High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

		design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.
Computational Fluid Dynamics	ME6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis Numerical Solution of Complete Fluid Flow and Energy Equation
Finite Element Method	ME8	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Advanced Heat and Mass Transfer	ME10	Advanced knowledge in heat and mass transfer Laminar boundary layer and forced convective heat, turbulent flow and heat transfer Heat transfer in porous media and heat transfer with phase change Radiation heat transfer
Reliability Engineering	ME13	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Manufacturing Technology	ME14	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.

(A2) ELECTIVES

Name of the Course	Course code	Course Outcome
Machine Design	ME3	Basic concepts in vibrations analysis
Structural Integrity Assessment Methods and NDE		Basics of rotor dynamics and rotor balancing Flow induced vibrations Response of systems to earthquake
Vibration Engineering and condition Monitoring		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	ME5	Introduction to earthquakes, design basis ground motion and IS 1893 spectra Introduction of earthquake engineering and analysis for multi degree freedom systems
Plant Dynamics		Analysis and design of structures, equipments and piping
Experimental Mechanics		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	training in formulating and executing a research problem.
Seminar -1,2,3	02ENGG04-001-S	learning oral communication of research results and improving presentation skills.

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	The subject is aimed on advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	training in formulating and executing a research problem.
Seminar -1,2,3	02ENGG04-002-S	learning oral communication of research results and improving presentation skills.

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Preparedness &Response to Nuclear Emergencies Artificial Intelligence Methods &Applications Membrane/ Separation Process and Technology	CEEL

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	training in formulating and executing a research problem.
Seminar -1,2,3	02ENGG04-003-S	learning oral communication of research results and improving presentation skills.

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

2	Turbine Generator Fundamentals	FRE10
3	Mechanical and Electrical Equipments	FRE11
4	Maintenance Engineering	FRE12
5	Regulatory Framework for NPPs	FRE13
6	Practical’s	FRE14
7		Viva Voce

Course Outcomes:

(E1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(E2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for pressure vessel and piping	FRE1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tube sheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.

Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2	Advanced knowledge in heat and mass transfer
		Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
		Heat transfer in porous media and heat transfer with phase change
		Radiation heat transfer
Transport Phenomena	FRE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyse transport problems
		Analyse transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyse transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

Course Outcomes:

(F1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(F2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	FRE15	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	FRE16	Students learn about basics of interaction of radiation with matter.
		Principle & Techniques to detect and measure ionizing radiation.
		Basics of radiation counting statistics
		Introduction to Neutron Flux Measurement in FBTR and PFBR.
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Embedded System Design & Human Machine Interface	FRE17	Introduction to Microprocessor Based Hardware Design
		Computer Communication and Networks
		Fault Tolerant and Distributed Architectures
		Programmable Logic Controller Design
		Overview of plant automation and Human Machine Interface (HMI)

Process Instrumentation	FRE18	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of various process variables
		Reliability principles, Fail safe design principles
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(F3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine Turbine troubles
Mechanical and Electrical Equipments	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	Assignment of the understanding of the subject by the student and its application in problem solving.

Course Structure:

V. Courses at RRCAT- M.Tech.

Program Code : ENGG01	Programme Specific Outcome	Impart training to students to increase the knowledge base required for research work
		Enhance analytical and computational skill of the students required for carrying out research work
		Provide training to work with various scientific equipment including sophisticated lasers and radiation available from synchrotron sources Indus-1 and Indus -2

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	03ENGG01-001-C
2	Magnet Physics and Technology	03ENGG01-002-C

(D) Foundation Courses

Sr. No.	Name of the Course	Course code
1	Physics Courses for Engineering Graduates	03ENGG01-001-F
2	Engineering courses for Physics Post-graduates	03ENGG01-002-F

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Engineering Mathematics	03ENGG01-001-C	This course reviews topics in Mathematics which are usually covered at the Master's level and are essential to understand the concepts of science and engineering
		This Course also deals with the advanced topics needed for carrying out research work in different areas of science and engineering
Magnet Physics and Technology	03ENGG01-002-C	Basic understanding of magnetism and its application.
		Analytical approach of magnet design mainly for accelerator application and field measurement technique.
		Fabrication technique and alignment of magnets.
Laser Physics and Technology	03ENGG01-003-C	This course introduces basic mechanism and principles of lasers, beam propagation, and optical resonators
		Introduction to physics and technology of various types of lasers
		This course introduces basic nonlinear optics
Electromagnetic Theory	03ENGG01-004-C	This course is meant for physicists and engineers. It reviews the M. Sc. Level and B. Tech level electromagnetic theory, and further strengthens some of the intricate concepts, and introduces new topics
		It emphasizes basic concepts needed to solve the electromagnetic boundary value problems, and prepares the students to develop better understanding of the computer codes used for that
		Students are expected to develop a better and rigorous understanding of generation of electromagnetic radiation, typically in synchrotron radiation source.
		Students learn about different types of electromagnetic waves – (i) plane waves, including its reflection and refraction at dielectric surface. (ii) Gaussian beams and Bessel beams, (iii) modes in waveguides and cavities, including its transport in

		microwave components and (iv) modes in optical fiber.
Accelerator Physics and Beam Diagnostics	03ENGG01-005-C	The course introduces basic concepts of accelerator physics and beam diagnostics.
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Reactor Physics, Radiation Physics, and Safety Issues	03ENGG01-006-C	Awareness about natural, man-made radiation, dose contribution from various practises, units and quantities, biological effects of radiation exposure and ICRP recommendations on radiation protection
		Awareness about the radiation hazards at work place, safe practises to be followed, exposure control measures, shielding philosophy and radiation detection.
		Understanding the radiation hazards at high energy electron and proton accelerators and laser facilities. Dose build up effects due to electromagnetic and hadronic cascade and its impact on radiation safety and tackling mechanisms
		Gaining fundamental concepts in reactor physics, interaction of various kind of radiation with matter.
Numerical and Mathematical Techniques and Scientific	03ENGG01-007-C	For rigorous and correct analysis of data (which are the outcome of research work), learning numerical and mathematical techniques is absolutely essential.
		This course teaches interpolation, extrapolation, error analysis etc which are integral parts of data analysis. The finite element method is a numerical method for solving problems of applied science and engineering, for example, structural analysis, heat transfer, fluid flow, mass transport etc
		Concept of scientific computing is necessary for numerically analyzing experimental and analytical results. For the same, programming languages (C and fortran) are taught.

		Different operating systems (windows, linux etc), which are taught, also help in understanding the working of computers, in turn, different aspects of scientific computing
Materials Science and Technology- I	03ENGG01-008-C	The course reviews the master's level solid state physics with certain advanced topics
		The advanced topics covered include: nonlinear properties of optical materials, electronic materials for novel applications like spintronics and introduction to symmetry and ferroelectric materials
		Students learn structures of various materials including alloys, ceramics, glasses, polymers, and composites
Applications of Lasers in Nuclear Science, Industry	03ENGG01-009-C	This course covers various applications of lasers in high resolution spectroscopy in metrology and medicine
		This courses exposes application of lasers in material processing
		This course introduces application of lasers in isotope separation
Applications of Accelerators in Nuclear Science, Industry	03ENGG01-010-C	This course aims to expose students to various applications of accelerators.
		Students become aware of applications in accelerator based radiotherapy and radiation processing
Vacuum Physics and Technology	03ENGG01-011-C	This course aims to introduce the basics of theory of vacuum
		Introduces various vacuum systems and components
		Students learn how to design a vacuum system
Quantum Mechanics	03ENGG01-012-C	This course reviews master's level quantum mechanics with more emphasis on problem solving and applications
		This course also covers advanced topics which will enhance understanding in many-electron systems and photo-atom interaction
Research Methodology	03ENGG01-013-C	Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

(B) Elective Courses

Name of the Course	Course code	Course Outcome
Power Supplies	03ENGG01-001-E	This course aims to introduce various concepts of power supplies to the students
		Make students aware of AC-DC and DC-AC converters and principles of feedback control systems
		Students learn about magnet power supplies for accelerators, power supplies for superconducting magnets, and laser/plasma power supplies
Power Electronics	03ENGG01-002-E	This course develops basic understanding of the power electronics
		Course will cover various power semiconductor devices
		Students will learn modelling of various components and carrying out analysis
		Course covers electromagnetic interference related measurement techniques and mitigation techniques
Advanced Course on RF and Microwaves	03ENGG01-003-E	This course develops understanding of the science and technology of RF and microwaves
		Students will learn various generation and transmission of RF waves
		Course covers various components for RF and cavities
		Course makes students learn various measurement techniques for RF and microwave
Advanced Data Acquisition and Control Systems	03ENGG01-004-E	Process control and Data Acquisition elements and models
		Continuous time domain controllers and digital controllers
		Feed-back and Feed-forward control systems
		Z-transform based Deadbeat and Dahlin algorithms, real time systems and scheduling methods, buses for instrument networks and communication protocols
Reliability Engineering	03ENGG01-005-E	This course aims to introduce various concepts and techniques for evaluating reliability and assessing quality of engineering processes

		Review of basic statistics and probability applied to reliability analysis
		Students will learn various concepts of quality assurance and reliability
		Students will learn topics related to total quality management
Advanced Course in High Voltage Engineering	03ENGG01-006-E	This course aims to introduce concepts and materials related to high voltage engineering
		Students learn about various dielectric materials relevant for high voltage applications
		Students learn various techniques for generating and measuring high voltages
		Course introduces aspects of designing high voltage circuits and safety issue associated with high votages
Digital Signal, Image Processing and Applications	03ENGG01-007-E	Basic understanding of machine vision systems and their specific application areas related to nuclear engineering
		Understanding of camera types, lenses, illumination, Component Selection of a machine vision system
		Understanding of the concept of digital image, basic definitions, image operators, and functions used in digital image processing software
		Applying functions for accomplishing particular image processing task according to application

(C) Laboratory Courses

Name of the Course	Course code	Course Outcome
Laser and Applications	03PHYS04-001-L	To provide first-hand experience in handling various lasers and related optics
		To provide training to carry out spectroscopic studies using laser
Accelerators related applications	03PHYS04-002-L	Students get first-hand experience in handling various instruments needed for accelerator technology
Electronics	03PHYS04-003-L	Students get first-hand experience in handling various instruments required for electronics, image processing, and RF components

		Students are also expected to learn and handle GUI software and communication protocols

(D) Foundation Courses

Name of the Course	Course code	Course Outcome
Physics Courses for Engineering Graduates	03ENGG01-001-F	This is a bridge course which introduces engineering graduates to some specialized subjects of physics
		These subjects helps graduates to understand aspects of lasers, accelerators, and materials sciences
Engineering courses for Physics Post-graduates	03ENGG01-002-F	This is a bridge course which introduces physics post-graduates to some specialized subjects of engineering
		These subjects helps candidates to understand mechanical, electronics, and electrical engineering aspects of lasers and accelerators

BACK TO MAIN

Course Structure:

VI. Courses at IPR

Program Code: ENGG01	Programme Specific Outcome	Learn about Plasma basics, its diagnostics and its applications.
		Learn Plasma and Fusion Technologies to build a device.
		Get detailed information on specific subject related to Fusion technology according to the stream of student i.e. Physics , mechanical etc.

T1. FUNDAMENTAL

Sr. No.	Name of the Course	Course code
1	Basic Plasma Physics	FC1
2	Experimental Plasma Physics	FC2
3	Tokamaks	FC3
4	Fusion Plasma Diagnostics	FC4
5	Measurement Techniques	FC5
6	Numerical Methods	FC6
7	Mathematical Methods	FC7
8	Vacuum, Cryogenics and Magnets	FC8

T2. CORE SUBJECTS

Sr. No.	Name of the Course	Course code
1	Fusion Neutronics	AS1
2	Plasma Facing Components: First Wall, Divertors, Blankets	AS2
3	Fusion Materials	AS3
4	RF, Current Drive and Neutral Beam Heating	AS4

T3. ELECTIVES

(A) PHYSICS

Sr. No.	Name of the Course	Course code
1	Magneto Hydro Dynamics	PH1
2	Kinetic Theory and Statistical Mechanics	PH2
3	Advanced Heat Transfer and Cryogenics	PH3/ME5
4	Tokamak Related Code	PH4

(B) MECHANICAL

Sr. No.	Name of the Course	Course code
1	Code Design for Internal and External Pressure Vessel	ME1
2	Finite Element and Volume Methods	ME2
3	Mechanics of Solid/Vibration/Remote Handling	ME3
4	Advanced Manufacturing Technologies	ME4
5	Advanced Heat Transfer and Cryogenics	ME5

(C) ELECTRICAL

Sr. No.	Name of the Course	Course code
1	Advanced Data Acquisition System	EE1
2	Advanced Tokamak controls	EE2
3	High Voltage, DC& AC/ Power Supplies	EE3
4	Signal Conditioning and EMI/EMC Aspects	EE4
5	Computer Based System Design	EE5
6	Digital Signal Processing and Image Processing	EE6

T4. MINI PROJECT (MP)

Sr. No.	Name of the Course	Course code
1	Mini Project	06ENGG01-001-MP

T5. PROJECT (P)

Sr. No.	Name of the Course	Course code
1	Project	06ENGG01-001-P

Course Outcomes:

T1. FUNDAMENTAL

Name of the Course	Course code	Course Outcome
Basic Plasma Physics	FC1	Course provides detailed information on: • Definition of plasma, description of collective behaviour in contrast to single particle behaviour. • Lorentz force equation, nonrelativistic motion of a charged particle in constant electric and magnetic field. • Fluid Description of Plasma, Waves in Plasma and MHD Description.
Experimental Plasma Physics	FC2	Course provides detailed information on: • Fundamental Gas Processes i.e. Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization, • Charged Particles in a Gas. • Self-sustaining Discharge i.e. Glow Discharge, Breakdown under Special Conditions, Arc Discharge. • Plasma Sheath and Diagnostics Experimental Plasma Devices.
Tokamaks	FC3	Course provides detailed information on: • Introduction to Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor, • Equilibrium and Transport i.e. Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport, • Heating i.e. Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive, Ion Cyclotron

		Resonance Heating, Electron Cyclotron Resonance Heating. • MHD Stability i.e. Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios. • Tokamak and Other Fusion Devices
Fusion Plasma Diagnostics	FC4	Course provides detailed information on, • Introduction to Tokomak diagnostics , Electrical diagnostics, Magnetic diagnostics • Measurements of plasma density and electron temperature i.e. Thomson scattering diagnostics, Reflectometery, Interferometry: ECE diagnostics. • Measurement of ion temperatures i.e. Charge exchange recombination spectroscopy (CXRS), X –ray crystal spectroscopy. • Measurements of Radiated power and Measurements of operational parameters i.e. Bolometers, Imaging Diagnostics and Beam emission spectroscopy.
Measurement Techniques	FC5	Course provides detailed information on, • Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements. • Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability. • Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power. • Sensors/Transducers and Their Applications to Physical Measurements , Introduction to Data Acquisition and Noise in Measurement System.
Numerical Methods	FC6	Course provides detailed information on, • Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study. • Solutions of Linear Algebraic equations. • Numerical Differentiation and Integration • Roots, optimization and nonlinear sets of Equations. • Application of Ordinary Differential equations. • Application of Partial Differential equations.

