and local gauge transformations, Abelian gauge fields.

Interaction fields : Perturbation expansion of correlation functions, Wick theorems, Feynman diagrams, S-matrix and cross section, Calculations of cross section and decay rates for elementary processes.

Suggested Books :

1. An introduction to Quantum Field Theory, *M. E. Peskin and D. V. Schroeder*
2. Quantum Field Theory, *L. H. Ryder*
3. Field Theory, *P. Ramond*
4. Gauge Field theory, *S. Pokoroski*
5. Quantum field theory, *L. S. Brown*

04PHYS04-009-C Basic Accelerator physics: Credit: 3

Introduction to accelerators: History of accelerators. Types of particle accelerators. Basic principle of Cockcroft-Walton, Van-de-graaff, Tandem, Linear accelerator, Cyclotron, Synchrotron, Storage rings and Betatron. Accelerators in India.

Transverse Beam Dynamics: Two dimensional field expansion, Field calculations of magnetic focusing and bending optics, Particle equations of motion, Thin-lens and Quadrupole focusing, Edge focusing, Solenoid focusing, Hill's equation, Phase advance in periodic focusing lattices, Transfer matrix technique, Transfer matrices for drift space, dipole, quadrupole, Stability criterion, Beta function, Courant-Snyder invariant and Twiss parameters, Beam emittance.

Longitudinal Beam Dynamics: Longitudinal Equation of Motion, Off-momentum orbits in synchrotrons, Transition and Momentum compaction, Phase stability, Synchrotron oscillation, Longitudinal emittance.

Cyclotron: Basic principle of cyclotron, Resonance condition, AVF cyclotron, Synchro-cyclotron, Betatron tunes, Shape of the cyclotron magnet, Injection, Extraction, Beam quality-time structure, energy resolution and emittance. Room temperature and Superconducting cyclotron.

RF Linear Accelerator: Principle of Linear accelerator, Wideroe and Alveraz linac, Transit time factor, Accelerating field and dispersion curve, Ion linac, Empty cavity and Loaded cavity, Travelling wave and standing wave structures.

Ion Sources: Principle of ionization, Ion sources for positive ions - Duoplasmatron, PIG, ECR, Ion sources for negative ions- surface, volume and charge exchange, Beam formation, ECR ion source and beam transport line.

Synchrotron and storage rings: Basic principle of Synchrotron, Electron and ion Synchrotron, Synchrotron radiation source, Total radiated power, Properties of Synchrotron radiation, Wiggler and undulator.

Application of accelerators: Research applications, Medicine, Industry etc.

04PHYS04-0010-C Basic Condensed Matter Physics: Credit: 3

Crystal structure and crystallography : Bravais lattice – Primitive vectors, Primitive unit cell, Conventional unit cell, Reciprocal lattice and Brillouin zone, X-ray diffraction, Comparison with electron and neutron diffraction.

Electronic structure of solids : Band structure of solids, Introduction to many body problem, Single particle approximation, Hartree-Fock methods, Bloch theorem, Tight binding method, Introduction to Density functionalal theory.

Lattice vibrations : Phonons-Debye model for specific heat of solids-lattice dynamics-phonon spectrum. Electrical & thermal transport in solids, Role of electron-phonon interaction-Boltzmann transport equation.

Magnetism : Origin of magnetism, Quantum theory of diamagnetism and paramagnetism, Heisenberg's exchange interaction and ferromagnetism, Introduction to superexchange, Direct exchange and double exchange,

Superconductivity & Superfluidity : Phenomenological description of superconductivity, Interaction between electron and phonon, Cooper pair, Meaning of energy gap, Meissner effect, London theory, Classification of superconductors, High temperature superconductors, Outline of the microscopic BCS theory, Ginzburg-Landau theory. Superfluidity in liquid He. Landau's critical velocity, Two-fluid model.

Dielectric properties of solids : Static dielectric constant, Electronic and ionic polarization of molecules, Ferroelectricity- dipole theory, Inter-band transitions, Kramers-Kronig relations, Polarons, Excitons, Optical properties of metals and insulators.

Defects in solids: Classification of defects, Role of dislocations in material behavior. Irradiation effects in solids, Concept of DPA, Introduction to nuclear reactor.

04PHYS04-011-C Basic Nuclear physics: Credit 3

1. Nuclear structure: Chart of Nuclide, Nuclear Ground State Properties (Mass, binding energy, moments etc.), Introduction to nuclear models, liquid drop model, mean field concept and basic shell model, Nuclear shapes and Deformed shell model, Introduction to Gamma-ray spectroscopy, Gamma ray selection rule, single particle states, collective states, Methods of production of excited states in nuclei, Present day challenges.

2. Nuclear reactions: Nuclear reaction kinematics, Nuclear radius and methods of determination of nuclear radius, Scattering theory (partial wave analysis etc.), Statistical model (compound nucleus), Fusion-evaporation, Fusion-Fission, Concept of Level density and Temperature and methods of its experimental estimation, Resonances, Breit-Wigner formula.Introduction to different nuclear reactions: Coulomb excitation, Direct reactions, Multi-nucleon transfer, Deep inelastic collision, Multi-fragmentation and spallation. Introduction to the present day interest in nuclear reaction studies.

3. Radioactive Ion Beam (RIB): What is RIB and why it is important, Basics of the methods of production of RIB, Challenges in doing experiments using RIB, RIB facilities in the world.

04PHYS04-012-C Laboratory experiments: Credit 6 (Each student will carry out minimum of 6 experiments)

The experiments that will be carried out will make the students familiar with different types of detectors and nuclear electronics required for nuclear physics experiments and high energy physics experiments. The students will also carry out specific materials science experiments.

1. Operation of vacuum pumps and gauges
2. Thickness measurement of thin foils
3. Calibration and energy resolution of different types of radiation detectors (e.g, Si, CsI(Tl), HPGe, BaF_2 , etc.)
4. Thickness uniformity test of different detectors
5. Characterization of a neutron detector
6. Characterization of a gaseous detector (Gas electron multiplier/avalanche counter)
7. Efficiency measurement of different types of γ detectors
8. Characterisation of samples using XRD (X-ray diffractometer)
9. Measurement of stored energy in deformed samples using DSC (differential scanning calorimeter)
10. Measurement of mechanical strength of different materials using universal testing machine.
11. Characteristion of samples using Scanning Electron Microscope and Energy Dispersive X-ray Analysis.
12. Nanostructuring by ion beam.
13. Preparation and characterisation of Nanoparticles by sol-gel method.
14. Measurement of muon life time
15. Characteristic study of wavelength shifter fibres
16. Fabrication and characterization of a scintillator detector.

04PHYS04-013-C Advanced Nuclear Structure: Credit: 4

Nuclear Models (HF, HFB), Microscopic-macroscopic model and total energy calculations (Strutinsky method), Introduction to Density Functional Theory, Electromagnetic moments, Different modes of excitation in nuclei, Giant resonances, Gamma ray spectroscopy and nuclear structure, Construction of level scheme, Spin and parity assignment of nuclear levels, Lifetime measurement of nuclear levels, Observables and deduced quantities, Nuclear Isomerism, Introduction to total Absorption Spectroscopy and beta-delayed neutron emission.

04PHYS04-014-C Advanced nuclear reaction: Credit: 4

Damped nuclear collision: General features, Kinetic energy loss, Angular distribution, Angular momentum dissipation, Time scale, Phenomenological and theoretical models for heavy ion collision, Dissipative forces: one-body, two-body dissipation. Fission dynamics: Dynamical models of fission, Quasi fission, Synthesis of super heavy elements (SHE), Heavy-ion physics at low and intermediate energies: Intermediate mass fragments emission, Reaction near Fermi energy domain, Hot nucleus, Multi-fragmentation, Liquid-gas phase transition, Theoretical models of multi-fragmentations, simulations and QMD model. Nuclear astrophysics: Nuclear resonances, Deep-sub-barrier fusion, Astrophysical S-factor, Gamow peak, Calculation of nuclear reaction rates and its use in calculating primordial and Stellar abundances; Equation of State for dense nuclear matter, β-equilibrium, Compact stars.

04PHYS04-015-C Advanced Accelerator physics: Credit: 4

Introduction: Sources of charged particle, Lorentz force and equation of motion, Hamiltonian of a charged particle, Charge particle motion in electromagnetic fields, Planer diode without and with space charge.

Basic beam parameters: Definition of beam parameters, Beam energy, Beam current, Time structure, Peak and average beam current, Beam size, Transverse beam dimensions, Bunch length, Energy spread, Beam emittances, Beam formation, Buncher, Beam chopper.

Beam optics and transport elements: Accelerator coordinate system, Paraxial ray equation for axially symmetric systems, Series representation of electric and magnetic fields, Paraxial ray equation, Solutions of the paraxial ray equations, Electrostatic lenses, Solenoidal magnetic lens, Larmor frame, Aberrations, Transfer matrix of transport elements, Stability condition, Beam envelope, Beam matrix, Transport notations, Basic focusing modules and different kinds of imaging, Telescopic system, Coupled systems, Transfer matrices of solenoid and Skew quadrupoles. Quadrupole doublet and Triplet.

Transverse and longitudinal beam dynamics: Beam envelope equation, Courant-Snyder invariant and emittance, Normalized emittance, Twiss parameters, Liouville's Theorem, Periodic system, FODO and FOFO Cell. Magnet imperfections, Dipole field and Quadrupole gradient errors, Resonances in circular accelerators. Off momentum orbit, Dispersion function, Momentum compaction, Transition energy, Negative mass, Dispersion matching, Chromaticity and its corrections. Longitudinal equation of motion, Phase stability and synchrotron oscillations, Fixed points, Bucket, Separatrix.

Beam with space charge: Space charge effects, Uniform beam model with elliptical symmetry, Applied and self fields, Beam envelope equation with space charge, Pervience, Beam transport in a uniform and periodic focusing channel, Tune shift and current limits, Envelope oscillations, modes and instabilities, Linear beam model with charge neutralization, Space charge compensation. Vlasov model, K-V and Waterbag distribution, Stationary distributions in a uniform focusing channel, RMS emittance, Concept of equivalent beams, RMS envelope equations, Sources of emittance growth, Filamentation of phase space, Wake fields and image charge effects**.**

Linear accelerators: Particle Acceleration in an RF Field, Energy Gain in an RF Gap, Transit-Time-Factor, Shunt impedance, Quality factor, Phase and group velocities, Periodic Structures, Floquet Theorem and Space Harmonics, Traveling-Wave Linac Structures, Constant-Impedance and Constant-Gradient Structure, Independent-Cavity Linacs, Wider¨oe Linac, H-Mode Structures, Alvarez Drift-Tube Linac, Coupled-Cavity Linacs, Accelerating Structures for Superconducting Linacs, Transverse dynamics in a Linac, Transverse RF Focusing and Defocusing, Quadrupole Focusing in a Linac, Longitudinal dynamics in Linac, Longitudinal Focusing, Stability analysis, Separatrix, RF Bunching, Beam dynamics in RFQ accelerator.

Storage rings and synchrotron radiation: Radiation from moving charges, Coulomb regime, Radiation regime, Radiation sources, Bending magnet radiation, Wavelength shifter, Wiggler magnet radiation, Undulator radiation, Radiation power and angular distribution, Quantum fluctuation, Beam lifetime.

Advance accelerators: Free electron laser, Plasma accelerators, Spallation neutron sources, Rare ion beam (RIB) facilities. Accelerators driven subcritical systems (ADSS).

04PHYS04-016-C Advanced High Energy Physics Credit: 4

Renormalization in quantum field theory: One loop radiative corrections in quantum electrodynamics (OED), Power counting and the index of Divergence, dimensional regularizations and renormalizations. Calculations of one loop diagrams in QED.

Quantum Chromodynamics (QCD): Non-abelian guage theory, one loop diagrams and running coupling, Pertubative QCD.

Structure of hadrons: Proton form factor, Deep inelastic scattering of electron off proton, Parton evolutions.

Heavy Ion collisions at Ultra Relativistic Energies : Quark Gluon Plasma, Hadrons in thermal bath, Thermodynamics of strongly interacting matter, QCD phase transition in the laboratory, Space time evolution and signals of quark gluon plasma.

Space time evolution of Quark Gluon Plasma and relativistic hydrodynamics.

Suggested Books :

6. An introduction to Quantum Field Theory, *M. E. Peskin and D. V. Schroeder*
7. Quantum Field Theory, *L. H. Ryder*
8. Field Theory, *P. Ramond*
9. Gauge Field theory, *S. Pokoroski*
10. Quantum field theory, *L. S. Brown*
11. Introduction to High Energy Heavy Ion Collisions, *C. Y. Wong*
12. Quark Gluon Plasma from Big Bang to Little Bang, K. Yagi, T. Hatsuda ,and Y. Miake.

04PHYS04-017-C Advanced Materials Science – I (Effects of radiation in metals and alloys): Credit: 4

Interaction of radiation with matter: Interaction of electromagnetic radiation, neutrons and charged particles with matter, Concept of nuclear and electronic energy loss, Differential cross section in projectile target collision

Radiation Damage Event: Neutron-nucleus interactions, Interaction between ions and atoms, Ionization collisions.

The displacement of atoms: Elementary displacement theory, Modification to Kinchin-Pease displacement model, Displacement cross-section

Damage cascade: Displacement mean free path, Primary recoil spectrum, Cascade damage energy and cascade volume, stages of cascade development, behaviour of defects within the cascade

Radiation induced defect formation: Point defect formation, Thermodynamics of point defect formation, Diffusion of point defects, Dislocations.

Radiation enhanced diffusion and reaction rate theory: Point defect balance equation, Radiation enhanced diffusion, Defect reactions, Reaction-rate controlled processes.

Radiation induced segregation (RIS): RIS in concentrated binary alloys and ternary alloys, Effect of local composition changes on RIS.

Phase stability under irradiation: Radiation induced segregation, Radiation induced precipitation, Meta-stable phases, Amorphization.

Unique effects of ion irradiation: Ion irradiation techniques, Composition changes, Other effects of ion implantation like grain growth, Texture, Dislocation microstructure.

Simulation of neutron damage with ions : Aspects of radiation damage relevant to ion irradiation, Advantages and disadvantages of various particle types, Emulation of neutron irradiation damage with proton, Irradiation parameters for particle irradiation, Effects on mechanical properties due to irradiation hardening, Embrittlement, Irradiation creep and growth.

04PHYS04-018-C Advanced Material Science II   Credit: 4

Multi-functional materials: Ferroelectricity, Multiferroic materials, Ferroelasticity, Magnetoelectric coupling, Conducting polymer and nanocomposites.

Nano-particle Physics: Introduction to nanoscale physics, nano mechanics, nano electronics, nano photonics, spintronics, various nano structured materials and their synthesis processes, probing of nano materials by advanced tools, applications of nano materials.

Advanced oxide materials: Crystal field splitting, John Teller distortion, Zener double exchange model, Mott insulator, Theory of superconductivity, Manganites, Density functional theory, Magnetic properties of solids, d0 ferromagnetism, Defect characterization in oxides by positron annihilation techniques, Mossbauer spectroscopy in oxides.

Suggested Books:

1. Solid State Physics, A J Dekker
2. Physics of Nanostructures, Dresselhaus and Dresselhauss
3. Transition Metals Oxides: An introduction to their electronic structure and properties, P A Cox.

04PHYS04-001-E Advanced High Energy Physics (Experiment) : Credit 4

Introduction to Relativistic Heavy-Ion Collisions-Experiments: Flow-chart from beam to Physics.

Relativistic Kinematics: Lorentz transformation; frequently used reference frames, Rapidity, pseudo-rapidity, invariant cross-section Collision and decays;

Distribution Functions: particle production and measurement in high energy collisions. ;

Detector Simulation in High Energy Physics: Requirement of detector simulation, Introduction to Geant4, Illustration with an example. ;

Physics of collisions: Synchrotron and Storage ring, Energy, Cross-section, Luminosity, Event rate, beam parameters.

Introduction to data analysis: hits, primary vertex, tracks, secondary vertex, trigger and pile-up.

Raw Data processing: Concept of detector and electronic noise, Detector calibration, Acceptance and Efficiency estimation, event and physics trigger selection, analysis for physics objectives.

Particle identification in high energy experiments: dE/dx, Range, TOF technique, Transition radiation.

Different techniques of Background and Error estimation.

Yield Calculations (Including Detector effects).

Global Observables: Multiplicity, (pseudo)rapidity distributions, invariant yields. ;

Centrality of events: Glauber Model, experimental methods.

Quarkonia suppression: Quarkonium spectroscopy, dynamics of quarkonium production in elementary collisions, cold nuclear matter effects, Debye screening, experimental observables and interpretation,

Correlations and Fluctuations: Concepts, BE correlations, Two particle angular correlation, physics interpretation**.**

Collective Flow: Radial flow, anisotropic flow: different flow harmonics and methods of extraction.

Physics of Jets: Formation, Energy loss, Jet reconstruction in high energy collisions (methodology), Importance.

Books:

1. Introduction to high energy Heavy-Ion Collisions, C. Y. Wong
2. Quark Gluon plasma from Big Bang to Little Bang, K. Yagi, T. Hatsuda and Y. Miake
3. Phenomenology of Ultra-Relativistic Heavy-Ion Collisions, Wojciech Florkowski
4. A Short Course on Relativistic Heavy Ion Collisions, Asis Kumar Chaudhuri
5. Ultrarelativistic Heavy-Ion Collisions, Ramona Vogt

04PHYS04-001-P Project work equivalent to 12 credit.

Total credit: 60

Ph.D. in Physical Science under SINP (Program Code: PHYS04)

BACK TO MAIN

Semester I

17 weeks during August–December, out of which 16 weeks are classes and 1 week for exams.
2 weeks festival holidays

Sl No	Course code	Name of the courses	Credit
1	CNM	Computational & Numerical Methods	6
2	SM2	Statistical Mechanics	6
3	QM2	Quantum Mechanics	6
4	OPT1	Optional course 1	6

Calculation of credit
For CNM/SM2/QM2: 2 Classes per week x 1.5 hour = 3 hr, tutorial = 2 hr, home assignment and self-study = 7 hr. Total 12 hr.
In 16 weeks = 16 x 12 = 192 hr. 1 credit = 30 contact hr. Total credit = 192 / 30 = 6.
For LAB: Lab hours per week = 12 hr. In 16 weeks = 12 x 16 = 192 hr = 6 credit.

Semester II

17 weeks during January–April, out of which 16 weeks are classes and one week for exams.

Sl No	Course code	Name of the courses	Credit
1	RM	Research Methodology	6
2	OPT2	Optional course 2	6
3	OPT3	Optional course 3	6
4	OPT4	Optional course 4	6

Optional and Lab courses are offered by various Division

Calculation of credit
For RM: Per week 2 classes x 1.5 hour = 3 hr, tutorial = 2 hr, home assignment and self-study = 7 hr. Total 12 hr.
For LAB: Per week 2 classes x 1.5 hour = 3 hr, Lab assignment = 6 hr, self-study = 3 hr. Total 12 hr.

1st & 2nd weeks of May are Holidays

Summer Semester

11 weeks during mid May–July.

Sl No	Course code	Name of course	Credit
1	PRO	Project	12

Presentation of project thesis in the 3rd week of July.

Calculation of credit
Project work per week = 30 hr, Self-study = 4 hr, Total = 34 hr. In 11 weeks = 11 x 34 = 374 hr = 12 credit.

Computational & Numerical Methods (CNM)

Introduction to Numerical Analysis; Error Analysis; Linear Algebra; Interpolation and Extrapolation; Differentiation and Integration; Root Finding and Optimization; Differential Equations; Python instalation, libraries and environment; Comparison of modern programing languages; Modern Scientific Computing using Python and C++; Interpolation and Fourier transform; Differential equations; Random numbers and multidimensional integration.

Pang, An Introduction to Computational Physics; R.H. Landau and M.J. Paez, Computational Physics; B. Stroustrup, C++ Programming language; S. Meyers, More Effective C++.

Statistical Methods (SM2)

Landau theory of phase transitions, Critical Phenomena, Kosterlitz-Thouless transition, Renormalization group, Ising model in one-dimension, Mean field solution of two-dimensional Ising model and Onsager solution, Theory of fluctuations (Central limit theorem, Law of large numbers, Random motion and Diffusions), Exactly solvable models (N-vector model, Spherical model in arbitrary dimension), Hydrodynamics (Viscosity, Navier-Stokes Theorem), Heat conduction in one-dimension, Out of equilibrium scenarios.

Quantum Mechanics (QM2)

Scattering Theory – Elastic and inelastic; Time dependent perturbation theory; Many particle Systems; Relativistic Quantum Mechanics; Path Integral Techquines; Theory of Measurements.

Reference

J.J. Sakurai, Modern Quantum Mechanics, Rev Ed; A. Messiah, Quantum Mechanics, Vol I & II; C. Cohen-Tannoudji et al, Quantum Mechanics, Vol I & II; H. Weyl, The Theory of Groups in Quantum Mechanics; L.D. Landau & E.M. Lifshitz, Quantum Mechanics, 3ed; J.D. Bjorken & S.D. Drell, Relativistic Quantum Mechanics; E.P. Wigner, Group Theory and Quantum Mechanics; L.S. Schulman, Techniques and Applications of Path Integration; A.L. Fetter & J.D. Walecka, Quantum Theory of Many-particle Systems; J.A. Wheeler & W.H. Zurek (Ed), Quantum Theory of Measurement

Research Methodology (RM)

Ph.D. thesis, Psychological and social factors during Ph.D., Students' role during Ph.D., Supervisors' role during and after Ph.D., Overview of research planning, Time management, Fair scientific practices.

Ethics in natural sciences, Avoiding research that cause unjustified risk to people, Jeopardizing the environment or convert public resources into private profits, Striving for objectivity (in the research process and in presentation of results), Handling uncertainties.

Literature survey, Critical use of existing knowledge, Finding a research problem, Scientific publishing, Classification of conferences and journals, Judging whether a material is publishable, Refereeing process, Criticizing own and others' work.

How to give seminars, How to use various softwares, How to use various instruments, How to interact with people, How to apply for jobs, Plagiarism in science – what to do and what not to do.

As a concrete example, each student will be asked to write a “prototype thesis” in a given area under a “supervisor”. The student will apply the knowledge, ethics and best scientific practices to produce this thesis. Each student will have to defend the thesis as well.

As optional courses: Quantum Field Theory I & II, General Relativity, Group Theory and Differential Geomery, Particle Physics, Nonequilibrium Statistical Mechanics, Condensed Matter Theory, Nuclear Physics and several Experiments in various Labs, are offered.

Syllabus for IPR's PhD Program as per HBNI guidelines

Ph.D. in Physical Science
(Program Code: PHYS04)

For applicants with
M.Sc. in Physics, Applied Physics & Engg. Physics

INSTITUTE for PLASMA RESEARCH Bhat, Gandhinagar

Enrollment under HBNI, Mumbai

Syllabus for IPR's Ph.D. Program

Trimester-1

Sr. No.	Subjects	Code	Lectures hrs.	Credits
1	Fundamentals of Plasma Physics – A	FPP – A	32	4
2	Fundamentals of Plasma Physics – B	FPP – B	32	4
3	Plasma Production and Measurements-I	PPM – I	32	4
4	Mathematical Methods – I	MM – I	32	4
5	Electromagnetic Theory – I	EMT – I	32	4
6	Mechanics –I (Classical Mechanics)	MEC-I	32	4
7	Laboratory Practical – I	LAP – I	64	4
	TRIMESTER – I		**256**	**28**

Trimester-II

Sr. No.	Subjects	Code	Lectures hrs.	Credits
1	Advance Plasma Physics – A	APP – A	32	4
2	Advance Plasma Physics – B	APP – B	32	4
3	Plasma Production & Measurement – II	PPM – II	32	4
4	Mathematical Methods – II	MM – II	32	4
5	Electromagnetic Theory – II	EMT – II	32	4
6	Mechanics –II (Fluid & Statistical Mechanics)	MEC – II	32	4
7	Numerical Methods and Advance Computing	NMAC	32	4
8	Laboratory Practical – II	LAP – II	64	4
	TRIMESTER – II		**288**	**32**

Trimester-III

Sr. No.	Subjects	Code	Lectures hrs.	Credits
1	Research Methodology	RM	8	1
2	Introduction to Materials Science	MS	8	1
3	Credit Seminar	CS	--	3
4	Mini Project	PROJ	--	4
	TRIMESTER – III		**16**	**9**

Total credit = 69

Duration: 1st August to 31st July (next year)
Course pattern: 3 trimester courses with 1 Project
Evaluation: Tests (Mid-term and Final) in each trimester, Presentations/Seminar in each trimester, Assignment and OGCE at the end of Trimester III

TRIMESTER – I

Total Credit – 28; Total subjects – 7;

Each course – 2 h Lectures per week per subject;

1. Fundamentals Plasma Physics (A); (32 Lectures ; 4 credit)

- **Overview (Plasma Physics and Applications)**
  Applications of Plasma: (industrial, space, biomedical, agriculture, fusion)
  Definition of Plasma (Saha Ionization, Macroscopic Neutrality, Debye Screening, Plasma frequency).
  Description of collective behavior, derivation of plasma frequency (slab model), Debye length, Plasma Criteria, Classification of plasmas.

- **Charged Particle Interaction**:
  Collision Processes in Plasma binary collisions (derivation of Rutherford scattering), derivation of collision frequency ν_{ei} (large angle collisions, cumulative effect of many small angle collisions, Coulomb logarithm), Mean free path, electron-electron, electron-ion, electron-neutral, rate constant.
- **Particle Orbit Theory:**
  Energy Conservation, Equations governing Single Particle Drifts in Constant electric and Magnetic field, Concept of Guiding center, Larmor radius, Magnetic moment, Plasma diamagnetism, Magnetization current, ExB Drift. Equations governing Single Particle Drifts in Non-uniform magneto-static Fields (Grad-B Drift, Curvature Drift).

- Magnetic mirror and trap, Adiabatic invariance and its utilization – (Magnetic moment, J and Magnetic flux in an inhomogeneous field).
- Drift in time-varying electric and Magnetic field (electromagnetic field) - Polarization drift, Ponderomotive forces, Guiding center approximation.

2. Fundamentals of Plasma Physics (B) ; (32 Lectures ; 4 credit)

- **Statistical description of plasma**
  Concepts of Distribution function, Boltzmann equation, Moments of the Boltzmann Equation, Maxwell-Boltzmann Distribution (Determination of the Constant Coefficients, moments of Maxwell-Boltzmann Distribution, RMS, Most probable speed, Speed and Energy distribution function.

  Average Values and Macroscopic Variables (average density, mass, flow velocity, temperature, pressure dyad, heat flow vector, Random Particle Flux, Kinetic Pressure and Heat Flux)

- **Macroscopic Transport Equations**
  Relation of Plasma Physics and Ordinary Electromagnetics (Maxwell equation)
  Fluid Equation of Motion (Convective Derivative Concept, Stress Tensor, equation of continuity, equation of state, energy transport equation)

- **Fluid Drifts**

  Fluid Drift Parallel to B (Boltzman relation for electrons, Physics interpretation, Quasi-neutrality & Plasma Approximation);
  Drifts Perpendicular to B (Diamagnetic Drift, physics interpretation)

- **Elementary Waves in Warm Plasma**

i. Basic Wave Concepts of Phase and group velocity, plane wave solution, Energy Flux, Dispersive Media, Linear perturbation
ii. Electrostatic waves in Cold un-magnetized plasma – Plasma Oscillation, Electron Plasma Wave, Validity of Plasma approximation, Ion Sound Wave,
iii. Comparison of Ion and Electron Plasma Wave, discussion of $k\lambda_D << 1$, plasma parameter).

3. Plasma Production and Measurements – I; (32 Lectures ; 4 credit)

- **Fundamentals of Vacuum Science:**

  Concepts of gas laws, inter-atomic distance, molar volume, Avogadro number, partial pressure, adsorption of gas atoms at surface.
  Vacuum Measurements – Pressure and flow measurements, different range of Vacuum, Concepts of Vapour pressure, different types of pressure measurement devices and different pumps.
  Concepts of mass flow rate, conductance calculation, pumping speed, volume flow rate, through-put.

- **Fundamentals of Gaseous Discharge:**

  Charge Particles under Constant Electric Field (E/p), Ionization processes in Plasma – Plasma interaction with surfaces, charge exchange processes, thermionic emission, field emission, electron multiplication.
  DC breakdown at low pressure, Paschen Law, condition for self-sustenance. Classification of d.c discharge – glow, abnormal glow, arc, Characteristics of Cathode glow, positive column and anode glow.

- **Equilibrium Discharge Properties**

  D.C & A.C Plasma conductivity, plasma resistivity, Mobility and Diffusion with/without Magnetic field, Ambipolar Diffusion

- **Plasma Sheaths**

  Bohm Criteria, Familiarity with different types of Sheaths –Child Langmuir, Matrix sheath, Significance of Pre-Sheath, Current-Voltage Characteristics of a Probe in Plasma (theory)

- **Discharge Modeling**

  Energy loss mechanism in Dc discharge, Particle and Energy Balance, Estimation of Plasma density and Temperature by Global Model

4. Mathematical Methods – I ; (32 Lectures ; 4 credit)

- **Ordinary Differential Equations (ODE):**. First and higher order linear ODEs with constant and variable coefficients, method of undetermined coefficients and functions.
  Non-homogeneous linear equations: method of variation of parameters. Green's function method, Nonlinear ODEs of first and higher orders: method of successive approximation,

Stability for a linear system of ODEs. Applications of ODEs in plasma physics with examples.

- **Approximate Methods for solving ODE:** Power series method of solution for linear ODEs: Legendre, Laguerre and Hermite ODEs and their solutions, Picard's method, Perturbative method, Poincare-Lindstedt Method, WKB method.
- **Complex Analysis:** Introduction to complex variables, function of a complex variable, continuity and differentiability of complex function, Cauchy-Riemann conditions, Analytic functions and singularities, representation of an analytic function by a convergent infinite series, complex integration, method of residue. Applications of complex analysis and complex integration in plasma physics: e.g., Landau damping, Fourier transforms etc.
- **Difference Equations (DE):** Introduction, linear difference equations of first and higher order with constant coefficients. Use of DE for solving ODE and PDE: first order fluid equation.

5. Electromagnetic Theory-I ; (32 Lectures ; 4 credit)

- **Electrostatics:**

  Fundamentals of electrostatics and its application: Coulomb's law, Principle of superposition, Gauss law with emphasis on symmetry requirements for the law to be applicable, Field near conductor, conducting sphere with cavity, concept of electrostatic shielding, electric breakdown and lightning, Capacitors; solution to problems (of the type that tests the understanding).Electrostatic potential, potential energy for various charge configuration.

  Uniqueness theorem, boundary conditions for electric fields, method of image (discussions beyond conventional configurations), Separation of variables, boundary value problems in curvilinear coordinate systems (Poissons and Laplaces equations), Multipole expansion of potentials.

  Green's function method for solving boundary value problems (derivation, Dirichilet, Neuman and mixed boundary conditions.
- **Magnetostatics:**

  Fundamental of magneto-statics drawing analogy to electrostatics,
  Biot-Savart, Amperes Laws, Vector Potential.
  Methods for solving boundary value problem in magneto-statics
  Multipole expansion.
- **Electrodynamics :**

  Laws of electrodynamics (Maxwell's equations) and its relevance in Plasma production, measurement.

  Application of electrodynamics: Current Transformer, Some applications in plasma (e.g B-dot and E-dot probe); self and mutual inductance, Magnetic levitation, eddy currents etc.

  Time dependent and time independent vector potential in different Gauges (coulomb and Lorentz gauge).

6. Mechanics-I (Classical Mechanics); (32 Lectures ; 4 credit)

- **Lagrangian mechanics:** Introduction to Newtonian mechanics, Advantage of Lagrangian mechanics over Newtonian mechanics, Constraints, principal of virtual work, Lagrange multiplier. D'Alembert's principle, generalized coordinates. Lagrange's equation of motion and its applications, e.g., Spherical pendulum, particle in EM fields.

- **Central force:** Two-body central force problem, Kepler's problem, and Scattering problem, relation with plasma physics.
- **Hamiltonian mechanics:** Need of Hamiltonian mechanics, Legendre transform, Hamilton's equation, Hamilton's principle of least action. Applications to classical systems.
- **Canonical transformations (CT):** Definition, generating functions, properties and examples of CT, Poisson bracket (PB) representation, invariance of PB under CT. Applications to classical systems.
- **Hamilton Jacobi Theory:** Hamilton Jacobi equation, Hamilton's principal function, action and angle variable, adiabatic invariants. Applications in plasma physics.
- **Canonical perturbation:** Anharmonic oscillator, time independent and dependent perturbations.

7. Laboratory Practical – I (64 Hrs ; 4 credit)

(To be carried out in different labs through student-group wise orientation)

- **Experimental Electronics**

  Application of Operational Amplifier, Summing amplifier (AC+DC), Differential Amplifier, Inverting and non-inverting amplifier, design of regulated DC power supply: tuneable ± 15 Volt power supply circuit, Design of analogue filter circuits: low pass, high pass and band pass filter circuits, Converting AC signal to a square wave and ramp signal.

  Assessment – Practical report on each devices and description of circuit with experimental data.

- **Characteristics of DC Discharge**

  Operation of rotary and diffusion pumps, creating vacuum from atmosphere and back, leak detection experiment, estimation of pumping speed, Paschen Breakdown Experiment, Measurements of current-voltage (DC impedance) characteristics of a discharge

  Assessment – Practical report on experimental data and description of the underlying theory

- **Computer Laboratory Practical through numerical programming**:
  - Root finding: Study of different methods its salient features, programming one method.
  - Interpolation and extrapolation programing: Study of different methods and features, Programming one method.
  - Differentiation and Integration programming: Study of different methods and features, Programming one method.
  - Basic single charge particle trajectory simulations in standard electric field and magnetic field.

  Assessment – Practical report with brief understanding of the underlying theory and programming results

TRIMESTER – I ends

TRIMESTER – II

Total Credit – 32; Total subjects – 8;

Each course: 2 hr Lectures per week;

1. Advanced Plasma Physics (Part-A); (32 Lectures ; 4 credit)

- **Waves and instability in inhomogeneous plasma:**
  Derivation of generalized Cold plasma dielectric constant.
  Electrostatic Waves, Electromagnetic Waves (B=0, propagation along the B and Perpendicular to B),CMA Diagram
  Concept of Instabilities (Classification, growth rates)
  Derivation of the dispersion relation for Drift waves, effect of finite ion inertia, excitation of drift wave instability by electron ion collisions.
  Two-fluid, Gravitational Instability
- **Kinetic Description of Plasma**
  Many body description for plasma**,** The Klimontovich Dupree system of equations.
  BBGKY Hierarchy, Boltzmann equation, Vlasov Equation, Fokker-Planck Equation.
  Properties of Vlasov Equation, Equilibrium Solutions
  Kinetic Instability – Two Stream Instability and negative energy waves
  Derivation of derivation for dispersion relation for electrostatic waves (Langmuir and ion sound) in warm plasma, Concept of Landau damping.

2. Advanced Plasma Physics (Part-B); (32 Lectures ; 4 credit)

- **Non-Linear Effects in Plasma**
  KdV equation, Solitary Wave Equations, Generation of Ion Acoustic Shock Waves.
- **Magneto-hydrodynamics:** Introduction to Basic MHD Equations (Ideal MHD, Resistive MHD), Generalized ohms law, Magneto-hydrodynamic Wave (Alfven and Magnetosonic waves), MHD energy.
- **Application of MHD:** Magnetic Viscosity and Reynold Number, Frozen of Magnetic Field lines in plasma Instabilities in Magnetized Devices, Pinch Effect – Kink , Sausage, Instabilities, Ideal Magnetohydrodynamics – Equilibrium in Cylindrical and Toroidal Plasma Devices;
- **Introduction to Tokamak Physics**

3. Plasma Production and Measurements – II; (32 Lectures ; 4 credit))

- Fundamentals of different types of Plasma Sources and its discharge circuits:
  - RF Capacitive Discharge
  - RF Inductive Discharge
  - ECR and Wave based (Helicon) discharge

- Principles of Spectroscopic and Laser Diagnostics:
  Basic introduction to spectrum and spectral lines based on Atomic and Molecular

structure, Introduction to Emission, Absorption and Fluorescence spectroscopy, Einstein's coefficients for transitions, Importance of Spectroscopic databases, Understanding of different spectroscopic models (Corona, CR model, LTE model), methodologies (absolute, line ratio) and its application suitability for an experiment.

- Microwave and Interferometric diagnostic techniques:
  Fundamentals of Microwave interferometry and its methodology. Understanding of a Microwave system and its parts and accessories.

4. Mathematical Methods-II; (32 Lectures ; 4 credit)

- **Partial Differential Equations (PDE):** Introduction, Classification of PDEs (elliptic, parabolic and hyperbolic type), First order PDEs, complete integral and general solution, methods of solution of a first order and second order PDEs, Separation of variables, Method of characteristics etc., Some important equations (Laplace equation, wave equation, heat conduction or diffusion equation), Green's function method for PDEs.
- **Integral equations:** Definition, homogeneous, inhomogeneous, linear, non-linear equations, Fredholm and Volterra equations, eigen-functions, Schmidt-Hilbert method of solutions. Applications of integral equations.
- **Integral Transforms:** Fourier Transforms, Laplace Transforms and the inverse transforms, connection to physical problems. Other transforms such as Mellin and Hankel transforms, and transforms generated by Green's function. Applications for obtaining solution of ordinary/partial differential equations. Applications and relevance in plasma physics.

5. Electromagnetic Theory-II; (32 Lectures ; 4 credit)

- **EM wave in bounded region**: Wave equation and their solution, Poynting's theorem, Reflection at a plane-conducting boundary, Reflection and refraction at a plane between dielectric.
- **Introduction to waveguides:** TEM, TE, TM modes, Transmission line theory (including Impedance matching, Smith chart), waveguide and cavity resonator theory; Dielectric waveguide, Optical Fiber.
- **Gauges:** Electromagnetic Potential theory and its solution with various Gauges (Lorentz and Coulomb Gauges).
- **Radiation:** Radiation by an accelerated particle, Elements of Antenna Theory, Advanced and Retarded Green functions; Lienard-Wiechert potentials; dipole radiation and Larmor's formula; spectral resolution and angular distribution of radiation from a relativistic point charge; synchrotron radiation; collision problems; Bremsstrahlung and Cerenkov radiation.
- **Scattering of electromagnetic waves:** Rayleigh and Thomson scattering, radiation damping.
- **Relativistic electrodynamics:** Lorentz Transformations, Four Vectors, Covariant and contra-variant tensors, Electrodynamics in Tensor Notation. Relativistic Potentials. Invariance.

6. Mechanics – II (Fluid Mechanics+ Statistical Mechanics);
(16+16 = 32 Lectures ; 4 credit)

Fluid mechanics:

- **Dimensional analysis and its application**: Techniques to generate dimensionless quantity:- Rayleigh's Indicial method, Buckingham Π (PI) method; Introduction of dimensionless quantities like: Reynold's no., Froude's no., Euler's no., Weber's no., Mach's no., Relation between model and 1:1 size prototype, Model analysis, Similitude theory.
- **Types of flow with their mathematical description** : Ideal flow, Real flow, Newtonian flow, Non-Newtonian flow, Steady and Unsteady flow, Uniform and Non-uniform flow, Laminar and Turbulent flow, Compressible and Incompressible flow, Rotational and Irrotational flow, 1D-2D-3D flows.
- **Dynamics of flow:** Bernoulli's theorem and its applications in real system
- **Kinematics of linear flow of incompressible fluid:** Introduction to Eulerian frame, Lagrangian frame, Specification of the flow field, Concept of convective field, Continuity equation, Velocity Potential function and Stream function, Flow net and their applications to analyze for superimposed flow, Vorticity distribution (line and sheet vortices). Navier-Stock's equation, Expression for stress tensor.
- **Kinematics of rotational flow of incompressible fluid:** Flow at large Reynolds's number, Vorticity dynamics, Kelvin's circulation theorem, Lagrange's theorem, Vorticity laws for inviscid fluid (having no viscosity).
- **Instabilities:** Introduction to Rayleigh-Taylor instability, Kelvin-Helmholtz instability in fluid.

Statistical Mechanics:

- **Classical Statistical Mechanics*:*** Introduction, postulates, Statistical description of many body systems: The many body distribution function and Liouville's equation, one and two particle distribution functions.
- **Non-Equilibrium Phenomena:** Elementary ideas, study of Brownian motion, random walk model, Langevin's force equation, fluctuation-dissipation theorem, Fokker-Planck equation.
- **Non-equilibrium dynamics:** Noose-Hoover Thermodynamics.
- **Numerical Statistical Mechanics:** Chaos and low degrees of freedom statistical mechanics, Driven-dissipative systems and Entropy rate models, Introduction to Non-extensive systems.
- **Quantum statistical Mechanics:** Bose and Fermi statistics.

7. Numerical Methods and Advance Computing ;
(32 Lectures ; 4 credit)

Numerical methods:

- **Taylor series and its application**.
- **Eigenvalue problems**: Symmetric matrix - Jacobi method, Un-symmetric Matrix - LR method, QR method.
- **Modeling of Data:** Introduction, Qualitative discussion on:- Chi-square Fitting**,** Variances and co-variances of the parameters**,** Fitting data to a straight line**,** General linear least square.

- **Integration of Ordinary Differential equations:** Introduction, Taylor's series method, Euler's method, Runge-Kutta Methods, Predictor-correction method, Boundary value problems, Finite-Difference method.
- **Fast Fourier transform (FFT) and its applications:** Introduction to FFT, Discrete Fourier Transform**,** Leakage and windows**,** Box-Car window**,** Hanning window**,** Convolution and correlation**,** Auto power spectra, cross power spectra and coherence spectra**,** Data smoothing**,** Bi-spectral analysis.

Advance Computer programming:

- Programming for particle motion simulation considering large number of particles (MC or MD type).
- Programming for Fluid simulation.

8. Laboratory Practical II ; (32 hrs; 4 credit)

(To be carried out in different labs through student-group wise orientation)

- **Excitation of Ion Acoustic Waves in Plasma and ion acoustic speed measurement**.
  Design understanding of the experimental setup including vacuum, launcher, receiver, electronics etc. and data analysis.
- **Electric Probe diagnostic (Single Langmuir Probe)**

  Design understanding and construction of a Single Langmuir Probe (vacuum connectors, vacuum feed throughs, probe tip dimension and configuration, electric conductivity)/Probe calibration experiment (trouble shooting)/Obtaining Ampere-Voltage Characteristic of probe in plasma; Electron energy distribution in plasma.
- **Measurements of Space potential / Electric Field in Plasma using Emissive Probe**.
  Design understanding and construction of an Emissive Probe. Probe Calibration experiment, Understand different methods of plasma potential measurement using Emissive probe, Measure and interpret the experimental data.
- **B-dot probe measurement.**
  Design understanding and construction of a B-dot Probe and its measurement principle, Probe Calibration experiment, Measurement and data interpretation in an experimental.
- **Spectroscopic measurements (density, temperature measurement)**.
  Understanding of a spectrometer and its parts and accessories, Arrangement of an experimental setup and data interpretation after experiment.
- **Plasma density measurement by Microwave**.
  Understanding of the experimental setup and measurement principle, arrangement of an experimental setup and data interpretation after experiment.

Assessment – Practical report on experimental data and interpretation including description of the underlying theory and viva.

TRIMESTER – II ends

TRIMESTER – III

Total Credit – 15

1. Research Methodology (Total lecture – 8; Total credit – 1)
• **Meaning of Research:** Objectives of Research, Motivation in Research, Defining the Research Problem • **Documentation:** Documentation in doing Research; proposal writing, report writing, manuscript writing • **Data collection:** error in experimental/obtained data, analysis of errors Statistical analysis techniques: mean, median, mode, Chi-square , variance, curve fitting, confidence in obtained data, Presentation of data, analysis and meaningful conclusion
2. Introduction to Materials Science (Total lecture – 8; Total credit – 1)
Fundamentals of Material Science: - **Atomic Bonding and Crystal structure:** Metallic bond, unit cell, atomic packing, interstitial sites, Miller indices, crystal orientation, Crystal defects in metals viz. vacancy, interstitial, substitutional, dislocations etc., - **Physical Properties of materials** : Electrical, Thermal, Magnetic, Dielectric, optical and other properties of materials **Material Development Using Plasma:** - Thin film process - Material and surface modification **Common Material Characterisation Techniques :** Optical Microscope, Electron Microscope, X-ray diffraction
3. Mini Project - Credit – 4
4. Credit Seminar – Credit - 3

TRIMESTER – III ends

Duration: 1st August to 31st July (next year)
Course pattern: 3 trimester courses with 1 Project
Evaluation:

- Tests (Mid-term and Final) in each trimester
- Presentations/Seminar in each trimester, Assignment
- OGCE at the end of Trimester III

BACK TO MAIN

Ph.D. in Physical Science
(Program Code: PHYS04)

New one-year Pre-doc Course Structure at IOP

To be implemented in August 2017

1 Introduction

Institute of Physics is conducting the Pre-doc courses in the existing format for around 20 years with some modifications as and when required. It is now felt that a major restructuring of the courses is necessary in view of the current research interests and student backgrounds.

The major modifications proposed are
(i) the switch over from three trimesters to two Semesters (Aug-Dec and Jan-June/July), and
(ii) several optional courses every semester, instead of making all courses compulsory.

2 Course structure

1 Semester-I (Aug-Dec) - 2 core courses+ 3 optional courses ($5 \times 6 = 30$ credits)

101 Advanced Quantum Mechanics (Core)

102 Quantum Field theory-I (Optional)

103 Advanced Statistical Mechanics (Optional)

104 Advanced classical field theory (Optional)

105 Many body Physics (Optional)

106 Soft Condensed matter Physics (Optional)

107 Advanced Experimental Techniques (Optional)

108 Experimental Physics - Lab course (Core)

2 Semester-II (Jan-June) - 1 core, 2 optional courses, 1 project ($3 \times 6 + 12 = 30$ credits)

201 Mathematical methods, Numerical Methods and Research methodology (Core)

202 Advanced Condensed Matter Physics (Optional)

203 Advanced Nuclear Physics (Optional)

204 Quantum Field theory II (Optional)

205 High Energy Physics (Optional)

206 Quantum information and computation (Optional)

207 Nonlinear dynamics and Chaos (Optional)

208 Special topics in Condensed Matter Physics (Optional)

209 Special topics in High Energy Physics (Optional)

210 Special topics in Mathematical Methods (Optional)

211 Special topics in Quantum Mechanics (Optional)

212 Special topics in Nuclear Physics (Optional)

213 Special topics in Statistical Physics (Optional)

214 Project (Core)

Project may be submitted and defended in July, A grand viva in July.
Total: 60 credits

3 Syllabus

101 Advanced Quantum Mechanics

Review of basics through problem solving

Schrödinger equation, Heisenberg Picture, Scattering problem in one dimension, Time-independent perturbation theory, Hydrogen atom, Born Approximation. Ladder operators and coherent states.

Time-dependent perturbation theory

Interaction picture, Time ordered perturbation theory, Fermis Golden rule, Floquet.

Relativistic Quantum Mechanics

Dirac Equation, Gamma matrices and Lorentz transformation of Dirac wave function, Positive and negative energy solutions and hole theory, Coupling to electromagnetic field, magnetic moment, Klein Paradox. Dirac equation for massless particles, Helicity. Majorana representation, Dirac equation in various space-time dimensions.

Path-integral formulation

Derivation of Path-Integral representation, Time-ordered correlators in path-integral formulation, coupling to electromagnetic field, Aharonov-Bohm effect, Double well potential in path-integral formulation, Instantons, Tunneling in path-integral formulation. Path-Integral in non-simply connected configuration space.

Geometric phase

Abelian and non-Abelian Berry phase. Some examples (According to the taste of the instructor), Aharonov-Bohm effect.

Discrete Symmetries

Wigners theorem, Translation, Rotation, Lorentz Transformation (Group), Parity, charge conjugation and Time-reversal. Kramers degeneracy.

Second quantization

Indistinguishable particles, Bose and Fermi statistics, Many-body quantum mechanics in the second quantized form, Electromagnetic field in the second quantized formalism, Light Atom interaction.

Books :

1) Sakurai - Modern Quantum Mechanics
2) Landau-Lifschitz - Quantum Mechanics (Non-relativistic theory)
3) Gottfried-Yan - Quantum Mechanics : Fundamentals
4) Feynman-Hibbs - Quantum Mechanics and Path Integrals
5) Sidney Coleman - Aspects of Symmetry, (Chapter : Uses of Instantons)

102 Quantum Field Theory-I

Canonical quantization of free field theory

Canonical quantization of free (complex) scalar field. Retarded, Advanced and Feynman propagator. Causality. Normal-ordering of operators. Concept of (connected) multi-point correlation function. Wicks theorem. Canonical quantization of free Dirac field. Feynman Propagator. Wicks theorem for Dirac field. Canonical quantization of electromagnetic field. Feynman Propagator. Casimir effect.

Interacting scalar field

Interacting scalar field : Perturbative evaluation of correlation functions. Time-ordered perturbation theory. Feynman Diagrams. Calculation of some tree-level amplitudes in phi-4 theory.

Path-integral quantization of scalar field theory

Derivation of Feynman propagator and Wicks theorem. Path-integral quantization of Maxwell theory. Grassmann numbers and Path-integral quantization of Dirac field. Path integral quantization of interacting scalar field theory : Generating functional of connected correlators and derivation of time-ordered perturbation theory.

S-matrix

LSZ reduction. Sample calculations of tree-level S-matrix.

Symmetries

Noether's theorem and Ward identity.

Miscellaneous topics

Wick rotation. Relation between d-dimensional QFT and (d + 1)-dimensional statistical mechanical system. Introduction to Wilsonian-RG and the concept of effective low energy field theory description.

Books :

1) Peskin and Schroeder - An introduction quantum field theory
2) Ramond - Field theory : A modern primer .

103 Advanced Statistical Mechanics

Review of Thermodynamics and Statistical mechanics by problem solving

a) Quick review of Basic postulates, potentials, Legendre transformation
b) Basics of Statistical Mechanics: random walk/Probability, Basics of ensembles , Quantum statistics

Dynamics

Boltzmann H theorem, its use for transport properties Master equation, Langevin Equation, Fokker Planck equation Simple discussions on Detailed balance, fluctuation-dissipation theorem, Onsager relations, Work theorem, Basics of Monte Carlo

Classical Interacting systems

Phase equilibrium, chemical equilibrium, Saha ionization; variational principle, Debye-Huckel theory; Van der Waals, Virial expansion; equilibrium curves, phase diagrams

Phase transitions and critical phenomena

First order,continuous transitions; Ising and O(n) models; mean field theory; symmetry breaking, Order parameter; Landau theory (scalar and vector order parameter), Tricritical point, Alexander-McTauge theory; Gaussian model, Ginzburg criterion. Scaling near critical point.

Quantum systems

Bosons: Details of Bose condensation of an ideal gas and in a harmonic trap Fermions: Chandrasekhar limit, Pauli paramagnetism, Landau diamagnetism, de Haas-van Alphen effect

Books:

1. F. Reif - Fundamentals of Statistical and thermal physics
2. K. Huang - Statistical Mechanics 2nd ed
3. Chaikin-Lubenskly - Principles of condensed matter physics

Other books by (a) Pathria, (b) J K Bhattacharjee, (c) Riechl, (d) S.K.Ma, (e) Newman-Barkema

104 Advanced Classical Field Theory

Selected topics from the list

Review of Basics Classical Electrodynamics

Vector analysis, Electrostatics Boundary-value Problems, Magnetostatics, Electric and Magnetic Fields in matter, Maxwell's Equations, Electromagnetic waves, Retarded Potentials, Relativistic Formulation

Classical Electrodynamics

Covariant formulation, Dynamics of relativistic particles in electromagnetic fields, Field and radiation from oscillating sources, Scattering and Diffraction, Wave-guides, Radiation by moving charges, Bremsstrahlung, Cherenkov radiation, etc

General Relativity

Principles of equivalence and general covariance, curvilinear coordinates, affine connection, covariant derivatives, metric, curvature tensors, geodesic equations, Einstein equation, Schwarzschild solutions, black holes, tests of general relativity, big bang theory

Hydrodynamics

Conservation laws and hydrodynamic description; Navier-Stokes equation for simple fluids; hydrodynamic description of ferro and antiferro magnets.

Field theory, Symmetry and Symmetry breaking

Landau-Ginzburg theory, order parameter, mean field theory, fluctuations Goldstone theorem, topological defects, solitons in different theories, nonlinear equations, Abelian Higgs model

Continuum Mechanics

General stress tensor, strain tensor, continuum limit, Hooke's law, Elastic distortions, models for elastic solids, liquid crystals, phonons in continuum

Books :

1) J. D. Jackson - Classical Electrodynamics
2) L. D. Landau and E. M. Lifshitz - The Classical Field Theory
3) S. Carroll - Space-time and Geometry
4) R. Rajaraman - Solitons and Instantons
5) P. M. Chaikin and T. C. Lubensky, "Principles of condensed matter physics"

105 Many Body Physics

Preliminaries

a) First and Second Quantization: Quantum Mechanics with many particles; b) First quantization, many particle systems; Operators in first quantization; c) Second quantization, basic concepts The occupation number representation; d) The general form for second quantization operators; Basis change in second quantization; Examples -Operators for kinetic energy, spin, density, and current; The Coulomb interaction in second quantization.

Mean Field Theories

a) Non-interacting many particle system vs interacting many particle system. Examples; b) Concepts of mean field approximation. Idea of broken symmetry; c) Hartree-Fock approximation, Thomas Fermi approximation.; d) Hohenberg-Kohn Theorem: Self-consistent Kohn-Sham Hartree-like theory for exact ground state energy and density of electrons; potential for alternative path to include many-electron effects; e) Application: i) model of ferromagnets, Stoner model of metallic ferromagnets , ii) application to BCS theory of superconductivity, iii) application to nuclear physics. f)Short discussion on the limitations of meanfield theories.

Method of Green functions

a) Single-particle Greens functions of many-body systems: meaning and significance; Greens function of free electrons; The Lehmann representation; The spectral function; Broadening of the spectral function due to interactions; Measuring the single-particle spectral function – spectroscopy; Two-particle correlation functions of many-body systems. b)Linear response theory and Kubo formalism for response function. c)Imaginary time Greens functions: Matsubara Greens functions; Connection between Matsubara and retarded and advanced Green's functions; Examples: Single-particle Matsubara Greens function; Evaluation of Matsubara sums .Equation of motion for Matsubara Greens functions; Wicks theorem and example of polarizability of free electrons. d) Feynman diagrams and Dyson series e) Application: i) Random impurities in disordered metals. ii) Anderson model for magnetic impurities iii) Random phase approximation for interacting electron system. iv) Application to interacting phonons(i.e beyond the Einstein model of lattice vibrations)

Renormalization Group method

a) Basic concepts; b) Wilsonian Renormalization Group c) Perturbative Renormalization Group d) Functional(or Exact) Renormalization Group method e) Applications.

Books:

1. Many-body quantum theory in Condensed Matter Physics - Karsten Flensberg and Henrik Bruus
2.Condensed Matter Field Theory - Alexander Altland and Ben Simons
3. Introduction to Many Body Physics - Piers Coleman
4. Green functions for solid state physicist - S. Doniach and E. H. Sondheimer
5. Quantum Theory of Many-Particle system - Alexander L fetter and J d Walecka
6. Renormalization methods - W. D. McComb
7. Electronic Structure Calculations for Solids and Molecules-Theory and Computational Methods by Jorge Kohanoff

106 Soft Condensed matter Physics

Selection of topics from the list

Basic introduction

Structure, scattering and correlation functions

various structures and scattering: ordered systems, liquids (classical and quantum), polymers, fractals, glasses. Effective forces: van der Waals to various time-temperature dependent forces

Liquid crystals, Polymers, and glass

1) Liquid crystals and colloids: models, phases, and phase diagrams
2) Polymers: Gaussian (ideal), self-avoiding, semiflexible polymer; scaling and its use; theta point; solutions and melts; topological effects; Response functions (elastic, viscoelastic behaviour); Dynamics: single and many chain;
3) Gels, rubber, percolation.
4) Introduction to glass transition

Generalized elasticity

XY model, Liquid crystals, crystals;

Hydrodynamic description

Conserved quantities, broken symmetry variables, dynamics near phase transitions (critical dynamics, nucleation, spinodal decomposition, phase ordering)

Topological and geometrical problems

topological defects in ordered systems like liquid crystals Elementary analysis of BKT transition; Fluctuating surfaces, topological invariants

Books:
1. Chaikin-Lubensky: Principles of condensed matter physics
2. Doi-Edwards, Polymer dynamics
3. M Doi, Soft matter physics
4. Richard A. L. Jones, Soft Condensed Matter

Review Articles:
1. Gary L Hunter and Eric R Weeks: The physics of the colloidal glass transition Rep. Prog. Phys. 75 (2012) 066501
2. Daan Frenkel, Soft condensed matter, Physica A, Volume 313, Issues 12, 1 October 2002
3. A. Bray, Theory of Phase ordering kinetics, Adv.Phys. 43,357 (1994)
4.R. D. Kamien, Rev Mod Phys. 84, 497 (2012)

107 Advanced experimental Techniques

Introduction to material science from bulk to nano to thin films. A multidisciplinary approach to structure-property relation and overview of few advanced experimental techniques to explore them.This course involves theory and visits to various experimental facilities toprovide first hand experience.

Crystallography

X-ray Diffraction and scattering, X-ray reflection from interfaces and multilayers, Neutron scattering

Optical spectroscopy

Raman spectroscopy, Photoluminescence spectroscopy, Infrared spectroscopy

Electron spectroscopy

Reveling the electronic structure via. Synchrotron radiation, Angle integrated and angle resolved Photoemission spectroscopy, X-ray absorption spectroscopy (XAS)

Ion spectroscopy

Introduction to particle accelerator, Ion Implantation, Rutherford back scattering (RBS), particle induced x-ray emission (PIXE)

Nuclear spectroscopy

Basic principles of Resonance spectroscopy and its application: Nuclear magnetic resonance spectroscopy(NMR), electron spin resonance (ESR), muon spin spectroscopy (μSR)

Surface Science

Growth of thin films and characterization by Scanning tunneling spectroscopy (STM), Atomic force microscopy (AFM), Low energy electron diffraction (LEED),transmission electron microscopy (TEM) scanning electron microscopy (SEM)

Transport measurements

Understanding magnetic and electronic transport measurements throughSQUID-VSM magnetometer, 4 probe resistivity.

108 Experimental Physics: Lab course

5 experiments to be done.

1. Nuclear Radiation Detectors: Semiconductor/gas/scintillation/particle detectors. Their calibrations, identifying unknown source, Identification of spectral features, Attenuation and other experiments,Charged particle spectroscopy,
2. Vacuum Techniques: Working with vacuum pumps,Pressure and flow measurements, leak detection
3. Workshop training: using lathe machine for making holes, cutting, casting, drawings.
4. Transport measurements:Temperature dependence of resistivity,Hall effect, Band gap determination
5. Surface science experiments:Thin film deposition,Investigating surface atomic structure, Scanning tunneling spectroscopy, Scanning electron microscopy.
6. Electronic experiments,Solvingdifferential equations using Op Amps,Digital electronics using OP Amps, timer etc., Analog to digital conversion &vice versa
7. Experimental control through computers
8. X-ray investigation of crystal structure/Laue method
9. Muon life time measurements.
10. Possible innovative experiment

201 Mathematical Methods, Numerical Methods and Research Methodology

Topics to be chosen as per interest:
Part-I: Mathematical Methods

Review (Problem solving)

Contour integration, analytic continuation, asymptotic expansion, branch cuts and Riemann surfaces, ODE/Special functions/integral representation,distributions (generalized functions)

Integral equations, Partial differential equations

Classification of Integral equations: Fredholm (1st, 2nd kind), Volterra; Method of solution in special cases, including Wiener-Hopf method, Numerical methods; Ill-posed problems and regularization. Partial differential equations (beyond what is done in other physics courses): First and second order equations: Classification (hyperbolic, elliptic and parabolic), method of solutions, special equations like KdV, KPZ, Navier-Stokes and others.

Ref: M. Stone and P. Goldbart, Mathematics for Physics; Arfken;

Group theory

Introduction to Groups, representations, Lie groups; Applications in quantum mechanics, crystal symmetry, solid state physics.
Ref: Books By A. W. Joshi, M. Tinkham

Probability theory, measure theory and Lebesgue integration

Introduction to probability and statistics; Introduction to measure theory and probability as a measure; Integration - Lebesgue- Stieltjes, Lebsgue integrals; Discrete and continuous random variables; Various standard distributions; transformations of probability distributions; Characteristic functions; Law of large number, Tchebyshebv's inequality, central limit theorem, stable laws, large deviation theory; Bayesian inference;
Ref: P. Halmos: Measure theory; Feller: Probability theory and applications;
For Bayesian inference: Udo von Toussaint, Bayesian inference in physics, Rev. Mod. Phys. 83, 943 (2011).

Introduction to topology

Basic notions of topological space, fundamental and homotopic groups, homology and cohomology; Application in physics, like configuration and phase spaces, path integrals in QM, defects, textures, instantons, etc.
Ref: Nash and Sen, Topology for physicists; Nakahara: Geometry, topology and physics.

Part-II: Numerical Methods

1. Introduction to computer languages:
   (Fortran/C/C++/python etc..) Representation of numbers, Numerical precision and estimation of errors.

2. Numerical Interpolation and extrapolations

3. Sorting and searching
4. Linear Algebra, eigenvalue and eigenvectors
5. Root finding algorithms: Bisection method, Newton-Raphsons method, The Secant Method
6. Numerical Integration, Quadratures
7. Numerical solution to Ordinary and Partial differential equations
8. Random number generation, Monte Carlo Simulation
9. Data fitting, chi-square fitting, goodness of fit test, Kolmogorov-Smirnov test

Part-III : Research Methodology Article writing, communication skills, seminar presentation, review of research papers.

202 Advanced Condensed Matter Physics

Selection of topics

The Electron Gas and Liquid

a) The electron gas, Hartree-Fock, The fermi liquid and Landau Parameters, The Random phase approximations, strong interaction (Wigner crystals) b) Non fermi liquid c) interactions in the presence of lattice (Mott insulators) d) Electron-Phonon interaction.

Reduced Dimensionality

a) Quantum Dots, b) The special case of 1D, the Landauer formalism for transport, c) interactions in 1D: Luttinger liquids d) The 2D electron gas, the quantum Hall effect (integer and fractional) e) introduction to topological insulators.

Physics of Disordered System

a) Anderson localization, b) Weak localization, c) Hopping transport, d) The metal insulator transition e) interactions in the presence of disorder, f) many body localization.

Superconductivity

a) Preliminaries, conventional vs unconventional superconductivity. b) Microscopics of BCS theories, gauge symmetry breaking, Josephson effect. c) High temperature superconductivity, Cuprate and Pnictides superconductivity, introduction to simple models of High Tc superconductivity. d) distinction between s-wave, p-wave, d-wave superconductivity. e) heavy fermionic superconductivity.

Magnetism

a) Basics, b) Ferromagnetism and Anti ferromagnetism, spin waves. c) Stoner model, t-J Model d) Introduction to frustrated magnetism, e) Local moments, the Kondo effects and RKKY interactions. f) Introduction to heavy Fermionic system, the Kondo lattice.

Books:

1. Karsten Flensberg and Henrik Bruus, Many-body quantum theory in Condensed Matter Physics
2. Philip Philips, Advanced Solid State Physics
3. Majlis, The quantum theory of Magnetism
4. Michael P Murder, Condensed Matter Physics
5. G Mahan, Many Particle Physics
6. P de Gennes, Superconductivity in metal and Alloys
7. D Pines, Elementary Excitations in Solids
8. A. C Hewson, The Kondo Problem to heavy fermions

203 Nuclear Physics

Nuclear Physics General

NN interaction: symmetries, basics, low energy scattering and shape independence, meson theory and properties of NN interaction, Nuclear systematics: masses, radii, shapes, magnetic and quadrupole moments, shell structure, radioactivity, fission, halo nuclei.

Nuclear models

Liquid drop model, semi empirical mass formula, Fermi gas model, Basics of shell model, Hartree- Fock, pairing, Relativistic mean field formalism for finite and infinite nuclear many-body problem (intro.) rotational and vibrational spectra, giant resonances.

Nuclear reactions

Resonances and compound nucleus, direct reactions (inelastic, stripping, pickup etc.), extracting nuclear information from reactions.

Nuclear matter

Nuclear equation of state (Relativistic and Non-relativistic Formalisms), neutron stars, Quark models, quark equation of state, relativistic heavy ion collisions, signature of QGP,

Big bang and QCD phase transition, hadron and quark, phase transition in neutron stars.

Books :

1. W. Greiner and J. Eisenberg - Nuclear Models, Vol. I, II and III
2. A. Bohr and B. R. Mottelson - Nuclear Structure, Vol I and II
3. Blatt and Weisskopf - Theoretical Nuclear Physics
4. M. A. Preston and R.K. Bhaduri - Structure of Nucleus
5. B. Muller - Physics of Quark Gluon Plasma
6. Cheuk-Yin Wong - Introduction to High-Energy Heavy-Ion Collision

204 Quantum Field Theory - II

A selection of topics from the following list.

Loop calculations in scalar field theory

One-loop calculation of 2 and 4-point functions in interacting scalar field theory, Regularization and Renormalization, Renormalization group equation and beta function, Anomalous dimension, Renormalization of composite operators.

Renormalization group flow

Solution of Callan-Symanzik equation, Classification of fixed points, Multiple couplings and linearized RG-flow in the neighborhood of a fixed point, Various types of asymptotic behavior of QFT, Wilson-Fisher fixed point and introduction to ϵ-expansion in large-N vector model.

Non-Abelian gauge theory

Non-Abelian gauge theory, Path-Integral quantization of Non-Abelian gauge theories, BRST symmetry, One loop beta function of non-Abelian gauge theory and asymptotic freedom, Introduction to Wilson loop and confinement .

Effective action and global symmetry breaking

1PI effective action and Coleman-Weinberg potential, Spontaneous global symmetry breaking using 1PI effective potential, Goldstone Boson.

Gauge symmetry breaking

Spontaneous breaking of gauge symmetry and Higgs mechanism.

Anomalies

Introduction to anomalies in QFT.

Finite temperature field theory

Introduction to finite temperature field theory, Coleman-Weinberg effective potential at finite temperature, Symmetry restoration at high temperature.

Miscellaneous topics

Non-Perturbative techniques in field theory. Solitons and Instantons in field theory.

Books :

1) Peskin and Schroeder - An introduction quantum field theory
2) Ramond- Field theory - A modern primer
3) Matthew Schwartz - Quantum field theory and the standard model
4) Weinberg- The quantum theory of fields, Vol-1 and Vol-2.
5) Sidney Coleman - Aspects of symmetry

205 High Energy Physics

A selection of topics from the following list.

Introduction

Broad preview and overview, a bit of discussion of history and current status, basic ingredients of modern theories, colliders and detectors, LHC and main detectors

Symmetries and Lie Groups

Quantum numbers, conservation laws, discrete and continuous symmetries, Lie groups and algebras, SU(n) and SO(n) groups and representations, Young Tableau, hadron spectroscopy, eight-fold way, quark model

S-Matrix, Cross section and Decay rates

General discussion, relativistic kinematics, phase space, basic formulas for $2 \to 2$ scattering and decays into 2 or 3 particles, Feynman rules

Gauge Theories and Spontaneous symmetry breaking

Construction of gauge theories, discrete symmetry breaking, breaking of global and local continuous symmetries, Goldstone and Higgs phenomena

Electromagnetic Interactions

Quantum Electrodynamics, Simple processes like Moller Scattering, Bhabha Scattering, Compton scattering, pair annihilation

Weak Interaction

Fermi theory, V-A theory, C, P and CP violation, muon decay, pion, kaon and B/D-mesons decay, neutrino-electron, neutrino-muon, and neutrino-quark scattering, IVB theory, problems

Strong Interaction

Deep-inelastic scattering and structure of hadrons, Bjorken scaling, Quark-parton model, sum rules, scaling violation, splitting functions, DGLAP equation, $e^-e^+ \to$ hadrons, basic $2 \to 2$ processes involving quarks and gluons, glimpse of helicity methods

Standard Model

Motivation for $SU_c(3) \otimes SU_L(2) \otimes U_Y(1)$ symmetry and its breaking, construction of the action, masses of vector bosons and fermions, CKM matrix and CP violation

Basic processes in the Standard Model

W/Z boson decays, heavy quark production, neutral-current processes, basic Higgs boson production and decays

Beyond Standard Model Scenarios

Neutrino oscillations and neutrino mass, standard model shortcomings, effective field theories, anomalous interactions, GUTs, supersymmetry, large extra dimension, etc

Books :

1) F. Halzen and A. D. Martin - Quarks and Leptons
2) T-P Cheng and L-F li - Gauge Theory of Elementary Particle Physics
3) V. D. Barger and R. J. N. Phillips - Collider Physics
4) V. Barger, D. Marfatia, and K. Whisnant - The Physics of Neutrinos

206 Introduction to Quantum Information

A selection of topics from the following list.

Quantum Mechanics Formalism

Postulates, density matrix, generalized measurements, qubits, no-cloning theorem

Composite Systems

Entangled states, partial trace, Schmidt decomposition, purification

Quantum Entanglement

Detection and quantification of entanglement in bipartite and multipartite systems, monotones, majorization

Quantum Operations

quantum channels, Kraus representation, quantum noise, master equations, tomography

Quantum Nonlocality

EPR paradox, Bell inequality, CHSH inequality, Tsirelson bound, PR box, steering, quantum games

Quantum Communication

superdense coding, teleportation, entanglement swapping, secret sharing

Quantum Cryptography

One-time pad, BB84, B92, Ekert protocols

Quantum Algorithms

Universal quantum gates, Deutsch algorithm, Deutsch-Jozsa algorithms, Quantum Fourier transform

Books :

1) M. A. Nielsen and I. L. Chuang - Quantum Computation and Quantum Information

2) J. Preskill - Lecture notes on Quantum Information Theory, Online at Caltech Website
3) M. M. Wilde - Quantum Information Theory
4) A. Peres - Quantum Theory: Concepts and Methods

207 Non-Linear dynamics and Chaos

Introduction

One and two dimensional systems

Fixed points, bifurcation, limit cycles; phase plane analysis; Topological analysis

Interacting systems

Predator-Prey model/Lotka-Volterra system

Specific systems

(one or more of the following)
Enzyme Kinetics (Michaelis-Menten equation)
Neuron dynamics (Hodgkin-Huxley and FitzHugh-Nagumo models)
Kinematic waves (Belousov-Zabotinski reaction, traffic flow, Singular perturbation/shocks)
Travelling waves (Fisher-Kolmogorov problem, kdV equation)
noisy problems (Edwards-Wilkinson/KPZ problem of surface growth)

Chaos

Lyapunov exponent, Lorentz equation, Logistic map, fractals

Turbulrnce

Elementary introduction to Kolmogorov scaling.

Books :

1. S. Strogatz: Nonlinear dynamics and Chaos
2. J. Murray: Mathematical Biology I, II
3. J. K. Bhattacharjee -Staticial Physics

208-213: Special Topics

These are special courses as per research requirements, may even be research level topics not covered in other courses or topics of current interest.

214 Project (core)

Each student has to do a project (equivalent to 2 courses) and defend it at the end of the semester.

Harish-Chandra Research Institute

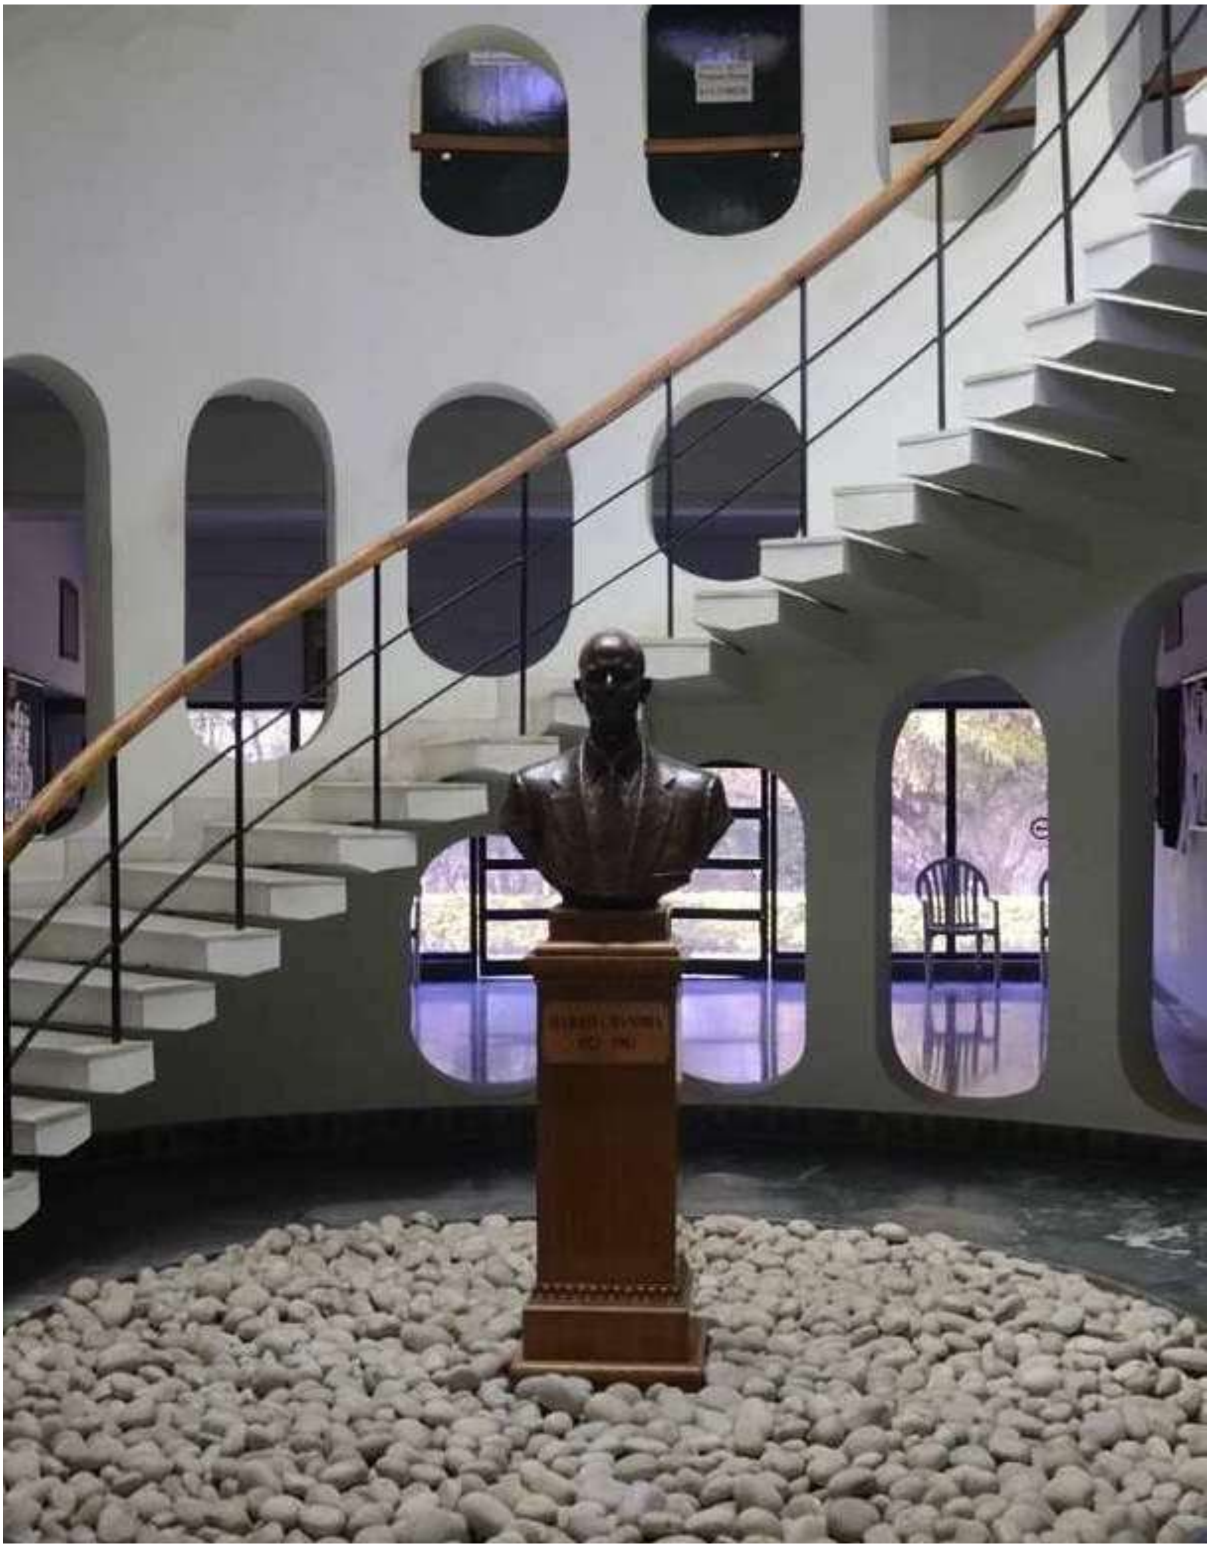
Doctoral Program in Physics

The Ph.D. program consists of course work and projects for the first three semesters, followed by research work leading to a Ph.D. degree.

Curriculum and detailed course content

SYLLABUS FOR

Ph.D. in Physical Science
(Program Code: PHYS04)



Degree granted by Homi Bhabha National Institute

Course Structure

The instructional part of the doctoral program consists of two semesters of pedagogical lectures followed by two projects in the third semester.

Semester I	Semester II	Semester II
Elective I	Elective II	Big Project
Project	Elective III	
Mathematical Methods II	Statistical Mechanics	Small Project
Quantum Field Theory I	Numerical Methods	

Elective I : Choose one from — Fluid Mechanics, General Relativity, Non-linear Dynamics, Quantum Information and Computation I, Quantum Mechanics III .

Elective II and III : Choose two from — Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure, Particle Physics, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra Cold Atoms.

Semester I

08PHYS04-001-C Quantum Field Theory I

Non-relativistic quantum field theory: quantum mechanics of many particle systems; second quantisation; Schrodinger equation as a classical field equation and its quantisation; inclusion of inter-particle interactions in the first and second quantised formalism

Irreducible representations of the Lorentz group, connection to quantum fields

Symmetries and conservation laws: examples in non-relativistic and relativistic field theories; translation, rotation, Lorentz boost/Galilean transformation and internal symmetry transformations; associated conserved charges

Free Klein-Gordon equation: classical action and its quantisation; spectrum; Feynman rules for computing n-point Green functions of elementary and composite operators.

Interacting Klein-Gordon field: Feynman rules for computing Green functions; physical mass of the particle from the analysis of two point Green functions; S-matrix and its computation from n-point Green functions; relating S-matrix to cross-section.

Quantisation of free Dirac fields: spectrum; Feynman rules

Quantisation of free electromagnetic field: role of gauge invariance; gauge fixing; physical state condition; spectrum; Feynman rules

Quantum electrodynamics: coupling Dirac field to electromagnetic field; gauge invariance; quantisation; Feynman rules for computing Green functions; Spectrum and S-matrix from the Green functions.

08PHYS04-002-C Mathematical Methods II

Integral transforms, Fourier transforms, inversion and convolution, Laplace transforms

Advanced topics in ODE, Partial differential equations: classification of second order PDEs, Laplace and Poisson equations, applications to electrostatics, Heat equation, Wave equation

Group theory, definitions and examples of groups. Homomorphism, isomorphism and automorphism, Permutation groups

Group representation: reducibility, equivalence, Schur's lemma. Lie groups and Lie algebras, SU(2) and SU(3). Representations of simple Lie algebras, SO(n), Lorentz group. Symmetries in physical systems, Young Tableau.

08PHYS04-003-C Project

In this semester, every student is supposed to do a project on a theoretical physics topic under the supervision of HRI faculty. Main fields in theoretical physics represented at HRI at the moment are, Astrophysics, Condensed Matter Physics, Particle Physics Phenomenology, Quantum Information and Computation, and String Theory.

Elective I

Choose any one of the following topics, Fluid Dynamics, General Theory of Relativity, Techniques in Nonlinear Dynamics, Quantum Information and Computation I and Quantum Mechanics III.

08PHYS04-001-E Fluid Mechanics

Ideal Fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity

Viscous Fluids: Viscosity, Navier-Stokes equation, Reynolds number, laminar flow, exact solution to the eq. of motion.

Turbulence: Stability of flows, instabilities, quasi-periodic flows, Strange attractors, turbulent flows, jets, free shear layers, wakes, boundary layers

Thermal Conduction in fluids: eq. of heat transfer, conduction in incompressible fluid, law of heat transfer, convection, convective instability in static fluid

Compressible flows

Relativistic Fluid dynamics: eq. of motion, energy-momentum tensor, eq. for flow with viscosity and thermal conduction.

08PHYS04-002-E General Theory of Relativity

Review of Lorentz transformations and special theory of relativity.

Tensors and their transformation laws; Christoffel symbol and Riemann tensor; geodesics; parallel transport along open lines and closed curves; general properties of the Riemann tensor.

Equivalence principle and its applications: gravity as a curvature of space-time; geodesics as trajectories under the influence of gravitational field; generalisation to massless particles; gravitational red-shift; motion of a charged particle in curved space-time in the presence of an electric field; Maxwells equation in curved space-time.

Einsteins equation, Lagrangian formulation, Einstein-Hilbert action.

Schwarzschild solution: construction of the metric and its symmetries; motion of a particle in the Schwarzschild metric; Schwarzschild black hole; white holes and Kruskal extension of the Schwarzschild solution: construction of the metric and its symmetries; Motion of a particle in the Schwarzschild metric; precession of the perihelion; bending of light; horizon, its properties and significance.

Precession of the perihelion; bending of light; radar echo delay.

Initial value problem; extrinsic curvature; Gauss-Codacci equations;

Linearised theory, gravitational waves, field far from a source, energy in gravitational waves, quadrupole formula

Elementary cosmology: principles of homogeneity and isotropy; Friedman-Robertson-Walker metric; open, closed and flat universes; Friedman equation and stress tensor conservation, equation of state, big bang hypothesis and its successes.

08PHYS04-003-E Nonlinear Dynamics

Long time behaviour of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.

Periodic orbit for conservative systems, periodic orbits for dissipative systems (limit cycles) and their stability, Bifurcations and centre manifolds.

Different kinds of perturbation theory for calculating periodic orbits, Renormalisation group aided perturbation theory, Poincare Bendixon theorem, chaos and strange attractors.

Maps, fixed points, cycles and stability, bifurcations , period doubling, intermittency and quasi periodicity, universal behavior at the onset of chaos , renormalization group and scaling behaviour.

Partial differential equations , patterns, Galerkin truncations and reduction to dynamical systems.

08PHYS04-004-E Quantum Information and Computation I

Quantum formalism: states, evolution, measurements.

Multipartite quantum systems: description and manipulation of bipartite systems and beyond.

Entanglement: quantification and detection in bipartite and multipartite systems.

Quantum communication: no-cloning theorem, quantum teleportation, quantum dense coding, multipartite communication protocols.

Quantum cryptography: essential classical cryptography, BB84, B92, Ekert, and secret sharing protocols.

Quantum computation: quantum algorithms, universal gates.

Interface of quantum information with other sciences.

Experimental realisations.

08PHYS04-005-E Quantum Mechanics III

Atomic physics: One electron atoms - spin-orbit interaction, fine structure, Lamb shift, Zeeman effect, Stark effect.

Two electron atoms: spin wave functions, approximate handling of electron-electron repulsion. Coupling of angular momenta, multiplet structure, gyromagnetic effects. Hyperfine and nuclear quadrupole interactions.

Many electron atoms: central field approximation, Thomas-Fermi and Hartree-Fock methods.

Molecular physics: Born-Oppenheimer approximation, molecular structure, rotation and vibration of diatomic molecules, hydrogen molecular ion, vibrational-rotational coupling, effect of vibration and rotation on molecular spectra. Electronic structure- molecular orbital and valence bond theories.

Atoms and light: transition rates, dipole approximation, Einstein coefficients, radiative damping, optical absorption, ac Stark effect.

Cold atoms: Doppler cooling, magneto-optical trap, ion traps, dipole force, evaporative cooling, optical lattice.

Collective effects: Feshbach tuning of interactions, Bose condensation of alkali atoms, BCS-BEC crossover, the unitary Fermi gas. Imaging cold atoms.

Computing with atoms: qubits and their properties, entanglement, quantum logic gates, decoherence and error correction.

Semester II

08PHYS04-004-C Statistical Mechanics

Basics: phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.

Non interacting classical systems: few level systems, ideal gases, oscillators.

Non interacting quantum systems: method of second quantisation, electrons in metals, relativistic electron systems, electrons in a strong magnetic field, lattice vibrations and phonon physics, photons, blackbody radiation, Bose condensation.

Interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.

Phase transitions: symmetry breaking and long range order, mean field approach, Landau theory, 2nd and 1st order transitions, Landau-Ginzburg functional, illustrative examples, estimate of fluctuations.

08PHYS04-005-C Research Methodology and Numerical Methods

Research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers

Introduction to programming languages: F77, F90 or C

Errors in numerical calculations.

Numerical linear algebra, eigenvalue and eigenvectors.

Interpolation techniques.

Generation and use of random numbers.

Sorting and searching.

Differentiation and Integration (including Monte Carlo techniques)

Root finding algorithms

Optimisation, extrema of many variable functions.

ODEs and PDEs: including FFT and finite difference methods, integral equations.

Elective II and III

Choose any two of the following topics,

Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure Calculations, Particle Physics, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra cold Atoms.

08PHYS04-006-E Astrophysics

Introduction to celestial objects, coordinates and the concept of time. Radiation transfer. Equations of radiation transfer, Black-body/thermal radiation, Opacity and optical depth, solutions of the radiation transfer equations in limiting cases, Rosseland mean opacity.

Thermal Bremsstrahlung emission, synchrotron emission. Self absorption and the emergent spectrum. Thomson scattering. Compton and Inverse-Compton scattering. Scattering in a region with magnetic field, Faraday rotation Introduction to fluid dynamics. Convection instability and transfer of energy from cores of stars. Supersonic motion, shocks.

Introduction to Magneto-hydro dynamics, flux freezing, Generation and amplification of magnetic fields in astrophysical situations.

Stellar structure. Mass-radius relation for main sequence stars, Minimum and maximum mass for nucleosynthesis, Hertzsprung-Russell diagram, Evolution of a star on the HR diagram. Novae and Supernovae, End points of stellar evolution. Inter-stellar medium. Phases of interstellar medium. Thermal, photoionisation, chemical and pressure equilibrium, Star formation, feedback and the evolution of ISM.

Orbits around massive bodies, Tidal disruption, restricted 3 body problem, Roche limit. Orbits in external potentials, potential-density pairs. An overview of models for galaxies. Accretion of matter on to a point mass, spherical accretion, Eddington limit.

Introduction to Cosmology, Friedmann models, equations. Hubble's law. A brief overview of the thermal history of the universe.

08PHYS04-007-E Condensed Matter Physics II

The course will consist of any two of A-D:

Part A: Mesoscopics and spintronics:

Foundation: low dimensional systems: quantum Wells, wires and quantum dots, 1D and 2D heterostructures, coupled wells and superlattices.

Charge Transport: transmission and its relation to conductance, Landauer theory, transmission function, S matrix and Green functions. Non-equilibrium Green functions and Landauer-Buttiker theory. Noise in Charge transport, scattering theory of shot noise.

Spintronics: introduction to spintronics.(Datta-Das spin transistor) equilibrium and non-equilibrium spin currents, spin Hall effect, coupled charge and spin transport, TMR, spin shot noise, entanglement generation and its detection.

Part B: Electronic structure:

Physics in low dimensions: surface states, reconstructions, adsorption, atomic wires and clusters.

Electron-electron interactions: Hartree-Fock approximation, electron gas, density functional theory.

Anharmonic effects in crystals: thermal expansion, lattice thermal conductivity, umklapp processes.

Phonons in metals: Kohn anomaly, dielectric constant, temperature dependence of electrical resistivity.

Dielectric properties of insulators. Plasmons, magnons etc.

Part C: Mesoscopics and interacting systems:

Quantum Hall effect

Quantum dots and quantum wires, Kondo effect

Fermi liquid theory and non Fermi liquids

Bosonization and Luttinger liquids.

Quantum spin systems

Part D: Correlated electrons:

Mott physics: electron localisation, magnetic order, doped phase, physics in the cuprates.

Kondo systems: physics of the single impurity, dense systems Kondo and Anderson lattice, heavy fermions, quantum criticality.

Metallic magnets: ferromagnetism in strongly repulsive systems, the transition metals, spin-fermion systems, the double exchange model, the classical Kondo lattice.

Electron-phonon coupling: the classical theory, polaron formation, many electron systems, polaron ordering, physics in the manganites.

Superconductivity: the BCS-BEC crossover, superconductivity in repulsive systems, competition with magnetism, effect of disorder.

08PHYS04-008-E Cosmology

Friedman-Robertson-Walker metric, Friedman equation and stress tensor conservation, equation of state: matter, radiation, cosmological constant, experimental evidence for dark matter and dark energy.

Age of the universe, cosmological horizon, expansion rate.

Thermal history of the universe, formation of hydrogen and origin of CMBR, decoupling of neutrinos, nucleosynthesis, recombination.

The horizon problem, possible resolution via inflation, slow roll condition and slow roll parameters, reheating, inflationary origin of density perturbation.

Early history, electroweak baryogenesis via leptogenesis, dark matter.

Theory of cosmological perturbations: gauge invariant scalar and tensor perturbations, spectral index, ratio of tensor to scalar fluctuation and Lyth bound, transition from quantum to classical perturbation: horizon exit and reentry, from density fluctuation to CMB fluctuations via Boltzmann transport equation, origin of the acoustic peak, origin of CMB polarisation, E and B modes.

08PHYS04-009-E Introduction to Electronic Structure

Review of QM: variational method, identical particles, many fermion wave functions.

First-principles Hamiltonian and Born-Oppenheimer approximation.

Treating electron-electron interactions: Hartree-Fock approximation, exchange energy, correlation energy.

Density functional theory: Thomas-Fermi method, Hohenberg-Kohn theorems, Levy constrained search formulation, Kohn-Sham formulation, exchange-correlation energy, LDA and GGA functionals, spin density functional theory.

Solution of the Kohn-Sham equations, basis sets - LCAO: STO-NG, 4-31G, 6-31G etc, quality of basis sets, polarisation functions, spin-restricted calculations, Roothan equations.

Spin unrestricted calculations. Plane wave basis set.

Pseudopotentials and PAW in conjunction with plane waves.

Structure optimisation, Hellman-Feynman theorem.

Simple practical applications: band structure of standard solids, metals and semiconductors, optimisation of lattice constants, cohesive energies and other simple properties.

Possible advanced topics: hybrid functionals, van der Waals interactions, density functional perturbation theory, phonon band structure, electron-phonon coupling. CI, CCSD methods, QMC.

08PHYS04-010-E Particle Physics

Experimental methods: fixed target and collider experiments, particle detectors.

Role of symmetries: charge conjugation, parity, time reversal, isospin and SU(2), quark model and SU(3).

Introduction to relativistic kinematics: Mandelstam variables, phase space, calculation of cross-sections and decay widths.

Basics of quantum electrodynamics: electron-positron annihilation, electron-muon scattering, Bhabha scattering, Compton scattering.

Deep inelastic scattering: Bjorken scaling, parton model, scaling violation, introduction to quantum chromodynamics and tree level processes.

Introduction to weak interactions: parity violation, V-A theory, pion and muon decay, neutrino scattering.

Standard Model: Glashow-Salam-Weinberg model, neutral current, physics of W, Z and Higgs, CKM mixing and CP violation.

Neutrino physics, neutrino oscillation

08PHYS04-011-E Quantum Field Theory II

Path integrals for scalar and fermionic fields: generating functional, Feynman rules, loop diagrams.

Renormalisation of scalar and Yukawa theories: power counting, regularisation, renormalisable and non-renormalisable theories, Green functions at 1 loop of some prototypical theories, basics of renormalisation group (running coupling), 1PI effective actions.

Spontaneous symmetry breaking and Goldstone's theorem.

Path integrals for the Maxwell field, gauge fixing.

Renormalisation of QED: 1 loop diagrams, Landau pole.

Non-abelian Gauge Theories: Classical theory of non-abelian gauge theories, Quantization of non-abelian gauge theories by path integral methods, Non-abelian gauge theories at one loop and asymptotic freedom, Spontaneous symmetry breaking in non-abelian gauge theories.

08PHYS04-012-E Quantum Information and Computation II

General evolution and Decoherence theory.

Master equations (Markovian and Non-Markovian, Various measure of nonmarkovianity).

Advanced entanglement theory (GM, GGM, newly proposed measures etc).

Quantum Correlation Beyond Entanglement (Quantum Discord, Geometric discord, Work-Deficit etc).

Resource theory in QI (Entanglement, Quantum Coherence, Reference Frame, Asymmetry etc).

Quantum Thermodynamics.

Advanced topics in quantum channels.

Quantum information and condensed matter systems.

08PHYS04-013-E Quantum Optics

Introduction: Quantization of the electromagnetic field, Fock states, coherent states, squeezed states, basic atom-photon interaction, density-matrix formalism.

Theory of coherence; Semiclassical theory of atom-photon interaction.

Quantum theory of atom-photon interaction.

Quantum theory of dissipation.

Quantum information in continuous variable systems; Quantum state engineering.

Quantum operations based on beam splitters, mirrors, squeezing and homodyne and heterodyne measurements and nonlinear operations such as parametric down converters.

Photon addition and subtraction operations; Elements of cavity QED.

08PHYS04-014-E Soft Matter

Forces, energies and timescales in soft matter, van der Waals force, hydrophobic and hydrophilic interactions. Basic phenomenology of liquid crystals, polymers, membranes, colloidal systems. Phase behaviour, diffusion and flow, viscoelasticity.

Order parameter, phase transitions: mean-field theory and phase diagrams, elasticity, stability, metastability, interfaces.

Colloidal systems: Poisson-Boltzmann theory, DLVO theory, sheared colloids, stability of colloidal systems, measurement of interaction.

Polymers: model systems, chain statistics, polymers in solutions and in melts, flexibility and semi-flexibility, distribution functions, self-avoidance, rubber elasticity, viscoelasticity, reptation ideas.

Membranes: fluid vs. solid membranes, energy and elasticity, surface tension, curvature, de Gennes-Taupin length, brief introduction to shape transitions.

Experimental tools and numerical approaches: Stokes limit, Rouse and Zimm Model for polymers, membranes, relaxation, computational studies, multiscale modelling.

08PHYS04-015-E Ultra Cold Atoms

Spatial, time, and energy scales in cold atom physics.

Experimental background: trapping and cooling, Feshbach resonance, optical lattices, cold atom spectroscopies.

Basic theory: many particle physics, mean field theory, phase transitions, perturbation theory.

Continuum bosons: bosons in free space, weak interactions, Bogoliubov theory, BEC in trapped systems, Gross-Pitaevski equation.

Continuum fermions: fermions in free space, trapped fermions, Fermi liquid theory, weak attraction - BCS instability, strong attraction - BEC of pairs, the unitary Fermi gas, Stoner instability.

Optical lattices: Hubbard model - Bose/Fermi cases, superfluid-Mott transition for repulsive bosons, BCS-BEC crossover for attractive fermions, Mott transition in repulsive fermions.

Spin systems: quantum, S = 1/2, magnetism on unfrustrated and frustrated lattices.
Entanglement in many body systems: pure states, mixed states, area laws, tensor network states.

Special topics: population imbalance, Anderson localisation, gauge fields, quench dynamics.

Semester III

By this time students would have already chosen their field of research. In this semester they are supposed to do two projects, a small project carrying 6 grade points and a big project with 12 grade points, preferably in their field of interest

---

BACK TO MAIN

Doctoral Programmes in Physics at IMSc

Ph.D. in Physical Science
(Program Code: PHYS04)

There are two streams leading to the Doctoral degree in Physics at IMSc: the one available to students who have completed their Master's degree prior to joining IMSc (Ph.D.) and the one available to students who join after their Bachelor's degree (Integrated Ph.D.). The Ph.D. program has *two semester compulsory course work* while the integrated Ph.D. has *four semester compulsory course work*. The third and fourth semester course work of the integrated Ph.D. program is the same as the two semester course work of the Ph.D. program.

The courses together with the pre-requisites and reference material, are given below. Integrated Ph.D. students begin with the *rst* semester courses while Ph.D. students begin with the *third* semester courses.

No.	Semester I	No.	Semester II	No.	Semester III
(11)	Classical Mechanics	(21)	Quantum Mechanics II	(31)	Quantum Field Theory I
(12)	Quantum Mechanics I	(22)	Classical Field Theory	(32)	Mathematical Methods II
(13)	Electromagnetic Theory	(23)	Condensed Matter Physics I	(33)	Statistical Mechanics II
(14)	Mathematical Methods I	(24)	Statistical Mechanics	(34)	Particle Physics I

The Fourth semester has *two core courses* (18 credits) and a *project* (12 credits). The core courses di er for students desirous of research in High Energy Physics (HEP) or Low Energy Physics (LEP). These are to be decided in consultation with the monitoring committee.

No.	HEP students	No.	LEP students
(41)	Quantum Field Theory II	(43)	Advanced Condensed Matter Physics
(42a) (42b)	Cosmology-and-Gravitation *or* Particle Physics II	(44a) (44b) (44c)	Nonlinear Dynamics *or* Quantum Information-and-Computation *or* Statistical Field Theory,

The integrated Ph.D. program students earn 123 credits while those of Ph.D. program earn 60 credits at the end of the course work.

Detailed syllabi of the proposed course

The course contents are indicative and will be ne tuned with experience.

---

11) Classical Mechanics (four-and-half hours classwork per week, **9 credits**)

- *Lagrangian formulation and the action principle:*

  Configuration space, generalized coordinates Constrained systems, holonomic constraints as coordinate transformations, motion in a central field, including Kepler problem, Rutherford scattering, Small oscillations, normal modes, total time derivatives, non-uniqueness of Lagrangian, Noether's theorem, Conservation laws;

- *Rigid body kinematics and dynamics:*

  Kinematics, rotational kinetic energy, moments of inertia, inertia tensor, Euler angles, angular momentum, Free rigid body motion, axisymmetric tops;

- *Hamiltonian formulation:*

  The Legendre transformation, canonical momentum Poisson brackets, Phase space reduction, cyclic coordinates, Phase space description and evolution, surfaces of section, periodically driven systems, Liouville's theorem, Poincaré recurrence;

- *Canonical transformations, Hamilton-Jacobi theory, perturbation theory:*

  Definition; point transformations; time-independent transformations; symplectic transformations and time-dependent transformations, Invariants of canonical transformations, Generating functions Hamilton-Jacobi equation, action-angle variables, Perturbation theory as a sequence of canonical transformations of a perturbed integrable system;

- *Relativistic mechanics (including Lagrangian formulation):*

  Space-time, 4-vectors, Lorentz transformations, basic relativistic kinematics and dynamics.

Textbooks:

1. L. Landau and E. Lifshitz, *Mechanics : Course of Theoretical Physics*, Vol.1, Pergamon, 1974.
2. W. D. McComb, *Dynamics and Relativity*, Oxford University Press, 1999.
3. V. I. Arnold, *Mathematical Theory of Classical Mechanics*, Springer, 1977.
4. M. Tabor, *Chaos and Integrability in Nonlinear Dynamics*, Wiley, 1989.
5. H. Goldstein, *Classical Mechanics*, Narosa, 1990.
6. I. Percival and D. Richards, *Introduction to Dynamics*, Cambridge, 1991
7. J.V. Jose and E.J. Saletan, *Classical dynamics: A contemporary approach*, Cambridge, 1998.

12) Quantum Mechanics I: (four-and-half hours classwork per week, **9 credits**)

- *Fundamentals of Quantum Theory:*

  The breakdown of classical physics, the polarization of photons, Wave-particle duality: Particle properties of photons and wave properties of electrons, Schrodinger evolution, Hamiltonian, examples: free particle, one-dimensional potential well, potential barrier, harmonic oscillator, etc., Hilbert space formulation of Quantum Mechanics: states, observables, measurement, evolution, collapse of wave function, uncertainty relation and its interpretation, Discrete and continuous spectra, canonically conjugate observables, Schrodinger, Heisenberg and interaction pictures, Virial theorem, Ehrenfest's theorem, semi-classical quantization;

- *Theory of spin-1/2 systems:*

  Stern-Gerlach experiment for the existence of spin Quantum Mechanics of two-level systems

- *Spherically symmetric potentials:*

  Schrodinger equation for spherically symmetric potentials, Orbital angular momentum and spherical harmonics, Hydrogen atom problem and three dimensional harmonic oscillator;

- *Symmetries and conservation laws:*

  What is a symmetry, Wigner's theorem, Continuous transformations, Rotation, Euclidean and Galilean groups, Transformations and invariances;

- *Angular momentum theory in Quantum Mechanics:*

  Orbital and spin angular momenta, Raising and lowering operators, Addition of angular momenta, Clebsch-Gordon coefficients, Schwinger oscillator model, Spherical tensors and Wigner-Eckart Theorem, Spin-orbit coupling,

- *Exactly solvable models:*

  Charged particle in a magnetic field, Landau levels, Quantum Hall e ect;

- *Time-independent perturbation theory:*

  Non-degenerate and degenerate cases, An-harmonic oscillator, Van der Waal's force, Dipole interactions for spin-1/2 systems, Stark e ect, Zeemann e ect;

- *Time-dependent perturbation theory:*

  Approximate solution of Schrodinger equation, Sinusoidal perturbation of two-level system: resonance phenomenon, Coupling with states of continuous spectrum, Fermi's golden rule, Interaction of atom with electromagnetic wave,

Textbooks:

1. C. Cohen-Tannoudji, B. Diu and F. Laloe, *Quantum Mechanics*, Vols. I and II, Wiley, 1970.
2. J. J. Sakurai, *Modern Quantum Mechanics*, Addisson Wesley, 1995.
3. Leslie E. Ballentine, *Quantum Mechanics: A Modern Development*, World Scientific, 1998.

13) Classical Electromagnetism: (three hours classwork per week, **6 credits**)

1. *Electrostatics and Magneto-statics :*

   Mathematical preliminaries, boundary value problems using Green function techniques, special techniques for calculating potentials, electrostatics of dielectric media, magnetic vector potential and the gauge problem, Biot-Savart law, magnetic dipole moment and the Larmor precession, magnetic susceptibility and permeability, ferromagnetism;

2. *Maxwell Electrodynamics :*

   Motion of charges in external fields, electromagnetic waves in vacua and propagation through continuous media, gauge transformations, Lorentz covariant formulation of electrodynamics, energy-momentum of electromagnetic field and Poynting's theorem, Lagrangian and Hamiltonian formulation of electrodynamics;

3. *Radiation Theory :*

   Advanced and retarded Green functions, Lienard-Wiechert potentials, dipole radiation and Larmor's formula, spectral resolution and angular distribution of radiation from a relativistic point charge, synchrotron radiation, Rayleigh and Thomson scattering;

4. *Classical Electron Theory :*

   Radiation reaction, acausality and preacceleration, incompleteness of Maxwell electrodynamics;

Textbooks :

1. D. J. Griffiths, *Introduction to Electrodynamics*, Prentice Hall, 1981.
2. L. Landau and E. Lifshitz, *The Classical Theory of Fields*, Pergamon, 1979.
3. J. D. Jackson, *Classical Electrodynamics*, Wiley Eastern, 1986.

14) Mathematical Methods I (three hours classwork per week, **6 credits**)

- *Linear Algebra:*

  Linear Vector spaces, Determinants & Matrices, Special matrices: orthogonal, hermitian, unitary, Eigenvalue problem: matrix diagonalization, Canonical Forms, Infinite-dimensional vector spaces: Hilbert space & Hermitian operators, Numerical solution of linear equations;

- *Complex Analysis:*

  Complex algebra, analytic functions, infinite sequences and series, tests of convergence, Weierstrass theorem, Taylor and Laurent series, classification of isolated singularities, poles & calculus of residues, contour integration, residue theorem and applications;

- *Di erential and Integral Equations:*

  Ordinary di erential equations, linear di erential equations up to second order, orthogonal polynomials and functions, Integral transforms: Laplace and Fourier transforms, partial di erential equations, classification of PDEs, Laplace and wave equations, boundary value problems, Special functions, Integral equations and Green functions, Ideas about nonlinear equations, Approximation methods: WKB approximation (at the level of Mathews-Walker);

Textbooks:

1. J Mathews and R L Walker, Mathematical Methods for Physicists, Benjamin, 1964;
2. G Arfken, Mathematical Methods for Physicists, Academic Press, 1995.

21) Quantum Mechanics II (four-and-half hours classwork per week, **9 credits**)

- *Quantum theory of identical particles:*

  Symmetrization of wave functions, Pauli's exclusion principle, Bosons and fermions, Spin-statistics theorem, Second quantization formalism, Quantum theory of many-electron atoms, Electron gas: application to solids;

- *Approximation methods:*

  WKB approximation, Variational methods, Absorption and stimulated emission of radiation;

- *Scattering theory:*

  Lipmann-Schwinger equation, Born approximation, Partial waves, The optical theorem, Determination of phase-shifts, Hard sphere scattering, Low energy scattering, Resonances;

- *Path integral approach to Quantum Mechanics:*

  Kernel of wave-packet evolution, Feynmann's approach, Examples of free particle and harmonic oscillator, Path-integral approach to spin systems, Aharonov-Bohm e ect, The adiabatic theorem, Berry's phase;

- *Relativistic Quantum Mechanics:*

  Dirac and Klein-Gordon equations and their solutions, Relativistic invariance, Space reflection and time reversal, Idea of spin, Helicity, Hydrogen atom, fine structure of spectral lines;

- *Phase-space description of Quantum Mechanics:*

  Coherent states, squeezed states and thermal states, Wigner's phase-space quasi-probability distribution, Glauber-Sudarshan's P-representation, Husimi distribution, Symplectic transformation and covariance matrix, Non-classical states of light;

- *Foundations of Quantum Mechanics:*

  Density operators formalism, Contradiction of Quantum Theory with local realism, The causality issue.

Textbooks:

1. C. Cohen-Tannoudji, B. Diu and F. Laloe, *Quantum Mechanics*, Vols. I and II, Wiley, 1970.
2. J. J. Sakurai, *Modern Quantum Mechanics*, Addisson Wesley, 1995.
3. Marlan O. Scully and M. Suhail Zubairy, *Quantum Optics*, Cambridge University Press, 1997.
4. W. Greiner, *Relativistic Quantum Mechanics: Wave Equations*, Springer, 1997.
5. Leslie E. Ballentine, *Quantum Mechanics: A Modern Development*, World Scientific, 1998.
6. S. D. Bjorken and J. D. Drell, *Relativistic Quantum Mechanics*,
   McGraw-Hill Science/Engineering/Math, 1998.

22) Classical Field Theory (three hours classwork per week, **6 credits**)

1. *Continuum Mechanics:*

   Coarse graining and continuum limit, The displacement field and strain tensor, The stress tensor and constitutive relations. Hooke's Law, The energy functional, Deformation of thin rods: Stretching, bending and torsion, Equations of motion. Elastic waves, Conservative systems, Lagrangian and Hamiltonian formalisms;

2. *Hydrodynamics:*

   The velocity and density fields. Continuity equation, Pascals Law and the stress tensor, Bernoullis principle, Euler equations. Gravity waves, Viscosity, Navier-Stokes equations. Boundary conditions, examples of flow, low Reynolds number flows, Stokes limit;

3. *Electrodynamics:*

   The electromagnetic field tensor and Bianchi identity, covariant charge density and current, action formalism for electrodynamics, Maxwell's equations and relativistic covariance, Wave solutions. Gauge invariance, Lagrangian and Hamiltonian formalism; [7 Lectures]

4. *Landau-Ginzburg theories:*

   Order parameter field, symmetry breaking, Noether theorem, mean-field theory, Gaussian fluctuations, Goldstone modes, generalized sti ness, topological defects, solitons, vortices, O(N) model, Abelian Higgs model (superconductivity);

5. *Gravitation:*

   Principle of equivalence, curvilinear coordinates, metric, connection, curvature tensor, energy-momentum tensor, Einstein equations;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *The Classical Theory of Fields*, Pergamon Press, 4th Edition, 1980.

2. G. Giachetta, L. Mangiarotti and G. Sardanashvily, *Advanced Classical Field Theory*, World Scientific, 2009.

23) Condensed Matter Physics I (four-and-half hours classwork per week, **9 credits**)

- *Introduction:*

  Length, time and energy scales in condensed matter, soft and hard condensed matter, examples of materials properties, bonding and interactions, van der Waals interaction, hydrogen bonding;

- *Condensed matter systems:*

  Crystals: Lattice, basis, 2-d and 3-d crystals, point and space groups, symmetries, experimental determination of structure, scattering, lattice with basis, Miller indices, structure factor, form factors, defects in crystals;

  Liquids and glasses, Liquid crystals, Polymers, Quasicrystals;

- *Electronic Properties:*

  Jhelium model: Single electron model, density of states, Fermi surface and quasiparticles;

  Thermodynamic properties: Review of thermodynamics, statistical mechanics of non-interacting electrons, Sommerfeld expansion, specific heat, magnetic susceptibility;

  Transport properties: Drude Model, electrical conductivity, thermal conductivity thermoelectric phenomena. Band theory;

  Electrons in periodic potentials, Bloch's theorem, Kronig-Penney model, Brillouin zones, nearly free and tightly bound electrons, Fermi surfaces, band theory, e ective mass, Wannier functions and tight binding, survey of the periodic table;

- *Lattice vibrations:*

  Cohesion of solids, mechanical properties, elasticity, constitutive relations;

  Modes of lattice vibrations. Quantization and phonons. Statistical mechanics of phonon gas, Einstein and Debye models, umklapp processes, thermal expansion, Kohn anomalies, charge-density waves;

  Electron phonon interactions;

- *Semiconductor Physics:*

  Introduction: Valence and conduction bands. Doping and the Fermi level;

  Band diagrams, metal interfaces, work functions, Schottky barrier, diodes and transistors;

  Nano-electronics: heterostructures, quantum wells, quantum wires and quantum dots;

- *Optical Properties:*

  Optical properties of metals, optical properties of semiconductors, direct and indirect band gaps, polarization, Clausius-Mosotti relation, polarons, point defects and color centres, metals at low frequencies, anomalous skin e ect, plasmons, Brillouin and Raman scattering;

- *Superfluidity and Superconductivity:*

  Superfluidity of Helium, BEC, Landau argument, two-fluid model, BEC in atomic gases, superconductivity, phenomenology including Meissner e ect, type-I and type-II superconductors;

- *Magnetism:*

  Atomic magnetism, Hunds rules, Curie's law, Pauli paramagnetism, Landau diamagnetism, quantum mechanics of interacting moments, Heisenberg model, spin waves;

Textbooks:

1. N. Ashcroft and N. Mermin, *Solid State Physics*, Holt, Rinehart and Winston, 1976.

24) Statistical Mechanics I (four-and-half hours classwork per week, **9 credits**)

1. *Fundamental principles :*

   Elements of probability theory, algebra and calculus of random variables, binomial, Poisson and Gaussian distributions, moments and cumulants of probability densities, the central limit theorem, the basic postulate of statistical mechanics, first discussion of ergodicity and mixing;

2. *Thermodynamics:*

   Macroscopic definition of thermodynamic variables, temperature, pressure, work and heat, the Carnot cycle and empirical definition of entropy, free energy and other thermodynamic potentials, convexity of entropy and thermodynamic potentials, thermodynamic potentials as Legendre transforms of the entropy, thermodynamic relations of Maxwell, Gibbs and Duhem, Clausius and Clapeyron, and Clausius and Mosotti, the third law of thermodynamics;

3. *The Gibbs distribution:*

   Gibbs definition of entropy, the Gibbs distribution as maximisation of entropy subject to constraints, connection with Legendre transforms, connection to thermodynamics, the three canonical distributions, the Maxwell-Boltzmann distribution, the probability distribution of a classical and quantum harmonic oscillator;

4. *Non-interacting systems I:*

   Classical ideal gas, the Boltzmann distribution and classical statistics, the counting approach to the Boltzmann distribution, free energy and equation of state of the ideal gas, the law of equipartition, ideal gases with internal degrees of freedom, diatomic and polyatomic gases, the magnetism of an ideal gas;

5. *Non-interacting systems II:*

   Fermi distribution, Bose distribution, counting approach to Fermi and Bose distributions, Fermi and Bose gases of elementary particles, the degenerate electron gas, the specific heat of the degenerate electron gas, magnetism of an electron gas, the degenerate Bose gas, black body radiation;

6. *Non-interacting systems III:*

   Solids at high temperature and the Dulong-Petit law, solids at low temperatures and Einstein's theory of specific heat, the Debye interpolation formula, thermal expansion of solids;

7. *Interacting systems I :*

   Deviations of gases from ideality, van der Waals equation, the conditions of phase equilibrium, the Clausius-Clapeyron equation, the critical point, law of corresponding states, virial and cluster expansions, the method of correlation functions, the Ornstein-Zernike relation;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *Statistical Physics*, 3rd Edition, Butterworth-Heinmann, 1980.
2. H. B. Callen, *Thermodynamics and an Introduction to Thermo-statistics*, 2nd Edition, Wiley, 1985.
3. D. Chandler, *Introduction to Modern Statistical Mechanics*, Oxford Univ. Press, 1987.
4. M. Plischke and B. Bergersen, *Equilibrium Statistical Mechanics*, World Scientific, 1994.
5. R. K. Pathria, *Statistical Mechanics*, Butterworth-Heinmann, 1996.
6. M. Kardar, *Statistical Mechanics of Particles*, Cambridge Univ. Press, 2007.
7. F. Reif, *Fundamentals of Statistical and Thermal Physics*, Waveland Pr. Inc., 2008.

31) Quantum Field Theory I (four-and-half hours classwork per week, **9 credits**)

First two-third portion of the course is meant for all students, while a bifurcation is made at the end of this for separately orienting students towards HEP and LEP, during the remaining one-third portion of the course. Thus the common section has 32 lectures, the other two parts have 16 to 18 lectures.

1. *QFT I part I:*

   (Common to all students. Knowledge of Relativistic Quantum Mechanics, *i.e.*, Dirac equation and KG equation is expected. Some basic notions of the Lorentz group and Poincare group are also expected)

   - *Elements of Classical Field theory:*
     Lagrangian and Hamiltonian densities, quantization of KG and Dirac and electromagnetic fields, propagators for KG, Dirac and vector (photons) ;
   - *Perturbation theory:*
     Wick's theorem and Wick expansion, Feynman diagrams, cross sections and S matrix. Feynman rules for scalars, spinors and gauge fields (Abelian) ;
   - *Elementary processes in QED:*
     electron positron annihilation, Compton scattering, Bhabha scattering, crossing symmetry etc. ;
   - *Radiative corrections for scalar theory:*
     loop corrections, regularization and renormalization, dimensional regularization. elementary ideas of the systematics of renormalization ;
   - *Functional method techniques:*
     Scalar field theory quantization (with, if time permits, some discussion of critical phenomena in this approach) ;
     The last two lectures below while not relativistic QFT is included because i would be useful for HEP students too and hence is placed in the common section
   - *Non-interacting electrons:*
     Tight binding models, the many body ground state, quasi-particle and quasi-hole excitations. Partially filled bands and Fermi surface kinematics ;

2. *QFT 1 part II:* (For HEP students)

   - *LSZ formalism:*
     one loop diagrams in QED, Ward Takahashi identities, regularization in QED ;
   - *Path integral/Functional method*
     Quantization in spinor and vector (gauge) theories ;
   - *Systematics of renormalization:*
     Power counting, idea of counter terms, structure of one loop and beyond in scalar and QED. (no explicit 2 loop calculations etc.) ;

3. *QFT I part III:* (Many Body Theory for Condensed Matter/LEP students)

   - *Second quantization in operator formalism (non-relativistic):*
     Diagrammatic perturbation theory, Retarded Greens functions, Spectral function, quasi-particle lifetimes, Angle resolved photoemission spectroscopy (ARPES) ;
   - *Linear response theory and Kubo formulae ;*
   - *Interacting bosons:*
     Symmetry breaking, semi-classical spectrum. Applications to cold atoms and superfluids ;
   - *Mean field theory:*
     BCS hamiltonian and superconductivity ;
   - *Magnetism:*
     Heisenberg models. Spin waves. Coherent states and path integrals for spin systems. Non-linear sigma models ;

Part II and part III will run concurrently, however, to allow the more enterprising and interested students to attend both parts (if they so wish), lectures for these two parts are intended to be arranged at non-overlapping times.

Textbooks:

1. M. E. Peskin and D. V. Schroyder, *Quantum Field Theory*, Sarat Book House, 2005.
2. G. D. Mahan, *Many-Particle Physics*, Springer, 2010.

32) Mathematical Methods II (three hours classwork per week, **6 credits**)

- *Numerical interpolation techniques (including Lagrange method)*
- *Advanced Complex Analysis:*

  Analytic continuation, branch cuts, Multivalued functions, Riemann surfaces, Conformal Mapping, Method of steepest descent;
- *Group theory:*

  Discrete and continuous groups;
- *Numerical methods:*

  Numerical solution of integrals, Numerical solution of ODEs, Numerical solution of PDEs: finite di erence Monte Carlo method (especially solving integrals), Spectral techniques (including FFT) Numerical minimization techniques;
- *Probability and statistics:*

  Brief survey of probability theory and statistical distributions, Bayesian probability Data analysis;

Textbooks:

1. C. M. Bender and S. A. Orszag, *Advanced Mathematical Methods for Scientists and Engineers: Asymptotic Methods and Perturbation Theory* (vol. 1), Springer, 1999.
2. T. W. Gamelin, *Complex Analysis*, Springer, 2001.
3. E. T. Jaynes and G. L. Bretthorst, *Probability Theory: The Logic of Science* (vol. 1), Cambridge Univ. Press, 2003.
4. M. Tinkham, *Group Theory and Quantum Mechanics*, Dover, 2003.
5. R. Gilmore, *Lie Groups, Lie Algebras, and Some of Their Applications*, Dover, 2006.
6. J. H. Mathews and R. W. Howell, *Complex Analysis for Mathematics and Engineers*, Jones and Bartlett, 2006.
7. N. G. Van Kampen, *Stochastic Process in Physics and Chemistry*, 3rd Edition, North Holland, 2007.

33) Statistical Mechanics II (four-and-half hours classwork per week, **9 credits**)

- *Introduction to critical phenomena:*

  Survey of experimental results, scaling hypothesis and empirical scaling relations, self-similarity and fractals;

- *Interacting systems:*

  Critical phenomena and continuous phase transitions, symmetry and the order parameter, Landau theory, introduction to the Ising model, Curie-Weiss mean field theory, the absence of phase transitions in one dimension;

- *Criticality in spin systems:*

  The Ising model in one dimensions, solution using transfer matrices, the lack of phase transitions in one dimensions, the Landau-Peirls argument. The Ising model in two dimensions, Wannier's calculation of the critical temperature, mean field solutions of the Ising model, survey of principle results of Onsager's exact solution;

- *Criticality in classical field theories:*

  Landau-Ginzburg theory, the Landau-Ginzburg functional as an e ective Hamiltonian, calculation of correlation functions, exponents and thermodynamic quantities, mean field and RPA closures, the problem of divergences;

- *Introduction to the renormalisation group:*

  Historical survey, integration of short-wavelength degrees of freedom, classification of fixed points, flow equations, illustration with Kadano block spins in the 1d Ising model;

- *perturbative renormalisation in momentum space:*

  Philosophy of the perturbative RG scheme, significance of the upper critical dimension, diagrammatic expansion in momentum space, the expansion, exponents and thermodynamic quantities in powers of , comparison with mean field approximations;

- *Non-perturbative renormalisation in real space:*

  Kadano block spins, techniques of approximate non-perturbative renormalisation, numerical renormalisation in the Ising model;

- *Broken Symmetry:*

  Continuous symmetry groups and e ective Hamiltonians, the consequences of broken symmetry, Goldstone modes and fluctuations, elastic variables, topological defects, fluctuation destruction of long-range order, the Mermin-Wagner and Landau-Peirles arguments, the disclination and dislocation unbinding transitions;

- *Disorder:*

  Disorder in physical systems, quenched and annealed disorder, the Parisi solution for quenched disorder, illustrative examples;

- *Dynamics of fluctuations:*

  Linear response in physical systems, the regression of fluctuations and Onsager's hypothesis, symmetry of kinetic coefficients, the Fokker-Planck and Langevin descriptions of fluctuations, the fluctuation-dissipation theorem;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *Statistical Physics*, 3rd Edition, Butterworth-Heinmann, 1980.
2. H. E. Stanley, *Introduction to Phase Transitions and Critical Phenomena*, Oxford Univ. Press, 1987.
3. D. Chandler, *Introduction to Modern Statistical Mechanics*, Oxford Univ. Press, 1987.
4. M. Plischke and B. Bergersen, *Equilibrium Statistical Mechanics*, World Scientific, 1994.
5. R. K. Pathria, *Statistical Mechanics*, Butterworth-Heinmann, 1996.
6. S.-k. Ma, *Modern Theory of Critical Phenomena*, Westview Press, 2000.
7. P. M. Chaikin and T. C. Lubensky, *Principles of Condensed Matter Physics*, Cambridge Univ. Press, 2000.

34) Particle Physics I (three hours classwork per week, **6 credits**)

Standard Model, Part I:

- *Symmetries and Quarks*:

  Discrete symmetries, isospin-SU(2), G-parity, SU(3)-classification of mesons and baryons, mass formula, magnetic moments, motivation for colour as an internal symmetry;

- *Scattering Processes*:

  Relativistic kinematics, phase space, lifetimes and cross-sections, Golden rule; scattering of a spinless charged particle by electromagnetic field, scattering of electrons by electromagnetic field, $e \quad \mu$ scattering, Moller scattering, electron-proton scattering and form factors, higher order corrections, vacuum polarization, charge renormalization, Lamb shift, $g \quad 2$;

- *Parton Model and QCD*:

  Deep inelastic scattering (DIS) of electrons on nucleons, structure functions and scale invariance, parton model; quantum chromodynamics : Lagrangian, symmetries;

Standard Model, Part II:

- *Early Developments*:

  Beta-decay, μ-decay, parity violation, $V \quad A$ theory of weak interactions, conserved vector current (CVC) hypothesis;

- Strange particle decay, mixing of neutral K-mesons, Cabibbo theory, current-current interaction, PCAC and current algebra;

- *CP Problem*:

  C,P,T transformations, CP violation;

- *Electro-Weak Unified Theory*:

  Spontaneous symmetry breaking, Higgs mechanism, $SU(2) \times U(1)$ theory, electroweak unification, neutral current phenomena, W,Z bosons;

- *Current Phenomenology*:

  New flavours, KM-matrix and associated phenomenology, neutrinos, masses and mixing, neutrino oscillations.

Textbooks:

1. T. D. Lee, *Particle Physics and Field Theory*, Harwood, 1981.
2. F. Halzen, A.D. Martin, *Quarks and Leptons*, Wiley, 1984.

41) Quantum Field Theory II (four-and-half hours classwork per week, **9 credits**)

- *Functional Methods in Quantum Field Theory*:

  Quantization of the Klein-Gordon and Dirac fields and their interactions, derivation of the Feynman rules of covariant perturbation theory, quantization of the Maxwell field, issues of gauge fixing, BRST invariance and QED Ward identities;

- *Functional Integral Quantization of Non-abelian Gauge fields*:

  Faddeev-Popov method of gauge fixing, BRST invariance and Slavnov-Taylor identities, Gribov ambiguities, loop computations in non-abelian gauge theories and renormalizability;

- *Renormalization Group and its Applications*:

  The Gell-Mann, Low and Wilson approaches to the renormalization group, Callan-Symanzik equations and fixed points of the beta function, asymptotic freedom of non-abelian gauge theories, applications to perturbative QCD;

- *Anomalies in Abelian and Non-abelian Gauge Theories*:

  The axial vector anomaly in QED and its implications, non-abelian anomalies, anomaly freedom vs renormalizability and unitarity, Fujikawa's approach to anomalies;

- *Topological Solutions*:

  Soliton solutions and their implications, Polyakov-'t Hooft magnetic monopole and the BPS limit, instantons and tunneling in quantum field theory;

Textbooks:

1. S. Coleman, *Aspects of Symmetry*, Cambridge University Press, 1985.

2. R. Rajaraman, *Solitons and Instantons*, Elsevier, 1986.

3. M. Peskin and D. Schroeder, *An Introduction to Quantum Field Theory*, Addison-Wesley, New York, 1995.

4. S. Weinberg, *Quantum Theory of Fields*, Vols. I and II, Cambridge University Press, 1996.

42a) Cosmology and Gravitation (four-and-half hours classwork per week, **9 credits**)

- Principle of relativity, principle of equivalence, tensors, tensor calculus on Riemannian manifolds, symmetries of Riemannian manifolds, hypersurfaces, extrinsic curvatures, Gauss-Codazzi equations;
- *Einstein's field equations:*

  Newtonian limit, tests of general relativity, gravitational radiation;
- *Solutions of Einstein's equations :*

  Schwarzschild solution, Kerr solution, black holes;
- Tetrad formulation of gravity, generalizations to arbitrary dimensions;
- *Hamiltonian formulation :*

  For metric gravity, for tetrad formulation, canonical quantization and path integral quantization;
- Cosmology : Robertson-Walker model, early universe;
- Singularity theorems;

Textbooks:

1. S. Weinberg, *Gravitation and Cosmology*, Wiley, 1972.
2. R. Wald, *General Relativity*, Chicago, 1987.

42b) Particle Physics II (four-and-half hours classwork per week, **9 credits**)

- *Basic Ingredients of the Standard Model*:

  Yang-Mills fields, Higgs mechanism, asymptotic freedom;

- *Electroweak Sector*:

  Weinberg-Salam Model, phenomenological consequences, families and flavours, anomaly cancellations, radiative corrections and precession tests;

- *Quantum Chromodynamics (QCD)*:

  Lagrangian, perturbative QCD, Altarelli-Parisi equations, nonperturbative QCD and colour confinement models, strong CP problem, chiral perturbation theory, heavy quark e ective theory, Skyrme model;

- *Neutrino Physics*:

  Solar neutrinos, double beta decay, neutrino masses and mixing models;

- *CP Violation*:

  CP violation in $K \quad \bar{K}$ system, $B \quad \bar{B}$ system, models of CP violation;

- *Supersymmetry*:

  Hierarchy problem, construction of the supersymmetric standard model, search for SUSY signals;

- *Other Approaches beyond the Standard Model*:

  Grand unified theories;

Textbooks:

1. T Cheng and L. Li, *Gauge Theory of Elementary Particles*, Oxford University Press, 1984.

43) Advanced Condensed Matter Physics (four-and-half hours classwork per week, **9 credits**)

- *Correlated Electron Physics:* Second quantization review, Hubbard model, Heisenberg model;

  Materials phenomenology, magnetic phases, CDW states;

  Quantum magnetism, Stoner criterion, double exchange;

  Superconductivity, Cooper argument, BCS, gap equation, Bogoliubov-de Gennes equations, strong coupling theory, RVB and modern approaches to superconductivity in correlated systems;

  Quantum Hall e ect, integer and fractional, edge states, Laughlin and Jain wave functions, topological defects; Luttinger liquids, Bethe ansatz;

  Mesoscopic physics;

  Disordered electronic systems and metal insulator transitions;

- *Soft Condensed Matter Physics* Interactions in soft matter, entropic interactions, fluctuation-induced interactions, hard sphere statistical mechanics and crystallization;

  Self-assembly of amphiphiles, phases, theoretical approaches;

  Colloids, self-assembly, the freezing transition;

  Polymers, polymer structure, self-avoidance, Edwards model, osmotic pressure, Flory-Huggins theory, screening, semi-flexibility, persistence length;

  Membranes, biological membranes, lipid bilayers, physical properties, de Gennes-Taupin length, tethered membranes;

  Liquid crystals, nematic, cholesteric and smectic, order parameters, Frank free energy, Landau-de Gennes model defects, defect phases;

  Survey of hydrodynamics, hydrodynamic approaches to soft matter physics, dynamical properties of polymers, membranes, colloids;

  Soft matter away from equilibrium, shear-induced phases;

  Optional: Granular media and Glasses;

Textbooks: <u>For Strongly Correlated Systems:-</u>

1. M. P. Marder, *Condensed Matter Physics*, Wiley-Interscience, 2000.
2. A. Altland and B. Simons, *Condensed Matter Field Theory*, Cambridge University Press, 2006.
3. G. D. Mahan, *Many-Particle Physics*, Springer, 2010.

<u>For Soft Condensed Matter:-</u>

1. P. M. Chaikin and T. C. Lubensky, *Principles of Condensed Matter Physics*, 1st Edition, Cambridge University Press, 2000.

44a) Quantum Information and Computation (four-and-half hours classwork per week, **9 credits**)

- *Resume of Quantum Mechanics:*

  Composite quantum systems and tensor product Hilbert spaces, Subsystems and density operators, From Schrödinger to Liouville evolution; completely positive maps as quantum channels; From projective measurements to POVMs; State estimation;

- *Entanglement and its applications:*

  EPR argument and Bell inequalities; Separability vs. entanglement; Positive unphysical maps witnessing entanglement; Partial transpose criterion for checking separability; Other entanglement detection criteria; Multi-partite entanglement; Quantum teleportation, dense coding, entanglement swapping;

- *Connection with Shannon information theory:*

  Shannon's noiseless coding theorem and Schumacher's quantum counterpart; Accessible information and Holevo's bound; Shannon's noisy channel coding theorem and HSW theorem; Quantum channel capacities; Decoherence and quantum error correction;

- *Measures of entanglement:*

  Thermodynamic considerations of entanglement under LOCC; Entanglement concentration and dilution; Several measures of entanglement; Majorization;

- *Quantum Cryptography:*

  Basics of classical cryptography; RSA cryptosystem; Quantum key distribution; Security of quantum key distribution;

- *Entanglement in continuous variable systems:*

  Gaussian states; Role of Wingner description and symplectic transformations; Quantum information processing with continuous variable systems;

- *Quantum computation:*

  Classical and quantum computers; Circuit complexity; One- and two-qubit gates; Universality of gates; Deutsch-Jozsa algorithm; Grover's search algorithm; Quantum Fourier transform and Shor's factorization algorithm;

- *Implementations:*

  Quantum key distribution experiments; Unconditional quantum teleportation using continuous variable systems; Implementations of quantum computers using NMR, trapped ions, Josephson junctions, linear optical devices, etc.;

Recommended readings:

1. *Quantum Computation and Information*, Michael A. Nielsen and Issac L. Chuang (Cambridge University Press, 2000);

2. John Preskill's Lectures on Quantum Information and Computation, available at: http://theory.caltech.edu/people/preskill/ph229/♯lecture;

3. David Mermin's Lectures on Quantum Computation, available at: http://people.ccmr.cornell.edu/ mermin/qcomp/CS483.html;

4. *The Physics of Quantum Information: Quantum Cryptography, Quantum Teleportation, Quantum Computation*, Dik Bouwmeester, Artur Ekert, Anton Zeilinger (eds.) (Springer, 2000);

5. *Elements of Information Theory*, Thomas M. Cover and Joy A. Thomas (John Wiley & Sons, 1999);

6. Contemporary review articles available at:- http://xxx.imsc.res.in/archive/quant-ph

44b) Nonlinear Dynamics (four-and-half hours classwork per week, **9 credits**)

- *Hamiltonian formulation*:

  Iterative maps, fixed points, Lyapunov exponents, Integrable systems, Perturbed integrable systems, Poincaré-Birkho construction (illustration with driven pendulum);

- *Deterministic Nonlinear Dynamics*:

  Discrete dynamics and maps, di erentiable dynamics: dissipative systems, non-dissipative systems, Hamiltonian systems;

- *Integrability Aspects of Hamiltonian Dynamics*:

  Liouville-Arnold theorem, KAM theory;

- *Chaos*:

  In discrete dynamical systems, in Hamiltonian systems, in dissipative systems;

- *Semiclassical Analysis*:

  Berry-Tabor theory, Gutzwiller Theory;

- *Quantum Aspects.*

Textbook:

1. M. Tabor, *Chaos and Integrability in Nonlinear Dynamics*, Wiley, 1989.
2. M. C. Gutzwiller, *Chaos in Classical and QUantum Mechanics*, Springer, 1990.

7. L. Reichl, *The transition to Chaos*, Springer, 2004.

44c) Statistical Field Theory (four-and-half hours classwork per week, **9 credits**)

- Review of quantum statistical mechanics, functional integration representation of partition function, scalar field, charged scalars and Bose-Einstein condensation, Fermions, interactions and diagrammatic techniques, self-coupled scalar field theory, Yukawa theory, QED, renormalization and loop corrections to $\ln Z$.
- Spontaneous symmetry breaking and Higgs model QCD, deconfinement phase transitions.
- Salem-Weinberg model and symmetry restoration, early universe, nuclear matter and pion condensates, neutron stars.

Textbook:

Courses of Study
For PhD Program

SCHOOL OF PHYSICAL SCIENCES

Ph.D. in Physical Science
(Program Code: PHYS04)

National Institute of Science Education and Research Bhubaneswar

(An Off-Campus Center

Of

Homi Bhabha National Institute – a deemed to be University, Anushkati Nagar, Mumbai)

With effect from the Academic Year 2018

School of Physical Sciences Ph. D course structure (60 credits)

Core courses				
Sl. No	Course code	Course title/Description	Contact hours/week (Lectures + Tutorial + Lab)	Credits
		Courses in odd semester		
1	P601	Classical Mechanics	3+1+0	6
2	P602	Mathematical Methods	3+1+0	6
3	P603	Electromagnetism	3+1+0	6
4	P698	Self Study/Mini project/credit seminar (One part of this will involve attending lectures of an elective course)		12
		Courses in even semester		
5	P614	Statistical Mechanics	3+1+0	6
6	P615	Quantum Mechanics	3+1+0	6
7		Any elective course from list below	3+1+0	6
8	P699	Mini Project		12

Elective courses				
Sl. No	Course code	Course title/Description	Contact hours/week (Lectures + Tutorial + Lab)	Credits
1	P648	Nuclei and Particle Physics	3+1+0	6
2	P649	Atoms Molecules and Radiation	3+1+0	6
3	P650	Introduction to Condensed Matter Physics	3+1+0	6
4	P651	Advanced Solid State Physics	3+1+0	6
5	P652	Computational Physics	3+1+0	6
6	P653	Quantum Field Theory I	3+1+0	6
7	P654	Particle Physics	3+1+0	6

8	P655	Introduction to Phase transitions and Critical phenomena	3+1+0	6
9	P656	Nonlinear Optics and Lasers	3+1+0	6

26	P673	Experimental Techniques	3+1+0	6
27	P674	Introduction to Cosmology	3+1+0	6

1 Core courses

P601: Classical Mechanics

1. Generalized coordinates, velocities and momenta, Lagranges formulation
2. Principle of least action, formulation by Maupertuis, Euler, Hamilton. Liouville's theorem
3. Two-body central force problem (reduced mass), planet orbits, Virial theorem
4. Collisions and scattering, CM and Lab frames, scattering cross section
5. Motion in non-inertial frames, Coriolis force
6. Hamilton's equations, Poisson brackets
7. Canonical transformations, Hamilton-Jacobi equation, Generating functions, Symmetries and conservation laws
8. Small oscillations, Normal modes.
9. Rigid body dynamics, Euler angles, Euler equations, rotation of a top
10. Special topics : nonlinear oscillators, non-linear dynamics, Lyapunov exponents, Introduction to chaos.

References:

1. Classical Mechanics, H. Goldstein
2. Mecanics - Landau and Lifshitz
3. Classical Mechanics - John R Taylor
4. Classical dynamics of particles and systems - Marion and Thornton
5. Introduction to dynamics - Percival and Richards

P602: Mathematical Methods

1. Vectors and Tensors (index notation, vector analysis in curvilinear coordinates, Cartersian tensors and four vectors, General tensors)
2. Review of Linear Algebra with emphasis on applications to physical problems (linear transformations + Matrix representations, Eigenvalues, Eigenvectors, Inner product spaces
3. Review of complex analysis with applications (Cauchy-Riemann equations, Complex integration, Cauchy theorems, Contour integration, Branch points and branch cuts, Applications to integrals, series etc)
4. Hilbert space methods, special functions (Hilbert space, Orthonormal series expansions in Hilbert space especially Fourier series, Special functions)
5. Ordinary and Partial differential equations (Analysis of second order OFEs Sturm-Liouville system, Boundary value problems for Laplace, Diffusion(Heat) and wave equations)
6. Integral Transforms, its applications and Generalized functions (Laplace and Fourier transform, Dirac delta and other generalized functions, Greens functions of ODE and PDE)
7. Group theory (introduction using various groups occurring in physics, its algebra, Representation of groups, Characters)

9. Graduate Mathematical Physics - James J. Kelly
10. Mathematical Methods In Classical And Quantum Physics : Tulsi Dass

P603: Electromagnetism

1. Electrostatics in vacuum, force, field, potentials and energy
2. Electrostatic boundary conditions and conductors
3. Solution of Laplace's equation in one, two and three dimensions, uniqueness theorem, methods of images, separation of variables, multipole expansion
4. Dielectrics
5. Current distributions, magnetic fields and magnetostatic boundary conditions
6. Motion of charges in electric and magnetic fields, energy and momentum of electromagnetic fields
7. Maxwell's equations, EM waves and their propagation in free space and in media
8. Potential formulation, Coulomb and Lorentz gauge, radiation from an accelerated charge, dipole radiation Special topics : Diffraction theory, polarization.

References:

1. Introduction to electrodynamics - David Griffiths
2. Foundations of electromagnetic theory - Reitz, Milford, Christy
3. Classical electrodynamics - J. D. Jackson
4. Electricity and Magnetism - M. H. Nayfeh, M. K. Brussel

P614: Statistical Mechanics

1. Review of thermodynamics, thermodynamic potentials, thermodynamic equilibrium and stability
2. Probability theory: Probability densities, cumulants and correlations, central limit theorem, laws of large numbers
3. Gibbs distribution : Ensembles, classical and quantum free particles, systems with continuous and discrete spectrum, degenerate Fermi systems, Bose condensation
4. Interacting systems: Cluster and Virial expansions, radial distribution function
5. Introduction to response, fluctuation and noise, Einstein formula
6. Phase transition : phenomenology of first order and continuous phase transitions, order parameters, 1D Ising model, universality and scaling, Ginzburg- Landau- Wilson theory, spontaneous symmetry breaking
7. Fundamentals of statistical mechanics: phase space, Liouville theorem, statistical distribution theorem
8. Brownian motion, Langevin equation, Markov processes and Fokker Planck equation

References:

1. Introduction to Statistical Mechanics - Kerson Huang
2. Statistical Physics - Reif
3. Statistical Physics of particles - M. Kardar
4. Introduction to Phase transitions and critical phenomena - H. E. Stanley

P615: Quantum Mechanics

1. Hilbert space (states, operators, evolution)
2. Review of one dimensional problems, delta and periodic potentials, Bound states vs scattering states, Simple harmonic oscillator
3. The central force problem, review of the hydrogen atom, hard and soft sphere
4. Angular momentum, rotation operators and the rotation group, spin, spherical harmmonics, addition of angular momentum.
5. Symmetries in quantum mechanics
6. Introduction to path integrals
7. Time independent perturbation theory, WKB approximation, variational method, Zeeman and Stark effects
8. Identical particles and exchange statistics
9. Time dependent perturbation theory, Heisenberg and interaction representations, Rabi Oscillations
10. Basic aspects of scattering theory : Born approximation and partial waves and phase shifts

    Special topics: Dirac equation/semi classical theory of radiation/geometric phase (a subset of these topics depending on available time)

References:

5. Quantum Physics - S. Gasiorowicz
6. Quantum Mechanics - E. Merzbacher
7. Quantum Mechanics - Bransden and Joachain
8. Introductory Quantum Mechanics - R. Liboff

2 Elective Courses

P648: Nuclei and Particle Physics

1. Nuclear systematics and stability (masses, sizes, spins, magnetic moments, quadrupole moments, energetics and stability against particle emission, beta decay).
2. Nucleon-Nucleon interaction, space-time symmetries, conservation laws, isospin symmetry, low energy (effective range, shape independence, meson exchange picture (qualitative).
3. Liquid drop model, compound nucleus and fission, nuclear vibrations and rotations.
4. Shell model, introduction to Hartree-Fock, spins and magnetic moments.
5. Direct nuclear reactions.
6. Mesons and baryons, resonances, SU(3) classification, isospin and strangeness, quark model, colour.
7. Weak interactions (nuclear and particle decays, neutrinos etc).

References:

1. Introduction to Nuclear Physics - Roy and Nigam
2. Nuclear Physics - Preston and Bhaduri
3. Introduction to particle physics - Griffith
4. Introduction to particle physics - Perkins

P649: Atoms, Molecules and Radiation

1. Hydrogen atom including l.s coupling and hyperfine interaction.
2. Helium atom introduction to exchange and correlation; variational calculation of ground and excited-states.
3. Introduction to the idea of effective potentials for electrons in many-electron atoms (Hartree theory and idea of self-consistency); use of Clementi-Roetti wave-functions.
4. One-electron atomic systems in an electromagnetic field; dipole approximation and associated selection rules; Stark and Zeeman effect (Note: Instructor will have to introduce the students to time-dependent perturbation theory here).
5. Einsteins A and B coefficients, population inversion, laser action, derivation of A and B coefficients from semi-classical treatment of light-atom interaction.
6. Molecular formation: Discussion of atom-atom interaction, van der Waals force, ionic interaction and covalent bond.
7. Molecular structure: Hydrogen molecule MO and VB pictures; Importance of correlations.
8. Molecular spectra (restricted to two atom molecules) electronic, rotational and vibrational.
9. Some lectures left for interesting current topics.

References:

1. Elementary Atomic Structure - G.K. Woodgate
2. Atomic Physics: C.J. Foot
3. Atoms, molecules and Photons: W. Demtroder
4. The Theory of Atomic Spectra: Condon and Shortley
5. Topics in Atomic Physics: C.E. Butkhardt and J.L. Leventhal
6. Physics of Atoms and Molecules - B.H. Bransden and C.J. Joachain

P650: Introduction to Condensed Matter Physics

1. General introduction, Drude and Sommerfeld model.
2. Crystal structure; x-ray diffraction.
3. Cohesive energy.
4. Blochs theorem; Band theory nearly free electrons; tight binding approximation; semi-classical dynamics of electrons in a band, definition of metals and insulators.
5. Basic properties of Semiconductors.
6. Thermal properties of insulators, phonons.
7. Landau levels - de Hass van Alphen effect and Integer quantum hall effect.
8. Introduction to Magnetism.
9. Introduction to Superconductivity.

References:

1. Introduction to Solid-state Physics, C. Kittel
2. Solid-state physics, N. Ashcroft and N.D. Mermin,
3. Solid-state physics, Rosenberg
4. Solid sate physics, Burn
5. Oxford Series in Condensed Matter [Oxford university press]

P651: Advanced Solid State Physics

1. Introduction to physics of metals and insulators. Electrical, thermal and optical properties of metals and insulators, and need to study excitation spectrum in detail.
2. Electrons, phonons and Magnons, Screening and Plasma Oscillations
3. Charge impurity in a metal: Friedel Oscillation, Magnetic impurity in a metal,
4. moment formation and suppression in metals.
5. Electron gas in Low dimension: impurity and interaction effects.
6. Quantum Hall Effect
7. Metal-Insulator transition
8. Electron - phonon interaction, Frohlich Hamiltonian and Superconductivity.

References:

1. Advanced Solid State Physics: Philip Phillips
2. Elementary Excitations in Solids: D. Pines
3. Solid State Physics: Marder
4. Concepts in Solids: P.W. Anderson
5. Basic Notions in Condensed Matter: P.W. Anderson

P652: Computational Physics

1. Monte Carlo: Markov chain, Metropolis algorithm, Ising Model, Quantum Monte Carlo
2. Molecular Dynamics: Integration methods, extended ensembles, molecular systems
3. Variational methods for SchrodingerdEquation: Hartree and Hartee-Fock methods, Post HF methods
4. Density Functional Theory: Fundamental theorem, XC-potentials
5. Quantum Molecular dynamics: Carr-Parinello approach, hybrid QM/MM method
6. Computational methods for lattice field theories

9. R. G. Parr and W. Yang, Density Functional theory of atoms and molecules
10. F. Jensen, Introduction to Computational Chemistry
11. C. J. Crammer, Essentials of computational chemistry

P653: Quantum Field Theory I

1. Relativistic quantum mechanics - Klein-Gordon equation, Dirac equation, free-particle solutions
2. Lagrangian formulation of Klein-Gordon, Dirac and Maxwell eqns, Symmetries (Noethers theorem), Gauge field, Actions
3. Canonical quantization of scalar and Dirac fields
4. Interacting fields - Heisenberg picture, perturbation theory, Wicks theorem, Feynman diagram
5. Cross-section and S-matrix
6. Quantization of gauge field, gauge fixing
7. QED and QED processes
8. Radiative corrections - self-energy, vacuum polarization, vertex correction
9. LSZ and optical theorem
10. Introduction to renormalization

References:

1. An Introduction to Quantum Field Theory - Peskin and Schroeder
2. Quantum Field theory: K. Huang
3. Quantum Field Theory: Mandl and Shaw
4. Quantum Field Theory: Itzykson and Zuber

P654: Particle Physics

1. Elementary particles, discrete symmetries and conservation laws.
2. Symmetries and Quarks.
3. Klein-Gordon equation, concept of antiparticle.
4. Lorentz symmetry and scalar / vector / spinor fields.
5. Dirac equation
6. Scattering processes of spin-1/2 particles (Feynmans rules as thumb rule QFT course), propagators.
7. Current-current interactions, weak interaction, Fermi theory.
8. Gauge symmetries, spontaneous symmetry breaking, Higgs mechanism
9. Electroweak interaction, Glashow-Salam-Weinberg model.
10. Intoduction to QCD, structure of hadrons (form factors, structure functions), parton model, Deep inelastic sattering.

References:

1. Quarks and Leptons: An Introductory Course in Modern Particle Physics - Francis Halzen, Alan D. Martin
2. Introduction to Elementary Particles, David Griffiths
3. An Introduction to Quantum Field Theory - Peskin and Schroeder

P655: Introduction to Phase transitions and Critical phenomena

Experimental evidences of classical and quantum critical phenomena, thermodynamic potentials. heat capacity, magnetic susceptibility, phases, phenomenol-ogy of 1st order phase transitions, continuous transitions, order parameters and models: Ising, XY, Heisenberg, uni-versality and scaling, Ginzburg-Landau-Wilson theory, spontaneous symmetry breaking. Bose-Einstein condensation,expansion around upper critical dimension, domain walls and surface tension, 1D Ising model and instantons, critical behavior, critical exponents, relations between critical exponents, Kadanoff scaling, universality conjecture, calculation of critical exponents: real space RG methods, Phi- 4 theory, 4- epsilon expansion.?RG of Wilson and Fisher, contin-uous symmetry: Mermin-Wagner theorem. Goldstone modes, non-linear sigma-model, vortices, Kosterlitz-Thouless phase transition, topology and duality, surface roughening and Sine-Gordon models, quantum critical phenomena,dissipative quantum tunneling, quantum phase transitions, Bose-Hubbard model.

5. Nonlinear Optics by Robert W. Boyd, Academic Press
6. Nonlinear Optics: Basic Concepts by D.L. Mills, Springer Verlag
7. Optical waves in crystals by Amnon Yariv and Pochi Yeh, Wiley-Interscience
8. Laser Spectroscopy by Wolfgang Demtrder, Springer Verlag

P657: General Relativity and Cosmology

1. Review of Newtonian Mechanics. Special theory of relativity. Prelude to General relativity, historical developments
2. 4-Vectors and 4-tensors, examples from physics
3. Principle of Equivalence, Equations of motion, Gravitational force
4. Tensor Analysis in Riemannian space, Effects of Gravitation, Riemann-Christoffel curvature tensor, Ricci Tensor, Curvature Scalar
5. Einstein Field Equations, Experimental tests of GT
6. Scwartzchild Solution, Gravitational lensing
7. Gravitational waves: generation and detection
8. Energy, momentum and angular momentum in Gravitation
9. Cosmological principle, Robertson-Walker metric, Redshifts
10. Big-Bang Hypothesis, CMB.
11. Issues in Quantum Gravity

2. Gravity: HJ. Hartle
3. The Classical Theory of Fields: Landau and Lifshitz
4. Gravitation and Cosmology: S. Weinberg
5. Introducing Einstein's Relativity: D'Inverno

P658: Soft Condensed Matter

1. Prerequisite: Introduction to condensed Matter Physics, Statistical Physics
2. What is Soft Condensed Matter: forces, energies and time scales.
3. Phase transition in soft matter, Radial distribution function and description of liquids.
4. Colloids Polymers Gels Liquid Crystals
5. Soft matter in nature

References:

3. Chandler: Statistical Physics (OUP 1987)
4. R A L Jones: Soft Condensed Matter (O U P 2002)
5. Soft Matter Physics: Daoud and Williams (Springer 1999)

P659: Applied Nuclear Physics

1. Basis of Nuclear Structure and reactions
2. Radioactivity and radioactive decays
3. Passage of charged particle through matter
4. Detectors and Accelerators
5. Applications: Effects of radiation on biological systems and nuclear medicine, Industrial applications
6. Power from fission and fusion: Characteristics of fission, Nuclear reactors, Thermonuclear fusion

References:

4. An introduction to the passage of energetic particles through matter, N. J. Caron
5. Accelerator Physics, Shyh-Yuan Lee, World Scientific

P660: Many Particle Physics

1. Prerequisite: Statistical Physics, Quantum Mechanics, Introduction to Condensed Matter Physics
2. Second Quantization, One and two body operators
3. Observables and their relationship to one and two body Greens functions
4. Thermodynamic potential, Spectral functions, Analytic properties of Green's functions
5. Linear Response, correlation function, sum rules
6. Canonical Transformation: Bogoliubov Valetin, Schrieffer Wolf, etc.
7. Equation of motion,
8. Diagrammatic Perturbation theory for Green function and thethermodynamic potential, Luttinger Ward Identities.
9. Mean field theory
10. Functional Integration Methods

References:

1. Lifshitz Pitaeviski (Landau Lifshitz Stat Phys Part II)

4. Fetter Walecka: Quantum Theory of Man body Particle systems:
5. Ben Simon: Many Particle Physics
6. Basic Notions in Condensed Matter: P.W. Anderson
7. Techniques and application of Path-integration Plan: S. Schulman

P661: Physics of Mesoscopic Systems

1. Prerequisite: Quantum Mechanics1; Statistical Mechanics; Introduction to Condensed Matter Physics
2. Effects of magnetic fields: The AharonovBohm effect; 2D electron gas; Landau levels; Transverse modes in 2D quantum wire; Shubnikovde Haas oscillations; Magnetic edge states; Integer Quantum Hall effect, Fractional Quantum Hall effect
3. Electron transport: Boltzmann semiclassical transport; Onsager reciprocity relations; Conventional Hall effect; Drude conductivity; Einstein relation; Electronic states in quantum confined systems; Conductance from transmission; Ballistic transport; Quantum of conductance; Landauer formula; Quantum point contact; T .matrices; Smatrix and Green functions; Current operator; LandauerButtiker formalism; Linear response and Kubo formula; Nonequilibrium Green's function approach to transport; Scattering: BreitWigner resonance and Fano resonance; Delay time for resonances; Friedel sum rule; Levinson.s theorem; Singleelectron tunneling: Coulomb blockade and Kondo effect
4. Quantum Information: Josephson Junctions and Cubits; Metastable states and escape dynamics
5. Disordered conductors: Weak localization; Mesoscopic fluctuations; Random Matrices; Anderson localization; Quantum Chaos; Dephasing; Decoherence

References:

1. Electronic Transport in Mesoscopic Systems, S. Datta, Cambridge University press.

3. Mesoscopic Electronics in Solid State Nanostructures, T. Heinzel, WileyVCH.
4. Quantum Transport in Mesoscopic Systems: Complexity and Statistical Fluctuations, P. Mello and N. kumar, Oxford University Press.

P662: Introduction to Quantum Optics

1. Prerequisite: Quantum Mechanics I & 2; Electromagnetism I
2. Electro-magnetic field quantization: Quantum fluctuation and Quadrature operators of a single mode field, Thermal fields, Vacuum fluctuation and zero point energy, Quantum phase
3. Coherent and squeezed states of radiation field: Properties and phase space picture of coherent state, Generation of a coherent state, Squeezed state physics, Generation and Detection of squeezed light, Schrodinger cat states, Multi-mode squeezing, Broadband squeezed light, Squeezing via non-linear process
4. Atom-field interaction: Rabi model (Semi-classical model for atom-field interaction), Jaynes-Cummings model (fully quantum mechanical model for atom-field interaction), Dressed states, Density operator approach, Hanle effect, Coherent trapping, electromagnetically induced transparency, Four wave mixing
5. Quantum coherence function: Photon detection and quantum coherence functions, First order coherence and Young.s type double source experiment, Second order coherence, Physics of Hanbury-Brown-Twiss effect, Experiments with single photon, Quantum mechanics of beam splitter, Interferometry with single photon
6. Optical test of quantum mechanics: Photon sources: spontaneous parametric down-conversion, Hong-Ou-Mandel Interferometer, Superluminal tunneling of photons, EPR paradox and optical test of Bell.s theorem
7. Atom Optics: Mechanical effects of light, Laser cooling, Atom interferometry, Atoms in cavity, Experimental realization of Jaynes-Cummings model
8. Heisenberg-limited interferometry and quantum information: Entanglement and interferometric measurements, Quantum teleportation, Quantum cryptography, An optical realization of some quantum gates.

4. Quantum Theory of Light, R. Loudon, Oxford science publication

P663: Astronomy and Astrophysics

1. Introduction and Tools :
   Tools - astronomical objects, scales, distance ladder, astrometry, magnitude scale
   Gravity - Keplers law, Virial theorem
   Radiation physics - radiative flux, transfer function, absorption, scattering and emission
2. Stars:
   Stars and stellar structures - stellar spectra, HR diagram
   Equilibrium in stars
   Star formation and Protostars
   Stellar evolution
   Supernovae
   black holes and gravitational waves
3. Interstellar medium
4. Galaxies
   The Milky way Galaxy - distribution of matter, differential rotation, formation of the spiral arms Elliptical and Spiral Galaxies
   Evidence for dark matter Active Galaxies - Active Galactic Nuclei, Seyfert Galaxies, Quasars, Blazers
5. Magnetic fields
   Astrophysical phenomena where magnetic fields are critical
   Galactic magnetic fields - dust and synchrotron polarization, Faraday rotation, Zeeman measurements
6. Gravitational Lensing (optional)
7. Clusters and Superclusters (optional)
8. Cosmology (optional)
   Cosmological Observations and the Cosmological Principle
   Newtonian Cosmology and Cosmological Models
   Cosmic Microwave Background

5. Introduction to Nanoelectronics: Science, Nanotechnology, Engineering and Applications - by Vladimir Mitin, Viatcheslav A. Kochelap, Michael A. Stroscio

P667: Nonlinear Physics, Chaos, Turbulence

1. General introduction and motivation : examples of linearity and nonlinearity in physics and the other sciences; modelling systems using iterated maps or differential equations, nonautonomous systems
2. General features of dynamical systems : Systems of differential equations with examples; control parameters; fixed points and their stability; phase space; linear stability analysis; numerical methods for nonlinear systems; properties of limit cycles; nonlinear oscillators and their applications; the impossibility of chaos in the phase plane; bifurcations: their classification and physical examples; spatial systems, pattern formation and the Turing mechanism; strange attractors and chaotic behaviour.
3. The logistic map: Linear and quadratic maps; graphical analysis of the logistic map; linear stability analysis and the existence of 2-cycles; numerical analysis of the logistic map; chaotic behaviour and the determination of the Lyapunov exponent; universality and the Feigenbaum numbers; other examples of iterated maps.
4. Hamiltonian Sysytems: Phase space; Constants of motion and integrable Hamiltonians; Nonintegrable systems, the KAM theorem and period-doubling; applications.
5. Fractal geometry: dimension of an object, Mandelbrot set, Julia set, iterated function systems.
6. Spatio-temporal dynamics: Spatio-temporal chaos
7. Quantum Chaos: Quantum analogies to Chaotic behaviour, Correalations in wave functions, chaos and semiclassical approaches to Quantum mechanics

P668: Magnetism and Superconductivity

1. Prerequisite: Solid State Physics, Quantum Mechanics, Statistical Physics
2. Review of atomic/ionic magnetism.
3. Diamagnetism Paramagnetism Ferromagnetism characteristics, Occurrence.
4. Orbital magnetism, de Haas van Alfen effect.
5. Heisenberg Model: Ground state, Spin waves.
6. Hubbard Model and Itinerant exchange.
7. Magnetic domains and hysteresis.
8. The phenomenon of Superconductivity: historical perspective, characteristics, occurrence.
9. London Equations, Thermodynamics, Meissner Effect.
10. Ginzburg Landau Theory, Abrikosov Vortices.
11. Josephson Effect.
12. Cooper Instability, BCS wave function, Gap equation, thermodynamics and magnetic response.
13. Conventional and non-conventional superconductors.