		• Application of Curve fitting methods.
Mathematical Methods	FC7	Course provides detailed information on,
		• Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl
		• Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors
		• Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series,
		• First and second order differential equations with constant and variable coefficients; Linear differential equations
Vacuum, Cryogenics and Magnets	FC8	Course provides detailed information on,
		• Fundamental of vacuum i.e. The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pump down time, Outgassing and permeation. Exposure to pumps and gauges.
		• Design of a vacuum system
		• Fundamental of cryogenics i.e. Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.
		• Design of cryogenics system i.e. Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
		• Applications of Cryogenics Engineering in Fusion machines.
		• Fundamentals of Magnet system
		• Design and fabrication of magnet system

T2. CORE SUBJECTS

Name of the Course	Course code	Course Outcome
Fusion Neutronics	AS1	Course provides detailed information on, • Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes. • Particle transport phenomena in matter and Basics of fusion neutronics & blanket neutronics. • Principles of Neutron & Fusion product diagnostics, Radiation and licensing and Radiation damage & transmutation.
Plasma Facing Components: First Wall, Divertors, Blankets	AS2	Course provides detailed information on, • First Wall, Firstwall Concepts, Loads on Firswtall and Challenges for Firstwall. • Divertor Concepts , Loads on Divertor , Challenges for Divertor , Divertor Testing and Novel Divertor Concepts • Blanket Concept, Shield Blanket, Breeding Blanket, Liquid Metal (Pb Li) Technology, Fusion Fuel Cycle and Blanket Safety.
Fusion Materials	AS3	Course provides detailed information on, • Fundamentals of Material Science • Fusion Materials Requirements & Issues • Material Development and Joining Technologies • Material Characterization & Qualification
RF, Current Drive and Neutral Beam Heating	AS4	Course provides detailed information on, • Heating and current drive physics by neutral beam • Neutral beam injector system design and engineering • Introduction to RF heating • RF devices and Design tools i.e. ICRH, ECRH and LHCD.

T3. ELECTIVES

(A) PHYSICS

Name of the Course	Course code	Course Outcome
Magneto Hydro Dynamics	PH1	Course provides detailed information on, • Physical description of electrically conducting fluids .Derivation of basic MHD equations: Continuity, Equation of

		motion, Energy flow, Ohm's law, Validity of MHD equations.
		• The low frequency dynamics of the electromagnetic field. Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of • resistivity, Similarity scaling, The Wöltjer invariants and helicity
		• Equilibrium general considerations, The Virial Theorem, Examples of simple equilibria: - pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm a shape, etc.
Kinetic Theory and Statistical Mechanics	PH2	Course provides detailed information on,
		• Gas dynamic way of describing an uncharged fluid – heuristic
		• Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
		• Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
		• Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
		• Examples of GK formalism and obtained transport and Very cursory introduction to Onsager relationships
Advanced Heat Transfer and Cryogenics	PH3/ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
Tokamak Related Code	PH4	Course provides detailed information on,
		• Plasma core modelling i.e. Plasma equilibrium IPREQ , Plasma transport TSC , Plasma stability ERATO, PEST2 , ICRH heating TORIC , NBI heating NUBEAMS , Plasma start up model , Reactor system code , Eddy current analysis.
		• Edge-SOL studies i.e. 2D blob transport, Divertor study SOLPS (B2+ERINE) , 3D plasma study ERINE-3D

		• First principle simulations i.e. Low frequency (w/wc <<1) transport – what is Gyrokinetic method? , What are the transport processes neglected by gyrokinetic formalism?

(B) MECHANICAL

Name of the Course	Course code	Course Outcome
Code Design for Internal and External Pressure Vessel	ME1	Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
		Thick cylinder, sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div. – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
		Bending of circular plates and determination of stresses in simply supported and clamped Circular plate. Basis of ASME equation for flat closures.
		Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
Finite Element and Volume Methods	ME2	Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation , piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
		Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
		2D plane elements – 3 node triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
		Finite element applications for design: Finite element modelling and discretization criterion,

		h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.
Mechanics of Solid/Vibration/Remote Handling	ME3	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Laminar Boundary Layer and Forced Convective Heat
		Turbulent Flow and Heat Transfer
		Natural Convection
		Numerical Solution of Complete Fluid Flow and Energy Equation
Advanced Manufacturing Technologies	ME4	Advance manufacturing processes i.e. mechanical energy based processes , electrical energy based processes, chemical and electro-chemical energy based processes.
		Advanced materials joining and testing i.e. bolting , riveting , soldering , blazing ,adhesive bonding , diffusion bonding , mechanical joining, fusion welding, oxyacetylene welding , smaw , gtaw , gmaw , fcaw ,saw , esw, high energy beam welding.
		Responses of materials to welding i.e. microstructural changes , distortion , defects, undercuts ,overlaps , grain growth , blowholes , inclusions.
		Destructive and non-destructive tests for welds.
Advanced Heat Transfer and Cryogenics	ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
		Cryogenic Insulations
		Instrumentation in Cryogenics

(C) ELECTRICAL

Name of the Course	Course code	Course Outcome
Advanced Data Acquisition System	EE1	Course provides detailed information on,
		• Theory of Quantization , Advanced Data Acquisition Systems
		• Data Acquisition Interface , Analog Input/output
		• DAQ Clock and Trigger , Synchronization
		• SST-1 Data Acquisition System

Advanced Tokamak controls	EE2	Course provides detailed information on, • Fundamentals of Control System i.e. Terminology and basic structure of control system , Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems. • Different types of Control Systems • Introduction to Plasma Control • ITER Instrumentation & Control • SST-1 Operation &Control • Monitoring and Control of Auxiliary Systems
High Voltage, DC& AC/ Power Supplies	EE3	Course provides detailed information on, • Overview of Electrical systems in Fusion machines i.e. Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement. • High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. • Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive, Requirement for arc fault protection, Protection by crowbar. • Power Electronics and design through modelling & simulation i.e. AC-DC Converters; Forced commutation;

		synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines.
Signal Conditioning and EMI/EMC Aspects	EE4	Course provides detailed information on, • Analog Signal Conditioning i.e. Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation. • Signal Processing and Applications i.e. Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters. • EMI/EMC i.e. Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling Inductance Coupling, Shielding. • EMI Modelling i.e. Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns.
Computer Based System Design	EE5	Course provides detailed information on, • Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications. • Asynchronous and synchronous communication, • Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. • Real-time Systems, their characteristics and applications, Real-time Operating Systems Concepts of Process and threads, Concurrency, Latency, context switching, scheduling policies.
Digital Signal Processing and Image Processing	EE6	Course provides detailed information on, • Basic elements of a digital signal processing system, Fourier series and Fourier transform, z transform Convolution, Correlation, Sampling

		theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.
		• Discrete Fourier Transform, Interpretation of DFT, Properties of DFT, DFT of real signals, Fast Fourier Transform Digital filters, DSP Applications.
		• Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.
		• Image Enhancement i.e. Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Color image processing.
		• Image Segmentation and Analysis i.e. Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.
		• Morphological operations i.e. Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

T4. MINI PROJECT (MP)

Name of the Course	Course code	Course Outcome
Mini Project	06ENGG01-001-MP	Student learns**:**
		• Literature Survey
		• Study of a small section of the major project based on either simulation or fabrication to realize the criticality and requirements to build a component for plasma application.
		• Practise for thesis writing

T5. PROJECT (P)

Name of the Course	Course code	Course Outcome
Project	06ENGG01-001-P	• Complete understanding about the criticality of a particular component to be built for plasma application.
		• Development of a component for a plasma application and get hands on experience.
		• Thesis report.

M.Phil. in CHEMICAL SCIENCES

(Program Code: CHEM02)

Course Structure:

I. Courses at BARC

Program Code : CHEM02	Programme Specific Outcome	Firm foundation in the fundamentals and application of current chemical and scientific theories including those in Analytical, Inorganic, Nuclear and Physical Chemistry.
		Ability to design and carry out scientific experiments as well as accurately record and analyze the results of such experiments.
		Skill development in problem solving, critical thinking and analytical reasoning as applied to scientific problems.
		Ability to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large.
		Appreciate the central role of chemistry in DAE programmes and use this as a basis for ethical behavior in issues facing chemists including an understanding of safe handling of chemicals, environmental issues and key issues facing our society in energy, health and medicine.

(A) FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Mathematics, Quantum Chemistry & Computational Methods	CY501

Sr. No.	Name of the Course	Course code
1	Nanomaterials, Chemical Sensors	CY701
2	Soft Condensed Matters	CY702
3	Nuclear Probes for Material Characterization	CY703
4	Molecular Bioorganics	CY704
5	Laser Spectroscopy	CY705
6	Actinide Chemistry	CY706
7	Computational Chemistry	CY707
8	Advanced NMR Spectroscopy	CY708
9	Atmospheric Chemistry	CY709
10	Statistical Analysis	CY710

(D) NON-SUBJECT ASSIGNMENTS

Sr. No.	Name of the Course	Course code
1	Viva Voce	CY591
2	Mini Project	CY592
3	Seminar	CY593

Course Outcomes:

(A) FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Mathematics, Quantum Chemistry & Computational Methods	CY501	Learn foundations of quantum mechanics to understand the difference between classical and quantum phenomena.
		Understanding the role of rotational and spin angular momenta in chemistry.
		Develop expertise in molecular orbital theory that helps in understanding structure of polyatomic molecules.
		Understanding molecular symmetry to predict the chemical reactions of atoms and molecules.
		Calculation and interpretation of errors in numerical computation.
Analytical Chemistry	CY502	Acquaintance with various analytical techniques
		Idea on how to tackle an analytical problem, pertaining to DAE and other industries.
		Acquaintance with theories of various matrix separation techniques
		Acquaintance with statistical treatment of analytical data
		The course gives sufficient expertise leading to enhanced employability
Material Science	CY503	Ability to analyse the Powder X-ray diffraction pattern for solving crystallographic structures
		Description of specific crystal structures by applying basic crystallographic concepts
		Establishing correlation between electrical behavior and crystal structure
		Understanding different types of defects and their effect on the functional properties
		Understanding the concept of solid solution formation for fine tuning the properties
Radiation Detection and Measurements	CY504	Expertise to choose a particular detector for a specific application
		Expertise to carry out identification and quantification of radionuclides
		Knowledge base to understand safety aspects while working with radioactivity
		Basic knowledgebase for orientation towards working in areas involving applications of nuclear techniques
		Basic knowledge to develop need-based measurement systems

Nuclear and Radiochemistry	CY505	Identifying the factors that affect nuclear stability
		Explain the different kinds of radioactive decay and interpret a radioactive decay series, apply radiotracer principles
		Calculate the specific activity of the produced radionuclides, estimate the conditions required for producing important isotopes
		Understand the basic concepts in fission and the production yields of different radioactive isotopes during fission
		Identify the nuclear analytical techniques useful for analysing the samples (neutron activation, Ion beam analysis techniques)
Thermodynamics	CY506	Analyze thermal effects on a chemical process
		Understanding that change in environmental conditions can change the process itself.
		Important concepts on Carnot engine and energy conversion efficiencies
		Thermodynamics of nuclear materials
		Idea about experimental thermodynamics

(B) CORE COURSES

Name of the Course	Course code	Course Outcome
Lasers	CY601	Understanding of the operation of laser
		Understanding the principle behind the selection of specific laser for a specific application in the field of laser spectroscopy
		Knowledge of different classes of laser and their applications in different fields.
Electronics & Chemical Instrumentation	CY602	Understanding the principle of operation of common laboratory instruments
		Setting up / wiring of components for furnace, thermocouple, temperature controller etc.
		Ability to do simple trouble-shooting related to instruments (checking fuse, voltage, resistance etc.)
		Application of noise reduction techniques during measurements
Production and Applications of Radioisotopes	CY603	Knowledge of different processes employed for the production and radiochemical processing of important artificially produced radionuclides
		Understanding how the radiation and radioisotopes can be employed to divulge the useful information regarding different human ailments as well as how to

		treat various diseases specifically cancer
		Appreciate how the radiation and radioisotopes have emerged as an essential tool in various industries
		Expected to comprehend the important roles radiation technologies are playing in various processes
		Appreciate that radiation and radioisotopes are boon for the development of nation and mankind
Reactor Physics and Reactor Chemistry	CY604	Understand various designs of nuclear reactors and its components.
		Gain insight about the details of reactor physics calculations which are required for designing a nuclear reactor.
		Become conversant with the purification techniques used for the preparation of demineralized water at large scale and also about the variation in its thermo-physical properties with temperature and pressure.
		Develop the understanding of the behaviour of various materials of construction in their operational environment of nuclear power plants.
		Understanding the guiding principles for evolving the chemistry control process and the actual practice been adopted for the various heat transport systems of the nuclear power plants.
Molecular Structure & Spectroscopy	CY605	Understand the general characteristics of the d and f block elements
		Thorough knowledge of the different theories to explain the bonding in coordination compounds
		Improve the level of understanding of the chemistry of lanthanides and actinides
		Develop understanding of various advanced spectroscopic techniques for analyzing complex compounds.
		Thorough knowledge of the fundamentals of microwave, infrared, Raman, electronic and magnetic resonance spectroscopy, X-ray photoelectron spectroscopy.
Radiation and Photochemistry	CY606	Awareness of radiation induced reactions and its applications
		Expertise to analyse and quantify radiation/photochemical induced chemical reactions
		Trained man power for using various radiation and photochemical sources and state-of art experimental facilities
		Hands-on experience and research training during project work

		Knowledge development in the DAE relevant activities and planning for future R&D programs
Chemistry in Nuclear Fuel Cycles	CY607	Knowledge of processes involved in recovery of nuclear material from ores
		Understanding the chemistry involved in different stages of nuclear fuel cycle
		Understanding of fabrication and quality control of nuclear fuel
		Knowledge in physico-chemical characterization of nuclear fuel, irradiation behaviour
		Understanding of reprocessing of spent fuel and waste management
Advanced Chemical Kinetics & Dynamics	CY608	Learn difference between chemical kinetics and dynamics, and their applications in real systems
		Predict the energy state of a reaction product, and required reactant states to obtain a desired product for a simple reaction.
		Learn the importance of energy transfer affecting the population inversion in a gas laser.
		Expertise developed in carrying out research in relevant area of chemical physics with acquired knowledge.
		The course gives sufficient expertise leading to enhanced employability
Health Physics and Radiation Biology	CY609	Basic knowledge of handling hazards of various radioactive materials
		Knowledge of radiation protection aspects in nuclear and radiation facilities
		Radiation Protection Aspects in Designing of Nuclear and Radiation Facilities
		Design of advanced radiation monitoring equipments
		Management of Nuclear/Radiological Emergencies in facilities
Research Methodology	CY610	Demonstrate knowledge of research processes (reading, evaluating, and developing)
		Perform literature reviews using print and online databases
		Identify, explain, compare, and prepare the key elements of a research proposal/report
		Knowledge of writing reports and thesis
		Idea about following ethical practices in research
Safety in Chemical and Radiochemical labs	CY 611	Develop an understanding of the principle of chemical/radiochemical safety.
		Acquire the ability to apply the safety concepts in to practice when they work in chemical /radiological laboratories.

		Inculcate a culture of safety which shall benefit the organization.
		Knowledge about various safety aspects including good laboratory practices.
		Awareness about various emergencies and the need of emergency preparedness plans.