P669: Density Functional Theory of Atoms, Molecules and Solids

Many-body problem: QM of electrons and nuclei, approximation methods for many electron systems, Born-Oppenheimer approximation, Hartree and HF theory, tight binding method, greens functions, electron correlation, CI & many-body and Moller-Plesset theory, complete active space methods, coupled cluster theory, density matrices, time-dependent approach to all the above formalism

Foundations of Density Functional Theory(DFT): Hohenberg-Kohn (HK) theorem, degenerate ground states, variational DFT, $N-$ and $v-$ representability problem, Levy-Lieb constrained search, fractional particle number & derivative discontinuity, spin polarized systems, Exited states part I: Effective Single Particle Picture: Kohn-Sham (KS) construction, non-interacting $v-$ representability, degenerate KS DFT, KS equations for spin polarized systems, interpretation of KS eigenvalues

Exchange-Correlation (XC) Energy Functional: exact exchange formalism within DFT, exact representations of the energy functional, LDA, GGA, meta-GGA, weighted density approximation, self interaction correction (SIC), virial theorems, exact exchange formalism (OPM, KLI, HS), where DFT goes wrong, strengths of DFT, strong correlation: DFT+U, RPA, GW, DFPT, DMFT, orbital free DFT, DFT-hybrid

Crossover to Excited-States: time-dependent DFT: Runge-Gross theorem, time-dependent KS equations, adiabatic LDA & TD XC potentials, linear response TDDFT, Excited states part II, spin polarized TDDFT, frequency dependent XC kernel, TDCDFT, TDOEP, relativistic DFT, molecular orbital theories

20. Material Modeling using DFT by Feliciano Giustino

P670: Quantum Field Theory II

1. Path-integral formulation of quantum mechanics
2. Path-integral for scalar fields, generating functional, connected Greens functions, Feynman rules, 1 loop diagrams
3. Grassmann variable, path-integral for Dirac field
4. Path-integral for Electromagnetic field, gauge fixing
5. QED, symmetries and Ward identity
6. Renormalization divergences and power counting, 4 theory, QED, spontaneous symmetry breaking, Renormalization Group basics (running of coupling).
7. Yang-Mills theory, gauge fixing and ghosts, BRST, asymptotic freedom

P671: Quantum Information and Quantum computation

1. Introduction to Classical information: Shannon entropy, Mutual Information
2. Quantum Information I: Hilbert space, density matrices, quantum entropy and Holevo bound
3. Quantum Information II: Entanglement, Teleportation, super dense coding and Bell inequalities
4. Quantum dynamics:Two level systems, decoherence and Rabi oscillations
5. Quantum computation: single qubit gates-phase, swap, Hadamard; two qubit gates-CNOT
6. Quantum algorithms: Deutsch, Grover, Introduction to Shor's algorithm
7. Quantum error correction
8. Applications: Quantum simulation and Adiabatic quantum computation
9. Solid state quantum information and computation: Introduction to entanglement in nanostructures, quantum computation with superconducting devices and topological quantum computation.

2. Nielsen and Chuang, Quantum Information and Computation (Cambridge U. Press)
3. Kaye, Laflamme, Mosca, An Introduction to quantum computing. (Oxford U. press)

P672: Experimental High Energy Physics

The interaction of high-energy particles with matter: specific applications related to EHEP.

1. Relativistic kinematics: Detailed derivation of kinematic variables and their transformations whenever needed. Decay kinematics. Rapidity, pseudo-rapidity, spacelike and time-like. Some examples where relativistic kinematics play important role for understanding of data.
2. Detectors in High Energy Physics: General concept of building a HEP experiment, coverage and options, Gas detectors; Semiconductor detector; Scintillator and Cerenkov detectors Specific to EHEP, Calorimeter and Preshower detectors: principle of electromagnetic and hadronic shower generation.
3. Detector Simulation: Need of simulation, various techniques, MC, some general Concepts.
4. Data Analysis in HEP: General approach of data cleanup, calibration, track reconstruction, reconstruction of events
5. Error analysis in EHEP.
6. Computing in EHEP: Basics of OO programming using C++, few applications in EHEPdata analysis.

4. Experimental Techniques in Hugh Energy Nuclear and Particle physics: T. Ferbel (World Scientific)
5. Introduction to Experimental Particle Physics : R.C. Fernow
6. Data Reduction and Error analysis for the physical sciences: P. Bevington and D. K.Robinson
7. Data Analysis Techniques for High Energy Physics: R. Frunwirth, M. Regler, R. K. Bock and H. Grote

P673: Experimental Techniques

1. Mechanical drawing and designs: Basics tools: hand tools, machines for making holes, the lathe, milling machines, grinders, casting; Mechanical drawing, drawing tools, basic principles of mechanical drawing, dimensions, tolerances, from design to working drawings
2. Vacuum technology: gases, gas flow, pressure and flow measurement, vacuum pumps, pumping mechanisms, ultrahigh vacuum, leak detection
3. Optical systems: optical components, optical materials, optical sources Charge particle optics: electrostatic lenses, charged-particle sources, energy and mass analyzer
4. Detectors: optical detectors, photoemission detectors, particle and ionizing radiation detectors, signal to noise ration detection, surface barrier detector.
5. Particle detectors and radioactive Decay: Interactions of charged particles and photons with matter; gaseous ionization detectors, scintillation counter, solid state detectors
6. Electronics: electronic noise, survey of analog and digital I/Cs, signal processing, data acquisition and control systems, data analysis evaluation
7. Nano- and micro-fabrication: various lithography techniques such as photolithography, nanoimprint lithography, e-beam lithography, ion-ball milling
8. Some experiments: SEM, TEM, X-ray diffraction, SQUID Magnetometry, Magnetotransport, PL/CL time resolved spectroscopy, Rutherford Backscattering spectrometry (RBS), RBS-Channeling, UV-VIS-IR spectrometry.

9. Techniques for Nuclear and particles physics experiments, W. R. Leo, 2nd edition, Springer

P674: Introduction to Cosmology

1. The cosmic history and inventory.
2. A sketch of General Relativity.
3. The expanding Universe
4. Friedmann Equations and Cosmological Models
5. The Standard cosmological model.
6. The inflationary Universe.
7. Primordial nucleosynthesis and the thermal history of the Universe.
8. Perturbations in an expanding Universe.
9. Growth of perturbations
10. Dark Matter Halos.
11. Statistical description of gravitational clustering
12. Special Topics:
    Fluctuations in the CMB, Lensing, Cluster Cosmology, The Lyman-Alpha Forest, Reionization, Halo Model, Redshift Space Distortions.

6. Large Scale Structure of the Universe - P.J.E. Peebles
7. Structure Formation in the Universe - T. Padmanabhan

P675: Quark-Gluon-Plasma and Nucleus-Nucleus Collisions

1. Introduction to high energy heavy ion collisions and Quark-Gluon-Plasma, comparison of big bang and the little bang.
2. Thermodynamics:relativistic gas (hadrons, quarks and gluons) and its statistical and thermodynamical properties, MIT Bag model,Hagedorn gas, phase diagram of QCD.
3. Relativistic Kinematics: four vectors notation, rapidity variables, pseudorapidity varibales, light cone variables, relativistic invariants, Dalitz plot, cross sections .
4. Collision Dynamics: initial state of nuclear collisions, fluid dynamical evolution, kinetic transport model, freeze-out and particle production.
5. Experiments: a general overview of different experimental setup related to search for QGP and relevant observables.
6. Signatures of QGP: collective flow, J/Ψ suppression, strangeness enhancement, jet quenching, electromagnetic probes, Hanbury-Brown-Twiss measurement.
7. Recent progresses.

10. The Early Universe by Kolb and Turner.
11. Fantastic Realities by Frank Wilczek.

Courses of Study

For PhD Program: Health Sciences

@

Tata Memorial Centre

Under the aegis of

Homi Bhabha National Institute

(For Academic year 2019 onwards)

Syllabus for Courses of Study for PhD Program: Health Sciences

Contents

****

Standing Committee for PhD in Health Sciences at TMC:

1.	Prof.Shripad. Banavali	-	Chairperson
2.	Prof.Sudeep Gupta	-	Member
3.	Prof. Rajiv Sarin	-	Member
4.	Prof. Kumar Prabhash	-	Member
5.	Prof.TanujaSheth	-	Member
6.	Prof. Rajesh Kinhikar	-	Member

Academic Committee for PhD in Health Sciences at TMC:

1.	Prof. RajivSarin	-	Chairperson
2.	Prof.Sorab Dalal	-	Member
3.	Prof. V. Prasanna	-	Member
4.	Prof.Abhijit Dey	-	Member
5.	Prof. Kumar Prabhash	-	Member
6.	Prof. Rajesh Dikshit	-	Member
7.	Prof. V. Rangarajan	-	Member
8.	Prof. Rajesh Kinhikar	-	Member

Board of Studies (BoS) in Health Sciences at TMC:

1.	Prof. S.D. Banavali, TMH	-	Convener
2.	Prof. Sandeep Basu, RMC	-	Co-convener
3.	Prof. S.V. Chiplunkar, ACTREC	-	Member
4.	Dr.Nithya Gogtay, KEM Hospital, Mumbai (Outside Expert)	-	Member
5.	Dr. Ashutosh Agarwal, PGIMER, Chandigarh (Outside Expert)	-	Member
6.	Prof. Kailash Sharma, TMC	-	Member
7.	Prof.Siddharth Laskar, TMC	-	Member
8.	Prof. Ajay Puri, TMC	-	Member
9.	Prof. J.P. Agarwal, TMC	-	Member
10.	Prof. Suyash Kulkarni, TMC	-	Member

Balancing Members

1.	Prof. Rajesh Kinhikar, TMC	-	Balancing Member
2.	Prof. A.K. Dureja, HBNI	-	Balancing Member

SOP for Approval of Course Work for Ph.D. in Health Sciences:

1. Each Ph.D., student will have to do 60 credit course work per year.
2. Semester I: August to November.
3. Semester II: January to April.
4. 3 lectures will be taken per week (consisting of 4 contact hours each).
5. There will be Tutorials/Assignments in addition to lectures.
6. 1st Year:
    a. There will be 8 courses in 1st year (Approx. 7.5 Credits each)
    b. There will be 4 courses per semester
    c. The core course is to be completed in the first year
7. 2nd Year:
    a. There will be 2 self-study courses consisting of 6 credits each in the second year.
8. There will be 8 “Core” course modules in total, which will be offered to all Ph.D. students.
9. Additionally, there will be “Elective” Modules to be completed by each student. There are many “Elective” modules submitted to HBNI for approval. Each student will select Elective modules from the approved modules as per their Ph.D. topic.
10. All the “Core” and “Elective” modules will be evaluated and Okayed by the Academic & Standing Committee of Ph.D. programme in Health Sciences & then sent to HBNI for final approval.
11. The students will have to choose a total of 8 Courses (Core + Elective) only from all the courses already approved by HBNI.

SOP for Advertising Ph.D. seats for that year:

1. Clinicians interested in becoming Ph.D. Guides should be at least 15 years post completion of M.D.
2. They should be well versed with conducting research and have funded projects to support students enrolled in Ph.D. programme under them.
3. The applications of those interested in becoming Ph.D. guide, after thorough review by Academic Director, will be sent to HBNI.

4. Once cleared by HBNI, these applications will be forwarded to BOS (Health Sciences) for recommendation.
5. The recommended applications will be then resent to HBNI for approval.

6. Once approved by HBNI, the Ph.D. guide will be sent intimation of the same.

7. The Academic Office will have a list of all approved Ph.D. guides. At the start of the year, The Academic Office will intimate the guide to submit to Academic Office If they have projects to support Ph.D. students.

8. The projects will then be submitted to Academic Committee & the Standing Committee of Ph.D. in Health Sciences & number of Ph.D. students to be taken for that year will be decided by April of that year & Advertisements made.

9. A PhD Guide in Health Sciences can get maximum of 2 New PhD Students in a year. Each PhD Guide in Health Sciences can have maximum of 4 PhD Students at any given time.

SOP for Enrolment of Ph.D. Students (Health Sciences) under HBNI:

1. Ph.D. Health Science Standing Committee will approve projects to be given to Ph.D. students for the batch.

2. Advertisement for Entrance Examination for Ph.D. in Health Sciences will be made.

3. Examination and Interviews will be done and the list of eligible candidates will be displayed at TMH website.

4. Students will join after medical fitness.

5. Enrollment Form – ‘A’ will be sent to HBNI with D/D of Rs. 10,000/- with their documents like
    a. All Mark sheets and appropriate degree certificates of B.Sc., M.Sc., MD
    b. Copy of AADHAR Card
    c. Copy of Award Letter
    d. Fellowship documents if any

6. HBNI will send Enrollment numbers for the batch.

7. JRF will be assigned to the Ph.D. guide as per their chosen field of work.

8. Lab rotation in first month declared

9. 1st Year course work will be of around 9 to 10 months. (Marks to be included of Main Course + Electives+ Open Seminar)

10. 1st DC will be held at around end of 1st year.

11. The Doctoral Committee of the staff (as per new ordinance) will be as follows:
    a. A Professor or an Associate Professor shall be the Chairman of the Committee,
    b. The Guide shall be the Convener and where applicable, the co-guide shall be a member.
    c. Two faculty members of the Institute specializing in a domain encompassing the topic of research.
    d. One faculty member preferably from any other CI or any other University/Academic Institute in an allied domain as the topic of research.
    e. A Technology Adviser, if any, shall be a Permanent Invitee.

12. HBNI will then send a letter approving DC committee.

13. 1st DC report will consists of documents mentioned below

14. (Set is to be submitted to HBNI):-
    a. Oral General Comprehensive Examination Report (OGCE)
    b. Annual Progress Report
    c. Mark sheet of Course work
    d. B & C part of Enrollment form

15. Request for synopsis: In total at least 4 DC reports will be needed for synopsis submission + one 1st author publication+ at least 1 conference to be attended.

Annexure - I

Details of Assessment for Course of PhD in Health Science at TMC:

1. Salient features of core course and electives:

Students at TMC are required to do a core course and take elective courses, which are determined by them in consultation with their thesis supervisor.

A] The core course is for 1000 marks which are equal to 500 contact Hrs (30 Credits) and is configured in the following manner:

a. There are 8 Core Course modules which are all compulsory as below:

b. The students are evaluated in a written exam for each course and have take-home assignments for each course.

c. The students also have to present two assigned papers over the period of the core course.

d. The courses also include lectures on advanced techniques that introduce the students to new methodologies.

B] Multiple electives are offered at TMC and the students will have to pick 4 for a total of 400 marks which are equal to 200 contact Hrs (12 Credits) Each elective has a course co-ordinator/co-ordinators who designs the course and determines the process by which the students are examined over the course.

C] Core course includes Special Lectures on Epidemiology and Bioinformatics (5 lectures), Intellectual Property rights (1 lecture) and Research Methodology (6 lectures). All these lectures have no separate credit points.

D] Research Methodology (6 lectures) is a separate module with no separate credit points. Laboratory Work all through the year carries 200 marks which are equal to 100 contact Hrs (6 Credit). Scientific writing assessed at the final seminar is for 100 marks which are equal to 50 contact Hrs (3 Credit)

E] Final Seminar presentation on the topic of Ph.D. dissertation carries 200 marks which are equal to 100 contact Hrs (6 Credit) and

F] Oral General Comprehensive Examination (OGCE) is for 100 marks which are equal to 50 contact Hrs (3 Credit)

Total course work is of 2000 marks which are equal to 1000 contact Hrs (60 Credits).

2. Choice based credit system:

TMC follows the HBNI guidelines on how many academic hours correspond to how many marks. While the core course is mandatory for all students, the students do have a choice of electives. Similarly, the credits for the Final seminar, lab work and scientific writing are based on the choice of project that will be pursued by the student. The courses were initially developed for Ph.D. in Life Sciences program and are formulated as per HBNI guidelines.

HBNI Orientation Course on Basic and Cancer Biology for Junior Research Fellows, Ph.D. Health Sciences

Proposed Lectures / Marks of Coursework: 1st year of the Ph.D. program

[Total: 2000 marks]

Sr. No	Orientation	No. of Lectures	Marks
1	Laboratory Safety Lectures	3	-
2	Visits to Library, Common Instrument Room and Laboratory Animal Facility	3	-
3	Orientation to the Cancer Clinic	4	-

A]Core Course **200 Contact hrs / 1000 marks**

Lectures

Course code	Core Course Topics	Lectures		Marks
		Contact Hrs	F/N Practicals	
09HLTH04-001-C	Cell Biology & Cancer Biology	32	20	Written Test 140 marks Home Assignments: 150 marks
09HLTH04-002-C	Cell Proliferation and Cell death	16		
09HLTH04-003-C	Oncogenes and Tumor Suppressors	20		
09HLTH04-004-C	Metastasis and Angiogenesis	16	20	Written Test 140 marks Home Assignments: 150 marks
09HLTH04-005-C	Cancer Epigenetics and Genetics	28		
09HLTH04-006-C	Carcinogenesis	20		
09HLTH04-007-C	Tumor Immunology	20	10	Written Test 120 marks Home Assignments: 100 marks
09HLTH04-008-C	Structural Biology and Biophysics	20		
	Presentations 1 & 2	28		200 Marks
		200		1000 marks = 30 credits

B] Electives

Each Elective 20 Contact hrs + FW/Practical 5 Contact hrs + 3 Credits each.

Course code	Core Course Topics	Lectures		Marks
		Contact Hrs	F/N Practicals	
09HLTH04-001-E	Biostatistics	20	5	Exam 100 marks
09HLTH04-002-E	Animal Models in Cancer Research	20	5	Exam 100 marks
09HLTH04-003-E	Cancer Therapeutics	20	5	Presentations 100 marks
09HLTH04-004-E	Carcinogenesis, Chemoprevention and DNA Repair	20	5	Presentations 100 marks
09HLTH04-005-E	Deregulation of Cell Growth in Cancer	20	5	Presentations 50 marks Assignment 50 marks
09HLTH04-006-E	Structural Bioinformatics, Biophysics & Structural Biology	20	5	Exam 100 marks
09HLTH04-007-E	Tumor Immunology	20	5	Presentations 100 marks
09HLTH04-008-E	Metastasis	20	5	Presentations 100 marks
09HLTH04-009-E	Bioinformatics	20	5	Presentations 100 marks
09HLTH04-010-E	Epidemiology & Preventive Oncology	20	5	Presentations 100 marks

		Clinical trial methodology		**100**
		Human genetics & Pathological anatomy of cancer		**100**
		Cancer registries & Biological sample collection and storage		**100**
	Mandatory	Research Methodology		

Annexure - II

Core Course

Core Course **Course I: BASIC CANCER BIOLOGY – I** **[Modules 1 – 3]**			
Module 1: Cell Biology and Cancer Cell Biology			
1	Lecture 1	Hallmarks of Cancer: Overview, Biological characteristics of cancer cells	Dr. SorabDalal Dr. NeelamShirsat
2	Lecture 2	Cell organelles in normal and cancer cells: Introduction to different organelles and their biogenesis, Intracellular protein	Dr. Dibyendu Bhattacharyya
3	Lecture 3	Differentiation, Development and Cancer	Dr. SanjeevWaghmare
4	Lecture 4	Stem cells & Cancer stem cells, Embryonic stem cells, Reprogramming &pluripotency, Adult stem cells	Dr. SanjeevWaghmare
5	Lecture 5	Advanced Technology: Lecture & Demo: Microscopy	Dr. D. Bhattacharyya / Ms. VaishaliKailaje
6	Lecture 6	Advanced Technology: Lecture & Demo: Electron Microscopy	Ms. SharadaSawant
7	Lecture 7	Advanced Technology: Lecture & Demo: *In vivo* imaging (Luminescence)	Dr. Abhijit De
8	Lecture 8	Advanced Technology: Lecture & Demo: In vivo imaging (microPET-CT)	Dr. PradipChaudhari

Module 2: Cell Proliferation and Cell Death			
9	Lecture 1	Deregulation of Proliferation: Cell cycle phases, Why is a cyclin called a cyclin?, Post-translational regulation of cdks: evidence from genetics, Biochemistry and structural biology, Regulation of cellular localization of cyclins	Dr. SorabDalal
10	Lecture 2	Deregulation of Proliferation: Regulation of cyclin turnover, How do cyclin - cdk complexes recognize substrates?, Phenotypes of cyclin / cdk knockout mice: What do they teach	Dr. SorabDalal
11	Lecture 3	Mechanisms of Cell Death: History, Methods of detection, Proteins that regulate cell death, Mitochondrial pathway of apoptosis	Dr. Pritha Ray
12	Lecture 4	Apoptosis, necrosis, autophagy: Death receptor pathway, Inhibitor of apoptosis family, Caspase-independent pathways	Dr. Pritha Ray
13	Lecture 5	Cancer Cell Metabolism - Basics	Dr.SanjeevWaghmare
14	Lecture 6	Cancer Cell Metabolism – Clinical and Therapeutics	Dr. VikramGota

Module 3: Oncogenes and Tumor Suppressors			
15	Lecture 1	Oncogenes: Definition, history, types Growth factors and receptors; Cytoplasmic tyrosine kinases	Dr. Amit Dutt
16	Lecture 2	Oncogenes: Serine-threonine kinases, G-proteins, Transcription factors	Dr. RukminiGovekar
17	Lecture 3	Tumour suppressor genes: Definition, History, Knudson's hypothesis, pRB signaling pathway	Dr. TanujaTeni
18	Lecture 4	Tumour suppressor genes: p53 signaling, Other tumour suppressor genes (PTEN, p16, etc)	Dr. TanujaTeni
19	Lecture 5	Telomerase: What is a telomere and telomerase, how does telomere stability affect cellular lifespan and tumorigenesis	Dr. SorabDalal
Written Test (Modules 1-3) - 140 marks			
Home Assignments (HAs) - 150 marks		**Assignment deadline:**	

Reading material:

1.Pawley, James (2013-04-11). Handbook of Biological Confocal Microscopy (Page iii). Springer.

2. A. Yildiz, R.D. Vale, Total Internal Reflection Fluorescence Microscopy, Cold Spring HarbProtoc. 2015 vol9 pdb. top086348–11. doi:10.1101/pdb.top086348.

3. Fundamentals of Physics Resnick.

4. Molecular Biology of the Cell – Alberts.

5. Principles and Techniques of Electron Microscopy Biological Applications by M. A Hayat. 6. The Molecular Basis of Cancer by Mendelson, Gray, Howley, Israel and Thompson.

In addition to these basic text books, the instructors also provide review articles and primary research papers that are relevant to the topic being covered.

Core Course

Course II: BASIC CANCER BIOLOGY – II

[Modules 4 – 6]

Module 4: Metastasis and Angiogenesis

20	Lecture 1	Mechanisms of contact inhibition and evasion: Cell-cell adhesion, junctional complexes, Cell-ECM interaction, epithelial mesenchymal transition	Dr.UjjwalaWarawdekar
21	Lecture 2	Migration and Invasion: Cytoskeletal elements: Role in cell architecture and motility	Dr. Milind Vaidya
22	Lecture 3	Metastasis: Introduction: Metastatic cascade mechanisms involved in different steps of metastasis, Degradation of matrix, Its complex regulation, Enzyme systems involved, Ways by which it aids metastasis, Receptors and cues used for cellular	Dr. SorabDalal
23	Lecture 4	Hypoxia and angiogenesis: Angiogenesis and vasculogenesis, Tumor angiogenesis and angiogenic switch, Models to study angiogenesis	Dr. Abhijit De

Module 5: Cancer Epigenetics and Genetics			
24	Lecture 1	Epigenetics and Cancer: Overview of epigenetics, Chromatin structure, Histone variants & modification, Histones & cancer	Dr. Sanjay Gupta
25	Lecture 2	Epigenetics and Cancer: Chromatin remodeling, Chromatin and gene regulation, DNA methylation, Methodologies related to chromatin biology	Dr. Sanjay Gupta
26	Lecture 3	Inherited cancer syndromes, Genetics, Genetic predisposition to cancer, Low & high penetrance genes, Multifactorial & polygenic inheritance, Non-traditional inheritance	Dr. Rajiv Sarin
27	Lecture 4	Advanced Technology: Lecture & Demo: Proteomics	Dr. RukminiGovekar
28	Lecture 5	Advanced Technology: Lecture & Demo: Genomics (Sanger sequencing, Real time PCR; Fragment analysis, etc)	Dr. PradnyaKowtal
29	Lecture 6	Advanced Technology: Lecture & Demo: Genomics (Expression profiling, Next Gen Sequencing, Copy Number Variation Analysis)	Dr. Amit Dutt
30	Lecture 7	Demo- NGS (Gr. Fl.-109)	Dr. Rajiv Sarin / Dr. PradnyaKowtal
Presentation I (Modules 1-4) - 100 marks			

Module 6: Carcinogenesis			
31	Lecture 1	Carcinogenesis - I: Overview of carcinogenesis, Carcinogen metabolism, Activation of cellular oncogenes, Experimental carcinogenesis, Initiation, promotion and progression stages of carcinogenesis, Theories of carcinogenesis	Dr. GB Maru / Dr. Manoj Mahimkar Dr. Sanjay Gupta
32	Lecture 2	Carcinogenesis – II: Animal models for carcinogenesis, Bioassays, Carcinogenesis and biomarkers; Environmental mutagens, carcinogens, initiators, promoters	Dr. ManojMahimkar
33	Lecture 3	Human tumor viruses: Human pathogenic viruses: Salient features of selective viruses, Phagenesis and its molecular determinants, Viral latency	Dr. Abhijit De
34	Lecture 4	DNA repair pathways: Mismatch repair, Base excision repair, Nucleotide excision repair	Dr. Shilpee Dutt

35	Lecture 5	DNA repair pathways: Non homologous end joining and Double strand break repair, Genomic instability	Dr. ShilpeeDutt
Written Test (Modules 4-6) - 140 marks			
Home Assignments (HAs) - 150 marks			
Reading Material: 1. Cancer Epigenetics by Gupta S, Khade B, VermaMukesh and Verma M. 2. DNA repair and mutagenesis by Freidberg, Walter and Seide. 3, Molecular Biology of the Cell by Alberts. 4. Introduction to Genetic Analysis by Griffiths, Wessler, Lewontin, Gelbart, Suzuki, Miller. 5. Molecular Mechanisms of HPV-induced Carcinogenesis. IARC MONOGRAPHS VOLUME 90:432-463. In addition to these basic text books, the instructors also provide review articles and primary research papers that are relevant to the topic being covered.			

Core Course **Course III: TUMOUR IMMUNOLOGY, STRUCTURAL** **[Modules 7-8]** **BIOLOGY & BIOPHYSICS**			
Module 7: Tumour Immunology			
36	Lecture 1	Tumour Immunology – I : Basic Concepts in Immunology, Immune evasion strategies; Cell types participating in Tumor Immunity, Immunotherapy	Dr. Shubhada Chiplunkar
37	Lecture 2	Tumour Immunology - II: Monoclonal Antibodies: Applications in cancer diagnosis/ therapy, Vaccines, Cell-based therapies	Dr. JyotiKode
38	Lecture 3	Tumour Immunology - III: Tumor Microenvironment, Role of cytokines/ chemokines, Role of Tumor-Associated Macrophages, Role of Myeloid Derived Suppressor cells, Role of T reg cells	Dr. Rushikesh Patil
39	Lecture 4	Advanced Technology: Lecture & Demo: Flow Cytometry	Dr. Rushikesh Patil / Ms. Shamal Vetale
40	Lecture 5	Nude / SCID Mice: Origin of Nude/SCID mice, Immune scenario/Immune defects; Models for tumor development, Newer strains, Applications in cancer research	Dr. Shubhada Chiplunkar

Module 8: Structural Biology and Biophysics			
41	Lecture 1	An overview of macromolecular crystallography; Crystal to X-ray diffraction; Different protein structures from primary to quaternary structure, Structure and Function of Biological Macromolecules	Dr. Ashok Varma
42	Lecture 2	Basics of Spectroscopy (Lecture + Demo): Application in studying structure & functions of macromolecules, UV / Vis, FTIR, Raman spectroscopy & fluorescence spectroscopy	Dr. Murali Chilakapati
43	Lecture 3	Interaction between Biomolecules: Structural and biophysical principles of protein-protein, protein-nucleic acid, protein-small molecule interaction and their relevance to function	Dr. Prasanna Venkatraman
44	Lecture 4	Advanced Technology: Biophysical tools for characterizing biomolecular interactions and protein oligomerization: Technique and Application of SPR and ITC in characterizing interactions (lecture xx module); Theory and Application of DLS for characterizing protein homogeneity and oligomerization.	Dr. Prasanna Venkatraman
45	Lecture 5	Protein Folding: Forces that determine the structure; The thermodynamic and kinetic concepts of folding; Folding in intracellular milieu; Tools to study protein folding in vitro	Dr. Kakoli Bose
46	Lecture 6	Enzymes: Classes of enzymes; Active site and Catalysis; Kinetics; Concept of initial rate, Vmax, Km and kcat; Enzyme Inhibition; Different type of inhibitions; Competitive, noncompetitive allostery. Applications…	Dr. Kakoli Bose
Written Test (Modules 7-8) - 120 marks			
Home Assignments (HAs) - 100 marks			
Presentation II (Modules 5-8) - 100 marks			

Reading material:

1. ‘Tumor Immunology’ Kuby

2. ‘Cancer Immunology’ by Hans Schreiber (chapter) from Fundamentals of Immunology.

3. Proteins second edition Structures and Molecular properties Thomas E Creighton.

In addition to these basic text books, the instructors also provide review articles and primary research papers that are relevant to the topic being covered.

MEDICAL PHYSICS

Module 1:- Teletherapy – Accelerator &telecobalt – Advances

Lectures	Topic
Lecture 1	Telecobalt& Linear Accelerators
Lecture 2	Advance Techniques 3DCRT,IMRT,SRS/SRT
Lecture 3	IGRT
Lecture 4	Tomotherapy
Lecture 5	QA in Telecobalt& LINAC
Lecture 6	Different phantoms for dosimetry of advance technology

Module 2:- Brachytherapy – Advances

Lectures	Topic
Lecture 1	Intracavitary and interstitial techniques and advances
Lecture 2	3D Brachytherapy guidelines
Lecture 3	3D Brachytherapy planning various optimization methods
Lecture 4	Inverse Brachytherapy planning
Lecture 5	Quality Assurance & Quality Control

Module 3:- Dosimetry

Lectures	Topic
Lecture 1	Dosimetry of X and gamma rays beams
Lecture 2	Details of IAEA and other protocols
Lecture 3	MOSFET and other advance dosimetryequipment
Lecture 4	In- vivo dosimetry for external and brachytherapy procedures
Lecture 5	Dosimetry of special procedures

Module 4:- Clinical Perspective

Lecture	Topic
Lecture 1	Introduction to Clinical Radiotherapy and Oncology
Lecture 2	Imaging modalities and methods in Oncology
Lecture 3	Effects of radiation on normal tissues
Lecture 4	Fractionation and multimodality treatment
Lecture 5	Genetic issues
Lecture 6	IGRT in H & N cancers
Lecture 7	IGRT in Gynecological cancers
Lecture 8	IGRT in Breast and lung cancers

Module 5:- Imaging Techniques

Lecture	Topic
Lecture 1	Modern Trends in Imaging techniques
Lecture 2	Magnetic Resonance Imaging (MRI)
Lecture 3	Clinical radioisotope laboratory and its organization, Cyclotron produces radionuclides, Cyclotron produced radionuclides
Lecture 4	PET, PET-CT, SPECT, Clinical Merits, Applications, Cases

Module 6:- Treatment Planning System

Lecture	Topic
Lecture 1	Computes in treatment planning, Factors to be incorporated in computational algorithms- Hardware and software requirements
Lecture 2	Review of algorithms for photon & electron beams
Lecture 3	Beam data requirements and acquisition
Lecture 4	Commissioning and QA of TPS, Role of Networking, Import/Export
Lecture 5	Concept of forward and Inverse planning
Lecture 6	Treatment planning for 3DCRT, evaluation tools (DVH,TCP/NTCP)
Lecture 7	Treatment planning for IMRT/IGRT Review of Literature and the AAPM task Groups, IAEA TECDOCS
Lecture 8	Treatment planning for Tomotherapy

Module 7: - Statistics

Lecture	Topic
Lecture 1	Introduction to probability, statistics and frequency distribution, Chi-square test, specificity, sensitivity, +ve predictive value, -ve predictive value
Lecture 2	Probability theory, sampling theory, correlation & regression
Lecture 3	Hypothesis testing, error types, follow-up indices
Lecture 4	Cancer registry, goodness of fit, Epidemiology

Mandatory Courses without Marks

Research Methodology		
RM1	Dr. SorabDalal Dr. P. Venkatraman	The flow and structure of a paragraph - case study. Grammar, common unscientific terms used in writing, the common pitfalls seen - direct translation of words from mother tongue to English
RM2	Dr. SorabDalal Dr. P. Venkatraman	Literature review - where to get material, the quality and quantity of content. Establishing a background for a research project
RM3	Dr. SorabDalal Dr. P. Venkatraman	Laboratory notebook maintenance - Do's and don'ts, Good research practice, ethics, plagiarism
RM4	Dr. SorabDalal Dr. P. Venkatraman	The art and science behind manuscript writing and successful research proposal Ideas, their formulations, what are aims and objectives, What constitutes results and discussions
RM5	Dr. SorabDalal Dr. P. Venkatraman	The fine art of power point presentation
RM6	Dr. Abhijit De	Preparing figures for manuscripts and grants

An abstract written by the students is corrected in class. There is no examination.

Reading material:

1. The Science of Scientific Writing. George D. Gopen and Judith A. Swan American Scientist, Volume 78

2. Guidelines on style for scientific writing by Will G Hopkins PhD

Annexure – III

ELECTIVES OFFERED AT TMC:

A total of twelve electives are being offered this year (this number will keep on changing as we start adding newer electives as per the needs of various PhD topics under the PhD guideship of a vast number of Guides with varied backgrounds)

The total marks for the electives are 400.

The Elective on Statistics (100 marks) is compulsory for all.

From the remaining options, the students have to choose any two or three electives for additional 300 marks.

JRFs must finalize their choice of electives in consultation with their Ph.D. guide, before sending an email to Academics Office.

The Course Coordinator would be the nodal person responsible for conducting the course and administering the tests.

The lectures may be taken by a number of faculty members, including those from institutions other than ACTREC / TMH.

Sr. No.	Elective Topics	Coordinator/s
1	**Biostatistics** ***Compulsory***	**Dr. Rajiv Sarin& Ms. Kannan**
2	**Animal Models in Cancer Research**	**Dr. Arvind Ingle**
3	**Cancer Therapeutics**	**Dr. Rukmini Govekar**
4	**Carcinogenesis, Chemoprevention and DNA Repair**	**Dr. Girish Maru & Dr. Manoj Mahimkar**
5	**Deregulation of Cell Growth in Cancer**	**Dr. Shilpee Dutt**
6	**Structural Bioinformatics, Biophysics & Structural Biology**	**Dr. Ashok Varma& Dr. Kakoli Bose**
7	**Tumor Immunology**	**Dr. Shubhada Chiplunkar**
8	**Metastasis**	**Dr. Pritha Ray**
9	**Nutrition**	**Dr. G. Chinnaswamy**
10	**Medical Physics**	**Dr. R. Kinhikar**
11	**Clinical Research**	**Dr. R. Sarin**
12	**Epidemiology & Preventive Oncology**	**Dr. R. Dikshit / Dr. S.A. Pimple**

Elective 1: Biostatistics

Coordinators: Dr. Rajiv Sarin& Mrs. SadhanaKannan

Sr. No.	Lecturer	Topic
1	Dr. Rajiv Sarin	An overview of Biostatistics
2	Mrs. SadhanaKannan	Probability distribution (normal, Poisson, t, F, Chi-square)
3	Mrs. SadhanaKannan	Problem solving - 1
4	Mrs. SadhanaKannan	Sample size determination and justification of power estimates in a research protocol - observational studies, clinical trials (superiority, non-inferiority / equivalence), animal studies
5	Mrs. SadhanaKannan	Problem solving - 2
6	Mrs. SadhanaKannan	Hypothesis testing: analysis of categorical data
7	Mrs. SadhanaKannan	Problem solving - 3
8	Dr. Sudeep Gupta	Biostatistics pertaining to survival analysis
9	Mrs. SadhanaKannan	Hypothesis testing: analysis of continuous data - parametric & non parametric tests (t-test, ANOVA, repeated measures ANOVA, ANCOVA, correlation, regression - linear and logistic)
10	Mrs. SadhanaKannan	Problem solving - 4
11	Mrs. SadhanaKannan	Hypothesis testing: analysis of time to event (survival data - Kaplan Meier analysis, log rank test and Cox regression analysis)
12	Mrs. SadhanaKannan	Problem solving - 5
	Mrs. SadhanaKannan	EXTRA – if needed
		Exam (100 marks)

Overall 100 Marks =

50 Lecture Contact Hours + 5 hours of Field Work / Practical = 3 Credits

Elective 2: Animal Models in Cancer Research

Coordinator: Dr. A.D. Ingle

Sr. No.	Lecturer	Topic
L1	Dr. Arvind Ingle	Introduction to laboratory animals
L2	Dr. Rahul Thorat	Anatomy of the laboratory rodents from cancer research aspect
L3	Dr. Arvind Ingle	Biology of commonly used laboratory animals
L4	Dr. SanjeevWaghmare	Generation of transgenic and knock-out mice and their application in cancer research
L5	Dr. GirishMaru	Animal models for carcinogenesis and chemoprevention
L6	Dr. VikramGota	PK/PD modelling in preclinical drug development
L7	Dr. Pritha Ray	Molecular imaging overview – tools and practices
L8	Dr. Abhijit De	Preclinical modelling of cancer – functional imaging techniques
L9	Dr. PradipChaudhari	Radio-isotopic techniques in cancer research
L10	Dr. PradipChaudhari	Spontaneous canine cancer and its application in cancer research
		Exam (100 marks)

Elective 3: Cancer Therapeutics

Coordinator: Dr. R. Govekar

Sr. No.	Lecturer	Topic
L1	Dr. Sudeep Gupta	Cancer chemotherapy; past , present and future
L2	Dr. Pritha Ray	Mechanisms of chemoresistance
L3	Dr. Rajiv Sarin	Cancer Radiotherapy
L4	Dr. RukminiGovekar	Identification of novel therapeutic targets
L5	Dr. ShilpeeDutt	Mechanisms of radioresistance
L6	Dr. Kumar Prabhash	Targeted therapy: clinical experience
L7	Dr. Ashok Varma	in silico tools for drug designing
L8	Dr. JyotiKode	Anticancer drug screening- in vitro and in vivo
L9	Dr. VikramGota	Drug development
L10	Dr. Abhijit De	Nanotherapeutics, theragnostics, cell therapeutic
L11	Dr. NeelamShirsat	Gene therapy and RNAi technology
L12	Dr. S.V. Chiplunkar	Cancer Immunotherapy
P	Presentations-1	
	Presentations-2	
	Presentations-3	
	Presentations-4	

Presentations (100 Marks)

Elective 4: Carcinogenesis, Chemoprevention and DNA Repair (100 marks)

Course Coordinators: Dr. Girish Maru& Dr. Manoj Mahimkar

Sr. No.	Lecturer	Topic
1	Dr. Girish Maru	Carcinogenesis overview and concepts of initiation, promotion and progression, Chemical carcinogenesis
2	Dr. Girish Maru	Biomarkers of carcinogen exposure, biologically effective dose. Markers of early response, late effects and disease
3	Dr. Manoj Mahimkar	Biomarkers of carcinogen exposure, biologically effective dose. Markers of early response, late effects and disease
4	Dr. Manoj Mahimkar	Short term and long term assays; Model test systems for detection of environmental mutagens/ carcinogens/ initiators/ promoters
5	Dr. Manoj Mahimkar	Short term and long term assays; Model test systems for detection of environmental mutagens/ carcinogens/ initiators/ promoters
6	Dr. Manoj Mahimkar	Role of DNA damage and repair in carcinogenesis
7	Dr. Sanjay Gupta	Epigenetics and Carcinogenesis
8	Dr. Abhijit De	Viral carcinogenesis with major focus on HPV
9	Dr. Girish Maru	Chemoprevention: Why chemoprevention, what is chemoprevention, Environmental chemopreventive agents
10	Dr. Girish Maru	Chemoprevention: Why chemoprevention, what is chemoprevention, Environmental chemopreventive agents
P	Presentations-1	
	Presentations-2	
	Presentations-3	
	Presentations-4	

Presentations (100 marks)

Electives 5: Deregulation of Cell Growth in Cancer

Coordinators: Dr. Shilpee Dutt

Sr. No.	Lecturer	Topic
L 1	Dr. S. Dalal	Orientation and Rb family of proteins in regulation of cell growth
L 2	Dr. A. Dutt	Role of Ras family in regulating cell growth
L 3	Dr. N. Shirsat	Role of the P13K-AKT-mTOR pathway in cancer
L 4	Dr. A. Dutt	Myc and tumor progression
L 5	Dr. S. Dalal	Cell cycle checkpoints and cancer
L 6	Dr. S. Dutt	The p53 family: regulation of cell growth and cell death
L 7	Dr. S. Dutt	Senescence and cancer
L8	Dr. N. Shirsat	Wnt signaling and cancer
P	Presentations-1	On Lecture 1 & 2
	Presentations-2	On Lecture 3 & 4
	Presentations-3	On Lecture 5 & 6
	Presentations-4	On Lecture 7 & 8
A	**Will be informed in the class**	**Assignment deadline**
Presentations (50 marks) & Home Assignments (50 marks)		

Electives 6: Structural Bioinformatics, Biophysics & Structural Biology

Coordinators: Dr. Ashok Varma& Dr. Kakoli Bose

Venue: Seminar Room (3rd Fl. KS-331B) Time: Lecture -10 am& Presentations - 10 am

Sr. No.	Lecturer	Topic
L1	Dr. Kakoli Bose	Spectroscopic techniques Absorption spectroscopy; Fluorescence spectroscopy: Basic and various applications (quenching, FRET, etc.)
L2	Dr. Murali Krishna Chilakapati	Spectroscopic techniques Raman spectroscopy
L3	Dr. Prasanna Venkatraman	Biophysical methods: Protein conformation, interactions and oligomeric properties
L4	Dr. MV Hosur	X-ray crystallography
L5	Dr. Ashok Varma	X-ray crystallography (Hands-on)
L6	Dr. Kakoli Bose	NMR spectroscopy -- 1
L7	Dr. Kakoli Bose	NMR spectroscopy -- 2
L8	Dr. M.S. Madhusudhan (IISER, Pune)	Structural Bioinformatics Molecular Modeling (homology, threading, ab initio); Small molecule/ peptide design; MDS: Different tools available for these insilico studies
L9	Mr. Nikhil Gadewal	Molecular Docking (protein-protein, protein-ligand/ small molecules)
L10	Ms. Alpana Gupte Bastikar, Elphinstone College	Drug Designing - challenges, in-silico drug design – advantages - steps and tools (QSAR, 3D-QSAR etc); Application - How drug design-ning leads to clinical trial - with examples.
L11	Mr. Nikhil Gadewal	Hands-on-session on Bioinformatics
100 Marks (Exam)		
Bioinformatics MCQ: 20 marks, Bioinformatics hands-on: 10 marks, other subjects: 10 marks each (MCQ, subjective and problems)		

Elective 7 - TUMOR IMMUNOLOGY Co-coordinator - Dr. Shubhada Chiplunkar(5 lectures, 100 marks - Presentations)		
Sr. No.	**Topic of Lecture**	**Faculty**
1	Immune cells & their role in tumor immunity	Dr. Shubhada Chiplunkar
2	Tumor Antigens and anti-tumor effector functions of immune cells	Dr. JyotiKode
3	Immunosuppressive networks in cancer	Dr. Rushikesh Patil
4	Cancer Immunotherapy	Dr. Shubhada Chiplunkar
5	Cellular and molecular techniques for studying tumor immunity	Dr. JyotiKode
	Presentations	On all lectures
Presentations - 100 marks		

Electives 8: Metastasis Coordinator: Dr. Pritha Ray		
Sr. No.	**Lecturer**	**Topic**
L1	Dr. Sorab Dalal	Molecular basis of detachment & migration of Cancer Cell Regulation of cell-cell adhesion, Regulation of cell-matrix adhesion, Regulation of cytoskeletal dynamics and how they affect migration
L2	Dr. Sorab Dalal	Molecular basis of invasion & intravasation Formation of invadopodia, Dissolution of cell matrix, Migration through narrow spaces
L3	Dr. Pritha Ray	Molecular basis of survival in bloodstream, arrest & extravasion Haematogenous & Lymphatic spread of metastatic tumor cells, Survival in intravascular environment, Extravasation & MET
L4	Dr. Manoj Mahimkar	Molecular basis of metastatic colonization Seed & soli hypothesis, Effect of microenvironment
L5	Dr. Sonam Mehrotra	EMT, Anoikis& MET during metastasis EMT-MET in phenotypic plasticity, Mechanisms that link

		oncogenic EMT and suppression of anoikis, How EMT programs may lead to anoikis resistance, The role of cell polarity in anoikis, Insights in to the role of Hippo, Wnt and TGF-b signalling in EMT and anoikis
L6	Dr. Sonam Mehrotra	Role of Hippo, Notch and Wnt signaling Cross talk between signalling pathways in cancer metastasis, Therapeutic potential of Hippo signalling and other signalling pathways in cancer
L7	Dr. Pritha Ray	CSCs, CTCs in metastasis Role of Cancer stem cell in metastatic spreading, Circulating tumor cells and their relation to metastatic progression
L8	Dr. Syed Hasan	Targeted therapy in metastasis Biological effects of the fusion proteins and genetic alterations in cancer metastasis, Molecular basis of the targeted therapy, Clinical applications
L9	Dr. Shubhada Chiplunkar	Immunotherapy Immune system in cancer metastasis, Tumor microenvironment in metastasis, Immunotherapy for metastasis
L10	Dr. Abhijit De	Models of metastasis & Imaging metastasis Challenges in in vivo metastasis experiments, In vivo metastatic models – chemically induced, transplantable and genetically modified model, Applications of imaging guidance in monitoring and quantitation of metastatic loads
P	Presentations -	On Lecture 1 & 2 On Lecture 3 & 4 On Lecture 5 & 6 On Lecture 7&8 On Lecture 9 & 10
Presentations 100 marks		

ELECTIVE 9: Bioinformatics

a. DNA data resources (EMBL, Gen Bank, DDBJ), Genome Browsers (UCSC, Ensembl, NCBI)
b. Data and sequence alignment, Protein scoring systems (PAM, BLOSUM), Phylogenetic trees
c. Transcriptomics (RNA and small RNA): study design, sample size, platform selection, analytical methods, tertiary analysis, pathways and network analysis
d. Whole genome and targeted sequencing: study design, sample size, platform selection, analytical methods, tertiary analysis, pathways and network analysis
e. Omics based techniques: introduction to – NGS, sequenome mass array, reverse phase protein array, circulating tumour cell isolation, single cell omics
f. Epigenomics: study design, sample size, analytical methods, tertiary analysis

ELECTIVE 10: Molecular epidemiology

a. Markers of exposure (chemical metabolite, biological agents, diet, DNA adduct)
b. Marker of effect (gene mutation, epigenetic alteration, cytogenetic abnormalities)
c. Markers of susceptibility (high penetrance gene, genetic polymorphism, DNA repair)
d. Brief description laboratory methods in molecular epidemiology
e. Outline of analysis for quality of molecular epidemiology data

ELECTIVE –11: Human genetics & Pathological anatomy of cancer

a. Mendelian genetic
b. Chromosome structure and function
c. Chromatin structure and function
d. Pathology-1 (Classification of neoplasm)
e. Pathology-2 (Carcinomas)
f. Pathology-3 (Sarcomas)
g. Pathology- 4 (Lymphoma)
h. Pathology- 5 (Leukemia)
i. Diagnostic tests for cancer

ELECTIVE – 12: Cancer registries & Biological sample collection and storage

a. Types of registries and their operation
b. Analysis of registry data
c. Methods of follow- up
d. Visit to PBCR, Mumbai
e. Storage and collection of biological samples in large scale studies
f. Pre- analytical methods to assess the quality
g. Quality assurance for collected samples
h. Use of advanced instruments – 1
i. Use of advanced instruments – 2

Elective 13: Pediatric Onco Nutrition

Content	Contact Hours	Credit Points
Onco Nutrition- Introduction, Concepts and Principles i. Assessment of various types of cancers through case study. (2) ii. Types of treatment – chemo, radiation and surgery along with drugs (2) iii. Nutritional assessment methods- Use of algorithms and TMH approach (2) iv. Energy and protein requirements for various types of cancer (2) v. Nutritional complications in cancer (4) vi. Review diets for Survivors of childhood cancer (1)	**50 + 5**	**3**
Medical Nutrition Therapy – Assessment and Dietary Principles i. Nutrigenomics & Nutrigenetics / immunomodulators (2) ii. Dietary guidelines in cancer patients including neutropenic diet (2) iii. Management of severe acute malnutrition (2) iv. Dietary assessment & estimation of protein & energy needs in children (2) v. Nutritional Risk assessment (2) vi. Enteral nutrition in children (2) vii. Parenteral nutrition in children (1)	**50 + 5**	**3**

Pediatric Onco Nutrition – Concepts and Principles i. Assessment of various types of cases through case study (2) ii. Types of treatment – chemo, radiation and surgery along with drugs (2) iii. Nutritional assessment methods – Use of algorithms and TMH approach (2) iv. Plan diets according to energy and protein requirements for various types of cancer (10) v. Plan diets for various nutritional complications in cancer (10) vi. Review and plan diets for Survivors of childhood cancer (4)	**50 + 5**	**3**
Medical Nutrition Therapy – Allied Services i. Diet Counselling (5) ii. Enteral nutrition in children- Practical aspects (Indications, algorithms for choice/access sites monitoring), RT feedingetc, Micronutrientsupplementation (5) iii. Parenteral nutrition in Children-Practical aspects (Indications, algorithms for choice. Access sites monitoring, nutrients- drug interaction) (5) iv. Psychosocial aspects of Nutrition in children with cancer families (4) v. Speech Therapy, occupational psychologists counselling (4) vi. Management of side reactions (4) vii. Keeping track of prognosis (3)	**50 + 5**	**3**

Mandatory Electives without Marks: Safety in Health Science Research

1. **Cyber Safety and Security (2 Lectures)**
2. **Fire Safety (2 Lectures twice in a year)**
3. **Radiation Safety (12 Lectures)**

ELECTIVE: RESEARCH METHODOLOGY – I

I. Basic tools of research

a. The flow and structure of a paragraph case study. Grammar common unscientific terms used in writing, the common pitfalls seen, direct translation of words from mother tongue to English
b. Literature review – where to get material, the quality and quantity of content. Establishing a background for a research project
c. Laboratory notebook maintenance – Do' s and Don'ts, Good research practice, ethics, plagiarism
d. The art and science behind manuscript writing and successful research proposal
e. The fine art of power point presentation

ELECTIVE: RESEARCH METHODOLOGY – II

Basic Epidemiology

a. Basic concept in epidemiology, study designs, Sample size determination, Descriptive studies, Interventional trials
b. Cohort studies, case- control studies
c. Bias and confounding, Interaction, Exposure assessment
d. Epidemiological field work in population based studies
e. Interpretation of epidemiological studies, Sample size determination
f. Principles of data analysis

ELECTIVE: RESEARCH METHODOLOGY – III

Clinical trial methodology introduction to evidence based medicine

a. Study designs in clinical trials, Study objectives and endpoints
b. Sample size determination, likelihood ratio
c. Study population, Baseline assessment, Randomization, Blinding
d. Follow –up, Counting events
e. Non- inferiority trials, Cross- over trials, Meta- analysis, Systematic reviews
f. Data Monitoring, Stopping rules
g. Ethical issues in clinical trials

ELECTIVE: RESEARCH METHODOLOGY – IV

Tumor Immunology & Stem Cell Biology

a. Differentiation, Development and Cancer
b. Stem cells & Cancer stem cells, Embryonic Stem cells, reprogramming &pluripotency, Adult stem cells
c. Tumour Immunology – I: Basic Concepts in immunology, immune evasion strategies, cell types participating in tumour immunity, immunotherapy
d. Tumour Immunology – II: Monoclonal Antibodies: Applications in cancer diagnosis / therapy, Vaccines, cell-based therapies
e. Tumour Immunology – II: Tumour microenvironment, Role of cytokines/ chemokines, role of tumour associated macrophages, role of myeloid derived suppressor cells, role of T-reg cells
f. Nude/ SCID mice: origin of nude /SCID mice, immune scenario/ immune defects; Models for tumour development, newer Strains, Applications in cancer research

Cancer Biology: Elective Courses

Sr. No.	Subject	Marks	Hours (Hrs)
1	Biostatistics	100	200 Hrs
2	Cancer Therapeutics	100	
3	Carcinogenesis, Chemoprevention and DNA repair	100	
4	Metastasis	100	

1	Biostatistics	100	200 Hrs
2	Animal models in cancer research	100	
3	Cancer Therapeutics	100	
4	Carcinogenesis, Chemoprevention and DNA repair	100	

1	Biostatistics	100	200 Hrs
2	Animal models in cancer research	100	
3	Cancer Therapeutics	100	
4	Deregulation of Cell Growth in Cancer	100	
5	Molecular biology of gene		

ANY 3 - TOTAL 300 MARKS

1	Bioinformatics	100	
2	Basic tools of research	100	
3	Tumour Immunology & Stem Cell biology	100	
4	Basic Epidemiology	100	
5	Molecular Epidemiology	100	
6	Clinical trial methodology	100	
7	Human genetics & Pathological anatomy of cancer	100	
8	Cancer registries & Biological sample collection and storage	100	

Pediatric Onco nutrition: Elective courses

Sr. No.	Subject	Marks	Hours (Hrs)
1	Biostatistics (Written Test)	100	200 Hrs
2	Cancer Therapeutics	100	
3	Carcinogenesis, Chemoprevention and DNA repair (Presentation)	100	
4	Deregulation of Cell Growth in Cancer (Assignment & Presentation)	100	

Mandatory (Research Methodology)

Research Methodology	No. of Lectures	Marks
Lectures	6 Lectures	No marks
Laboratory work	All through the year	200 marks = 100 hrs = 6 credits
Scientific writing	Assessed at final seminar	100 marks = 50 hrs = 3 credits

- **Course work duration : 3 trimesters**
- **No. of core courses to be taken: 4 Nos.**
- **Minimum No. of elective courses to be taken: 4 Nos. from a total of 7 available elective courses**
- **Research project assignment to be taken: 2 nos.**

Clinical Research: Elective Courses

Sr. No.	Subject	Marks	Hours (Hrs)
1	Oncology health care systems and optimal resource utilization	100	200 Hrs
2	Oncogenetic counseling & risk management	100	
3	Genetic testing & its interpretation	100	
4	Applied Biostatistics	100	

Medical Physics: Elective Courses

Any 2 _ 20 Lectures / 40 academics hrs/200 marks **20 Lectures / 100 academics hrs/200 marks**			
Sr. No.	**Subject**	**Marks**	**Hours (Hrs)**
1	3DCRT Planning & Image Fusion	100	100 Hrs
2	IMRT Commissioning / Planning	100	
3	IGRT Commissioning / Planning	100	
4	3D Brachy Planning	100	
5	QA Lin. Accelerator & Brachytherapy	100	

TATA MEMORIAL CENTRE

Ph.D Course in Health Sciences

MARKSHEET

Academic Year: 2018 - 2019

Program Name: Ph.D. Discipline: Health Sciences

Student Name: Enrolment No.: HLTH

Core Course (Total 1000 marks)	Maximum Marks	Marks Obtained
I . Cell Biology and Cancer Cell Biology	250	
II. Molecular Biology and Epigenetics	250	
III.Tumour Immunology, Stem Cell Biology and Macromolecular Biophysics	200	
Presentation - I	100	
Presentation - II	100	
Advanced Technology	100	
Sub Total	**1000**	
Electives (totaling 400 marks) (Any 4)	**Maximum Marks**	**Marks Obtained**
Biostatistics	100	
Animal Models in Cancer Research	100	
Cancer Therapeutics	100	
Carcinogenesis, Chemoprevention and DNA Repair	100	
Deregulation of Cell Growth in Cancer	200	
Structural Bioinformatics, Biophysics and Structural Biology	100	
Tumour Immunology	100	
Sub Total	**400**	
Seminar	**200**	
Research Methodology	**300**	
General Comprehensive Exam	**100**	
Total Marks: / 2000 (%)	**Pass / Fail**

Ph.D. PROGRAMME (Health Sciences)

PROGRESS REVIEW[1] REPORT

1. **Name of the Student:**
2. **Name of the Constituent Institution: Tata Memorial Centre-ACTREC**
3. **Enrolment No. and Date of Enrolment:**
4. **Title of the Thesis:**
5. **OGCE:** Held on / yet to be held
6. **Review Period and Date of Meeting:**

1. Report of Doctoral Committee

2. Recommendations

Grade : Excellent/Very Good/Good/Satisfactory/Poor

Recommendation for continuation: Yes/No

Likely year of finishing the programme(in case recommended to Continue):

3. Future Guidelines

[1] To be conducted only after a student has submitted a brief progress report to doctoral committee explaining progress made during the period in research, papers published, completed courses with marks obtained (taught courses, self-study courses, credit seminars) with appropriate certification thereof, pending courses and work planned in next year. Report from the student should be attached to the progress review report.

4. **Next[2] Progress Report due on:**

5. **Doctoral Committee:**

Sr. No.	Name	Designation	Signature	Date
1.		Chairman		
2.		Guide &Convener		
3.		Co-guide (if any) Member		
4.		Member		
5.		Member		
6.		Member		
7.		Technology Adviser

Dean, HBNI

[2] One progress report per year is mandatory. Doctoral committee can ask more frequent progress reports.

C.C. All monitoring committee members and Reporting Student

TATA MEMORIAL CENTRE

REPORT OF THE FIRST DOCTORAL COMMITTEE MEETING OF

____

Mr./Ms................................

FOR REGISTRATION TO HBNI FOR THE Ph.D. DEGREE (Health Sciences)

Doctoral Committee of Mr./ Ms. ________________________________, Ph.D. student with Research Guide, Dr. ________________________________ was held on _______________ at ______ ____________________________, The committee comprised of the following members:

1. Dr. _______________________ (Chairperson)
2. Dr. _______________________ (Guide)
3. Dr. _______________________ (Member)
4. Dr. _______________________ (Member)
5. Dr. _______________________ (Member)
6. Dr. _______________________ (Invitee)
7. Dr. _______________________ (Advisor)

The committee questioned the candidate on his / her project entitled '____________________ ____'. They are of the opinion that:

1. The candidate is suitable for conducting research
2. He / She has the adequate knowledge base to pursue research

Based on his / her performance the committee recommends _____ **/100** marks as an evaluation parameter. He / She may **thus proceed with the project work for Ph.D. degree of the HBNI**. His / Her fellowship may be continued for the second year.

____________ ____________ ____________ ____________

Dr. XYZ, Chairperson Dr. ABC, Guide Dr. EFG, Member Dr. EFG, Member

Ph.D. PROGRAMME (Health Sciences)

ORAL GENERAL COMPREHENSIVE EXAMINATION REPORT (OGCE)

3. **Name of the Student:**

4. **Name of the Constituent Institution: TMC-ACTREC**

3. **Enrolment No.:**

4. **Board of Studies: Life Sciences**

The Oral General Comprehensive Examination of Shri/Ms.______________________ was conducted on __________. The monitoring/doctoral committee is fully satisfied with his/ her performance and permits him/ her to continue with his/ her Ph.D. Programme.

The student has studied research methodology theory and on examination was found to be proficient in research methodology as applicable to his/her field of study. He / She fulfills the criterion 4 and criterion 6 of UGC 11 point criteria.

Doctoral Committee:

Sr. No.	Doctoral Committee	Name	Signature	Date
1.	Chairman			
2.	Guide/Convener			
3.	Co-Guide (if any)			
4.	Member-1			
5.	Member-2			
6.	Member-3			
7.	Technology Advisor (if any)

Assessment Report of Doctoral Committee (Ph.D. Health Sciences)

For Upgradation To SRF

Name of Ph.D. student : Shri. / Ms………………………..

Enrollment Number : …………………………………..

Date of Open DC Meeting : …………………………………..

Venue : ………………………………….

The committee members were satisfied with the work done and presented by Shri/Ms………….. and Doctoral Committee recommends her/him to be upgraded from JRF to SRF and that he/she can continue the fellowship for the next year.

RCOMMENDATION :(strike out whichever is not admissible)

1. Shri/Ms ___________________________ may be upgraded as SRF and his/her Stipend per month may be raised as per rules.
2. Shri/ Ms __________________________ may be allowed to continue for third year on the existing rate of stipend.

DOCTORAL COMMITTEE:

BHABHA ATOMIC RESEARCH CENTRE

SYLLABUS

Orientaion Course for Engineering Graduates and Science Post Graduates (OCES)

INTEGRATED Ph.D.(DOUBLE DEGREE) ENGINEERING SCIENCES (PROGRAM CODE: ENGG05)

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as "Radiological Safety Engineering' course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

1	Artificial Intelligence & Applications	EN703	30	4	100
2	Digital Signal Processing & Image Processing	EN706	30	4	125
3	Embedded Electronics Software	EN707	25	2	100
4	Image Processing & Machine Vision	EN710	30	4	125
5	Signal Conditioning, Recovery and EMI Aspects	EN719	25	2	100
6	Software Engineering	EN720	25	2	100
	ELECTIVES TOTAL (APPROX)		**90**	**6-12**	**350**

	THEORY TOTAL	**530**	**60-66**	**2125**

NON-SUBJECT ASSIGNMENTS

S.No.	Subject Title	Course Code	Credits	Marks
1	VivaVoce–I & VivaVoce-II	EN591	2	200
2	Practicals	EN592	1	100
3	MiniProject	EN593	9	300
		TOTAL	**12**	**600**

M.TECH. THESIS WORK (SECOND YEAR)

1	Thesis Work	Dissertation	**32**

Total Contact Hrs: 530; Total Credits: 104-110; Total Marks: 2725

Note: Credit Requirement for M.Tech: 92 (60+32)
Credit Requirement for Non Trg Sch M.Sc.(Engg): 60 (through course work and two viva)

COURSE STRUCTURE - INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING (FOUNDATION COURSES)

S.No.	Subject Title	Course Code	Hours	Credits	Marks
1	Accelerator Physics and Technology	EN501	40	4	150
2	Engineering Mathematics	EN502-505	30	4	125
3	Health Physics and Rad & Indl Safety	EN506	20	2	75
4	Material Science in Nuclear Engineering (EE)	EN508	20	2	75
5	Nuclear Fuel Cycle Technology	EN509	35	4	150
6	NPP & Advanced Reactor Concepts	EN510	40	4	150
7	Reactor Physics and Engineering	EN501	55	6	225
	FOUNDATION TOTAL		**240**	**26**	**950**

CORE ENGINEERING (INSTRUMENTATION)

S.No.	Subject Title	Course Code	Hours	Credits	Marks
1	Applied Process Instrumentation	EN607	40	4	150
2	Computer Based System Design I	EN612	25	2	100
3	Modern Control Systems Design and Simulation	EN625	35	4	150
4	Reactor C&I and Human Machine Interface	EN636	40	4	150
5	Reactor Control Engineering and Instrumentation	EN637-8	35	4	150
6	Reliability Engineering	EN639	20	2	75
	CORE TOTAL		EN639	**20**	**775**

ELECTIVES (INSTRUMENTATION) Any 3 Courses-- 9 Credits

S.No.	Subject Title	Course Code	Hours	Credits	Marks
1	Artificial Intelligence & Applications	EN703	30	4	125
2	Computer Based System Design II	EN706	25	2	100
3	Digital Signal Processing & Image Processing	EN707	30	4	125
4	Image Processing & Machine Vision	EN710	30	4	125
5	Signal Conditioning, Recovery and EMI Aspects	EN719	25	2	100
6	Software Engineering	EN720	25	2	100
	ELECTIVES TOTAL (APPROX)		**90**	**8-12**	**350**

	THEORY TOTAL	**525**	**54-58**	**2075**

NON-SUBJECT ASSIGNMENTS

S.No.	Subject Title	Course Code	Credits	Marks
1	VivaVoce–I & VivaVoce-II	EN591	2	200
2	Practicals	EN592	1	100
3	MiniProject	EN593	9	300
	TOTAL		**12**	**600**

M.TECH. THESIS WORK (SECOND YEAR)

1	Thesis Work	Dissertation	**32**

Total Contact Hrs: 525; Total Credits: 98-102; Total Marks: 2675

Note: Credit Requirement for M.Tech: 92 (60+32)
Credit Requirement for Non Trg Sch M.Sc.(Engg): 60 (through course work and two viva)

Total Contact Hrs: 530; Total Credits: 98-104; Total Marks: 2725

Note: Credit Requirement for M.Tech: 92 (60+32)

Credit Requirement for Non Trg Sch M.Sc.(Engg): 60 (through course work and two viva)

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

12. The Principles of Circular Accelerators and Storage Rings - Philip Byrant.
13. Introduction to Vacuum Technology-Compiled by K.G. Bhushan, BARC

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 503: Engineering Maths-II (20) (ME Group)

- Introduction to discretization methods and approximate solution of differential equations (FDM, FEM and FVM), Finite Difference Approximations in 1-D, Solution of steady and unsteady heat conduction equations, wave equation
- Formulation of the matrix methods by equilibrium concepts (1D-heat conduction, 2D-truss and 1D-hydraulic flow examples).
- Approximate solution of differential equations – Weighted residual method, collocation, least squares and Galerkin's methods, Piecewise approximations. Basis of Finite Element Method, energy principles in structural mechanics and principles of minimum potential energy, assembly concept.
- Solution of steady and unsteady heat conduction equations with finite element method, Implicit and explicit methods.
- Finite element formulations of convection dominated problems using classical Galerkin methodology and need for alternate trial functions and upwinding.
- Finite element formulation for laminar and turbulent flows.
- Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
- Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
- Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
- Response Surface Method 2K+1, factorial design, 3k factorial design
- Monte Carlo Method
- Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.
- Artificial Intelligence and Genetic Algorithm
- Artificial Neural Network
- Gram-Schmidtt Orthogonalization
- Transformation of matrix

EN 504:Engineering Maths-II (20) (MT)

Applications in Materials Science:

- Use of matrix in crystallography. Stereographic analysis, lattice correspondence, orientational relationship, applications to twinning and martensitic. transformations,
- Tensor analysis in phase transformation and deformation studies
- Analysis of diffusion data, Solutions of diffusion equations - error function and Eigen value analysis, Polynomial fitting of diffusion profiles.

Application in thermodynamics of metallurgical systems:

- Temperature dependence of thermodynamic quantities, graphical and analytical integration of Gibbs-Duhem equation. Introduction to database for thermodynamic tables
- Analysis and synthesis of phase diagrams, introduction to first principles calculations of phase diagrams with computer demonstration, cluster variation and Monte Carlo methods

EN 505: Engineering Maths-II (20)(EE Group)

- Transforms: Laplace & solution to ODE, Bilinear & Z transforms, Discrete cosine transforms & compression, Entropy & Haufman coding for compression
- Solution of Matrix Differential Equation: Existence & uniqueness of solutions, Solution of Non-Linear continuous time state equation, Solution of Linear time varying continuous time state equation, Solution of linear time invariant continuous time state equations
- Basic Procedure for Designing Conservational Logic: Quine McCluskey method, Iterative consensus method, Design example
- Design of Sequential Circuit Using Sequential Machine Flow Chart: Sequential machine flow chart, Reading reduced dimension maps, Output function synthesis, Next state function synthesis, State assignment & design examples
- Counting Statistics and Error Prediction: Statistical models -Binomial, Poisson and Gaussian distributions, Application of statistical models: Error propagation, Optimization of counting experiments, Limits of detectability, Distribution of time intervals

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods**,** liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

2. Strosal and Vapet, "Power Plant Engineering & Economics".
3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
  - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
  - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
  - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons

- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction

- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process

- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors

- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics

- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up

- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons

- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients

- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)

- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.

- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)

- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)

- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN602: Advanced Electrical Engineering Design-I (20)

- Materials: Soft Magnetic Materials and their properties and applications, Permanent Magnetic Materials and their properties and applications, Super conducting Materials and their properties and applications. (5)
- Special Electrical Machines and their applications: Servo motors, their design and application in control rod mechanisms, Hysteresis motors, Switched Reluctance motors, Canned motors, High speed motors (5)
- Control Machines: Conventional control, Vector control (5)
- Special Techniques of Magnetic Circuit Design: Finite Difference Methods, Finite Element Methods, Their applications, design of machines and Transformer, chokes and other Electromechanical Equipment.
- NDT Methods: MFL Technique, Eddy current Technique, Remote Field eddy current Methods. (5)

References:

(Reference materials will be provided during the course)

EN603: Advanced Electronics Circuit Design Techniques (30)

- Silicon Processing: Various steps involved in fabrication of Silicon devices (2)
- Semiconductor Detectors: Theory, design, fabrication and applications (2)
- Micro-Electro-Mechanical Systems (MEMS): Theory, design, fabrication and applications (2)
- Programmable Logic Devices: PLD, CPLD and FPGA, Technology architecture (4)
- Hardware Description Languages: VHDL – language details (6)
- Digital Circuit Design using VHDL: Design methodology and optimization, Design of a multiplexer, counter, finite state machine etc., test bench (4)
- RF Electronics: RF system for particle accelerator (1)
- RF System Components: Transmission lines, waveguides, circulators, resonators, power couplers (3)
- RF Power Amplifiers: Theory, design (2)
- RF Signal Processing: Low level RF controls, beam diagnostics, measurement and protection (4)

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:

- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:

- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design

- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology

- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra

- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics

- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures

- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations

- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)
- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):
- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):
- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff’s law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi’s model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow’s correlation) and flow boiling (Chen’s correlation)
- Condensation heat transfer: Nusselt’s theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

EN 612: Computer Based System Design- I (25)

Hardware Design

- Overview of microprocessors and peripherals: 8086, 68000, Digital Signal Processor (TMS320) DMA controller, serial communication controller and timer/counter.
- Personal computer architecture, memory organization, industrial PC
- Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications
- Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL)
- Case Study: Design of a single board computer with shared memory interface, I/O board design using ADC, DAC etc with emphasis on signal conditioning and isolation
- System design concepts: Fault tolerance, hot standby, live insertion, triple modular redundancy and safety issues

EN 613: Computer Graphics and Visualization (35)

- Introduction overview, Graphics software/hardware and types of graphics applications (1)
- 2D/3D Geometric Transformations, Affined transformations-Translation, Rotation, Scaling, Shear and reflection. (3)
- Homogeneous coordinates, composite transformations, rotation with qutenion, current transformations and matrix stacks. (3)
- Two dimensional viewing 2D viewing – window, viewport, viewport transformations, clipping operations, line clipping algorithms – Cohen-Sutherland, Liang-Barsky, polygon clippimg algorithm – Sutherland-Hodgman. (4)
- Three dimensional graphics – Planer geometric projections – parallel and perspective, Mathematics for projections, classical three-dimensional viewing, specifying views, viewing transformations, 3D clipping operations. (4)
- Hidden surface removal, object space and image space approach, back face culling, z-buffer algorithm, LOD.(2)
- Illumination and shading – Basic illumination models, light sources, material properties, polygon shading methods – flat, gouraud and phong shading, ray tracing methods. (2)
- Color - Color perception, color models – RGB,CMY,HSV (1)
- Visual Realism – Depth cuing, texture mapping, transparency, shadow, steropsis. (2)
- Curves and surfaces – Representation of curves and surfaces, Algebric and geometric form, Blending functions, interpolation, Hermite, Bezier, B-spline curves and surfaces, Rational polynomials, NURBS (5)
- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

EN 615: Corrosion (15)

- Definition and importance of corrosion, corrosion principles; thermodynamic and electrochemical aspects; electrode potentials; polarization and corrosion rates; passivity, mixed potential theory, environmental effects: Dissolved Oxygen, temperature, pH, Velocity bacteria, dissolved salts and metallurgical variables, composition and heat treatment. (3 Lectures)
- Forms of corrosion: uniform attack; corrosion rate measurements, Galvanic corrosion, pitting and crevice corrosion; selective leaching; erosion corrosion; intergranular corrosion, low temperature sensitization, corrosion of weldments; stress corrosion cracking (SCC), irradiation assisted SCC; hydrogen embrittlement, hydrogen attack, corrosion fatigue; oxidation; microbiological induced corrosion (MIC), Corrosion testing procedures, failure analysis, specification tests, advanced methods for on-line corrosion monitoring. (7 Lectures)
- General principles of corrosion control – anodic and cathodic protection, inhibitors and passivators, corrosion protection by alloying, surface treatment and surface modification. (1 Lecture)
- Corrosion in the nuclear industry – Corrosion in nuclear fuel reprocessing, waste management and heavy water plants. corrosion in fluoride and ammonia containing environments; liquid metal corrosion. low alloy steels, stainless steels and Ni and Cu base alloys, protective magnetite formation on carbon steel, stress corrosion cracking of stainless steels and nickel base alloys. high temperature oxidation and hydriding of zirconium alloys, materials for fast breeder reactor system. Effects of radiation on corrosion (4 Lectures).

EN 616: Distributed Computing (45)

Advanced Computer Architecture

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

  c. Approaches for improving interconnect performance
  d. Case studies – Ethernet, Infiniband, SCI

- Cache
  a. Associative, Direct mapped
  b. Write through, Write back
  c. MESI
  d. Shared caches
- Advances in storage systems
  a. Direct attached storage, Network attached storage, Storage Area Networks
  b. File level and block level accesses
  c. Storage protocols
  d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
  e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing
  a. Need for HPC
  b. Applications of HPC
  c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)
- Pipelining, Vector processing, SIMD
  a. Pipeline, Speedup and Efficiency of pipeline
  b. Pipeline stalls, out of order execution
  c. Techniques to improve pipeline efficiency
  d. Superscalar, Superpipelined, VLIW, EPIC architecture
  e. Vector processors, vector instruction sets, registers
- MIMD Architecture
  a. Classification of MIMD machines
  b. UMA, NUMA, CC-NUMA, COMA, NORMA
- Interconnection networks and topologies
  a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
  b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.
- Current Parallel Architectures
  a. Parallel Vector processor
  b. Symmetric Multiprocessors
  c. CC-NUMA
  d. Massively Parallel Computers
  e. Clusters of workstations
- Clusters
  a. Classification of clusters
  b. Cluster software
  c. File systems for clusters
- Software concepts of High Performance Computing
  a. Parallelism – Algorithmic, Geometric, Event, Data
  b. Granularity – Coarse and Fine grains
  c. Speedup, Efficiency, Amdahl's and Gustaffson's Laws
- Parallel Programming Models
  a. Shared Variable Model
  b. Message Passing Model
  c. Threads Model
  d. Data parallel Model
- Design of parallel algorithms
  a. Data dependencies
  b. Data partitioning
  c. Communication patterns
  d. Synchronization
  e. Load balancing
- Parallel Programming Environments
  a. Parallel Languages
  b. Parallel Extensions to Sequential Languages
  c. Parallel APIs – MPI, OpenMP
- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)
  a. Introduction to MPI
  b. MPI constructs
  c. Example programs in MPI
- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

EN 619: Embedded & Computer Based System Design (45)

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)

- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)

- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)

- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity

- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:

- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour

- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys

- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics

- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:

- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

4. Elementary Dislocation Theory - J. Weertman & J. R. Weertman
5. Introduction to Dislocations - D. Hull
6. Mechanical Metallurgy : Principles and Applications - M. A. Meyers & K. K. Chawla
7. Deformation and Fracture Mechanics of Engineering Materials - R. W. Hertzberg

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)

- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)

- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 625: Modern Control Systems Design and Simulation (35)

- Introduction, Examples of Dynamic Systems, Elementary definitions, Analyti- cal methods of modeling.
- State Space Characterization State 5PaCe representation, solution of state equation, state Transition matrix, properties of STM, computation methods, Companion form, Diagonal and Jordan form representation of linear models
- Controllability and Observability State transfer and Kaiman Controllability criterion, Algebraic controllability and Observability criteria, Gilbert's criterion, Eigenvalue controllability, Duality, Control- lability and observability of Discrete data systems.
- Stability liapunov,s stability criterion, Application to linear models, Extension to non-linear models.
- Control System Design Guillemin-Truxal design Procedure, pole placement by state feedback. H,' meth- od, Ackermann's formula, Bass and Gura formula, optimal control formulation, LQR theory, Matrix Riccati equation.
- Linear Observers Luenberger observers, Kaiman filter as OPtimum observer.
- Other Modeling Approaches Energy approach of modeling, Empirical modeling - impulse and frequency re- sponse methods, Recurise Least square Identification technique.
- Introduction to Adaptive and Robust control.

References:

(Reference materials will be provided during the course)

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

Design Basis Hazards (Natural)

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall

- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications

- FTP, DNS, Mail, application based attacks

Network Security

- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms

- Symmetric and Asymmetric.