(C) ELECTIVES

Name of the Course	Course code	Course Outcome
Nanomaterials, Chemical Sensors	CY701	Idea about different synthesis methods for nanomaterials,
		Knowledge about modern techniques like pulsed laser deposition, spray pyrolysis etc.
		The concepts of Chemical sensors are taught which comprise of various per-requisites of a sensor material.
		Idea about several characterization techniques which are very useful for research work in this area.
		Theory behind the unique properties exhibited by nano-materials help the students to rationally design these materials.
Soft Condensed Matters	CY702	Students get to know about the physical basis of soft condensed matter systems
		Learn interpretation of rheological properties of soft matter with specific examples relevant to pharmaceutical formulations
		Learn about how to choose appropriate amphiphiles for emulsification
		Learn about tools for kinetic stabilization of colloidal systems
		Get an overview of application of soft matter systems in industry
Nuclear Probes for Material Characterization	CY703	Idea about defects using positron annihilation spectroscopy (PAS)
		Free volume structure characterization of amorphous material using PAS
		Compositional characterization using Ion beam techniques
		Phase structure, pore structure, Dynamics, magnetic structure using neutron scattering techniques
		Analysis of local structure of amorphous and crystalline materials using X-ray absorption methods

Molecular Bioorganics	CY704	Knowledge about synthetic design, and to enable a student to devise a synthetic route for a target molecule
		Knowledge about the various strategies in organic synthesis
		Knowledge about the green strategies, and the know-how of applying the same in organic synthesis
		Knowledge about the most recent advancements in organic synthesis
		Knowledge about the use of functional materials used in nuclear fuel cycle in DAE
Laser Spectroscopy	CY705	Skill development in handling high power ultra-short pulsed laser
		Application of time-resolved and nonlinear laser spectroscopy techniques in chemistry, biology and material science
		Expertise in indigenous development of novel spectroscopy techniques using Lasers
Actinide Chemistry	CY706	Understanding of the fuel cycle operations including reprocessing and waste management.
		Idea about environmental aspects of actinide migration in case of accident
		Pursue further areas of study such as transactinides and ‘atom at a time chemistry’
Computational Chemistry	CY707	Calculation of transition state structure and understand reaction mechanism
		Interpretation of IR and UV-Vis spectra of a system
		Band structure calculations of solids and analyze results
		Planning theoretical calculation to explain experimental results and predict molecular properties
		MD simulation and analysis of simulation results
Advanced NMR Spectroscopy	CY708	Student can learn how to validate the experimental results of synthesis and purity in a fast and efficient way.
		Determination of solution structure with the help of 1H and multi-nuclear NMR spectra
		Student can analyze the inter-molecular interactions and dynamics in solution state
		Familiarise the student to use solid state NMR technique for solving problems in Materials science
Atmospheric Chemistry	CY709	Idea about structure of atmosphere and atmospheric radiation
		Knowledge about various photochemical cycles

		Knowledge about various atmospheric pollutants and their harmful effects
		Idea about experimental methods to study reactions of importance in the atmosphere
Statistical Analysis	CY710	Knowledge of various terminologies used in Statistics
		Understanding of various statistical tools which can help in decision making
		Ways to improve quality in analytical data
		Proper way of representing analytical data

(D) NON-SUBJECT ASSIGNMENTS

Name of the Course	Course code	Course Outcome
Viva Voce	CY591	To evaluate the understanding of subject
		To judge the thinking process
Mini Project	CY592	Idea about how to do literature survey on a given topic
		Idea about planning and execution of an experiment
		Data analysis
		Writing project report
		Presentation of data and results
Seminar	CY593	Idea about how to do literature survey on a given topic
		Dissemination of information available in literature
		Practical experience of preparing presentation slides
		Practical experience of discussing scientific results in front of a knowledgeable audience

Course Structure:

II. Courses at IGCAR

Program Code : CHEM02	Programme Specific Outcome	Theoretical work for understanding solvent – metal ion interactions.
		Matrix isolation spectroscopy to understand conformers and weak molecular attractions
		Solvent development for reprocessing of nuclear fuels.
		Novel sensor materials development and characterization for sensor applications
		Materials development for matrices for nuclear waste immobilization

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Mathematical and Computational Methods, Numerical Analysis and Computer Programming	CH1
2	Chemical Thermodynamics	CH2
3	Electrochemistry	CH3
4	Introduction to Materials Science and Engineering	CH4
5	Analytical Chemistry for Nuclear Fuel Cycle	CH5
6	Chemical Instrumentation and Laboratory Techniques	CH6
7	Health Physics and Radiation Sciences	CH7
8	Introductory Reactor Physics and Fuel Design	CH8
9	Chemistry of Fuel Cycle - I	CH9
10	Chemistry of Fuel Cycle - II	CH10
11	Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH11
12	Nuclear and Radiochemistry	CH12
13	Corrosion Science and Engineering	CH13
14	Quantum Chemistry & Group Theory	CH-14
15	Molecular Spectroscopy	CH-15
16	Lasers and Application	CH-16
17	Nanomaterials and Advanced Chemical Sensors	CH-17
18	Course on Research Methodology	CH-RM

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Mathematics and Computational methods	CH-1	Practical applications of mathematical and computational methods are taught; besides these, computational software packages are introduced. The course basically prepares students to apply these aspects in their research areas for solving problems.
Chemical Thermodynamics	CH-2	This course helps students to understand various processes employed in chemical industries. Experimental methods to determine thermodynamic properties and phase diagram investigations are unique to this course. Estimation of thermodynamic properties and thermodynamic modelling study helps for a career in research and industry.
Electrochemistry and Corrosion Science	CH-3	Fundamentals and practical applications of electrochemistry are discussed. Advanced electrochemical techniques, pyrochemical process are taught. Aqueous corrosion and engineering help students to take up career in research and industry.
Introduction to Materials Science and Engineering	CH-4	Various characterisation techniques are taught. Material synthesis methods e.g. sol-gel are discussed extensively. Students handle various characterisation tools e.g. XRD, and Thin-film deposition followed by characterisation.
Analytical Chemistry for Nuclear Fuel Cycle	CH-5	Handling and learning about various sophisticated analytical techniques and instrumentation. Students are exposed to latest analytical techniques. Methodology for development of analytical technqiues for various materials is discussed. This Course prepare students for both research and industry.
Chemical Instrumentation and Laboratory Techniques	CH-6	This course helps students to have flair for setting-up of facility and analytical instruments.

Health Physics and Radiation Sciences	CH-7	Specialised course for students to work on radiation and associated safety aspects. Basics of interaction of radiation with matter. Introduces theory of various nuclear radiation detectors and their practical applications Introduces Biological Effects, Radiation Protection and Regulation procedure, Emergency Preparedness and Management
Chemistry of Fuel Cycle-I	CH-9	This course gives basic introduction to nuclear materials and thermodynamic properties of fuel at higher temperature. Many theories and concepts taught will be directly applied to nuclear plants.
Chemistry of Fuel Cycle-II: Actinide chemistry and separation science	CH-10	This course gives basic introduction to nuclear reactors and fuels. Many theories and concepts of re-use of nuclear fuel, need for nuclear energy are dealt extensively.
Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH-11	Brief overview of nuclear reactors in India and across the world. Details of nuclear materials are dealt extensively.
Nuclear and Radiochemistry	CH-12	Advanced course in nuclear chemistry. Helps students to understand and appreciate various fundamental aspects of radioactivity. Practicals help students to develop expertise in handling radioactive materials. Students measure half-life of radioactive nuclides. The fundamentals and applications taught helps in preparing students for various out-reach programs.
Corrosion Science and Engineering	CH-13	Fundamentals and practical applications of corrosion science and engineering help students to take up career in research. Also prepares students for a career in industry.
Quantum Chemistry & Group Theory	CH-14	Train students to gain expertise in theoretical chemistry. Students are trained to handle modelling software packages. Students apply these for metal-

		complexation, weak intermolecular interactions, thermodynamic calculations.
Molecular Spectroscopy	CH-15	Train students to gain expertise in theoretical chemistry. Besides applied experimental spectroscopy is taught which helps candidate in research career and subsequent job prospects. Special techniques such as matrix isolation spectroscopy, laser-Raman techniques are taught with experimental demonstration.
Lasers and Application	CH-16	(a) Both fundamentals and general applications of Lasers are taught. (b) Students handle lasers in the practical for technological applications. (c) Students handle lasers for various analytical chemistry applications.
Nanomaterials and Advanced Chemical Sensors	CH-17	The fundamental knowledge gained in this course had helped to (a) understanding and development of materials (b) tailor made materials for preparation of chemical sensors (c) indigenous sensors (d) special sensors (for e.g. in-sodium) which have to be developed - which will not be supplied by commercial sources.
Course on Research Methodology	CH-RM	Ethics in research, plagiarism, manuscript writing, Data analysis, presentation of results are dealt extensively. Ensure students are ready for taking up research work.

M.Phil. in PHYSICAL SCIENCES (Program Code: PHYS02)

Course Structure:

I. Courses at BARC

Program Code : PHYS02	Programme Specific Outcome	Apply principles of basic science concepts in understanding, analysis and prediction of physical systems.
		Introduce advanced ideas and techniques required in emergent areas of Physics.
		Introduce advanced experimental techniques in proposing experimental investigations in the frontiers of physics.
		Understand the basic concepts of research, data collection and presentation, scientific report writing, and ethics in research
		Gain an overall practical experience to decide and apply the appropriate method in future experimental investigations.
		Get the exposure to the steps needed towards completing a focused topic as well as the research areas of thesis supervisor.

(A) Foundation Courses

Sr. No.	Name of the Course	Course code
1	MATHEMATICAL PHYSICS	PH 501
2	QUANTUM MECHANICS	PH 502

3	STATISTICAL PHYSICS	PH 503
4	ELECTROMAGNETIC THEORY	PH 504
5	COMPUTATIONAL PHYSICS	PH 505

(B) Core Courses:

Sr. No.	**Name of the Course**	**Course code**
1	Nuclear Physics	PH 601
2	Atomic, Molecular & Laser Physics	PH 602
3	Plasma Physics & Technology	PH 603
4	Physics of Materials and Surfaces	PH 604
5	Reactor Physics & Technology	PH 605
6	Accelerator Physics & Technology	PH 606
7	Astrophysics	PH 607
8	Electronics	PH 608
9	Health Physics and Radiation Detectors	PH 609

(C) Experimental and Lab Courses

Sr. No.	**Name of the Course**	**Course code**
1	Engineering Drawing & Workshop Practices	PH 610
2	Research Methodologies and Methods of Experimental Physics	PH 611

(D) Elective Courses

Sr. No.	**Name of the Course**	**Course code**
1	Special topics in Mathematical Physics	PY 701

2	Selected Topics in Classical Mechanics	PY 702
3	Chaos and Nonequilibrium Statistical Mechanics	PY 703
4	Nonlinear Dynamics	PY 704
5	Advanced Computational Physics	PY 705
6	Stochastic Physics	PY 706
7	Selected Topics in Nuclear Physics	PY 707
8	Advanced Accelerator Physics & Technology	PY 708
9	Introduction to Neutrino Physics	PY 709
10	High Energy Astrophysics	PY 710
11	Synchrotron Radiation and its Applications	PY 711
12	Selected Topics in Atomic and Molecular Physics	PY 712
13	Advanced Photonics	PY 713
14	Quantum Optics and Information	PY 714
15	High Power Lasers and Applications	PY 715
16	Laser-Matter Interactions and Applications to Advanced Material Processing	PY 716
17	Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique	PY 717
18	Nonlinear Plasma Theory	PY 718
19	Modeling and Simulations in Physics	PY 719
20	Selected topics in Condensed Matter Theory	PY 720
21	Organic Semiconductor Devices	PY 721
22	Single Crystal Growth and Devices	PY 722
23	Advanced Magnetism and Superconductivity	PY 723
24	Neutron as a Probe of Condensed Matter	PY 724
25	Structure and Crystallography of Biomolecules	PY 725
26	Advanced Reactor Physics	PY 726

27	High Energy Density Physics: Theory	PY 727
28	High Energy Density Physics: Experimental	PY 728
29	Nuclear Data Physics for Advanced Nuclear Applications	PY 729
30	Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport	PY 730
31	Accelerator Driven Systems	PY 731

Course Outcomes:

(A) Foundation Courses

Name of the Course	Course code	Course Outcome
MATHEMATICAL PHYSICS	PH 501	Understand and apply mathematical techniques for describing and deeper understanding of physical systems.
QUANTUM MECHANICS	PH 502	Understand and apply principles of Quantum mechanics for understanding the physical systems in quantum realm.
STATISTICAL PHYSICS	PH 503	Understand and apply statistical methods for describing the classical and quantum particles in various physical systems and processes.
ELECTROMAGNETIC THEORY	PH 504	Gain knowledge in understanding the principles and dynamic phenomena of electromagnetism that occur in the case of time-varying sources (local charges and currents). Equips the students with the necessary mathematical knowledge for a detailed and accurate description of these phenomena and for solving related problems.
COMPUTATIONAL PHYSICS	PH 505	Gain knowledge in basic concepts in computational & numerical skills and apply them for understanding and describing complex physical systems.

(B) Core Courses:

Name of the Course	Course code	Course Outcome
Nuclear Physics	PH 601	Understand the properties and structure of nuclei, nuclear reaction mechanisms and their role in formation of universe consisting of different elements.
Atomic, Molecular & Laser Physics	PH 602	Understand the role of atoms and molecules in the structure and properties of mater. Describe different types of atomic and molecular spectra with and without external field.
Plasma Physics & Technology	PH 603	Describe basic concept of plasma, its physical parameters and applications. Describe basic processes in plasma and associated theory and solve simple plasma physics problems.
Physics of Materials and Surfaces	PH 604	Able to formulate basic models for electrons and lattice vibrations for describing the physics of crystalline materials; and understand band structure and electrical/optical properties, magnetism, superconductivity and surface structure of a material, .
Reactor Physics & Technology	PH 605	Understand the basic principle of nuclear power generation and physics design of a reactor.
Accelerator Physics & Technology	PH 606	Understand working principles and design concepts of different accelerators and their applications in industry and research in basic and applied sciences.
Astrophysics	PH 607	Able to identify and explain the properties of different astrophysical objects, learn experimental techniques to study them, understand the fundamentals of radiative transfers, theory of accretion and jets & outflows.
Electronics	PH 608	Understand how an analog signal is processed through different electronics modules and converted to digital signals,

		stored in memory and transferred to another deivice.
Health Physics and Radiation Detectors	PH 609	Gain basic knowledge of different types of radiations, doses, shielding, health effects and safety

(C) Experimental and Lab Courses:

Name of the Course	Course code	Course Outcome
Engineering Drawing & Workshop Practices	PH 610	Introduce advanced experimental techniques in proposing experimental investigations in the frontiers of physics.
Research Methodologies and Methods of Experimental Physics	PH 611	Understand the basic concepts of research, data collection and presentation, scientific report writing, and ethics in research

(D) Elective Courses:

Name of the Course	Course code	Course Outcome
Special topics in Mathematical Physics	PY 701	Learn about a few special topics in mathematical methods- difference equations, local analysis and global analysis.
Selected Topics in Classical Mechanics	PY 702	Learn about transformation theory of mechanics, integrable systems, canonical perturbation theory and near–integrable systems
Chaos and Nonequilibrium Statistical Mechanics	PY 703	Learn about Chaos and non-linear statistical mechanics involving Boltzmann and Liouville equation, Green-Kubo formulae, nonlinear maps, open systems and dynamical foundation of Boltzmann equation
Nonlinear Dynamics	PY 704	Learn about instabilities and chaos of periodically forced nonlinear oscillators, bifurcations and chaos in laboratory-scale systems, control and synchronization of

		nonlinear phenomena, experiments and numerical projects
Advanced Computational Physics	PY 705	Learn different programming languages and able to solve physics problems using advanced computer programming and/or Monte-Carlo simulation.
Stochastic Physics	PY 706	Learn about classical theory of Brownian motion, nucleation and coagulation theory and growth models.
Selected Topics in Nuclear Physics	PY 707	Learn about theoretical tools and techniques of advanced nuclear physics research areas and topics of current interest.
Advanced Accelerator Physics & Technology	PY 708	Learn about proton and heavy ion advanced accelerators, Giga-watt pulsed power & industrial accelerators, beam dynamics and design of advanced accelerators.
Introduction to Neutrino Physics	PY 709	Able to appreciate the intense activity worldwide in the field of neutrino physics. Get a brief exposition of a non-invasive method of monitoring fissile materials using neutrinos.
High Energy Astrophysics	PY 710	Able to identify and explain the properties of different astrophysical objects, learn experimental techniques to study them, understand the fundamentals of radiative transfers, theory of accretion and jets & outflows.
Synchrotron Radiation and its Applications	PY 711	Learn about the basic of production of Synchrotron radiation, beam line instrumentation and experimental techniques to study atomic, molecular and cluster physics
Selected Topics in Atomic and Molecular Physics	PY 712	Learn about coherent spectroscopy, physics with trapped ions and atoms, and behaviour of atoms and molecules under intense fields.
Advanced Photonics	PY 713	Learn the basics of LASER, fibre and non-linear optics, and get exposed to nano-photonics and meta-materials.

Quantum Optics and Information	PY 714	Learn about quantum theory of radiation, light atom interaction, ultra-cold atoms, quantum degenerate gases, and elements of atom optics and quantum information.
High Power Lasers and Applications	PY 715	Learn about non-linear optical processes, Laser dynamics and pulse generation, ultra-short pulse generation, amplification & compression and their applications.
Laser-Matter Interactions and Applications to Advanced Material Processing	PY 716	Learn about laser matter interaction, surface characterization, measurement & diagnostic techniques, and applications to advanced material processing
Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique	PY 717	Make mathematical modelling of a particle in a cell and solve Maxwell's equations.
Nonlinear Plasma Theory	PY 718	Learn about non-linear waves, non-linear wave-wave interaction and wave-particle interaction.
Modeling and Simulations in Physics	PY 719	Learn about electronic structure theory and modelling & simulations using Monte Carlo and Cluster Molecular dynamics
Selected topics in Condensed Matter Theory	PY 720	Learn about the application of quantum mechanical and atomistic lattice dynamics and computer simulations to model, understand, and predict the properties of real materials.
Organic Semiconductor Devices	PY 721	Learn about the techniques of preparation of organic thin films and their characterization, molecular electronics, organic electronics, organic solar cells and organic gas sensors.
Single Crystal Growth and Devices	PY 722	Learn about the techniques of single crystal growth, their characterization and applications
Advanced Magnetism and Superconductivity	PY 723	Learn about magnetism, magnetic exchange interaction, spintronics and superconductivity.
Neutron as a Probe of Condensed Matter	PY 724	Learn about neutron scattering, crystal structure study using neutron diffraction technique, neutron reflectometry and dynamics in condensed matter.

Structure and Crystallography of Biomolecules	PY 725	Learn about the computational and experimental methods of determining 3D structures in protein and nucleic acid, macromoleculer crystallisation and characterization, diffraction data collection and data processing
Advanced Reactor Physics	PY 726	Learn about neutron transport theory, numerical methods for solution of the multi-group neutron diffusion equation, reactor dynamics and reactor noise and its applications
High Energy Density Physics: Theory	PY 727	Learn about hydrodynamic and shock wave, equation of state and radiation opacities, radiation hydrodynamic instabilities and inertial confinement fusion.
High Energy Density Physics: Experimental	PY 728	Learn about the physics of high energy density effects in matter, energy storage systems, energetic materials and applications, diagnostic techniques and data interpretation.
Nuclear Data Physics for Advanced Nuclear Applications	PY 729	Learn about nuclear physics data, representation of nuclear data, nuclear data processing, multi-grouping, concept of critical facility and exposure to error propagation and sensitivity studies.
Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport	PY 730	Learn about solution of transport equation, neutron thermalization, treatment of resonances, solution of time dependent transport equation and solution of the fuel depletion equations.
Accelerator Driven Systems	PY 731	Learn about spallation neutron sources, sub-critical reactor, accelerator driven systems and waste transmutation

Course Structure:

II. Courses at IGCAR

Program Code : PHYS02	Programme Specific Outcome	Training in carring out fast reactor based research.
		Unique exposure to nuclear fuel cycle activities
		Material development for specific applications

Course Structure:

Sr. No.	Name of the Course	Course code
1	Mathematical Methods	PY1
2	Computational Methods	PY2
3	Introductory Reactor Physics and Engineering	PY3
4	Nuclear Physics and Nuclear Data	PY4
5	Engineering Drawing and Laboratory Practices and Experimental Methods	PY5
6	Reactor Materials	PY6
7	Radiation Detection and Measurements	PY7
8	Reactor Types and Advanced Reactor Concepts	PY8
9	Radiation Shielding Design and Protection	PY9
10	Reactor Dynamics and Safety Analysis	PY10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	PY11
12	Fluid Dynamics and Thermal Hydraulics	PY12
13	Advanced Computational Methods in Reactor Physics	PY13
14	Experimental and Operational Reactor Physics	PY14
15	Design Methods in Thermal and Fast Reactors and Computer codes	PY15
16	In Core of Fuel Management	PY16

Course Outcomes:

Name of the Course	Course code	Course Outcome
Mathematical Methods	PY1	Students learn vector spaces, Hilbert space, matrix methods, eigen value problems, differential and integral equations, complex variables.
Computational Methods	PY2	Since some complex equations cannot be solved analytically, numerical and computational methods are important. Students study the basics of computer architecture - hardware and software,
		Learn Various numerical methods
		Programming in Fortran and C
Introductory Reactor Physics and Engineering	PY3	Learn neutron physics, reactor physics including fast reactors; reactor kinetics and reactor control, all needed for working with nuclear reactors.
Nuclear Physics and Nuclear Data	PY4	Learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, nuclear models, nuclear data evaluation and processing which are Needed to work with nuclear reactors and for nuclear research.
Engineering Drawing and Laboratory Practices and Experimental Methods	PY5	Machine Drawings Projections, drafting, Autocad other material in this course are essential for engineers to produce accurate drawing for fabrication of small and large components for nuclear reactors and associated facilities.
Reactor Materials	PY6	Properties of nuclear fuels such as uranium, uranium oxide, plutonium, carbide and nitride fuels, MOX fuel, fuel fabrication, structural materials and clad materials, zirconium and alloys, moderators, Mechanical properties of materials, Radiation effects in materials, corrosion of metals and related topics makes this course a very important one for nuclear scientists and engineers.
		Ability to Solve unforeseen materials problems in operational reactors
		Ability to look for future candidate materials
Radiation Detection and Measurements	PY7	Required for radiation, safety workers and related scientists: Interaction of radiation with matter, radiation detectors including

		gas, semiconductor and scintillation detectors; ionization chambers; high resolution gamma spectroscopy, Monte Carlo simulations
Reactor Types and Advanced Reactor Concepts	PY8	Students will learn about different type of reactors such as Thermal reactors, fast reactors, High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR). Metal fuelled FBR and Accelerator driven systems (ADS); Indian reactors APSARA, CIRUS, DHRUVA, PHWR, FTBR AND PFBR
Radiation Shielding Design and Protection	PY9	Students will study Radiation sources, its interaction with matter; summary of basic interaction mechanisms of alpha, beta, gamma/x -rays and neutrons with matter; radiation dosimetry; Interaction of radiation with biological matter; Radiation toxicity, Risk factors; radiation protection, shielding, and nuclear emergency management
Reactor Dynamics and Safety Analysis	PY10	Neutron kinetics and thermal effects. Feedback effects; Description of main reactor systems. Coolant system behaviour. Plant dynamics; safety systems; Reliability and Probabilistic Safety Analysis and related topics are taught in this course
Fuel Cycle Physics and Introduction to Fuel Cycle	PY11	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India. Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Issues related recycling – Effective fissile content of discharged fuel for next cycle; re-fabrication of fuel for the next cycle Activity and toxicity of discharged fuel
Fluid Dynamics and Thermal Hydraulics	PY12	Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines; Navier Stokes equations; Hydrostatics – Manometry; Fluids subjected to uniform linear acceleration and uniform rotation; Thermal hydraulics.

		Important specialisation for understanding behaviour of reactor coolants (liquid sodium and water) for safe reactor operation
Advanced Computational Methods in Reactor Physics	PY13	Students will learn Methods of solving neutron Diffusion equation; Finite element method- its advantages and disadvantages. Coarse mesh rebalancing. Methods of solving neutron transport equation; (a) PN method (b) Discrete ordinates method (c) Collision probabilities methods; Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations.
Experimental and Operational Reactor Physics	PY14	In-depth exposure and develop expertise to experiential aspects of Reactor operations
		Dynamical methods to evaluate and monitor reactivity measurements
		Expertise to monitor delayed neutron counting and noble gas fission products to detect early stages of fuel failures.
		Exposure to operation aspects of various types of reactors
Design Methods in Thermal and Fast Reactors and Computer codes	PY15	Exposure to model and design of both thermal and fast reactors using neutron production, transport and reactions
		Expertise to use various design and validation codes for neutronics
In Core of Fuel Management	PY16	Develop expertise in various safety aspects of in-core fuel handling and management in different types of reactors
		Exposure to reactor specific fuel handling methods and controls
		Exposure to specialised computer codes for in-core fuel handling

III. Courses at RRCAT

Program Code : PHYS02	Programme Specific Outcome	Impart training to students to increase the knowledge base required for research work
		Enhance analytical and computational skill of the students required for carrying out research work
		Provide training to work with various scientific equipment including sophisticated lasers and radiation available from synchrotron sources Indus-1 and Indus -2

(A) Core Courses

(D) Reading Courses

Sr. No.	Name of the Course	Course code
1	Self-Reading	03PHYS02-001-R

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Engineering Mathematics	03PHYS02-001-C	This course reviews topics in Mathematics which are usually covered at the Master's level and are essential to understand the concepts of science and engineering
		This Course also deals with the advanced topics needed for carrying out research work in different areas of science and engineering
Magnet Physics and Technology	03PHYS02-002-C	Basic understanding of magnetism and its application.
		Analytical approach of magnet design mainly for accelerator application and field measurement technique.
		Fabrication technique and alignment of magnets.
Laser Physics and Technology	03PHYS02-003-C	This course introduces basic mechanism and principles of lasers, beam propagation, and optical resonators
		Introduction to physics and technology of various types of lasers
		This course introduces basic nonlinear optics
Electromagnetic Theory	03PHYS02-004-C	This course is meant for physicists and engineers. It reviews the M. Sc. Level and B. Tech level electromagnetic theory, and further strengthens some of the intricate concepts, and introduces new topics
		It emphasizes basic concepts needed to solve the electromagnetic boundary value problems, and prepares the students to develop better understanding of the computer codes used for that
		Students are expected to develop a better and rigorous understanding of generation of electromagnetic radiation, typically in synchrotron radiation source.
		Students learn about different types of electromagnetic waves – (i) plane waves, including its reflection and refraction at dielectric surface. (ii) Gaussian beams and Bessel beams, (iii) modes in waveguides and cavities, including its transport in microwave components and (iv) modes in optical fiber.

Accelerator Physics and Beam Diagnostics	03PHYS02-005-C	The course introduces basic concepts of accelerator physics and beam diagnostics.
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Reactor Physics, Radiation Physics, and Safety Issues	03PHYS02-006-C	Awareness about natural, man-made radiation, dose contribution from various practises, units and quantities, biological effects of radiation exposure and ICRP recommendations on radiation protection
		Awareness about the radiation hazards at work place, safe practises to be followed, exposure control measures, shielding philosophy and radiation detection.
		Understanding the radiation hazards at high energy electron and proton accelerators and laser facilities. Dose build up effects due to electromagnetic and hadronic cascade and its impact on radiation safety and tackling mechanisms
		Gaining fundamental concepts in reactor physics, interaction of various kind of radiation with matter.
Numerical and Mathematical Techniques and Scientific	03PHYS02-007-C	For rigorous and correct analysis of data (which are the outcome of research work), learning numerical and mathematical techniques is absolutely essential.
		This course teaches interpolation, extrapolation, error analysis etc which are integral parts of data analysis. The finite element method is a numerical method for solving problems of applied science and engineering, for example, structural analysis, heat transfer, fluid flow, mass transport etc
		Concept of scientific computing is necessary for numerically analyzing experimental and analytical results. For the same, programming languages (C and fortran) are taught.
		Different operating systems (windows, linux etc), which are taught, also help in understanding the working of computers, in turn, different aspects of scientific computing
Materials Science and Technology-I	03PHYS02-008-C	The course reviews the master's level solid state physics with certain advanced topics
		The advanced topics covered include: nonlinear properties of optical materials,

		electronic materials for novel applications like spintronics and introduction to symmetry and ferroelectric materials
		Students learn structures of various materials including alloys, ceramics, glasses, polymers, and composites
Applications of Lasers in Nuclear Science, Industry	03PHYS02-009-C	This course covers various applications of lasers in high resolution spectroscopy in metrology and medicine
		This courses exposes application of lasers in material processing
		This course introduces application of lasers in isotope separation
Applications of Accelerators in Nuclear Science, Industry	03PHYS02-010-C	This course aims to expose students to various applications of accelerators.
		Students become aware of applications in accelerator based radiotherapy and radiation processing
Vacuum Physics and Technology	03PHYS02-011-C	This course aims to introduce the basics of theory of vacuum
		Introduces various vacuum systems and components
		Students learn how to design a vacuum system
Quantum Mechanics	03PHYS02-012-C	This course reviews master's level quantum mechanics with more emphasis on problem solving and applications
		This course also covers advanced topics which will enhance understanding in many-electron systems and photo-atom interaction
Research Methodology	03PHYS02-013-C	Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

(B) Elective Courses

Name of the Course	Course code	Course Outcome
Modern Optics	03PHYS02-001-E	This course reviews the basic understanding of geometrical & wave optics with emphasis on topics of importance to lasers, laser-based measurements and laser-based systems.
		This course helps scholars to develop a sound understanding of optics required for designing and modelling lasers and laser-based systems.
Advanced Accelerator Physics	03PHYS02-002-E	This course discusses electron and ion sources, and the processes involved.
		This course discusses concepts related to proton and heavy ion linacs, transport of ion beams, and beam instabilities
		The course introduces advanced topics of free electron lasers, linear accelerator-based synchrotron radiation sources, laser plasma based accelerators and the concept of Accelerator Driven Systems.
Statistical Physics	03PHYS02-003-E	This course reviews master's level statistics focusing attention on quantum degenerate gases.
		This course helps scholars to develop deeper understanding of phase transition and concepts required to handle many-body systems of condensed matter and plasma physics
Plasma Physics and Technology	03PHYS02-004-E	This course aims to make students of basic plasma physics and the involved technology
		This course exposes students various aspects of plasma physics like waves in plasma, plasma production, plasma diagnostics, and plasma radiation
		This course introduces laser-plasma interaction at ultrahigh intensities
Materials Science & Tech. II	03PHYS02-005-E	To understand and interpret phase diagram for material synthesis.
		To learn about material synthesis by solid state and liquid phase route and methods of preparation of ceramics, thin film, nano-powder and single crystal
		To evaluate the direct & indirect band-gap, impurity & defect absorption, molecular vibrations by spectroscopic

		techniques like UV-vis-NIR spectroscopy, FTIR and Raman spectroscopy.
		To get acquainted with various spectroscopic instruments for materials like polarized light microscope, Scanning electron microscope, Transmission electron microscope and Scanning probe microscopes (AFM, STM).
Advanced Beam dynamics	03PHYS02-006-E	This course is meant for physicists, specializing in the field of particle accelerators. The selected topics on beam dynamics form the basis of design of modern particle accelerators.
		Students are expected to develop a clear understanding of how a charge particle beam evolves under the influence of applied electromagnetic field, including the self-force due to space charge
		Students learn about the physics underlying the phenomenon of emittance growth, and beam halo formation, which is a topic of current interest.
		The course prepares the students for using computational tools to address the design problems in the area of beam dynamics
Bio-photonics	03PHYS02-007-E	This course aims to introduce interaction of light with cells and tissues
		This course introduces optical imaging of tissues in turbid medium
		This course exposes the students to aspect of biomedical diagnosis and micromanipulation
Advance course on atom-photon interaction	03PHYS02-008-E	This course deals with interaction of light with matter at fully quantum and semi-classical levels
		This course exposes students to various perturbative and non-perturbative techniques to determine probabilities
		This course covers coherent dynamics of atoms in the interaction with light
		This course covers concepts of coherence of light and various quantum state of radiation field
Concepts in X-ray Physics	03PHYS02-009-E	The course deals with the basics of interaction between matter with x-rays
		The various x-ray based materials characterisation techniques like X-ray diffraction, X-ray absorption and

		photoelectron spectroscopy are dealt in details.
		This course is beyond the content matter of normal master level courses.
Physics of semiconductor Quantum structures	03PHYS02-010-E	The aim of this course is to introduce the students to various aspects of semiconductor nanostructures
		Students learn aspects of growing nanostructures
		Students learn various methods of characterising nanostructures

(C) Laboratory Courses

Name of the Course	Course code	Course Outcome
Laser and Applications	03PHYS02-001-L	Students get first-hand experience in handling various lasers and laser-based instrumentations
		Students learn various techniques to align and characterize lasers
Accelerators related applications	03PHYS02-002-L	Students get first-hand experience in handling various instruments needed for accelerator technology
Electronics	03PHYS02-003-L	Students get first-hand experience in handling various instruments required for electronics, image processing, and RF components
		Students are also expected to learn and handle GUI software and communication protocols

(D) Reading Courses

Name of the Course	Course code	Course Outcome
Self-Reading	03PHYS02-001-R	This course helps scholars to develop understanding in some of the key topics related to his/her research work

M.Sc. in ENGINEERING SCIENCES

(Program Code: ENGG03)