Symmetric Algorithm

- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms

- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)

- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)

- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)

- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli's Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.
- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)
- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory
- Introduction to state-space controls, state & measurement equations, general solution **o**f the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls
- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation
- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:
- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 708: Feedback Control Systems (25)
- Introduction: The control systems, Basic elements of FIB control systems, Types of FIB control systems.
- Transfer Function: Transfer function of linear systems, Impulse response, Block diagrams, Signal flow graphs, Mason's gain formula, Polar plots, Bode plot.
- State Variable Characterization: State concept, State equation, Standard representation, State transition matrix and solution of state equations, relationship between state equations and transfer functions, Characteristic equation, Illus- trative examples of some electrical, mechanical, electromechanical systems.
- Time Domain Analysis: Test input signals, Time domain perform- ance characteristics, Transient response of a typical second order system, PID controllers
- Stability: Definition, Routh-Hurwitz criterion, Nyquist criterion. Relative stability, Gain and Phase margins.

EN 709:Fluid Power Technology (25)
Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics
- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal’s Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli’s theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air
- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors
- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.

- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.

- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design

- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:

- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:

- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :

1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing

- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;
- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision
- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:
- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices
- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods
- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric ‘O’ rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques
- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:
- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
  - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
  - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
  - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
  - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

- Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
- Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
- Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, llllcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

References

2. Membrane Handbook by Ho and Sircar (1992)
3. Transport Phenomena in Membrane by K. Lakshminarayanaiah (1970)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
- Scheduling in a project by critical path method, CPM
- Scheduling in a project by Precedence Diagram Method.
- Use of Project Management Software for project planning, scheduling & monitoring.
- Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
  - Constraints of project and its effective management
  - Development of Six Monthly Plan and its review process
  - Resource based planning
  - Physical & Financial Monitoring of project, Use of S-curve
  - Capital Budgeting & expenditure control in a project
  - Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
- Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
- Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.

Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control.

Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5

Final control element - Linear pneumatic control valve.

Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.

Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology (NRST)

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single - phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.

3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9^{th} Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No. **Course content**

Curriculum for Metal Forming

1. **Uniaxial tensile test**:
   a. Engineering stress, engineering stain, true stress, true strain;
   b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations;
   c. Tensile instability and significance of strain harkening exponent;
   d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2. Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3. Small strain matrix and rotation matrix obtained from the displacement functions;
4. **Elements of the theory of plasticity**:
   a. Decomposition of stress matrix to hydrostatic and deviatoric matrices;
   b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess;
   c. Normality flow rule and convexity of the yield surface; concept of equivalent strain

Curriculum for Materials Joining

1. **Welding Processes**
   a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding
   b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding
   c. Resistance Welding Processes
2. **Thermal Cycle during welding**
   a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3. **Residual Stress and Distortion**
   a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses
   b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No. **Course content**

1. Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2. Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber's rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O' rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson’s ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., “Dynamics of Structures, Theory and applications to Earthquake Engineering”, Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures”, New York, McGraw-Hill Book Company.
3. Mariopaz, “Structural Dynamic (Theory and Computation)”, CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., “Numerical Methods in Finite Element Analysis”, Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.

4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.

5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.

6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. **Engineering Mathematics (EM) (35 hours)**

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

8. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
9. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
10. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
11. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
12. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).

13. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
14. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :** Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No.	Course content
12.	**Introduction: Reliability Engg. Applied to C&I Systems** Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors. Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems. Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
13.	**Reliability Maths/Statistics:** • Mathematical and statistical expressions required for reliability study. • Types of failures in electrical, electronic and computer components • Failure probability concept, statistical distribution models_ • Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions • Chi-square distribution and its use in confidence and risk factors • Baye's theorem • Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software. • Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions. • Derivation of exponential reliability expression_ • R(t)=[exp-(lt)] for electronic components and systems. • Examples to solve

14. **Fault Tolerance and Systems Reliability:**

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**

- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), (‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:

1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4. Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.
5. DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. **Fault Tolerant and Distributed Architectures**

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.

2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. **Real-Time System Design**

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.

2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	**Course content**
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type-Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,
    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

    Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

    Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
Total		**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
Total		**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.

Course content

1. **Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity.

   Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.

2. **Biological effects of Radiation:**

   Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).

3. **Radiation Protection and Regulations:**

   Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India.

   Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.

   Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.

   Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.

4. **Radiation protection and measurement (External and Internal):**

   Control of external exposures (with problems in each case).

   Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources.

   Routes of intake of radioactive material,

   Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. **Thermal Power Reactors :**

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. **Fast Power Reactors :**

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology**

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2. Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.

7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.

8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.

9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.

10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Syllabus for CE610 : Heat Transfer (10 hrs.)

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
   Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi's model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)

Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.
Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.
5. Piquet, J. (1999): Turbulent Flows: Models and Physics, Springer-Verlag: Berlin.
6. Holman, J.P. (1997): Heat Transfer, 8"" ed., McGraw-Hill : NY.
7. Kays, W.M. and Crawford, M.E. (1993); Convective Heat Transfer, McGraw-Hill: NY.
8. Gebhart, B., et al. (1988): Buoyancy-Induced Flows and Transport, Hemisphere.
9. Barret, K. (1982): Numerical Modelling in Diffusion-Convection, Pentach Press : London, Polymouth.
10. Hussaini, M.Y. et al. (1997): Up-wind and High Resolution Schemes, Springer-Verlag : Berlin.
11. Warsi, Z.U.A. (1998): Fluid Dynamics: Theoretical and Computational Approaches, 2"" Ed., CRC Press.
12. Cebeci, T. and Bradshaw, P. (1984): Physical and Computational'Aspects of Heat Transfer, Springer-Verlag.
13. Quartepelle, L. (1993): Numerical Solution of the Incompressible Navier-Stokes Equations, Birkhauser Verlag.
14. Patankar, S.V. (1982): Numerical Heat Transfer and Fluid Flow, Hemisphere.
15. Versteeg, H.K. and Malalasekera, (1996): An Introduction to Computational Fluid Dynamics: the Finite
16. Volume Method, Addison-Weslev.
17. Gresho, P.M. et al.. (1999): Incompressible Flow and the Finite Element Method, John Wiley & Sons.
18. Comini, G., et al. (1994): Finite Element Analysis of Heat Transfer, Taylor & Francis : Washington DC.
19. Canuto, C., et al. (1988): Spectral Methods in Fluid dynamics, Springer-Verlag :NY, 557pp.
20. Thompson, J.F., Soni, B. and Weatherill, N.P. (1998): Handbook of Grid Generation, CRC Press.
21. Glowinski. R., et al. (Eds.) (1997): Domain Decomposition Methods in Science and Engineering, Wiley.
22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Froment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO's).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2nd edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2nd edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2
MS6	Metallurgical Thermodynamics	30	4
MS7	Experimental Methods for Materials Research	45	6
MS8	Structural Materials for Nuclear Reactors	45	6
MS9	NDE Science and Technology	30	4
MS10	Physical Metallurgy	45	6
MS11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
MS12	Introduction to Materials Science and Engineering	45	6
MS13	Corrosion Science and Engineering	30	4
MS14	Mechanical Behavior of Engineering Materials	30	4
MS15	Manufacturing Technology	30	4
Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:**Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:**Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods

1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;

1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):

Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation- bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM

2.2. Scanning electron microscopy:

Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;

EPMA Electron probe micro-analyzer

2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species

3.1. Ion beams – production-ion guns; manipulation- ion, filters

3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):

High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy

3.3. Nuclear reaction analysis – elemental specificity – depth profiling

3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis

3.5. Surface Mass Spectriscopy-SIMS:

Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons

4.1 Photoelectron spectroscopy:

Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin

4.2 Auger Electron Sepctroscopy:

Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.

4.3 Experimental methods;

Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. **VIBRATIONAL SPECTROSCOPIES**

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. **8.RESONANCE ABSORPTION SPECTROSCOPIES**

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.
2. Williams (D B), Carter (C B), Transmission Electron Microscopy: A Textbook For Materials Science, New York, Plenum, 1996
3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)

S.No.	**Course Content**
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

9. NDE Science and Technology (MS9 - 30 hours)

S.No.	Course Content
1.	**Introduction to NDE:**Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:**Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:**Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:**Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:**Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:**NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys. Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition.
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation.

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232.
MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Introduction to Materials Science & Engineering (MS12/CH4-40 hours)

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.
5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.
6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.
7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, "Corrosion and corrosion protection handbook", USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger's vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt's factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith's law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2
7.	FRE7	Seismic Design of Nuclear Reactors and Facilities	30	4
8.	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**210**	**26**

MODULE III- OPERATIONS

S. No	*Code*	*SUBJECT TITLE*	*HOURS*	*CREDITS*
1.	FRE9	Plant Dynamics and Control	25	3
2.	FRE10	Turbine Generator Fundamentals	25	3
3.	FRE11	Mechanical and Electrical Equipments	25	3
4.	FRE12	Maintenance Engineering	25	3
5.	FRE13	Regulatory Framework for NPPs	25	3
6.	FRE14	Practical's	**6 Weeks**	**12**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. **Coolant circuits**

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.
12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No **Course content**

1. **Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2. **Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3. **Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4. **Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5. **Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6. **Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single - phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies
8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

AHMT

1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974.
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.
3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No. **Course content**

1. **Momentum Transport:**

   1.1 Viscosity and Mechanisms of Momentum Transport: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends***.***

2. **Energy Transport:**

Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.

2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.

4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.

5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.

6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.

7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987

8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.

9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No. **Course content**

1. Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2. Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3. Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4. Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5. Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6. Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. **Class room Training**
   a. Reactor System

      Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

   b. Sodium system

      Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

   c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

   d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation.
After classroom training field training will be provided as follows

2. **Field training**
   a. Reactor Operation
   b. Maintenance Activities
   c. Technical Service Activities
   d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical's	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018

MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. El-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
   Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
   Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
   Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
   - Fault tolerance concept for electronic and Computer based C&I systems.
   - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
   - Series, parallel, active, passive, and voting redundancy
   - Redundancy and other fault tolerance methods for software
   - FMEA, FMECA concepts for C&I and Examples to solve
   - Concepts for the analysis of System Reliability, availability, and maintainability.
   - System reliability and availability analysis methods
   - Boolean logic
   - Digraph, cutest-tie set method
   - Fault tree model, and consideration of CCF, CMF, software errors
   - Markov Model

   Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
   - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
   - Environmental qualification, testing of the C&I systems
   - Effects of various environments on the electrical/ electronic components
   - Climatic Qualification tests: Temperature, Humidity
   - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
   - Reliability Testing of the electronic components, equipment and C&I systems
   - Reliability screening tests for electronic components
   - Accelerated environmental tests
   - Failure terminated and time terminated tests
   - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
   - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
   - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
   - Explain Event Tree
   - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
   - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment
(1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher
(2001),
('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position
6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.
7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,
Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. **Class room Training**
    a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

IMSc

SYLLABUS FOR

Int Ph.D. in LIFE SCIENCES (Program Code: LIFE05)

Syllabus

Candidates should take all core courses (exemptions can be granted on case-by-case basis but an assessment must be made), as well as at least two electives and experimental components (workshops or lab rotations at collaborating institutes.)

CORE COURSES (Semester 1)		
10-LIFE05-001-C Biology-1 (24 lectures), 100 marks		
1	Basic molecular biology	Biomolecules, DNA, RNA, proteins; genetic code; "central dogma"; gene transcription, translation; packaging of DNA in eukaryotes; introns/exons, splicing
2	Cell biology	Cellular metabolism, cell motility, cytoskeleton, intracellular transport, membrane transport, channels, receptors, signalling, cell cycle
3	Genetics	Mendelian genetics, definitions (genes, loci, alleles), dominance; replication, mitosis/meiosis, linkage/crossover
4	Gene regulation	Transcriptional regulation, miRNA and RNAi
5	Developmental biology	differentiation, early development of drosophila via gradients, gap and pair-rule genes, role of hox genes, Williston's "law", other organisms
6	Evolutionary biology	Molecular evolution, evolution of DNA, genes, proteins and regulation. Molecular mechanisms of evolution -- mutation, recombination, duplication, mobile elements
10-LIFE05-002-C Protein Structure (24 lectures, 100 marks)		
1	Taxonomy	Primary, Secondary and tertiary structure, fold types
2	Protein folding	The Anfinsen experiments, Protein database (PDB), Helix-helix packing in globular proteins, Beta-sheet packing, Folding pathways, thermal denaturation, partially folded intermediates, misfolding and aggregation
3	Membrane proteins	Cell membranes, simple and facilitated diffusion across membranes, membrane protein structural biology, ion channels and receptors, transport via membrane proteins, membrane channels:potassium channel, aquaporins, G-coupled protein receptors, ligand/voltage gated ion channels
4	Enzymes	Biological catalysts, Gibbs free energy, transition state complex, substrate, products, active sites, activation energy barrier, induced-fit hypothesis, cofactors, coenzymes, Michaelis-Menten enzyme kinetics
5	Electrostatics in biology	Continuum methods, solvation and ions, implicit solvent models, Poisson equation, Poisson-Boltzmann equation, solvation free energy
6	Structural characterization	x-ray crystallization, circular dichroism, spectroscopy, NMR, single molecule experiments

7	Homology modelling	Homology Modeling, Visualization
10-LIFE05-003-C Mathematics and statistics for biologists (30 lectures, 100 marks)		
1	Differential equations	introduction to ODEs and PDEs, linear and non-linear, properties, how to solve analytically and numerically; examples -- Hodgkin-Huxley, reaction-diffusion equations, Volterra equations
2	Essentials of linear algebra	vectors, matrices, eigenvalues and eigenvectors; orthogonal bases of functions, Sturm-Liouville theory and differential equations; Fourier series and Fourier transforms
3	Probability theory and statistics	basic concepts -- random variables, mean, variance, moments; conditional probabilities, hypothesis and data, likelihood, Bayes' theorem; probability distributions -- binomial, multinomial, Poisson, normal; the central limit theorem; hypothesis testing, significance testing (orthodox and Bayesian methods); parameter estimation
4	Simulations	Introduction to Markov Chain Monte Carlo for exploring space of hypotheses: ergodicity, detailed balance, convergence. Metropolis and Gibbs sampling
5	Machine learning	decision tree learning, artificial neural networks, support vector machines, Bayesian learning and Bayesian networks
6	Other topics	Game theory, applications to evolutionary biology, agent-based modelling of complex systems
10-LIFE05-004-C Physical Methods for Biologists (37 lectures, 100 marks)		
1	Basic physics of soft matter	What is soft matter, length scales and time scales, biological matter as soft matter, self-organization and self assembly, illustrative examples - DNA, microtubules and/or actin and lipid membranes, coarse-grained representations, interactions and bonding in soft matter systems (including van der Waals forces, hydrogen bonding, electrostatics and screening), what can be measured, energy scales
2	Thermodynamics and statistical mechanics	Thermal equilibrium, the idea of entropy, laws of thermodynamics, free energies, Legendre transformations, different ensembles and relation to computational biology examples, Boltzmann distribution, harmonic oscillator, equipartition theorem, virial theorem, thermodynamics of self assembly, simple ideas of phase transitions, Poisson-Boltzmann theory, dealing with electrostatics
3	Noise, diffusion and drift	Thermal fluctuations and noise, random walk, diffusion equation as continuum limit of the random walk, probability density, continuity equation, Fick’s law, drift-diffusion equation, Stokes-Einstein formula, example of receptor clustering
4	Mechanics of continuous media	Elasticity of isotropic solids, estimates for elastic constants of biological materials, fluids in biology, basics of fluid mechanics, Pascals law, Euler’s equation, viscosity, Reynolds number, Navier-Stokes equation, flow through narrow pipes, dimensionless groups, swimming of microorganisms, hydrodynamic interactions, rheology of biological matter, introduction to viscoelasticity, Maxwell model
5	Polymers, membranes and gels	Simple ideas of polymers and membranes, polymer elasticity, polymer dynamics (Rouse and Zimm model) qualitative discussion, scaling ideas in polymers, semi-flexibility, membrane elasticity, membrane fluctuations, passive gels

6	Out of equilibrium	Active matter, simple examples, what do we need to model them, polymerization forces, cell streaming, molecular motors and models, active gels
7	Other topics	Interfacial tension in biological systems, Laplace pressure, wetting and spreading, osmotic effects, capillary effects in biology, micro-rheology
		for biological systems

CORE COURSES (Semester 2)

10-LIFE05-005-C Biology-2 (25 lectures, 100 marks)

1	Epigenetics	DNA packaging, heterochromatin and euchromatin, methylation, histone tail modifications and gene regulation
2	Basics of neuroscience	Neurons, synapses, neural architecture in various organisms, action potential, Hodgkin-Hoxley equation, firing rates, plasticity, artificial neural networks
3	Introduction to ecology	Ecology and evolution, ecosystems, food webs, large-scale ecology
4	Experimental techniques	PCR, southern/northern/western blots, chromatin immunoprecipitation, microarrays, high-throughput sequencing, ChIP-chip and ChIP-seq, high-resolution microscopy (fluoroscence imaging, confocal, FRET, PALM etc), GFP and reporter gene assays
5	Other topics	Basics of: Intercellular communication, epidemiology, physiology, immunology

10-LIFE05-006-C Biological sequence analysis (30 lectures, 100 marks)

1	Biomolecules	Basics (DNA, RNA, proteins)
2	Probability theory	Basic laws -- joint probabilities, conditional probabilities, likelihood, Bayes' theorem
3	String algorithms	finding common substrings and subsequences: Boyer-Moore algorithm, suffix trees, finding strings with mismatches
4	Sequence alignment	algorithms for pairwise and multiple sequence alignment -- scoring model, Needleman-Wunsch and Smith-Waterman algorithms, BLAST and other heuristic algorithms, significance of scores, structural alignment
5	Sequence assembly	assembling short reads, with and without scaffold; ChIP-seq algorithms
6	Markov models	Markov chains, hidden Markov models, Baum-Welch and Viterbi algorithms, profile HMMs and software (HMMer, etc)
7	Transcriptional regulation	Transcription factor binding sites, position weight matrices, sequence logos, motif-finding via expectation maximisation (MEME) and Gibbs sampling
8	Phylogenetic trees	building a tree from pairwise distances, neighbour-joining, parsimony
9	Transformational grammars	regular grammars, context-free grammars; RNA structure analysis

10-LIFE05-007-C Systems Biology (30 lectures, 100 marks)

1	Networks in biology	The diversity of networks across space and time in biological systems Intra-cellular networks: The gene network and protein-protein interaction network Intra-cellular networks: The metabolic network Intra-cellular networks: signaling networks - pathways and	
		enzyme-substrate reaction cascades The signaling network coordination of immune response to infection Reconstructing biological networks from lab experiments Structural analysis of networks: Global properties Structural analysis of networks: Motifs and Modules Dynamics on biological networks: Modeling signaling pathways Inter-cellular networks: Neuronal networks Inter-organism networks: Contact structure and contagion propagation Inter-species networks: Stability-instability of food webs	
2	Patterns in Biology	Temporal patterns: Biological clocks and circadian rhythms Oscillatory activity in Pancreatic beta cells and insulin secretion Pattern formation during development Development in Drosophilia Development of the vertebrate body plan Modeling developmental patterns: Reaction-diffusion models and Turing Patterns Spatial patterns: Linear stability analysis and Fourier modes Autocatalysis and lateral inhibition: Gierer-Meinhardt and related pattern generation mechanisms in biosystems, center-surround principle in retina and cortex Modeling genesis of functional patterns: Ocular dominance columns Development of plants and L-systems modeling Cell differentiation and Random NK Boolean Networks Morphogenesis Fractals in biology: Examples (1/f noise, circulation system), characterization Fractals in biology: Generation mechanisms	
3	Waves in biology	Importance of waves in biology for communication and coordination Intra-cellular waves: Calcium waves, targets and spirals Inter-cellular waves: Waves in the brain, heart and uterus Excitable media models of physiological systems Ionic basis of excitation: Hodgkin-Huxley formalism Simple and complex models of excitability Excitability, Oscillatory and Bistability regimes of systems Wave propagation through inter-cellular gap junctions: Diffusion approximation Genesis and dynamics of spiral waves: kinematic approach Nonlinear dynamical aspects of spiral waves: Restitution and dispersion Excitation-contraction coupling and the role of organ structure in wave dynamics Bidomain models of biological electrical activity Waves in single populations: Fisher waves Waves in interacting populations: Propagating epidemics, spiral waves in host-parasite spatial dynamics	

ELECTIVE COURSES (semester flexible)

10-LIFE05-001-E Biophysics of Macromolecular Structures (32 lectures)

I. Structure and Biophysics of Biomolecules (10 lectures)

Introduction to macromolecular chemistry, building blocks for macromolecular structures, biophysical methods for structure analysis, nucleic acid structure, protein-nucleic acid interactions, membrane proteins, microtubules and other supramolecular assemblies, investigative methods from the atomic to cellular levels, including X-ray crystallography, NMR spectroscopy, molecular dynamics, electron and light microscopy, AFM, single molecule techniques and simulations

II. Kinetics (5 lectures)

Chemical kinetics and application to dynamical processes in proteins, self assembly processes, classical kinetics, transition state theory, unimolecular decomposition, potential energy surfaces, scattering processes and photodissociation processes, enzyme kinetics

III. Biophysical approaches to Biopolymers (6 lectures)

Basics of polymers, protein folding problem, protein aggregation, DNA, DNA electrostatics, DNA force extension relations, RNA folding, polymerization, polymerization forces, dynamic instability, tread-milling and their physical description

IV. Biophysical Approaches to Membranes (5 lectures)

Lipids and Membranes: Structure of various cell membranes, surface tension and curvature energies, Helfrich theory, clustering, phase separation, nanoscale structures i.e. rafts, multicomponent membranes.

SPECIAL TOPICS

V. Kinetics and statistical mechanics of helix coil transitions; physical approaches to the refolding and assembly of multi-subunit proteins; fluorescence spectroscopic studies of macromolecules, molecular basis of enzyme catalysis, antibody structure and function, virus structure and assembly (6 lectures)

10-LIFE05-002-E Simulation Techniques in Biology (32 lectures)

I. Molecular Dynamics (8 Lectures)

Introduction to MD and applications in biology and drug design; Basic Statistical mechanics: Basic thermodynamics, Ensembles (microcanonical, canonical, grand canonical, isothermal-isobaric), Virial theorem, Nose-Hoover chains; Forcefields and interaction potential: Many body potentials, Born-Oppenheimer approximation, electrostatic interactions including Ewald sum, interaction potential for organic molecules; popular forcefields: AMBER, CHARMM, OPLS etc.,;Integration methods and Liouville time operators Phase space concepts, Liouville theorem, Equilibrium solution of Louiville equation, Trotter factorization; Integration algorithms: Verlet, Velocity-Verlet, Gear-Predictor, multiple-time step algorithm, holonomic constraints (RATTLE/SHAKE)

II. Monte Carlo Simulations (6 lectures)

Importance Sampling, Random variables and stochastic processes,lattice models, Random walks, Gibbs sampling, sampling errors, configurational-bias Monte Carlo method, Markov chain Monte Carlo, Advanced Monte Carlo methods: Parallel tempering, simulated annealing

III. Reaction Diffusion (4 Lectures)

Predator Prey Models, Reaction Kinetics, diffusion-limited reactions, Population dynamics, Reaction-diffusion Equations

IV. Brownian/Stochastic simulations (8 lectures)

Stochastic reaction-diffusion models:Compartment-based reaction-diffusion algorithm, reaction-diffusion master equation, pattern formation; Diffusion:

Brownian motion, On/Off-Lattice models, diffusion to adsorbing surfaces, reactive boundary conditions, Einstein-Smoluchowski relation; Stochastic models of transport processes in cells: Fokker Planck Equations, Brownian rachet models, Chapman

-

Kolmogorov equation, Gillespie algorithm, chemical master equation

SPECIAL TOPICS

V. Free energy methods (3 lectures)

Potential of mean force, umbrella sampling, Adaptive bias force method,

thermodynamic integration

VI. Binding and Docking (3 lectures)

Enzyme-substrate recognition process, Search Algorithms (simulated annealing, steepest descent, genetic algorithms), Scoring Functions, Applications of Docking, Softwares for docking

10-LIFE05-003-E **Population Biology, Ecology and Evolution (30 lectures)**

1. Single species population (10 lectures)

Continuous and discrete-time models of population growth (Logistic and related models)
Models of age-structured populations
Population dynamics in the presence of noise
Time-series analysis of data
Flies: Model experimental organism for studying population dynamics
Modeling migration of populations
Territorial behavior
Fundamentals of game theory
Evolution of cooperation between individuals
Spatial dynamics of strategies (Example: Spatial Prisoners Dilemma)

2. Interaction between multiple populations (10 lectures)

Introduction to food webs and ecological interactions between species
Predator-prey interactions: Lotka-Volterra and related models
Functional response
Competition
Cooperation
Multiple prey and predators: Generalized Lotka-Volterra and related models
Stability vs complexity in ecosystems: Single trophic level
Stability vs complexity in ecosystems: Multiple trophic levels
Experimental techniques for studying impact of diversity on stability
The robustness of complex ecological networks

3. Evolution and population genetics (10 lectures)

Fundamentals of population genetics: Random mating and Hardy-Weinberg principle
Classical mathematical genetics: Single locus with multiple alleles
Classical mathematical genetics: Multiple loci
X-linked genes; Linkage and its distribution
The molecular basis of classical genetics
Fitness landscapes and mathematical models of evolution
The major transitions in evolution
Mutation and natural selection
Random genetic drift
Neutral theory of evolution
Coevolution and evolutionary game theory
Evolutionary ecology

<u>10-LIFE05-004-E</u> **Computational Neuroscience (30 lectures)**

1. Neurons, Synapses, Gap Junctions and Small Circuits (10 lectures)
   - Introduction to the biological components of the nervous system
   - Types of Neurons and Glial cells
   - Neuronal activity: Action potential and Graded potential
   - Ion channels and electrical activity of neurons
   - Dynamics of graded potential neurons (Example: retina)
   - Dynamics of action potential neurons, spikes and spike trains
   - Dynamics of inter-neuron communication: Synaptic transmission
   - Dynamics of inter-neuron communication: Gap junctions
   - Introduction to GENESIS/NEURON simulation platforms
   - Neuron-Glial interaction
   - Small neuronal circuits and motifs

2. Systems Neuroscience (10 lectures)
   - Introduction to the computational perspective for studying the brain
   - Introduction to Neural Network Models: McCulloch-Pitts paradigm
   - Associative Memory and the Hopfield Network
   - Storage capacity and stability of memories in Hopfield Network: Mean-field theory
   - Learning: Donald Hebb’s Hypothesis, Long-Term Potentiation and STDP
   - Perceptron and related models: learning to generalize
   - Dynamics of Learning: Hebbian and Competitive principles
   - Information theory and neuro-communication
   - Development of the nervous system in a growing organism
   - Evolution of the nervous system: from single cells to the brain
   - Invertebrate neuroscience: C. elegans as a model organism
   - Modeling the nervous system of invertebrates
   - Sensory-motor integration in the nervous system

3. Vision and cognitive neuroscience (10 lectures)
   - Introduction to Sensory Processing in the Nervous System
   - Components of the Visual System
   - Dynamics of Early Visual Processing at Retina
   - Receptive fields and centre-surround principle (Mach bands, etc.)
   - Processing at the Primary Visual Cortex and Higher Brain Areas
   - Modeling edge detection, shape from texture and motion detection
   - Visual binding: Synchronization of neuronal activity
   - Optical illusions as tool for studying vision
   - Information theory of vision
   - Introduction to cognitive neuroscience
   - Experimental tools of cognitive neuroscience: fMRI, PET, etc.
   - Linguistic ability: A model system for cognitive neuroscience

10-LIFE05-005-E **Modeling of Infectious Diseases (28 lectures)**

1. Genomics & evolutionary biology of pathogens (8 lectures)

Dynamics of molecular evolution
Vertical and horizontal gene transfer
Genomic landscape of pathogens, vectors and humans (Example: malaria); Coevolution and Red queen hypothesis
Gene regulation, pathogenesis and immune response
Evolution of virulence

2. The biology and modeling of host-pathogen interactions (8 lectures)

The immune system: design, phylogeny and ontogeny
The functional anatomy of immune response
Analysis of idiotypic network interactions
Systems biology principles for intra-cellular sigaling in immune response
Systems-level modeling of Mycobacterium tuberculosis host-parasite protein-protein interactions
Micro-edipdemiology: population dynamics of viruses and host cells, May-Nowak and related models; application to HIV

3. Epidemiology: data analysis and mathematical modeling (12 lectures)

Epidemics: Dynamics and basic reproductive ratio R0
Estimation of R0 from data - statistical technqiues
Immunization and other public health intervention strategies
SIR model of epidemics: derivation and solution
Variants of SIR model: SEIR, SIS and SIRS
Modeling vector-borne diseases
Host-parasite models (example: Nicholson-Bailey model)
Cellular automata models
Eco-epidemiological models
Contact network: structure and dynamics
Agent-based models of infection propagation

BACK TO MAIN

IMSc

INTEGRATED Ph.D. (Dual Degree) MATHEMATICAL SCIENCES (Program Code: MATH05)

COURSEWORK AND SYLLABI FOR THE PH.D. AND INTEGRATED PH.D. PROGRAMS IN MATHEMATICS AT IMSC

All courses in mathematics carry 8 credits except for the seminar course which carries 4 credits and the research methodology course which is a pass/fail course with no credits earned.

The Ph.D. program requires a total of 9 courses including the seminar course and the research methodology course (for a total of 60 credits).

The I.Ph.D. program requires 13 courses including the seminar course and the research methodology course along with a 28 credit master's thesis (for a total of 120 credits).

The courses are chosen from among the courses listed below along with other courses offered from time to time either at IMSc or at other institutes with which HBNI has an MoU such as CMI. Topics courses in mathematics may be repeated for credit and will be shown on the transcript with suffixes such as I, II, III etc.

10MATH04-001-C ALGEBRA I - 8 CREDITS

Group theory
- Group actions: Orbits, stabilisers, transitivity
- Lagrange, Cauchy, Sylow theorems in the language of group actions
- Direct and semidirect products
- symmetric and alternating groups

Matrices, determinants and linear maps
- Linear maps and matrices, dual = transpose
- determinants
- Equality of row, column and determinantal rank over a commutative ring

Representations of a single endomorphism
- Minimal and characteristic polynomials, eigenvalues and eigenvectors
- Rational and Jordan canonical forms
- S-N decomposition

Bilinear forms and spectral theorems
- Preliminaries and quadratic maps
- Symmetric forms, orthogonal basis, Sylvester's theorem
- Hermitian forms, polarization, Cauchy-Schwarz inequality
- Spectral theorems, polar decomposition

Basic category theory
- Categories and functors
- Universal properties
- Sums, products and limits

Rings and modules over a PID
- Finitely generated abelian groups
- PID $\Rightarrow$ UFD, R UFD $\Rightarrow$ $R[X]$ UFD, Gauss' lemma

- Irreducibility criteria
- Modules over a PID

Tensor products

- Of vector spaces, modules over a ring, basic properties
- connection with Hom, of algebras
- tensor, symmetric and exterior algebras and connection with the determinant

10MATH04-002-C ALGEBRA II - 8 CREDITS

Group theory

- simple, solvable and nilpotent groups
- Jordan-Holder theorem

Galois theory

- Finite extensions, algebraic extensions, algebraic closure
- Splitting fields and normal extensions
- separable extensions
- Finite fields
- Inseparable extensions
- Galois extensions
- Examples and applications
- Cyclotomic fields
- Independence of characters, norm and trace
- Cyclic extensions
- Solvable and radical extensions

Instructor's choice from among the following suggested topics or others.

Semisimplicity

- Schur's lemma and semisimple modules
- Jacobson density theorem, DCT
- Structure of semisimple rings
- Structure of simple rings

Representations of ftnite groups

- Maschke's theorem
- Characters
- Class functions
- Orthogonality relations

Commutative algebra and Dedekind domains

- Prime, maximal ideals, Zariski topology, CRT
- Localization and its properties
- Integral extensions
- Dedekind domains - characterizations
- Unique factorisation - failure and restoration

10MATH04-003-C ANALysis I - 8 crEDiTs

Measure Theory

- Measurable spaces, Caratheodory's theorem and construction of measures, Lebesgue measure, Riesz representation theorem for compact metric spaces
- Measurable mappings, various convergence concepts like almost sure, convergence in measure.
- Integration, MCT, DCT.
- Product measures, Fubini's theorem.
- Radon-Nikodym theorem, Lebesgue decomposition theorem.
- L^p spaces: Basic theory, Holder's inequality, Minkowsky inequality, completeness, their duality.
- (*) Analysis on $\mathbb{R}^n$; convolutions; approximate identity; approximation theorems; Fourier transform; Fourier inversion formula; Plancherel theorem.

Note: Topics marked with asterisk are optional.

10MATH04-004-C ANALysis II - 8 crEDiTs

Elementary functional analysis

- Topological vector spaces; Banach spaces; Hilbert spaces.
- bounded linear transformation;linear functionals and dual spaces.
- Hahn Banach theorem and it's geometric meaning.
- Category theoem and it's applications like open mapping theorem, uniform boundedness principle, closed graph theorem.
- Weak and Weak-* topologies, Banach-Alaoglu's theorem.

Instructor's choice from among the following suggested topics or others.

Distribution Theory

- The spaces $D(\Omega)$, $E(\Omega)$, for Ω open in IR^n.
- $S(\mathbb{R}^n)$ and their duals, convolution, Fourier transform.
- Paley-Wiener theorems; fundamental solutions of constant coefficient partial differential operators.

Banach Algebras and Spectral Theory

- Banach algebras, spectrum of a Banach algebra element, Holomorphic functional calculus, Gelfand theory of commutative Banach algebras.
- Hilbert space operators, C*-algebras of operators, commutative C*-algebras.
- Spectral theorem for bounded self-adjoint and normal operators. formulation).
- Spectral theorem for compact operators,(*) application to Peter-Weyl theorem.

Note: Topics marked with asterisk are optional.

10MATH04-005-C Topology I - 8 credits

Point-set topology

- Quotient topology including the construction of standard topological spaces such as surfaces and real and complex projective spaces as quotient spaces
- The notion of attachment of a cell to a topological space
- Group actions and orbit spaces
- Topologies on function spaces
- Baire category theorem
- Arzelà-Ascoli theorem

Fundamental groups and covering spaces

- Fundamental groups, covering spaces and their relationship
- Free groups, free products of groups
- Seifert-van Kampen theorem - examples and applications

Introduction to homology

- Definition of homology groups
- Homotopy invariance of homology groups
- The first homology group as the abelianization of the fundamental group
- Review of homological algebra necessary to introduce the Mayer-Vietoris sequence
- Mayer-Vietoris sequence and its applications in computing homology groups of surfaces, complex projective spaces, real projective spaces etc.

Applications of fundamental groups and homology groups

Instructors choice among the following topics or other topics at this level.

- Jordan curve theorem
- Winding number of a closed curve
- Brouwer's fixed point theorem
- Fundamental theorem of algebra
- Nielsen-Schreier theorem

10MATH04-006-C Topology II - 8 credits

Instructors choice among the following topics. It is suggested that one topic from the first two and basic notions of differential topology be covered in addition to some of the advanced topics.

Homology theory

- Quick review of homology theory
- Relative homology and the associated long exact sequence
- Excision theorem and its applications
- Characterisation of homology theory by the Eilenberg-Steenrod axioms
- Homology with coefficients

Cohomology theory and introduction to homotopy groups

- Basic notions of cohomology
- Universal coefficient theorem
- Künneth formula
- Cup product and the cohomology ring, Borsuk-Ulam theorem

Basic notions of differential topology

- Differentiable manifolds, tangent bundle, vector fields, flows
- Differential forms and de Rham cohomology
- Integration on manifolds
- Stokes theorem
- Poincaré duality using differential forms.

Advanced topics

- Higher homotopy groups and the Hurewicz theorem
- H-spaces, suspensions, fibre bundles
- Cap product and various forms of duality with integral coefficients
- Bott periodicity theorem
- Topics in differential geometry such as:
  - Smooth vector bundles
  - Notions of connection, curvature and parallel transport
  - Definition of Riemannian manifold
  - Gauss-Bonnet formula
  - Notion of geodesic and Hopf-Rinow theorem
- Obstruction theory and introduction to characteristic classes:
- Topics in Morse theory such as:
  - Definition and genericity of Morse functions
  - Lemma of Morse
  - Cell structure associated to a Morse function and Morse homology
  - Morse-Smale-Witten complex

10MATH04-007-C COMPLEX ANALYSIS - 8 CREDITS

- Analytic function, Cauchy-Riemann equations, power series, exponential and logarithmic function
- Cauchy theorem on a disc, Integral formula, power series and Laurent series expansion Product development, Weierstrass theorem, Homotopy version of Cauchy's theorem, Liouville's theorem, residue theorem, Argument principle
- Maximum modulus principle, Schwarz lemma, Phragmen-Lindelof method
- Conformal mapping, Mobius transformation, Automorphisms of the disc and upper half plane, Riemann mapping theorem
- Harmonic functions, Dirichlet problem, Mean value property
- Analytic continuation, Monodromy theorem
- (optional) Introduction to Hyperbolic geometry
- (optional) Elliptic functions, Gamma and Zeta functions

10MATH04-008-C CREDIT SEMINAR - 4 CREDITS

The topic of the seminar will be chosen by the student in consultation with an assigned faculty member. The student will read recent research papers as assigned by the faculty member, and present the results in a formal seminar.

10MATH04-009-C Research Methodology - Pass/Fail

An introduction to the methods and techniques of academic research through a project and presentations - both oral and written.

The following courses are advanced level research courses whose content will be decided by the instructor based on current research and the requirements of the individual students.

10MATH04-001-E Topics in analytic number theory - 8 credits

Course content varies according to instructor's choice. Possibilities for topics are: introduction to arithmetic functions, convolution and Mobius inversion for-mula, basic asymptotic formulas for arithmetic functions, characters and Fourier analysis on finite abelian groups, theory of Dirichlet series, primes in arithmetic progression, Riemann zeta function, Poisson summation and functional equation, The prime number theorem, error term in prime number theorem, its oscillation and the Riemann hypothesis, equivalent formulations of Riemann hypothesis, zero-free regions, explicit formula and Siegel's theorem, introduction to sieve methods, Brun and Selberg sieve, large sieve and the Bombieri-Vinogradov theorem and Vinogradov's three prime Theorem.

10MATH04-002-E Topics in algebraic number theory - 8 credits

Course content varies according to instructor's choice. Possibilities for topics are: Dedekind domains, ramification, different and discriminants, decomposition and inertia groups, quadratic fields and genus theory, classification of primitive quadratic characters, Gauss sums and quadratic reciprocity, geometry of numbers, finiteness of class number and explicit computations, regulators and Dirichlet's unit theorem, cyclotomic fields and inverse Galois problem for abelian number fields, Artin symbol and splitting in cyclotomic fields, Dedekind zeta function, the analytic class number formula and introduction to the Chebotarev density theorem

10MATH04-003-E Topics in commutative algebra - 8 credits

Course content varies according to instructor's choice. One possibility is a course covering the second half of Matsumura's text including topics such as: regular sequences, Koszul complex, Cohen-Macaulay rings, Gorenstein rings, regular rings, UFDs, complete intersections, local flatness criterion, generic freeness, derivations and differentials, separability, I-smoothness, Cohen's structure theorems and applications of complete local rings.

10MATH04-004-E Topics in modular forms - 8 credits

Course content varies according to instructor's choice. Possibilities include: Introduction to $SL_2(\mathbb{R})$ and its action on the Poincare upper half-plane $\mathcal{H}$, discrete subgroups Γ of $SL_2(\mathbb{R})$ and their cusps, the modular group $SL_2(\mathbb{Z})$, Topology, measure theory and complex structure on $\mathcal{H}/\Gamma$ and its compactification, Modular functions, modular forms and cusp forms on $SL_2(\mathbb{Z})$, examples : Eisenstein Series and the delta Function, finite dimensionality of space of modular forms, the Miller basis and the $\mathbb{Z}$-structure on the space of modular forms, growth of Fourier coefficients of cusp forms, introduction to Ramanujan's conjectures, theory of Hecke operators and Petersson inner-product on the space of cusp forms, application to Ramanujan's conjectures, the L-function of modular forms, congruence subgroups, modular forms and cusp forms on congruence subgroups, spectral theory of automorphic forms, introduction to Galois representations and Deligne's theorem, Lehmer's conjecture and the Atkin-Serre Conjecture.

10MATH04-005-E Topics in elliptic curves - 8 credits

Course content varies according to instructor's choice. Possibilities for material to be covered include selected topics from Elliptic functions by Lang, The arithmetic of Elliptic curves by Silverman, Elliptic curves by Milne or Elliptic curves by Husemoller. Another possibility would be to prove Mazur's theorem which is a well-known and important result covering elliptic curves and abelian varieties, and the moduli of elliptic curves.

10MATH04-006-E Topics in algebraic curves - 8 credits

Course content varies according to instructor's choice. Possibilities for material to be covered include selected topics from An invitation to arithmetic geometry by Lorenzini, Algebraic Curves by Fulton or lectures notes of Joseph Oesterle. Topics such as the basics of algebraic varieties over the complex numbers (with focus on dimension 1), singularities of curves (what are they and when is a curve nonsingular), desingularization of curves by normalization, the relationship between nonsingular algebraic curves and complex manifolds of dimension 1, nonsingular projective algebraic curves and function fields, the Riemann-Roch theorem, and also some of its applications.

10MATH04-007-E Topics in diophantine geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: introduction to Global fields, absolute values on global fields, theory of heights, rational points on conics. local-global principle and application to quadratic forms, affine and projective varieties, morphisms and rational maps, explicit arithmetic on function fields and their zeta-functions, divisors on curves, The Riemann-Roch theorem, elliptic curves over global fields, endomorphism rings of Elliptic curves, CM and non-CM curves, ehe Mordell-Weil group and rank of an elliptic curve and local-global principle on elliptic curves and the Tate-Shaferevich group.

10MATH04-008-E Topics in transcendental number theory - 8 credits

Course content varies according to instructor's choice. Possibilities are: Liouville's theorem and Liouville Numbers, elements of rational approximation, transcendence of e and π, irrationality of $\zeta(3)$, introduction to algebraic independence, Lindemann-Weierstrass theorem, Schanuel's conjecture and Ax's theorem for formal power series, the Schneider-Lang Theorem, Hilbert's seventh problem and the Gelfond-Schneider theorem, Baker's Theorem and applications, six exponential theorem, introduction to heights and Roth's Theorem, the p-adic Baker theorem (by Brumer) and introduction to Leopoldt's conjecture and the p-adic subspace theorem and applications.

10MATH04-009-E Topics in algebraic groups - 8 credits

Course content varies according to instructor's choice. One possibility is to cover the basic theory of linear algebraic groups over an algebraically closed field up to the classification of the reductive groups by means of root data, developing the necessary background from algebraic geometry as and when needed. Thus covering preliminaries from algebraic geometry, linear algebraic groups: definition and first properties, commutative algebraic groups, derivations, differentials, and Lie algebras, topological properties of morphisms applied to this context, Parabolic subgroups, Borel subgroups, and solvable subgroups, Weyl group, roots, and root datum and reductive groups and their classification: isomorphism and existence theorems.

10MATH04-010-E Topics in infinite dimensional Lie algebras - 8 credits

Course content varies according to instructor's choice. Some possibilities are: generalized Cartan matrices and their associated Lie algebras, symmetrizability, the invariant bilinear form, the Weyl group, classification of indecomposable GCMs, finite, affine and indefinite types, affine Kac-Moody algebras, roots, the affine Weyl group, realizations of untwisted and twisted affine Kac-Moody algebras in terms of loop algebras, representation theory: integrable representations, category $\mathcal{O}$, proof of the Weyl-Kac character formula, highest weight integrable representations, weights, representations of affine Kac-Moody algebras.

10MATH04-011-E Topics in functional analysis - 8 credits

Course content varies according to instructor's choice. Some possibilities are: analytic Fredholm theory, compact and Fredholm operators, Atkinson's theorem, Gelfand duality, properties of the analytic index, Toeplitz operators on Hardy spaces, Pseudo-differential operators and Elliptic regularity, Fourier transforms and Sobolev spaces on R^n, Symbol calculus and Pseudo-differential operators, Ellipticity and Pseudo-differential operators on smooth manifolds, construction of parametrices, Elliptic regularity theorem, Ellipticity and Fredholm property of Dirac operators on closed manifolds.

10MATH04-012-E Topics in non-commutative geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Vector bundles, K-theory for topological spaces, Serre Swan theorem, K_0 and $K_1$for a C*-algebra, homotopy invariance, split exactness, half-exactness, stability of K-theory, inductive limits and K-theory, Bott periodicity, Six term exact sequences, computations with them, Pimsner-Voiculescu exact sequence, Thom isomorphism, Hilbert C*-modules, KK groups, Geometric index theory, Vector bundles, connections and curvature on Riemannian manifolds, structure equations of Cartan, invariant forms and characteristic classes in de Rham cohomology, Chern-Gauss-Bonnet theorem and idea of proof, topological index and statement of the Atiyah-Singer index theorem

10MATH04-013-E Topics in Lie groups - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Introduction to Lie algebras, definitions, examples, abelian, nilpotent, solvable lie algebras, semisimple lie algebras, representation of Lie algebras, structure of general Lie algebras over characteristic zero field : statement of the Levi decomposition, statement of Ado's theorem, Introduction to real differentiable manifolds, and various standard objects associated with it, statement of the Frobenius theorem on integrability, definition of real Lie groups, examples, associated Lie algebra, the exponential map and its properties, closed subgroup theorem, continuous homomorphisms, definition of Lie subgroups and examples, association of lie subgroups and lie subalgebras, covering Lie groups, simply connected lie groups and association with real Lie algebras, the adjoint representation, the manifold structure of the left or right coset space with respect to a closed subgroup and the (subgroup)-principal bundle structure of the Lie group with respect to the projection to the coset space, Construction of left invariant Haar measure using left invariant differential forms, formula for modular function, compact Lie groups, Peter-Weyl theorem, embedding compact groups in linear Lie groups, Weyl group, conjugacy of maximal tori in connected compact Lie groups, Centralizers of tori, basic structure of semisimple Lie groups, existence of compact real forms of complex semi-simple Lie algebras, Cartan decomposition both at the Lie algebra and Lie group level, Iwasawa decomposition.

10MATH04-014-E Topics in algebraic geometry - 8 credits

Course content varies according to instructor's choice. One possibility is an introduction to the language of schemes, properties of morphisms, and sheaf cohomology. So that the students gain an understanding of the basic notions and techniques of modern algebraic geometry.

10MATH04-015-E Topics in differential geometry - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Definition of smooth manifolds, atlas, examples, tangent spaces, inverse and implicit functon theorems for manifolds, vector fields, flow, completeness of the flow function, integrability and Frobenius theorem, differential forms, pullback by functions, exterior derivative, orientations, manifolds with boundary, Stokes theorem, DeRham cohomology, computations using Mayer Vietoris, Riemannian metrics and geodesics.

10MATH04-016-E Topics in partial differential equations - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Examples of partial differential equations, Strategies for studying PDE., Well posed problem, Brief introduction to classical solutions, weak solution and regularity, Transport equation, Laplace's equation, Heat equation and wave equation, Problems associated to these equations, notion of fundamental solution etc., Non-linear first order PDE, Hamilton Jacobi equations, calculus of variations, Hamilton's ode, Legendre transforms, etc., Theory of linear partial differential equations: Sobolev spaces, weak derivative, Sobolev inequalities, Elliptic equations, Weak solutions, the existence of weak solutions, regularity, maximum principles, eigenvalues and eigenfunctions of elliptic operators, compactness, etc.

10MATH04-017-E Topics in mathematical physics - 8 credits

Course content varies according to instructor's choice. One possibility is to cover classical and quantum mechanics covering topics such as: review of Galilean group, mechanical system with one degree of freedom, mechanical system consisting of motion of a point in three dimensional space and motion of system of n points, review of calculus of variation, Lagrange's equation, Hamilton's equations, Liouville's theorem, Symplectic structures on phase spaces and Noether's theorem, D'Alembert's principle, Symplectic manifolds, Hamiltonian mechanics on symplectic manifolds, moment map, postulates of quantum mechanics, mathematical aspects of Schrödinger's equation, review of Lie group, Lie algebra and their representations with main focus on groups like $U(1)$, $SO(3)$, $SU(2)$, Spin groups in 3 and 4 dimensions, Spin $\frac{1}{2}$ particle in magnetic field, review of Fourier transforms, position and momentum space, Dirac notation, Heisenberg's uncertainty principle, Hydrogen atom, quantization, canonical quantization, The Groenewold-van Hove no-go theorem, canonical quantization in n–dimensions, quantization and symmetries.

10MATH04-018-E Topics in algebra - 8 credits

Course content varies according to instructor's choice. One possibility is a course in commutative algebra covering prime ideals and maximal ideals, nilradical and jacobson radical, prime avoidance and the Chinese remainder theorem, extension and contraction of ideals, modules, submodules and quotient modules, direct sum and direct product, finitely generated modules and Nakayama lemma, exact sequences, tensor products, restriction and extension of scalars, exactness properties of the tensor product, algebras, tensor product of algebras, localization, local properties, extended and contracted ideals in rings of fractions, primary decomposition, integral extensions, lying over, going-up theorems, integrally closed domains and the going-down theorem, valuation rings, Noetherian and Artinian modules, Noetherian rings, Hilbert basis theorem, primary decomposition in Noetherian rings, Artinian rings and their structure, discrete valuation rings and Dedekind domains, fractional ideals, completions, filtrations, topologies, and completions, graded rings and modules, associated graded ring, dimension theory, Hilbert functions, dimension theory of Noetherian local rings, regular local rings, transcendental dimension, relation to algebraic varieties and algebraic geometry.

10MATH04-019-E Topics in operator algebras - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Banach algebras, spectrum, spectral radius formula, C*-algebras, Gelfand Naimark theorem, continuous functional calculus, GNS construction, positivity, measurable functional calculus, von Neumann algebras, Kaplansky density theorem, double commutant theorem, finite-dimensional C*-algebras, representation theory of the C*-algebra of compact operators, Toeplitz algebra, Coburn's theorem, group C*-algebras, crossed products, amenability, groupoid C*-algebras.

10MATH04-020-E Topics in representation theory - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Lie algebras: definition and basic properties, ideals, subalgebras, homomorphisms, nilpotent and solvable Lie algebras, Lie's and Engel's theorems, semisimple Lie algebras, the Killing form, Cartan's criterion, abstract Jordan decomposition, classification of finite dimensional semisimple Lie algebras, Dynkin diagrams, the Weyl group, isomorphism and conjugacy theorems, representations, Verma modules, category $\mathcal{O}$, irreducible highest weight modules, complete reducibility, Weyl character formula, Freudenthal weight multiplicity formula, Kostant and Steinberg formulas.

10MATH04-021-E Topics in algebraic combinatorics - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Partially ordered sets and Mobius inversion, generating functions, permutations and statistics, Robinson-Schensted correpondence, partitions, Young's lattice, hook-length formula, Representation theory of symmetric groups, similarity classes of matrices and orthogonal polynomials

10MATH04-022-E Topics in topology - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Definitions and basic construction of homotopy groups, Whitehead's theorem, Hurewicz's theorem, stable homotopy groups, fibrations and obstruction theory, Bott's periodicity theorem, H-cobordism theorem, construction and applications of characteristic classes.

10MATH04-023-E Topics in symplectic geometry - 8 credits

Course content varies according to instructor's choice. Possibilities include: Motivations of sympletic Geometry from Hamiltonian mechanics, neighbourhood theorems, compatible almost complex structure, and the contractibility of the space of almost complex structures, integrability of almost complex structures, Newlander-Nirenberg theorem, Hamiltonian circle actions on symplectic manifolds, moment maps, Fubini-Studi form on projective space, Kähler forms as Hessians of plurisubharmonic function on complex manifolds, introduction to pseudoholomorphic curves, outline of proof of Gromov's non-squeezing theorem.

10MATH04-024-E Programming for mathematicians - 8 credits

Course content varies according to instructor's choice. Some possibilities are: Basic python syntax, Iterables and generators, Object oriented programming, introduction to Sage, the Numpy library, the Networkx library, graphics with Sage and Matplotlib and a Programming project.

BACK TO MAIN

Harish-Chandra Research Institute

Doctoral Program in Physics

The Ph.D. program consists of course work and projects for the first three semesters, followed by research work leading to a Ph.D. degree.

Curriculum and detailed course content

SYLLABUS FOR

INTEGRATED Ph.D. in PHYSICAL SCIENCES (PROGRAM CODE: PHYS05)

Course Structure

The Masters program consists of four semesters of pedagogical lectures

No	COURSE CODE	Semester I	No	COURSE CODE	Semester II	No	COURSE CODE	Semester III	No	COURSE CODE	Semester IV

Elective I : Choose one from — Advanced Statistical Mechanics, Fluid Mechanics, General Relativity, Non-linear Dynamics, Quantum Information and Computation I.

Elective II and III : Choose two from — Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra Cold Atoms.

Semester I

(1) Classical Mechanics

- A rapid review/summary of Newtonian mechanics
- Calculus of variations: Concept of variation - Euler equation - Applications - Variation subject to constraints and Lagrange multipliers.
- The Lagrangian formulation: Generalised coordinates and velocities - The principle of least action and the Lagrange equations of motion - Extension to constrained systems.
- Conservation laws: Symmetries and Noether's theorem.
- Integration of the Lagrange equations of motion: Motion in one dimension - The two body problem, reduced mass and the equivalent one-dimensional problem - Motion in a central field - Kepler's problem - Scattering.
- Small oscillations: Free, damped and forced oscillations in one dimension - Resonance - Damped and forced oscillations - Parametric resonance.
- Rigid body motion: Angular velocity - The inertia tensor and angular momentum of a rigid body - The equations of motion- Eulerian angles - Motion of tops - Motion in a rotating frame - Coriolis force.
- The Hamiltonian formulation: Hamiltonian and Hamilton equations - Poisson brackets - Dynamics in the phase space - Hamilton-Jacobi equation - Separation of variables and solutions - Action-angle variables - Adiabatic invariants.
- Elements of non-linear dynamics: Differential equations as dynamical systems - Lyapunov exponents.

Textbooks:

1. Mathematical Methods of Classical Mechanics, V I Arnold,
2. Classical Mechanics, T W B Kibble and F H Berkshire,
3. Classical Mechanics, H Goldstein,
4. Classical Mechanics, L D Landau and L M Lifshitz,
5. Introduction to Dynamics, I. Percival and D. Richards.

(2) Quantum Mechanics I

- Basic notions: states, operators, time evolution
- One-dimensional problems: harmonic oscillator, periodic potential, Kronig-Penny model;
- Three-dimensional problems: central force potential, the hydrogen atom
- Charged particle in an electromagnetic field: gauge invariance, Landau levels
- Symmetries and conservation laws in QM: Degeneracies, Discrete symmetries
- Angular momentum in quantum mechanics: raising and lowering operators, angular momentum addition, Clebsch-Gordon coefficients; Tensor operators and Wigner-Eckart theorem
- Time-independent perturbation theory: non-degenerate and degenerate cases, Stark and Zeeman effects
- Semiclassical (WKB) approximation and variational methods

Textbooks:

1. Introduction to Quantum Mechanics, D. J. Griffiths,
2. Quantum Mechanics, B. H. Bransden and C. H. Joachain,
3. Principles of Quantum Mechanics, P.A.M. Dirac,
4. Modern Quantum Mechanics, J. J. Sakurai,
5. Quantum Mechanics, E. Merzbacher,
6. Quantum Mechanics, L. I. Schiff,
7. Quantum Mechanics (Non-relativistic Theory), L.D. Landau and E.M. Lifshitz.

(3) Classical Electrodynamics

- Special theory of relativity and electrodynamics: Lorentz transformation of electromagnetic fields, Lorentz covariant formulation of electrodynamics; gauge invariance, Maxwell equations from action principle.
- The electrostatic limit of Maxwell equations, multipole expansion, uniqueness, boundary value problems, solution of Poisson equation.
- The magnetostatic limit of Maxwell equations, applications.
- Electrodynamics: motion of charges in external fields; electromagnetic waves in vacua and propagation through continuous media; energy-momentum of electromagnetic field and Poynting theorem.
- Advanced and retarded Green functions; Lienard-Wiechert potentials; dipole radiation and Larmor's formula; spectral resolution and angular distribution of radiation from a relativistic point charge; synchrotron radiation; Rayleigh and Thomson scattering; collision problems; Bremsstrahlung and Cerenkov radiation.
- Scattering of electromagnetic waves: Rayleigh and Thomson scattering, radiation damping.

Textbooks:

1. Introduction to Electrodynamics, D.J. Griffith,
2. Classical Electrodynamics, J.D. Jackson,
3. Electrodynamics of Continuous Media, Vol. 6 of Course of Theoretical Physics, L.D. Landau and E.M. Lifshitz.

(4) Mathematical Methods I

- Vector Analysis: operations with vectors, scalar and vector fields, gradient, curl and divergence. Line, surface, and volume integrals, Curvilinear coordinate systems, Elements of tensors.
- Vector Spaces, linear transformations, scalar product and dual space, bases, linear operators, eigenvalues and eigenfunctions, unitary and hermitian operators
- Complex Analysis: functions of a complex variable, analytic functions, integral calculus, contour integrals, Taylor and Laurent series, singularities, residues, principal values, Riemann surfaces, conformal mapping, analytic continuation

- Ordinary differential equations: linear ODEs, Green functions, second order differential equations: classification of singularities and local solutions, special functions
- Elements of statistics: probability, random walk. Probability distributions.

Textbooks:

1. Mathematical Methods in Physics, J. Mathews, R. L. Walker,
2. Advanced Mathematical Methods for Scientists and Engineers, C. M. Bender, S. A. Orszag,
3. Mathematical Methods for Physicists, G. B. Arfken, H. J. Weber, F. E. Harris,
4. Fundamentals of Mathematical Physics, E. A. Kraut,
5. Complex Variables, M. J. Ablowitz and A. S. Fokas.

(5) Laboratory I

- Forced Oscillations-Pohl's Pendulum:
- Coupled Pendula and Chaotic oscillator:
- Photoelectric effect:
- Normal and Anomalous Zeeman Effect:
- Michelson Interferometer:
- Mach-Zehnder Interferometer:
- Faraday Effect:
- Millikan Oil-drop Experiment:
- Electron Diffraction:
- Fine Structure:

Semester II

(6) Quantum Mechanics II

- Scattering theory and applications
- Schrodinger and Heisenberg pictures; postulates of quantisation
- Time dependent perturbation theory, Interaction picture, Fermi golden rule
- Path integrals: propagators, amplitudes as path integrals, Semiclassical methods revisited
- Quantum mechanics of many particles, identical particles and symmetries of the wave-function, scattering of identical particles
- Relativistic quantum mechanics, Klein-Gordon and Dirac equations and their solutions, gyromagnetic ratio of the electron, relativistic corrections to the Schrodinger equation
- Entangled states and Bell inequalities

Textbooks:

1. Principles of Quantum Mechanics, P.A.M. Dirac,
2. Quantum Mechanics and Path Integrals, R. P. Feynman and A. R. Hibbs,
3. Modern Quantum Mechanics, J. J. Sakurai,
4. Quantum Mechanics, E. Merzbacher,
5. Quantum Mechanics, L. I. Schiff,
6. Quantum Mechanics (Non-relativistic Theory), L.D. Landau and E.M. Lifshitz

(7) Research Methodology and Numerical Methods

- Research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers
- Introduction to programming languages: F77, F90 or C
- Errors in numerical calculations.
- Numerical linear algebra, eigenvalue and eigenvectors.
- Interpolation techniques.
- Generation and use of random numbers.
- Sorting and searching.
- Differentiation and Integration (including Monte Carlo techniques)
- Root finding algorithms
- Optimisation, extrema of many variable functions.
- ODEs and PDEs: including FFT and finite difference methods, integral equations.

Textbooks:

1. Research Methodology: Methods and Techniques, C.R. Kothari,
2. Numerical Mathematical Analysis by J. B. Scarborough,
3. Computer oriented numerical methods, V. Rajaraman,
4. Data reduction and error analysis for the physical sciences, P. R. Bevington and D. K. Robinson,
5. An Introduction to Error Analysis, J.R. Taylor.

(8) Statistical Mechanics

- Basics: phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
- Non interacting classical systems: few level systems, ideal gases, oscillators.
- Non interacting quantum systems: method of second quantisation, electrons in metals, relativistic electron systems, electrons in a strong magnetic field, lattice vibrations and phonon physics, photons, blackbody radiation, Bose condensation.

- Interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
- Phase transitions: symmetry breaking and long range order, mean field approach, Landau theory, 2nd and 1st order transitions, Landau-Ginzburg functional, illustrative examples, estimate of fluctuations.

Textbooks:

1. Statistical Mechanics, K. Huang,
2. Statistical Mechanics, R. K Pathria,
3. Fundamentals of statistical and thermal physics, F. Reif.

(9) Electronics

- Circuit theory: lumped circuit approximation, circuit elements, Kirchoff's current and voltage laws, resistive networks, node and loop analysis, Thevenin and Norton's theorem, time domain response of RL, RC and RLC circuits, frequency domain response, impedance, filters and transfer function.
- Analog electronics: discrete devices, characteristics and operation - diode, Zener diode, LED, photodiode. Simple diode circuits. Bipolar junction transistor (BJT): biasing, h parameters, small and large signal response, amplifiers. Field effect transistors.
- Operational amplifiers: device properties, integrator, differentiator, RC active filter, negative and positive feedback, oscillators.
- Digital electronics: logic gates, truth table, multiplexer, combinatorial circuits, flip-flop, counters, programmable logic devices, microprocessors.

Textbooks:

1. Electronic Principles, A. P. Malvino and D. J. Bates,
2. Digital Electronics, A. P. Malvino and A. P. Leach,
3. Integrated Electronics, J. Millman and C. C. Halkias.

(10) Laboratory II

- Coupled Oscillator Circuits:
- Thermal Equation of State and Critical point:
- Lock-in Amplifier and Signal Processing:
- OpAmps I: Amplifiers & Negative Feedback:
- OpAmps II: Limitations & Applications:
- Diodes: Clamps, Rectifiers, Power supplies
- Transistors I: Switch, Common Emitter Amplifier, Push-pull Follower
- Transistors II: Characteristics, Comparators, MoSFET, CMoS Inverter
- Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
- Flip-flops: as Memory element, Shift Register, Counters

- Microcontroller I: Programming to MCU, using the port for input
- Microcontroller II: Some Applications, Seven Segment Display

---

Semester III

(11) Condensed Matter Physics I

- The building blocks - atoms to solids: atomic physics, Coulomb effects, crystal fields in solids, local moments and band electrons, lattice vibrations, electron-lattice coupling, electron-electron interactions.
- Structure: characterizing structures - crystalline/amorphous/liquids, classification of periodic structures, reciprocal space, x-ray and neutron diffraction.
- Electronic structure: free electrons - spectrum, density of states, thermodynamics, band electrons - nearly free electron and tight binding limits, consequences for thermodynamics and transport.
- Physics of metals: specific heat, susceptibility, impurity scattering, basic transport theory. Response to magnetic fields: Landau quantization, quantum Hall effect.
- Phonons: Debye and Einstein model, spectrum of a real lattice, thermodynamics of phonons, anharmonic effects, Debye-Waller factor.
- Magnetism: spin paramagnetism, itinerant-vs-localised electrons, Stoner and Heisenberg models, mean-field theory, spin waves.
- Superconductivity: phenomenology, pairing interaction, BCS theory, Ginzburg-Landau theory and type II superconductors.

Textbooks:

1. Condensed matter physics - N. W. Ashcroft and N. D. Mermin,
2. Solid State Physics - C. Nayak,
3. Solid State Basics - S. Simon,
4. Introduction to many body physics - T. Giamarchi, A. Lucci and C. Berthod,
5. Lessons from nano-electronics - a new perspective on transport - S. Datta.

(12) Quantum Mechanics III

- Atomic physics: One electron atoms - spin-orbit interaction, fine structure, Lamb shift, Zeeman effect, Stark effect.

- Two electron atoms: spin wave functions, approximate handling of electron-electron repulsion. Coupling of angular momenta, multiplet structure, gyromagnetic effects. Hyperfine and nuclear quadrupole interactions.
- Many electron atoms: central field approximation, Thomas-Fermi and Hartree-Fock methods.
- Molecular physics: Born-Oppenheimer approximation, molecular structure, rotation and vibration of diatomic molecules, hydrogen molecular ion, vibrational-rotational coupling, effect of vibration and rotation on molecular spectra. Electronic structure- molecular orbital and valence bond theories.
- Atoms and light: transition rates, dipole approximation, Einstein coefficients, radiative damping, optical absorption, ac Stark effect.
- Cold atoms: Doppler cooling, magneto-optical trap, ion traps, dipole force, evaporative cooling, optical lattice.
- Collective effects: Feshbach tuning of interactions, Bose condensation of alkali atoms, BCS-BEC crossover, the unitary Fermi gas. Imaging cold atoms.
- Computing with atoms: qubits and their properties, entanglement, quantum logic gates, decoherence and error correction.

Textbooks:

1. Theoretical Atomic Physics, H. Friedrich,
2. Atomic Physics, C. Foot,
3. Physics of Atoms and Molecules, B. H. Bransden and C. H. Joachain,
4. Molecular Quantum Mechanics, P. Atkins and R. Friedman.

(13) Quantum Field Theory I

- Non-relativistic quantum field theory: quantum mechanics of many particle systems; second quantisation; Schrodinger equation as a classical field equation and its quantisation; inclusion of inter-particle interactions in the first and second quantised formalism
- Irreducible representations of the Lorentz group, connection to quantum fields
- Symmetries and conservation laws: examples in non-relativistic and relativistic field theories; translation, rotation, Lorentz boost/Galilean transformation and internal symmetry transformations; associated conserved charges
- Free Klein-Gordon equation: classical action and its quantisation; spectrum; Feynman rules for computing n-point Green functions of elementary and composite operators.
- Interacting Klein-Gordon field: Feynman rules for computing Green functions; physical mass of the particle from the analysis of two point Green functions; S-matrix and its computation from n-point Green functions; relating S-matrix to cross-section.
- Quantisation of free Dirac fields: spectrum; Feynman rules
- Quantisation of free electromagnetic field: role of gauge invariance; gauge fixing; physical state condition; spectrum; Feynman rules

- Quantum electrodynamics: coupling Dirac field to electromagnetic field; gauge invariance; quantisation; Feynman rules for computing Green functions; Spectrum and S-matrix from the Green functions.

Textbooks:

1. An introduction to Quantum Field Theory, M. E. Peskin and D. V. Schroeder,
2. Quantum Field Theory, C. Itzykson and J-B Zuber,
3. Relativistic Quantum Fields, J. D. Bjorken and S. Drell.

(14) Mathematical Methods II

- Integral transforms, Fourier transforms, inversion and convolution, Laplace transforms
- Advanced topics in ODE, Partial differential equations: classification of second order PDEs, Laplace and Poisson equations, applications to electrostatics, Heat equation, Wave equation
- Group theory, definitions and examples of groups. Homomorphism, isomorphism and automorphism, Permutation groups
- Group representation: reducibility, equivalence, Schur's lemma. Lie groups and Lie algebras, SU(2) and SU(3). Representations of simple Lie algebras, SO(n), Lorentz group. Symmetries in physical systems, Young Tableau.

Textbooks:

1. Mathematics for Physicists, P. Dennery and A. Krzywicki,
2. Introduction to Topology, Differential geometry, and group theory to physicists, S. Mukhi and N. Mukunda,
3. Classical Groups for physicists, B. G. Wybourne,
4. Group Theory, P. Ramond.

(15) Elective I

Choose any one of the following topics, Advanced Statistical Mechanics, Fluid Dynamics, General Theory of Relativity, Techniques in Nonlinear Dynamics, Quantum Information and Computation I.

• Advanced Statistical Mechanics

- Critical phenomena : Liquid-gas transition and Van der Waals equation of state, Classical spin systems, Transfer matrix for one dimensional systems, Order parameters, Mean field approach, Landau theory, Universality, Critical exponents, Scaling hypothesis, Estimating fluctuations
- Renormalisation : Hubbard-Stratanovich transformation and the Ginzburg-Landau-Wilson functional,Self-consistent approximation, Basic ideas of renormalisation

group, Real space RG in one and two dimensions, Spherical limit, Wilsonian RG and ε-expansion, Field theoretic RG, Two dimensions and BKT transition

- Equilibrium dynamics : Conserved and broken symmetry variables, Hydrodynamic approach, Dynamical critical phenomena
- (Extra module : one of the following two) :
- Non-equilibrium phenomena : Fluctuation-dissipation, Linear response, Kubo formula, Langevin and Fokker-Planck descriptions
- Stochastic thermodynamics : Non-equilibrium work theorems (Jarzynski, Crooks, …), Non-equilibrium steady-states, Stochastic heat engines, Examples from colloidal systems and molecular motors

Textbooks:

1. Field Theory and Renormalisation Group, D. J. Amit,
2. Modern Theory of Critical Phenomena, S. K. Ma,
3. Lectures on Phase Transition and The Renormalisation Group, N. Goldenfeld,
4. Quantum Field Theory and Critical Phenomena, J. Zinn-Justin.

• Fluid Mechanics

- Ideal Fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity
- Viscous Fluids: Viscosity, Navier-Stokes equation, Reynolds number, laminar flow, exact solution to the eq. of motion.
- Turbulence: Stability of flows, instabilities, quasi-periodic flows, Strange attractors, turbulent flows, jets, free shear layers, wakes, boundary layers
- Thermal Conduction in fluids: eq. of heat transfer, conduction in incompressible fluid, law of heat transfer, convection, convective instability in static fluid
- Compressible flows
- Relativistic Fluid dynamics: eq. of motion, energy-momentum tensor, eq. for flow with viscosity and thermal conduction.

Textbooks:

1. Fluid Mechanics, L. D. Landau and E. M. Lifshitz,
2. An Introduction to Fluid Dynamics, G. K. Batchelor,
3. Relativistic Fluid Dynamics, A. Anile and Y. Choquet-Bruhat.

• General Theory of Relativity

- Review of Lorentz transformations and special theory of relativity.
- Tensors and their transformation laws; Christoffel symbol and Riemann tensor; geodesics; parallel transport along open lines and closed curves; general properties of the Riemann tensor.

- Equivalence principle and its applications: gravity as a curvature of space-time; geodesics as trajectories under the influence of gravitational field; generalisation to massless particles; gravitational red-shift; motion of a charged particle in curved space-time in the presence of an electric field; Maxwells equation in curved space-time.
- Einsteins equation, Lagrangian formulation, Einstein-Hilbert action.
- Schwarzschild solution: construction of the metric and its symmetries; motion of a particle in the Schwarzschild metric; Schwarzschild black hole; white holes and Kruskal extension of the Schwarzschild solution: construction of the metric and its symmetries; Motion of a particle in the Schwarzschild metric; precession of the perihelion; bending of light; horizon, its properties and significance.
- Precession of the perihelion; bending of light; radar echo delay.
- Initial value problem; extrinsic curvature; Gauss-Codacci equations;
- Linearised theory, gravitational waves, field far from a source, energy in gravitational waves, quadrupole formula
- Elementary cosmology: principles of homogeneity and isotropy; Friedman-Robertson-Walker metric; open, closed and flat universes; Friedman equation and stress tensor conservation, equation of state, big bang hypothesis and its successes.

Textbooks:

1. General Relativity, S. Weinberg,
2. Lecture Notes on General Relativity, S. Carroll,
3. Introducing Einstein's Relativity, R. D'Inverno,
4. General Relativity, R. M. Wald.

• Nonlinear Dynamics

- Long time behaviour of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
- Periodic orbit for conservative systems, periodic orbits for dissipative systems (limit cycles) and their stability, Bifurcations and centre manifolds.
- Different kinds of perturbation theory for calculating periodic orbits, Renormalisation group aided perturbation theory, Poincare Bendixon theorem, chaos and strange attractors.
- Maps, fixed points, cycles and stability, bifurcations , period doubling, intermittency and quasi periodicity, universal behavior at the onset of chaos , renormalization group and scaling behaviour.
- Partial differential equations, patterns, Galerkin truncations and reduction to dynamical systems.

Textbooks:

1. Chaos in Dynamical Systems, E. Ott,

2. Arithmetical Chaos, E. B. Bogomolny, B. Georgeot, M.-J. Giannoni, C. Schmit,
3. Nonlinear Dynamics and Chaos, S. H. Strogatz.
4. Deterministic Chaos, H. G. Schuster.

- ## Quantum Information and Computation I

- Quantum formalism: states, evolution, measurements.
- Multipartite quantum systems: description and manipulation of bipartite systems and beyond.
- Entanglement: quantification and detection in bipartite and multipartite systems.
- Quantum communication: no-cloning theorem, quantum teleportation, quantum dense coding, multipartite communication protocols.
- Quantum cryptography: essential classical cryptography, BB84, B92, Ekert, and secret sharing protocols.
- Quantum computation: quantum algorithms, universal gates.
- Interface of quantum information with other sciences.
- Experimental realisations.

Textbooks:

1. Quantum Computation and Quantum Information, M. Nielsen and I. Chuang,
2. Lecture Notes of J. Preskill, available at http://www.theory.caltech.edu/~preskill/ph229/
3. Quantum information, G. Alber et al (Editors),
4. Lectures on Quantum Information, D. Bruss and G. Leuchs,
5. Quantum Theory: Concepts and Methods, A. Peres,
6. The Physics of Quantum Information: Quantum Cryptography, Quantum Teleportation, Quantum Computation, D. Bouwmeester, A. Ekert, and A. Zeilinger.

Semester IV

(16) Particle Physics

- Experimental methods: fixed target and collider experiments, particle detectors.
- Role of symmetries: charge conjugation, parity, time reversal, isospin and SU(2), quark model and SU(3).
- Introduction to relativistic kinematics: Mandelstam variables, phase space, calculation of cross-sections and decay widths.

- Basics of quantum electrodynamics: electron-positron annihilation, electron-muon scattering, Bhabha scattering, Compton scattering.
- Deep inelastic scattering: Bjorken scaling, parton model, scaling violation, introduction to quantum chromodynamics and tree level processes.
- Introduction to weak interactions: parity violation, V-A theory, pion and muon decay, neutrino scattering.
- Standard Model: Glashow-Salam-Weinberg model, neutral current, physics of W, Z and Higgs, CKM mixing and CP violation.
- Neutrino physics, neutrino oscillation

Textbooks:

1. Quarks and Leptons: F. Halzen and A. Martin,
2. An Introductory Course of Particle Physics: P. B. Pal,
3. Dynamics of the Standard Model: J. F. Donoghue, E. Golowich and B. R. Holstein,
4. Field Theory and Particle Physics: B. De Witt and J. Smith.

(17) Elective II and (18) Elective III

Choose any two of the following topics,

Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure Calculations, Quantum Field Theory II, Quantum Optics, Soft Matter, Ultra cold Atoms.

• Astrophysics

- Introduction to celestial objects, coordinates and the concept of time. Radiation transfer. Equations of radiation transfer, Black-body/thermal radiation, Opacity and optical depth, solutions of the radiation transfer equations in limiting cases, Rosseland mean opacity.
- Thermal Bremsstrahlung emission, synchrotron emission. Self-absorption and the emergent spectrum. Thomson scattering. Compton and Inverse-Compton scattering. Scattering in a region with magnetic field, Faraday rotation Introduction to fluid dynamics. Convection instability and transfer of energy from cores of stars. Supersonic motion, shocks.
- Introduction to Magneto-hydro dynamics, flux freezing, Generation and amplification of magnetic fields in astrophysical situations.
- Stellar structure. Mass-radius relation for main sequence stars, Minimum and maximum mass for nucleosynthesis, Hertzsprung-Russell diagram, Evolution of a star on the HR diagram. Novae and Supernovae, End points of stellar evolution. Inter-stellar medium. Phases of interstellar medium. Thermal, photoionisation, chemical and pressure equilibrium, Star formation, feedback and the evolution of ISM.

- Orbits around massive bodies, Tidal disruption, restricted 3 body problem, Roche limit. Orbits in external potentials, potential-density pairs. An overview of models for galaxies. Accretion of matter on to a point mass, spherical accretion, Eddington limit.
- Introduction to Cosmology, Friedmann models, equations. Hubble's law. A brief overview of the thermal history of the universe.

Textbooks:

1. Theoretical Astrophysics-I, T. Padmanabhan,
2. Theoretical Astrophysics-II, T. Padmanabhan,
3. An Introduction to Modern Astrophysics, B. W. Carroll and D. A. Ostlie,
4. Astrophysics for Physicists, A. Roy Choudhuri.

• Condensed Matter Physics II

The course will consist of any two of A-D:

Part A: Mesoscopics and spintronics:

- Foundation: low dimensional systems: quantum Wells, wires and quantum dots, 1D and 2D heterostructures, coupled wells and superlattices.
- Charge Transport: transmission and its relation to conductance, Landauer theory, transmission function, S matrix and Green functions. Non-equilibrium Green functions and Landauer-Buttiker theory. Noise in Charge transport, scattering theory of shot noise.
- Spintronics: introduction to spintronics.(Datta-Das spin transistor) equilibrium and non-equilibrium spin currents, spin Hall effect, coupled charge and spin transport, TMR, spin shot noise, entanglement generation and its detection.

Part B: Electronic structure:

- Physics in low dimensions: surface states, reconstructions, adsorption, atomic wires and clusters.
- Electron-electron interactions: Hartree-Fock approximation, electron gas, density functional theory.
- Anharmonic effects in crystals: thermal expansion, lattice thermal conductivity, umklapp processes.
- Phonons in metals: Kohn anomaly, dielectric constant, temperature dependence of electrical resistivity.
- Dielectric properties of insulators. Plasmons, magnons etc.

Part C: Mesoscopics and interacting systems:

- Quantum Hall effect
- Quantum dots and quantum wires, Kondo effect
- Fermi liquid theory and non-Fermi liquids
- Bosonization and Luttinger liquids.
- Quantum spin systems

Part D: Correlated electrons:

- Mott physics: electron localization, magnetic order, doped phase, physics in the cuprates.
- Kondo systems: physics of the single impurity, dense systems Kondo and Anderson lattice, heavy fermions, quantum criticality.
- Metallic magnets: ferromagnetism in strongly repulsive systems, the transition metals, spin-fermion systems, the double exchange model, the classical Kondo lattice.
- Electron-phonon coupling: the classical theory, polaron formation, many electron systems, polaron ordering, physics in the manganites.
- Superconductivity: the BCS-BEC crossover, superconductivity in repulsive systems, competition with magnetism, effect of disorder.

Textbooks:

1. Condensed matter field theory - A. Altland and B. Simons,
2. Field theories of condensed matter physics - E. Fradkin,
3. Electronic transport in mesoscopic systems - S. Datta,
4. Composite fermions - J. K. Jain,
5. Topological insulators and topological superconductors - B. Bernevig and T. Hughes.
6. Aromaticity and Metal Clusters, Ed. P. Chattaraj
7. Introduction to Cluster Dynamics, P.-G. Reinhard and E. Suraud
8. Surface Science, an Introduction by Oura et al.
9. Principles of Surface Physics, F. Bechstedt
10. Physics at Surfaces, A. Zangwill

• Cosmology

- Friedman-Robertson-Walker metric, Friedman equation and stress tensor conservation, equation of state: matter, radiation, cosmological constant, experimental evidence for dark matter and dark energy.
- Age of the universe, cosmological horizon, expansion rate.
- Thermal history of the universe, formation of hydrogen and origin of CMBR, decoupling of neutrinos, nucleosynthesis, recombination.
- The horizon problem, possible resolution via inflation, slow roll condition and slow roll parameters, reheating, inflationary origin of density perturbation.
- Early history, electroweak baryogenesis via leptogenesis, dark matter.

- Theory of cosmological perturbations: gauge invariant scalar and tensor perturbations, spectral index, ratio of tensor to scalar fluctuation and Lyth bound, transition from quantum to classical perturbation: horizon exit and reentry, from density fluctuation to CMB fluctuations via Boltzmann transport equation, origin of the acoustic peak, and origin of CMB polarisation, E and B modes.

Textbooks:

1. Cosmology, S. Weinberg,
2. Physical Foundations of Cosmology, V. Mukhanov,
3. Particle Physics and Inflationary Cosmology, A. Linde.

• Introduction to Electronic Structure

- Review of QM: variational method, identical particles, many fermion wave functions.
- First-principles Hamiltonian and Born-Oppenheimer approximation.
- Treating electron-electron interactions: Hartree-Fock approximation, exchange energy, correlation energy.
- Density functional theory: Thomas-Fermi method, Hohenberg-Kohn theorems, Levy constrained search formulation, Kohn-Sham formulation, exchange-correlation energy, LDA and GGA functionals, spin density functional theory.
- Solution of the Kohn-Sham equations, basis sets - LCAO: STO-NG, 4-31G, 6-31G etc, quality of basis sets, polarisation functions, spin-restricted calculations, Roothan equations.
- Spin unrestricted calculations. Plane wave basis set.
- Pseudopotentials and PAW in conjunction with plane waves.
- Structure optimisation, Hellman-Feynman theorem.
- Simple practical applications: band structure of standard solids, metals and semiconductors, optimisation of lattice constants, cohesive energies and other simple properties.
- Possible advanced topics: hybrid functionals, van der Waals interactions, density functional perturbation theory, phonon band structure, electron-phonon coupling. CI, CCSD methods, QMC.

Textbooks:

1. Density Functional Theory of Atoms and Solids, R. G. Parr and W. Yang,
2. Modern Quantum Chemistry, A. Szabo and N. S. Ostlund,
3. Electronic Structure of Materials, R. Prasad,
4. Electronic Structure, R. Martin.

• Quantum Field Theory II

- Path integrals for scalar and fermionic fields: generating functional, Feynman rules, loop diagrams.
- Renormalisation of scalar and Yukawa theories: power counting, regularisation, renormalisable and non-renormalisable theories, Green functions at 1 loop of some prototypical theories, basics of renormalisation group (running coupling), 1PI effective actions.
- Spontaneous symmetry breaking and Goldstone's theorem.
- Path integrals for the Maxwell field, gauge fixing.
- Renormalisation of QED: 1 loop diagrams, Landau pole.
- Non-abelian Gauge Theories: Classical theory of non-abelian gauge theories, Quantization of non-abelian gauge theories by path integral methods, Non-abelian gauge theories at one loop and asymptotic freedom, Spontaneous symmetry breaking in non-abelian gauge theories.

Textbooks:

1. An introduction to Quantum Field Theory, M. E. Peskin and D. V. Schroeder,
2. Quantum Field Theory, C. Itzykson and J-B Zuber,
3. Quantum Field Theory: A Modern Primer, P. Ramond.

• Quantum Information and Computation II

- General evolution and Decoherence theory.
- Master equations (Markovian and Non-Markovian, Various measure of nonmarkovianity).
- Advanced entanglement theory (GM, GGM, newly proposed measures etc).
- Quantum Correlation beyond Entanglement (Quantum Discord, Geometric discord, Work-Deficit etc).
- Resource theory in QI (Entanglement, Quantum Coherence, Reference Frame, Asymmetry etc).
- Quantum Thermodynamics.
- Advanced topics in quantum channels.
- Quantum information and condensed matter systems.

Textbooks:

1. Lecture Notes on the Theory of Open Quantum Systems by D. A. Lidar,
2. The Theory of Open Quantum Systems by H.-P. Breuer, F. Petruccione,
3. Classical and Quantum Computation, A. Yu. Kitaev, A. H. Shen, and M. N. Vyalyi.

• Quantum Optics

- Introduction: Quantization of the electromagnetic field, Fock states, coherent states, squeezed states, basic atom-photon interaction, density-matrix formalism.
- Theory of coherence; Semiclassical theory of atom-photon interaction.
- Quantum theory of atom-photon interaction.
- Quantum theory of dissipation.
- Quantum information in continuous variable systems; Quantum state engineering.
- Quantum operations based on beam splitters, mirrors, squeezing and homodyne and heterodyne measurements and nonlinear operations such as parametric down converters.
- Photon addition and subtraction operations; Elements of cavity QED.

Textbooks:

1. Quantum Optics, M. O. Scully and S. Zubairy,
2. Introductory Quantum Optics, C. C. Gerry and P. L. Knight,
3. Quantum Optics, D. F. Walls and G. J. Milburn,
4. Quantum Information with Continuous Variables of Atoms and Light, N. J. Cerf, G. Leuchs and E. S. Polzik (eds.),
5. Quantum information with continuous variables, S. L. Braunstein and P. van Loock.

• Soft Matter

- Forces, energies and timescales in soft matter, van der Waals force, hydrophobic and hydrophilic interactions. Basic phenomenology of liquid crystals, polymers, membranes, colloidal systems. Phase behaviour, diffusion and flow, viscoelasticity.
- Order parameter, phase transitions: mean-field theory and phase diagrams, elasticity, stability, metastability, interfaces.
- Colloidal systems: Poisson-Boltzmann theory, DLVO theory, sheared colloids, stability of colloidal systems, measurement of interaction.
- Polymers: model systems, chain statistics, polymers in solutions and in melts, flexibility and semi-flexibility, distribution functions, self-avoidance, rubber elasticity, viscoelasticity, reptation ideas.
- Membranes: fluid vs. solid membranes, energy and elasticity, surface tension, curvature, de Gennes-Taupin length, brief introduction to shape transitions.
- Experimental tools and numerical approaches: Stokes limit, Rouse and Zimm Model for polymers, membranes, relaxation, computational studies, multiscale modelling.
- The intent is to train students in the applications of classical statistical mechanics in areas like fluids, colloids, membranes polymers. This includes training in the mathematical tools as well as the phenomenology.

Textbooks:

1. Soft Matter Physics, M. Kleman and O. D. Lavrentovich,
2. Soft Condensed Matter, R. L. Jones,
3. Principles of Condensed Matter Physics, P. Chaikin and T. C. Lubensky (Cambridge),
4. Statistical Mechanics of Surfaces, Interfaces and Membranes, S. A. Safran,
5. Soft Matter Physics, Ed, M. Daoud and C. E. Williams,
6. The Structure and Rheology of Complex Fluids, R. Larson,
7. Intermolecular and Surface Forces, J. Israelachvili.

• Ultra-Cold Atoms

- Spatial, time, and energy scales in cold atom physics.
- Experimental background: trapping and cooling, Feshbach resonance, optical lattices, cold atom spectroscopies.
- Basic theory: many particle physics, mean field theory, phase transitions, perturbation theory.
- Continuum bosons: bosons in free space, weak interactions, Bogoliubov theory, BEC in trapped systems, Gross-Pitaevski equation.
- Continuum fermions: fermions in free space, trapped fermions, Fermi liquid theory, weak attraction - BCS instability, strong attraction - BEC of pairs, the unitary Fermi gas, Stoner instability.
- Optical lattices: Hubbard model - Bose/Fermi cases, superfluid-Mott transition for repulsive bosons, BCS-BEC crossover for attractive fermions, Mott transition in repulsive fermions.
- Spin systems: quantum, S = 1/2, magnetism on unfrustrated and frustrated lattices. Entanglement in many body systems: pure states, mixed states, area laws, tensor network states.
- Special topics: population imbalance, Anderson localisation, gauge fields, quench dynamics.
- The course combines elements of atomic physics with many body theory to model collective phenomena in cold atomic gases. The students would learn of the application of quantum statistical mechanics and many body theory in the context of interacting Bose and Fermi gases.

Textbooks:

1. Many Body Physics with Ultracold Gases, Les Houches Lectures, Ed, C. Salomon, G. Shlyapnikov and L. F. Cugliandolo,
2. Ultracold Quantum Fields, H. T. C. Stoof, K. B. Gubbels and D. B. M. Dickerscheid,

3. Ultracold Bosonic and Fermionic Gases, K. Levin, A. L. Fetter and D. M. Stamper-Kurn,
4. Bose-Einstein Condensation in Dilute Gases, C. J. Pethick and H. Smith,
5. Bose-Einstein Condensation, L. P. Pitaevskii and S. Stringari,
6. Theory of Ultracold Fermi Gases, S. Giorgini, L. P. Pitaevskii and S. Stringari,
7. Ultracold Atoms in Optical Lattices: M. Lewenstein et al.
8. Cold Atoms and Molecules: Weidenmuller, Zimmerman.

(19)Project

In this semester, every student is supposed to do a project on a theoretical physics topic under the supervision of HRI faculty. Main fields in theoretical physics represented at HRI at the moment are, Astrophysics, Condensed Matter Physics, Particle Physics Phenomenology, Quantum Information and Computation, and String Theory.

(20) Laboratory III

- Ferro to Para Electric Phase Transition (or its Magnetic analogue)
- Raman Spectroscopy
- ESR
- Earth's field NMR gradient
- Bragg Diffraction by Microwaves
- Hall Effect
- G-M counter, Counting Statistics, Gamma ray absorption cross section
- Gamma ray Spectroscopy
- STM with Graphene, HOPG, Gold, Semiconductors and CDW
- Measurement of Speed of Light

Other Electives

• Advanced Particle Physics

- The discovery of the Higgs boson; the Higgs and vacuum stability.
- Issues in collider physics, motivations and outcome of the LHC, motivations for future collider experiments.
- CP-violation, the unitarity triangle, outcomes of B-factory measurements.
- The evolution of parton distribution functions, Altarelli-Parisi equation, applications to LHC physics.
- The motivations for physics beyond the Standard Model current constraints from accelerator and astroparticle/cosmological data, the dark matter issue; supersymmetry, grand unification.

Textbooks:

1. Gauge Theory of Elementary particle physics, T.-P. Cheng and L.-F. Li,
2. Foundations of Quantum Chromodynamics, T. Muta,
3. Collider Physics, V. D. Barger and R. J. N. Phillips,
4. Beyond Standard Collider Phenomenology of Higgs Physics and Supersymmetry, M. C. Thomas.

• Spectroscopic Methods

- Probes for matter on different energy and spatial scales.
- Interaction of electromagnetic radiation with matter, correlation functions in classical and quantum matter, point group symmetries and selection rules.
- Electron spectroscopy in atoms and molecules: single and many electron atoms, simple molecules, vibronic transitions.
- Vibration and rotational spectroscopy: infrared, Raman and microwave methods. Computing the spectrum of simple atomic and molecular systems.
- Probing spin states: electron spin resonance and nuclear magnetic resonance. Mossbauer spectroscopy. Spectra of magnetic ions. Solid state effects on the spectrum.
- Probe of collective effects: X-ray and neutron scattering from condensed matter. Static structure and dynamical correlations. Effect of phonons on lattice dynamical structure factor. Dynamical magnetic structure factor from ferro and antiferromagnetic spin waves. Diffuse magnetic scattering. Dynamics of classical liquids.
- Extended electronic states: angle resolved photoemission spectroscopy, computing the spectrum for weakly correlated electron systems.
- Ultrafast dynamics: control and probe of chemical reactions via femtosecond spectroscopy.

Textbooks:

1. Modern Spectroscopy, J. M. Hollas,
2. Symmetry and Spectroscopy, Harris and Bertolucci,
3. Introductory Raman Spectroscopy, J. R. Ferraro, K. Nakamoto and C. W. Brown,
4. Understanding NMR Spectroscopy, J. Keeler,
5. Theory of Neutron Scattering from Condensed Matter, S. W. Lovesey,
6. Dynamic Light Scattering, Berne and Pecora,
7. Photoemission in High Tc Superconductors, Campuzano, Norman and Randeria, in Bennemann and Ketterson, Superconductivity Vol. 2,
8. Chemical Reactions and their Control on the Femtosecond Time Scale, P. Gaspard and I. Burghardt Femtosecond Laser Spectroscopy, Ed, P. Hannaford.

Quantum Many Body Theory

- Basics: second quantisation, the many body Hilbert space, few particle problems. Green functions: formal definition, Lehmann representation, calculation for quadratic problems, expression of observables in terms of Green functions. Finite temperature: the imaginary time formulation, analytic continuation.
- Perturbation theory: the interaction representation, Wicks theorem, low order expansion and diagrammatic representation, Dyson equation and self-energy, vertex functions and Bethe-Salpeter equation, explicit calculations in the Anderson impurity model.
- Resummations: random phase approximation in the electron gas, ladder summation in dilute hardcore systems, Hartree-Fock and higher order conserving approximations.
- Long range order: self-consistent calculations for broken symmetry phases, static mean field and dynamical calculations, Nambu formulation and Eliashberg theory. Goldstone modes in the ordered phase - metallic antiferromagnets and superconductivity,
- Functional integral methods: representing the partition function, bosons and fermions, quadratic integrals, Hubbard-Stratonovich decomposition of interactions, saddle point, gaussian fluctuations, beyond the gaussian theory, Ginzburg-Landau expansions.

Textbooks:

1. Introduction to Many-Body Physics, P. Coleman,
2. Fundamentals of Many-Body Physics: Principles and Methods, W. Nolting,
3. Quantum Theory of Many-Particle Systems, A. L. Fetter and J. D. Walecka,’
4. Many-Body Physics, G. D. Mahan.

The instructional part of the doctoral program consists of two semesters of pedagogical lectures followed by two projects in the third semester.

Semester V	Semester VI
Elective I	Elective II
Project	Elective III
Mathematical Methods II	Statistical Mechanics
Quantum Field Theory I	Numerical Methods

Elective I : Choose one from — Fluid Mechanics, General Relativity, Non-linear Dynamics, Quantum Information and Computation I, Quantum Mechanics III .

Elective II and III : Choose two from — Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure, Particle Physics, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra Cold Atoms.

Semester V

08PHYS05-021-C Quantum Field Theory I

Non-relativistic quantum field theory: quantum mechanics of many particle systems; second quantisation; Schrodinger equation as a classical field equation and its quantisation; inclusion of inter-particle interactions in the first and second quantised formalism

Irreducible representations of the Lorentz group, connection to quantum fields

Symmetries and conservation laws: examples in non-relativistic and relativistic field theories; translation, rotation, Lorentz boost/Galilean transformation and internal symmetry transformations; associated conserved charges

Free Klein-Gordon equation: classical action and its quantisation; spectrum; Feynman rules for computing n-point Green functions of elementary and composite operators.

Interacting Klein-Gordon field: Feynman rules for computing Green functions; physical mass of the particle from the analysis of two point Green functions; S-matrix and its computation from n-point Green functions; relating S-matrix to cross-section.

Quantisation of free Dirac fields: spectrum; Feynman rules

Quantisation of free electromagnetic field: role of gauge invariance; gauge fixing; physical state condition; spectrum; Feynman rules

Quantum electrodynamics: coupling Dirac field to electromagnetic field; gauge invariance; quantisation; Feynman rules for computing Green functions; Spectrum and S-matrix from the Green functions.

08PHYS05-022-C Mathematical Methods II

Integral transforms, Fourier transforms, inversion and convolution, Laplace transforms

Advanced topics in ODE, Partial differential equations: classification of second order PDEs, Laplace and Poisson equations, applications to electrostatics, Heat equation, Wave equation

Group theory, definitions and examples of groups. Homomorphism, isomorphism and automorphism, Permutation groups

Group representation: reducibility, equivalence, Schur's lemma. Lie groups and Lie algebras, SU(2) and SU(3). Representations of simple Lie algebras, SO(n), Lorentz group. Symmetries in physical systems, Young Tableau.

08PHYS05-023-C Project

In this semester, every student is supposed to do a project on a theoretical physics topic under the supervision of HRI faculty. Main fields in theoretical physics represented at HRI at the moment are, Astrophysics, Condensed Matter Physics, Particle Physics Phenomenology, Quantum Information and Computation, and String Theory.

Elective I

Choose any one of the following topics, Fluid Dynamics, General Theory of Relativity, Techniques in Nonlinear Dynamics, Quantum Information and Computation I and Quantum Mechanics III.

08PHYS05-015-E Fluid Mechanics

Ideal Fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity

Viscous Fluids: Viscosity, Navier-Stokes equation, Reynolds number, laminar flow, exact solution to the eq. of motion.

Turbulence: Stability of flows, instabilities, quasi-periodic flows, Strange attractors, turbulent flows, jets, free shear layers, wakes, boundary layers

Thermal Conduction in fluids: eq. of heat transfer, conduction in incompressible fluid, law of heat transfer, convection, convective instability in static fluid

Compressible flows

Relativistic Fluid dynamics: eq. of motion, energy-momentum tensor, eq. for flow with viscosity and thermal conduction.

08PHYS05-016-E General Theory of Relativity

Review of Lorentz transformations and special theory of relativity.

Tensors and their transformation laws; Christoffel symbol and Riemann tensor; geodesics; parallel transport along open lines and closed curves; general properties of the Riemann tensor.

Equivalence principle and its applications: gravity as a curvature of space-time; geodesics as trajectories under the influence of gravitational field; generalisation to massless particles; gravitational red-shift; motion of a charged particle in curved space-time in the presence of an electric field; Maxwells equation in curved space-time.

Einsteins equation, Lagrangian formulation, Einstein-Hilbert action.

Schwarzschild solution: construction of the metric and its symmetries; motion of a particle in the Schwarzschild metric; Schwarzschild black hole; white holes and Kruskal extension of the Schwarzschild solution: construction of the metric and its symmetries; Motion of a particle in the Schwarzschild metric; precession of the perihelion; bending of light; horizon, its properties and significance.

Precession of the perihelion; bending of light; radar echo delay.

Initial value problem; extrinsic curvature; Gauss-Codacci equations;

Linearised theory, gravitational waves, field far from a source, energy in gravitational waves, quadrupole formula

Elementary cosmology: principles of homogeneity and isotropy; Friedman-Robertson-Walker metric; open, closed and flat universes; Friedman equation and stress tensor conservation, equation of state, big bang hypothesis and its successes.

08PHYS05-017-E Nonlinear Dynamics

Long time behaviour of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.

Periodic orbit for conservative systems, periodic orbits for dissipative systems (limit cycles) and their stability, Bifurcations and centre manifolds.

Different kinds of perturbation theory for calculating periodic orbits, Renormalisation group aided perturbation theory, Poincare Bendixon theorem, chaos and strange attractors.

Maps, fixed points, cycles and stability, bifurcations , period doubling, intermittency and quasi periodicity, universal behavior at the onset of chaos , renormalization group and scaling behaviour.

Partial differential equations , patterns, Galerkin truncations and reduction to dynamical systems.

08PHYS05-018-E Quantum Information and Computation I

Quantum formalism: states, evolution, measurements.

Multipartite quantum systems: description and manipulation of bipartite systems and beyond.

Entanglement: quantification and detection in bipartite and multipartite systems.

Quantum communication: no-cloning theorem, quantum teleportation, quantum dense coding, multipartite communication protocols.

Quantum cryptography: essential classical cryptography, BB84, B92, Ekert, and secret sharing protocols.

Quantum computation: quantum algorithms, universal gates.

Interface of quantum information with other sciences.

Experimental realisations.

08PHYS05-019-E Quantum Mechanics III

Atomic physics: One electron atoms - spin-orbit interaction, fine structure, Lamb shift, Zeeman effect, Stark effect.

Two electron atoms: spin wave functions, approximate handling of electron-electron repulsion. Coupling of angular momenta, multiplet structure, gyromagnetic effects. Hyperfine and nuclear quadrupole interactions.

Many electron atoms: central field approximation, Thomas-Fermi and Hartree-Fock methods.

Molecular physics: Born-Oppenheimer approximation, molecular structure, rotation and vibration of diatomic molecules, hydrogen molecular ion, vibrational-rotational coupling, effect of vibration and rotation on molecular spectra. Electronic structure- molecular orbital and valence bond theories.

Atoms and light: transition rates, dipole approximation, Einstein coefficients, radiative damping, optical absorption, ac Stark effect.

Cold atoms: Doppler cooling, magneto-optical trap, ion traps, dipole force, evaporative cooling, optical lattice.

Collective effects: Feshbach tuning of interactions, Bose condensation of alkali atoms, BCS-BEC crossover, the unitary Fermi gas. Imaging cold atoms.

Computing with atoms: qubits and their properties, entanglement, quantum logic gates, decoherence and error correction.

Semester VI

08PHYS05-024-C Statistical Mechanics

Basics: phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.

Non interacting classical systems: few level systems, ideal gases, oscillators.

Non interacting quantum systems: method of second quantisation, electrons in metals, relativistic electron systems, electrons in a strong magnetic field, lattice vibrations and phonon physics, photons, blackbody radiation, Bose condensation.

Interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.

Phase transitions: symmetry breaking and long range order, mean field approach, Landau theory, 2nd and 1st order transitions, Landau-Ginzburg functional, illustrative examples, estimate of fluctuations.

08PHYS05-025-C Research Methodology and Numerical Methods

Research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers

Introduction to programming languages: F77, F90 or C

Errors in numerical calculations.

Numerical linear algebra, eigenvalue and eigenvectors.

Interpolation techniques.

Generation and use of random numbers.

Sorting and searching.

Differentiation and Integration (including Monte Carlo techniques)

Root finding algorithms

Optimisation, extrema of many variable functions.

ODEs and PDEs: including FFT and finite difference methods, integral equations.

Elective II and III

Choose any two of the following topics,

Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure Calculations, Particle Physics, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra cold Atoms.

08PHYS05-020-EAstrophysics

Introduction to celestial objects, coordinates and the concept of time. Radiation transfer. Equations of radiation transfer, Black-body/thermal radiation, Opacity and optical depth, solutions of the radiation transfer equations in limiting cases, Rosseland mean opacity.

Thermal Bremsstrahlung emission, synchrotron emission. Self absorption and the emergent spectrum. Thomson scattering. Compton and Inverse-Compton scattering. Scattering in a region with magnetic field, Faraday rotation Introduction to fluid dynamics. Convection instability and transfer of energy from cores of stars. Supersonic motion, shocks.

Introduction to Magneto-hydro dynamics, flux freezing, Generation and amplification of magnetic fields in astrophysical situations.

Stellar structure. Mass-radius relation for main sequence stars, Minimum and maximum mass for nucleosynthesis, Hertzsprung-Russell diagram, Evolution of a star on the HR diagram. Novae and Supernovae, End points of stellar evolution. Inter-stellar medium. Phases of interstellar medium. Thermal, photoionisation, chemical and pressure equilibrium, Star formation, feedback and the evolution of ISM.

Orbits around massive bodies, Tidal disruption, restricted 3 body problem, Roche limit. Orbits in external potentials, potential-density pairs. An overview of models for galaxies. Accretion of matter on to a point mass, spherical accretion, Eddington limit.

Introduction to Cosmology, Friedmann models, equations. Hubble’s law. A brief overview of the thermal history of the universe.

08PHYS05-021-E Condensed Matter Physics II

The course will consist of any two of A-D:

Part A: Mesoscopics and spintronics:

Foundation: low dimensional systems: quantum Wells, wires and quantum dots, 1D and 2D heterostructures, coupled wells and superlattices.

Charge Transport: transmission and its relation to conductance, Landauer theory, transmission function, S matrix and Green functions. Non-equilibrium Green functions and Landauer-Buttiker theory. Noise in Charge transport, scattering theory of shot noise.

Spintronics: introduction to spintronics.(Datta-Das spin transistor) equilibrium and non-equilibrium spin currents, spin Hall effect, coupled charge and spin transport, TMR, spin shot noise, entanglement generation and its detection.

Part B: Electronic structure:

Physics in low dimensions: surface states, reconstructions, adsorption, atomic wires and clusters.

Electron-electron interactions: Hartree-Fock approximation, electron gas, density functional theory.

Anharmonic effects in crystals: thermal expansion, lattice thermal conductivity, umklapp processes.

Phonons in metals: Kohn anomaly, dielectric constant, temperature dependence of electrical resistivity.

Dielectric properties of insulators. Plasmons, magnons etc.

Part C: Mesoscopics and interacting systems:

Quantum Hall effect

Quantum dots and quantum wires, Kondo effect

Fermi liquid theory and non Fermi liquids

Bosonization and Luttinger liquids.

Quantum spin systems

Part D: Correlated electrons:

Mott physics: electron localisation, magnetic order, doped phase, physics in the cuprates.

Kondo systems: physics of the single impurity, dense systems Kondo and Anderson lattice, heavy fermions, quantum criticality.

Metallic magnets: ferromagnetism in strongly repulsive systems, the transition metals, spin-fermion systems, the double exchange model, the classical Kondo lattice.

Electron-phonon coupling: the classical theory, polaron formation, many electron systems, polaron ordering, physics in the manganites.

Superconductivity: the BCS-BEC crossover, superconductivity in repulsive systems,

competition with magnetism, effect of disorder.

08PHYS05-022-E Cosmology

Friedman-Robertson-Walker metric, Friedman equation and stress tensor conservation, equation of state: matter, radiation, cosmological constant, experimental evidence for dark matter and dark energy.

Age of the universe, cosmological horizon, expansion rate.

Thermal history of the universe, formation of hydrogen and origin of CMBR, decoupling of neutrinos, nucleosynthesis, recombination.

The horizon problem, possible resolution via inflation, slow roll condition and slow roll parameters, reheating, inflationary origin of density perturbation.

Early history, electroweak baryogenesis via leptogenesis, dark matter.

Theory of cosmological perturbations: gauge invariant scalar and tensor perturbations, spectral index, ratio of tensor to scalar fluctuation and Lyth bound, transition from quantum to classical perturbation: horizon exit and reentry, from density fluctuation to CMB fluctuations via Boltzmann transport equation, origin of the acoustic peak, origin of CMB polarisation, E and B modes.

08PHYS05-023-E Introduction to Electronic Structure

Review of QM: variational method, identical particles, many fermion wave functions.

First-principles Hamiltonian and Born-Oppenheimer approximation.

Treating electron-electron interactions: Hartree-Fock approximation, exchange energy, correlation energy.

Density functional theory: Thomas-Fermi method, Hohenberg-Kohn theorems, Levy constrained search formulation, Kohn-Sham formulation, exchange-correlation energy, LDA and GGA functionals, spin density functional theory.

Solution of the Kohn-Sham equations, basis sets - LCAO: STO-NG, 4-31G, 6-31G etc, quality of basis sets, polarisation functions, spin-restricted calculations, Roothan equations.

Spin unrestricted calculations. Plane wave basis set.

Pseudopotentials and PAW in conjunction with plane waves.

Structure optimisation, Hellman-Feynman theorem.

Simple practical applications: band structure of standard solids, metals and semiconductors, optimisation of lattice constants, cohesive energies and other simple properties.

Possible advanced topics: hybrid functionals, van der Waals interactions, density functional perturbation theory, phonon band structure, electron-phonon coupling. CI, CCSD methods, QMC.

08PHYS05-024-E Particle Physics

Experimental methods: fixed target and collider experiments, particle detectors.

Role of symmetries: charge conjugation, parity, time reversal, isospin and SU(2), quark model and SU(3).

Introduction to relativistic kinematics: Mandelstam variables, phase space, calculation of cross-sections and decay widths.

Basics of quantum electrodynamics: electron-positron annihilation, electron-muon scattering, Bhabha scattering, Compton scattering.

Deep inelastic scattering: Bjorken scaling, parton model, scaling violation, introduction to quantum chromodynamics and tree level processes.

Introduction to weak interactions: parity violation, V-A theory, pion and muon decay, neutrino scattering.

Standard Model: Glashow-Salam-Weinberg model, neutral current, physics of W, Z and Higgs, CKM mixing and CP violation.

Neutrino physics, neutrino oscillation

08PHYS05-025-E Quantum Field Theory II

Path integrals for scalar and fermionic fields: generating functional, Feynman rules, loop diagrams.

Renormalisation of scalar and Yukawa theories: power counting, regularisation, renormalisable and non-renormalisable theories, Green functions at 1 loop of some prototypical theories, basics of renormalisation group (running coupling), 1PI effective actions.

Spontaneous symmetry breaking and Goldstone’s theorem.

Path integrals for the Maxwell field, gauge fixing.

Renormalisation of QED: 1 loop diagrams, Landau pole.

Non-abelian Gauge Theories: Classical theory of non-abelian gauge theories, Quantization of non-abelian gauge theories by path integral methods, Non-abelian gauge theories at one loop and asymptotic freedom, Spontaneous symmetry breaking in non-abelian gauge theories.

08PHYS05-026-E Quantum Information and Computation II

General evolution and Decoherence theory.

Master equations (Markovian and Non-Markovian, Various measure of nonmarkovianity).

Advanced entanglement theory (GM, GGM, newly proposed measures etc).

Quantum Correlation Beyond Entanglement (Quantum Discord, Geometric discord, Work-Deficit etc).

Resource theory in QI (Entanglement, Quantum Coherence, Reference Frame, Asymmetry etc).

Quantum Thermodynamics.

Advanced topics in quantum channels.

Quantum information and condensed matter systems.

08PHYS05-027-E Quantum Optics

Introduction: Quantization of the electromagnetic field, Fock states, coherent states, squeezed states, basic atom-photon interaction, density-matrix formalism.

Theory of coherence; Semiclassical theory of atom-photon interaction.

Quantum theory of atom-photon interaction.

Quantum theory of dissipation.

Quantum information in continuous variable systems; Quantum state engineering.

Quantum operations based on beam splitters, mirrors, squeezing and homodyne and heterodyne measurements and nonlinear operations such as parametric down converters.

Photon addition and subtraction operations; Elements of cavity QED.

08PHYS05-028-E Soft Matter

Forces, energies and timescales in soft matter, van der Waals force, hydrophobic and hydrophilic interactions. Basic phenomenology of liquid crystals, polymers, membranes, colloidal systems. Phase behaviour, diffusion and flow, viscoelasticity.

Order parameter, phase transitions: mean-field theory and phase diagrams, elasticity, stability, metastability, interfaces.

Colloidal systems: Poisson-Boltzmann theory, DLVO theory, sheared colloids, stability of colloidal systems, measurement of interaction.

Polymers: model systems, chain statistics, polymers in solutions and in melts, flexibility and semi-flexibility, distribution functions, self-avoidance, rubber elasticity, viscoelasticity, reptation ideas.

Membranes: fluid vs. solid membranes, energy and elasticity, surface tension, curvature, de Gennes-Taupin length, brief introduction to shape transitions.

Experimental tools and numerical approaches: Stokes limit, Rouse and Zimm Model for

polymers, membranes, relaxation, computational studies, multiscale modelling.

08PHYS05-029-E Ultra Cold Atoms

Spatial, time, and energy scales in cold atom physics.

Experimental background: trapping and cooling, Feshbach resonance, optical lattices, cold atom spectroscopies.

Basic theory: many particle physics, mean field theory, phase transitions, perturbation theory.

Continuum bosons: bosons in free space, weak interactions, Bogoliubov theory, BEC in trapped systems, Gross-Pitaevski equation.

Continuum fermions: fermions in free space, trapped fermions, Fermi liquid theory, weak attraction - BCS instability, strong attraction - BEC of pairs, the unitary Fermi gas, Stoner instability.

Optical lattices: Hubbard model - Bose/Fermi cases, superfluid-Mott transition for repulsive bosons, BCS-BEC crossover for attractive fermions, Mott transition in repulsive fermions.

Spin systems: quantum, S = 1/2, magnetism on unfrustrated and frustrated lattices.
Entanglement in many body systems: pure states, mixed states, area laws, tensor network states.

Special topics: population imbalance, Anderson localisation, gauge fields, quench dynamics.

BACK TO MAIN

INTEGRATED Ph.D. in PHYSICAL SCIENCES (PROGRAM CODE: PHYS05)

Doctoral Programmes in Physics at IMSc

There are two streams leading to the Doctoral degree in Physics at IMSc: the one available to students who have completed their Master's degree prior to joining IMSc (Ph.D.) and the one available to students who join after their Bachelor's degree (Integrated Ph.D.). The Ph.D. program has *two semester compulsory course work* while the integrated Ph.D. has *four semester compulsory course work*. The third and fourth semester course work of the integrated Ph.D. program is the same as the two semester course work of the Ph.D. program.

The courses together with the pre-requisites and reference material, are given below. Integrated Ph.D. students begin with the *rst* semester courses while Ph.D. students begin with the *third* semester courses.

No.	Semester I	No.	Semester II	No.	Semester III
(11)	Classical Mechanics	(21)	Quantum Mechanics II	(31)	Quantum Field Theory I
(12)	Quantum Mechanics I	(22)	Classical Field Theory	(32)	Mathematical Methods II
(13)	Electromagnetic Theory	(23)	Condensed Matter Physics I	(33)	Statistical Mechanics II
(14)	Mathematical Methods I	(24)	Statistical Mechanics	(34)	Particle Physics I

The Fourth semester has *two core courses* (18 credits) and a *project* (12 credits). The core courses di er for students desirous of research in High Energy Physics (HEP) or Low Energy Physics (LEP). These are to be decided in consultation with the monitoring committee.

No.	HEP students	No.	LEP students
(41)	Quantum Field Theory II	(43)	Advanced Condensed Matter Physics
(42a) (42b)	Cosmology-and-Gravitation *or* Particle Physics II	(44a) (44b) (44c)	Nonlinear Dynamics *or* Quantum Information-and-Computation *or* Statistical Field Theory,

The integrated Ph.D. program students earn 123 credits while those of Ph.D. program earn 60 credits at the end of the course work.

Detailed syllabi of the proposed course

The course contents are indicative and will be ne tuned with experience.

---

11) Classical Mechanics (four-and-half hours classwork per week, **9 credits**)

- *Lagrangian formulation and the action principle:*

  Configuration space, generalized coordinates Constrained systems, holonomic constraints as coordinate transformations, motion in a central field, including Kepler problem, Rutherford scattering, Small oscillations, normal modes, total time derivatives, non-uniqueness of Lagrangian, Noether's theorem, Conservation laws;

- *Rigid body kinematics and dynamics:*

  Kinematics, rotational kinetic energy, moments of inertia, inertia tensor, Euler angles, angular momentum, Free rigid body motion, axisymmetric tops;

- *Hamiltonian formulation:*

  The Legendre transformation, canonical momentum Poisson brackets, Phase space reduction, cyclic coordinates, Phase space description and evolution, surfaces of section, periodically driven systems, Liouville's theorem, Poincaré recurrence;

- *Canonical transformations, Hamilton-Jacobi theory, perturbation theory:*

  Definition; point transformations; time-independent transformations; symplectic transformations and time-dependent transformations, Invariants of canonical transformations, Generating functions Hamilton-Jacobi equation, action-angle variables, Perturbation theory as a sequence of canonical transformations of a perturbed integrable system;

- *Relativistic mechanics (including Lagrangian formulation):*

  Space-time, 4-vectors, Lorentz transformations, basic relativistic kinematics and dynamics.

Textbooks:

1. L. Landau and E. Lifshitz, *Mechanics : Course of Theoretical Physics*, Vol.1, Pergamon, 1974.
2. W. D. McComb, *Dynamics and Relativity*, Oxford University Press, 1999.
3. V. I. Arnold, *Mathematical Theory of Classical Mechanics*, Springer, 1977.
4. M. Tabor, *Chaos and Integrability in Nonlinear Dynamics*, Wiley, 1989.
5. H. Goldstein, *Classical Mechanics*, Narosa, 1990.
6. I. Percival and D. Richards, *Introduction to Dynamics*, Cambridge, 1991
7. J.V. Jose and E.J. Saletan, *Classical dynamics: A contemporary approach*, Cambridge, 1998.

12) Quantum Mechanics I: (four-and-half hours classwork per week, **9 credits**)

- *Fundamentals of Quantum Theory:*

  The breakdown of classical physics, the polarization of photons, Wave-particle duality: Particle properties of photons and wave properties of electrons, Schrodinger evolution, Hamiltonian, examples: free particle, one-dimensional potential well, potential barrier, harmonic oscillator, etc., Hilbert space formulation of Quantum Mechanics: states, observables, measurement, evolution, collapse of wave function, uncertainty relation and its interpretation, Discrete and continuous spectra, canonically conjugate observables, Schrodinger, Heisenberg and interaction pictures, Virial theorem, Ehrenfest's theorem, semi-classical quantization;

- *Theory of spin-1/2 systems:*

  Stern-Gerlach experiment for the existence of spin Quantum Mechanics of two-level systems

- *Spherically symmetric potentials:*

  Schrodinger equation for spherically symmetric potentials, Orbital angular momentum and spherical harmonics, Hydrogen atom problem and three dimensional harmonic oscillator;

- *Symmetries and conservation laws:*

  What is a symmetry, Wigner's theorem, Continuous transformations, Rotation, Euclidean and Galilean groups, Transformations and invariances;

- *Angular momentum theory in Quantum Mechanics:*

  Orbital and spin angular momenta, Raising and lowering operators, Addition of angular momenta, Clebsch-Gordon coefficients, Schwinger oscillator model, Spherical tensors and Wigner-Eckart Theorem, Spin-orbit coupling,

- *Exactly solvable models:*

  Charged particle in a magnetic field, Landau levels, Quantum Hall e ect;

- *Time-independent perturbation theory:*

  Non-degenerate and degenerate cases, An-harmonic oscillator, Van der Waal's force, Dipole interactions for spin-1/2 systems, Stark e ect, Zeemann e ect;

- *Time-dependent perturbation theory:*

  Approximate solution of Schrodinger equation, Sinusoidal perturbation of two-level system: resonance phenomenon, Coupling with states of continuous spectrum, Fermi's golden rule, Interaction of atom with electromagnetic wave,

Textbooks:

1. C. Cohen-Tannoudji, B. Diu and F. Laloe, *Quantum Mechanics*, Vols. I and II, Wiley, 1970.
2. J. J. Sakurai, *Modern Quantum Mechanics*, Addisson Wesley, 1995.
3. Leslie E. Ballentine, *Quantum Mechanics: A Modern Development*, World Scientific, 1998.

13) Classical Electromagnetism: (three hours classwork per week, **6 credits**)

1. *Electrostatics and Magneto-statics :*

   Mathematical preliminaries, boundary value problems using Green function techniques, special techniques for calculating potentials, electrostatics of dielectric media, magnetic vector potential and the gauge problem, Biot-Savart law, magnetic dipole moment and the Larmor precession, magnetic susceptibility and permeability, ferromagnetism;

2. *Maxwell Electrodynamics :*

   Motion of charges in external fields, electromagnetic waves in vacua and propagation through continuous media, gauge transformations, Lorentz covariant formulation of electrodynamics, energy-momentum of electromagnetic field and Poynting's theorem, Lagrangian and Hamiltonian formulation of electrodynamics;

3. *Radiation Theory :*

   Advanced and retarded Green functions, Lienard-Wiechert potentials, dipole radiation and Larmor's formula, spectral resolution and angular distribution of radiation from a relativistic point charge, synchrotron radiation, Rayleigh and Thomson scattering;

4. *Classical Electron Theory :*

   Radiation reaction, acausality and preacceleration, incompleteness of Maxwell electrodynamics;

Textbooks :

1. D. J. Griffiths, *Introduction to Electrodynamics*, Prentice Hall, 1981.
2. L. Landau and E. Lifshitz, *The Classical Theory of Fields*, Pergamon, 1979.
3. J. D. Jackson, *Classical Electrodynamics*, Wiley Eastern, 1986.

14) Mathematical Methods I (three hours classwork per week, **6 credits**)

- *Linear Algebra:*

  Linear Vector spaces, Determinants & Matrices, Special matrices: orthogonal, hermitian, unitary, Eigenvalue problem: matrix diagonalization, Canonical Forms, Infinite-dimensional vector spaces: Hilbert space & Hermitian operators, Numerical solution of linear equations;

- *Complex Analysis:*

  Complex algebra, analytic functions, infinite sequences and series, tests of convergence, Weierstrass theorem, Taylor and Laurent series, classification of isolated singularities, poles & calculus of residues, contour integration, residue theorem and applications;

- *Di erential and Integral Equations:*

  Ordinary di erential equations, linear di erential equations up to second order, orthogonal polynomials and functions, Integral transforms: Laplace and Fourier transforms, partial di erential equations, classification of PDEs, Laplace and wave equations, boundary value problems, Special functions, Integral equations and Green functions, Ideas about nonlinear equations, Approximation methods: WKB approximation (at the level of Mathews-Walker);

Textbooks:

1. J Mathews and R L Walker, Mathematical Methods for Physicists, Benjamin, 1964;
2. G Arfken, Mathematical Methods for Physicists, Academic Press, 1995.

21) Quantum Mechanics II (four-and-half hours classwork per week, **9 credits**)

- *Quantum theory of identical particles:*

  Symmetrization of wave functions, Pauli's exclusion principle, Bosons and fermions, Spin-statistics theorem, Second quantization formalism, Quantum theory of many-electron atoms, Electron gas: application to solids;

- *Approximation methods:*

  WKB approximation, Variational methods, Absorption and stimulated emission of radiation;

- *Scattering theory:*

  Lipmann-Schwinger equation, Born approximation, Partial waves, The optical theorem, Determination of phase-shifts, Hard sphere scattering, Low energy scattering, Resonances;

- *Path integral approach to Quantum Mechanics:*

  Kernel of wave-packet evolution, Feynmann's approach, Examples of free particle and harmonic oscillator, Path-integral approach to spin systems, Aharonov-Bohm e ect, The adiabatic theorem, Berry's phase;

- *Relativistic Quantum Mechanics:*

  Dirac and Klein-Gordon equations and their solutions, Relativistic invariance, Space reflection and time reversal, Idea of spin, Helicity, Hydrogen atom, fine structure of spectral lines;

- *Phase-space description of Quantum Mechanics:*

  Coherent states, squeezed states and thermal states, Wigner's phase-space quasi-probability distribution, Glauber-Sudarshan's P-representation, Husimi distribution, Symplectic transformation and covariance matrix, Non-classical states of light;

- *Foundations of Quantum Mechanics:*

  Density operators formalism, Contradiction of Quantum Theory with local realism, The causality issue.

Textbooks:

1. C. Cohen-Tannoudji, B. Diu and F. Laloe, *Quantum Mechanics*, Vols. I and II, Wiley, 1970.
2. J. J. Sakurai, *Modern Quantum Mechanics*, Addisson Wesley, 1995.
3. Marlan O. Scully and M. Suhail Zubairy, *Quantum Optics*, Cambridge University Press, 1997.
4. W. Greiner, *Relativistic Quantum Mechanics: Wave Equations*, Springer, 1997.
5. Leslie E. Ballentine, *Quantum Mechanics: A Modern Development*, World Scientific, 1998.
6. S. D. Bjorken and J. D. Drell, *Relativistic Quantum Mechanics*, McGraw-Hill Science/Engineering/Math, 1998.

22) Classical Field Theory (three hours classwork per week, **6 credits**)

1. *Continuum Mechanics:*

   Coarse graining and continuum limit, The displacement field and strain tensor, The stress tensor and constitutive relations. Hooke's Law, The energy functional, Deformation of thin rods: Stretching, bending and torsion, Equations of motion. Elastic waves, Conservative systems, Lagrangian and Hamiltonian formalisms;

2. *Hydrodynamics:*

   The velocity and density fields. Continuity equation, Pascals Law and the stress tensor, Bernoullis principle, Euler equations. Gravity waves, Viscosity, Navier-Stokes equations. Boundary conditions, examples of flow, low Reynolds number flows, Stokes limit;

3. *Electrodynamics:*

   The electromagnetic field tensor and Bianchi identity, covariant charge density and current, action formalism for electrodynamics, Maxwell's equations and relativistic covariance, Wave solutions. Gauge invariance, Lagrangian and Hamiltonian formalism; [7 Lectures]

4. *Landau-Ginzburg theories:*

   Order parameter field, symmetry breaking, Noether theorem, mean-field theory, Gaussian fluctuations, Goldstone modes, generalized sti ness, topological defects, solitons, vortices, O(N) model, Abelian Higgs model (superconductivity);

5. *Gravitation:*

   Principle of equivalence, curvilinear coordinates, metric, connection, curvature tensor, energy-momentum tensor, Einstein equations;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *The Classical Theory of Fields*, Pergamon Press, 4th Edition, 1980.

2. G. Giachetta, L. Mangiarotti and G. Sardanashvily, *Advanced Classical Field Theory*, World Scientific, 2009.

23) Condensed Matter Physics I (four-and-half hours classwork per week, **9 credits**)

- *Introduction:*

  Length, time and energy scales in condensed matter, soft and hard condensed matter, examples of materials properties, bonding and interactions, van der Waals interaction, hydrogen bonding;

- *Condensed matter systems:*

  Crystals: Lattice, basis, 2-d and 3-d crystals, point and space groups, symmetries, experimental determination of structure, scattering, lattice with basis, Miller indices, structure factor, form factors, defects in crystals;

  Liquids and glasses, Liquid crystals, Polymers, Quasicrystals;

- *Electronic Properties:*

  Jhelium model: Single electron model, density of states, Fermi surface and quasiparticles;

  Thermodynamic properties: Review of thermodynamics, statistical mechanics of non-interacting electrons, Sommerfeld expansion, specific heat, magnetic susceptibility;

  Transport properties: Drude Model, electrical conductivity, thermal conductivity thermoelectric phenomena. Band theory;

  Electrons in periodic potentials, Bloch's theorem, Kronig-Penney model, Brillouin zones, nearly free and tightly bound electrons, Fermi surfaces, band theory, e ective mass, Wannier functions and tight binding, survey of the periodic table;

- *Lattice vibrations:*

  Cohesion of solids, mechanical properties, elasticity, constitutive relations;

  Modes of lattice vibrations. Quantization and phonons. Statistical mechanics of phonon gas, Einstein and Debye models, umklapp processes, thermal expansion, Kohn anomalies, charge-density waves;

  Electron phonon interactions;

- *Semiconductor Physics:*

  Introduction: Valence and conduction bands. Doping and the Fermi level;

  Band diagrams, metal interfaces, work functions, Schottky barrier, diodes and transistors;

  Nano-electronics: heterostructures, quantum wells, quantum wires and quantum dots;

- *Optical Properties:*

  Optical properties of metals, optical properties of semiconductors, direct and indirect band gaps, polarization, Clausius-Mosotti relation, polarons, point defects and color centres, metals at low frequencies, anomalous skin e ect, plasmons, Brillouin and Raman scattering;

- *Superfluidity and Superconductivity:*

  Superfluidity of Helium, BEC, Landau argument, two-fluid model, BEC in atomic gases, superconductivity, phenomenology including Meissner e ect, type-I and type-II superconductors;

- *Magnetism:*

  Atomic magnetism, Hunds rules, Curie's law, Pauli paramagnetism, Landau diamagnetism, quantum mechanics of interacting moments, Heisenberg model, spin waves;

Textbooks:

1. N. Ashcroft and N. Mermin, *Solid State Physics*, Holt, Rinehart and Winston, 1976.

24) Statistical Mechanics I (four-and-half hours classwork per week, **9 credits**)

1. *Fundamental principles :*

   Elements of probability theory, algebra and calculus of random variables, binomial, Poisson and Gaussian distributions, moments and cumulants of probability densities, the central limit theorem, the basic postulate of statistical mechanics, first discussion of ergodicity and mixing;

2. *Thermodynamics:*

   Macroscopic definition of thermodynamic variables, temperature, pressure, work and heat, the Carnot cycle and empirical definition of entropy, free energy and other thermodynamic potentials, convexity of entropy and thermodynamic potentials, thermodynamic potentials as Legendre transforms of the entropy, thermodynamic relations of Maxwell, Gibbs and Duhem, Clausius and Clapeyron, and Clausius and Mosotti, the third law of thermodynamics;

3. *The Gibbs distribution:*

   Gibbs definition of entropy, the Gibbs distribution as maximisation of entropy subject to constraints, connection with Legendre transforms, connection to thermodynamics, the three canonical distributions, the Maxwell-Boltzmann distribution, the probability distribution of a classical and quantum harmonic oscillator;

4. *Non-interacting systems I:*

   Classical ideal gas, the Boltzmann distribution and classical statistics, the counting approach to the Boltzmann distribution, free energy and equation of state of the ideal gas, the law of equipartition, ideal gases with internal degrees of freedom, diatomic and polyatomic gases, the magnetism of an ideal gas;

5. *Non-interacting systems II:*

   Fermi distribution, Bose distribution, counting approach to Fermi and Bose distributions, Fermi and Bose gases of elementary particles, the degenerate electron gas, the specific heat of the degenerate electron gas, magnetism of an electron gas, the degenerate Bose gas, black body radiation;

6. *Non-interacting systems III:*

   Solids at high temperature and the Dulong-Petit law, solids at low temperatures and Einstein's theory of specific heat, the Debye interpolation formula, thermal expansion of solids;

7. *Interacting systems I :*

   Deviations of gases from ideality, van der Waals equation, the conditions of phase equilibrium, the Clausius-Clapeyron equation, the critical point, law of corresponding states, virial and cluster expansions, the method of correlation functions, the Ornstein-Zernike relation;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *Statistical Physics*, 3rd Edition, Butterworth-Heinmann, 1980.

2. H. B. Callen, *Thermodynamics and an Introduction to Thermo-statistics*, 2nd Edition, Wiley, 1985.

3. D. Chandler, *Introduction to Modern Statistical Mechanics*, Oxford Univ. Press, 1987.

5. R. K. Pathria, *Statistical Mechanics*, Butterworth-Heinmann, 1996.

6. M. Kardar, *Statistical Mechanics of Particles*, Cambridge Univ. Press, 2007.

7. F. Reif, *Fundamentals of Statistical and Thermal Physics*, Waveland Pr. Inc., 2008.

31) Quantum Field Theory I (four-and-half hours classwork per week, **9 credits**)

First two-third portion of the course is meant for all students, while a bifurcation is made at the end of this for separately orienting students towards HEP and LEP, during the remaining one-third portion of the course. Thus the common section has 32 lectures, the other two parts have 16 to 18 lectures.

1. *QFT I part I:*

   (Common to all students. Knowledge of Relativistic Quantum Mechanics, *i.e.*, Dirac equation and KG equation is expected. Some basic notions of the Lorentz group and Poincare group are also expected)

   - *Elements of Classical Field theory:*
     Lagrangian and Hamiltonian densities, quantization of KG and Dirac and electromagnetic fields, propagators for KG, Dirac and vector (photons) ;
   - *Perturbation theory:*
     Wick's theorem and Wick expansion, Feynman diagrams, cross sections and S matrix. Feynman rules for scalars, spinors and gauge fields (Abelian) ;
   - *Elementary processes in QED:*
     electron positron annihilation, Compton scattering, Bhabha scattering, crossing symmetry etc. ;
   - *Radiative corrections for scalar theory:*
     loop corrections, regularization and renormalization, dimensional regularization. elementary ideas of the systematics of renormalization ;
   - *Functional method techniques:*
     Scalar field theory quantization (with, if time permits, some discussion of critical phenomena in this approach) ;
     The last two lectures below while not relativistic QFT is included because i would be useful for HEP students too and hence is placed in the common section
   - *Non-interacting electrons:*
     Tight binding models, the many body ground state, quasi-particle and quasi-hole excitations. Partially filled bands and Fermi surface kinematics ;

2. *QFT 1 part II:* (For HEP students)

   - *LSZ formalism:*
     one loop diagrams in QED, Ward Takahashi identities, regularization in QED ;
   - *Path integral/Functional method*
     Quantization in spinor and vector (gauge) theories ;
   - *Systematics of renormalization:*
     Power counting, idea of counter terms, structure of one loop and beyond in scalar and QED. (no explicit 2 loop calculations etc.) ;

3. *QFT I part III:* (Many Body Theory for Condensed Matter/LEP students)

   - *Second quantization in operator formalism (non-relativistic):*
     Diagrammatic perturbation theory, Retarded Greens functions, Spectral function, quasi-particle lifetimes, Angle resolved photoemission spectroscopy (ARPES) ;
   - *Linear response theory and Kubo formulae ;*
   - *Interacting bosons:*
     Symmetry breaking, semi-classical spectrum. Applications to cold atoms and superfluids ;
   - *Mean field theory:*
     BCS hamiltonian and superconductivity ;
   - *Magnetism:*
     Heisenberg models. Spin waves. Coherent states and path integrals for spin systems. Non-linear sigma models ;

Part II and part III will run concurrently, however, to allow the more enterprising and interested students to attend both parts (if they so wish), lectures for these two parts are intended to be arranged at non-overlapping times.

Textbooks:

1. M. E. Peskin and D. V. Schroyder, *Quantum Field Theory*, Sarat Book House, 2005.
2. G. D. Mahan, *Many-Particle Physics*, Springer, 2010.

32) Mathematical Methods II (three hours classwork per week, **6 credits**)

- *Numerical interpolation techniques (including Lagrange method)*
- *Advanced Complex Analysis:*

  Analytic continuation, branch cuts, Multivalued functions, Riemann surfaces, Conformal Mapping, Method of steepest descent;
- *Group theory:*

  Discrete and continuous groups;
- *Numerical methods:*

  Numerical solution of integrals, Numerical solution of ODEs, Numerical solution of PDEs: finite di erence Monte Carlo method (especially solving integrals), Spectral techniques (including FFT) Numerical minimization techniques;
- *Probability and statistics:*

  Brief survey of probability theory and statistical distributions, Bayesian probability Data analysis;

Textbooks:

1. C. M. Bender and S. A. Orszag, *Advanced Mathematical Methods for Scientists and Engineers: Asymptotic Methods and Perturbation Theory* (vol. 1), Springer, 1999.
2. T. W. Gamelin, *Complex Analysis*, Springer, 2001.
3. E. T. Jaynes and G. L. Bretthorst, *Probability Theory: The Logic of Science* (vol. 1), Cambridge Univ. Press, 2003.
4. M. Tinkham, *Group Theory and Quantum Mechanics*, Dover, 2003.
5. R. Gilmore, *Lie Groups, Lie Algebras, and Some of Their Applications*, Dover, 2006.
6. J. H. Mathews and R. W. Howell, *Complex Analysis for Mathematics and Engineers*, Jones and Bartlett, 2006.
7. N. G. Van Kampen, *Stochastic Process in Physics and Chemistry*, 3rd Edition, North Holland, 2007.

33) Statistical Mechanics II (four-and-half hours classwork per week, **9 credits**)

- *Introduction to critical phenomena:*

  Survey of experimental results, scaling hypothesis and empirical scaling relations, self-similarity and fractals;

- *Interacting systems:*

  Critical phenomena and continuous phase transitions, symmetry and the order parameter, Landau theory, introduction to the Ising model, Curie-Weiss mean field theory, the absence of phase transitions in one dimension;

- *Criticality in spin systems:*

  The Ising model in one dimensions, solution using transfer matrices, the lack of phase transitions in one dimensions, the Landau-Peirls argument. The Ising model in two dimensions, Wannier's calculation of the critical temperature, mean field solutions of the Ising model, survey of principle results of Onsager's exact solution;

- *Criticality in classical field theories:*

  Landau-Ginzburg theory, the Landau-Ginzburg functional as an e ective Hamiltonian, calculation of correlation functions, exponents and thermodynamic quantities, mean field and RPA closures, the problem of divergences;

- *Introduction to the renormalisation group:*

  Historical survey, integration of short-wavelength degrees of freedom, classification of fixed points, flow equations, illustration with Kadano block spins in the 1d Ising model;

- *perturbative renormalisation in momentum space:*

  Philosophy of the perturbative RG scheme, significance of the upper critical dimension, diagrammatic expansion in momentum space, the expansion, exponents and thermodynamic quantities in powers of , comparison with mean field approximations;

- *Non-perturbative renormalisation in real space:*

  Kadano block spins, techniques of approximate non-perturbative renormalisation, numerical renormalisation in the Ising model;

- *Broken Symmetry:*

  Continuous symmetry groups and e ective Hamiltonians, the consequences of broken symmetry, Goldstone modes and fluctuations, elastic variables, topological defects, fluctuation destruction of long-range order, the Mermin-Wagner and Landau-Peirles arguments, the disclination and dislocation unbinding transitions;

- *Disorder:*

  Disorder in physical systems, quenched and annealed disorder, the Parisi solution for quenched disorder, illustrative examples;

- *Dynamics of fluctuations:*

  Linear response in physical systems, the regression of fluctuations and Onsager's hypothesis, symmetry of kinetic coefficients, the Fokker-Planck and Langevin descriptions of fluctuations, the fluctuation-dissipation theorem;

Textbooks:

1. L. D. Landau and E. M. Lifshitz, *Statistical Physics*, 3rd Edition, Butterworth-Heinmann, 1980.
2. H. E. Stanley, *Introduction to Phase Transitions and Critical Phenomena*, Oxford Univ. Press, 1987.
3. D. Chandler, *Introduction to Modern Statistical Mechanics*, Oxford Univ. Press, 1987.
4. M. Plischke and B. Bergersen, *Equilibrium Statistical Mechanics*, World Scientific, 1994.
5. R. K. Pathria, *Statistical Mechanics*, Butterworth-Heinmann, 1996.
6. S.-k. Ma, *Modern Theory of Critical Phenomena*, Westview Press, 2000.
7. P. M. Chaikin and T. C. Lubensky, *Principles of Condensed Matter Physics*, Cambridge Univ. Press, 2000.

34) Particle Physics I (three hours classwork per week, **6 credits**)

Standard Model, Part I:

- *Symmetries and Quarks*:

  Discrete symmetries, isospin-SU(2), G-parity, SU(3)-classification of mesons and baryons, mass formula, magnetic moments, motivation for colour as an internal symmetry;

- *Scattering Processes*:

  Relativistic kinematics, phase space, lifetimes and cross-sections, Golden rule; scattering of a spinless charged particle by electromagnetic field, scattering of electrons by electromagnetic field, e μ scattering, Moller scattering, electron-proton scattering and form factors, higher order corrections, vacuum polarization, charge renormalization, Lamb shift, g 2;

- *Parton Model and QCD*:

  Deep inelastic scattering (DIS) of electrons on nucleons, structure functions and scale invariance, parton model; quantum chromodynamics: Lagrangian, symmetries;

Standard Model, Part II:

- *Early Developments*:

  Beta-decay, μ-decay, parity violation, V A theory of weak interactions, conserved vector current (CVC) hypothesis;

- Strange particle decay, mixing of neutral K-mesons, Cabibbo theory, current-current interaction, PCAC and current algebra;

- *CP Problem*:

  C,P,T transformations, CP violation;

- *Electro-Weak Unified Theory*:

  Spontaneous symmetry breaking, Higgs mechanism, $SU(2) \times U(1)$ theory, electroweak unification, neutral current phenomena, W,Z bosons;

- *Current Phenomenology*:

  New flavours, KM-matrix and associated phenomenology, neutrinos, masses and mixing, neutrino oscillations.

Textbooks:

1. T. D. Lee, *Particle Physics and Field Theory*, Harwood, 1981.

2. F. Halzen, A.D. Martin, *Quarks and Leptons*, Wiley, 1984.

41) Quantum Field Theory II (four-and-half hours classwork per week, **9 credits**)

- *Functional Methods in Quantum Field Theory*:

  Quantization of the Klein-Gordon and Dirac fields and their interactions, derivation of the Feynman rules of covariant perturbation theory, quantization of the Maxwell field, issues of gauge fixing, BRST invariance and QED Ward identities;

- *Functional Integral Quantization of Non-abelian Gauge fields*:

  Faddeev-Popov method of gauge fixing, BRST invariance and Slavnov-Taylor identities, Gribov ambiguities, loop computations in non-abelian gauge theories and renormalizability;

- *Renormalization Group and its Applications*:

  The Gell-Mann, Low and Wilson approaches to the renormalization group, Callan-Symanzik equations and fixed points of the beta function, asymptotic freedom of non-abelian gauge theories, applications to perturbative QCD;

- *Anomalies in Abelian and Non-abelian Gauge Theories*:

  The axial vector anomaly in QED and its implications, non-abelian anomalies, anomaly freedom vs renormalizability and unitarity, Fujikawa's approach to anomalies;

- *Topological Solutions*:

  Soliton solutions and their implications, Polyakov-'t Hooft magnetic monopole and the BPS limit, instantons and tunneling in quantum field theory;

Textbooks:

1. S. Coleman, *Aspects of Symmetry*, Cambridge University Press, 1985.
2. R. Rajaraman, *Solitons and Instantons*, Elsevier, 1986.
3. M. Peskin and D. Schroeder, *An Introduction to Quantum Field Theory*, Addison-Wesley, New York, 1995.
4. S. Weinberg, *Quantum Theory of Fields*, Vols. I and II, Cambridge University Press, 1996.

42a) Cosmology and Gravitation (four-and-half hours classwork per week, **9 credits**)

- Principle of relativity, principle of equivalence, tensors, tensor calculus on Riemannian manifolds, symmetries of Riemannian manifolds, hypersurfaces, extrinsic curvatures, Gauss-Codazzi equations;
- *Einstein's field equations:*

  Newtonian limit, tests of general relativity, gravitational radiation;
- *Solutions of Einstein's equations :*

  Schwarzschild solution, Kerr solution, black holes;
- Tetrad formulation of gravity, generalizations to arbitrary dimensions;
- *Hamiltonian formulation :*

  For metric gravity, for tetrad formulation, canonical quantization and path integral quantization;
- Cosmology : Robertson-Walker model, early universe;
- Singularity theorems;

Textbooks:

1. S. Weinberg, *Gravitation and Cosmology*, Wiley, 1972.
2. R. Wald, *General Relativity*, Chicago, 1987.

42b) Particle Physics II (four-and-half hours classwork per week, **9 credits**)

- *Basic Ingredients of the Standard Model*:

  Yang-Mills fields, Higgs mechanism, asymptotic freedom;

- *Electroweak Sector*:

  Weinberg-Salam Model, phenomenological consequences, families and flavours, anomaly cancellations, radiative corrections and precession tests;

- *Quantum Chromodynamics (QCD)*:

  Lagrangian, perturbative QCD, Altarelli-Parisi equations, nonperturbative QCD and colour confinement models, strong CP problem, chiral perturbation theory, heavy quark e ective theory, Skyrme model;

- *Neutrino Physics*:

  Solar neutrinos, double beta decay, neutrino masses and mixing models;

- *CP Violation*:

  CP violation in $K \quad \bar{K}$ system, $B \quad \bar{B}$ system, models of CP violation;

- *Supersymmetry*:

  Hierarchy problem, construction of the supersymmetric standard model, search for SUSY signals;

- *Other Approaches beyond the Standard Model*:

  Grand unified theories;

Textbooks:

1. T Cheng and L. Li, *Gauge Theory of Elementary Particles*, Oxford University Press, 1984.

43) Advanced Condensed Matter Physics (four-and-half hours classwork per week, **9 credits**)

- *Correlated Electron Physics:* Second quantization review, Hubbard model, Heisenberg model;

  Materials phenomenology, magnetic phases, CDW states;

  Quantum magnetism, Stoner criterion, double exchange;

  Superconductivity, Cooper argument, BCS, gap equation, Bogoliubov-de Gennes equations, strong coupling theory, RVB and modern approaches to superconductivity in correlated systems;

  Quantum Hall e ect, integer and fractional, edge states, Laughlin and Jain wave functions, topological defects; Luttinger liquids, Bethe ansatz;

  Mesoscopic physics;

  Disordered electronic systems and metal insulator transitions;

- *Soft Condensed Matter Physics* Interactions in soft matter, entropic interactions, fluctuation-induced interactions, hard sphere statistical mechanics and crystallization;

  Self-assembly of amphiphiles, phases, theoretical approaches;

  Colloids, self-assembly, the freezing transition;

  Polymers, polymer structure, self-avoidance, Edwards model, osmotic pressure, Flory-Huggins theory, screening, semi-flexibility, persistence length;

  Membranes, biological membranes, lipid bilayers, physical properties, de Gennes-Taupin length, tethered membranes;

  Liquid crystals, nematic, cholesteric and smectic, order parameters, Frank free energy, Landau-de Gennes model defects, defect phases;

  Survey of hydrodynamics, hydrodynamic approaches to soft matter physics, dynamical properties of polymers, membranes, colloids;

  Soft matter away from equilibrium, shear-induced phases;

  Optional: Granular media and Glasses;

Textbooks: For Strongly Correlated Systems:-

1. M. P. Marder, *Condensed Matter Physics*, Wiley-Interscience, 2000.
2. A. Altland and B. Simons, *Condensed Matter Field Theory*, Cambridge University Press, 2006.
3. G. D. Mahan, *Many-Particle Physics*, Springer, 2010.

For Soft Condensed Matter:-

1. P. M. Chaikin and T. C. Lubensky, *Principles of Condensed Matter Physics*, 1st Edition, Cambridge University Press, 2000.

44a) Quantum Information and Computation (four-and-half hours classwork per week, **9 credits**)

- *Resume of Quantum Mechanics:*

  Composite quantum systems and tensor product Hilbert spaces, Subsystems and density operators, From Schrödinger to Liouville evolution; completely positive maps as quantum channels; From projective measurements to POVMs; State estimation;

- *Entanglement and its applications:*

  EPR argument and Bell inequalities; Separability vs. entanglement; Positive unphysical maps witnessing entanglement; Partial transpose criterion for checking separability; Other entanglement detection criteria; Multi-partite entanglement; Quantum teleportation, dense coding, entanglement swapping;

- *Connection with Shannon information theory:*

  Shannon's noiseless coding theorem and Schumacher's quantum counterpart; Accessible information and Holevo's bound; Shannon's noisy channel coding theorem and HSW theorem; Quantum channel capacities; Decoherence and quantum error correction;

- *Measures of entanglement:*

  Thermodynamic considerations of entanglement under LOCC; Entanglement concentration and dilution; Several measures of entanglement; Majorization;

- *Quantum Cryptography:*

  Basics of classical cryptography; RSA cryptosystem; Quantum key distribution; Security of quantum key distribution;

- *Entanglement in continuous variable systems:*

  Gaussian states; Role of Wingner description and symplectic transformations; Quantum information processing with continuous variable systems;

- *Quantum computation:*

  Classical and quantum computers; Circuit complexity; One- and two-qubit gates; Universality of gates; Deutsch-Jozsa algorithm; Grover's search algorithm; Quantum Fourier transform and Shor's factorization algorithm;

- *Implementations:*

  Quantum key distribution experiments; Unconditional quantum teleportation using continuous variable systems; Implementations of quantum computers using NMR, trapped ions, Josephson junctions, linear optical devices, etc.;

Recommended readings:

1. *Quantum Computation and Information*, Michael A. Nielsen and Issac L. Chuang (Cambridge University Press, 2000);
2. John Preskill's Lectures on Quantum Information and Computation, available at: http://theory.caltech.edu/people/preskill/ph229/♯lecture;
3. David Mermin's Lectures on Quantum Computation, available at: http://people.ccmr.cornell.edu/ mermin/qcomp/CS483.html;
4. *The Physics of Quantum Information: Quantum Cryptography, Quantum Teleportation, Quantum Computation*, Dik Bouwmeester, Artur Ekert, Anton Zeilinger (eds.) (Springer, 2000);
5. *Elements of Information Theory*, Thomas M. Cover and Joy A. Thomas (John Wiley & Sons, 1999);
6. Contemporary review articles available at:- http://xxx.imsc.res.in/archive/quant-ph

44b) Nonlinear Dynamics (four-and-half hours classwork per week, **9 credits**)

- *Hamiltonian formulation*:

  Iterative maps, fixed points, Lyapunov exponents, Integrable systems, Perturbed integrable systems, Poincaré-Birkho construction (illustration with driven pendulum);

- *Deterministic Nonlinear Dynamics*:

  Discrete dynamics and maps, di erentiable dynamics: dissipative systems, non-dissipative systems, Hamiltonian systems;

- *Integrability Aspects of Hamiltonian Dynamics*:

  Liouville-Arnold theorem, KAM theory;

- *Chaos*:

  In discrete dynamical systems, in Hamiltonian systems, in dissipative systems;

- *Semiclassical Analysis*:

  Berry-Tabor theory, Gutzwiller Theory;

- *Quantum Aspects.*

Textbook:

1. M. Tabor, *Chaos and Integrability in Nonlinear Dynamics*, Wiley, 1989.
2. M. C. Gutzwiller, *Chaos in Classical and QUantum Mechanics*, Springer, 1990.
3. I. Percival and D. Richards, *Introduction to Dynamics*, Cambridge, 1991.
4. L. Reichl, *A Modern Course in Statistical Physics*, Wiley, 1998.
5. S.H. Strogatz, *Nonlinear dynamics and Chaos: Applications to Physics, Biology, Chemistry and Engineering*, Cambridge, 2001.
6. M. Lakshmanan and S. Rajasekar, *Nonlinear Dynamics*, Springer, 2003.
7. L. Reichl, *The transition to Chaos*, Springer, 2004.

44c) Statistical Field Theory (four-and-half hours classwork per week, **9 credits**)

- Review of quantum statistical mechanics, functional integration representation of partition function, scalar field, charged scalars and Bose-Einstein condensation, Fermions, interactions and diagrammatic techniques, self-coupled scalar field theory, Yukawa theory, QED, renormalization and loop corrections to $\ln Z$.
- Spontaneous symmetry breaking and Higgs model QCD, deconfinement phase transitions.
- Salem-Weinberg model and symmetry restoration, early universe, nuclear matter and pion condensates, neutron stars.

Textbook:

1. P. Kapusta, *Finite Temperature Field Theory*, Cambridge University Press, 1989.

BACK TO MAIN

Courses of Study

INTEGRATED Ph.D. in PHYSICAL SCIENCES

(DUAL DEGREE)

(PROGRAM CODE: PHYS05)

SCHOOL OF PHYSICAL SCIENCES

National Institute of Science Education and Research Bhubaneswar

(An Off-Campus Center
Of
Homi Bhabha National Institute – a deemed to be University, Anushkati Nagar, Mumbai)

With effect from the Academic Year 2018

School of Physical Sciences Ph. D course structure (60 credits)

Core courses				
Sl. No	Course code	Course title/Description	Contact hours/week (Lectures + Tutorial + Lab)	Credits
Courses in odd semester				
1	P601	Classical Mechanics	3+1+0	6
2	P602	Mathematical Methods	3+1+0	6
3	P603	Electromagnetism	3+1+0	6
4	P698	Self Study/Mini project/credit seminar (One part of this will involve attending lectures of an elective course)		12
Courses in even semester				
5	P614	Statistical Mechanics	3+1+0	6
6	P615	Quantum Mechanics	3+1+0	6
7		Any elective course from list below	3+1+0	6
8	P699	Mini Project		12

Elective courses				
Sl. No	Course code	Course title/Description	Contact hours/week (Lectures + Tutorial + Lab)	Credits
1	P648	Nuclei and Particle Physics	3+1+0	6
2	P649	Atoms Molecules and Radiation	3+1+0	6
3	P650	Introduction to Condensed Matter Physics	3+1+0	6
4	P651	Advanced Solid State Physics	3+1+0	6
5	P652	Computational Physics	3+1+0	6
6	P653	Quantum Field Theory I	3+1+0	6
7	P654	Particle Physics	3+1+0	6

8	P655	Introduction to Phase transitions and Critical phenomena	3+1+0	6
9	P656	Nonlinear Optics and Lasers	3+1+0	6
10	P657	General Relativity and Cosmology	3+1+0	6
11	P658	Soft Condensed Matter	3+1+0	6
12	P659	Applied Nuclear Physics	3+1+0	6
13	P660	Many Particle Physics	3+1+0	6
14	P661	Physics of Mesoscopic Systems	3+1+0	6
15	P662	Introduction to Quantum Optics	3+1+0	6
16	P663	Astronomy and Astrophysics	3+1+0	6
17	P664	Plasma Physics and Magnetohydrodynamics	3+1+0	6
18	P665	Biophysics	3+1+0	6
19	P666	Quantum Nanoelectronics	3+1+0	6
20	P667	Nonlinear Physics, Chaos and Turbulence	3+1+0	6
21	P668	Magnetism and Superconductivity	3+1+0	6
22	P669	Density Functional Theory of Atoms, Molecules and Solids	3+1+0	6
23	P670	Quantum Field Theory II	3+1+0	6
24	P671	Quantum Information and Quantum computation	3+1+0	6
25	P672	Experimental High Energy Physics	3+1+0	6
26	P673	Experimental Techniques	3+1+0	6
27	P674	Introduction to Cosmology	3+1+0	6

Syllabus for Ph. D courses

1 Core courses

P601: Classical Mechanics

1. Generalized coordinates, velocities and momenta, Lagranges formulation
2. Principle of least action, formulation by Maupertuis, Euler, Hamilton. Liouville's theorem
3. Two-body central force problem (reduced mass), planet orbits, Virial theorem
4. Collisions and scattering, CM and Lab frames, scattering cross section
5. Motion in non-inertial frames, Coriolis force
6. Hamilton's equations, Poisson brackets
7. Canonical transformations, Hamilton-Jacobi equation, Generating functions, Symmetries and conservation laws
8. Small oscillations, Normal modes.
9. Rigid body dynamics, Euler angles, Euler equations, rotation of a top
10. Special topics : nonlinear oscillators, non-linear dynamics, Lyapunov exponents, Introduction to chaos.

References:

1. Classical Mechanics, H. Goldstein
2. Mecanics - Landau and Lifshitz
3. Classical Mechanics - John R Taylor
4. Classical dynamics of particles and systems - Marion and Thornton
5. Introduction to dynamics - Percival and Richards

P602: Mathematical Methods

1. Vectors and Tensors (index notation, vector analysis in curvilinear coordinates, Cartersian tensors and four vectors, General tensors)
2. Review of Linear Algebra with emphasis on applications to physical problems (linear transformations + Matrix representations, Eigenvalues, Eigenvectors, Inner product spaces
3. Review of complex analysis with applications (Cauchy-Riemann equations, Complex integration, Cauchy theorems, Contour integration, Branch points and branch cuts, Applications to integrals, series etc)
4. Hilbert space methods, special functions (Hilbert space, Orthonormal series expansions in Hilbert space especially Fourier series, Special functions)
5. Ordinary and Partial differential equations (Analysis of second order OFEs Sturm-Liouville system, Boundary value problems for Laplace, Diffusion(Heat) and wave equations)
6. Integral Transforms, its applications and Generalized functions (Laplace and Fourier transform, Dirac delta and other generalized functions, Greens functions of ODE and PDE)
7. Group theory (introduction using various groups occurring in physics, its algebra, Representation of groups, Characters)

References:

1. Mathematical Methods in the Physical Sciences, M. L. Boas
2. Mathematical Methods for Physicists, Arfken and Weber
3. Mathematical methods, C. Harper
4. Mathematical method for physicists, T. L. Chow
5. Mathematical methods in science and engineering (2books) - Seluk Bayin
6. Mathematical Methods in Physics and Engineering :Riley, Hobson
7. Mathematical Physics I and II: S.D. Joglekar
8. Mathematical Methods for Engineers and Physicists (3 books) -K. T. Tang
9. Graduate Mathematical Physics - James J. Kelly
10. Mathematical Methods In Classical And Quantum Physics : Tulsi Dass

P603: Electromagnetism

1. Electrostatics in vacuum, force, field, potentials and energy
2. Electrostatic boundary conditions and conductors
3. Solution of Laplace's equation in one, two and three dimensions, uniqueness theorem, methods of images, separation of variables, multipole expansion
4. Dielectrics
5. Current distributions, magnetic fields and magnetostatic boundary conditions
6. Motion of charges in electric and magnetic fields, energy and momentum of electromagnetic fields
7. Maxwell's equations, EM waves and their propagation in free space and in media
8. Potential formulation, Coulomb and Lorentz gauge, radiation from an accelerated charge, dipole radiation Special topics : Diffraction theory, polarization.