Course Structure:

I. Courses at BARC

Program Code : ENGG03	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

	EN593	ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem

(B) CHEMICAL ENGINEERING COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1
2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design
		Shallow and deep foundation design; machine foundation design

Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN5A93	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics

		Understanding Transmission Lines, Waveguides, RF Amplifiers,
Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters

		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models

		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code

5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720

(G3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(G2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

Computer Based System Design II	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Digital Signal Processing & Image Processing	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(G3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(H)COMPUTER SCIENCE AND ENGINEERING

(H1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Operating Systems	EN606
2	Computer Graphics & Visualisation	EN613
3	Distributed Computing	EN616
4	Networking & Information Security	EN627
5	Reactor Control Engineering	EN637
6	Software Engineering and Formal Methods	EN640

(H2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Data Base Management System & Web Technology	EN705
3	Digital Signal Processing & Image Processing	EN706
4	Embedded Electronics Software	EN707
5	Feedback Control System	EN708
6	Image Processing & Machine Vision	EN710

(H3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life

Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

BACK TO MAIN

Course Structure:

II. Courses at IGCAR

Program Code: ENGG03	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(A) MECHANICAL ENGINEERING

(A1) CORE ENGINEERING

Sr. No.	**Name of the Course**	**Course code**
1	Code Design for Pressure Vessels and Piping	ME1
2	High Temperature Design and Inelastic Analysis	ME4
3	Computational Fluid Dynamics	ME6
4	Finite Element Method	ME8
5	Advanced Heat and Mass Transfer	ME10
6	Reliability Engineering	ME13
7	Manufacturing Technology	ME14

Sr. No.	**Name of the Course**	**Course code**
1	Machine Design	ME3
2	Structural Integrity Assessment Methods and NDE	
3	Vibration Engineering and condition Monitoring	
4	Seismic Design of Nuclear Reactors and Facilities	ME5
5	Plant Dynamics	

6	Experimental Mechanics	
7	Process Control and Instrumentation	ME15

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping. In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

<table>
<tr><td></td><td></td><td>design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.</td></tr>
<tr><td>Computational Fluid Dynamics</td><td>ME6</td><td>Basics of Fluid Flow, Heat Transfer and Numerical Analysis
Numerical Solution of Complete Fluid Flow and Energy Equation</td></tr>
<tr><td rowspan="4">Finite Element Method</td><td rowspan="4">ME8</td><td>Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element</td></tr>
<tr><td>2D isoparametric formulation</td></tr>
<tr><td>Introduction to Nonlinear problems</td></tr>
<tr><td>Finite element applications for design</td></tr>
<tr><td>Advanced Heat and Mass Transfer</td><td>ME10</td><td>Advanced knowledge in heat and mass transfer
Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
Heat transfer in porous media and heat transfer with phase change
Radiation heat transfer</td></tr>
<tr><td rowspan="4">Reliability Engineering</td><td rowspan="4">ME13</td><td>Regression analysis, Functions of Random Variables</td></tr>
<tr><td>Probabilistic Fracture Mechanics</td></tr>
<tr><td>System Reliability Analysis</td></tr>
<tr><td>Reliability in Engineering Design</td></tr>
<tr><td rowspan="2">Manufacturing Technology</td><td rowspan="2">ME14</td><td>The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.</td></tr>
<tr><td>Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.</td></tr>

</table>

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	Training in formulating and execution of a research project.
Seminar -1,2,3	02ENGG04-001-S	training in presentation of research results orally and in writing.

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	The subject is aimed on advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	Training in formulating and execution of a research project.
Seminar -1,2,3	02ENGG04-002-S	training in presentation of research results orally and in writing.

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Preparedness &Response to Nuclear Emergencies Artificial Intelligence Methods &Applications Membrane/ Separation Process and Technology	CEEL

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	Training in formulating and execution of a research project.
Seminar -1,2,3	02ENGG04-003-S	training in presentation of research results orally and in writing.

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

(E) FAST REACTOR ENGINEERING – I

(E1) FUNDAMENTALS

Sr. No.	Name of the Course	Course code
1	Nuclear Reactors & Sodium Technology	NR
2	Reactor Engineering	RE
3	Fast Reactor Physics and Shielding	RP

4	Materials and Metallurgy	MM
5	Health Physics and Radiological Safety	HP

(E2) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Code Design for pressure vessel and piping	FRE1
2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2

4	Reliability Engineering	FRE4
5	Process Design and Control	FRE5
6	Vibration Engineering and Condition Monitoring	FRE6
7	Seismic Design of Nuclear Reactors and Facilities	FRE7
8	Emergency Preparedness and Disaster Management	FRE8

(E3) OPERATIONS

Sr. No.	Name of the Course	Course code
1	Plant Dynamics and Control	FRE9
2	Turbine Generator Fundamentals	FRE10
3	Mechanical and Electrical Equipments	FRE11
4	Maintenance Engineering	FRE12
5	Regulatory Framework for NPPs	FRE13
6	Practical's	FRE14
7		Viva Voce

Course Outcomes:

(E1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(E2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for pressure vessel and piping	FRE1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tube sheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.

Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2	Advanced knowledge in heat and mass transfer
		Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
		Heat transfer in porous media and heat transfer with phase change
		Radiation heat transfer
Transport Phenomena	FRE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyse transport problems
		Analyse transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyse transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(F) FAST REACTOR ENGINEERING – II

2	Turbine Generator Fundamentals	FRE10
3	Mechanical and Electrical Equipments	FRE11
4	Maintenance Engineering	FRE12
5	Regulatory Framework for NPPs	FRE13
6	Practical's	FRE14
7		Viva-Voce

Course Outcomes:

(F1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(F2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	FRE15	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	FRE16	Students learn about basics of interaction of radiation with matter.
		Principle & Techniques to detect and measure ionizing radiation.
		Basics of radiation counting statistics
		Introduction to Neutron Flux Measurement in FBTR and PFBR.
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Embedded System Design & Human Machine Interface	FRE17	Introduction to Microprocessor Based Hardware Design
		Computer Communication and Networks
		Fault Tolerant and Distributed Architectures
		Programmable Logic Controller Design
		Overview of plant automation and Human Machine Interface (HMI)

Process Instrumentation	FRE18	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of various process variables
		Reliability principles, Fail safe design principles
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(F3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine Turbine troubles
Mechanical and Electrical Equipments	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To assess the understanding of the subject by the student and applying in problem solving.

BACK TO MAIN

Course Structure:

III. Courses at IPR

Program Code: ENGG03	Programme Specific Outcome	Learn about Plasma basics, its diagnostics and its applications.
		Learn Plasma and Fusion Technologies to build a device.
		Get detailed information on specific subject related to Fusion technology according to the stream of student i.e. Physics , mechanical etc.

T1. FUNDAMENTAL

Sr. No.	Name of the Course	Course code
1	Basic Plasma Physics	FC1
2	Experimental Plasma Physics	FC2

Course Outcomes:

T1. FUNDAMENTAL

Name of the Course	Course code	Course Outcome
Basic Plasma Physics	FC1	Course provides detailed information on,
		• Definition of plasma, description of collective behaviour in contrast to single particle behaviour.
		• Lorentz force equation, nonrelativistic motion of a charged particle in constant electric and magnetic field.
		• Fluid Description of Plasma, Waves in Plasma and MHD Description.
Experimental Plasma Physics	FC2	Course provides detailed information on,
		• Fundamental Gas Processes i.e. Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization,
		• Charged Particles in a Gas.
		• Self-sustaining Discharge i.e. Glow Discharge, Breakdown under Special Conditions, Arc Discharge.
		• Plasma Sheath and Diagnostics Experimental Plasma Devices.
Tokamaks	FC3	Course provides detailed information on,
		• Introduction to Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor,
		• Equilibrium and Transport i.e. Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport,
		• Heating i.e. Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive, Ion Cyclotron

		Resonance Heating, Electron Cyclotron Resonance Heating. • MHD Stability i.e. Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios. • Tokamak and Other Fusion Devices
Fusion Plasma Diagnostics	FC4	Course provides detailed information on, • Introduction to Tokomak diagnostics , Electrical diagnostics, Magnetic diagnostics • Measurements of plasma density and electron temperature i.e. Thomson scattering diagnostics, Reflectometery, Interferometry: ECE diagnostics. • Measurement of ion temperatures i.e. Charge exchange recombination spectroscopy (CXRS), X –ray crystal spectroscopy. • Measurements of Radiated power and Measurements of operational parameters i.e. Bolometers, Imaging Diagnostics and Beam emission spectroscopy.
Measurement Techniques	FC5	Course provides detailed information on, • Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements. • Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability. • Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power. • Sensors/Transducers and Their Applications to Physical Measurements , Introduction to Data Acquisition and Noise in Measurement System.
Numerical Methods	FC6	Course provides detailed information on, • Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study. • Solutions of Linear Algebraic equations. • Numerical Differentiation and Integration • Roots, optimization and nonlinear sets of Equations. • Application of Ordinary Differential equations. • Application of Partial Differential equations.

		• Application of Curve fitting methods.
Mathematical Methods	FC7	Course provides detailed information on,
		• Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl
		• Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors
		• Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series,
		• First and second order differential equations with constant and variable coefficients; Linear differential equations
Vacuum, Cryogenics and Magnets	FC8	Course provides detailed information on,
		• Fundamental of vacuum i.e. The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pump down time, Outgassing and permeation. Exposure to pumps and gauges.
		• Design of a vacuum system
		• Fundamental of cryogenics i.e. Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.
		• Design of cryogenics system i.e. Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
		• Applications of Cryogenics Engineering in Fusion machines.
		• Fundamentals of Magnet system
		• Design and fabrication of magnet system

T2. CORE SUBJECTS

Name of the Course	Course code	Course Outcome
Fusion Neutronics	AS1	Course provides detailed information on, • Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes. • Particle transport phenomena in matter and Basics of fusion neutronics & blanket neutronics. • Principles of Neutron & Fusion product diagnostics, Radiation and licensing and Radiation damage & transmutation.
Plasma Facing Components: First Wall, Divertors, Blankets	AS2	Course provides detailed information on, • First Wall, Firstwall Concepts, Loads on Firswtall and Challenges for Firstwall. • Divertor Concepts , Loads on Divertor , Challenges for Divertor , Divertor Testing and Novel Divertor Concepts • Blanket Concept, Shield Blanket, Breeding Blanket, Liquid Metal (Pb Li) Technology, Fusion Fuel Cycle and Blanket Safety.
Fusion Materials	AS3	Course provides detailed information on, • Fundamentals of Material Science • Fusion Materials Requirements & Issues • Material Development and Joining Technologies • Material Characterization & Qualification
RF, Current Drive and Neutral Beam Heating	AS4	Course provides detailed information on, • Heating and current drive physics by neutral beam • Neutral beam injector system design and engineering • Introduction to RF heating • RF devices and Design tools i.e. ICRH, ECRH and LHCD.

T3. ELECTIVES

(A) PHYSICS

Name of the Course	Course code	Course Outcome
Magneto Hydro Dynamics	PH1	Course provides detailed information on, • Physical description of electrically conducting fluids .Derivation of basic MHD equations: Continuity, Equation of

		motion, Energy flow, Ohm’s law, Validity of MHD equations.
		• The low frequency dynamics of the electromagnetic field. Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of • resistivity, Similarity scaling, The Wöltjer invariants and helicity
		• Equilibrium general considerations, The Virial Theorem, Examples of simple equilibria: - pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm a shape, etc.
Kinetic Theory and Statistical Mechanics	PH2	Course provides detailed information on,
		• Gas dynamic way of describing an uncharged fluid – heuristic
		• Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
		• Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
		• Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
		• Examples of GK formalism and obtained transport and Very cursory introduction to Onsager relationships
Advanced Heat Transfer and Cryogenics	PH3/ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
Tokamak Related Code	PH4	Course provides detailed information on,
		• Plasma core modelling i.e. Plasma equilibrium IPREQ , Plasma transport TSC , Plasma stability ERATO, PEST2 , ICRH heating TORIC , NBI heating NUBEAMS , Plasma start up model , Reactor system code , Eddy current analysis.
		• Edge-SOL studies i.e. 2D blob transport, Divertor study SOLPS (B2+ERINE) , 3D plasma study ERINE-3D

		• First principle simulations i.e. Low frequency (w/wc <<1) transport – what is Gyrokinetic method? , What are the transport processes neglected by gyrokinetic formalism?

(B) MECHANICAL

Name of the Course	Course code	Course Outcome
Code Design for Internal and External Pressure Vessel	ME1	Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
		Thick cylinder, sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div. – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
		Bending of circular plates and determination of stresses in simply supported and clamped Circular plate. Basis of ASME equation for flat closures.
		Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
Finite Element and Volume Methods	ME2	Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation , piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
		Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
		2D plane elements – 3 node triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
		Finite element applications for design: Finite element modelling and discretization criterion,

		h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.
Mechanics of Solid/Vibration/Remote Handling	ME3	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Laminar Boundary Layer and Forced Convective Heat
		Turbulent Flow and Heat Transfer
		Natural Convection
		Numerical Solution of Complete Fluid Flow and Energy Equation
Advanced Manufacturing Technologies	ME4	Advance manufacturing processes i.e. mechanical energy based processes , electrical energy based processes, chemical and electro-chemical energy based processes.
		Advanced materials joining and testing i.e. bolting , riveting , soldering , blazing ,adhesive bonding , diffusion bonding , mechanical joining, fusion welding, oxyacetylene welding , smaw , gtaw , gmaw , fcaw ,saw , esw, high energy beam welding.
		Responses of materials to welding i.e. microstructural changes , distortion , defects, undercuts ,overlaps , grain growth , blowholes , inclusions.
		Destructive and non-destructive tests for welds.
Advanced Heat Transfer and Cryogenics	ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
		Cryogenic Insulations
		Instrumentation in Cryogenics

(C) ELECTRICAL

Name of the Course	Course code	Course Outcome
Advanced Data Acquisition System	EE1	Course provides detailed information on,
		• Theory of Quantization , Advanced Data Acquisition Systems
		• Data Acquisition Interface , Analog Input/output
		• DAQ Clock and Trigger , Synchronization
		• SST-1 Data Acquisition System

Advanced Tokamak controls	EE2	Course provides detailed information on, • Fundamentals of Control System i.e. Terminology and basic structure of control system , Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems. • Different types of Control Systems • Introduction to Plasma Control • ITER Instrumentation & Control • SST-1 Operation &Control • Monitoring and Control of Auxiliary Systems
High Voltage, DC& AC/ Power Supplies	EE3	Course provides detailed information on, • Overview of Electrical systems in Fusion machines i.e. Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement. • High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. • Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive, Requirement for arc fault protection, Protection by crowbar. • Power Electronics and design through modelling & simulation i.e. AC-DC Converters; Forced commutation;

		synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines.
Signal Conditioning and EMI/EMC Aspects	EE4	Course provides detailed information on, • Analog Signal Conditioning i.e. Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation. • Signal Processing and Applications i.e. Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters. • EMI/EMC i.e. Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling Inductance Coupling, Shielding. • EMI Modelling i.e. Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns.
Computer Based System Design	EE5	Course provides detailed information on, • Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications. • Asynchronous and synchronous communication, • Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. • Real-time Systems, their characteristics and applications, Real-time Operating Systems Concepts of Process and threads, Concurrency, Latency, context switching, scheduling policies.
Digital Signal Processing and Image Processing	EE6	Course provides detailed information on, • Basic elements of a digital signal processing system, Fourier series and Fourier transform, z transform Convolution, Correlation, Sampling

		theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.
		• Discrete Fourier Transform, Interpretation of DFT, Properties of DFT, DFT of real signals, Fast Fourier Transform Digital filters, DSP Applications.
		• Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.
		• Image Enhancement i.e. Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Color image processing.
		• Image Segmentation and Analysis i.e. Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.
		• Morphological operations i.e. Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

T4. MINI PROJECT (MP)

Name of the Course	Course code	Course Outcome
Mini Project	06ENGG01-001-MP	Student learns: • Literature Survey • Study of a small section of the major project based on either simulation or fabrication to realize the criticality and requirements to build a component for plasma application. • Practise for thesis writing

T5. PROJECT (P)

Name of the Course	Course code	Course Outcome
Project	06ENGG01-001-P	• Complete understanding about the criticality of a particular component to be built for plasma application.
		• Development of a component for a plasma application and get hands on experience.
		• Thesis report.

Ph.D. in APPLIED SYSTEMS ANALYSIS
(Program Code: APSA04)

Course Structure:

I. Courses at NISER

Program Code : APSA04	Programme Specific Outcome	Policy oriented research
		Multidisciplinary approach for Problem solving
		Interaction between natural science and Social Sciences

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Research Methods - I	H 601	Understanding logic and empiricism
		Creating perspectives, theory building
		Legacy of science and scientific method
Research Methods - II	H 602	Understanding of Qualitative and quantitative research
		Imparting basic Research skills and ethical principles in research
		Inputs on data collection methods and techniques
		Inputs of Data Analysis and Report writing

(B) ELECTIVES

Name of the Course	Course code	Course Outcome
Advanced Economic Theory	H 611	Advanced knowledge of micro economic theory
		Advanced knowledge of macroeconomic theory
		Applications of the theories in various fields
Econometric Theory and Applications	H 612	Sample designing
		Regression using cross section data
		Regression using time series data
		Regression using panel data
Issues in Public Finance	H613	Budgeting
		Rule based and discretionary fiscal policy
		Public debt of Union and states
		Tax reforms
Development Economics	H614	Alternative approaches to development
		Different inequality measurement
		Different poverty measurements and controversies
		Basics of health economics and education
Environmental and Ecological Economics	H615	Environmental degradation and economic consequences
		Alternative approaches to control pollution
		Valuation methods
		Integrated environmental and economic accounting
Poverty, inequality and Development	H616	Debates on poverty measurements in India
		Measures of inequality
		Poverty and inequality in India
		Critiques of development policies to address poverty and inequality in India
Project Evaluation	H617	Welfare foundations of project evaluation
		Alternative approaches of project evaluation
		Case studies
Indian Industrial Development	H618	Review of Indian Industrial Policies since independence
		Policies for small scale industries
		Policies for foreign direct investment
New Institutional Economics	H619	Introduction to NIE
		Role of property rights, transaction costs in economic development.
		Role of norms and contracts in economic development
International Trade and Finance	H620	Evolution of IT theories
		International trading system
		Recent developments in international trade
		Recent status of international monetary system
Topics in experimental and behavioural approaches to economic development	H621	Basic concepts of behavioural economics
		Overview of experimental economics
		Application of behavioural and experimental economics

Environmental Economics and EIA	H 622	Broad aspects of environmental economics
		Environmental legislations in India
		Environmental Impact Assessment in India
Humanities and the Institutional Space	H631	To critically engage with the concept of the 'humanities.'
		To understand its place in the modern educational system.
		To examine the notion of 'value' with reference to disciplinary streams.
The Modern European Novel	H632	To survey modern European fiction.
		To examine the broader themes and contexts predicating the text.
		To build an understanding of the primary tropes inhabiting these narratives.
The idea of the nation in Indian English Fiction	H633	To gain substantial knowledge about the concepts of nation, nation-state, the Euro-centric as well as Indian notions of these ideas and the historical evolution of the same
		To be familiar with various literary texts coming within the purview of "Indian English fiction" and the numerous ways in which they grapple with the idea of nation
Black Intellectual traditions and the Narratives of Race in America	H634	To understand the intellectual evolution of race theory in America.
		To cross reference color hierarchies across geographies.
		To evaluate concepts such as citizenship, community and justice in relation to African American literary narratives.
Writings of the South Asian Diaspora	H 635	To be familiar with the history, significance, and related concepts about 'diapsora'
		To know the role of the colonial project in the creation of displacement and diaspora
		To be familiar with some of the prominent south Asian diasporic writers and their writings
		To be familiar with some of the major concerns in south Asian diasporic writings
Translation and Culture: Issues and Perspectives	H 636	To know about the importance of literary translation and be familiar with various translation theories and the ways in which they approach translation
		To understand and appreciate the difficulties of cross-cultural translation
		To have some familiarity with issues of adaptation (such as literary text to film)
Organizational Behaviour	H 651	Acquire knowledge and thorough understanding of the historical background and growth of OB
		Understand the dynamics of individual human behavior and group behavior at the workplace.

		Identify and analyze how individuals, groups and organization systems interact to influence organizational effectiveness and efficiency.
Leadership	H 652	understood the different attributes of effective leadership in terms of traits and styles.
		Compare and contrast different leadership theories and their relevance within a context.
		Sources of power and its influence on leader-member relationship in a diverse and interdependent group.
Organizational Change and Development	H 653	Define the different concepts of Organizational Change and Organizational Development
		Explain different change models, the need for change.
		Learn about different OD models, diagnosis, intervention and evaluation.
		Discuss OD process and human resource within the framework of organization's culture.
Positive Psychology	H 654	Understand the basic assumptions, principles and concepts of Positive Psychology
		Study positive phenomena in real life as to how it applies to relationships and teams.
		To identify and describe research methods predominantly used in positive psychology research.
		Critically evaluate theory and research
Cross Cultural Psychology	H 655	Have a strong knowledge base in the concepts and theories of cross-cultural psychology
		Acquire an overview of methods used in cross-cultural research, critically evaluate cross-cultural research and review the generalizability of such research findings.
		Identify the ways in which cultural dimensions influence human cognition and behavior
Business Ethics	H 656	Understand and evaluate various ethical frameworks of business decision making
		Analyze the relationship between macroeconomic policy, good economics and corporate social responsibility.
		Understand stakeholder relations and challenges to ethical business in a globalized world.
Classical Sociological Theory	H 671	Application of Sociological theories
		Understanding the fundamental concepts and perspectives
		Conceptualisation of social systems/structures/functions
Information and Society (Theory)	H 672	Demonstrate an understanding of the impact of information & information technology on society & change process.

		Identify key issues involved in the development of the Information Society.
		Articulate personal perspectives and show a critical awareness of the positive and negative issues of the information society.
		Use the internet and social media to develop communication skills and share information.
Sociology of Development	H 673	Understanding various notions of development
		Broadened perspectives on various models of development
		Understanding development indicators and contemporary issues in Development
Contemporary Social Theory	H 674	Able to demonstrate an understanding and knowledge of a range of sociological theorists and their contributions to the field.
		Able to assemble ideas about sociological theory into a coherent argument, applying the tools of critical analysis.
		Evaluate the theories encountered and assess their relevance to contemporary problems.
		Analyze the differences between theories according to different social realities.
Qualitative Research Methods	H 675	Able to understand the nuances of qualitative research approaches
		Skills for qualitative research tools
		Making sense of qualitative data and analysis
		Competence for report writing
Quantitative Research Method I	H 676	Able to collect, organize, design, and draw inferences from data with respect to a question using appropriate statistical methodology and problem solving skill.
		Able to read, interpret, and critically analyze journal articles directed at Ph.D. students.
		Arrange a sample survey for his/her own research purposes.
		Undertake univariate and bivariate statistical tests as appropriate.
Social Network Analysis I	H 677	Able to collect, organize, design, and draw inferences from data with respect to a question using appropriate statistical methodology and problem solving skill.
		Able to read, interpret, and critically analyze journal articles directed at Ph.D. students.
		Arrange a sample survey for his/her own research purposes.
		Undertake univariate and bivariate statistical tests as appropriate.

BACK TO MAIN

Ph.D. in CHEMICAL SCIENCES
(Program Code: CHEM04)

Course Structure:

II. Courses at IGCAR

Program Code : CHEM04	Programme Specific Outcome	Theoretical work for understanding solvent – metal ion interactions.
		Matrix isolation spectroscopy to understand conformers and weak molecular attractions
		Solvent development for reprocessing of nuclear fuels.
		Novel sensor materials development and characterization for sensor applications
		Materials development for matrices for nuclear waste immobilization

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Mathematical and Computational Methods, Numerical Analysis and Computer Programming	CH1
2	Chemical Thermodynamics	CH2
3	Electrochemistry	CH3
4	Introduction to Materials Science and Engineering	CH4
5	Analytical Chemistry for Nuclear Fuel Cycle	CH5
6	Chemical Instrumentation and Laboratory Techniques	CH6
7	Health Physics and Radiation Sciences	CH7
8	Introductory Reactor Physics and Fuel Design	CH8
9	Chemistry of Fuel Cycle - I	CH9
10	Chemistry of Fuel Cycle - II	CH10
11	Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH11
12	Nuclear and Radiochemistry	CH12
13	Corrosion Science and Engineering	CH13
14	Quantum Chemistry & Group Theory	CH-14
15	Molecular Spectroscopy	CH-15
16	Lasers and Application	CH-16
17	Nanomaterials and Advanced Chemical Sensors	CH-17
18	Course on Research Methodology	CH-RM

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Mathematics and Computational methods	CH-1	Practical applications of mathematical and computational methods are taught; besides these, computational software packages are introduced. The course basically prepares students to apply these aspects in their research areas for solving problems.
Chemical Thermodynamics	CH-2	This course helps students to understand various processes employed in chemical industries. Experimental methods to determine thermodynamic properties and phase diagram investigations are unique to this course. Estimation of thermodynamic properties and thermodynamic modelling study helps for a career in research and industry.
Electrochemistry and Corrosion Science	CH-3	Fundamentals and practical applications of electrochemistry are discussed. Advanced electrochemical techniques, pyrochemical process are taught. Aqueous corrosion and engineering help students to take up career in research and industry.
Introduction to Materials Science and Engineering	CH-4	Various characterisation techniques are taught. Material synthesis methods e.g. sol-gel are discussed extensively. Students handle various characterisation tools e.g. XRD, and Thin-film deposition followed by characterisation.
Analytical Chemistry for Nuclear Fuel Cycle	CH-5	Handling and learning about various sophisticated analytical techniques and instrumentation. Students are exposed to latest analytical techniques. Methodology for development of analytical technqiues for various materials is discussed. This Course prepare students for both research and industry.
Chemical Instrumentation and Laboratory Techniques	CH-6	This course helps students to have flair for setting-up of facility and analytical instruments.

Health Physics and Radiation Sciences	CH-7	Specialised course for students to work on radiation and associated safety aspects. Basics of interaction of radiation with matter. Introduces theory of various nuclear radiation detectors and their practical applications Introduces Biological Effects, Radiation Protection and Regulation procedure, Emergency Preparedness and Management
Chemistry of Fuel Cycle-I	CH-9	This course gives basic introduction to nuclear materials and thermodynamic properties of fuel at higher temperature. Many theories and concepts taught will be directly applied to nuclear plants.
Chemistry of Fuel Cycle-II: Actinide chemistry and separation science	CH-10	This course gives basic introduction to nuclear reactors and fuels. Many theories and concepts of re-use of nuclear fuel, need for nuclear energy are dealt extensively.
Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH-11	Brief overview of nuclear reactors in India and across the world. Details of nuclear materials are dealt extensively.
Nuclear and Radiochemistry	CH-12	Advanced course in nuclear chemistry. Helps students to understand and appreciate various fundamental aspects of radioactivity. Practicals help students to develop expertise in handling radioactive materials. Students measure half-life of radioactive nuclides. The fundamentals and applications taught helps in preparing students for various out-reach programs.
Corrosion Science and Engineering	CH-13	Fundamentals and practical applications of corrosion science and engineering help students to take up career in research. Also prepares students for a career in industry.
Quantum Chemistry & Group Theory	CH-14	Train students to gain expertise in theoretical chemistry. Students are trained to handle modelling software packages. Students apply these for metal-

		complexation, weak intermolecular interactions, thermodynamic calculations.
Molecular Spectroscopy	CH-15	Train students to gain expertise in theoretical chemistry. Besides applied experimental spectroscopy is taught which helps candidate in research career and subsequent job prospects. Special techniques such as matrix isolation spectroscopy, laser-Raman techniques are taught with experimental demonstration.
Lasers and Application	CH-16	(a) Both fundamentals and general applications of Lasers are taught. (b) Students handle lasers in the practical for technological applications. (c) Students handle lasers for various analytical chemistry applications.
Nanomaterials and Advanced Chemical Sensors	CH-17	The fundamental knowledge gained in this course had helped to (a) understanding and development of materials (b) tailor made materials for preparation of chemical sensors (c) indigenous sensors (d) special sensors (for e.g. in-sodium) which have to be developed - which will not be supplied by commercial sources.
Course on Research Methodology	CH-RM	Ethics in research, plagiarism, manuscript writing, Data analysis, presentation of results are dealt extensively. Ensure students are ready for taking up research work.

Course Structure:

III. Courses at NISER

Program Code : CHEM04	Programme Specific Outcome	Ability to pursue a career in chemical research
		Human resource with knowledge base in theoretical and experimental chemistry
		Ability to work on societal problems involving chemistry
		Ability to apply the basic concepts and principles of chemistry in solving real life problems

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Physical Methods in Chemistry I	C606
2	Physical Methods in Chemistry II	C601
3	Coordination Chemistry	C604
4	Chemical Binding	C605
5	Advanced Organic Chemistry	C665

(B) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Chemical Rate Processes	C602
2	Chemistry of Heterocycles and Natural Products	C603

5	Solid State Chemistry	C652
6	Crystallography	C654
7	Principles of Drug action	C655
8	Advanced Bio-inorganic Chemistry	C656
9	Nuclear Magnetic Resonance	C657
10	Advanced Functional Materials	C658

11	Supramolecular Chemistry	C659
12	Chemistry of Nanomaterials	C660
13	Polymer Chemistry	C662
14	Molecular Reaction Dynamics	C663
15	Theory of Molecular Spectroscopy	C664
16	Catalysis: Reaction Mechanisms and Applications	C666
17	Advanced Main group Chemistry	C667
18	Advanced Fluorescence Spectroscopy	C668
19	Biomacromolecules	C669
20	Advanced Heterocyclic Chemistry	C670
21	Statistical Mechanics	C671
22	Photochemistry	C751
23	Pharmaceutical Chemistry	C752
24	Group Theory and Molecular Spectroscopy	C753

(C) LIST OF RESEARCH PROJECT COURSES

Sr. No.	Course Name	Course No
1	Minor Organic Chemistry Project-I	C754
2	Minor Organic Chemistry Project-II	C755
3	Minor Inorganic Chemistry Project-I	C756
4	Minor Inorganic Chemistry Project-II	C757
5	Minor Physical Chemistry Project-I	C758
6	Minor Physical Chemistry Project-II	C759

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Physical Methods in Chemistry I	C606	Understand the basics of absorption and fluorescence spectroscopy.
		Theoretical prediction of absorption maximum of some organic molecules.
		Identifying and distinguishing various type of electronic transition using solvent perturbation techniques.
		Understanding the concept of micro polarity and the importance of this parameter in spectroscopy
		Understanding some important photoprocessess such as electron transfer and energy transfer and their applications in energy related applications.

		Applications of fluorescence spectroscopy in detecting various analytes (Sensing applications)
Physical Methods in Chemistry II	C601	Understanding the concepts of energy minimization, frequency calculations and transition state optimization.
		Practical experience in applications of quantum chemical calculations
Coordination Chemistry	C604	Understand the fundamentals of Group Theory and apply it to molecular spectroscopy
		Understand the link between molecular spectroscopy, symmetry and information content of molecular spectra.
		Understanding the formation of molecular orbitals.
		Calculate/predict energy levels and spectral features using symmetry as a simplification tool
		Use symmetry arguments to possibly solve molecular Problems.
Chemical Binding	C605	Understand the quantum mechanics of molecules
		Construct molecular orbitals for polyatomic molecules
		Apply symmetry and molecular orbital theory to derive molecular terms
		Understand the theory Hartree-Fock (HF), DFT, and semi-empirical methods
Advanced Organic Chemistry	C665	Understanding of important organic transformations with advanced mechanisms.
		Learning the recent advances in organic chemistry
		Enhanced ability to connect the learned topics with current research problem and envisage new research projects.

(B) ELECTIVES

Name of the Course	Course code	Course Outcome
Chemical Rate Processes	C602	Understanding of important organic transformations with advanced mechanisms.
		Learning the recent advances in organic chemistry
		Enhanced ability to connect the learned topics with current research problem and envisage new research projects.
		Understanding of important organic transformations with advanced mechanisms.