References:

1. Introduction to electrodynamics - David Griffiths
2. Foundations of electromagnetic theory - Reitz, Milford, Christy
3. Classical electrodynamics - J. D. Jackson
4. Electricity and Magnetism - M. H. Nayfeh, M. K. Brussel

P614: Statistical Mechanics

1. Review of thermodynamics, thermodynamic potentials, thermodynamic equilibrium and stability
2. Probability theory: Probability densities, cumulants and correlations, central limit theorem, laws of large numbers
3. Gibbs distribution : Ensembles, classical and quantum free particles, systems with continuous and discrete spectrum, degenerate Fermi systems, Bose condensation
4. Interacting systems: Cluster and Virial expansions, radial distribution function
5. Introduction to response, fluctuation and noise, Einstein formula
6. Phase transition : phenomenology of first order and continuous phase transitions, order parameters, 1D Ising model, universality and scaling, Ginzburg- Landau- Wilson theory, spontaneous symmetry breaking
7. Fundamentals of statistical mechanics: phase space, Liouville theorem, statistical distribution theorem
8. Brownian motion, Langevin equation, Markov processes and Fokker Planck equation

References:

1. Introduction to Statistical Mechanics - Kerson Huang
2. Statistical Physics - Reif
3. Statistical Physics of particles - M. Kardar
4. Introduction to Phase transitions and critical phenomena - H. E. Stanley

P615: Quantum Mechanics

1. Hilbert space (states, operators, evolution)
2. Review of one dimensional problems, delta and periodic potentials, Bound states vs scattering states, Simple harmonic oscillator
3. The central force problem, review of the hydrogen atom, hard and soft sphere
4. Angular momentum, rotation operators and the rotation group, spin, spherical harmmonics, addition of angular momentum.
5. Symmetries in quantum mechanics
6. Introduction to path integrals
7. Time independent perturbation theory, WKB approximation, variational method, Zeeman and Stark effects
8. Identical particles and exchange statistics
9. Time dependent perturbation theory, Heisenberg and interaction representations, Rabi Oscillations
10. Basic aspects of scattering theory : Born approximation and partial waves and phase shifts

    Special topics: Dirac equation/semi classical theory of radiation/geometric phase (a subset of these topics depending on available time)

References:

1. Principles of Quantum Mechanics - R. Shankar
2. Quantum Mechanics I and II - Cohen-Tannoudji, Diu and Laloe
3. Modern Quantum Mechanics - J. J. Sakurai
4. Introduction to Quantum Mechanics - David Griffiths
5. Quantum Physics - S. Gasiorowicz
6. Quantum Mechanics - E. Merzbacher
7. Quantum Mechanics - Bransden and Joachain
8. Introductory Quantum Mechanics - R. Liboff

2 Elective Courses

P648: Nuclei and Particle Physics

1. Nuclear systematics and stability (masses, sizes, spins, magnetic moments, quadrupole moments, energetics and stability against particle emission, beta decay).
2. Nucleon-Nucleon interaction, space-time symmetries, conservation laws, isospin symmetry, low energy (effective range, shape independence, meson exchange picture (qualitative).
3. Liquid drop model, compound nucleus and fission, nuclear vibrations and rotations.
4. Shell model, introduction to Hartree-Fock, spins and magnetic moments.
5. Direct nuclear reactions.
6. Mesons and baryons, resonances, SU(3) classification, isospin and strangeness, quark model, colour.
7. Weak interactions (nuclear and particle decays, neutrinos etc).

References:

1. Introduction to Nuclear Physics - Roy and Nigam
2. Nuclear Physics - Preston and Bhaduri
3. Introduction to particle physics - Griffith
4. Introduction to particle physics - Perkins

P649: Atoms, Molecules and Radiation

1. Hydrogen atom including l.s coupling and hyperfine interaction.
2. Helium atom introduction to exchange and correlation; variational calculation of ground and excited-states.
3. Introduction to the idea of effective potentials for electrons in many-electron atoms (Hartree theory and idea of self-consistency); use of Clementi-Roetti wave-functions.
4. One-electron atomic systems in an electromagnetic field; dipole approximation and associated selection rules; Stark and Zeeman effect (Note: Instructor will have to introduce the students to time-dependent perturbation theory here).
5. Einsteins A and B coefficients, population inversion, laser action, derivation of A and B coefficients from semi-classical treatment of light-atom interaction.
6. Molecular formation: Discussion of atom-atom interaction, van der Waals force, ionic interaction and covalent bond.
7. Molecular structure: Hydrogen molecule MO and VB pictures; Importance of correlations.
8. Molecular spectra (restricted to two atom molecules) electronic, rotational and vibrational.
9. Some lectures left for interesting current topics.

References:

1. Elementary Atomic Structure - G.K. Woodgate
2. Atomic Physics: C.J. Foot
3. Atoms, molecules and Photons: W. Demtroder
4. The Theory of Atomic Spectra: Condon and Shortley
5. Topics in Atomic Physics: C.E. Butkhardt and J.L. Leventhal
6. Physics of Atoms and Molecules - B.H. Bransden and C.J. Joachain

P650: Introduction to Condensed Matter Physics

1. General introduction, Drude and Sommerfeld model.
2. Crystal structure; x-ray diffraction.
3. Cohesive energy.
4. Blochs theorem; Band theory nearly free electrons; tight binding approximation; semi-classical dynamics of electrons in a band, definition of metals and insulators.
5. Basic properties of Semiconductors.
6. Thermal properties of insulators, phonons.
7. Landau levels - de Hass van Alphen effect and Integer quantum hall effect.
8. Introduction to Magnetism.
9. Introduction to Superconductivity.

References:

1. Introduction to Solid-state Physics, C. Kittel
2. Solid-state physics, N. Ashcroft and N.D. Mermin,
3. Solid-state physics, Rosenberg
4. Solid sate physics, Burn
5. Oxford Series in Condensed Matter [Oxford university press]

P651: Advanced Solid State Physics

1. Introduction to physics of metals and insulators. Electrical, thermal and optical properties of metals and insulators, and need to study excitation spectrum in detail.
2. Electrons, phonons and Magnons, Screening and Plasma Oscillations
3. Charge impurity in a metal: Friedel Oscillation, Magnetic impurity in a metal,
4. moment formation and suppression in metals.
5. Electron gas in Low dimension: impurity and interaction effects.
6. Quantum Hall Effect
7. Metal-Insulator transition
8. Electron - phonon interaction, Frohlich Hamiltonian and Superconductivity.

References:

1. Advanced Solid State Physics: Philip Phillips
2. Elementary Excitations in Solids: D. Pines
3. Solid State Physics: Marder
4. Concepts in Solids: P.W. Anderson
5. Basic Notions in Condensed Matter: P.W. Anderson

P652: Computational Physics

1. Monte Carlo: Markov chain, Metropolis algorithm, Ising Model, Quantum Monte Carlo
2. Molecular Dynamics: Integration methods, extended ensembles, molecular systems
3. Variational methods for SchrodingerdEquation: Hartree and Hartee-Fock methods, Post HF methods
4. Density Functional Theory: Fundamental theorem, XC-potentials
5. Quantum Molecular dynamics: Carr-Parinello approach, hybrid QM/MM method
6. Computational methods for lattice field theories

References:

P653: Quantum Field Theory I

1. Relativistic quantum mechanics - Klein-Gordon equation, Dirac equation, free-particle solutions
2. Lagrangian formulation of Klein-Gordon, Dirac and Maxwell eqns, Symmetries (Noethers theorem), Gauge field, Actions
3. Canonical quantization of scalar and Dirac fields
4. Interacting fields - Heisenberg picture, perturbation theory, Wicks theorem, Feynman diagram
5. Cross-section and S-matrix
6. Quantization of gauge field, gauge fixing
7. QED and QED processes
8. Radiative corrections - self-energy, vacuum polarization, vertex correction
9. LSZ and optical theorem
10. Introduction to renormalization

References:

1. An Introduction to Quantum Field Theory - Peskin and Schroeder
2. Quantum Field theory: K. Huang
3. Quantum Field Theory: Mandl and Shaw
4. Quantum Field Theory: Itzykson and Zuber

P654: Particle Physics

1. Elementary particles, discrete symmetries and conservation laws.
2. Symmetries and Quarks.
3. Klein-Gordon equation, concept of antiparticle.
4. Lorentz symmetry and scalar / vector / spinor fields.
5. Dirac equation
6. Scattering processes of spin-1/2 particles (Feynmans rules as thumb rule QFT course), propagators.
7. Current-current interactions, weak interaction, Fermi theory.
8. Gauge symmetries, spontaneous symmetry breaking, Higgs mechanism
9. Electroweak interaction, Glashow-Salam-Weinberg model.
10. Intoduction to QCD, structure of hadrons (form factors, structure functions), parton model, Deep inelastic sattering.

References:

1. Quarks and Leptons: An Introductory Course in Modern Particle Physics - Francis Halzen, Alan D. Martin
2. Introduction to Elementary Particles, David Griffiths
3. An Introduction to Quantum Field Theory - Peskin and Schroeder

P655: Introduction to Phase transitions and Critical phenomena

Experimental evidences of classical and quantum critical phenomena, thermodynamic potentials. heat capacity, magnetic susceptibility, phases, phenomenol-ogy of 1st order phase transitions, continuous transitions, order parameters and models: Ising, XY, Heisenberg, uni-versality and scaling, Ginzburg-Landau-Wilson theory, spontaneous symmetry breaking. Bose-Einstein condensation,expansion around upper critical dimension, domain walls and surface tension, 1D Ising model and instantons, critical behavior, critical exponents, relations between critical exponents, Kadanoff scaling, universality conjecture, calculation of critical exponents: real space RG methods, Phi- 4 theory, 4- epsilon expansion.?RG of Wilson and Fisher, contin-uous symmetry: Mermin-Wagner theorem. Goldstone modes, non-linear sigma-model, vortices, Kosterlitz-Thouless phase transition, topology and duality, surface roughening and Sine-Gordon models, quantum critical phenomena,dissipative quantum tunneling, quantum phase transitions, Bose-Hubbard model.

6. Nonlinear Optics: Basic Concepts by D.L. Mills, Springer Verlag
7. Optical waves in crystals by Amnon Yariv and Pochi Yeh, Wiley-Interscience
8. Laser Spectroscopy by Wolfgang Demtrder, Springer Verlag

P657: General Relativity and Cosmology

1. Review of Newtonian Mechanics. Special theory of relativity. Prelude to General relativity, historical developments
2. 4-Vectors and 4-tensors, examples from physics
3. Principle of Equivalence, Equations of motion, Gravitational force
4. Tensor Analysis in Riemannian space, Effects of Gravitation, Riemann-Christoffel curvature tensor, Ricci Tensor, Curvature Scalar
5. Einstein Field Equations, Experimental tests of GT
6. Scwartzchild Solution, Gravitational lensing
7. Gravitational waves: generation and detection
8. Energy, momentum and angular momentum in Gravitation
9. Cosmological principle, Robertson-Walker metric, Redshifts
10. Big-Bang Hypothesis, CMB.
11. Issues in Quantum Gravity

2. Gravity: HJ. Hartle
3. The Classical Theory of Fields: Landau and Lifshitz
4. Gravitation and Cosmology: S. Weinberg
5. Introducing Einstein's Relativity: D'Inverno

P658: Soft Condensed Matter

1. Prerequisite: Introduction to condensed Matter Physics, Statistical Physics
2. What is Soft Condensed Matter: forces, energies and time scales.
3. Phase transition in soft matter, Radial distribution function and description of liquids.
4. Colloids Polymers Gels Liquid Crystals
5. Soft matter in nature

References:

3. Chandler: Statistical Physics (OUP 1987)
4. R A L Jones: Soft Condensed Matter (O U P 2002)
5. Soft Matter Physics: Daoud and Williams (Springer 1999)

P659: Applied Nuclear Physics

1. Basis of Nuclear Structure and reactions
2. Radioactivity and radioactive decays
3. Passage of charged particle through matter
4. Detectors and Accelerators
5. Applications: Effects of radiation on biological systems and nuclear medicine, Industrial applications
6. Power from fission and fusion: Characteristics of fission, Nuclear reactors, Thermonuclear fusion

References:

1. Nuclear Physics : Principles and Applications, John Lilley

3. Fundamentals of Nuclear Reactor Physics, Elmer Lewis, Academic Press
4. An introduction to the passage of energetic particles through matter, N. J. Caron
5. Accelerator Physics, Shyh-Yuan Lee, World Scientific

P660: Many Particle Physics

1. Prerequisite: Statistical Physics, Quantum Mechanics, Introduction to Condensed Matter Physics
2. Second Quantization, One and two body operators
3. Observables and their relationship to one and two body Greens functions
4. Thermodynamic potential, Spectral functions, Analytic properties of Green's functions
5. Linear Response, correlation function, sum rules
6. Canonical Transformation: Bogoliubov Valetin, Schrieffer Wolf, etc.
7. Equation of motion,
8. Diagrammatic Perturbation theory for Green function and thethermodynamic potential, Luttinger Ward Identities.
9. Mean field theory
10. Functional Integration Methods

References:

1. Lifshitz Pitaeviski (Landau Lifshitz Stat Phys Part II)

3. Doniach and Sondhaimer Greens function for condensed Matter
4. Fetter Walecka: Quantum Theory of Man body Particle systems:
5. Ben Simon: Many Particle Physics
6. Basic Notions in Condensed Matter: P.W. Anderson
7. Techniques and application of Path-integration Plan: S. Schulman

P661: Physics of Mesoscopic Systems

1. Prerequisite: Quantum Mechanics1; Statistical Mechanics; Introduction to Condensed Matter Physics
2. Effects of magnetic fields: The AharonovBohm effect; 2D electron gas; Landau levels; Transverse modes in 2D quantum wire; Shubnikovde Haas oscillations; Magnetic edge states; Integer Quantum Hall effect, Fractional Quantum Hall effect
3. Electron transport: Boltzmann semiclassical transport; Onsager reciprocity relations; Conventional Hall effect; Drude conductivity; Einstein relation; Electronic states in quantum confined systems; Conductance from transmission; Ballistic transport; Quantum of conductance; Landauer formula; Quantum point contact; T .matrices; Smatrix and Green functions; Current operator; LandauerButtiker formalism; Linear response and Kubo formula; Nonequilibrium Green's function approach to transport; Scattering: BreitWigner resonance and Fano resonance; Delay time for resonances; Friedel sum rule; Levinson.s theorem; Singleelectron tunneling: Coulomb blockade and Kondo effect
4. Quantum Information: Josephson Junctions and Cubits; Metastable states and escape dynamics
5. Disordered conductors: Weak localization; Mesoscopic fluctuations; Random Matrices; Anderson localization; Quantum Chaos; Dephasing; Decoherence

References:

1. Electronic Transport in Mesoscopic Systems, S. Datta, Cambridge University press.

3. Mesoscopic Electronics in Solid State Nanostructures, T. Heinzel, WileyVCH.
4. Quantum Transport in Mesoscopic Systems: Complexity and Statistical Fluctuations, P. Mello and N. kumar, Oxford University Press.

P662: Introduction to Quantum Optics

1. Prerequisite: Quantum Mechanics I & 2; Electromagnetism I
2. Electro-magnetic field quantization: Quantum fluctuation and Quadrature operators of a single mode field, Thermal fields, Vacuum fluctuation and zero point energy, Quantum phase
3. Coherent and squeezed states of radiation field: Properties and phase space picture of coherent state, Generation of a coherent state, Squeezed state physics, Generation and Detection of squeezed light, Schrodinger cat states, Multi-mode squeezing, Broadband squeezed light, Squeezing via non-linear process
4. Atom-field interaction: Rabi model (Semi-classical model for atom-field interaction), Jaynes-Cummings model (fully quantum mechanical model for atom-field interaction), Dressed states, Density operator approach, Hanle effect, Coherent trapping, electromagnetically induced transparency, Four wave mixing
5. Quantum coherence function: Photon detection and quantum coherence functions, First order coherence and Young.s type double source experiment, Second order coherence, Physics of Hanbury-Brown-Twiss effect, Experiments with single photon, Quantum mechanics of beam splitter, Interferometry with single photon
6. Optical test of quantum mechanics: Photon sources: spontaneous parametric down-conversion, Hong-Ou-Mandel Interferometer, Superluminal tunneling of photons, EPR paradox and optical test of Bell.s theorem
7. Atom Optics: Mechanical effects of light, Laser cooling, Atom interferometry, Atoms in cavity, Experimental realization of Jaynes-Cummings model
8. Heisenberg-limited interferometry and quantum information: Entanglement and interferometric measurements, Quantum teleportation, Quantum cryptography, An optical realization of some quantum gates.

2. Quantum Optics, M. O. Scully and M. S. Zubairy, Cambridge University Press
3. Quantum Optics, M. Fox, Oxford Master series in Atomic, Optical and Laser physics
4. Quantum Theory of Light, R. Loudon, Oxford science publication

P663: Astronomy and Astrophysics

1. Introduction and Tools :
   Tools - astronomical objects, scales, distance ladder, astrometry, magnitude scale
   Gravity - Keplers law, Virial theorem
   Radiation physics - radiative flux, transfer function, absorption, scattering and emission
2. Stars:
   Stars and stellar structures - stellar spectra, HR diagram
   Equilibrium in stars
   Star formation and Protostars
   Stellar evolution
   Supernovae
   black holes and gravitational waves
3. Interstellar medium
4. Galaxies
   The Milky way Galaxy - distribution of matter, differential rotation, formation of the spiral arms Elliptical and Spiral Galaxies
   Evidence for dark matter Active Galaxies - Active Galactic Nuclei, Seyfert Galaxies, Quasars, Blazers
5. Magnetic fields
   Astrophysical phenomena where magnetic fields are critical
   Galactic magnetic fields - dust and synchrotron polarization, Faraday rotation, Zeeman measurements
6. Gravitational Lensing (optional)
7. Clusters and Superclusters (optional)
8. Cosmology (optional)
   Cosmological Observations and the Cosmological Principle
   Newtonian Cosmology and Cosmological Models
   Cosmic Microwave Background

8. An Introduction to Plasma Astrophysics and Magnetohydrodynamics by M. Goossens

P665: Biophysics

Under development.

P666: Quantum Nanoelectronics

Introduction and Review of Electronic Technology, From Electronics to Nanoelectronics: particles, waves and Schrodinger Equation, Quantum Description of atoms and molecules Quantum Description of metals, semiconductors, junction devices, Some newer building blocks for nanoelectronic devices, Fabrication and Characterization Methods for nanoelectronics, The field effect transistor FET: size limits and alternative forms, Devices based on electron tunneling, resonant tunnel diodes, Single electron transistors, molecular electronics, hybrid electronics, Devices based on electron spin and ferromagnetism, Qubits vs. binary bits in a Quantum Computer, Applications of nanoelectronic technology to energy issues, Summary and brief comment on the future of nanoelectronic techniques

5. Introduction to Nanoelectronics: Science, Nanotechnology, Engineering and Applications - by Vladimir Mitin, Viatcheslav A. Kochelap, Michael A. Stroscio

P667: Nonlinear Physics, Chaos, Turbulence

1. General introduction and motivation : examples of linearity and nonlinearity in physics and the other sciences; modelling systems using iterated maps or differential equations, nonautonomous systems
2. General features of dynamical systems : Systems of differential equations with examples; control parameters; fixed points and their stability; phase space; linear stability analysis; numerical methods for nonlinear systems; properties of limit cycles; nonlinear oscillators and their applications; the impossibility of chaos in the phase plane; bifurcations: their classification and physical examples; spatial systems, pattern formation and the Turing mechanism; strange attractors and chaotic behaviour.
3. The logistic map: Linear and quadratic maps; graphical analysis of the logistic map; linear stability analysis and the existence of 2-cycles; numerical analysis of the logistic map; chaotic behaviour and the determination of the Lyapunov exponent; universality and the Feigenbaum numbers; other examples of iterated maps.
4. Hamiltonian Sysytems: Phase space; Constants of motion and integrable Hamiltonians; Nonintegrable systems, the KAM theorem and period-doubling; applications.
5. Fractal geometry: dimension of an object, Mandelbrot set, Julia set, iterated function systems.
6. Spatio-temporal dynamics: Spatio-temporal chaos
7. Quantum Chaos: Quantum analogies to Chaotic behaviour, Correaltions in wave functions, chaos and semiclassical approaches to Quantum mechanics

P668: Magnetism and Superconductivity

1. Prerequisite: Solid State Physics, Quantum Mechanics, Statistical Physics
2. Review of atomic/ionic magnetism.
3. Diamagnetism Paramagnetism Ferromagnetism characteristics, Occurrence.
4. Orbital magnetism, de Haas van Alfen effect.
5. Heisenberg Model: Ground state, Spin waves.
6. Hubbard Model and Itinerant exchange.
7. Magnetic domains and hysteresis.
8. The phenomenon of Superconductivity: historical perspective, characteristics, occurrence.
9. London Equations, Thermodynamics, Meissner Effect.
10. Ginzburg Landau Theory, Abrikosov Vortices.
11. Josephson Effect.
12. Cooper Instability, BCS wave function, Gap equation, thermodynamics and magnetic response.
13. Conventional and non-conventional superconductors.

6. Superconductivity - de Gennes
7. Superconductivity - Tinkham

P669: Density Functional Theory of Atoms, Molecules and Solids

Many-body problem: QM of electrons and nuclei, approximation methods for many electron systems, Born-Oppenheimer approximation, Hartree and HF theory, tight binding method, greens functions, electron correlation, CI & many-body and Moller-Plesset theory, complete active space methods, coupled cluster theory, density matrices, time-dependent approach to all the above formalism

Foundations of Density Functional Theory(DFT): Hohenberg-Kohn (HK) theorem, degenerate ground states, variational DFT, $N-$ and $v-$ representability problem, Levy-Lieb constrained search, fractional particle number & derivative discontinuity, spin polarized systems, Exited states part I: Effective Single Particle Picture: Kohn-Sham (KS) construction, non-interacting $v-$ representability, degenerate KS DFT, KS equations for spin polarized systems, interpretation of KS eigenvalues

Exchange-Correlation (XC) Energy Functional: exact exchange formalism within DFT, exact representations of the energy functional, LDA, GGA, meta-GGA, weighted density approximation, self interaction correction (SIC), virial theorems, exact exchange formalism (OPM, KLI, HS), where DFT goes wrong, strengths of DFT, strong correlation: DFT+U, RPA, GW, DFPT, DMFT, orbital free DFT, DFT-hybrid

Crossover to Excited-States: time-dependent DFT: Runge-Gross theorem, time-dependent KS equations, adiabatic LDA & TD XC potentials, linear response TDDFT, Excited states part II, spin polarized TDDFT, frequency dependent XC kernel, TDCDFT, TDOEP, relativistic DFT, molecular orbital theories

5. Fundamentals of TDDFT by Miguel A.L. Marques et al.
6. Time-dependent Density Functional Theory by Miguel A.L. Marques et al.
7. Time-dependent Density Functional Theory by Carsten Ullrich
8. Quantal Density Functional Theory I & II by Viraht Shani

9. Recent Advances in Density Functional Methods (Part I, II & III) by Delano P Chong
10. Atomic and Electronic Structure of Solids - by Ethimios Kaxiras
11. Electronic Structure: basic theory and practical methods by Richard M. Martin
12. Many-Body Quantum Theory in Condensed Matter Physics by H. Bruus, K. Flensberg
13. Quantum Theory of the Electron Liquid by Gabriele Giuliani, Giovanni Vignale
14. Molecular Electronic Structure Theory by T.U. Helgaker, P. Jorgensen, and J. Olsen
15. Electronic Structure Calculations for Solids and Molecules by J. Kohanoff
16. Methods of Electronic Structure Calculations by M. Springborg
17. Self Consistent Fields in Atoms by Norman March
18. Computational Materials Science by J. G. Lee
19. Density Functional Theory in Quantum Chemistry by Takao Tsuneda
20. Material Modeling using DFT by Feliciano Giustino

P670: Quantum Field Theory II

1. Path-integral formulation of quantum mechanics
2. Path-integral for scalar fields, generating functional, connected Greens functions, Feynman rules, 1 loop diagrams
3. Grassmann variable, path-integral for Dirac field
4. Path-integral for Electromagnetic field, gauge fixing
5. QED, symmetries and Ward identity
6. Renormalization divergences and power counting, 4 theory, QED, spontaneous symmetry breaking, Renormalization Group basics (running of coupling).
7. Yang-Mills theory, gauge fixing and ghosts, BRST, asymptotic freedom

P671: Quantum Information and Quantum computation

1. Introduction to Classical information: Shannon entropy, Mutual Information
2. Quantum Information I: Hilbert space, density matrices, quantum entropy and Holevo bound
3. Quantum Information II: Entanglement, Teleportation, super dense coding and Bell inequalities
4. Quantum dynamics:Two level systems, decoherence and Rabi oscillations
5. Quantum computation: single qubit gates-phase, swap, Hadamard; two qubit gates-CNOT
6. Quantum algorithms: Deutsch, Grover, Introduction to Shor's algorithm
7. Quantum error correction
8. Applications: Quantum simulation and Adiabatic quantum computation
9. Solid state quantum information and computation: Introduction to entanglement in nanostructures, quantum computation with superconducting devices and topological quantum computation.

2. Nielsen and Chuang, Quantum Information and Computation (Cambridge U. Press)
3. Kaye, Laflamme, Mosca, An Introduction to quantum computing. (Oxford U. press)

P672: Experimental High Energy Physics

The interaction of high-energy particles with matter: specific applications related to EHEP.

1. Relativistic kinematics: Detailed derivation of kinematic variables and their transformations whenever needed. Decay kinematics. Rapidity, pseudo-rapidity, spacelike and time-like. Some examples where relativistic kinematics play important role for understanding of data.
2. Detectors in High Energy Physics: General concept of building a HEP experiment, coverage and options, Gas detectors; Semiconductor detector; Scintillator and Cerenkov detectors Specific to EHEP, Calorimeter and Preshower detectors: principle of electromagnetic and hadronic shower generation.
3. Detector Simulation: Need of simulation, various techniques, MC, some general Concepts.
4. Data Analysis in HEP: General approach of data cleanup, calibration, track reconstruction, reconstruction of events
5. Error analysis in EHEP.
6. Computing in EHEP: Basics of OO programming using C++, few applications in EHEPdata analysis.

6. Data Reduction and Error analysis for the physical sciences: P. Bevington and D. K.Robinson
7. Data Analysis Techniques for High Energy Physics: R. Frunwirth, M. Regler, R. K. Bock and H. Grote

P673: Experimental Techniques

1. Mechanical drawing and designs: Basics tools: hand tools, machines for making holes, the lathe, milling machines, grinders, casting; Mechanical drawing, drawing tools, basic principles of mechanical drawing, dimensions, tolerances, from design to working drawings
2. Vacuum technology: gases, gas flow, pressure and flow measurement, vacuum pumps, pumping mechanisms, ultrahigh vacuum, leak detection
3. Optical systems: optical components, optical materials, optical sources Charge particle optics: electrostatic lenses, charged-particle sources, energy and mass analyzer
4. Detectors: optical detectors, photoemission detectors, particle and ionizing radiation detectors, signal to noise ration detection, surface barrier detector.
5. Particle detectors and radioactive Decay: Interactions of charged particles and photons with matter; gaseous ionization detectors, scintillation counter, solid state detectors
6. Electronics: electronic noise, survey of analog and digital I/Cs, signal processing, data acquisition and control systems, data analysis evaluation
7. Nano- and micro-fabrication: various lithography techniques such as photolithography, nanoimprint lithography, e-beam lithography, ion-ball milling
8. Some experiments: SEM, TEM, X-ray diffraction, SQUID Magnetometry, Magnetotransport, PL/CL time resolved spectroscopy, Rutherford Backscattering spectrometry (RBS), RBS-Channeling, UV-VIS-IR spectrometry.

8. Radiation detection and Measurements, G. Knoll, 3rd Edition
9. Techniques for Nuclear and particles physics experiments, W. R. Leo, 2nd edition, Springer

P674: Introduction to Cosmology

1. The cosmic history and inventory.
2. A sketch of General Relativity.
3. The expanding Universe
4. Friedmann Equations and Cosmological Models
5. The Standard cosmological model.
6. The inflationary Universe.
7. Primordial nucleosynthesis and the thermal history of the Universe.
8. Perturbations in an expanding Universe.
9. Growth of perturbations
10. Dark Matter Halos.
11. Statistical description of gravitational clustering
12. Special Topics:
    Fluctuations in the CMB, Lensing, Cluster Cosmology, The Lyman-Alpha Forest, Reionization, Halo Model, Redshift Space Distortions.

P675: Quark-Gluon-Plasma and Nucleus-Nucleus Collisions

1. Introduction to high energy heavy ion collisions and Quark-Gluon-Plasma, comparison of big bang and the little bang.
2. Thermodynamics:relativistic gas (hadrons, quarks and gluons) and its statistical and thermodynamical properties, MIT Bag model,Hagedorn gas, phase diagram of QCD.
3. Relativistic Kinematics: four vectors notation, rapidity variables, pseudorapidity varibales, light cone variables, relativistic invariants, Dalitz plot, cross sections .
4. Collision Dynamics: initial state of nuclear collisions, fluid dynamical evolution, kinetic transport model, freeze-out and particle production.
5. Experiments: a general overview of different experimental setup related to search for QGP and relevant observables.
6. Signatures of QGP: collective flow, J/Ψ suppression, strangeness enhancement, jet quenching, electromagnetic probes, Hanbury-Brown-Twiss measurement.
7. Recent progresses.

7. Extreme states of matter in strong interaction physics by Helmut Satz.
8. Relativistic Hydrodynamics by L. Rezzolla and O. Zanotti.
9. Finite Temperature Field Theory by J. I. Kapusta and C. Gale.
10. The Early Universe by Kolb and Turner.
11. Fantastic Realities by Frank Wilczek.

Syllabus for Diploma in Medical Radioisotope Techniques (DMRIT)

(PROGRAM CODE: HLTH07)

Scheme

Paper 1 - Basic Sciences for Nuclear Medicine – 100 marks

Paper II - Radiation Physics, Radiation Biology & Radiation Protection– 100 marks

Paper III - Diagnostic Radiopharmaceuticals & In-vitro Techniques – 100 marks

Paper IV- Instrumentation & Imaging Technology – 100 marks

Paper V - Clinical Nuclear Medicine Techniques – 100 marks

Basic Sciences for Nuclear Medicine - Paper 1

1. **Atomic structure & Periodic table** **2 Lectures**

Atom and sub atomic particles, Rutherford's atomic structure and its limitations, Bohr's atomic structure. Quantum numbers, Isotope, Isobar and Isotone, Periodic properties like atomic radius, ionic radius, Electro negativity, Ionisation potential, Electron affinity.

2. Introduction Human Anatomy and Physiology **10 Lectures**

Human Anatomy, Brief introductory anatomical features of: Cardiovascular system, Respiratory system, Alimentary system, Renal system, Central nervous system, Endocrine systems, Reproductive system, Musculoskeletal system. Haematology. Human Physiology and Pathophysiology.

3. General Cell Biology & Cellular Physiology **2 Lectures**

The basic structure of eukaryotic and prokaryotic cell and their internal environment. Cell wall, cell membranes. Functions of endoplasmic reticulum, mitochondria, Golgi complex, lysosomes. Transmembrane potential of mitochondria and its implications in transport and intramitochodrial localization of isonitrile compounds. Transport across cell membranes, Functional systems in the cells. Cell reproduction; Concept of Cell doubling time and its implication in Oncology.

4. Basic Electronics **8 Lectures**

Fundamentals of electricity and electronics, Coulombs law, Ohms law, Ohmic & non ohmic devices, Kirchhoff's law, regulated power supply, Semiconductor physics, PN junction diode, LED, Rectifiers, Transistors (PNP & NPN), Feedbacks, Operational amplifiers, Oscillators, Binary, Octal, Hexadecimal number system, Logic circuits, CRO , ADC and DAC. Defibrillator circuit and uses.

5. Basic Mathematics **12 Lectures**

Numbering system, Accuracy and Precision, Significant figures, Matrices, Mathematical Constants. Linear and Polynomial Equations, Linear and Quadratic Equations and Identities, Slope, Roots, Relation between Roots and Coefficients. **Logarithms;** Definition, Laws of Logarithms, Rule for Change of Base, Common and Natural Logarithms, **Permutations and Combinations,** Probability, Factorials. **Calculus;** Relations and functions, Limits, Definition of Derivative, Physical Significance, Differentiation of Simple Functions, Differential Equations, integration and Summation, Definition of Trigonometric Functions, Identities.
Introduction to Mathematical Transformation: Fourier Transform, Laplace transform.

6. Chemistry relevant for radiopharmaceuticals **10 Lectures**

Concept of Bohr model, Hybridization with example of Methane, Ethylene and acetylene etc, Solvent strength, Acid base , pH, buffers, Titrations, Organic Chemistry, Resonance effect, Steric effect, Dielectric constant, various type of organic solvents, Mesomeric effect, determination of organic acid base strength and other organic phenomena utilizing the basic principle, various type of organic reactions, Nucleophilic Substitution reactions in details, Aromatic substitution reactions, ^{99m}Tc-chemistry, Core structures of various common ^{99m}Tc-radiopharmaceuticals, labelling techniques, importance of ^{99m}Tc-kit components, peptide chemistry with respect to ^{68}Ga/^{177}Lu-DOTATOC, DOTA-TATE etc. Principle of radionuclide choice for imaging and therapy with example of ^{68}Ga, ^{177}Lu, ^{90}Y, ^{18}F, ^{99m}Tc etc. Principle of TLC, HPLC with respect to radiochemical purity (RCP).

7. Introduction to Immunology: **4 Lectures**

Structure and function of immune system, Immune response – humoral and cell-mediated immune response – primary and secondary responses. Antigens, Antibodies, Structure of Antibodie's, Classification of antibodies, Antigen-antibody interaction, and Monoclonal antibodies. New generation antibodies. Implications in molecular imaging & therapy.

8. Basic Biochemistry and Molecular biology **10 Lectures**

Introduction to carbohydrates, Proteins, Nucleic acids, Enzymes, Lipids. Protein structure and protein 3-dimensional shape, Structure-function relationship, Proteins purification, Nature of enzyme catalyzed reactions, their regulation, inhibition and mechanisms. Structure and function of carbohydrates and their importance in central metabolism. Structures and nature of fatty acids and lipids found in biological membranes. Lipid Metabolism. Nucleic Acids and Biological Information Flow. Related Biochemical and molecular biology techniques. Aptamers with radiolabelled apatamers for Nuclear imaging and therapy.

9. Biostatistics **12 Lectures**

Basic Concepts: Probability, a Priori and posteriori Probabilities. Statistical significance of probabilities Sample and Population, Variables, Classification of Variables, Nominal, Ordinal, interval and Ratio, Fixed and Random, Population Distributions: Binomial distributions and Poisson distributions – their properties, parameters and applications. Normal and't' distributions – Population and Sample Parameters. Measures of central tendency, measures of dispersion, Variance, degrees of freedom, confidence limits and intervals. Probability of occurrence – use of Z and t tables. Sampling, Estimates and Hypothesis testing: Sampling methods, Random sampling and estimates of population parameters from samples. Sample statistics, Hypothesis testing. Drawing inferences and confidence limits. P values. Student's t test for comparing means. General and paired t tests. Special cases where Variances are unequal. Central Limit Theorem. Analysis of Variance- F- Distribution, Test for Homogeneity of Variance One Way ANOVA, Comparison of Means of Multiple Groups By Partitioning of the total Sum of Squares as within and between Sum of Squares, Assumptions in ANOVA, Missing Values, Two Way ANOVA; Design of Experiments. Correlation and Regression: Pearsons' Product Moment Correlation Coefficient, comparison of Correlation Coefficients, Partial and Multiple Correlation, Linear Regression Analysis. Interpretation of Regression Coefficients. Application of Correlation and Regression in Method Comparison and Evaluation. Nonparametric Statistics: Spearman's Coefficient of Rank Correlation, Chi Square Test. Nonparametric Methods for Hypothesis Testing Based on Ranks. Mann Whitney U Test, Wilcoxon Signed Rank test, T Test.

Clinical Statistics: Cohort Studies, Case Control Studies, Sample Size calculations, Clinical Trials, Meta analysis. Demonstration of application Software's in Statistics.

10. Introduction to Biology of cancer **2 Lectures**

Neoplastic processes. Inflammatory & Degenerative processes. Classification and nomenclature of neoplasms. Concept of Cell doubling time and its implication in Oncology; Warburg effect and its implications in metabolic imaging, Apoptotic pathway and role of Annexin V.

11. Basic Medical Terminology **2 Lectures**

Descriptive – describing shape, color, size, function, etc, and eponyms. Word root for eg. Myocarditis (prefix) (root) (suffix). Prefix change, Suffix change. -itis, -osis, -ectomy, -otomy, -ostomy, a/an -, micro -, macro -, mega -/ -megaly, -scopy/ -scopic with examples. Pathological Nomenclatures Specially For Tumours.

12. Introduction Common hospital practices **2 Lectures**

Pathogens, Disinfection methods, Sterilisation, Communicable diseases, Nosocomial infections, Hepatitis, HIV, Biohazards, Principles of asepsis - handling of contaminated swabs, used syringes and needles, Bio-waste management. Policies for management of Niddle stick injury/Exposure to blood or body fluids.

Radiation Physics, Radiation Biology & Radiation Protection - Paper -II

1. Origin & Types of Radiation **4 Lectures**

Fundamental constituents (quarks, leptons) and interactions of matter according to the "Standard Model", Properties of Nuclear Forces, Phenomenological Nucleon-Nucleon Potentials, Stability of nuclides - binding energy forces and nuclear forces, Spin, electric and magnetic moments, Experimental Nuclear Moments, Size, Parity and Isospin of Nuclei, Laws of radioactivity, Units of radioactivity. Decay modes, Stability of atom, Mass defect, Binding energy, The basis of radioactivity (N/Z ratio).Types of radioactivity depending on N/Z ratio Types of radiation (α[one body theory of alpha decay, microscopic theories of alpha decay], β[theory of beta decay; types of weak interaction; selection rules in beta decay; parity non conservation in beta decay], γ, X-ray, n). Theory of gamma decay, Experimental gamma ray transition rates: isomeric states; Vibrational motion (theory of Nuclear vibrations); Rotational motion (theory of Nuclear rotation); Interacting Boson models; Clustering (especially in context of alpha particles); Recent developments (qantum chromodynamics, perturbation theory, meson field theory and chiral perturbation theory), radionuclide chart, Laws of successive transformations, Theories of alpha, beta and positron emission; beta particle spectrum; K shell electron capture; Cerenkov radiation, characteristic radiation, Auger effect, Bremsstrahlung radiations, Metastable state and isomeric transition, internal conversion. Nuclear reactions, Nuclear reaction cross section, neutron activation with thermal neutrons, Nuclear isomerism, nuclear fission, fission products, nuclear reactors.

2. Interaction of radiation with matter **5 Lectures**

Gamma ray interactions - Excitation, ionization, photoelectric effect, Compton effect, pair production, annihilation radiations, specific ionization and linear energy transfer; Charged Particle interactions: range of charged particles, Interaction of neutrons with matter, Elastic scattering. Importance of these interactions in radiology and nuclear medicine.

3. Radiation Quantities and units **3 Lectures**

Exposure, Absorbed dose, Radiation weighting factor, Concept of radiation weighting factor W_R, Sievert, Equivalent dose, Concept of tissue weighting factor W_T, Effective dose, Committed equivalent dose, Committed effective dose, ICRP and AERB dose limits. Use of dose constraints for staff and comforter. Annual Limit of Intake and derived air concentration. Reference levels: Recording levels, Investigation levels and Action levels.

4. Gas filled detector **3 Lectures**

Theory of ionization chamber, design consideration in an ionization chamber, operating voltage, theory and construction of condenser type of chambers and thimble chambers; gas multiplication, pulse mode detector for single ionizing events, Proportional Counters - design and characteristics, Geiger-Mueller Counters - design consideration, dead time and recovery time, characteristics of organic and inorganic quenchers, operation.

5. Scintillation detectors – (Organic and inorganic) **3 Lectures**

Atomic basis of scintillation. Scintillation process. Dopants. Inorganic and Organic Scintillators, Comparison of properties by comparison of characteristics like stability, light output, decay time, intrinsic efficiency, dead time, considerations on fabrication and cost.

6. Gamma Ray Spectrometry **5 Lectures**

Construction of a Gamma Ray Spectrometer. Components of GRS. Detection principle – light collection, light guide, and Photomultiplier tubes. Coincidence & anti coincidence circuits. Single channel analyzer, multi channel analyzer. Study of gamma ray spectrum: photopeaks, Compton valley, edge and plateau, characteristic X-ray peak, backscatter peak, Iodine escape peak, annihilation peak, coincidence peak. Gamma ray spectrometer : calibration, energy resolution, integral & differential counting, linearity, counting efficiency.

7. Statistics of counting: **3 Lectures**

Poisson distribution, Poisson approximation to radioactive decay, measures of counting error. Accuracy and precision, standard error, counting in low background and high background scenarios, net count rates and standard deviation of count rates. Gaussian distribution and propagation of errors. Distribution of counting times to minimize errors.

8. Semiconductor detectors: **2 Lectures**

Semiconductors junction and surface barrier detectors, Diode detectors, Ge(Li) detectors, High Purity Germanium detectors, their response and characteristics, energy calibration and detector efficiencies, Cadmium-zinc-telluride detector. Room temperature semiconductor diodes. Advantages and disadvantages of semiconductor detectors.

9. Liquid Scintillation Counters **2 Lectures**

Composition of liquid scintillator, scintillation cocktail: primary solute, secondary solute and organic solvent (toluene, 1, 4 dioxane, anthracene) and solublizing agents for tissues, PM tubes, Coincidence circuits and count display systems. Quenching, Quench corrections methods: Internal standard method, external standard method and channel ratio. Discrimination of alpha, beta by liquid scintillations.

10. Radiation Biology **10 Lectures**

Radiolysis of water, interactions of free radicals, Direct versus indirect effects. Influence of LET, oxygen and various compounds on free radical forming reactions Target Theory, Multitarget theory, Target size, Multi hit theory, Multitarget multi hit theory.

Radiation effects on macromolecules, cell membrane, chromosomes. Chromosomal type aberrations. Radiation effects on cell division. Radiation effects on microorganisms and independent cell systems.

Differential cell sensitivity. Criteria of sensitivity, Factors affecting sensitivity. Anti-oxidative enzymes: Super Oxide dismutase, Catalase, Glutathione reductase, Glutathione -S-transferase, Monoamine oxygenase, Glutathione peroxidase.

Radiation effects on major organ systems: hematopoietic system, digestive system, reproductive system, nervous system. Effects of Ionizing Radiation on the Embryo and Fetus. Teratogenic and delayed effects.

Linear Energy Transfer, Relative biological effectiveness, Dose rate effect, chronic irradiation, factors influencing radiation response - oxygen concentration, Temperature etc.

Acute radiation effects: Lethality, Stochastic and Nonstochastic effects of radiation: Late effects in normal tissue systems and organs, Radiation carcinogenesis, genetic effect of radiation, radiation induced mutations, dose effect relationship, pre-natal effects of radiation, types of genetic disorders, risk estimation, direct method, doubling dose method, uncertainties. Basis for ICRP dose limits for occupational exposure, embryo / fetus, members of the public, risks associated with recommended limits, Biodosimetry, Bioassays, Extremity dosimetry. Low Dose Exposure to Ionizing Radiation: Medical, Natural background, Radon. Radiation Hormesis; BERT.

11. Personnel monitoring devices **4 Lectures**

Film badges, Ring badges, Thermoluminescent dosimeters (TLD's), Pocket dosimeters. Characteristics of TLD phosphors, Glow curves, dose and energy response, sensitivity and application in dosimetry and personnel monitoring devices. Other types of dosimeters - radiation calorimetry, photographic dosimetery, chemical dosimetry.

12. Radiation Protection: **6 Lectures**

Types of exposure: internal and external exposure, Routes of internal exposure Principles of radiation protection, time, distance, shielding. Exposure rate & shielding calculations by defining types of materials, and thickness needed using attenuation coefficients. Concept of Half value layer and tenth value layer. Work place monitoring: Radiation field, contamination and airborne radioactivity monitoring. AERB directive for derived working levels for radioactive contamination, airborne radioactivity and Radiation field. Radiation protection in diagnostic nuclear medicine, therapeutic nuclear medicine (with AERB directives for discharge of patients) and Medical cyclotron.

13. Radiation dosimetry **7 Lectures**

Metabolic pathways of radioisotope deposition, beta particle dosimetry; Equilibrium Dose rate equation. Gamma dose calculation, Specific gamma ray constant (Γ) and average geometrical factor. MIRD method of internal dose calculation, Absorbed Fraction and calculation of absorbed dose.

14. Transport of radioactive material **2 Lectures**

Classification of radioactive materials, general packing requirements, transport documents, Type of package, Transport Index, Category of package, approval requirements, TREMCARD.

15. Radiological emergency and preparedness **1 Lecture**

Major spillage, loss of radioactive source, Misadministration, Medical emergencies involving radioactive patients and Death of therapy in-patient. AERB directives to handle the cadaver. Radioactive decontamination.

16. Radioactive waste management **2 Lectures**

Philosophy of radioactive waste management, Management of solid waste, liquid waste and gaseous waste, Segregation, Collection and Safe disposal, Delay tank facility. Radioactive & Biohazardous Waste Disposal Methods - Decay in Storage, Separation by Half Life, Incineration, Sewer or Atmosphere. Airborne Radiation Exposure Measurements, Effluent Concentration (^{131}Iodine, ^{177}Lutetium, etc). AERB directives for safe disposal of radioactive waste. Concept of Exclusion, exemption and clearance of radionuclide in solid materials.

Diagnostic Radiopharmaceuticals & In-vitro Techniques - Paper III

1. **Radionuclides in Nuclear Medicine** **3 Lectures**

Radioactive decay, Physical Half-Life, Activity, Decay Constant, Mode of radioactive decay, Alpha particle decay, Beta particle decay, Gamma ray, Requirements for Radiotracers, Radionuclides used in Nuclear Medicine, Radionuclide Considerations, Type and Energy of Emissions, Specific Activity, Radionuclidic Purity, Chemical Properties, Economics, Production of radionuclides, Radiopharmaceuticals, Ideal radiopharmaceuticals, Important characteristics of a radionuclide to be used in imaging.

2. **Production of reactor & accelerator produced radionuclides** **5 Lectures**

Successive decay and radioactivity equilibrium, Equation for radionuclide production Reactors and charged particle accelerators. Nuclear reactors: neutron energy and neutron flux, neutron cross section, targets and specific activities, mathematical principles, general radiochemistry. Charged particle accelerators: physics of linear accelerator, Cyclotron, Synchro-cyclotron, Isochronous cyclotron. Medical cyclotron: threshold energy, nuclear cross section, q value, RF frequency, magnets, beam focusing and extraction, target design. Types and makes. Cyclotron produced radionuclides, cyclotron based generator.Chemical processing of reactor and accelerator targets; Separation techniques using precipitation, solvent extraction, distillation, gas evolution, ion exchangers; Structure of cation and anion exchangers; relative affinity of ions in exchangers; Use of exchangers in ion exchange columns; other column separation techniques.

3. **Compartmental Analysis** **4 Lectures**

Compartmental analysis and its applications in Nuclear Medicine, Assumptions in Compartmental model, Single compartment model, The Continuously stirred tank reactor (CSTR); Single Compartment model: The Charged Capacitor; Single Compartment model:

Discrete time analogues for two compartment systems; Occupancy theorem. Application of Differential equations, Open and closed models, Single compartment, two compartment and multicompartment models, reversible and irreversible exchanges, Mammary and Caternary models, Problems on radioactive generators, biological elimination processes of radiopharmaceuticals. Distributed Models.

4. **Generator produced Radionuclides** **5 Lectures**

Need for Generator, Advantages of generator system, Definition, Properties of Ideal Generator, Basic Principle, Principles of generator system, Parent Daughter Growth –Decay Relationship, Parent Daughter Equilibrium, Transient Equilibrium, Secular equilibrium. Various generator systems.

a) Gamma emitting radionuclidic generators: ^{99}Mo - ^{99m}Tc, ^{113}Sn – ^{113m}In, Special emphasis on ^{99}Mo - ^{99m}Tc generator: Production of parent, Decay Scheme, Characteristics of Daughter Radionuclide, Types of generators – column generator, solvent extraction generator, gel generator, sublimation generator, various generator suppliers, Applications of Daughter Radionuclide.

b) Beta emitting radionuclidic generators: ^{188}W -^{188}Re, ^{90}Sr - ^{90}Y, ^{194}Os - ^{194}Ir, ^{132}Te - ^{132}I. Production of parent, decay Scheme, characteristics of daughter radionuclides, generator suppliers, applications of daughter radionuclide.

c) Positron emitting radionuclidic generators: ^{68}Ge – ^{68}Ga, ^{82}Sr - ^{82}Rb : Production of parent, Decay Scheme, Characteristics of Daughter Radionuclide, Various generator suppliers, Applications of Daughter Radionuclide.

d) Alpha emitting radionuclidic generators and Complex Systems: ^{225}Ac - ^{213}Bi, $^{224}Ra/^{212}Pb/^{212}Bi$.

5. **Radiopharmaceutical Chemistry** **4 Lectures**

General physicochemical properties of radioactive compounds: distinction between radionuclide, radiochemical and radiopharmaceuticals, carrier concept (carrier-free, carrier added, no carrier added). Chemistry of tracer radionuclide metals: hydrolysis, reduction-oxidation, concentration methods, radiolytic decomposition.

Study of Phosphorous (P), Chromium (Cr), Cobalt (Co), Iron (Fe), Indium (In), Thallium (Tl), Technetium-99m (Tc), Iodine (I), Yttrium (Y), Strontium (Sr), Rhenium (Re), Samarium (Sm), Lutetium-177 (Lu), radioactive gases (i.e. Xenon ^{133}Xe, ^{127}Xe, ^{81m}Kr-) & positron emitting nuclides like Fluorine (F), Oxygen (O), Carbon (C), Nitrogen (N), Copper (Cu), Rubidium (Rb), Gallium (Ga).

6. **Development of radiopharmaceuticals** **2 Lecture**

Empirical and Rational approaches to design, charge and size of the molecule, protein binding solubility, stability and bio-distribution. Structure- activity relationship. Biological properties of radiopharmaceuticals, pharmacokinetics, distribution, metabolism, excretion.

7. **Modes of localisation:** **2 Lectures**

localisation in organ of interest for diagnostic and therapeutic purposes. Various Mechanism of localisation with respect to each radiopharmaceutical. Ideal characteristic of RP for modes of localisation: Active and passive modes of localisation. Substrate specific radiopharmaceutical localization, Receptor mediated biochemical, metabolic trapping, enzyme substrate, antibodies to tumor associated antigens. Filtration, Phagocytosis, Cell Sequestration, Capillary blockade, ion Exchange, Chemisorption, Cellular migration.

8. **Methods of radiolabeling:** **4 Lectures**

Definition of a Radiopharmaceutical, ideal Radiopharmaceutical, availability, short effective half-Life, particle emission, decay by electron capture or isomeric transition. High target-to-nontarget activity ratio. Design of new Radiopharmaceuticals. General considerations. Factors influencing the design of new radiopharmaceuticals. Methods of radiolabeling. Isotope exchange reactions. Introduction of a foreign label. Labeling with bifunctional chelating agents. Biosynthesis. Important factors in labelling. Efficiency of the labeling process. Chemical stability of the product. Denaturation or alteration. Isotope Effect. Carrier-free or No-carrier-added state. Storage conditions. Purification analysis, shelf life.

9. **Specific methods of labelling: Radioiodinated radiopharmaceuticals:** **2 lectures**

Introduction, isotopes of iodine, production of isotopes with physical properties, principle of radioiodination, methods of radioiodination, iodination of organic compounds – Chemistry of Iodine, chemical properties, oxidation, methods to minimize oxidation. Various radioiodinated radiopharmaceuticals –1)^{131}I-NaI, 2)^{131}I-OIH, 3) ^{131}I-Rose Bengal, 4)^{131}I-IMP (n-isopropyl, p-iodo amphetamine), 5)^{131}I-HIPDM (NNN'-trimethyl,N'(2-hydroxy,,3-methyl,5-iodobenzyl)1,3propane diamine), 6) ^{131}I-mIBG, 7)^{131}I-Fibrinogen, 8)^{131}I- lipiodol, 9)^{131}I-19-Iodocholesterol, radioiodination of peptides, proteins, antibodies/monoclonal antibodies, Methods of labelling, Applications, Advantages, Disadvantages, Dose Administration etc.

10. Specific methods of labeling – Technetium labeling **4 Lecture**

Chemistry of Technetium with respect to oxidation states, reduction methods, technetium tin-ligand reactions in aqueous solution, hydrolysis, re-oxidation, complexation, carrier effects, radiolytic decomposition.

Kit formulation of radiopharmaceuticals and their classification. Additives, stabilisers and preservatives.

Labelling with ^{99m}Tc: formation of ^{99m}Tc- complexes by ligand exchange, structure of ^{99m}Tc-complexes, oxidation states of ^{99m}Tc in radiopharmaceuticals and kits for ^{99m}Tc-labeling-: DTPA, GHA, DMSA, MIBI, MAG_3, MDP, Phytates, ECD, EC, IDA compounds and Sulfur Colloid. Dextran colloid and labeled particles. Metal chelate and congugates, ^{99m}Tc-tricarbonyl core, ^{99m}Tc-nitrido compounds, ^{99m}Tc-Hynic-TOC.

11. Radiolabeling of Cells: **2 Lectures**

Methods of labelling for blood pool studies & detection of gastrointestinal bleeding , ^{99m} Tc-RBC (i.e. In-vitro, In-vivo and modified In-vivo), ^{99m} Tc- RBC's (denatured) for splenic imaging, ^{99m} Tc- / ^{111}In- - Leucocytes (i.e. Methods of radiolabeling for inflammation / abscess localization), ^{51}Cr- red blood cells (i.e. Methods of radiolabeling for blood volume measurement & Splenic Sequestration studies), ^{111}In-platelets (i.e. Methods for radiolabeling).

12. Altered biodistribution related to improper preparation of Radiopharmaceuticals. 1 Lecture

Radiopharmaceutical formulation problems, problems caused by radiopharmaceutical administration technique and procedure, changes in biochemical and phathophysiology, previous medical procedure such as surgery, radiation therapy and dialysis, drug interactions.

13. PET radiopharmaceuticals: 6 Lectures

Positron emitters & radiochemistry to produce, ^{18}F-Sodium Fluoride, ^{18}F-Fluorodeoxyglucose (FDG) , ^{18}F-Fluorodopa , ^{18}F-Fluorothymidine (FLT), ^{18}F-MISO, ^{18}F-FAZA, ^{18}F-FET, ^{18}F-FBA, ^{11}C-Sodium Acetate, $^{13}NH_3$ and $H_2{}^{15}O$._FDG synthesis and QC Details of automated steps involved during synthesis, QC done before supply for patient's use.

14. Molecular Imaging probes: Target specific radiopharmaceuticals 1 Lecture

Basics of molecular imaging, methodology of molecular imaging, Classification of radiopharmaceuticals, blood flow/membrane transport radiopharmaceutical, metabolism based radiopharmaceutical. Receptor & transport mediated radiopharmaceutical. Receptors, receptor binding, design of radiopharmaceutical, bifunctional approach, chelating agents, radiolabeling, Ideal radiopharmaceutical, Various receptor imaging agents SSTR, Bombesin, Vasoactive intestinal peptides, α-Melanocyte-Stimulating Hormone, Neurotensin, Substance P (SP), Cholecystokinin (CCK), Neuropeptide Y (NPY) reporter genes for imaging.

15. Quality control of Radiopharmaceuticals 4 Lectures

General Schemes, Physicochemical tests: physical characteristics, pH and ionic strength, radionuclide purity, radiochemical purity, chemical purity, radio assay.

QC of kits – radiochemical purity, sterility check, membrane filtration, chromatography, pyrogen test, bio-distribution studies, Molybdenum break through test. Breakthrough of methyl ethyl ketone, alumina. QA of PET radiopharmaceuticals by TLC scanner, HPLC and gas chromatography (GC). QC in hospital radiopharmacy practices - includes aseptic practices & pharmaceutical safety aspects. Good manufacturing practice (GMP), ISO and ISI standards in radiopharmaceuticals. Adverse reactions to and altered biodistribution of radiopharmaceuticals, iatrogenic alterations in the biodistribution of radiopharmaceuticals Regulations, ethics and registration of radiopharmaceuticals.

16. Therapeutic applications of radionuclides 2 Lecture

Radionuclide therapy (RNT), definition, Problems for development of therapeutic RP, Uptake mechanisms of therapeutic radiopharmaceuticals, types of preparation, Properties of ideal therapeutic radiopharmaceuticals, selection of appropriate radionuclides includes particle emission, half-life, Specific Activity, decay characteristics, characteristics of the ideal therapeutic radiopharmaceutical.

Ranges of emitted particle radiation in the tissue: Beta particle emitting radionuclides: Response of beta particle radiation on tumor, classification of b- particles, Alpha particle emitting Radionuclides, Auger-electrons emitting radionuclides, properties of Auger-electron-emitting radionuclides. Dosimetry in therapy by Radiopharmaceuticals: Absorbed radiation dose, Patient Specific Dosimetry.

17. Radioisotopes: Beta particle emitting radioisotopes **3 Lectures**

Phosphorus-32, Samarium-153, Holmium-166, Thalium-170, Rhenium-186, 188. Rhenium Chemistry, Rhenium-188, Production and Physical Characteristics, Issues with Column Generator Production, Uptake and Biokinetic Properties, Rhenium radiopharmaceuticals.

Lutetium-177: Production and physical characteristics influence of production mode for ^{177} Lu, ^{176}Lu-route versus ^{176}Yb-route, Uptake and biokinetic properties, Peptide receptor radionuclide therapy, Dosimetry.

Yttrium-90: Production and physical characteristics, ^{90}Sr/^{90}Y generators, uptake and biokinetic properties, uses of ^{90}Y Radiopharmaceuticals: microspheres, MAA, antibodies, dosimetry.

18. Alpha emitting Radioisotopes for therapy **1 Lecture**

^{223}Radium-: Alpharadin, (Generator prod. RP ^{227}Ac - ^{223}Ra), ^{212}Bismuth, (^{212}Bi is produced by chemistry generator from ^{224}Ra), ^{213}Bismuth (^{213}Bi is produced by chemistry generator from ^{225}Ac), ^{211}Astatium: (cyclotron produced RP. ^{209}Bi (α, 2n) ^{211}At), ^{225}Actinium: Cyclotron produced RP. ^{226}Ra (p, 2n) ^{225}Ac. Production and physical characteristics, uptake and biokinetic properties.

Auger-electrons emitting Radioisotopes: ^{111}Indium (^{111}In): Production and physical characteristics, uptake and biokinetic properties, dosimetry. Application of therapeutic radiopharmaceuticals: Bone pain palliatiation, Radiosynovectomy, Radioimmunotherapy.

19. Nanotechnology **2 Lectures**

Concepts and its biomedical applications, liposomes, aerosols, nanoparticles, immuno-liposomes, drug delivery systems. Introduction to Nanotechnology and their application in nuclear medicine for diagnostic and therapeutic purposes. Different types of drug delivery nanocarriers for diagnostic and therapeutic purposes (Liposomes, micelles, phytosomes, Chitosan Nanoparticles etc) and their advantages over present drug delivery systems. Methods of preparation of Nanocarriers and quality control procedures. Mechanism of localisation of nanodrug delivery systems. Future applications in Nuclear Medicine.

20. Design of Radiopharmacy laboratory: **2 Lectures**

Regulatory requirements, pharmaceutical aspects, radiation protection aspects, local constraints, design of hospital pharmacy, stocking of consumables and labels, disposable materials. Laminar airflow (LAF) hood, its testing and maintenance.

Centralized Nuclear Pharmacy, considerations & layouts. Automated Modules.

Licenses and procurement of radiopharmaceuticals. Trace of delayed shipments, surveys, wipe tests, packaging, disposal, storage requirements, and record keeping logs.

21. Diagnostic In-vitro Techniques: **12 Lectures**

Principle of RIA, Immunoradiometric assay (IRMA), Enzyme linked immunosorbent assay (ELISA), Fluorescent immunoassay (FIA), Chemiluminescent Immunoassay (CLIA), Methods of receptor assays. In-vitro Uptake studies, In-vitro radiorespirometry, Quality Control Parameters and methods and Applications for hormones & drugs, example of assays for T_3, T_4, TSH, free hormones, thyroid antibodies and thyroglobulin, other hormones and drugs.

Instrumentation & Imaging Technology - Paper - IV

1. QC of Radiation Protection Instruments **2 Lectures**

QC of - Ionization chamber Type, Geiger-Muller Counter, pocket dosimeter, Dose calibrator, Scintillation type Gamma ray spectrometer, Zone monitors.

2. Instrumentation aspects of Medical Cyclotron **4 Lectures**

Reactors and charged particle accelerators. Physics of linear accelerator, cyclotron, synchro-cyclotron, isochronous cyclotron. Medical cyclotron: threshold energy, nuclear cross section, q value, RF frequency, magnets, beam focusing and extraction, target design. Types and makes their advantages and limitations. Safety Concerns. Cyclotron produced radionuclides, Cyclotron based generators.

3. Collimator Systems **4 Lectures**

Counting Geometry & Need for Collimator, Types of Collimator- Parallel Hole, Slant Hole, Rotating Hole, Focusing, Convering Hole and Diverging Hole Collimators, Material design with regards to Cost, Geometric Efficiency and Resolution. Pinhole Collimator and its Adaptation in Gamma Camera. Fanbeam collimator, Slit collimator, Slit slat collimator, Collimator in 2D PET.

4. Probe systems **2 Lectures**

Thyroid uptake probe, basic components, system set-up and calibration, flat field collimator, iso-response curve and working distance. All quality control parameter including iso-response curve, and working distance. Significance or application in non imaging procedures.

5. Rectilinear scanner **2 Lectures**

Block diagram, principle of working, effect of scanning speed, dot factor, time constant, line spacing, film density, information density, photo recording display, contrast enhancement and clinical applications. Focal plane and depth of focus.

6. Gamma Camera and quality control **5 Lectures**

Scintillation camera, Basic principles of gamma camera, collimators, NaI (T) detector, position determining circuits, Display. Gamma camera-computer interface- ADC/DAC. Correction Circuits. Criteria of Selection & installation of Gamma camera, Frontiers of Gamma Camera Technology, LSF, MTF, Avalanche photodiodes, CZT detectors.

7. Application of Computers in Nuclear Medicine **3 Lectures**

Image Acquisition Matrix, Byte Mode and Word Mode, Frame Mode Acquisition, List mode, Static, Dynamic and Gated Acquisition, Image Display methods, Image Perception and Analysis, Image Manipulations and Presentations, Background Correction Methods, Image Interpolation, Region of Interest Analysis, Time Activity Curves and General Filters and Normalization methods, Automated ROI's and Computational methods.

8. Single Photon Emission Computerized Tomography & QC **5 Lectures**

Principles of Tomography, longitudinal and transverse or axial tomography, Theoretical aspects of image acquisition & reconstruction techniques, filters, artifacts in SPECT, effect of scatter & scatter correction, noise, role of collimators, rotating gamma camera, single or multiple detector devices, data collection, SPECT acquisition – step & shoot/continuous.

Whole body SPECT. SPECT v/s Planar camera, SPECT v/s other modalities (CT, MRI, Ultrasonography).

9. Positron Emission Tomography Equipment: 5 Lectures
Gamma camera for PET imaging. Dedicated and hybrid PET systems. Principles of PET imaging, detectors assembly, various corrections in PET, 2-D and 3-D acquisitions, performance of PET imagers, sensitivity, spatial resolution. PET Detectors, Attenuation correction, TOF concept, instrumentation, data collection, data correction, data storage, reconstruction, quality control, Performance characteristics, NECR, NEMA specifications, PET v/s SPECT, PET Protocols.

10. Multicrystal Gamma Camera and Intraoperative probes 2 Lectures
Emerging designs and considerations of Multicrystal Gamma Camera and Intraoperative probes, its relevances in nuclear medicine, Discussions on Standards and Quality Control. Small animal imaging systems.

11. Overview of Whole body counting system: 1 Lecture
Whole body counting: principles of whole body counting, design of whole body counting system, stationary systems, single and multiple crystal systems, shadow shield geometry, moving systems, calibration of whole body system, clinical and other applications of whole body counters.

12. Medical Informatics 2 Lectures
Image Formats, Concept of DICOM (Digital image communication in medicine) and DICOM-RT and etc, DICOM and interfile conversion software, Interfacing; TCP/IP protocols, PACS (Picture Archiving and Communication System); Telemedicine.

13. Biomedical Ultrasound 2 Lectures
Ultrasound generators, properties of ultrasound waves and its propagation in biological tissues, Pulse echo techniques, Scan types. Doppler principle.

14. Magnetic Resonance Imaging (MRI) 2 Lectures
Basic Magnetism, Physics of magnetic resonance, MRI equipment its advantage over CT / Ultrasound, – Image artifacts – MRI safety. Principal of FMRI (functional magnetic resonance imaging), MR spectroscopy, MRI contrast, Limitations and uses of MRI. Configuration of machines available, PET/MRI fusion problems and solutions.

15. Radiological Instrumentation - CT scanner 4 Lectures
Discovery - Production - Properties of X-rays, basic requirements for diagnostic tubes, Classification of tubes, Filters, Measurement of kV and mAs, CT detectors, CT acquisition, CT reconstruction, CT attenuation correction, CT dose index, dose length product, Radiation dose, CT-PET fusion, Quality Control of CT, Scanner design, Spiral Computed Tomography, Difference between conventional single slice, multislice, spiral and electron beam CT. Comparison of patient radiation doses and effects of slice thickness.

16. **Advanced Molecular Imaging 1 Lecture**
Optical, Molecular, Positron Emmision Mammography: (Basic principles, Instrumentation)

Clinical Nuclear Medicine Techniques - Paper V

1. Non-imaging applications of radionuclides **4 Lectures**

^{51}Cr labeled RBC's for blood volume, red cell volume measurement, spleen uptake, red cell survival studies. Schilling's test using ^{58}Co/^{57}Co for vitamin B12 absorption, applications of ^{14}C radiorespirometry for H.Pylori ulcers, Ferrokinetic studies using radioisotopes of Iron.

Important: ***Common in all In-Vivo Techniques is a discussion on choice of radiopharmaceuticals and its dose, choice of equipment, imaging considerations, patient preparation & instruction, selection of imaging parameters, interventional approaches, quantitative data analysis, display, filming or its report generation.***

Clinical Nuclear Medicine Techniques in two parts

i) One by the technologists emphasizing the **technical part** and (ii) the other by the Clinical Staff.

2. Thyroid studies **3 +3 Lectures**

Thyroid imaging and uptakes (^{99m}Tc and ^{131}I), Perchlorate discharge test, T_3/T_4 suppression test, TSH stimulation test. ^{131}I whole-body imaging. Post Therapy Scans.

3. Lung imaging studies **4+4 Lectures**

Ventilation lung imaging studies using gases (^{133}Xe, ^{81m}Kr), Inhalation imaging using aerosols, aerosols generators, mucociliary clearance, COPD, Pulmonary permeability using DTPA, perfusion imaging using MAA, Microsphere, and pulmonary embolism.

4. Liver-spleen imaging **2+2 Lectures**

Liver imaging for Diffuse and Focal liver diseases, Dynamic Liver studies, Quantitative methods for Hepatic Perfusion Index, Blood pool liver studies. portosystemic shunt evaluation by Per-rectal Scintigraphy.

5. Hepatobiliary imaging **3 +3 Lectures**

Hepatobiliary imaging protocols, Neonatal hepatitis versus Biliary atresia, Gall bladder dynamic studies using IDA compounds. Deconvolution analysis, Hepatic Extraction Fraction, Interventional methods. Bile leak studies.

6. Gastrointestinal studies **5+5 Lectures**

Conventional imaging modalities used for GI studies. Advantages and disadvantages of these modalities over scintigraphy. Oesophageal transit time studies, Gastric oesophageal reflux, gastric emptying time, Duodeno-gastric reflux, Meckel's diverticulum imaging, GI bleeding with ^{99m}Tc-RBC, ^{99m}Tc-S.Collide. Advantages and disadvantages of each method

7. Cardiac studies **5+5 Lectures**

ECG, First pass study (shunt detection), Importance of Electrocardiogram (ECG), gated blood pool study, MUGA, Ejection fraction, Wall motion analysis, Infarct avid imaging, Rest / Stress myocardial imaging, Gated SPECT, Pharmacological stress, Bulls Eye analysis, Severity scores. Use of ^{201}Tl, ^{18}FDG and $^{13}NH_3$ for cardiac studies.

8. Bone imaging **3 +3 Lectures**

Routine bone (whole body and spot) imaging, bone flow study, quantitative bone scan-sacroiliac index, 3-phase bone scans, Bone SPECT. Bone imaging in Metabolic Disorders. MDP retention studies, ^{18}F-Fluoride Bone Scans.

9. Renal imaging studies **5+5 Lectures**

Standard Renogram, Diuretic renogram, Captopril renogram, Renal Perfusion analysis, Differential function, GFR estimation by Gates Method, Renal transplant studies, Background subtraction methods, Rutland Patlak-Plot, Plasma Sampling methods, Advantages and Disadvantages of various GFR estimation methods, Uretic reflux study, Interventional methods, Direct and indirect radionuclide cystourethrography, Cortical Renal Scans using ^{99m}Tc-GHA &^{99m}Tc-DMSA, Differential function by Geometric Mean.

10. Brain imaging **3+ 3 Lectures**

Cerebral blood flow dynamic studies, Blood Brain Barrier imaging, Perfusion Imaging, Brain SPECT, Interventional methods, Cisternography, CSF leak,PET brain imaging.

11. Tumour Imaging: **2 Lectures**

^{18}F-FDG PET Scans for Oncologic Staging and Evaluation of Post therapy status. Imaging for Medullary Carcinoma of Thyroid, Neural Crest Tumours, Apoptotic Imaging. Post Therapy Scans. Organ specific (cold spot, hot spot), nonspecific (^{67}Ga- Citrate, ^{201} Tl, ^{131}I MIBI, ^{99m}Tc Tetrofosmine, ^{18}F-FDG), Tumor type specific (^{131} I for papillary and follicular carcinoma,^{131}I mIBG (adrenal cortex), NP59 for adrenal medulla, ^{99m}Tc Mebrofenin for hepatocelluar ca, Antibody (^{111}In Oncoscint, ^{99m}Tc CEA,^{111}In Prostascint, ^{99m}Tc-Verluma, peptide (^{111}In Somatostatin,^{68}Ga DOTATATE).

12. Lymphoscintigraphy & Sentinel Node Scintigraphy **2 Lectures**

13. Infection and inflammation **2+2 Lectures**

Use of Labelled Leukocyte, ^{99m}Tc-Ciprofloxacin, ^{68}Gallium for detection of Infectious foci. Discussion of imaging preferences.

14. Salivary gland imaging **1 Lecture**

Imaging for parenchymal and obstructive diseases of salivary glands. Post Radiation Xerostomia evaluation.

15. Parathyroid Imaging **1 Lecture**

Dual isotope technique and Subtraction scans. ^{99m}Tc-MIBI wash out studies.

16. Bone marrow imaging **1 Lecture**

Imaging techniques for visualisation of Bone marrow infiltration

17. Lymphoscintigraphy & Sentinel Node Scitigraphy **2 Lectures**

Infrequently performed studies in Nuclear Medicine

18. Scrotal Imaging **1 Lecture**

19. Dacryoscintigraphy **1 Lecture**

20. Scintimammography **1 Lecture**

Early and Delayed Imaging. Special Positions and Restraining means.

21. Hysterosalphingography **1 Lecture**

22. Contrast Agents **2 Lectures**

Contrast media agents: Oral, IV – ionic/nonionic, Rectal, Intrathecal, Catheters, Types/indication/chemical makeup etc. Iodinated contrast materials, Characteristics of iodinated contrast materials, Water solubility and hydrophilicity, Osmolality, High osmolar contrast media (HOCM), Low osmolar contrast media (LOCM), Advantages of LOCM, Disadvantages of LOCM, Viscosity, Calcium binding, Iodine concentration, Adverse reactions. Substitution of barium based contrast instead of iodinated oral contrast, Indications for steroid premedication, Contraindications for steroid premedication.

23. Radiation protection in NM - Regulatory Aspects **8 Lectures**

Guidance level for diagnostic administration, misadministration and preventive measures, reporting of misadministration.

Layout of Nuclear Medicine Laboratory, Design of radiation labs, types of labs, Security of Sources and radioactive cautions signs and labels. The Atomic Energy Act, Rules issued under the Act, Surveillance procedures issued under the Rules, Notifications issued under RPR, 2004, AERB Safety Directive, Safety code for NM facility, Duties of RSO, Regulatory clearance-Approval of NM Lab, Physician & RSO, Regulatory consent, authorisation- for disposal of radioactive waste and safe transport of Radioactive materials. Radiation Safety Program, Radiation Safety Officer and duties of Radiation Safety Officer, Radiation Safety Committee, Responsibilities for Implementation of Basic Safety Standards Requirements, AERB Regulation Related to Medical Cyclotron and PET.

Practicals

A. Practicals – Physics

1. To measure Half Value Layer of β and γ emitters and to measure the absorption coefficients of different materials with gamma rays and beta particles.
2. To study back scatter.
3. To determine the half life of a radioactive material.
4. To study the change in activity of a sample consisting of two independently decaying radioisotopes (or a mixture of isotopes)
5. To determine the plateau of GM tube and find out the dead time/ resolving time of GM counter.
6. To determine the efficiency of GM counter and find out the activity of the given unknown radioactive source.
7. Gamma ray spectrometry of ^{137}Cs with a single channel analyzer.
8. To find out the spectrum of energies emitted by a radioisotope by using gamma ray spectrometer. (e.g. ^{131}I)
9. To study the statistics of radioisotopic measurements and observe the effect of background on the counting statistics.
10. To determine the energy resolution of spectrometer
11. To study the energy linearity of given spectrometer
12. To observe gamma ray spectrum of the given two radionuclide sources (A and B) and identify composition of a tube containing mixture of these two radionuclide sources by evaluating scatter fraction.
13. To identify unknown radionuclide on the basis of its principal energy by using scintillation counter.
14. To study iso- response curve of Flat Field Collimator. To perform QC and calibration of uptake probe
15. To study the line spread function of a parallel hole collimator at various depths.
16. To perform Quality Control of Planar Gamma Camera and assess (intrinsic/extrinsic) uniformity, resolution by 4 quadrant bar phantom and assessment of linearity.
17. To study the counting errors originating from sample geometry and determine Critical Volume for counting in a well counter.
18. To estimate pipetting error and Estimation of Unknown Volume by Dilution principle
19. To perform Tomography with Jaszczak Phantom and evaluate the results.
20. Gamma Spectrometry with HPGe detector : Energy calibration, Efficiency and Identification of Unknown radionuclides

Practicals - Radiopharmaceutical & *In-vitro* Techniques

1. Perform Radioimmunoassay & IRMA.
2. To perform quality control of Dose Calibrator
3. Radiopharmacy procedure: Elution of generators and Determination of Impurities (a) Radionuclidic (^{99}Mo breakthrough in ^{99m}Tc), (b) Chemical (Alumina Breakthrough) and (c) Radiochemical (TcO4 paper chromatography)
4. Q.C. of radiopharmaceuticals by paper chromatography & to determine the Rf of ^{99m}Tc and the given labeled compounds by using ascending chromatography including Rapid determination of radiochemical purity of radiopharmaceuticals.
5. QC of ^{68}Ga and ^{177}Lu labeled radiopharmaceuticals by ITLC and paper chromatography
6. Q.C. of PET radiopharmaceuticals by TLC scanner and HPLC
7. Rapid determination of radiochemical purity of radiopharmaceuticals..
8. Biodistribution study of radiopharmaceuticals.

(Demonstration)....

1. Quality Controls of SPECT/CT system (once SPECT/CT is procured)
2. Quality Controls of PET/CT system (Uniformity, Attenuation correction, Partial volume effect, Co-registration evaluation of SPECT/CT & PET/CT, SUV measurements, CT QC)
3. Biological Quality control (a) ST (b) BET,
4. CPCR (Cardio-pulmonary & cerebral resuscitation
5. Visit to BARC (Reactor, whole body counter,TLD reader, biodosimetry),
6. Visit to BRIT.
7. Visit to NM centres to see special studies and instruments.

Apprentice Program:

420 hours (roughly eight months of Apprentice in various areas of Nuclear Medicine @3hrs per day)

BACK TO MAIN

HRI

Masters Program in Physics

(PROGRAM CODE: PHYS08)

Course Structure

The Masters program consists of four semesters of pedagogical lectures

No	COURSE CODE	Semester I	No	COURSE CODE	Semester II	No	COURSE CODE	Semester III	No	COURSE CODE	Semester IV
1	08PHYS08-001-	Classical Mechanics	6	08PHYS08-006-	Numerical Methods	11	08PHYS08-011-	Condensed Matter I	16	08PHYS08-016-C	Particle Physics
2	08PHYS08-002-	Quantum Mechanics I	7	08PHYS08-007-	Quantum Mechanics II	12	08PHYS08-012-	Quantum Mechanics III	17	08PHYS08-017-C	Elective II
3	08PHYS08-003-	Electrodynamics	8	08PHYS08-008-	Statistical Mechanics	13	08PHYS08-013-C	Quantum Field Theory I	18	08PHYS08-018-C	Elective III
4	08PHYS08-004-	Mathematical Methods I	9	08PHYS08-009-	Electronics	14	08PHYS08-014-C	Mathematical Methods II	19	08PHYS08-019-C	Project
5	08PHYS08-005-	Laboratory I	10	08PHYS08-010-	Laboratory II	15	08PHYS08-015-C	Elective I	20	08PHYS08-020-C	Laboratory III

Elective I : Choose one from — Advanced Statistical Mechanics, Fluid Mechanics, General Relativity, Non-linear Dynamics, Quantum Information and Computation I.

Elective II and III : Choose two from — Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure, Quantum Field Theory II, Quantum Information and Computation II, Quantum Optics, Soft Matter, Ultra Cold Atoms.

Semester I

(1) Classical Mechanics

- A rapid review/summary of Newtonian mechanics
- Calculus of variations: Concept of variation - Euler equation - Applications - Variation subject to constraints and Lagrange multipliers.
- The Lagrangian formulation: Generalised coordinates and velocities - The principle of least action and the Lagrange equations of motion - Extension to constrained systems.
- Conservation laws: Symmetries and Noether's theorem.
- Integration of the Lagrange equations of motion: Motion in one dimension - The two body problem, reduced mass and the equivalent one-dimensional problem - Motion in a central field - Kepler's problem - Scattering.
- Small oscillations: Free, damped and forced oscillations in one dimension - Resonance - Damped and forced oscillations - Parametric resonance.
- Rigid body motion: Angular velocity - The inertia tensor and angular momentum of a rigid body - The equations of motion- Eulerian angles - Motion of tops - Motion in a rotating frame - Coriolis force.
- The Hamiltonian formulation: Hamiltonian and Hamilton equations - Poisson brackets - Dynamics in the phase space - Hamilton-Jacobi equation - Separation of variables and solutions - Action-angle variables - Adiabatic invariants.
- Elements of non-linear dynamics: Differential equations as dynamical systems - Lyapunov exponents.

Textbooks:

1. Mathematical Methods of Classical Mechanics, V I Arnold,
2. Classical Mechanics, T W B Kibble and F H Berkshire,
3. Classical Mechanics, H Goldstein,
4. Classical Mechanics, L D Landau and L M Lifshitz,
5. Introduction to Dynamics, I. Percival and D. Richards.

(2) Quantum Mechanics I

- Basic notions: states, operators, time evolution
- One-dimensional problems: harmonic oscillator, periodic potential, Kronig-Penny model;
- Three-dimensional problems: central force potential, the hydrogen atom
- Charged particle in an electromagnetic field: gauge invariance, Landau levels
- Symmetries and conservation laws in QM: Degeneracies, Discrete symmetries
- Angular momentum in quantum mechanics: raising and lowering operators, angular momentum addition, Clebsch-Gordon coefficients; Tensor operators and Wigner-Eckart theorem
- Time-independent perturbation theory: non-degenerate and degenerate cases, Stark and Zeeman effects
- Semiclassical (WKB) approximation and variational methods

Textbooks:

1. Introduction to Quantum Mechanics, D. J. Griffiths,
2. Quantum Mechanics, B. H. Bransden and C. H. Joachain,
3. Principles of Quantum Mechanics, P.A.M. Dirac,
4. Modern Quantum Mechanics, J. J. Sakurai,
5. Quantum Mechanics, E. Merzbacher,
6. Quantum Mechanics, L. I. Schiff,
7. Quantum Mechanics (Non-relativistic Theory), L.D. Landau and E.M. Lifshitz.

(3) Classical Electrodynamics

- Special theory of relativity and electrodynamics: Lorentz transformation of electromagnetic fields, Lorentz covariant formulation of electrodynamics; gauge invariance, Maxwell equations from action principle.
- The electrostatic limit of Maxwell equations, multipole expansion, uniqueness, boundary value problems, solution of Poisson equation.
- The magnetostatic limit of Maxwell equations, applications.
- Electrodynamics: motion of charges in external fields; electromagnetic waves in vacua and propagation through continuous media; energy-momentum of electromagnetic field and Poynting theorem.
- Advanced and retarded Green functions; Lienard-Wiechert potentials; dipole radiation and Larmor's formula; spectral resolution and angular distribution of radiation from a relativistic point charge; synchrotron radiation; Rayleigh and Thomson scattering; collision problems; Bremsstrahlung and Cerenkov radiation.
- Scattering of electromagnetic waves: Rayleigh and Thomson scattering, radiation damping.

Textbooks:

1. Introduction to Electrodynamics, D.J. Griffith,
2. Classical Electrodynamics, J.D. Jackson,
3. Electrodynamics of Continuous Media, Vol. 6 of Course of Theoretical Physics, L.D. Landau and E.M. Lifshitz.

(4) Mathematical Methods I

- Vector Analysis: operations with vectors, scalar and vector fields, gradient, curl and divergence. Line, surface, and volume integrals, Curvilinear coordinate systems, Elements of tensors.
- Vector Spaces, linear transformations, scalar product and dual space, bases, linear operators, eigenvalues and eigenfunctions, unitary and hermitian operators
- Complex Analysis: functions of a complex variable, analytic functions, integral calculus, contour integrals, Taylor and Laurent series, singularities, residues, principal values, Riemann surfaces, conformal mapping, analytic continuation

- Ordinary differential equations: linear ODEs, Green functions, second order differential equations: classification of singularities and local solutions, special functions
- Elements of statistics: probability, random walk. Probability distributions.

Textbooks:

1. Mathematical Methods in Physics, J. Mathews, R. L. Walker,
2. Advanced Mathematical Methods for Scientists and Engineers, C. M. Bender, S. A. Orszag,
3. Mathematical Methods for Physicists, G. B. Arfken, H. J. Weber, F. E. Harris,
4. Fundamentals of Mathematical Physics, E. A. Kraut,
5. Complex Variables, M. J. Ablowitz and A. S. Fokas.

(5) Laboratory I

- Forced Oscillations-Pohl's Pendulum:
- Coupled Pendula and Chaotic oscillator:
- Photoelectric effect:
- Normal and Anomalous Zeeman Effect:
- Michelson Interferometer:
- Mach-Zehnder Interferometer:
- Faraday Effect:
- Millikan Oil-drop Experiment:
- Electron Diffraction:
- Fine Structure:

Semester II

(6) Quantum Mechanics II

- Scattering theory and applications
- Schrodinger and Heisenberg pictures; postulates of quantisation
- Time dependent perturbation theory, Interaction picture, Fermi golden rule
- Path integrals: propagators, amplitudes as path integrals, Semiclassical methods revisited
- Quantum mechanics of many particles, identical particles and symmetries of the wave-function, scattering of identical particles
- Relativistic quantum mechanics, Klein-Gordon and Dirac equations and their solutions, gyromagnetic ratio of the electron, relativistic corrections to the Schrodinger equation
- Entangled states and Bell inequalities

Textbooks:

1. Principles of Quantum Mechanics, P.A.M. Dirac,
2. Quantum Mechanics and Path Integrals, R. P. Feynman and A. R. Hibbs,
3. Modern Quantum Mechanics, J. J. Sakurai,
4. Quantum Mechanics, E. Merzbacher,
5. Quantum Mechanics, L. I. Schiff,
6. Quantum Mechanics (Non-relativistic Theory), L.D. Landau and E.M. Lifshitz

(7) Research Methodology and Numerical Methods

- Research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers
- Introduction to programming languages: F77, F90 or C
- Errors in numerical calculations.
- Numerical linear algebra, eigenvalue and eigenvectors.
- Interpolation techniques.
- Generation and use of random numbers.
- Sorting and searching.
- Differentiation and Integration (including Monte Carlo techniques)
- Root finding algorithms
- Optimisation, extrema of many variable functions.
- ODEs and PDEs: including FFT and finite difference methods, integral equations.

Textbooks:

1. Research Methodology: Methods and Techniques, C.R. Kothari,
2. Numerical Mathematical Analysis by J. B. Scarborough,
3. Computer oriented numerical methods, V. Rajaraman,
4. Data reduction and error analysis for the physical sciences, P. R. Bevington and D. K. Robinson,
5. An Introduction to Error Analysis, J.R. Taylor.

(8) Statistical Mechanics

- Basics: phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
- Non interacting classical systems: few level systems, ideal gases, oscillators.
- Non interacting quantum systems: method of second quantisation, electrons in metals, relativistic electron systems, electrons in a strong magnetic field, lattice vibrations and phonon physics, photons, blackbody radiation, Bose condensation.

- Interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
- Phase transitions: symmetry breaking and long range order, mean field approach, Landau theory, 2nd and 1st order transitions, Landau-Ginzburg functional, illustrative examples, estimate of fluctuations.

Textbooks:

1. Statistical Mechanics, K. Huang,
2. Statistical Mechanics, R. K Pathria,
3. Fundamentals of statistical and thermal physics, F. Reif.

(9) Electronics

- Circuit theory: lumped circuit approximation, circuit elements, Kirchoff's current and voltage laws, resistive networks, node and loop analysis, Thevenin and Norton's theorem, time domain response of RL, RC and RLC circuits, frequency domain response, impedance, filters and transfer function.
- Analog electronics: discrete devices, characteristics and operation - diode, Zener diode, LED, photodiode. Simple diode circuits. Bipolar junction transistor (BJT): biasing, h parameters, small and large signal response, amplifiers. Field effect transistors.
- Operational amplifiers: device properties, integrator, differentiator, RC active filter, negative and positive feedback, oscillators.
- Digital electronics: logic gates, truth table, multiplexer, combinatorial circuits, flip-flop, counters, programmable logic devices, microprocessors.

Textbooks:

1. Electronic Principles, A. P. Malvino and D. J. Bates,
2. Digital Electronics, A. P. Malvino and A. P. Leach,
3. Integrated Electronics, J. Millman and C. C. Halkias.

(10) Laboratory II

- Coupled Oscillator Circuits:
- Thermal Equation of State and Critical point:
- Lock-in Amplifier and Signal Processing:
- OpAmps I: Amplifiers & Negative Feedback:
- OpAmps II: Limitations & Applications:
- Diodes: Clamps, Rectifiers, Power supplies
- Transistors I: Switch, Common Emitter Amplifier, Push-pull Follower
- Transistors II: Characteristics, Comparators, MoSFET, CMoS Inverter
- Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
- Flip-flops: as Memory element, Shift Register, Counters

- Microcontroller I: Programming to MCU, using the port for input
- Microcontroller II: Some Applications, Seven Segment Display

---

Semester III

(11) Condensed Matter Physics I

- The building blocks - atoms to solids: atomic physics, Coulomb effects, crystal fields in solids, local moments and band electrons, lattice vibrations, electron-lattice coupling, electron-electron interactions.
- Structure: characterizing structures - crystalline/amorphous/liquids, classification of periodic structures, reciprocal space, x-ray and neutron diffraction.
- Electronic structure: free electrons - spectrum, density of states, thermodynamics, band electrons - nearly free electron and tight binding limits, consequences for thermodynamics and transport.
- Physics of metals: specific heat, susceptibility, impurity scattering, basic transport theory. Response to magnetic fields: Landau quantization, quantum Hall effect.
- Phonons: Debye and Einstein model, spectrum of a real lattice, thermodynamics of phonons, anharmonic effects, Debye-Waller factor.
- Magnetism: spin paramagnetism, itinerant-vs-localised electrons, Stoner and Heisenberg models, mean-field theory, spin waves.
- Superconductivity: phenomenology, pairing interaction, BCS theory, Ginzburg-Landau theory and type II superconductors.

Textbooks:

1. Condensed matter physics - N. W. Ashcroft and N. D. Mermin,
2. Solid State Physics - C. Nayak,
3. Solid State Basics - S. Simon,
4. Introduction to many body physics - T. Giamarchi, A. Lucci and C. Berthod,
5. Lessons from nano-electronics - a new perspective on transport - S. Datta.

(12) Quantum Mechanics III

- Atomic physics: One electron atoms - spin-orbit interaction, fine structure, Lamb shift, Zeeman effect, Stark effect.

- Two electron atoms: spin wave functions, approximate handling of electron-electron repulsion. Coupling of angular momenta, multiplet structure, gyromagnetic effects. Hyperfine and nuclear quadrupole interactions.
- Many electron atoms: central field approximation, Thomas-Fermi and Hartree-Fock methods.
- Molecular physics: Born-Oppenheimer approximation, molecular structure, rotation and vibration of diatomic molecules, hydrogen molecular ion, vibrational-rotational coupling, effect of vibration and rotation on molecular spectra. Electronic structure- molecular orbital and valence bond theories.
- Atoms and light: transition rates, dipole approximation, Einstein coefficients, radiative damping, optical absorption, ac Stark effect.
- Cold atoms: Doppler cooling, magneto-optical trap, ion traps, dipole force, evaporative cooling, optical lattice.
- Collective effects: Feshbach tuning of interactions, Bose condensation of alkali atoms, BCS-BEC crossover, the unitary Fermi gas. Imaging cold atoms.
- Computing with atoms: qubits and their properties, entanglement, quantum logic gates, decoherence and error correction.

Textbooks:

1. Theoretical Atomic Physics, H. Friedrich,
2. Atomic Physics, C. Foot,
3. Physics of Atoms and Molecules, B. H. Bransden and C. H. Joachain,
4. Molecular Quantum Mechanics, P. Atkins and R. Friedman.

(13) Quantum Field Theory I

- Non-relativistic quantum field theory: quantum mechanics of many particle systems; second quantisation; Schrodinger equation as a classical field equation and its quantisation; inclusion of inter-particle interactions in the first and second quantised formalism
- Irreducible representations of the Lorentz group, connection to quantum fields
- Symmetries and conservation laws: examples in non-relativistic and relativistic field theories; translation, rotation, Lorentz boost/Galilean transformation and internal symmetry transformations; associated conserved charges
- Free Klein-Gordon equation: classical action and its quantisation; spectrum; Feynman rules for computing n-point Green functions of elementary and composite operators.
- Interacting Klein-Gordon field: Feynman rules for computing Green functions; physical mass of the particle from the analysis of two point Green functions; S-matrix and its computation from n-point Green functions; relating S-matrix to cross-section.
- Quantisation of free Dirac fields: spectrum; Feynman rules
- Quantisation of free electromagnetic field: role of gauge invariance; gauge fixing; physical state condition; spectrum; Feynman rules

- Quantum electrodynamics: coupling Dirac field to electromagnetic field; gauge invariance; quantisation; Feynman rules for computing Green functions; Spectrum and S-matrix from the Green functions.

Textbooks:

1. An introduction to Quantum Field Theory, M. E. Peskin and D. V. Schroeder,
2. Quantum Field Theory, C. Itzykson and J-B Zuber,
3. Relativistic Quantum Fields, J. D. Bjorken and S. Drell.

(14) Mathematical Methods II

- Integral transforms, Fourier transforms, inversion and convolution, Laplace transforms
- Advanced topics in ODE, Partial differential equations: classification of second order PDEs, Laplace and Poisson equations, applications to electrostatics, Heat equation, Wave equation
- Group theory, definitions and examples of groups. Homomorphism, isomorphism and automorphism, Permutation groups
- Group representation: reducibility, equivalence, Schur's lemma. Lie groups and Lie algebras, SU(2) and SU(3). Representations of simple Lie algebras, SO(n), Lorentz group. Symmetries in physical systems, Young Tableau.

Textbooks:

1. Mathematics for Physicists, P. Dennery and A. Krzywicki,
2. Introduction to Topology, Differential geometry, and group theory to physicists, S. Mukhi and N. Mukunda,
3. Classical Groups for physicists, B. G. Wybourne,
4. Group Theory, P. Ramond.

(15) Elective I

Choose any one of the following topics, Advanced Statistical Mechanics, Fluid Dynamics, General Theory of Relativity, Techniques in Nonlinear Dynamics, Quantum Information and Computation I.

• Advanced Statistical Mechanics

- Critical phenomena : Liquid-gas transition and Van der Waals equation of state, Classical spin systems, Transfer matrix for one dimensional systems, Order parameters, Mean field approach, Landau theory, Universality, Critical exponents, Scaling hypothesis, Estimating fluctuations
- Renormalisation : Hubbard-Stratanovich transformation and the Ginzburg-Landau-Wilson functional,Self-consistent approximation, Basic ideas of renormalisation

group, Real space RG in one and two dimensions, Spherical limit, Wilsonian RG and ε-expansion, Field theoretic RG, Two dimensions and BKT transition
- Equilibrium dynamics : Conserved and broken symmetry variables, Hydrodynamic approach, Dynamical critical phenomena
- (Extra module : one of the following two) :
- Non-equilibrium phenomena : Fluctuation-dissipation, Linear response, Kubo formula, Langevin and Fokker-Planck descriptions
- Stochastic thermodynamics : Non-equilibrium work theorems (Jarzynski, Crooks, …), Non-equilibrium steady-states, Stochastic heat engines, Examples from colloidal systems and molecular motors

Textbooks:

1. Field Theory and Renormalisation Group, D. J. Amit,
2. Modern Theory of Critical Phenomena, S. K. Ma,
3. Lectures on Phase Transition and The Renormalisation Group, N. Goldenfeld,
4. Quantum Field Theory and Critical Phenomena, J. Zinn-Justin.

• Fluid Mechanics

- Ideal Fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity
- Viscous Fluids: Viscosity, Navier-Stokes equation, Reynolds number, laminar flow, exact solution to the eq. of motion.
- Turbulence: Stability of flows, instabilities, quasi-periodic flows, Strange attractors, turbulent flows, jets, free shear layers, wakes, boundary layers
- Thermal Conduction in fluids: eq. of heat transfer, conduction in incompressible fluid, law of heat transfer, convection, convective instability in static fluid
- Compressible flows
- Relativistic Fluid dynamics: eq. of motion, energy-momentum tensor, eq. for flow with viscosity and thermal conduction.

Textbooks:

1. Fluid Mechanics, L. D. Landau and E. M. Lifshitz,
2. An Introduction to Fluid Dynamics, G. K. Batchelor,
3. Relativistic Fluid Dynamics, A. Anile and Y. Choquet-Bruhat.

• General Theory of Relativity

- Review of Lorentz transformations and special theory of relativity.
- Tensors and their transformation laws; Christoffel symbol and Riemann tensor; geodesics; parallel transport along open lines and closed curves; general properties of the Riemann tensor.

- Equivalence principle and its applications: gravity as a curvature of space-time; geodesics as trajectories under the influence of gravitational field; generalisation to massless particles; gravitational red-shift; motion of a charged particle in curved space-time in the presence of an electric field; Maxwells equation in curved space-time.
- Einsteins equation, Lagrangian formulation, Einstein-Hilbert action.
- Schwarzschild solution: construction of the metric and its symmetries; motion of a particle in the Schwarzschild metric; Schwarzschild black hole; white holes and Kruskal extension of the Schwarzschild solution: construction of the metric and its symmetries; Motion of a particle in the Schwarzschild metric; precession of the perihelion; bending of light; horizon, its properties and significance.
- Precession of the perihelion; bending of light; radar echo delay.
- Initial value problem; extrinsic curvature; Gauss-Codacci equations;
- Linearised theory, gravitational waves, field far from a source, energy in gravitational waves, quadrupole formula
- Elementary cosmology: principles of homogeneity and isotropy; Friedman-Robertson-Walker metric; open, closed and flat universes; Friedman equation and stress tensor conservation, equation of state, big bang hypothesis and its successes.

Textbooks:

1. General Relativity, S. Weinberg,
2. Lecture Notes on General Relativity, S. Carroll,
3. Introducing Einstein's Relativity, R. D'Inverno,
4. General Relativity, R. M. Wald.

• Nonlinear Dynamics

- Long time behaviour of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
- Periodic orbit for conservative systems, periodic orbits for dissipative systems (limit cycles) and their stability, Bifurcations and centre manifolds.
- Different kinds of perturbation theory for calculating periodic orbits, Renormalisation group aided perturbation theory, Poincare Bendixon theorem, chaos and strange attractors.
- Maps, fixed points, cycles and stability, bifurcations , period doubling, intermittency and quasi periodicity, universal behavior at the onset of chaos , renormalization group and scaling behaviour.
- Partial differential equations, patterns, Galerkin truncations and reduction to dynamical systems.

Textbooks:

1. Chaos in Dynamical Systems, E. Ott,

2. Arithmetical Chaos, E. B. Bogomolny, B. Georgeot, M.-J. Giannoni, C. Schmit,
3. Nonlinear Dynamics and Chaos, S. H. Strogatz.
4. Deterministic Chaos, H. G. Schuster.

• Quantum Information and Computation I

- Quantum formalism: states, evolution, measurements.
- Multipartite quantum systems: description and manipulation of bipartite systems and beyond.
- Entanglement: quantification and detection in bipartite and multipartite systems.
- Quantum communication: no-cloning theorem, quantum teleportation, quantum dense coding, multipartite communication protocols.
- Quantum cryptography: essential classical cryptography, BB84, B92, Ekert, and secret sharing protocols.
- Quantum computation: quantum algorithms, universal gates.
- Interface of quantum information with other sciences.
- Experimental realisations.

Textbooks:

1. Quantum Computation and Quantum Information, M. Nielsen and I. Chuang,
2. Lecture Notes of J. Preskill, available at http://www.theory.caltech.edu/~preskill/ph229/
3. Quantum information, G. Alber et al (Editors),
4. Lectures on Quantum Information, D. Bruss and G. Leuchs,
5. Quantum Theory: Concepts and Methods, A. Peres,
6. The Physics of Quantum Information: Quantum Cryptography, Quantum Teleportation, Quantum Computation, D. Bouwmeester, A. Ekert, and A. Zeilinger.

Semester IV

(16) Particle Physics

- Experimental methods: fixed target and collider experiments, particle detectors.
- Role of symmetries: charge conjugation, parity, time reversal, isospin and SU(2), quark model and SU(3).
- Introduction to relativistic kinematics: Mandelstam variables, phase space, calculation of cross-sections and decay widths.

- Basics of quantum electrodynamics: electron-positron annihilation, electron-muon scattering, Bhabha scattering, Compton scattering.
- Deep inelastic scattering: Bjorken scaling, parton model, scaling violation, introduction to quantum chromodynamics and tree level processes.
- Introduction to weak interactions: parity violation, V-A theory, pion and muon decay, neutrino scattering.
- Standard Model: Glashow-Salam-Weinberg model, neutral current, physics of W, Z and Higgs, CKM mixing and CP violation.
- Neutrino physics, neutrino oscillation

Textbooks:

1. Quarks and Leptons: F. Halzen and A. Martin,
2. An Introductory Course of Particle Physics: P. B. Pal,
3. Dynamics of the Standard Model: J. F. Donoghue, E. Golowich and B. R. Holstein,
4. Field Theory and Particle Physics: B. De Witt and J. Smith.

(17) Elective II and (18) Elective III

Choose any two of the following topics,

Astrophysics, Condensed Matter Physics II, Cosmology, Introduction to Electronic Structure Calculations, Quantum Field Theory II, Quantum Optics, Soft Matter, Ultra cold Atoms.

• Astrophysics

- Introduction to celestial objects, coordinates and the concept of time. Radiation transfer. Equations of radiation transfer, Black-body/thermal radiation, Opacity and optical depth, solutions of the radiation transfer equations in limiting cases, Rosseland mean opacity.
- Thermal Bremsstrahlung emission, synchrotron emission. Self-absorption and the emergent spectrum. Thomson scattering. Compton and Inverse-Compton scattering. Scattering in a region with magnetic field, Faraday rotation Introduction to fluid dynamics. Convection instability and transfer of energy from cores of stars. Supersonic motion, shocks.
- Introduction to Magneto-hydro dynamics, flux freezing, Generation and amplification of magnetic fields in astrophysical situations.
- Stellar structure. Mass-radius relation for main sequence stars, Minimum and maximum mass for nucleosynthesis, Hertzsprung-Russell diagram, Evolution of a star on the HR diagram. Novae and Supernovae, End points of stellar evolution. Inter-stellar medium. Phases of interstellar medium. Thermal, photoionisation, chemical and pressure equilibrium, Star formation, feedback and the evolution of ISM.

- Orbits around massive bodies, Tidal disruption, restricted 3 body problem, Roche limit. Orbits in external potentials, potential-density pairs. An overview of models for galaxies. Accretion of matter on to a point mass, spherical accretion, Eddington limit.
- Introduction to Cosmology, Friedmann models, equations. Hubble's law. A brief overview of the thermal history of the universe.

Textbooks:

1. Theoretical Astrophysics-I, T. Padmanabhan,
2. Theoretical Astrophysics-II, T. Padmanabhan,
3. An Introduction to Modern Astrophysics, B. W. Carroll and D. A. Ostlie,
4. Astrophysics for Physicists, A. Roy Choudhuri.

• Condensed Matter Physics II

The course will consist of any two of A-D:

Part A: Mesoscopics and spintronics:

- Foundation: low dimensional systems: quantum Wells, wires and quantum dots, 1D and 2D heterostructures, coupled wells and superlattices.
- Charge Transport: transmission and its relation to conductance, Landauer theory, transmission function, S matrix and Green functions. Non-equilibrium Green functions and Landauer-Buttiker theory. Noise in Charge transport, scattering theory of shot noise.
- Spintronics: introduction to spintronics.(Datta-Das spin transistor) equilibrium and non-equilibrium spin currents, spin Hall effect, coupled charge and spin transport, TMR, spin shot noise, entanglement generation and its detection.

Part B: Electronic structure:

- Physics in low dimensions: surface states, reconstructions, adsorption, atomic wires and clusters.
- Electron-electron interactions: Hartree-Fock approximation, electron gas, density functional theory.
- Anharmonic effects in crystals: thermal expansion, lattice thermal conductivity, umklapp processes.
- Phonons in metals: Kohn anomaly, dielectric constant, temperature dependence of electrical resistivity.
- Dielectric properties of insulators. Plasmons, magnons etc.

Part C: Mesoscopics and interacting systems:

- Quantum Hall effect
- Quantum dots and quantum wires, Kondo effect
- Fermi liquid theory and non-Fermi liquids
- Bosonization and Luttinger liquids.
- Quantum spin systems

Part D: Correlated electrons:

- Mott physics: electron localization, magnetic order, doped phase, physics in the cuprates.
- Kondo systems: physics of the single impurity, dense systems Kondo and Anderson lattice, heavy fermions, quantum criticality.
- Metallic magnets: ferromagnetism in strongly repulsive systems, the transition metals, spin-fermion systems, the double exchange model, the classical Kondo lattice.
- Electron-phonon coupling: the classical theory, polaron formation, many electron systems, polaron ordering, physics in the manganites.
- Superconductivity: the BCS-BEC crossover, superconductivity in repulsive systems, competition with magnetism, effect of disorder.

Textbooks:

1. Condensed matter field theory - A. Altland and B. Simons,
2. Field theories of condensed matter physics - E. Fradkin,
3. Electronic transport in mesoscopic systems - S. Datta,
4. Composite fermions - J. K. Jain,
5. Topological insulators and topological superconductors - B. Bernevig and T. Hughes.
6. Aromaticity and Metal Clusters, Ed. P. Chattaraj
7. Introduction to Cluster Dynamics, P.-G. Reinhard and E. Suraud
8. Surface Science, an Introduction by Oura et al.
9. Principles of Surface Physics, F. Bechstedt
10. Physics at Surfaces, A. Zangwill

• Cosmology

- Friedman-Robertson-Walker metric, Friedman equation and stress tensor conservation, equation of state: matter, radiation, cosmological constant, experimental evidence for dark matter and dark energy.
- Age of the universe, cosmological horizon, expansion rate.
- Thermal history of the universe, formation of hydrogen and origin of CMBR, decoupling of neutrinos, nucleosynthesis, recombination.
- The horizon problem, possible resolution via inflation, slow roll condition and slow roll parameters, reheating, inflationary origin of density perturbation.
- Early history, electroweak baryogenesis via leptogenesis, dark matter.

- Theory of cosmological perturbations: gauge invariant scalar and tensor perturbations, spectral index, ratio of tensor to scalar fluctuation and Lyth bound, transition from quantum to classical perturbation: horizon exit and reentry, from density fluctuation to CMB fluctuations via Boltzmann transport equation, origin of the acoustic peak, and origin of CMB polarisation, E and B modes.

Textbooks:

1. Cosmology, S. Weinberg,
2. Physical Foundations of Cosmology, V. Mukhanov,
3. Particle Physics and Inflationary Cosmology, A. Linde.

• Introduction to Electronic Structure

- Review of QM: variational method, identical particles, many fermion wave functions.
- First-principles Hamiltonian and Born-Oppenheimer approximation.
- Treating electron-electron interactions: Hartree-Fock approximation, exchange energy, correlation energy.
- Density functional theory: Thomas-Fermi method, Hohenberg-Kohn theorems, Levy constrained search formulation, Kohn-Sham formulation, exchange-correlation energy, LDA and GGA functionals, spin density functional theory.
- Solution of the Kohn-Sham equations, basis sets - LCAO: STO-NG, 4-31G, 6-31G etc, quality of basis sets, polarisation functions, spin-restricted calculations, Roothan equations.
- Spin unrestricted calculations. Plane wave basis set.
- Pseudopotentials and PAW in conjunction with plane waves.
- Structure optimisation, Hellman-Feynman theorem.
- Simple practical applications: band structure of standard solids, metals and semiconductors, optimisation of lattice constants, cohesive energies and other simple properties.
- Possible advanced topics: hybrid functionals, van der Waals interactions, density functional perturbation theory, phonon band structure, electron-phonon coupling. CI, CCSD methods, QMC.

Textbooks:

1. Density Functional Theory of Atoms and Solids, R. G. Parr and W. Yang,
2. Modern Quantum Chemistry, A. Szabo and N. S. Ostlund,
3. Electronic Structure of Materials, R. Prasad,
4. Electronic Structure, R. Martin.

• Quantum Field Theory II

- Path integrals for scalar and fermionic fields: generating functional, Feynman rules, loop diagrams.
- Renormalisation of scalar and Yukawa theories: power counting, regularisation, renormalisable and non-renormalisable theories, Green functions at 1 loop of some prototypical theories, basics of renormalisation group (running coupling), 1PI effective actions.
- Spontaneous symmetry breaking and Goldstone's theorem.
- Path integrals for the Maxwell field, gauge fixing.
- Renormalisation of QED: 1 loop diagrams, Landau pole.
- Non-abelian Gauge Theories: Classical theory of non-abelian gauge theories, Quantization of non-abelian gauge theories by path integral methods, Non-abelian gauge theories at one loop and asymptotic freedom, Spontaneous symmetry breaking in non-abelian gauge theories.

Textbooks:

1. An introduction to Quantum Field Theory, M. E. Peskin and D. V. Schroeder,
2. Quantum Field Theory, C. Itzykson and J-B Zuber,
3. Quantum Field Theory: A Modern Primer, P. Ramond.

• Quantum Information and Computation II

- General evolution and Decoherence theory.
- Master equations (Markovian and Non-Markovian, Various measure of nonmarkovianity).
- Advanced entanglement theory (GM, GGM, newly proposed measures etc).
- Quantum Correlation beyond Entanglement (Quantum Discord, Geometric discord, Work-Deficit etc).
- Resource theory in QI (Entanglement, Quantum Coherence, Reference Frame, Asymmetry etc).
- Quantum Thermodynamics.
- Advanced topics in quantum channels.
- Quantum information and condensed matter systems.

Textbooks:

1. Lecture Notes on the Theory of Open Quantum Systems by D. A. Lidar,
2. The Theory of Open Quantum Systems by H.-P. Breuer, F. Petruccione,
3. Classical and Quantum Computation, A. Yu. Kitaev, A. H. Shen, and M. N. Vyalyi.

• Quantum Optics

- Introduction: Quantization of the electromagnetic field, Fock states, coherent states, squeezed states, basic atom-photon interaction, density-matrix formalism.
- Theory of coherence; Semiclassical theory of atom-photon interaction.
- Quantum theory of atom-photon interaction.
- Quantum theory of dissipation.
- Quantum information in continuous variable systems; Quantum state engineering.
- Quantum operations based on beam splitters, mirrors, squeezing and homodyne and heterodyne measurements and nonlinear operations such as parametric down converters.
- Photon addition and subtraction operations; Elements of cavity QED.

Textbooks:

1. Quantum Optics, M. O. Scully and S. Zubairy,
2. Introductory Quantum Optics, C. C. Gerry and P. L. Knight,
3. Quantum Optics, D. F. Walls and G. J. Milburn,
4. Quantum Information with Continuous Variables of Atoms and Light, N. J. Cerf, G. Leuchs and E. S. Polzik (eds.),
5. Quantum information with continuous variables, S. L. Braunstein and P. van Loock.

• Soft Matter

- Forces, energies and timescales in soft matter, van der Waals force, hydrophobic and hydrophilic interactions. Basic phenomenology of liquid crystals, polymers, membranes, colloidal systems. Phase behaviour, diffusion and flow, viscoelasticity.
- Order parameter, phase transitions: mean-field theory and phase diagrams, elasticity, stability, metastability, interfaces.
- Colloidal systems: Poisson-Boltzmann theory, DLVO theory, sheared colloids, stability of colloidal systems, measurement of interaction.
- Polymers: model systems, chain statistics, polymers in solutions and in melts, flexibility and semi-flexibility, distribution functions, self-avoidance, rubber elasticity, viscoelasticity, reptation ideas.
- Membranes: fluid vs. solid membranes, energy and elasticity, surface tension, curvature, de Gennes-Taupin length, brief introduction to shape transitions.
- Experimental tools and numerical approaches: Stokes limit, Rouse and Zimm Model for polymers, membranes, relaxation, computational studies, multiscale modelling.
- The intent is to train students in the applications of classical statistical mechanics in areas like fluids, colloids, membranes polymers. This includes training in the mathematical tools as well as the phenomenology.

Textbooks:

1. Soft Matter Physics, M. Kleman and O. D. Lavrentovich,
2. Soft Condensed Matter, R. L. Jones,
3. Principles of Condensed Matter Physics, P. Chaikin and T. C. Lubensky (Cambridge),
4. Statistical Mechanics of Surfaces, Interfaces and Membranes, S. A. Safran,
5. Soft Matter Physics, Ed, M. Daoud and C. E. Williams,
6. The Structure and Rheology of Complex Fluids, R. Larson,
7. Intermolecular and Surface Forces, J. Israelachvili.

• Ultra-Cold Atoms

- Spatial, time, and energy scales in cold atom physics.
- Experimental background: trapping and cooling, Feshbach resonance, optical lattices, cold atom spectroscopies.
- Basic theory: many particle physics, mean field theory, phase transitions, perturbation theory.
- Continuum bosons: bosons in free space, weak interactions, Bogoliubov theory, BEC in trapped systems, Gross-Pitaevski equation.
- Continuum fermions: fermions in free space, trapped fermions, Fermi liquid theory, weak attraction - BCS instability, strong attraction - BEC of pairs, the unitary Fermi gas, Stoner instability.
- Optical lattices: Hubbard model - Bose/Fermi cases, superfluid-Mott transition for repulsive bosons, BCS-BEC crossover for attractive fermions, Mott transition in repulsive fermions.
- Spin systems: quantum, S = 1/2, magnetism on unfrustrated and frustrated lattices. Entanglement in many body systems: pure states, mixed states, area laws, tensor network states.
- Special topics: population imbalance, Anderson localisation, gauge fields, quench dynamics.
- The course combines elements of atomic physics with many body theory to model collective phenomena in cold atomic gases. The students would learn of the application of quantum statistical mechanics and many body theory in the context of interacting Bose and Fermi gases.

Textbooks:

1. Many Body Physics with Ultracold Gases, Les Houches Lectures, Ed, C. Salomon, G. Shlyapnikov and L. F. Cugliandolo,
2. Ultracold Quantum Fields, H. T. C. Stoof, K. B. Gubbels and D. B. M. Dickerscheid,

3. Ultracold Bosonic and Fermionic Gases, K. Levin, A. L. Fetter and D. M. Stamper-Kurn,
4. Bose-Einstein Condensation in Dilute Gases, C. J. Pethick and H. Smith,
5. Bose-Einstein Condensation, L. P. Pitaevskii and S. Stringari,
6. Theory of Ultracold Fermi Gases, S. Giorgini, L. P. Pitaevskii and S. Stringari,
7. Ultracold Atoms in Optical Lattices: M. Lewenstein et al.
8. Cold Atoms and Molecules: Weidenmuller, Zimmerman.

(19)Project

In this semester, every student is supposed to do a project on a theoretical physics topic under the supervision of HRI faculty. Main fields in theoretical physics represented at HRI at the moment are, Astrophysics, Condensed Matter Physics, Particle Physics Phenomenology, Quantum Information and Computation, and String Theory.

(20) Laboratory III

- Ferro to Para Electric Phase Transition (or its Magnetic analogue)
- Raman Spectroscopy
- ESR
- Earth's field NMR gradient
- Bragg Diffraction by Microwaves
- Hall Effect
- G-M counter, Counting Statistics, Gamma ray absorption cross section
- Gamma ray Spectroscopy
- STM with Graphene, HOPG, Gold, Semiconductors and CDW
- Measurement of Speed of Light

Other Electives

• Advanced Particle Physics

- The discovery of the Higgs boson; the Higgs and vacuum stability.
- Issues in collider physics, motivations and outcome of the LHC, motivations for future collider experiments.
- CP-violation, the unitarity triangle, outcomes of B-factory measurements.
- The evolution of parton distribution functions, Altarelli-Parisi equation, applications to LHC physics.
- The motivations for physics beyond the Standard Model current constraints from accelerator and astroparticle/cosmological data, the dark matter issue; supersymmetry, grand unification.

Textbooks:

1. Gauge Theory of Elementary particle physics, T.-P. Cheng and L.-F. Li,
2. Foundations of Quantum Chromodynamics, T. Muta,
3. Collider Physics, V. D. Barger and R. J. N. Phillips,
4. Beyond Standard Collider Phenomenology of Higgs Physics and Supersymmetry, M. C. Thomas.

• Spectroscopic Methods

- Probes for matter on different energy and spatial scales.
- Interaction of electromagnetic radiation with matter, correlation functions in classical and quantum matter, point group symmetries and selection rules.
- Electron spectroscopy in atoms and molecules: single and many electron atoms, simple molecules, vibronic transitions.
- Vibration and rotational spectroscopy: infrared, Raman and microwave methods. Computing the spectrum of simple atomic and molecular systems.
- Probing spin states: electron spin resonance and nuclear magnetic resonance. Mossbauer spectroscopy. Spectra of magnetic ions. Solid state effects on the spectrum.
- Probe of collective effects: X-ray and neutron scattering from condensed matter. Static structure and dynamical correlations. Effect of phonons on lattice dynamical structure factor. Dynamical magnetic structure factor from ferro and antiferromagnetic spin waves. Diffuse magnetic scattering. Dynamics of classical liquids.
- Extended electronic states: angle resolved photoemission spectroscopy, computing the spectrum for weakly correlated electron systems.
- Ultrafast dynamics: control and probe of chemical reactions via femtosecond spectroscopy.

Textbooks:

1. Modern Spectroscopy, J. M. Hollas,
2. Symmetry and Spectroscopy, Harris and Bertolucci,
3. Introductory Raman Spectroscopy, J. R. Ferraro, K. Nakamoto and C. W. Brown,
4. Understanding NMR Spectroscopy, J. Keeler,
5. Theory of Neutron Scattering from Condensed Matter, S. W. Lovesey,
6. Dynamic Light Scattering, Berne and Pecora,
7. Photoemission in High Tc Superconductors, Campuzano, Norman and Randeria, in Bennemann and Ketterson, Superconductivity Vol. 2,
8. Chemical Reactions and their Control on the Femtosecond Time Scale, P. Gaspard and I. Burghardt Femtosecond Laser Spectroscopy, Ed, P. Hannaford.

- # Quantum Many Body Theory

- Basics: second quantisation, the many body Hilbert space, few particle problems. Green functions: formal definition, Lehmann representation, calculation for quadratic problems, expression of observables in terms of Green functions. Finite temperature: the imaginary time formulation, analytic continuation.
- Perturbation theory: the interaction representation, Wicks theorem, low order expansion and diagrammatic representation, Dyson equation and self-energy, vertex functions and Bethe-Salpeter equation, explicit calculations in the Anderson impurity model.
- Resummations: random phase approximation in the electron gas, ladder summation in dilute hardcore systems, Hartree-Fock and higher order conserving approximations.
- Long range order: self-consistent calculations for broken symmetry phases, static mean field and dynamical calculations, Nambu formulation and Eliashberg theory. Goldstone modes in the ordered phase - metallic antiferromagnets and superconductivity,
- Functional integral methods: representing the partition function, bosons and fermions, quadratic integrals, Hubbard-Stratonovich decomposition of interactions, saddle point, gaussian fluctuations, beyond the gaussian theory, Ginzburg-Landau expansions.

Textbooks:

1. Introduction to Many-Body Physics, P. Coleman,
2. Fundamentals of Many-Body Physics: Principles and Methods, W. Nolting,
3. Quantum Theory of Many-Particle Systems, A. L. Fetter and J. D. Walecka,’
4. Many-Body Physics, G. D. Mahan.

TMC

M.D. PATHOLOGY
(PROGRAM CODE: HLTH09A01)

HOMI BHABHA NATIONAL INSTITUTE (HBNI)

CURRICULUM FOR MD PATHOLOGY

YEAR 2009 - VERSION 1

PRODUCED BY – Department of Pathology

DATE ACTIVE – Sept 2009

DATE OF REVIEW -

INDEX

1. INTRODUCTION

The MD Pathology course under the HBNI comprises of histopathology, autopsy pathology cytopathology, clinical pathology, and hematology and transfusion medicine

The course complies with Medical Council of India Guidelines and ensures the following

- MD Pathology Post Graduate (PG) program is of three years duration after MBBS
- Postgraduate curriculum is competency based
- Learning in Postgraduate program is essentially autonomous and self directed
- A combination of both formative and summative assessment is vital for the successfu completion of the PG program
- The training of PG students involves learning experience 'derived from' and 'targeted to' the needs of the community

2.SELECTION GUIDELINES

1. Students for the postgraduate medical course shall be selected strictly on the basis of their academic merit
2. The basis of merit will be determined by the competitive test conducted by the State Government of Maharashtra or by the competent authority appointed by the State Government of Maharashtra to determine merit (such as MHCET)
3. Any other inputs may be obtained from Dean's Office

3. DURATION OF TRAINING

The period of training will stretch over three years

It is recommended that the course of Doctor of Medicine (Pathology) or MD (Pathology) be of THREE YEARS duration in the form of a residency program that is FULL TIME

The course curriculum is divided into three stages covering these three years as

Junior registrar I, Junior registrar II, Junior registrar III

The major components of the postgraduate curriculum are as as under

- Theoretical Knowledge
- Practical and Clinical skills
- Thesis skills
- Attitudes including communication skills
- Training in research methodology

4. PURPOSE OF THE CURRICULUM

The educational programme is aimed at providing:

- ✓ Experience of the diagnostic techniques required to become technically competent in Practical Laboratory Diagnostic Work

- ✓ Broad practical and theoretical knowledge of all aspects of routine surgical pathology and also specialist areas such as cytopathology, hematology, oncopathology and histopathology of specific systems in order to be able to provide specialist advice

- ✓ Experience of the practice of evidence based clinical medicine through attendance in joint clinics or multi disciplinary teams.

- ✓ Inculcating a habit of literature searches, attendance at scientific meetings, and the presentation of scientific work

- ✓ Competency to impart training to students at various levels including postgraduate level in the subject and carry out research

- ✓ Competency for planning, organizing and establishing pathology services / department in all types of medical establishments

5. BROAD OBJECTIVES

Cognitive Domain

- Diagnose routine and complex clinical problems on the basis of Histopathology (Surgica Pathology) and Cytopathology specimens, Blood and Bone Marrow examination and various tests under the domain of Laboratory Medicine (Clinical Pathology, Clinica Biochemistry/Chemical Pathology) as well as Blood Banking (Transfusion Medicine).
- Interpret clinical and laboratory data with reasonable accuracy.
- Correlate and advice further on pathology data so that various clinical aspects of disease can be correlated and explained.
- Should be able to teach pathology to undergraduates, postgraduates, nurses and paramedica staff including laboratory personnel.
- Able to supervise work of subordinate laboratory staff and colleagues.
- Able to initiate research questions and systematically write or present a paper and publish in a journal.
- Aware of quality control and biosafety and waste disposal issues in a laboratory.
- Subject himself/herself to continuing education and constantly update his/her knowledge o recent advances in Pathology and allied subjects.

Psychomotor Domain

- Able to perform most of the routine tests in a Pathology Laboratory including grossing o specimens, processing, cutting of paraffin sections making smears, making frozen sections anc staining.
- Able to collect specimens by routinely performed non-invasive out-patient procedures such as venepuncture, finger-prick, fine needle aspiration biopsy of superficial lumps and bone-marrow aspirates.
- Perform an autopsy, dissect various organ complexes and display the gross findings.
- Should be familiar with the function, handling and routine care of equipment in the laboratory.

Affective Domain

- Should be able to function as a part of a team that is essential for the diagnosis anc management of a patient and interact with the patient, the clinician and all other colleagues tc provide the best possible diagnosis or opinion.
- Always adopt ethical principles and maintain proper etiquette in his/her dealings with patients relatives and colleagues.
- Develop communication skills to word reports and interact with patient's relatives, peers anc paramedical staff.

6. TRAINING SCHEDULE

Scope of training –

As pathology is a bridge between basic medicine and all other clinical branches it covers a wide range of subjects and subspecialities.It involves both clinical skills and laboratory technological methods which are both traditional and novel. It is difficult to expect full proficiency in all branches of pathology within the limited span of three years. Keeping the aims of this course in mind the following are the levels of competence that are expected to be achieved.

A) High Degree of Professional Competence: In the subjects of Anatomic Pathology (Surgical Pathology and Cytopathology) and Haematology

B) Reasonable working knowledge: In the subjects of Laboratory Medicine (Clinical Chemistry/Clinical Pathology/ Microscopy) and Transfusion Medicine (Blood–Banking)

C) General /Theoretical Acquaintance in the following subjects

- **Immunopathology / Immunofluoroscence**
- **Immunohistochemistry**
- **Molecular Pathology/ Cytogenetics/ Tissue Culture**
- **Medical Statistics / Ethics**
- **Library / Information retrieval / Web search engines in medicine.**

7. ROTATION SCHEDULE

There will be two years of training in Tata Memorial Hospital and one year training in a General Teaching Hospital (either Government or Municipal).

Section /Subject	Duration in months
(i)Orientation Rotation	2
(ii) Government / Municipal Medical College /Hospital*	6
(iii) Surgical Pathology and Fine Needle Aspiration Cytopathology	14
(iv) Hematology	2
(v) Exfoliative Cytology	1
(vi) Transfusion Medicine/Blood Bank	2
(vii) Basic sciences including Molecular Biology, Cytogenetics, Research techniques	1
(viii)Government / Municipal Medical College /Hospital **	6
(ix) Elective / Reorientation)	2
TOTAL	36 Months

*The peripheral posting in the first year in Government / Municipal Medical College / Hospital will specifically include Autopsy, non oncology related aspects of Pathology, Clinical Pathology, Hematology, Systemic Pathology, Blood Bank and Immunohematology.

** The peripheral posting in the third year in Government / Municipal Medical College /Hospital will include Surgical Pathology specialized postings such as Neuropathology, Dermatopathology, Cardiac Pathology and Renal Pathology

8. YEARLY ASSESSMENT

Purpose of assessment

This assessment seeks at evaluating students in the areas they were trained within the period. A standardized scheme is necessary to train candidates in any teaching program

Method of assessment

Log book (Work Diary) : Record of Three Years

The postgraduate students should record all their activities in a log book includes duration of posting, the period of absence if any, skills performed, and remarks if any by teacher/ faculty member

The log book should also record journal clubs, seminars attended / part taken as well as undergraduate and paramedical teaching activities the candidate has participated

Annual assessment based on the work diary shall be done by the P G teacher and Head of the Department

First year assesment (External & Internal) : Total Marks 500

i)Multiple choice question / MCQ paper (Hematology & Surgical Pathology) = 220 marks
ii) Brief answer question paper comprising 10 questionsX 10 marks = 100 marks
iii) Microscopy test (10 slides X 5 marks) = 50 marks
iv) Thesis status discussion by external assessor = 30 marks
v) General Viva= 100 marks

Final year examination : Total marks 800

a)Essay paper – 400 marks
There shall be four theory papers of 100 marks each

Paper I - General pathology including general neoplasia, immunopathology and cytopathology
Paper II - Systemic Pathology including Systemic Neoplasia
Paper III – Hematology, Transfusion Medicine, Immunohematology, including recent advances
Paper IV – Clinical Pathology, Chemical Pathology, Pathology of Infectious Diseases, Recent Advances

b)Practical examination- 400 marks
Details of exercises and marks

1. Histopathology Slides (25slides X 5 marks each)- 125 marks
2. Clinical case – 75 marks
   - Urine Examination
   - Biochemical Test
   - Hemogram

- Special Hematology test
- Case Discussion

3. Hematology and Cytology Slides (15 slides X 5 marks each) - 75 marks
4. Gross/ Morbid Anatomy – 35 marks
   - Seven spots of Gross specimens (7 X 5 marks each)and no viva for the same
5. Autopsy/Reconstructed Autopsy – 20 marks

   Student have to do internal or external examination of dead body in post mortem room
6. Histopathology Techniques – 15 marks
   - To perform H & E staining
   - Block cutting on microtome
   - To perform special stains
   - Viva for the same
7. Serology technique – 15 marks
   - Blood grouping
   - Cross matching
   - DCT/ ICT titre
   - Viva for the same

c) Viva Voce Examination - 40 marks

Includes thesis discussion

d) **Dissertation**

Date of submission: Six months before the Final Examination

Aims:
To encourage the spirit of enquiry, inventiveness and inculcate aptitude for research.

Objectives:
1.Discern and recognize areas where research is informative and useful to improve medica practice

2.Assimilate/ analyze data and compare results from similar studies in past or in latest world literature

General guidelines:
1. Dissertation based on research work is aimed at encouraging a spirit of enquiry, aptitude foı research, critical analysis of methods and results in the light of the latest developments in medicine.

2. All students registered for the course will have to submit dissertation/thesis work during the course The research work done independently by the candidate under the guidance of his guide should be the basis of the dissertation.
3. Prior sanction – IRB review

If the research work involves coordination or collaboration with another department, a suitable co-guide from that department from among the PG teachers may be designated by the Head of the Institution.

If the PG guide becomes unavailable, on account of transfer, retirement etc in the last two terms o training, the student may be allowed to continue under the same guide and sign the required certificate with specific approval from the University. If the guide becomes unavailable earlier than the 5th term, a new guide has to be assigned to the student. The new guide cannot be assigned for another PG student for the next term or next two terms as the case may be.

The age limit for PG teachers for guiding students shall be 65 years

Once the dissertation is accepted, the candidate can appear for the final examination for up to 4 years Any candidate failing to appear in the final examination within 4 years, will be required to undergo training again for a period of 4 terms before appearing for degree examination.

Grading of students

Criteria for passing : Minimum 50% of total marks in each paper and practicals separately

9. LEARNING MODULES

The following teaching/learning methods will be used to identify how individual objectives will be achieved.

a) Routine work: the most important learning experience will be day-to-day work.
b) Textbooks: A departmental library is available for quick reference for students
c) Histology, cytology and hematology slide meetings.
d) Gross meetings
e) Journal club
f) Symposia
g) Intradepartmental student debate
h) Interhospital CPC meeting
i) Attend monthly teaching pathologist meeting
j) Attend specialist lectures, training courses and CME's conducted in house and elsewhere
k) Scientific meetings: Residents will be encouraged to attend and participate in the Maharashtra Chapter and National meeting of the Indian association of Pathologist and microbiologist (IAPM).
l) Clinical meetings: - Comprising weekly multi faculty hospital joint meeting and interdepartmental multidisciplinary joint meeting.
m) E-learning and internet literature search
n) Log book
o) Basic statistics training program
p) Good clinical practice training

10. DETAILED SYLLABUS

09HLTH09A01-001-C

SURGICAL PATHOLOGY

AIM – Training to include

1. Grossing of all surgical specimens in keeping with protocol or guidelines for handling various specimens
2. Identify, and systematically and accurately describe the chief gross and microscopic alterations in the surgically removed specimens
3. Correctly diagnose majority of the lesions received on an average day from the surgical service of a general hospital.
4. Knowledge and incorporation of internationally approved terminology for classification of diseases e.g. WHO and TNM staging for tumors.

Title	Gross	Skill	Knowledge
General Surgical Pathology	Correct specimen orientation Protocols for obtaining fresh tissues for ancillary methods Grossing of all common specimens and understanding attention to detail during specimen description and section taking	Setting up a microscope Normal histology of various organs Be able to start a tissue processor, process tissues make a paraffin block and cut sections of good quality on a rotary microtome. Stain paraffin sections Haematoxylin & eosin, PAS stain, mucin, Masson Fontana, AFB.	Normal histology and pathologic conditions, types of fixatives, tissue processing, special stains Frozen section competency, Ancillary methods in histopathologic diagnosis like Immunofluorescence, ultra structure, cytogenetics, understand integration of ancillary methods and clinical information
Breast	Grossing mastectomies, breast conservative surgical resection specimens including lymphnode dissection.	Diagnosis of invasive breast carcinoma and subtypes, Histopathology reporting and essentials to be included in a report on breast carcinoma.	Prognostic and predictive factors in breast cancer, Identifying DCIS, firboadenoma, phyllodes tumor, spectrum of proliferative breast disease, special tumors like adenomyoepithelioma, Paget's disease, Diagnostic methods, disease of male breast,
Gastrointestinal tract	Grossing of Radical excisions such as APR, anterior resections etc	Classification of gastritis, identifying Barrets esophagus, identifying H pylori, diagnosis and classification of inflammatory bowel	Congenital and mechanical disorders, Molecular and etiopathogenetic mechanisms in adenocarcinoma, premalignant disease, Prognostic and predictive

		disease, different histology's in polyps, Adenomas, Infections and parasites affecting the GIT Diagnosis and histopathology reporting of carcinomas and other tumors such as Gastrointestinal stromal tumors,	factors in carcinomas of GIT, unique lymphomas involving the GIT, neuroendocrine tumors of GIT, Polyposis syndromes, malabsorption syndromes, Celiac disease and tropical sprue, vascular disorders, diverticulosis, intussusceptions,
Hepatobiliary system	Hepatectomy specimens Cholecystectomy specimen Whipple's surgery	Histopathology reporting in hepatectomy, Cholecystectomy and Whipple's resection. Liver biopsy – diagnosis of cirrhosis and malignancies , classification or grading of hepatitis	Types of cirrhosis, Drug induced hepatitis, metastatic carcinoma, Hepatocellular carcinoma(HCC) variants like fibrolamellar HCC, hepatoblastoma, Metabolic liver disease, Liver in inherited disorders of metabolism e.g. Wilsons disease, glycogen storage disorder Pancreatic disease e.g. diabetes mellitus, islet cell tumors
Head and Neck	Grossing of major resections in head and neck e.g. composite resection, hemimandibulectomy, maxillectomy, salivary gland excisions etc	Diagnosis of squamous carcinoma Evaluating dysplastic changes in squamous epithelium Identify chief types of salivary gland tumors- Pleomorphic adenoma, adenoid cystic carcinoma, Warthin's tumor, ductal carcinoma	Nasal polyps, common tumors in children, Myoepithelial salivary gland tumors, neck cysts
Neuropathology	Neurosurgical resections	Common brain tumors, Metastatic carcinomas, tumors of peripheral nerves, WHO classification of CNS tumors	Dementia, Demyelinating diseases of brain, muscle/ nerve biopsy

Gynecology	Examination of hysterectomy and salphingo-oophorectomy for benign and malignant diseases. Cervix cone biopsy processing Grossing of placenta	Endometrial pathology, leiomyoma, endometriosis, adenomyosis, common ovarian tumors, Cervical pathology including intraepithelial neoplasia, Reporting of Wertheim's hysterectomy	Normal ovarian and endometrial histology, Polycystic ovarian disease, endometrial biopsy interpretation in infertility or dysfunctional bleeding, Endometrial stromal sarcom, malignant mixed mullerian tumor, placental pathologic abnormalities, ectopic pregnancy, Gestational trophoblastic disease
Male genital system	Radical prostatectomy, Orchidectomy and penectomy specimen evaluation	Evaluating prostatic biopsies for cancers Diagnosis of testicular germ cell tumors Histopathology reporting of orchidectomy	Gleason's grading system, Non germ cell tumors of testes. carcinoma of penis and scrotum, Testicular biopsy and investigations in male infertility
Urology and Nephropathology	Renal and bladder tumor excisions	Renal biopsy interpretation with emphasis on glomerular disease, bladder biopsy evaluation for urothelial tumors and inflammations, Histopathologic reporting of nephrectomy specimens	Immunofluorescence and ultrastructural findings in glomerular diseases, Urinary outflow obstruction causes and pathology.
Dermatopathology	orientation of skin biopsy	Inflammatory skin biopsy :- descriptions and observations, Diagnose basic skin carcinomas Diagnosis of nevi and melanoma	Histologic findings in bullous skin lesions, pemphigus, psoriasis, dermatitis herpetiformis, seborrheic keratosis, actinic keratosis, hemangiomas, skin cysts, granulomatous lesions of skin, infections, common ski adnexal tumors,
Lymph Node pathology	Recording abnormal gross appearances	Identifying metastatic carcinoma, granulomatous lesions, Distinguish reactive Vs malignant lymphoid proliferation, Hodgkin's from Non	Recognition of viral / bacteri lymphadenitides and lymphadenopathies, Immunohistochemical distinction between different primary carcinomas Immunohistochemistry in lymphoid disorders and lymphomas

		Hodgkin's lymphoma, Identify broad categories of Non Hodgkin's lymphoma	
Respiratory tract	Lung resections lobectomy and pneumonectomies	Reporting on lung cancer resections, Lung biopsy interpretation for cancer , granulomas.	Histologic subtypes of lung carcinomas, Lung biopsy interpretation in interstitial lung disease Distinguishing primary from metastatic lung carcinomas, common pleural tumors :- mesothelioma
Mediastinum	Wide excsions of tumors	Core biopsy in mediastinal tumors, Thymic tumors-classification and diagnosis	Diagnosis and approach to common tumors and cysts within the mediastinum
Endocrine System	Thyroidectomy and parathyroid, adrenal excisions	Diagnose goitre, papillary thyroid carcinoma, follicular carcinoma, adenoma in thyroid. Distinguish parathyroid hyperplasia from adenoma or carcinoma Distinguish adrenal adenoma from a carcinoma. Diagnose a Pituitary adenoma.	Approach to evaluation of solitary thyroid nodule, Hurthle cell tumors, Types of thyroiditis, Graves disease, Functional disorders of thyroid, Metabolic disorder associated with parathyroid hormone secretion. Clinical presentation and Investigations in secreting tumors of pituitary and adrenal gland, Multiple endocrine neoplasia
Musculoskeletal system	Soft tissue tumor resections, Bone tumor and amputation grossing	Common bone and soft tissue tumors	Paget's disease of bone, osteomyelitis, Degenerative and dystrophic muscle disease, synovial diseases, Cytogenetic and immunohistochemistry in bone and soft tissue tumors, tumor like lesions, joint diseases and arthritis, metabolic bone disease and bone biopsy interpretation, synovial biopsy indications and evaluation
Pediatric pathology	Pediatric embroyonal tumor excision grossing	Inflammatory and neoplastic lesions in children Hirshsprung's disease evaluaution.	Myofibroblastic tumors in children, common developmental pediatric tumors e.g neuroblastoma, retinoblastoma, hepatoblastoma, Wilms tumors and rhabdomyosarcoma.

09HLTH09A01-002-C

AUTOPSY PATHOLOGY

AIM – Resident should be able

1. To perform autopsies safely, eviscerate and dissect organs
2. To liase with clinician and identify issues to be addressed by autopsy exmination
3. Correctly identify all major lesions which have caused, or contributed to, the patient's death on macroscopic examination.

Systems	Technique	Knowledge expected
Cardiovascular	Demonstration of heart chambers, major vessels and coronaries. Demonstration of pulmonary embolism identification of abnormalities like infarcts and congenital anomalies	Normal age related changes, All major pathologic processes involving valves and vessels, causes of cardiac failure, infarction, rheumatic heart disease, infective and non infective endocarditis, cardiomyopathy, myocarditis, pericarditis and effusion, causes of sudden cardiac death, congenital heart disease, dissectior of aorta, classification of vasculitis, aneurysms, tumors of vessels and heart
Respiratory	Dissection of bronchi and lung lobes Demonstration of pneumonia, air embolism, pneumothorax	Gross appearance of lung tumors, infarct, interstitial lung disease, pneumoconiosis, sarcoidosis, infections like tuberculosis, fungal infections etc , adult respiratory distress syndrome, drug, toxin and radiation induced injury, obstructive pulmonary disease, bronchial asthma, bronchiectasis, chronic bronchitis, emphysema , atelectasis, pulmonary hypertension, pleural effusion causes
Gastrointestinal tract (GIT)	Dissection of entire system in continuity, Identification of ampulla of Vatr Normal mucosal surface in entire GIT	Appearances of esophageal varices, distinguishing the various ulcerative lesions within the GIT, Diverticulitis, gangrenous changes etc
Hepatobiliary	Removal of liver and dissecting the gall bladder and entire bilary tract , hepatic vein and portal vein	Evaluation of different abnormal changes in liver in cirrhosis etc. Causes and spectrum of acute and chronic liver failure chronic and acute hepatitis, autoimmune hepatitis, alcoholic liver injury and alcoholic liver disease, Biliary obstruction, veno occlusive disorder, Budd Chiari syndrome, Portal hypertension effects anc causes, cholecystitis, Acute and chronic pancreatitis

		Identification of tumors in the system
Male genital	Dissection of entire urinary system with kidneys and urinary bladder in continuity with vas deferens, prostrate and testes	Evaluation of abnormalities of kidney and pelvicalyceal system Diseases affecting the male genitals
Endocrine	Removal of pituitary, parathyroid, adrenal and thyroid	Normal weights and gross abnormalities ir these organs
Nervous	Brain removal and slicing to demonstrate important brain nuclei, internal capsule, hypothalamus and other structures Demonstration of circle of Willis	Abnormal appearances of vessels, infarcts, atrophic changes and tumors, Ateriovenuos malformations, cerebrovascular disease, increased intracranial pressure causes and effects,
Lymphoreticular	Examination of draining nodes in different systems Spleen removal and examination Collecting marrow	Knowledge on common blood diseases and causes of nodal or spleen enlargement
Musculoskeletal	Identify fractures and collecting muscle biopsy	Pathological conditions affecting bone anc soft tissue

CYTOPATHOLOGY

Subject	Skill	Knowledge
Gynecologic cytology	Technique for spreading and fixing a smear, specimen adequacy , how to screen a smear, knowledge of infections in cervical smears, picking up abnormal cells, understanding the Bethesda system of reporting cervical smears, understand reasons for cytology-histology discrepancy	Smear taking techniques, Basic knowledge of colposcopy and treatment implications of abnormal cytology report, awareness of pitfalls and limitations of cervical smear screening.
Nongynecologic exfoliative cytology	Preparation and fixing of smears Diagnose malignancy in commonly investigated sites like pleural fluid, ascitic fluid and urine, distinguish from reactive mesothelial cells	Knowledge of staining techniques, understand structuring of reports and histological correlation, understand pitfalls and artifacts in processing
Fine needle aspiration cytology	Breast :- Diagnose malignancy and fibroadenoma Thyroid:- Diagnose papillary carcinoma, approach to diagnosis of follicular lesions, medullary carcinoma and lymphoma Lymph nodes:- Recognize specific and nonspecific reactive lymphadenitis,	Understand role of FNAC in diagnosis of lesions of thyroid, breast, node and salivary glanc Recognize when definitive diagnosis requires histology, Familiarity with processing of guided FNAC, Awareness of situations requiring

	diagnose metastatic carcinoma and lymphoma Salivary gland :- Diagnose pleomorphic adenoma, Warthin's tumor, adenoid cystic carcinoma Diagnose cancer in Lung, Liver, Mediastinal and Abdominal FNAC	multidisciplinary discussions
Miscellaneous	Knowledge of likely outcome of all diagnosis., of malignancy or infections in unusual specimens e.g. bile duct brushings etc	Quality assurance in cytology, Audit of cervical screening programs etc, role of ancillary methods like immunocytochemistry, flow cytometry in common cancers

09HLTH09A01-003-C

CLINICAL PATHOLOGY and ROUTINE HEMATOLOGY

Aim :-

(1)Establish and direct a hematopathology laboratory that includes clinical hematology, urine analysis, clinical microscopy, flow cytometry and diagnostic hematopathology

(2) to provide consultation to clinicians on patient problems related to hematopathology.

Training period: four month rotation in the service, weekly didactic teaching and slide sessions

Subject	Skill	Knowledge
Blood collection	Learn safe practices for patient blood collection, use of different anticoagulants for blood collection. Blood collection procedures for venous, capillary and from central lines	Understand physiological variations in samples
Blood cell counters / Automated Hematology	Interpret results of automated and manual cell counts and scattergrams. Review abnormal results, correlate results with peripheral blood smear findings and clinical history	Knowledge of the principles of automated cell counting including RBC indices and their derivation and the principles by which each instrument type arrives at a 5 part differential. Know the effect of nucleated RBC on WBC counting, and appropriate WBC correction, Know the importance of absolute versus relative counts and the absolute neutrophil count (ANC) and its clinical utility, principles of automated Reticulocyte enumeration, pathophysiology and laboratory findings of the major disorders causing anemia

Peripheral smear analysis	Learn proper preparation and handling of peripheral blood smear Learn normal RBC, WBC and platelet morphology Estimate WBC and platelet counts, Recognize abnormal RBC, WBC, platelet morphology, and interpretation in a clinical context Detection of parasites in peripheral blood	Knowledge of methods of staining peripheral thick and thin smear and trouble shooting Knowledge of WBC, RBC and platelet disorders Implications for an abnormal peripheral smear finding Knowledge of special types of smears and timing for collecting blood for detection of parasites like microfilaria etc
Blood indices , ESR, Reticulocyte counting	Methods to estimate hematocrit / blood indices and ESR Perform manual hematocrit and ESR testing	Principle of estimation and abnormalities in erythrocyte sedimentation rate Understand the principle and utility of supravital stains, reticulocyte stain, Heinz body demonstration etc
Body fluid analysis **(Pleural, ascitic fluid, CSF, synovial fluid)**	Learn manual hemocytometer cell counting, Understand cytocentrifuge preparation and slide staining Identify blood and body fluid cell morphology Recognize malignant cells and recommend appropriate confirmatory tests. Identify organisms: bacteria, fungi, parasites	Neubauer's chamber use and counting principle, Stains used to count cells in fluid, Knowledge of fluid composition in normal and pathologic states, ability to diagnose based on findings documented and Correlate with clinical history and other laboratory results. Principles and use of dark field or fluorescent and polarized microscopy in fluid examination Abnormalities seen and reporting of a semen sample in infertility Special stain on fluids, India Ink preparation on CSF, Gram stain, Z N stain
Urine analysis	Interpret routine urinalysis(Cellular and chemical) and identify abnormal cells and organisms, Know to perform chemical tests in urine sample for pH, occult blood, protein, sugar chyluria, bile salts/ pigments, etc	Understand the principles of methods involved in urine chemistry and urine cytology by wet preparation examination Understand indications for urinalysis Understand the principles of

		automated urine cytology analyzers
Stool examination	Wet mount of stool for examination Identify abnormal cells, parasites. Learn to detect occult blood in stools	Knowledge of parasites in stool , their stages of development, Implications of detection of abnormalities

09HLTH09A01-004-C

HEMATOPATHOLOGY

Subject like lymph node pathology and bone marrow trephine biopsy will be reported in the surgical pathology section while marrow aspirates and fluid hematology will be covered in 7th floor hematology laboratory and residents will rotate through Gvernment/ Municipal hospital for non neoplastic and immunohematopathology training

Subject	Skill	Knowledge
Bone marrow aspirates	Work up a aspirate right from obtaining the peripheral blood smear, aspirate smear, relevant lab results /history to seeing cells Learn normal aspirate cellular findings, approach to diagnose abnormal findings and integrate aspirate with trephine biopsy findings Recognize normal WBC, RBC and platelet maturation, as well as cellular dysplasia Diagnosis of all common hematological conditions. Stain and Interpret cytochemical stains like Pearl/Iron stain, Myeloperoxidase, Non Specific Esterase	Abnormalities detected in a marrow aspirate including abnormal cells, abnormal maturation, viral inclusions, marrow in storage disorders, diagnose iron overload, Marrow findings in refractory anemia's, leukemia's and lymphomas Understand the principle and clinical utility of cytochemical stains, their interpretation, and applications
Bone marrow trephine biopsy	Learn technical aspects of performing and analyzing bone marrow aspiration and biopsy Learn handling, preparation and interpretation of bone marrow biopsy specimen including special stains (e.g.Wright's, LAP(Neutrophil	Know causes of cytopenias or aplastic marrow, Integrate morphology, cytochemistry, immunophenotype and molecular and cytogenetics and render a preliminary diagnosis. Knowledge of all subtypes of

	Alkaline Phosphatase), Iron, Myeloperoxidase, Non Specific Esterase,Tatrate Resistant Acid Phosphatase, Alkaline Phosphatase, Prussian blue) Correctly assess bone marrow cellularity, storage iron and fibrosis. Recognize reactive bone marrow and abnormal infiltrates, effects of chemotherapy and growth factor stimulation on blood and bone marrow Diagnose and classify leukemia , hematolymphoid malignancies	acute and chronic leukemias, myeloproliferative disease, patterns of involvement by lymphoma.
Flow Cytometry	Observe lymphoma/leukemia panel performed on blood and/or bone marrow. Clinical presentation, morphology, evaluate and interpret results of flow cytometry in conjunction with cytochemistry Clinical Presentation, Morphology and immunohistochemistry studies	Understand the physical components and operating principles of a flow cytometer and quality control procedures, Know the principles of routine flow cytometry evaluation of leukocytes, including both surface and intracellular markers, and recognize clonal abnormalities, principle of tests designed to evaluate the DNA content (ploidy) and cell cycle. Understand the diagnostic, prognostic information provided by flow cytometry and lymphocyte subset analysis: know the commonly used antigens to define T helper, T suppressor, natural killer and B cell, Understanc the characteristic clinical, morphologic, immunophenotypic, cytochemical and

		cytogenetic/molecular features of leukemia's, lymphomas and Plasma cell dyscrasias, Paroxysmal Nocturnal Hemoglobinuria
Coagulation profile	Be able to perform coagulation tests like Prothrombin Time, Activated Partial Thromboplastin Time Interpret results of laboratory tests utilized in the management of bleeding and thrombotic disorders, Interpret results of coagulation tests in the setting of fibrinolytic therapy Recognize platelet function abnormalities associated with acquired and congenital thrombocytopathies (thrombasthenia, Bernard Soulier Syndrome, Storage Pool Disease), Interpret platelet function studies including platelet aggregation and secretion studies, and screening studies and "in vitro" screening tests of platelet function Interpret studies performed for the evaluation of vWD	Develop basic understanding of haemostatic and thrombotic disorders Knowledge of the effect of hematocrit and blood drawing technique on anticoagulation of blood sample for coagulation testing principles of routine coagulation analysis (PT, APTT, fibrinogen, Thrombin Time), INR derivation and its clinical significance, principle of tests involved in monitoring heparins, laboratory evaluation of DIC, qualitative and quantitative testing. pathophysiology of the coagulation factor deficiencies tests involved in the identification of lupus anticoagulant and antiphospholipid antibody syndromes Interpret results of tests measuring components of the fibrinolytic system Interpret results of test for thrombotic risk factor identification: Protein C, S, ATIII, and Activated Protein C Resistance Discuss risk factors leading to arterial and venous thromboembolic disease. Understand the mechanism of action of platelet directed inhibitors and fibrinolytic agents, and their effects on laboratory testing
Hemoglobinopathies	Be able to perform Sickling test and osmotic fragility test, Interpret an Hb electrophoretic pattern and diagnose major hemoglobinopathies (Sickle cell anemia, alpha/beta thalassemia, Hgb E disease	Understand the role of Fe in RBC production/hemoglobin synthesis Describe Fe metabolism and laboratory tests for Fe (Serum ferritin Serum iron and total iron binding capacity) Understand Hemoglobin synthesis

	and Hgb C disease)	and degradation and genetic mechanisms in hemoglobinopathies. Knowledge of principles of hemoglobin screening by HPLC and electrophoresis, osmotic fragility test, sickle solubility screening, Kleihauer Betke, Ancillary tests for the RBC disorders related to enzyme defects (G6PD deficiency, methemoglobinemia) / Hereditary spherocytosis/ Paroxysmal nocturnal hemoglobinuria / Hemolytic Anemia / Congenital dyserythropoietic anemias Prenatal diagnosis of Thalassemias
Platelet disorders	Perform manual estimation of platelets	Knowledge of causes of Thrombocytopenia and thormocytosis, Understand the principles of platelet discrimination and counting by automated hematology analyzers, Knowledge of platelet function tests and their uses.

09HLTH09A01-005-C

IMMUNOLOGY

Subject	Skill	Knowledge
Cells of immune system	Interpret lymphocyte immunophenotyping on flow cytometry data used to characterize leukocyte populations	Understand the growth and development of cells that comprise the immune system and the principles of structural and functional evaluation of B-cells, T-cells, NK-cells, and phagocytic cells. Knowledge of the T-cell receptor and Ig rearrangement, HLA class I and class II molecules, pathways for acquired immune response, acquired immunodeficiency disorders. Understand principles of neutrophil and phagocyte function assays, and methods to evaluate Understand the molecular changes in lymphoid neoplasms and be able to correlate with clinical behavior of disease and current and potential therapy.

Immunoglobulin - Quantitative and Qualitative Disorders	Interpret the protein electrophoresis patterns observed in normal serum, normal plasma, normal urine, and in large monoclonal gammopathies such as multiple myeloma and Waldenstrom's macroglobulinemia	Knowledge of the basic biology of immunoglobulins structure, classes of immunoglobulins, the types of immunoglobulin fragment and the principles of protein electrophoresis & immunofixation
Proteins of Innate Immunity and Inflammation	Knowledge of the role of the complement system or proteins in health and disease, complement protein measurements to assess inherited and acquired deficiency states, Understand the acute phase response and acute phase proteins, such as C-reactive protein, to assess inflammatory conditions. Understand cytokines as mediators and markers of immune and inflammatory responses.	
Transplant associated pathology	Bone marrow and solid organ transplant – principles, GVHD types and diagnosis, chimerism	

09HLTH09A01-006-C

TRANSFUSION MEDICINE

The objective is to produce a specialist who possesses the competencies and skills to cope with the problems presented by everyday in-hospital and outpatient Transfusion Medicine practice.

Subject	Skill	Knowledge
Donor selection and bleeding	Good practices for collection of blood and bleeding donors, phlebotomy techniques.	Donor selection criteria , Donor counseling , donor notification associated with positive infectious disease testing results, blood bags and coagulants used in a blood bank, adverse reactions associated with blood donation/phlebotomy (whole blood and aphaeresis donations) Knowledge of handling massive transfusion protocols , Multiple transfusions, evaluating patients refractory to platelet transfusions,
Routine blood grouping and cross matching	Procedure for correct identification of blood samples Able to do ABO and Rh Grouping (cell and reverse),	Knowledge of abnormal blood groups like Bombay O group, Lewis Blood Group Substance Secretors, Non secretors and ABO groups in saliva,

	cross match procedure	Identify ABO and Rh Discrepancies , weak antibodies , auto antibodies etc Demonstrate familiarity with the requirements of all applicable regulatory and accrediting agencies
Antibody	Perform Direct Coombs(DCT)and Indirect Coombs Test (IAT)	Antibody Identification Procedure, Causes for warm and cold antibodies and handling transfusions in patients with these antibodies
Special techniques in blood bank		Viral inactivation, autologus transfusion, therapeutic apheresis, plasma fractionation, Cryopreservation, leucodepletion and use of irradiated blood
Transfusion reactions	Recognize the symptoms and signs of hemolytic and non-hemolytic transfusion reactions,	Pathophysiology, treatment, outcomes and prevention of noninfectious and infectious transfusion transmitted diseases. Knowledge of protocol for investigating a transfusion reaction and typing the exact nature
Blood components	Be able to review requests for blood components and discuss with the requesting physician, Collect blood for component preparation and know how to store blood components	Steps in blood component and blood derivative preparation, Composition and Clinical use of common blood components :- Packed cells, platelets, granulocytes etc Artificial blood substitutes
Transplantation	----	Knowledge of HLA cross matching problems, Principles of hematopoietic stem cell transplantation including collection, processing, and storage of these stem cell products, and the indications for use (e.g., bone marrow peripheral blood, and cord blood

09HLTH09A01-007-C

BIOCHEMISTRY / LABORATORY MEDICINE

Aims:

Plan and organize the work flow in a routine clinical pathology laboratory in keeping with gooc laboratory practices

Be able to correctly interpret the laboratory data of such studies, and discuss their significance with ε view to arrive at a diagnosis

Subject	Skill	Knowledge
Laboratory instrumentation	Handling and use of automated biochemical analyzers	Principle of Instrumentation, use and application of (i)Photoelectric colorimeter (ii) Spectrophotometer (iii) pH meter (iv) Centrifuge (v) Analytical balance (vi)Electrophoresis apparatus (vii)Electrolyte Analyzer (viii)Osmometer Prepare standard solutions anc reagents relevant to the above tests, including the preparation ol normal solution, molar solution anc Buffers.
Routine biochemical investigations	Independently perform the Quantitative Estimations by Manual / Automated Techniques : Blood urea, Blood sugar, Albumin, Serum Proteins(total & fractional) Serum Cholesterol, Serum Creatinine Knowledge of manual evaluation of the tests listed above is desirable	Normal values and units for each ol the investigations, significance anc interpretation of an abnormal result Demonstrate familiarity with the following Quantitative Estimations by Automated Techniques. Cholesterol, Proteins, Billirubir (Total & Direct) Uric acid, Serum Transaminases (ALT and AST/SGOT and SGPT) Serum Alkaline Phosphatase Creatinine Biochemical principles involved ir the estimation of Renal functior test, Liver function test, Gastric anc Pancreatic function, Endocrine function test and Tests foi malabsorption
Arterial, Capillary, & Venous blood gas analysis	Familiarity with use of machines used for the blood gas analysis Interpret results generated and ability to diagnose conditions based on same.	Knowledge of causes of electrolyte imbalances - Serum Electrolyte (Na+ and K+), Serum calcium anc phosphorous, etc
Tumor Markers	Interpretation of Electrophoresis In Multiple Myeloma / Abnormal proteins	Automated procedures foi Estimation of protein Electrophoresis, Immunofixation, Quantitation o immunoglobulins, Bence Jones Proteins Significance and reference values Background of Tumoui markers, New Tumour Markers

		Principle of Enzyme Immunc Assay, Radio Immuno Assay
Quality control and Automation in a laboratory	Know the principles, advantages and disadvantages scope anc limitation of Automation in laboratory, Types of chart or methods usec to monitor quality in a routine laboratory, use of standards for routine biochemical testing, Levy Jennings chart etc Accreditation in Biochemistry, Proficiency Testing (EQAS), and peei evaluation	

09HLTH09A01-008-C

Molecular Pathology

Subject	Knowledge
	Basic structure of DNA / RNA, Various techniques used in molecular pathology, principles, scope and limitations
Reverse Transcriptase Polymerase Chain Reaction (RT –PCR)	Principle, steps in technique, role in diagnostic pathology and infectious diseases, advantages and disadvantages, modifications of technique such as real time PCR, qPCR etc
Fluorescent In Situ Hybridization (FISH)	Principle, technique, advantages and disadvantages of hybridization procedures. Role in diagnostic pathology and neoplasia, Types of FISH – interphase, metaphase
Other techniques	Southern Blot / Northen Blot and Western Blot techniques

09HLTH09A01-009-C

Cytogenetics

Subject	Knowledge
Tissue culture and karyotyping	Demonstrate familiarity with methods of tissue culture and karyotyping in medical cytogenetics and cancer cytogenetics on peripheral blood culture, amniotic fluid culture, bone marrow aspiration culture Basic cytogenetics nomenclature
Molecular cytogenetics	Advanced technologies of molecular cytogenetics such as FISH, CGH Role of cytogenetics in diagnostic pathology, hematological malignancies, solid tumors and patient management

09HLTH 09A01-010C

Medical Statistics

Subject	Skill	Knowledge
Principles of medical Statistics	Calculate means, standard deviation and standard error from the given experimental data	Demonstrate familiarity with importance of statistical methods in assssing data from patient material and experimantal studies e.g. correlation coefficients, expected versus observed, etc and their interpretation Use of SPSS program

09HLTH09A01-011-C

Library / Information Retrieval / Web Search Engines in medicine

Subject	Skill	Knowledge
	Online access for all journals listed in the curriculum Use of Web based search engines, pubmed for reasearch, case studies and thesis.	To get acquainted with the digital library, its services and the effective use of e – resources information to further their knowledge and to supplement conventional reading

General Pathology Training Schedule

Aims

- Theoretical knowledge of basics of all disease processes

Cell Injury & Death

- Causes of cell injury.
- Reversible and irreversible cell injury.
- Mechanisms of cell injury and Structural changes
- **Necrosis:** definition, types of necrosis
- **Apoptosis:** definition, causes, morphology and mechanisms. Systemic effects of cell injury.