Chemistry of Heterocycles and Natural Products	C603	Understanding nomenclature, structure and reactivity of aromatic and non-aromatic heterocycles.
		Understanding the design and application of various organic reactions for the synthesis of natural products.
		Understanding the classification, structure and synthesis of biomolecules
Molecular Modeling	C651	Construct potential energy surfaces and force-fields for molecules
		Perform HF, DFT, and semi-empirical calculations on molecules
		Perform chemical dynamics simulations for simple reactions
		Apply molecular dynamics and Monte-Carlo simulations on large sized molecules
Classics in Molecules	C653	To learn discovery of organic molecules and their impact on the world such as Urea, Glucose, & Penicillin
		To understand the basic organic chemistry for learning chemical biology
		To learn the small organic molecules that interaction with molecular targets
		To find the nature of drugs and their function in biological changes
Solid State Chemistry	C652	Describe the principles concerning solid state structures
		Describe specific crystal structures by applying basic crystallographic concepts
		Describe the experimental use of the diffraction phenomenon
		Use powder diffraction data for characterising cubic substances
		Analyse thermograms and phase diagrams in known systems
Crystallography	C654	Define concepts such as lattice, point and space groups
		Be familiar with Bragg's Law and explain its the relation to crystal structure
		Identify and describe different diffraction methods
		Interpret and assign X-ray and electron diffraction patterns
		use crystallographic data for a validated phase analysis
Principles of Drug action	C655	To learn pharmacokinetics and pharmacology
		To understand absorption, distribution, metabolism, and excretion of drugs

		To learn various stages of drug discovery process such as clinical trails
		To find the modern drug discovery and development processes including the identification of molecular targets, High-throughput screening (HTS)
Advanced Bio-inorganic Chemistry	C656	Apply the basic principles in inorganic and general chemistry to interdisciplinary topics in the field of bioinorganic chemistry.
		Describe the main roles of metal ions in biological processes, and identify the chemical properties that are required to each particular function.
		Describe the role of metal ions in enzymes involved in acid-base reactions.
		Describe the role of metal ions that are involved in electron-transfer reactions in biological systems.
		Describe how oxygen is transported in different species and identify the metal centers involved in this task.
		Describe the different metal-activation sites in enzymes that are involved in the activation of oxygen.
		Identify the main toxicological mechanisms of metals and the biological defenses against the toxic effects.
		List some medical applications of inorganic compounds.
Nuclear Magnetic Resonance	C657	Theoretical understanding of the basic working principle of NMR spectroscopy.
		Building in-depth knowledge of the routinely performed experimental steps.
		Analysis of pulse sequence of few key one- and two-dimensional experiments to understand how certain spectra are generated.
		Understanding the theory behind common problems encountered during routine operation of an NMR spectrometer.
Advanced Functional Materials	C658	Introduction to materials in modern technology
		Learn about semiconductor and dielectric materials.
		Exploring the role of magnetic materials in inter-disciplinary sciences
		Use of polymer materials and nano-composites in chemistry and day-today life.
Supramolecular Chemistry	C659	Learn various noncovalent interactions.
		Design the synthesis of novel macrocycles

		Understand the stabilization of anions, cations and neutral substrates.
		To evaluate the binding and stability constants
Chemistry of Nanomaterials	C660	Key concepts of Bottom-up and Top down approaches
		Understanding the mechanism of formation of 0-D, 1-D, 2-D, 3-D
		nanostructured materials.
		Understanding the structure-property relationship of carbon nanomaterials and
		self-assembled monolayers.
		Application of nanomaterials for energy applications and biological applications.
Polymer Chemistry	C662	Different types of polymers
		Concepts of polymers
		Applications of polymers
		Challenges involved in making bio-degradable polymers
Molecular Reaction Dynamics	C663	Apply transition state theory and RRKM theory to compute rate constants
		Understand the theory of classical and quantum scattering phenomena
		Learn, how to follow the dynamics of chemical reactions experimentally and theoretically
Theory of Molecular Spectroscopy	C664	Separate the molecular motion into translations, rotations, and vibrations components
		Transform between internal and normal mode coordinates
		Understand the rovibronic spectroscopy of molecules
		Understand multiphoton processes and their application in modern spectroscopy
Catalysis: Reaction Mechanisms and Applications	C666	Understanding the principles of catalysis.
		Key concepts of various elementary steps which are important in catalytic cycle.
		Understanding the development of various catalysts in many important catalytic reactions.
		Implications and applications of catalysis in industry and academia.
Advanced Main group Chemistry	C667	Understanding the structure and bonding aspects of metal-metal single or multiple bond of main group elements
		Soluble main group metal hydrides: synthesis and their reactivity studies.
		Group 13 and Group 14 low valent metallacylces: synthesis and reactivity studies

		Application of Main group compounds in homogeneous catalysis.
Advanced Fluorescence Spectroscopy	C668	Describes basic principles and application of fluorescence spectroscopy.
		To learn, how fluorescence spectroscopy is used for frequency and time domain studies of important chemical process.
		To learn to use fluorescence spectroscopy in biological related molecules.
		It also introduces fluorescence imaging**.**
Biomacromolecules	C669	Basic understanding of biomolecules with respect to their structure
		Structure and function relation of biologically important molecules
		In-depth understanding of various biological processes such as DNA replication, protein synthesis
Advanced Heterocyclic Chemistry	C670	Basic understanding of biomolecules with respect to their structure
		Structure and function relation of biologically important molecules
		In-depth understanding of various biological processes such as DNA replication, protein synthesis
		Basic understanding of biomolecules with respect to their structure
Statistical Mechanics	C671	Understanding the concepts of ensembles, energy partition and probability distribution
		Learning of classical and quantum statistical mechanics
		Application of statistical mechanics to study the thermodynamic properties of simple gases and solids.
Photochemistry	C751	Understanding the photoinduced reactions in chemical and biological systems.
		Understanding the photo-physical processes
		Basic principles and application of fluorescence spectroscopy
		Use the knowledge of photochemistry in materials applications
Pharmaceutical Chemistry	C752	To learn pharmacokinetics and pharmacology
		To understand pharmacores and their interactions in molecular targets
		To interpret AMDE principle of drugs (absorption, distribution, metabolism, and excretion)
		To understand drug discovery processes

Group Theory and Molecular Spectroscopy	C753	Understand the fundamentals of Group Theory and apply it to molecular spectroscopy
		Understand the link between molecular spectroscopy, symmetry and information content of molecular spectra.
		Understanding the formation of molecular orbitals.
		Calculate/predict energy levels and spectral features using symmetry as a simplification tool
		Use symmetry arguments to possibly solve molecular Problems.
		Understand the basics of light-matter interaction.
		Understand the fundamentals of rotational, vibrational and electronic spectroscopy. Calculation of some useful parameters from spectral data.

(C) RESEARCH PROJECT COURSES:

Name of the Course	Course Code	Course Outcome
Minor Organic Chemistry Project I	C754	Understanding review of literature in a specified research field
		To learn characterization of organic molecules such as spectral and analytical data
		To set up experiments for known compounds
Minor Organic Chemistry Project II	C755	Independent ability to set up a chemical reaction
		Understanding the reaction progress and monitoring
		Isolation and characterization of organic compounds
Minor Inorganic Chemistry Project I	C756	Understanding review of literature in a specified research field
		Find out the research problem
		To learn the synthesis of known compounds
Minor Inorganic Chemistry Project II	C757	To learn the characterization of compounds
		Ability to write a report
		Ability to design future plans
Minor Physical Chemistry Project I	C758	Understanding review of literature in a specified research field
		To learn several spectroscopic techniques
		Learning basic laboratory techniques
Minor Physical Chemistry Project II	C759	Ability to study in detail about selected research problem
		Ability to find new alternative approaches to a research problem
		Ability to design future plans

Ph.D. in ENGINEERING SCIENCES (Program Code: ENGG04)

BACK TO MAIN

Course Structure:

I. Courses at BARC

Program Code : ENGG04	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	**Name of the Course**	**Course code**
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	**Course code**	**Course Outcome**
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

	EN593	ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Learning oral and written communication of research results.

(B) CHEMICAL ENGINEERING COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

		Material characterization techniques
Membrane Technology	EN714	Overview of Novel Membranes
		Preparation and Characterization
		Membrane Technologies
		Applications of Membrane Technology

(B3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Learning oral and written communication of research results.

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1

2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design

		Shallow and deep foundation design; machine foundation design
Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN5A93	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics
		Understanding Transmission Lines, Waveguides, RF Amplifiers,

Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP

Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS

Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Computer Based System Design II	EN706
3	Digital Signal Processing & Image Processing	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720

(G3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(G2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

Computer Based System Design II	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Digital Signal Processing & Image Processing	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(G3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(H)COMPUTER SCIENCE AND ENGINEERING

(H1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Operating Systems	EN606
2	Computer Graphics & Visualisation	EN613
3	Distributed Computing	EN616
4	Networking & Information Security	EN627
5	Reactor Control Engineering	EN637
6	Software Engineering and Formal Methods	EN640

(H2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Data Base Management System & Web Technology	EN705
3	Digital Signal Processing & Image Processing	EN706
4	Embedded Electronics Software	EN707
5	Feedback Control System	EN708
6	Image Processing & Machine Vision	EN710

(H3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Training in formulation and execution of research project.
		Training in written and oral presentation skills.

BACK TO MAIN

Course Structure:

II. Courses at IGCAR

Program Code: ENGG04	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	**Name of the Course**	**Course code**
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	**Course code**	**Course Outcome**
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	Training in Planning and execution of a research project

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles.
		The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

		design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.
Computational Fluid Dynamics	ME6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis Numerical Solution of Complete Fluid Flow and Energy Equation
Finite Element Method	ME8	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Advanced Heat and Mass Transfer	ME10	Advanced knowledge in heat and mass transfer Laminar boundary layer and forced convective heat, turbulent flow and heat transfer Heat transfer in porous media and heat transfer with phase change Radiation heat transfer
Reliability Engineering	ME13	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Manufacturing Technology	ME14	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.

(A2) ELECTIVES

Name of the Course	Course code	Course Outcome
Machine Design	ME3	Basic concepts in vibrations analysis
Structural Integrity Assessment Methods and NDE		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
Vibration Engineering and condition Monitoring		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	ME5	Introduction to earthquakes, design basis ground motion and IS 1893 spectra Introduction of earthquake engineering and analysis for multi degree freedom systems
Plant Dynamics		Analysis and design of structures, equipments and piping
Experimental Mechanics		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	Training in formulation and execution of research project.
Seminar -1,2,3	02ENGG04-001-S	Training in presentation of research results.

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	The subject is aimed on advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	Training in formulation and execution of research project.
Seminar -1,2,3	02ENGG04-002-S	Training in presentation of research results.

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

	Artificial Intelligence Methods &Applications	
	Membrane/ Separation Process and Technology	

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	Training in formulation and execution of research project.
Seminar -1,2,3	02ENGG04-003-S	Training in presentation of research results.

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical’s	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	assessment of the understanding of the subject by the student and its application in problem solving.

	Computational Methods and Programming	
7	Experimental techniques and methods	04ENGG04-007-C
8	Basic Field Theory	04ENGG04-008-C
9	Basic Accelerator physics	04ENGG04-009-C
10	Basic Condensed Matter Physics	04ENGG04-0010-C
11	Basic Nuclear physics	04ENGG04-011-C
12	Laboratory experiments	04ENGG04-012-C
13	Advanced Nuclear Structure	04ENGG04-013-C
14	Advanced nuclear reaction	04ENGG04-014-C
15	Advanced Accelerator physics	04ENGG04-015-C
16	Advanced High Energy Physics	04ENGG04-016-C
17	Advanced Materials Science – I	04ENGG04-017-C

18	Advanced Material Science II	04ENGG04-018-C
19	Advanced High Energy Physics (Experiment)	04ENGG04-001-E
20	Project	04ENGG04-001-P

Course Outcomes:

(A) Core Courses

Name of the Course	**Course code**	**Course Outcome**
Mathematical Physics	04ENGG04-001-C	Understanding the underlying mathematical structure of Quantum Physics
		Using the techniques of complex analysis to solve realistic physical problems
		Model the Regression Learning Models
		Understanding the Geometric ideas behind modern physics
QUANTUM MECHANICS	04ENGG04-002-C	Learn approximation methods used in quantum mechanics
		Basic understanding in Collision theory
		Exposure to relativistic quantum mechanics
		Learn Lagrangian formulation
Classical Mechanics	04ENGG04-003-C	Introduction of Lagrangian formulation
		Introduction of Hamiltonian formulation
		Connection of classical mechanics with quantum mechanics
Statistical Mechanics	04ENGG04-004-C	Detailed understanding of the different distribution functions, statistical techniques and their application to different physical systems
		Understanding of different statistical methods, thermodynamic connection and their application to different physical problems related to condensed matter physics and nuclear physics
		Learnt advance topics of equilibrium and non-equilibrium statistical mechanics (ex: phase transition kinetics, transport theory) which are extensively used in state-of-the art research problems.
Classical Electrodynamics	04ENGG04-005-C	Impart knowledge on classical field theory
		Learn the basic science of electricity and magnetism

		Develop skill in applications of electromagnetic theory invarious practical problems
		Develop mathematical skill to solve partial differential equations.
Research Methodology	04ENGG04-006-C	This is an essential course to pursue research work for PhD in Physical Sciences and Engineering Sciences
		Impart knowledge and skills to analyse data and prepare scientific manuscript.
		Learn about Ethical aspects in research
Computational Methods and Programming		Applications of the machine learning and programming in understanding the numerical approach to solve a scientific project which can hardly be solved analytically
		Use of the numerical methods for simulating detection techniques and performances a priori and check the feasibility
		Implement the machine learning and numerical approach to understand the human learning aspects.
		Implementation of numerical techniques in the analysis of experimental data and understand them in the framework of numerical modelling with associated physics.
		Machine learning and numerical methods have an important role in illustrating and predicting in the field of Bioinformatics, Linguistics, Data mining and Big data analysis both in the social and scientific paradigm
Experimental techniques and methods	04ENGG04-007-C	Imparts knowledge on laboratory safety, vacuum techniques, cryogenics and workshop practices
		Provides understanding on different material characterization techniques viz. electron microscopy, XRD, optical, electrical and magnetic measurements
		Learns about different detectors and techniques used in nuclear and high energy physics.

Basic Field Theory	04ENGG04-008-C	This course is designed to provide an elementary idea about the Lorentz invariance and Relativistic kinematics.
		Basic concepts about the classical field theory and symmetries and conservation laws are provided.
Basic Accelerator physics	04ENGG04-009-C	The Basic Accelerator Physics course focuses on the key concepts of particle accelerators and their applications. The objective of the course is to emphasize the knowledge of beam dynamics in Linear and circular accelerator including the effect of space charge. Exposure regarding various types of accelerators is given.
Basic Condensed Matter Physics	04ENGG04-0010-C	In the basic materials science courses the covered areas are mainly crystal structure and crystallography, defects in solids, electronic structure of solids. Also the magnetism, superconductivity, superfluidity and dielectric properties of solids have been taught.
Basic Nuclear physics	04ENGG04-011-C	Learning basic properties of nuclei like mass, charge, shape etc.
		Learning nuclear models related to nuclear collective dynamics and fission decay
		Learning microscopic many-body thoery for nucleus
Laboratory experiments	04ENGG04-012-C	Gives hands on experience and understanding on topics discussed in the experimental techniques and methods course
		Provides practical understanding on the operation and use of a different types of instrument and facility
		Get basic training for planning a goal oriented real life experiment
		Learn to prepare scientific reports
Advanced Nuclear Structure	04ENGG04-013-C	Different model calculations of nuclear structure physics
		Different modes of excitations in nuclei and associated observables
		Specific knowledge of gamma ray spectroscopy and its application to nuclear structure

		Methods of lifetime and moment measurements in nuclei
		Total absorption spectroscopy and beta-delayed neutron emission measurements and their practical application.
		A detailed and overall theoretical understanding on the ground and excited state properties in nuclei along with a detailed knowledge on the experimental know-how in the measurement of different nuclear structure quantities. Students are expected to connect the experimental observables and the deduced quantities with the theoretical parameters related to nuclear structure.
Advanced nuclear reaction	04ENGG04-014-C	Advanced nuclear reaction course is designed to develop basic understanding of nature around us which includes formation of stars to discovery of new elements using accelerator based research. It includes following modules
		Study of fusion –fission dynamics, deep - inelastic reactions, multi fragmentation etc.
		Nuclear Astro physics and Equation of State for dense nuclear matter
Advanced Accelerator physics	04ENGG04-015-C	The Advance Accelerator Physics course focuses on the key concepts of modern particle accelerators and their applications. The objective of the course is to emphasize the knowledge of beam dynamics in Linear and circular accelerator including the effect of space charge. Various advanced accelerator projects has also been discussed.
		It covers Advance accelerators: Free electron laser, Plasma accelerators, Spallation neutron sources, Rare ion beam facilities. Accelerators driven subcritical systems.
		It covers Storage rings and synchrotron radiation**:** Radiation from moving charges, Radiation power and angular distribution, Quantum fluctuation, Beam lifetime, beam cooling.