Cellular adaptations to injury

- **Growth disturbances:** atrophy, hypertrophy, hyperplasia, metaplasia, dysplasia.
- **Intracellular accumulations:** fatty change, cholesterol and cholesterolesters, proteins, glycogen.

- **Pigments:** exogenous and endogenous. Lipofuscin, melanin, haemosiderin, bilirubin, haematin.

- **Matrix changes :** Pathology of collagen, elastin, basement membranes. Amyloid. Pathological calcification; dystrophic and metastatic. Crystal depositions - Uric acid deposition.

Tissue Responses to Injury

- **Inflammation**

Definition; Acute /Chronic inflammation. Definition; primary causes, Cells involved; Chemical mediators. Granulomatous inflammation: definition of a granuloma; causes; morphology. Special macroscopic appearances in certain tissues.
Healing, Regeneration & Repair

- **Vascular Disturbances**

Oedema, Hyperaemia and congestion, Haemorrhage, Ischaemia, Thrombosis, Fate of thrombi; Embolism, Infarction, Shock, Atherosclerosis
Neoplasia

- Definition and terminology.
- Definition of benign and malignant tumours
- Nomenclature of neoplasms.
- The biology of neoplasms: immortalisation, DNA abnormalities, mitosis and apoptosis in neoplasms, metabolic abnormalities.
- The molecular basis of cancer: oncogenes, suppressor genes, regulatory genes of apoptosis, DNA repair genes.
- Molecular basis of invasion and metastases.
- Carcinogenic agents
- Multistep hypothesis of carcinogenesis.
- Epidemiology of cancer Host factors in carcinogenesis;
- Host defence, cell mediated and humoral immunity.
- Clinical effects of neoplasia: local effects, general effects; cachexia and paraneoplastic syndromes.
- Ancillary methods is; morphological techniques, excision/biopsy, fine-needle aspiration, cytology, immunocytochemistry, flow cytometry
- Biochemical assays for tumour markers
- Molecular diagnosis
- DNA microarray analysis
- Prognostic factors: type of tumour, grading and staging of tumours. Tumour dormancy.

Infections & Parasitic Diseases

Importance of infections & parasitic diseases.

- Changing patterns; effects of travel, change in the environment, new infectious diseases.

- Methods of identifying organisms in tissues. Types of reaction in tissues to the presence of an organism. Interaction with hosts immune state.

General pathology of diseases caused by bacteria, viruses, fungi, parasites and prions.

Selected examples to illustrate mode of spread, tissue reaction, identification of organism in tissues, type of disease and host modifying factors.

Environmental Pathology

Inhaled pollutants:

- Air pollution and occupational dust diseases (pneumoconiosis)*. * (Covered in lectures on respiratory diseases).
- Enumeration of diseases associated with smoking.

Chemical injury:

- Organic and inorganic compounds, metals, gases, toxic mushrooms.
- The pathology of alcohol (covered in 4th medical year) and drug abuse.
- Adverse reactions of therapeutic drugs.

Physical agents:

mechanical trauma, thermal injury, atmospheric pressure, electrical injury, ultraviolet light, ionising radiation injury (mechanisms and morphological changes, complications of radiotherapy, whole body radiation).

Nutritional Pathology

- Causes and effects of malnutrition. Protein-energy malnutrition. Anorexia nervosa and bulimia.
- Vitamin deficiencies and vitamin toxicity.
- Trace elements and disease.

READING MATERIAL

A complete list of reading material is extremely difficult to provide for the postgraduate student ir Pathology. In any postgraduate course reading should not be limited only to the subject oi specialization. One is expected to acquire as much theoretical and practical knowledge as possible. There can be no set guidelines in this regard. Students must be encouraged to utilise the Internet anc similar information technologies to further their knowledge and to supplement conventional reading The following is an incomplete list of reading material that may be helpful to a postgraduate student o Pathology. The habit of referring to current literature and the method of searching for literature must be made a mandatory component of the training.

11.1 Journals and Periodicals

- Acta Cytologica
- The American Journal of Pathology
- The American Journal of Surgical Pathology
- The American Journal of Hematology
- The American Journal of Clinical Pathology
- Archives of Pathology and Laboratory Medicine
- British Journal of Haematology
- Blood
- Diagnostic Cytopathology
- Histopathology
- Human Pathology
- Indian Journal of Cytology
- Indian Journal of Pathology and Microbiology
- Journal of Pathology
- Journal of Clinical Pathology
- Laboratory Investigation
- Modern Pathology
- Pathology
- Seminars in Hematology
- Seminars in Diagnostic Pathology
- Virchows Archives
- Year Book Series
- Recent Advances Series

The list of journals is incomplete. It is also expected that the students make it a habit to read othe journals because pathology is not confined to pathology journals alone. Specialty journals such as those related to oncology (Cancer, British Journal of Cancer, International Journal of Cancer, Cance Research, Journal of National Cancer Institute, Journal of Surgical Oncology etc.) are excellent sources of information regarding the pathology of tumors. Similarly journals related to Cardiology, Ches Diseases, Dermatology, Endocrinology, Gynecology, Gastroenterology, Hepatology, Nephrology Neurology, Neurosurgery, etc. are invaluable sources of material on the appropriate pathology. Furthe Journals such as Lancet, New England Journal of Medicine, Nature and Science are a must for every postgraduate student who wishes to keep abreast with what is new in medical science and therefore ir pathology.

- Histology for Pathologists. Stephen S. Sternberg (Ed), Raven Press, New York.
- General Pathology JB Walter, MS Israel. Churchill Livingstone, Edinburgh
- Robbin's Pathologic Basis of Disease Ramzi S.Cotran, Vinay Kumar, Stanley L Robbins WB Saunders Co., Philadelphia.
- Pathology Emanuel Rubin, John L Farber. JB Lippincott Co., Philadelphia
- Anderson's Pathology. John M Kissane (Ed). The CV Mosby Co., St. Louis

- Ackerman's Surgical Pathology. Juan Rosai Mosby. St. Louis
- Diagnostic Surgical Pathology. Stephen S Sternberg. Lippincott, William Wilkins. Philadelphia
- Systemic Pathology. W St. C Symmers (Series Ed) Churchill Livingstone, Edinburgh
- Diagnostic Histopthology of Tumours. Christopher DM Fletcher (Ed). Churchill Livingstone. Edinburgh.
- Soft Tissue Tumors. Franz M Enzinger, Sharon W Weiss. Mosby, St. Louis
- Cardiovascular Pathology Malcolm D Silver Churchill Livingstone New York.
- Pathology of Pulmonary Diseases Mario J Saldhana. JB Lippincott Co., Philadelphia
- Spencer's Pathology of the Lung. PS Hasleton. Mc Graw-Hill, New York.
- Dahlin's Bone Tumors. K Krishnan Unni. Lippincott-Raven Publishers, Philadelphia, New York
- Bone Tumours Andrew G Huvos WB Saunders Co. Philadelphia
- Greenfield's Neuropathology. J Hume Adams (Ed) Edward Arnold, London.
- Russell & Rubeinstein's Pathology of the Tumours of the Nervous System. Darrell D Bigna. Roger E Mc Lendon, Janet M Bruner (Eds.), Arnold, London
- Rosen's Breast Pathology. Paul Peter Rosen. Lippincott-Raven Publishers, Philadelphia, New York.
- Pathology of the Gastrointestinal Tract. S-I Chun Ming. Harvey Goldman (Eds.) Williams & Wilkins, Baltimore.
- Haynes and Taylor Obstetrical & Gynaecological Pathology. H Fox, M Wells. Churchill Livingstone New York.
- Heptinstall's Pathology of the Kidney. J Charles Jenette, Jean L Olson, Melvin M Schwartz, Fred G Silva (Eds.). Lippincott-Raven Publishers, Philadelphia, New York.
- Potter's Pathology of the Fetus & Infant. Enid Gilbert-Barnes (Ed). Mosby, St. Louis
- Lever's Histopathology of the Skin, David Elder (Ed), Lippincott-Raven Publishers, Philadelphia, New York
- Theory and Practice of Histological Techniques, Bancroft JD, Stevens A, Turner DR, Churchill Livingstone, Edinburgh
- Histotechnology – A Self Instructional Text, Carlson FL, American Society of Clinical Pathologists Chicago
- Histochemistry Theoretical and Applied. AG Everson Pearse. Churchill Livingstone, Edinburgh
- Manual & Atlas of Fine Needle Aspiration Cytology. Svante R Orell, Gregory F Sterrett, Max NI. Walters, Darrel Whitaker. Churchill Livingstone, London
- Cytopathology. Zuher M Naib. Little Brown and Company, Boston.
- Diagnostic Cytology and its Histopathologic Basis, Koss LG, J.B. Lippincott, Philadelphia
- Comprehensive Cytopathology, Bibbo M, W.B. Saunders Co., Philadelphia
- William's Hematology Beutler E, Lichtmann MA, Coller BS, Kipps TJ, McGraw Hill, New York
- Postgraduate Hematology Hoffbrand AV, Lewis SM, Tuddenham EGD, Butterworth Heinemann, Oxford
- Wintrobe's Clinical Hematology, Lee GR, Foerster J, Lupeus J, Paraskevas F, Gveer JP, Rodgers GN, Williams & Wilkins, Baltimore
- Practical Haematology, Dacie JV, Lewis SM, Churchill Livingstone, Edinburgh
- Bone Marrow Pathology, Bain BJ, Clark DM, Lampert IA, Blackwell Science, Oxford
- Leukemia Diagnosis- A guide to the FAB Classification, Bain BJ, J.B. Lippincott, Philadelphia
- Clinical Diagnosis and Management by Laboratory Methods, Henry JB, WB Saunders.(Indian Edition, Eastern Press, Bangalore).

RADIO-DIAGNOSIS — M D

GOAL-

Goal of the course is to orient and train the students on different aspects of diagnostic and interventional radiology in the diseases of various organ systems of the human body. They should be able to apply this training at secondary and tertiary level of medical care.

OBJECTIVES

In order to achieve the goal of this course, following objectives are to be accomplished by the time the candidate completes the 3 years course.

Three broad domains of the objectives are:

1. Cognitive domain (Knowledge)
2. Psychomotor domain (Skills)
3. Attitudinal domain (Human values, ethical practice etc.)

Congnitive Domain (Knowledge)

1. Describe aetiology, pathophysiology, and principles of diagnosis and management of common problems including emergencies, in adults and children.
2. Demonstrate understanding of basic sciences relevant to this specialty.
3. Identify important determinants in a case (e.g. social, economic, environmental) and take them into account for planning therapeutic measures.
4. Recognize conditions that may be outside the area of specialty/competence and to refer them to proper specialist or ask for help.
5. Advise regarding the management (including interventional radiology) of the case and to carry out the management effectively.
6. Update oneself by self-study and by attending courses, seminars, conferences and workshop which are relevant to the field of radio-Diagnosis.
7. Carry out guided research with the aim of publishing his/her work and presenting work at various scientific fora.

Psychomotor Domain (Skills)

1. Take a proper clinical history, examine the patient, perform essential diagnostic/interventional procedures and interpret the results to come to a reasonable diagnosis or differential diagnosis in the condition.
2. Provide basic life saving support service in emergency situations.
3. Undertake complete patient monitoring including the care of the patient.

Attitudinal Domain

1. Adopt ethical principles in all aspects of his/her practice. Professional honesty and integrity to be fostered.
2. Develop communication skills in order to explain the various options available in management and to obtain a true informed consent from the patient.
3. Be humble and accept the limitations of his knowledge and skills and to ask for help from colleagues/ seniors when needed.
4. Respect patient rights and privileges including patient's right to information and right to seek a second opinion.

COURSE CONTENT

09HLTH09A03-001-C BASIC SCIENCES RELATED TO RADIO-DIAGNOSIS

(a) Radiation physics and Radio-Biology.

(b) Radiological anatomy and pathology of various organ systems

(c) Imaging Techniques.

(d) Radiography.

Includes all aspects of: Fundamentals of electromagnetic radiation, X-Ray production, characteristic properties of X-Rays, units of radiation, radiation measurement, X-ray equipments, X-Ray films, intensifying screens, other X-Ray appliances, dark room equipments and procedures, II TV, cine fluorography, tomography.

- Quality assurance.
- Radiation hazards and principle and methods of radiation protection.
- Contrast media : types, chemistry, mechanisms of action, dose schedule, routes of administration, their potential adverse reactions and management.
- Clinical applications of important isotopes and instrumentation in Nuclear medicine with advances in both.
- Physics and applications of advanced imaging i.e., Ultrasound, CT, MRI, Angiography (DSA), PET etc.
- Practical experiments in radiological physics : A list of experiments, which a resident should be able to do and interpret the results, is available in the department, including quality assurance test for radiological equipment

09HLTH09A03-002-C

2. RESPIRATORY SYSTEM

Goal

At the completion of the course the resident should be able to interpret conventional and advanced (CT. MRI) chest examinations. differentiating normal from abnormal cases and be able to recognize specific imaging pattern of different diseases.

Content Coverage

Diseases of the chest wall. diaphragm. pleura and airways: pulmonary infections; pulmonary vasculature: pulmonary neoplasms: diffuse lung disease: mediastinal disease: chest trauma: post- operative lung and X-Rays in intensive care.

Essential Objectives

1. Should be able to localize the chest pathology into one of the following compartments: pulmonary. pleural. mediastinal. extra-pleural. extra-thoracic. diaphragmatic. infradiaphragmatic.
2. Recognize chest pathology that requires urgent or emergency treatment and describe this in an adequate manner: Pneumothorax. traumatic aortic rupture. esophageal rupture. acute pulmonary embolism. CHF and tracheo-bronchial foreign bodies.
3. Recognize acute and chronic patterns of bacterial and viral pneumonia's. occupational diseases. allergic states.
4. Recognize acute and chronic cardiac failure patterns and non-cardiogenic edemas.
5. Understand the radiographic features and precipitating causes of adult and infant respiratory distress syndrome.
6. Recognize and describe appropriately the various manifestations of benign and malignant neoplasm's of the lung.

Evaluation — Annual assessment by an outside exper

- Resident's progress through daily observation of work
- At the end of the rotation an assessment by a small group of faculty.
- Maintain a log book showing techniques learnt during the rotation – to be supervised.

3. GASTROINTESTINAL (GIT) AND HEPATO-BILIARY-PANCREATIC SYSTEM

09HLTH09A03-003-C

Goal

At the completion of this course the resident should be able to interpret both the conventional and other newer (ultrasound. CT. MRI. angiography) examinations. This includes examination of GIT i.e.. esophagus. upper gastrointestinal study. follow through for small bowel (including small bowel enterolysis) and enema (both conventional and double contrast) for colon. It also includes examination of liver. biliary system and pancreas using all the imaging modalities available to a radiologist including specialized investigations like ERCP. PTC and interventional procedures like abscess drainage. Percutaneous Transhepatic biliary drainage (PTBD. internal and external). tumor embolization. Radiofrquency (RF) ablation etc.

During this posting resident also performs other investigations done using fluoroscopic guidance e.g: hysterosalpingography (HSG): fistulogram. sinogram. T-Tube cholangiography. sialography etc. and he/she should be able to perform and interpret studies using these modalities.

Content Coverage

Diseases and disorders of mouth, pharynx, salivary glands, esophagus, stomach, small intestine, large intestine, diseases of omentum, peritoneum and mesentery, acute abdomen, abdominal trauma using conventional and newer imaging methods like CT, MRI, DSA, isotope studies.

Diseases and disorders of hepato-biliary-pancreatic system using conventional & newer imaging methods.

Essential Objectives

1. Learn to evaluate the clinical condition & needs of a patient and to decide the appropriate studies and approach for examining the GIT or hepato-biliary-pancreatic system of a patient.
2. Learn a proper approach to fluoroscopy: this includes developing proficiency in GIT fluoroscopy, mastering the equipment and using proper radiation protection measures (both for the patient and the operator).
3. Learn the basic pathology and patho-physiology of GIT/hepato-biliary-pancreatic diseases.
4. Learn to communicate the findings both at fluoroscopy and in films, in an accurate, succinct and meaningful way.

Evaluation:

- Day to day obseration of residents work including documentation and interpretation
- Assessment by a group of faculty at the end of the rotation.
- Log book will be maintained of the procedures learnt.

4. GENITO-URINARY SYSTEM

09HLTH09AP3-004-C

Goal

At the completion of this course resident should be able to perform, direct the radiography and interpret the conventional radiological examinations of the urinary tract. These includes: excretory urography (intravenous pyelography); cystograms, micturating cystourethrography (MCU) and retrograde urethrography (RGU).

[HSG is included under GIT rotation].

In addition the resident should be able to perform and interpret other diagnostic imaging modalities and procedures which are used to evaluate urinary tract pathology i.e., ultrasound, CT, MRI, angiography, as well as various interventional procedures like percutaneous nephrostomy, kidney biopsy, stent placement, antegrade pyelography, tumor embolization etc.

Obstetrics and gynaelogy ultrasound : separate posting in III year.

Hysterosalpingography : ~~already included with GIT posting~~.

Content Coverage

Imaging : conventional, ultrasound, CT, MRI, angiography; of various diseases and disorders of genito-urinary system. These includes : congenital, inflammatory, traumatic, neoplastic, calculus and miscellaneous conditions.

Essential Objectives

1. Recognize and evaluate emergency conditions involving the urinary tract including trauma, infection, vascular compromise and obstruction.

2. Recognize and understand the patho-physiology of stone disease.
3. Recognize patterns of infectious diseases and the modalities necessary for diagnostic evaluation.
4. Understand the complete evaluation of renal mass lesions and the evaluation of other urinary tract neoplasms. including the detection and staging of the tumor.
5. Recognize the difference between the pattern of diseases affecting the genito-urinary tract of adults and that of children and understand and identify the common conditions affecting the peadiatric genito-urinary system on imaging.

Evaluation:

- day to day, based on daily work assessment
- by a group of faculty at the end of the posting.
- Maintain a log book

5. MUSCULOSKELETAL SYSTEM

09HLTH09A03-005-C

Goal

At the end of the course the resident should be able to correctly interpret all the common abnormalities of the bones and joints. He/She should have a good understanding of the common congenital abnormalities. arthritis. bone and joint trauma. neoplastic conditions. metabolic bone disease and inflammatory diseases. He/She should also have an understanding of the role of CT/MRI in all these conditions and should be able to perform and interpret CT/MRI in diseases of musculo-skeletal system.

Content Coverage

Imaging (Conventional. ultrasound. CT. MRI. angiography. Radio-isotope studies) and interpretation of diseases of muscles. soft tissue. bones and joints including congenital. inflammatory. traumatic. neoplastic and miscellaneous conditions.

Essential Objectives

1. Communicate precisely and cogently radiographic descriptions of bone and joint trauma.
2. Differentiate various forms of arthritis and know correlative laboratory and clinical findings.
3. Enumerate the radiogrphic features that differentiate benign and malignant bone tumors with a basic familiarity of more common tumors.
4. Know radiographic features of acute and chronic osteomyelities and discitis (including tuberculosis).
5. Recognize differential features of osteoporosis (including Bone Mineral Density or BMD assessment techniques e.g: US.CT.Dexa) including various endocrine and metabolic diseases e.g: osteomalacia. hyperparathyrodism etc.
6. Know the application and interpretation of ultrasound/CT/MRI/angiography in one or more of the above situations.

Evaluation

- through daily sessions assessment
- by a small group of faculty at the end of the posting
- Will maintain a log book

09HLTH09A03-006-C

6. CARDIOVASCULAR RADIOLOGY/ECHO CARDIOGRAPHY

Goal

Goal is to provide experience in the role of imaging in cardiovascular diseases by different techniques including cardiac cathaterization and cardiac angiography. Digital subtraction angiography (DSA) and interventional procedures in non cardiac arterial and venous diseases.

Content Coverage

Diseases and disorders of cardiovascular system including congenital conditions and the role of imaging by conventional, ultrasound, Echo, color-Doppler, CT, MRI, angiography (including DSA) and radionuclide studies. It also includes interventional procedures e.g; balloon angioplaty, embolization etc.

Essential Objectives

1. Understand the anatomy and common pathology of congenital and acquired cardiac conditions.
2. Correlate plain film findings of common congenital abnormalities with those shown by angiography and explain the pathophysiology including abnormal pressure measurements.
3. Correlate plain film findings and the echocardiographic studies of patients with acquired valvular diseases and other common pathologic conditions including pericardial pathology.
4. Understand the role of newer modalities like CT/MRI, in aortic diseases e.g., aorto- arteritis, aortic dissection and aortic aneurysm.
5. Should be able to perform fluoroscopy on patients before and after valve replacement and identify those with complications after valve replacement.
6. Understand the principle and logic behind various interventional procedures carried out in the cardiovascular labs e.g; PTCA, balloon dilatation of valvular lesions, septostomy etc.

Evaluation

- day to day assessment
- by a small group of faculty
- Maintain a log book to be checked by faculty in charge

09HLTH09A03-007-C

7. NEURORADIOLOGY

Goal

At the end of the course the resident should be able to demonstrate reasonable proficiency in the assisstance during performance as well as in the interpretation of all neuro-radiological studies. This includes angiograms, both cerebral and non-cerebral studies, transluminal angioplasties, embolization procedures and myelography. They should also be able to perform and interpret CT and MRI of head and spine.

Content Coverage

Includes imaging (using conventional and newer methods) and interpretation of various diseases and disorders of the head, neck and spine covering congenital lesions, infective lesions, vascular lesions, traumatic conditions and neoplasia. It also includes a number of interventional procedures carried out in the department of neuroradiology.

Essential Objectives

1. Know detailed normal neuro-imaging anatomy on different imaging modalities.

2. Identify pathologic conditions (listed under the content) on images acquired using different techniques and communicate the report in a concise manner.
3. Participate in daily neuroradiology conferences held with the neurosurgery or neurology units.

Evaluation

- day to day based on reporting and procedures performed.
- by a small group of faculty.
- Will maintain a log book to be checked by faculty in neuroradiology.

8. GENERAL RADIOLGY

09HLTH09A03-008-C

Goal

as well as computerised / digital radiogr

In this rotation the resident learns to evaluate conventional radiographs. This includes radiographs of : chest, abdomen, pelvis, skull, spine, musculo-skeleton and soft tissues. Resident is posted in OPD and indoor radiography rooms for this purpose.

During indoor posting, he/she will also have the additional responsibility of directing, evaluating and reporting mammographic procedures including related interventional procedures.

Essential objectives

8.1

1. Learns to direct and perform radiography on patients.
2. He/she should be able to decide on further imaging views based on the clinical suspicion and the initial imaging.
3. Write reports on the radiographs obtained in a methodical, concise and precise way and communicate it to the referring unit.
4. Present interesting cases in the departmental meets.

9. ULTRASOUND (INCLUDING GYNAE/OBSTETRICS)

09HLTH09A03-009-C

Goal

At the completion of this rotation the resident should be able to perform and interpret all ultrasound studies. These studies include : abdomen, pelvis, small parts, neonatal head, color-duplex imaging (including peripheral i.e: extremity arterial and venous studies), obstetrics/gynaecology (in the deptt of Gyn/Obstet) and interventional procedures using ultrasound guidance. The resident should have a thorough knowledge of the common abnormalities of the abdominal/pelvic organs, retroperitoneal structures, neck, chest, extremities and small parts (thyroid/parathyroid, scrotum, orbit, breast).

Essential Objectives

1. Determine or select the appropriate diagnostic procedure for the clinical problem.
2. Demonstrate proficiency in patient scanning using appropriate techniques and instrumentation.
3. Modify the procedure, if required, based upon the observed abnormalities (pathology).
4. Analyze the results of the diagnostic procedure, make diagnosis and record the findings.
5. Communicate findings, diagnosis and other relevant information to the referring physician.
6. Present interesting ultrasound cases in the departmental conferences/meetings.

Evaluation

- ongoing basis using day to day work

- presentations in departmental meets
- maintain a log book
- by a group of faculty at end of the rotation

09HLTH09A03-010-C

10. CT

Goal/Objectives

The goals/objectives to be achieved by the end of this rotation are:

1. Select CT protocol according to the clinical diagnosis. He/she should be able to direct and modify (if required) the performance of the CT examination
2. Demonstrate knowldege of the CT findings of the common pathologic conditions occuring in the head, neck, chest, abdomen, pelvis, and in the soft tissues and musculo-skeletal system.
3. Resident should be familiar with both the conventional and different modified CT techniques (High resolution, Dual phase, CT angio, BMD, multislice CT etc.)
4. Interpret conventional and modified body CT examinations (including HRCT, dual/triple phase CT, CT portography, virtual CT etc.) with a reasonable degree of accuracy.
5. Demonstrate proficiency in verbal and written reporting of CT findings and differential diagnosis.
6. Demonstrate knowledge of the limitations (and potential fallacies) of CT imaging of various pathologic conditions and be able to perform correlations with other imaging modalities including formulations of recommendations for additional appropriate imaging procedures.
7. Perform CT guided biopsy procedures under guidance of seniors.
8. Present interesting cases of CT in the departmental meetings.

Essential Objectives

1. The resident will review the daily body CT schedule and based upon the known clinical information and review of other radiologic studies of the same patient done earlier, select the most appropriate CT imaging protocol for the each patient. This may include altering an existing CT protocol to provide the most appropriate examination for an individual patient.
2. Develop a working knowledge of the actual performance of the CT examinations. This includes starting intravenous lines, amount and timing of injecting i.v. contrast, and actual operation of CT machine.
3. Review and report all the completed body CT examinations. Initially this will be under the supervision of the seniors but later independently – but all repots will be signed by the faculty incharge.
4. Participate and present CT cases in departmental and inter departmental meets.

Evaluation

- on daily basis after observing reporting and working in the CT room
- by a group of faculty
- Maintain a log book under the supervision of faculty incharge.

09HLTH09A03-011-C

11. ANGIOGRAPHY AND INTERVENTIONAL RADIOLOGY

Goal

At the completion, the resident should be able to perform the most common non-cerebral angiographic studies. He/she should have a good basic understanding of both; the vascular interventional radiologic procedures such as angioplasty, embolization using various embolizing agents; as well as the various non-vascular interventional procedures such as percutaneous nephrostomy, stenting, abscess drainage, PTC/PTBD, percutaneous biopsy, balloon dilatation of the esophagus etc. He/she should have a good understanding of the various equipment and available catheters and guidewires and other technical aspects of special procedures. In addition he/she should know all the potential risks and complications of these procedures and their management.

Essential Objectives

1. Evaluate the requisition for appropriate clinical information to determine if additional information is needed.
2. Determine or select appropriate diagnostic procedure for the clinical problem.
3. Assisst and perform appropriate procedures under supervision and modify procedures based on observed abnormalities (pathology).
4. Know the potential risks and complications of procedures performed.
5. Know normal vascular anatomy applicable to angiographic procedures performed and know normal anatomy and landmarks to perform other non-vascular procedures.
6. Present interesting cases in the departmental meets.

Evaluation

- day to day evaluation
- by a group of faculty
- Will maintain a log book

09HLTH09A03-012-C

12. PAEDIATRIC RADIOLOGY

Goal

Intention is to train residents to perform common radiologic procedures and to be able to interpret paediatric studies in order that they can apropriately deal with examinations of children in a non paediatric hospital environment.

At the completion the resident should be able to interpret most of the conventional and newer paediatric examinations which includes: upper airways, chest, genito-urinary, gastro-intestinal and musculo-skeletal systems. Resident should be familiar with many of the neurologic conditions encountered in neonates and children. Resident should also be able to perform transfontanelle cranial ultrasound.

Content Coverage:

Common diseases and disorders of different organ systems covering congenital, inflammatory, traumatic, neoplastic and other miscellaneous conditions, using both conventional and newer imaging methods.

Essential Objectives

1. Understand the appropriate indications for various imaging procedures and determine that the patient has been properly prepared for the procedure.
2. Know the standard radiographic views for paediatric examinations.
3. Learn to recognize and evaluate imaging manifestations (on conventional and newer methods) of common paediatric conditions occurring in the head/neck, chest, abdomen/pelvis and in the musculo-skeleton.

4. Perform paediatric fluoroscopic examinations with skill and accuracy.
5. Understand and apply the knowledge and principle of radiation protection, both for the child and the operator.

09HLTH09A03-013-C

13. RADIOLOGY IN EMERGENCY MEDICINE

Goal

At the end of the course, resident should be able to give an evaluation of the emergency radiographic examinations. He/she should also be familiar with medicolegal cases (MLC) procedures.

Essential Objectives

1. Determine and direct radiography in emergency patients and review and interpret the radiographs.
2. If study is incomplete then dertermine additional views or repeat views.
3. Know indications for and limitations of the common emergency imaging procedures.
4. Communicate findings, diagnosis and other releveant information to the emergency room physicion.
5. He/she should be able to perform (some under supervision) and interpret special imaging procedures needed in emergency room e.g: barium studies, excretory urography, CT, ultraound, Doppler and angiography.

09HLTH09A03-014-C

14. ONCOLOGIC RADIOLOGY

Goal

At the end of the rotation the resident should be able to interpret radiological investigations in patients with neoplastic diseases (both benign and malignant). He/she should be able to perform, interpret and diagnose these patients.

Essential objectives

1. Understand pathology and patho-physiology of common neoplasms.
2. Learn the algorithmic approach to image these patients based on the suspected disease, its biological behaviour and potential and limitations of various imaging modalities.
3. Perform appropriate investigation(both conventional and newer methods), interpret the results and reach at a reasonable diagnosis/ differential diagnosis based on the clinical and biochemical results.
4. Learn to communicate the results in a precise way in a written report to the concerned unit.
5. Present interesting cases in the departmental meets.

09HLTH09A03-015-C

15. NUCLEAR MEDICINE /PET

Goal

At the completion of this rotation the resident should be able to interpret common nuclear medicine examinations (including cardiac cases). He /she should be able to evaluate the examinations for completion and determine what further images (including non nuclear medicine) need to be done. He/she should have a good understanding of the physical and biological properties of the commonly used radiopharmceuticals and become familiar with safe handling of isotopes and basic radiation safety measures while dealing with isotopes.

Essential objectives

1. Review all cases performed each day.
2. Interpret the results of the procedures and give an appropriate diagnosis.
3. Observe and help in some common procedures performed in the department (e.g: thyroid, kidney, bone, cardiac scans), understand the principle underlying the procedure and the basis for using a particular isotope in an investigation.

Evaluation

- Day to day by the nuclear medicine staff.

DISSERTATION

Thesis

1. Every candidate pursuing MD degree course is required to carry out work on a selected research project under the guidance of a recognised post graduate teacher. The results of such a work shall be submitted in the form of a dissertation.
2. The dissertation is aimed to train a post graduate student in research methods and techniques. It includes identification of a problem, formulation of a hypothesis, search and review of literature, getting acquainted with recent advances, designing of a research study, collection of data, critical analysis, comparision of results and drawing conclusions.
3. Chief guide will be from the department of Radio-diagnosis while co-guides will be from either the department of Radio-diagnosis or other disciplines related to the dissertation topic.
4. Every candidate shall submit a thesis protocol to the Dean of the Institute in the prescribed proforma containing particulars of proposed dissertation work four months from the date of commencement of the course. The thesis protocol shall be sent through the proper channel.

   Protocol in essence should consist of:-

   (a) Introduction and objectives of the research project.

   (b) Brief review of literature

   (c) Suggested material and methods

   (d) Bibliography

   by Hospital Scientific Review Committee and Hospital ethics committee

5. Such thesis protocol will be reviewed and the dissertation topic will be registered by the Institute. No change in the dissertation topic or guide shall be made without prior approval of the Dean of the Institute.
6. Submission of thesis.

Thesis will be submitted at the end of two and a half (2.5) years.

Thesis should consist of

(e) Introduction

(f) Review of literature

(g) Aims and objectives

(h) Material and methods

(i) Results

(j) Discussion

(k) Summary and Conclusions

(l) Tables

(m) Annexures

(n) Bibliography

7. ~~Two~~ Five copies of dissertation thus prepared shall be submitted to the Dean AIIMS, six months before the final examination.

8. The dissertation shall be valued by two external examiners appointed by the Institute. Approval of dissertation work is an essential precondition for a candidate to appear in the final MD examination.

Dissertation is graded as follows :

- Highly commendable
- Commendable
- Satisfactory
- Rejected

MD (Radodiagnosis), Posting Schedule

Total Duration : 3 years

Applied Physics and Basic Sciences

First Year	Second Year	Third Year
ConventionalRadiolgy (OPD) — 3 months	Ultrasound (with interventions) –2 months	Emergency Radiology (Casualty) –2 months
Genitourinary-3 months	CT (with interventions) –2 months	Oncologic Radiology (IRCH) – 2 months
Conventional Radiology, including Paediatric Radiology (Indoor) – 3 months	Angiography (with interventions) –2 months	Nuclear Medicine – 1 month
Observer Postings:		
1. GIT - 1 month	MRI – 2 months	Obstet Gyn (US)- 15 days
2. Ultrasound-1 month		
3. CT –1 month		
	Cardiac Radology- 2 months	Echocardiography – 15 days
		Ultrasound – 1 Month
	Neuroradiology – 2 months	CT — 1 month
		MRI — 1 month
		Angiography — 1 month
		Elective – 2 months
Dissertation submission at the end of 2 ½ years		

Classes on Statistics : A series of lectures held for every one

MEDICAL COUNCIL OF INDIA

(Published in Part III, Section 4 of the Gazette of India dated 06.4.2002)

DECLARATION

(At the time of registration, each applicant shall read and agree to abide by the same)

1) *I solemnly pledge myself to consecrate my life to service of humanity.*

2) *Even under threat, I will not use my medical knowledge contrary to the laws of Humanity.*

3) *I will maintain the utmost respect for human life from the time of conception.*

4) *I will not permit considerations of religion, nationality, race, party politics or social standing to intervene between my duty and my patient.*

5) *I will practice my profession with conscience and dignity.*

6) *The health of my patient will be my first consideration.*

7) *I will respect the secrets which are confined in me.*

8) *I will give to my teachers the respect and gratitude which is their due.*

9) *I will maintain by all means in my power, the honour and noble traditions of medical profession.*

10) *I will treat my colleagues with all respect and dignity.*

11) *I shall abide by the code of medical ethics as enunciated in the Indian Medical Council (Professional Conduct, Etiquette and Ethics) Regulations 2001.*

I make these promises solemnly, freely and upon my honour.

Tata Memorial Centre

Tata Memorial Hospital

DEPARTMENT OF RADIATION ONCOLOGY

THREE-YEAR TRAINING PROGRAMME

OBJECTIVES

General:

The aim of the training is to enable the trainee capable of practicing independently as a competent doctor. The trainee should be compassionate and ethical in their practice of oncology and would also contribute to the future developments in oncology.

Specific:

a. The trainees should acquire a sound working knowledge of the use of ionizing radiation, cytotoxic agents, hormones, biological response modifiers, etc. in the management of cancer.

b. The trainees practice "Evidence Based Medicine" whenever possible, and be familiar with Clinical Trial Methodology.

c. The trainees should become competent in providing and organizing a comprehensive supportive and palliative care in patients with very advanced disease and in terminally ill patients.

d. The trainees should develop the ability of reasoning / logical thinking and decision making in grey areas and in difficult cases.

e. The trainees should become competent to provide guidance and leadership in the 'Cancer Prevention Efforts'.

f. The training should generate awareness and interest in basic and applied cancer biology and whenever possible, experience in the field.

g. The trainees should develop leadership qualities and learn basic management and administration skills.

Three Year Structured Training comprise of the following:

1. Induction program for all trainees.
2. Theory and practical sessions separately for first, second and third year trainees
3. Dissertation
4. Departmental academic activities including seminars, journal clubs, ward rounds, planning meetings etc. as per weekly schedule
5. Joint clinics such as Lymphoma /Gynae /Paediatric /Breast /CNS /Palliative Clinics
6. Clinical data analysis - As instructed by the teacher
7. Rotation posting in other departments /disciplines such as Medical Oncology /

Radio-Diagnosis / Radiation Medicine Centre etc. and presentation of the experience in these postings.

8. Scientific paper presentation at conferences.

For practical the student will maintain individual diary/logbook, which will be reviewed and endorsed by the teacher, under whom the candidate is registered. The individual teacher will be responsible for checking the progress of the candidate.

Trainees should discuss with their teacher regarding topic for presentation at clinical meetings, clinical data analysis and paper for presentation at conferences. Topics for presentations will be from the allotted list displayed on the notice board. The presentation should be on transparencies/slide with neat labeled diagram whenever necessary. The subject should be prepared well in advance and discussed with the individual teacher, minimum of a week before presentation. The literature search from journals and books or Internet is mandatory for second and third year students. Whenever the data from Tata Memorial Hospital is available, should be included in the presentation.

There will be internal assessment / examination (Practical and theory) in the month of January each year and after three years of training and submission of dissertation, the trainees would be eligible for the examination conducted by the university of Mumbai.

ORIENTATION FOR NEW TRAINEES

Within first two weeks of joining

Objective:

The orientation will make familiarize the trainee with the Departments of Radiation Oncology and Medical Physics. The trainee will be acquainted with the various places and the activities in the Department. This will preferably be done on Saturday. The trainee will be taken to following minimum places:

1. General OPD & Joint Clinics
2. Minor Operating Theatre
3. Teletherapy Machines: Accelerators and telecobalt areas
4. Simulators
5. HDR brachytherapy area
6. Mould room
7. Medical Physics TPS area
8. Private OPDs
9. Radiation Oncology in-patient Ward
10. General & Private wards
11. IEC office
12. Digital Library

INDUCTION PROGRAMME

Two Sessions (am or pm) each in the first six to eight weeks

Objective:

The induction programme is intended to give the new trainees a general idea about Tata Memorial Centre [TMC], the nature of work done in various departments and the location of various departments within the five interconnected buildings of TMH and ACTREC. The emphasis will be on the departments of Radiation Oncology, Medical Physics, and frequently used diagnostic and rehabilitative services. The Senior Registrar will introduce and guide the new students to various facilities listed below.

1. Teletherapy Machines (To know about the machines available in the hospital; Energy, accessories, types of treatment possible, operation of machines)
2. Brachytherapy Machines, Operation Theatre (types of brachytherapy procedure done) Learn about radiation protection measures, know the procedures such as CVS, VSA and intracavitary
3. Computer Treatment Planning, Physics (Simple plans, isodose charts)
4. Mould Room & Simulator (Making POP, acrylic and thermoplastic moulds, Alloy blocks, Styrofoam cutter, Tissue compensators, Bolus and surface moulds)
5. Radiotherapy In-patients: (Visit to wards, patient management with IV fluids, care of patients admitted to wards, management of radiation reactions general aspects)
6. I.V. Team & Day care: Various investigations, IV access & chemotherapy administration.
7. Other rehabilitative services such as Palliative care, Occupational and physiotherapy, Medical Social Workers, and voluntary organizations such as CPAA and 'V' Care.
8. Preventive Oncology department
9. Clinical Research Secretariat [CRS].
10. Radio-diagnosis department
11. Histopathology, microbiology, biochemistry and blood bank.
12. Main operation theatre and ICU.

TEACHING CURRICULAM

First Year

Candidates are expected to have wide knowledge of malignant diseases and the management of patients with cancer.

09HLTH09A04-001-C CLINICAL ONCOLOGY [Theory] –I

1. Introduction to Oncology
2. Principles of clinical and pathological staging of cancers
3. Basics of Radiation Therapy
4. Basics of Cancer Chemotherapy, Hormone & Biological therapy
5. Basics of cancer surgery
6. Decision making process in Oncology
7. Combined modality of Radiotherapy and Surgery
8. Combined modality of Radiotherapy and Chemotherapy
9. Basics of Radiation Treatment Planning: Clinical aspects.
10. Radiotherapy Techniques: Patient positioning, Immobilization techniques, Target determination, field arrangements, Tissue compensation, Shielding, Megavoltage techniques, electrons, Dose calculation, Radiotherapy prescription, quality assurance, radiation safety
11. Care of patient and assessment of treatment: Reviews, treatment checks, symptom control, follow-up
12. Drug Therapy: Drug delivery, support techniques, management of acute complications

09HLTH09A04-001-P CLINICAL ONCOLOGY [Practical] –I (Patient Evaluation, Care and procedures):

1. Communication with cancer patients and their relatives.
2. Clinical examination methods like gynecological, laryngeal, breast, neurological and lymph node examination.
3. Obtaining informed consent for routine treatment.
4. Management of treatment complications like mucositis, dermatitis, proctitis, diarrhea, nausea, vomiting, xerostomia, lymphoedema, candidacies etc.
5. Management/Care of patients with fluid electrolyte imbalance, malnutrition, neutropaenic sepsis, raised intracranial pressure, seizures, paraplegia, bed sores, tracheostomy, Nasogastric tube or gastrostomy, bleeding PV or SVC compression.
6. Cervical biopsy, PAP smear, FNAC, Pleural and peritoneal paracentesis, bone marrow and lumbar puncture.
7. Insertion and maintenance of IV lines (butterfly and Venflon types) for blood collection and giving fluids or cytotoxic agents.
8. Patient positioning and immobilization using Thermoplastic, Acrylic and POP Masks
9. Surface marking
10. Simple Simulation techniques of such as single for Bone Metastasis, two or four Field for cervix, AP/PA for Lung, three Field for Esophagus and Bilateral Fields for Head & Neck.
11. CVS and Intrauterine applications.
12. Giving simple chemotherapy drugs like 5-FU, Bleomycin, Cyclophosphamide, low dose methotrexate (CMF), Procarbazene, CCNU, Cisplatin, Adriamycin etc.
13. Interpreting Simple Radiographs like chest x-rays, barium swallows, osseous metastases, bone scan etc.
14. Getting familiar and follow the established principles of bio-safety e.g. MRSA, Hepatitis B and C, HIV etc.

09HLTH09A04-002-C PHYSICS [Theory] –I

1. Electromagnetic radiation & spectrum
2. Atomic structure, electron shells and energy levels, energy quantitization
3. Relation between wavelength, frequency and energy
4. Radioactivity, description of x- and γ- beams (quality, energy, intensity, size etc.)
5. Radioactive sources used in radiotherapy
6. Production of x-Rays: The basic x-Ray tube, characteristics of x-Rays
7. Interaction of x-Rays with matter (Elastic scattering, Common effects, Pair production, Photonuclear interaction, Auger effect, scattering radiation, secondary electrons, range verses energy, Linear Energy transfer etc.)
8. Interaction of sub-atomic particles with matter (Ionization & excitation due to charges particles, collision loss, particle range, Bragg peak, Bremsstrahlung, elastic & inelastic neutrons, proton ionization profile, pions & heavy ions)
9. Radiation Dosimetry (radiation units, exposure and KERMA, Absorbed dose, radiation dose measurement, Methods of measurement
10. Teletherapy machines: Telecobalt & Linac (Superficial & orthovoltage machines, microwave production, waveguide construction, electron production, x-ray production and beam control. Construction of linear accelerator & telecobalt machine, output, Energy range, build up, skin sparing, isodose curves, fixed & isocentric approaches, wedges, output factors, beam geometry)
11. Radiotherapy Simulators (Conventional and CT simulators structure and use)
12. Machine calibration, acceptance test and Quality assurance
13. Mould room Techniques (Beam modifying devices, tissue compensators)
14. Basics of dose calculation (Simple methods, shielding, Clarkson integration, field matching, attenuation coefficient and half value layers)
15. Basics of treatment planning and Dosimetric physical aspects (data required, immobilization techniques, patient & organ movements, tumor localization methods, transportation of patient data, data from MRI, USG and PET, single & multifield planning, Coplanar & non-coplanar planning, isodose dose distribution)
16. ICRU guidelines: Teletherapy & Brachytherapy
17. Principles of radiation protection (Radiation risk, stochastic and non-stochastic process, Quality factor, statutory framework, background radiation , radiation limits, classification of staff and designated areas, controlled areas and screening, guidance notes, protection mechanism (time, distance & shielding), primary secondary barriers, treatment room design, personnel Monitoring, film/TLD badges, dosemeters, Dose reporting mechanism)

09HLTH09A04-002-P PHYSICS [Practical] –I

1. Parts and functions of various Teletherapy and Brachytherapy machines
2. Radioisotope handling, Radiation Protection
3. Calculation of output from ^{60}Co machine
4. Treatment time calculation for simple fields (open, regular)
5. Quality control and machine calibration
6. Isodose curves and manual treatment plans using isodose curves
7. Visit to BARC / BRIT / nuclear installations

09HLTH09A04-003-C MEDICAL STATISTICS & EPIDEMIOLOGY [Theory] –I

1. Sampling: Concept of a population and a sample and the need for statistics, random sampling, standard error, Confidence intervals.
2. Properties of “Normal or Gaussian Distribution” curve
3. Types of data: Paired and Unpaired; Categorical and continuous, Numerical data [discrete & continuous], Bar charts & histograms
4. Comparing mean and median: $\chi 2$, Student ‘t’ test etc.
5. Measurements & tests of association between variables: Correlation & regression scatter plots, sensitivity, and specificity, positive & negative predictive values.

09HLTH09A04-003-P MEDICAL STATISTICS & EPIDEMIOLOGY [Practical] –I

1. Chi-square test on simple data set (degree of freedom 1).

09HLTH09A04-004-C CANCER BIOLOGY [Theory] –I

1. Cellular structure and function
2. Cell membrane and Cytoplasm
3. Nucleus, normal gene transcription, DNA repair mechanism, polymorphism, micro-satellites, Methylation, hypomethylation & methylation reversal
4. Haemopoiesis: Marrow structure, haemopoietic microenvironment, cell lineage & hierarchies
   Cell growth control: Normal cell growth & control, Autocrine, paracrine & endocrine control, signal transduction, cyclin kinases, gene promoters, signal pathways
5. Cell Cycle Control and cancer, basic kinetics
6. Growth disorders: Hyperplasia, dysplasia, *carcinoma-in-situ* and neoplasia
   Causation of Cancer: Environmental factors, carcinogenesis [viral, radiation] Normal tissue damage [early & late],
7. Mechanism of spread, local invasion, metastasis
8. Multistage carcinogenesis and metastatic cascade
9. Tumor vasculature & angiogenesis

09HLTH09A04-005-C RADIOBIOLOGY [Theory] –I

1. Cellular system (hierarchical / flexible), Parallel and Linear systems
2. Cell, tissue and tumour kinetics, Cell survival curve & basis of fractionation
3. Radiation damage at cellular level (membrane, cytoplasmic, nuclear): normal tissue tolerance, effects on different tissues, schemes of reporting normal tissue damage
4. LET, OER and RBE
5. Factors affecting Radio-sensitivity, Radio-sensitizers & Radio-protectors
7. Radiation biology models: monolayer, spheroids, animal [normal & transgenic], re-growth curves, clonogenic assay, MTT
8. Acute and late effects of Whole body irradiation
9. Radiation Carcinogenesis

09HLTH09A04-004-P RADIOBIOLOGY [Practical] –I

1. Using Flow-Cytometry to estimate Ploidy & S-Phase

Internal Assessment / Examination

First Year

Theory: Physics, basic radiobiology and statistics, MCQ.

Practical: Machine operations, various parts of the machines, set-up of the patient, treatment time calculation, calibration, gap calculation, instruments, evaluation of isodose charts, computer plans and related medical physics.

Clinical: Staging of common cancers, examination procedures, simple planning - clinical and simulation, recognition and management of radiation induced reactions.

Evaluation: Logbook, presentations during the year, appraisal scores.

Second Year

09HLTH09A04-006-C CLINICAL ONCOLOGY [Theory] –II

Pathology, Staging, Prognostic factors, Management, Surgery, Radiotherapy, Drug therapy (Cytotoxic chemotherapy, Hormone & Biological) and outcome of the anatomical tumor sites.

1. Head & Neck Tumors: Lip, Oral cavity & Oro-pharynxl, Nasopharynx & PNS, Hypopharynx and Larynx, salivary glands, ear, orbit, Lacrimal gland, Thyroid, Glomas Jugulare & Carotid body tumors
2. Female Genital Tract: Uterine cervix, Endometrium, vagina, ovary, vulva, Fallopian tubes
3. Breast cancers
4. Genito-Urinary: Kidney, prostate, bladder, Ureter, Testis, Urethra and penile cancers
5. Tumors of Chest & Pleura: Lung, Mediastinal tumours, Thymus, Pleura and Trachea
6. Gastro-Intestinal Tract Tumors: Oesophageal, gastric, Small Bowel, Colon & rectum, Anal Canal & perianal region, Pancreas, Liver & Biliary tract
7. Endocrine: Thyroid, Parathyroid, Pituitary, Adrenal
8. CNS Tumours: Brain, Spinal cord, Craniopharyngioma, Chordoma, acoustic neuroma, meninges
9. Bones & Soft-Tissue: Sarcomas, Bone tumors
10. Lymphoproliferative disorders: Hodgkin's & Non-Hodgkin's lymphomas, Plasma cell malignancies, Acute & Chronic leukemias,
11. Skin: Basal cell, squamous cell carcinomas, Malignant melanoma, Cutaneous lymphomas, Mycosis Fungoides, Kaposi sarcomas
12. Oncological emergencies

09HLTH09A04-005-P CLINICAL ONCOLOGY [Practical] –II

1. Knowledge about treatment options and decision making for various cancers
2. Discussing Randomized Trials with patients and obtaining their consent
3. Management of patients with Renal failure, G.I. obstruction, SVCO, TOF, Cord Compression, severe vaginal bleeding, neutropaenic sepsis, hypercalcaemia, necrosis, pathological fractures etc.
4. Management of patients in severe pain and of dying patients, palliative care.
5. Hospice care: visit to 'Shanti Avedana Ashram', use of Morphine
6. Use of divergent blocks (Mantle, Inverted Y, Rectum, Brain etc), Electron cut outs.
7. Simulation Techniques e.g. Conservative Breast, Mantle, Inverted-Y, Dog leg, Pancreas, Nasopharynx, PNS, Vocal Cord, Brain, Planning CT Scans
8. Magna-field Irradiation: Hemi Body irradiation, Total Body Irradiation, Whole Abdomen
9. Computer Treatment Planning: Parallel opposed, Antero-lateral, 3 or 4-field beam arrangement with equal and unequal weight. Intracavitary and simple interstitial brachytherapy plans of breast, template, buccal mucosa
10. Organizing and maintaining central lines (Hickman's), Parental Nutrition, Cytotoxic drugs such as Doxorubicin, Vincristine, Mitoxantrone, Cisplatinum etc.
11. Assisting Interstitial Implants/ ILRT/ EBRT procedures. Performing simple procedures like intracavitary, CVS etc.
12. Retrieving information from Medline, Internet etc.

09HLTH09A04-007-C PHYSICS [Theory] –II

1. Radiation Dosimetry & Calibration methods (Ionization chambers, Geiger counter, diodes, Chemical methods, films, Thermo-luminescence [TLD], Scintillation counters, calorimetry)
2. Electron beam therapy (energy range, percent depth dose, factor affecting depth dose, build-up, effect of surface obliquity & inhomogeneity, internal shielding)
3. Principals of CT planning (data acquisition, image manipulation, defining volumes, plan verification, DVH, element of inverse planning & Intensity Modulated Radiation Therapy)
4. Treatment Planning (Arc & rotation, non-coplanar planning, conformal, in homogenous media, volume definition, dose prescription, defining beam geometry, collimators, penumbra, beam quality,

Wedge & applicators, Multi-leaf collimators)

5. Evolution of brachytherapy dosage systems
6. Modern brachytherapy dosage calculation
7. Radioactive Sources (Isotopes, radioactive decay, parent & daughter decay series, half-life, characteristics of radiation, types of sources & their construction, requirement for clinical use, dose distribution around sources, sealed & unshielded sources and their storage, safety devices)
8. Physics principles in clinical use (Distribution rules & dose calculations, Gynecological brachytherapy systems, principle and types of after-loading)
9. Remote after-loading LDR, HDR and PDR machines
10. Computer Treatment planning systems
11. Use of unsealed sources (Isotopes, shelf-life, physical & biological life, radiopharmaceuticals, use in imaging & therapy, clinical applications and dose calculations)
12. Principles of CT, MR, PET and USG imaging

09HLTH09A04-006-P PHYSICS [Practical] –II

1. Manual localization of brachytherapy sources from orthogonal x-Rays and estimation of the Basal Dose Rate and Reference Dose Rate as per 'Paris' rules.
2. Complex field shapes and modified beams. Computer treatment planning teletherapy (AP/PA; 3 or 4 fields, anterior/lateral; weighting)
3. Computer treatment planning brachytherapy (CVS, Intracavitary, Breast, Buccal Mucosa, Template)
4. Simple Conformal plans; Conformal blocks, CT Planning.
5. Radio-Isotope waste disposal; Functions of RSO.
6. HDR & LDR Surface mould treatment execution.

09HLTH09A04-008-C MEDICAL STATISTICS & EPIDEMIOLOGY [Theory] –II

1. Principles of statistical inferences: Hypothesis testing, Sample size, Type I & II errors, interpretation of p-values, statistical & clinical significance.
2. Survival analysis in cancer: Types of time-to-event data, Kaplan-Meier & Actuarial Survival Curves,
3. Comparing groups: Log rank test, use of Cox's proportional hazards regression model, Hazard ratio and their interpretation
4. Clinical trial methodology: Phase I-IV trials, Randomization & stratification methods, problem with non-randomized studies & historical controls, Blinding/masking, Design of clinical trials, Contents of trial protocols, ethics & informed consent, Sample size calculation, Interim analysis
5. Measures of response: Tumor regression, Morbidity, Local/regional recurrence, Distant Metastasis, Death, Quality of Life. Intent-to-treat analysis
6. Epidemiology: Retrospective (case control studies) & Prospective (Cohort studies), Odds ratio & relative risks, Mortality rates, cancer registration & follow-up, Trends in cancer incidence.

09HLTH09A04-007-P MEDICAL STATISTICS & EPIDEMIOLOGY [Practical] –II

1. Actuarial Survival Curves for a given data set
2. Estimating Sample size for given type I and II error

09HLTH09A04-009-C CANCER BIOLOGY [Theory] –II

1. Genetic Predisposition to Cancer
2. Proto Oncogenes and Tumour suppressor genes, Protine-protein interaction
3. Principles of molecular biology techniques (PCR, FCM, Electrophoresis, cloning etc.)
4. Tissue culture techniques and Clonogenic assays
5. Cancer Genetics: Genes associated with cancer, Inherited syndromes associated with cancer [ataxia telangiectasia, xeroderma pigmentosa, Nijmegin break syndrome, Li-Fraumeni, Lynch, Cockayne's familial polyposis coli, inherited breast cancer syndromes], Linkage analysis, genetic counseling.

6. Human Genome Project

09HLTH09A04-008-P CANCER BIOLOGY [Practical] –II

1. Basic Tissue Culture Techniques
2. Nucleic acid analysis including electrophoresis, hybridization, blotting, PCR, sequencing, transfection

09HLTH09A04-010-C RADIOBIOLOGY [Theory] –II

1. Molecular Biology of Radiation Damage & Repair: molecular process in radiation damage repair, time course of repair, chemotherapy drug resistance, damage [lethal, sublethal, potentially lethal]
2. Acute & Late responding tissue and dose response relationship
3. Time Dose Fractionation and the evolution of Bioeffect models
4. Hyperfractionation, accelerated fractionation and hypofractionation, influence of gaps and time on radiation response
5. Methods of identifying hypoxia
6. Isoeffect curves, α/β ratio and relevance to acute & late responding tissues
7. Linear Quadratic Model
8. Predictive assays of Radiation response
9. Radiation effect on embryo & Foetus

09HLTH09A04-009-P RADIOBIOLOGY [Practical] –II

1. Calculation of Biologically Effective Doses for tumour control, acute and late effects using the LQ model.
2. Clonogenic assays and Survival Fraction (SF2)
3. Using Radio-sensitizers or Radio-Protectors (e.g. Amifostine, 2-Deoxy-Glucose, Curcumin).

09HLTH09A04-011-C CHEMOTHERAPY & CLINICAL PHARMACOLOGY [Theory] –II

1. Mechanism of action of Cytotoxic drugs: Mechanism of action, Phase & cell cycle specific drugs, Mechanism of cell death, Mechanism of cell death, Drug resistance modifiers, drug interaction.
2. Pharmacokinetics and Pharmacodynamics: General Principles, Route & timing of administration, Plasma concentration, AUC, Drug activation, metabolism & clearance, Protein & tissue binding, Drug concentration at target site.
3. Principal of Clinical use: Dose response curves, Dose intensity, Single agent & combination chemotherapy, Adjuvant & neo-adjuvant therapy, high dose chemotherapy, continuous infusion, intrathecal treatment.
4. Toxicity of Chemotherapy: Mechanism of toxicity, Dose limiting & common toxicities, Dose related & idiosyncratic toxicities, Early, intermediate & late toxicity, factors modifying toxicities, safe handling of Cytotoxic drugs.
5. Clinical pharmacology of analgesics, steroids & anti-emetics: Morphine & derivatives, drug interactions.
6. Endocrine Therapy: Mechanism of action, resistance, common side effects and combination with other therapies.
7. High dose therapy: Clinical methods (clinical trials), Protection & rescue of stem cells, unusual toxicities [veno-occlusive disease].

Internal Assessment / Examination

Second Year

Theory: Physics, radiobiology, statistics and clinical science, MCQ.

Practical: Computerized treatment plan assessment and discussion. Divergent blocks, calculation of ERD/BED etc., complex time calculations.

Clinical: Case presentation - long and short cases, assessment of examination and diagnostic skills, doctor-patient relationship, decision making ability.

Evaluation: Logbook, presentations during the year, appraisal scores.

Third Year

09HLTH09A04-012-C CLINICAL ONCOLOGY [Theory] –III

1. Paediatric solid tumours
2. Cranial & Extracranial Stereotactic Irradiation
3. Radiotherapy of Non-Malignant diseases
4. Advances in Interstitial and Intracavitary Brachytherapy, Endovascular Irradiation
5. Hyperthermia
6. Photodynamic therapy
7. AIDS related malignancies
8. Problem solving in grey areas & difficult cases
9. Supportive & Palliative Care: Pain relief, Symptom control in advanced cancer (nausea, vomiting, anorexia, dysphagia, depression and anxiety), Care of the dying patients & the Hospice care, The 'Truth' about cancer: When to tell, How much to tell & to whom?
10. Quality of Life: QoL assessment tools for clinical trials & routine practice, outcome measures
11. Medical ethics: A clinician's perspective, ethics in biomedical research, Professional values, Legal considerations
12. National Cancer Control Programme
13. Screening for common cancers : Pragmatic approaches for our country
14. Rehabilitation of cancer patients
15. Investigational Techniques in clinics and laboratory, Technology assessment and outcome measures, Economics in Radiation Oncology
16. Setting up Radiotherapy departments in India. Equipment and facilities needed?
17. Oncologists as managers of Health care system
18. Communication and publications

09HLTH09A04-010-P CLINICAL ONCOLOGY [Practical] –III

1. Complex Simulation and treatment techniques e.g. asymmetric beam, TSET, Craniospinal Irradiation, Paediatric tumours, TBI.
2. Treatment Planning (mixed beam, matching fields, electrons, head and neck implants)
3. Intracavitary, ILRT and simple implants
4. Preparing Surface Moulds
5. Assisting EBRT, Head/Neck Implant, Templates
6. Cytotoxic drugs (Taxenes, BCNU, High dose Methotrexate, Interferon, G-CSF, Leuprolide etc.)

09HLTH09A04-013-C PHYSICS [Theory] –III

1. Use of PET and SPECT
2. Special techniques principles & practice (Total Body Irradiation, Total Skin Electron Therapy, IMRT/IGRT, Stereotactic radiation)
3. Dosimetric aspects of Magna field therapy.
4. Complex field arrangements & mixed beams, electron arcs, Matching fields, asymmetric fields.
5. Recent developments and future trends in RT planning and treatment delivery
6. Quality Assurance in Radiotherapy (Quality Assurance & quality control, Monitoring accuracy,

verification parameters, megavoltage imaging, tolerance limits, Legal requirements)

09HLTH09A04-011-P PHYSICS [Practical] –III
1. 3-Dimensional conformal planning
2. Electronic portal imaging
3. Networking
4. Quality assurance tests in radiotherapy

09HLTH09A04-014-C MEDICAL STATISTICS & EPIDEMIOLOGY [Theory] –III
1. Role and function of cancer registries
2. Multivariate analysis
3. Meta-Analysis
4. Writing research articles for journals

09HLTH09A04-012-P MEDICAL STATISTICS & EPIDEMIOLOGY [Practical] –III
1. Designing and writing protocols for Phase I, II and III studies

09HLTH09A04-015-C CANCER BIOLOGY [Theory] –III
1. Molecular basis of radiation sensitivity
2. Molecular basis of cytotoxic drug action and drug resistance
3. Immunological aspects of cancer and cancer vaccines: Antigen recognition, Dendritic cells, immunological surveillance, tumor immunology,
4. Antisense and Gene therapy
   Basic principles of Hyperthermia

09HLTH09A04-013-P CANCER BIOLOGY [Practical] –III
1. Understanding micro-array technique
2. Transgenic models

09HLTH09A04-016-C RADIOBIOLOGY [Theory] –III
1. Dose rate effect in Brachytherapy
2. How to compensate for missed treatment days?

09HLTH09A04-017-C CHEMOTHERAPY & CLINICAL PHARMACOLOGY [Theory] –III
1. Drug Design and development: Novel therapeutic targets, New drug discovery & development, Preclinical assessment of candidate compounds and phase I-IV studies.
2. Biological & Novel therapies: Biological therapies mechanism & combination, Mode of action of interferons, interleukins, growth factors, gene therapy & immunotherapy, Novel targets, cell signal control, Oncogene products, Cancer vaccines.

Internal Assessment / Examination
Third Year

Theory: Comprehensive knowledge of clinical oncology, optimal combination of surgery, radiotherapy, chemotherapy and hormones. Value of support services such as pathology, cytology, occupational therapy and preventive oncology. Medical statistics and design of clinical trial.

Practical: Update of previous years, use of MLC, IMRT CT planning, complex time calculations, pathology slides, pathology specimens, chemotherapeutic drugs, procedures, e.g. ILRT, ICA.

Clinical: Case presentation - Long and short cases, assessment of examination and diagnostic skills, doctor-patient relationship, decision making ability.

Evaluation: Logbook, Thesis / dissertation, paper presentations during the year, appraisal scores, publications.

Final Examination after completing three years of training

होमी भाभा राष्ट्रीय संस्थान
Homi Bhabha National Institute

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS

OF

MD MICROBIOLOGY

(Program Code: HLTH09A05)

M.D. (MICROBIOLOGY)

The aim of this course is to train the students of Medicine in the field of Medical Diagnostic Microbiology. Knowledge and practical skills shall be acquired by the candidates in the sub-specialities of Bacteriology including Mycobacteriology, Virology, Parasitology, Immunology, Serology & Mycology so as to be able to deal with diagnosis and prevention of infectious diseases in the community. They will be trained in basic research methodology including molecular biology so that they are able to conduct fundamental and applied research. They will also be trained in teaching methods so that they can take up teaching assignments.

GOAL:

The goal of the postgraduate medical education shall be to produce a competent specialist and Medical teacher:

- Who shall recognize the health needs of the community and carry out professional obligations ethically in keeping with the objectives of the national health policy;
- Who shall have mastered most of the competencies, pertaining to Medical diagnostic Microbiology that are required to be practiced at the secondary and the tertiary levels of the health care delivery system;
- Who shall be aware of the contemporary advances and developments in the field of medical and diagnostic Microbiology
- Who shall have acquired the spirit of scientific inquiry and is oriented to the principles of research methodology and epidemiology
- Who shall have acquired the basic skills of teaching of the medical and paramedical professionals.

EDUCATIONAL OBJECTIVES:

KNOWLEDGE:

At the end of the course the students shall be able to:

1.State and explain the clinical features, etiology, pathogenesis and methods of laboratory diagnosis of infectious diseases and apply that knowledge in the treatment, prevention and control of communicable diseases caused by micro-organisms.

2.State and explain the principles of immunity and immunological phenomenon which help to understand the pathogenesis, laboratory diagnosis of infectious and non-infectious diseases.

3. Establish and practice "laboratory medicine" for diagnosis of infectious diseases in hospitals and community in the field of bacteriology, parasitology, virology, mycology, serology and immunology in the light of clinical findings.

4. Organize the prevention and control of communicable diseases in the community.

5. Understand and practice the principle of prevention and control of health

care associated infections and rational antibiotic policy.

6. State the recent advances in the field of Medical Microbiology and apply this knowledge in understanding aetiopathogenesis and diagnosis of diseases caused by micro-organisms.

7. Carry out fundamental or applied research in the branches of medicine involving microbiological work.

8. Develop specialization in any of the above subspecialities.

9. Undertake teaching assignments in the subject of medical Microbiology.

(B) Skills

At the end of the course the student shall be able to

1. Plan the laboratory investigations for the diagnosis of infectious diseases

2. Perform laboratory procedures to arrive at the etiological diagnosis of infectious diseases caused by bacteria, fungi, viruses and parasites including the drug sensitivity profile.

3. Perform and interpret immunological and serological tests.

4. Operate routine and sophisticated instruments in the laboratory.

5. Develop microteaching skills and Pedagogy

6. Successfully implement the chosen research methodology

COURSE CONTENT (SYLLABUS)

DURATION OF COURSE:

The minimum period of training shall be three calendar years and the candidates can be admitted to this training after their full registration with the Medical Council. No exemption shall be given from this period of training of three years either for doing housemanship or for any other experience or diploma.

TRAINING PROGRAM:

The candidates joining the course must work as full time residents during the whole period of their postgraduate training. They will be required to attend a minimum of 80% of training period. Candidate shall be given full time responsibility and assignments and their participation in all facets of the educational process assured.

Postgraduate students must maintain a record book of the work carried out by them and the training undergone by them during the period of training. These record books shall be checked and assessed by the faculty.

TEACHING /LEARNING METHODS:

Learning in M. D. (Microbiology) will essentially be self-learning.

Following teaching-learning methods shall be followed-

Group teaching sessions:

- Journal review
- Subject seminar presentation
- Group discussion
- Slides seminars
- Clinical case presentations pertaining to infectious diseases
- Presentation of the findings of an exercise on any of the sub-specialities
- Participation in CME programs and conferences

Hands on experience (practical training)

Practical training shall be imparted by posting the students in various sub-specialities (sections) as detailed in the intrinsic and extrinsic rotation.

Student shall be actively involved in day to day working of all the sections. He/she will be trained under the guidance of teachers in all the aspects of Clinical Microbiology and applied aspects of laboratory medicine including collection and transport of specimens, receiving of samples, preparation of requisite reagents, chemicals, media and glassware, processing of specimens, performing required antimicrobial susceptibility testing and reporting on the specimens, interpretation of results, sterilization procedures, bio-safety precautions, infection control practices, maintenance of equipments, record keeping and quality control in Microbiology.

Suggested schedule of rotation:

Intrinsic rotation:

1. Bacteriology(Aerobic and anaerobic)	6 months
2. Mycobacteriology	3 months
3. Hospital infection surveillance	3 months
4. Serology/Immunology	6 months
5. Mycology	3 months
6. Virology/HIV	3 months
7. Parasitology	3 months
8. Clinical Microbiology(OPD)	2 months
9. Molecular Diagnostics	1 month

Extrinsic rotation:

Clinical Pathology	3 months
*Elective posting	3 months
Total	36 months

Emergency duty:

Student shall be posted for managing emergency laboratory services in Microbiology. He/she will deal with all the emergency investigations in Microbiology.

Training in research methodology:

Training in research methodology shall be imparted by planning of a research project by the student under the guidance of a recognized guide to be executed and submitted in the form of a dissertation.

The dissertation is aimed at training the candidate in research methods and techniques. It will include identification of a research question, formulation of a hypothesis, search and review of relevant literature, getting acquainted with recent advances, designing of research study, collection of data, critical analysis of the results and drawing conclusions.

The topic shall be communicated to the university within six months of registration and at least 12 months should be spent on the research project.

The dissertation shall be completed and submitted by the student six months before appearing for the final university examination.

Teaching experience:

Student shall be actively involved in the teaching of undergraduate students. He/she will be trained in teaching methods and use of audiovisual aids.

BROAD AREAS OF STUDY

General Microbiology; Systematic Bacteriology, Mycology, Virology, Parasitology; Serology,Immunology, molecular diagnostics and Applied Clinical Microbiology including recent advances in Microbiology.

09HLTH09A05-001-C **GENERAL MICROBIOLOGY**

1. History and pioneers in Microbiology
2. Microscopy
3. Morphology of bacteria and other micro-organisms.
4. Nomenclature and classification of microbes.
5. Growth and nutrition of bacteria.
6. Bacterial metabolism.
7. Sterilization and disinfection.
8. Biomedical waste disposal
9. Bacterial toxins.
10. Bacterial antagonism: Bacteriocins.
11. Bacterial genetics, gene cloning.
12. Antibacterial substances used in treatment of infections and drug resistance in bacteria.
13. Bacterial ecology-normal flora of human body, hospital environment, air, water and milk
14. Host parasite relationship.
15. Quality control and Quality Assurance in Microbiology.
16. Laboratory Biosafety
17. Health care associated infections- prevention and control

09HLTH09A05-002-C **IMMUNOLOGY AND APPLIED ASPECTS**

1. The normal immune system.
2. Innate immunity.
3. Antigens.
4. Immunoglobulins.

5. Complement.
6. Antigen and antibody reactions.
7. Hypersensitivity.
8. Cell medidated immunity.
9. Immunodeficiency.
10. Autoimmunity.
11. Immune tolerance.
12. Transplantation immunity.
13. Tumour immunity.
14. Prophylaxis and immunotherapy
15. Measurement of immunity.
16. Immunity and immunopathogenesis of specific infectious diseases
17. Molecular Biology Techniques. For e.g. PCR, DNA probes.

09HLTH09A05-003-C **SYSTEMATIC BACTERIOLOGY**

1. Isolation, description and identification of bacteria. The epidemiology, pathogenesis, antigenic characteristics and laboratory diagnosis of disease caused by them
2. Staphylococcus and Micrococcus; Anaerobic Gram positive cocci.
3. Streptococcus and Lactobacillus.
4. Neisseria, Branhamnella and Moraxella.
5. Corynebacterium and other coryneform organisms.
6. Bacillus: the aerobic spore-bearing bacilli.
7. Clostridium: the spore-bearing anaerobic bacilli.
8. Non-sporing anaerobes
9. The Enterobacteriaceae.
10. Vibrios, Aeromonas, Plasiomonas, Campylobacter and Spirillum,H.pylori
11. Erysipelothrix and Listeria
12. Pseudomonas.
13. Chromobacterium, Flavobacterium, Acinetobacter and Alkaligens.
14. Pasteurella, Francisella.
15. Haemophilus and Bordetella.
16. Brucella.
17. Mycobacteria.
18. The spirochaetes.
19. Actinomyces, Nocardia and Actinobacillus.
20. Mycoplasmatales: Mycoplasma, Ureaplasma and Acholeplasma.
21. Rickettsiae.
22. Chlamydiae.
23. Emerging bacterial pathogens.

09HLTH09A05-004-C **VIROLOGY**

1. The nature of viruses
2. Classification of viruses
3. Morphology :virus structure
4. Virus replication
5. The genetics of viruses
6. The pathogenicity of viruses
7. Epidemiology of viral infections
8. Vaccines and antiviral drugs
9. Bacteriophages
10. Pox viruses
11. Herpes viruses
12. Vesicular viruses
13. Togaviridae

14. Bunyaviridae
15. Arenaviridae
16. Marburg and Ebola viruses
17. Rubella virus
18. Orbi viruses
19. Influenza virus
20. Respiratory disease: Rhinoviruses, adenoviruses, corona viruses
21. Paramyxoviridae
22. Enteroviruses : Polio, Echo, Coxsackie viruses
23. Other enteric viruses
24. Hepatitis viruses
25. Rabies virus
26. Slow viruses
27. Human immunodeficiency viruses
28. Oncogenic viruses
29. Teratogenic viruses
30. Viruses of gastroenteritis
31. Prion diseases
32. Emerging viral infections – SARS, Avian influenza

09HLTH09A05-005-C **PARASITOLOGY**

1.Protozoan parasites of medical importance : Entamoeba, Giardia, Trichomonas, Leishmania, Trypanosoma, Plasmodium, Toxoplasma, Sarcocystis, Cryptosporidium, Balantidium,Isospora, Cyclospora,Microsporidium etc.

2. Helminthology : All those medically important helminths belonging to Cestoda, Trematoda and Nematoda.

Cestodes : Diphyllobothrium, Taenia, Echinococcus, Hymenolepis, Dypyllidium, Multiceps etc.

Trematodes : Schistosomes, Fasciola, Gastrodiscoides, Paragonimus, Clonorchis, Opisthorchis etc.

Nematodes : Trichuris, Trichinella, Strongyloides, Ancylostoma, Nicator, Ascaris, Toxocara, Enterobius, Filarial worms, Dracunculus, etc.

3. Ectoparasites : Common arthropods and other vectors viz.,Mosquito, Sandfly, Ticks, Mite, Cyclops.

09HLTH09A05-006-C **MYCOLOGY**

1. The morphology and reproduction of fungi and antimycotic agents
2. Classification of fungi
3. Contaminant and opportunistic fungi
4. Fungi causing superficial mycoses
5. Fungi causing subcutaneous mycoses
6. Fungi causing systemic infections
7. Antifungal agents

09HLTH09A05-007-C **APPLIED CLINICAL MICROBIOLOGY**

1. Epidemiology of infectious diseases
2. Hospital acquired infections
3. Infections of various organs and systems of the human body
4. Molecular genetics as applicable to Microbiology
5. Automation in Microbiology
6. Rapid diagnostic techniques for microbial diseases.
7. Vaccinology : principle, methods of preparation, administration of vaccines
8. Outbreak investigations & disaster management
9. Biological warfare

PRACTICALS (SKILLS)

09HLTH09A05-001-P **BACTERIOLOGY**

Must acquire:

1. Care and operation of Microscopes viz. Light, Dark ground, Phase contrast, Inverted, Fluorescent microscopes.
2. Preparation of stains viz. Gram's, Albert's, Ziehl- Neelson and other special stains - performing of staining and interpretation of stained smears.
3. Washing and sterilization of glassware including plugging and packing.
4. Operation of incubator, autoclave, hot air oven, inspissator, distillation plant, filters like Seitz and membrane and sterility tests.
5. Care and maintainance of common laboratory equipments like water bath, centrifuge, refrigerators, incubators etc.
6. Preparation and pouring of liquid and solid media - Nutrient agar, Blood agar, MacConkey agar, sugars, TSI agar, Robertson's cooked meat, Lowenstiein- Jensen's, selective media.
7. Preparation of reagents – oxidase, Kovac, etc.
8. Tests for beta-lactamases including ESBLs.
9. Collection of specimens for Microbiological investigations such as blood, urine, throat swab, rectal swab, stool, pus, OT specimens.
10. Preparation, examination and interpretation of direct smears from clinical specimens,viz. Sputum for AFB – ZN & auramine O, slit smears for *M..leprae,*-ZN stain, conjunctival smear for Chlamydiae – Giemsa/Iodine.
11. Techniques of anaerobiosis – Gaspack system,anaerobic jars-evacuation & filling with H_2, CO_2
12. Identification of bacteria of medical importance upto species level (except anaerobes – upto generic level)
13. Quantitative analysis of urine by pour plate method and semiquantitative analysis by standard loop test for significant bacteriuria.
14. Plating of clinical specimens on media for isolation, purification identification and quantitation.
15. Tests for motility: hanging drop, Craige's tube, dark ground microscopy for Spirochaetes – Treponema & Leptospira.
16. In-vitro toxigenicity tests – Elek test, Nagler's reaction
17. Special tests – Bile solubility, chick cell agglutination, sheep cell haemolysis, niacin and catalase tests for mycobacterium, satellitism, CAMP test, catalase test and slide agglutination tests, and other as applicable t identification of bacteria upto species level
18. Preparation of antibiotic discs; performance of antimicrobial susceptibility testing by Kirby-Bauer disk diffusion method; estimation of Minimum

inhibitory /Bactericidal concentrations by tube/plate dilution methods. Tests for drug susceptibility of Mycobacterium tuberculosis

19. Skin tests like Mantoux, Lepromin etc.
20. Testing of disinfectants- Phenol coefficient and 'in use' tests.
21. Quality control of media reagents etc. and validation of sterilization procedures.
22. Aseptic practices in laboratory and safety precautions.
23. Disposal of contaminated material like cultures.
24. Bacteriology of food, water, milk, air
25. Maintenance of stock cultures.

Desirable to acquire:

1. Care and breeding of laboratory animals viz. Mice, rats, guinea pigs and rabbits.
2. Techniques of withdrawal of blood from laboratory animals includingsheep.
3. Inoculation of infective material in animals by different routes.
4. Animal pathogenicity /toxigenicity tests for *C.diphtheriae, Cl.tetani, S. pneumoniae, S.typhimurium, K. pnumoniae etc.*