		It covers Beam with space charge: Envelope oscillations, modes and instabilities, Sources of emittance growth, Wake fields and image charge effects.
Advanced High Energy Physics	04ENGG04-016-C	This course is designed to provide an elementary idea about the Standard Model of particle physics with particular emphasis on Quantum Chromodynamics. Basic concepts about the structure of hadrons as well as relativistic heavy ion collisions are also provided
Advanced Materials Science – I	04ENGG04-017-C	Understand formation of defects due to particle irradiation in materials Understand effect of radiation damage on physical and mechanical properties of materials Correlate defects and property changes due to irradiation in materials Emulate neutron damage with ion irradiation in structural materials.
Advanced Material Science II	04ENGG04-018-C	In this course mainly properties of advance functional materials, e.g., multi-functional materials, nano-particle system and advanced oxide materials have been covered. Defect characterization in oxides by positron annihilation techniques and Mossbauer spectroscopy in oxides have also been covered
Advanced High Energy Physics (Experiment)	04ENGG04-001-E	Advanced EHEP course is tuned to train the students with following objectives (a) experimental techniques and methodologies used specifically in EHEP (b) detailed courses on research topics being followed in experimental high energy heavy ion collision research like, collectivity, correlation, particle production mechanism, heavy flavour production The students after completion of course can handle EHEP data to extract physics information after various levels of corrections and error analysis. They are also trained to handle particle detectors for HEP applications Students have a detailed overview on particle production mechanism both in hard and soft sector

		Students, after completion of course know about production of heavy flavours (open and hidden charm)
		Students can handle Monte-Carlo models for particle production
Project	04ENGG04-001-P	Exposure to a particular experimental or theoretical work
		Literature survey and develop expertise in problem identification
		Data collection and subsequent analysis of data , presentation of data
		Develop documentation and presentation skills

BACK TO MAIN

Course Structure:

IV. Courses at IPR

Program Code: ENGG04	Programme Specific Outcome	Learn about Plasma basics, its diagnostics and its applications.
		Learn Plasma and Fusion Technologies to build a device.
		Get detailed information on specific subject related to Fusion technology according to the stream of student i.e. Physics , mechanical etc.

T1. FUNDAMENTAL

Sr. No.	Name of the Course	Course code
1	Basic Plasma Physics	FC1
2	Experimental Plasma Physics	FC2
3	Tokamaks	FC3
4	Fusion Plasma Diagnostics	FC4
5	Measurement Techniques	FC5
6	Numerical Methods	FC6
7	Mathematical Methods	FC7
8	Vacuum, Cryogenics and Magnets	FC8

T2. CORE SUBJECTS

Sr. No.	Name of the Course	Course code
1	Fusion Neutronics	AS1
2	Plasma Facing Components: First Wall, Divertors, Blankets	AS2
3	Fusion Materials	AS3
4	RF, Current Drive and Neutral Beam Heating	AS4

T3. ELECTIVES

(A) PHYSICS

Sr. No.	Name of the Course	Course code
1	Magneto Hydro Dynamics	PH1
2	Kinetic Theory and Statistical Mechanics	PH2
3	Advanced Heat Transfer and Cryogenics	PH3/ME5
4	Tokamak Related Code	PH4

(B) MECHANICAL

Sr. No.	Name of the Course	Course code
1	Code Design for Internal and External Pressure Vessel	ME1
2	Finite Element and Volume Methods	ME2
3	Mechanics of Solid/Vibration/Remote Handling	ME3
4	Advanced Manufacturing Technologies	ME4
5	Advanced Heat Transfer and Cryogenics	ME5

(C) ELECTRICAL

Sr. No.	Name of the Course	Course code
1	Advanced Data Acquisition System	EE1
2	Advanced Tokamak controls	EE2
3	High Voltage, DC& AC/ Power Supplies	EE3
4	Signal Conditioning and EMI/EMC Aspects	EE4
5	Computer Based System Design	EE5
6	Digital Signal Processing and Image Processing	EE6

T4. MINI PROJECT (MP)

Sr. No.	Name of the Course	Course code
1	Mini Project	06ENGG04-001-MP

T5. PROJECT (P)

Sr. No.	Name of the Course	Course code
1	Project	06ENGG04-001-P

Course Outcomes:

T1. FUNDAMENTAL

Name of the Course	Course code	Course Outcome
Basic Plasma Physics	FC1	Course provides detailed information on,
		• Definition of plasma, description of collective behaviour in contrast to single particle behaviour.
		• Lorentz force equation, nonrelativistic motion of a charged particle in constant electric and magnetic field.
		• Fluid Description of Plasma, Waves in Plasma and MHD Description.
Experimental Plasma Physics	FC2	Course provides detailed information on,
		• Fundamental Gas Processes i.e. Maxwell-Boltzmann distribution, Mean Free Path, Collision Cross Section, and Frequency, Elastic and Inelastic Collisions, Ionization by Electron Impact, X-rays, Nuclear Radiation and Photoionization,
		• Charged Particles in a Gas.
		• Self-sustaining Discharge i.e. Glow Discharge, Breakdown under Special Conditions, Arc Discharge.
		• Plasma Sheath and Diagnostics Experimental Plasma Devices.
Tokamaks	FC3	Course provides detailed information on,
		• Introduction to Thermonuclear Fusion reactions, Power Balance and Lawson Criteria, Tokamak as Fusion reactor,
		• Equilibrium and Transport i.e. Tokamak Equilibrium, Grad-Shafranov Equation, Safety Factor, q and Plasma Beta, Shafranov Shift and Plasma position control, Classical Transport,
		• Heating i.e. Ohmic Heating, Neutral Beam Heating, Wave Heating, Lower Hybrid Heating and Current Drive, Ion Cyclotron

		Resonance Heating, Electron Cyclotron Resonance Heating.
		• MHD Stability i.e. Ideal Kink modes, Ideal internal modes, Resistive tearing modes, Mirnov Oscillations, Saw-tooth oscillations, ELMs, Disruption scenarios.
		• Tokamak and Other Fusion Devices
Fusion Plasma Diagnostics	FC4	Course provides detailed information on,
		• Introduction to Tokomak diagnostics , Electrical diagnostics, Magnetic diagnostics
		• Measurements of plasma density and electron temperature i.e. Thomson scattering diagnostics, Reflectometery, Interferometry: ECE diagnostics.
		• Measurement of ion temperatures i.e. Charge exchange recombination spectroscopy (CXRS), X –ray crystal spectroscopy.
		• Measurements of Radiated power and Measurements of operational parameters i.e. Bolometers, Imaging Diagnostics and Beam emission spectroscopy.
Measurement Techniques	FC5	Course provides detailed information on,
		• Measurement system architecture, Computer based measurement systems, Errors in measurements, Measurement Units, Standard used in measurements.
		• Sensitivity, Resolution, Nonlinearity, Saturation, Dynamic Range, Offset, Drift, Electromagnetic Compatibility, Reliability.
		• Measurement of Electrical Parameters: Voltage, Current, Resistance, Capacitance, Impedance, Frequency, Phase shift, Power.
		• Sensors/Transducers and Their Applications to Physical Measurements , Introduction to Data Acquisition and Noise in Measurement System.
Numerical Methods	FC6	Course provides detailed information on,
		• Mathematical modeling, numerical methods and problem solving, Introduction to MATLAB programming, Error analysis methods, Case study.
		• Solutions of Linear Algebraic equations.
		• Numerical Differentiation and Integration
		• Roots, optimization and nonlinear sets of Equations.
		• Application of Ordinary Differential equations.
		• Application of Partial Differential equations.

		• Application of Curve fitting methods.
Mathematical Methods	FC7	Course provides detailed information on,
		• Vector analysis: vector identities, Use of Levi Civita and Kronecker delta functions for the derivation of vector identities, Notion of gradient, divergence and curl
		• Classification of matrices; Elementary operations; Determinant, rank and inverse of a matrix; Solution of linear equations; Eigenvalues and eigenvectors
		• Complex variables, function of a complex variable, continuity and differentiability, Cauchy-Riemann conditions, Analytic functions, Taylor and Laurent Series,
		• First and second order differential equations with constant and variable coefficients; Linear differential equations
Vacuum, Cryogenics and Magnets	FC8	Course provides detailed information on,
		• Fundamental of vacuum i.e. The vacuum and its applications, Gas laws, Pressure and mean free path, Flow regimes, Conductance, Throughput and pumping speed, Ultimate pressure and pump down time, Outgassing and permeation. Exposure to pumps and gauges.
		• Design of a vacuum system
		• Fundamental of cryogenics i.e. Cryogens properties, Heat loads in Cryogenic systems, Basic Thermodynamics and Cryogenic Processes, Material properties at low temperatures.
		• Design of cryogenics system i.e. Design aspects of Cryostat, Dewars and Cryolines. Fundamentals of Thermo-hydraulics and distribution network, Economics of Cryogens, Recovery of Helium and Thermal insulation.
		• Applications of Cryogenics Engineering in Fusion machines.
		• Fundamentals of Magnet system
		• Design and fabrication of magnet system

T2. CORE SUBJECTS

Name of the Course	Course code	Course Outcome
Fusion Neutronics	AS1	Course provides detailed information on, • Fusion Neutronics Principles, neutron production & detection techniques, nuclear interaction processes. • Particle transport phenomena in matter and Basics of fusion neutronics & blanket neutronics. • Principles of Neutron & Fusion product diagnostics, Radiation and licensing and Radiation damage & transmutation.
Plasma Facing Components: First Wall, Divertors, Blankets	AS2	Course provides detailed information on, • First Wall, Firstwall Concepts, Loads on Firswtall and Challenges for Firstwall. • Divertor Concepts , Loads on Divertor , Challenges for Divertor , Divertor Testing and Novel Divertor Concepts • Blanket Concept, Shield Blanket, Breeding Blanket, Liquid Metal (Pb Li) Technology, Fusion Fuel Cycle and Blanket Safety.
Fusion Materials	AS3	Course provides detailed information on, • Fundamentals of Material Science • Fusion Materials Requirements & Issues • Material Development and Joining Technologies • Material Characterization & Qualification
RF, Current Drive and Neutral Beam Heating	AS4	Course provides detailed information on, • Heating and current drive physics by neutral beam • Neutral beam injector system design and engineering • Introduction to RF heating • RF devices and Design tools i.e. ICRH, ECRH and LHCD.

T3. ELECTIVES

(A) PHYSICS

Name of the Course	Course code	Course Outcome
Magneto Hydro Dynamics	PH1	Course provides detailed information on, • Physical description of electrically conducting fluids .Derivation of basic MHD equations: Continuity, Equation of

		motion, Energy flow, Ohm's law, Validity of MHD equations.
		• The low frequency dynamics of the electromagnetic field. Some properties of MHD: Ideal MHD equations, The Frozen Flux theorem, The effect of • resistivity, Similarity scaling, The Wöltjer invariants and helicity
		• Equilibrium general considerations, The Virial Theorem, Examples of simple equilibria: - pinch, Z-pinch, screw pinch, Poloidal , paramagnetic and diamagnetic states, Force-free fields, Toroidal equilibrium: the Grad-Shafranov equation, nonlinearity, Definition of q, beta, plasm a shape, etc.
Kinetic Theory and Statistical Mechanics	PH2	Course provides detailed information on,
		• Gas dynamic way of describing an uncharged fluid – heuristic
		• Recollect derivation of basic MHD equations – one fluid only (Continuity, Eqn of motion, Energy equation [thermodynamic closure], Electron equation of motion [Ohm's Law])
		• Introduce ideas of Phase Space (x,v) and distribution functions f(x,v,t)
		• Langmuir Oscillations and Waves – Vlasov-Poisson dispersion
		• Examples of GK formalism and obtained transport and Very cursory introduction to Onsager relationships
Advanced Heat Transfer and Cryogenics	PH3/ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
Tokamak Related Code	PH4	Course provides detailed information on,
		• Plasma core modelling i.e. Plasma equilibrium IPREQ , Plasma transport TSC , Plasma stability ERATO, PEST2 , ICRH heating TORIC , NBI heating NUBEAMS , Plasma start up model , Reactor system code , Eddy current analysis.
		• Edge-SOL studies i.e. 2D blob transport, Divertor study SOLPS (B2+ERINE) , 3D plasma study ERINE-3D

		• First principle simulations i.e. Low frequency (w/wc <<1) transport – what is Gyrokinetic method? , What are the transport processes neglected by gyrokinetic formalism?

(B) MECHANICAL

Name of the Course	Course code	Course Outcome
Code Design for Internal and External Pressure Vessel	ME1	Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and tori spherical end closures.
		Thick cylinder, sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div. – II equations for cylindrical / Spherical shell and conical, ellipsoidal and tori spherical end closures.
		Bending of circular plates and determination of stresses in simply supported and clamped Circular plate. Basis of ASME equation for flat closures.
		Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3.
Finite Element and Volume Methods	ME2	Introduction to FEM: Weighted residual method, Galerkin's methods, Weak form formulation , piecewise approximations. Basis of Finite Element Method, Variation principles, energy principles in structural mechanics, Element libraries
		Element shape functions: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements
		2D plane elements – 3 node triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
		Finite element applications for design: Finite element modelling and discretization criterion,

		h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.
Mechanics of Solid/Vibration/Remote Handling	ME3	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Laminar Boundary Layer and Forced Convective Heat
		Turbulent Flow and Heat Transfer
		Natural Convection
		Numerical Solution of Complete Fluid Flow and Energy Equation
Advanced Manufacturing Technologies	ME4	Advance manufacturing processes i.e. mechanical energy based processes , electrical energy based processes, chemical and electro-chemical energy based processes.
		Advanced materials joining and testing i.e. bolting , riveting , soldering , blazing ,adhesive bonding , diffusion bonding , mechanical joining, fusion welding, oxyacetylene welding , smaw , gtaw , gmaw , fcaw ,saw , esw, high energy beam welding.
		Responses of materials to welding i.e. microstructural changes , distortion , defects, undercuts ,overlaps , grain growth , blowholes , inclusions.
		Destructive and non-destructive tests for welds.
Advanced Heat Transfer and Cryogenics	ME5	Computational Fluid Dynamics
		Heat Transfer : Conduction
		Heat Transfer : Convection:
		Heat Transfer : Radiation:
		Cryogenics
		Gas Liquefaction and Refrigeration Systems
		Cryogenic Insulations
		Instrumentation in Cryogenics

(C) ELECTRICAL

Name of the Course	Course code	Course Outcome
Advanced Data Acquisition System	EE1	Course provides detailed information on,
		• Theory of Quantization , Advanced Data Acquisition Systems
		• Data Acquisition Interface , Analog Input/output
		• DAQ Clock and Trigger , Synchronization
		• SST-1 Data Acquisition System

Advanced Tokamak controls	EE2	Course provides detailed information on, • Fundamentals of Control System i.e. Terminology and basic structure of control system , Open loop and Closed loop systems, servomechanism, regulatory system, analogous systems, electrical analogy of physical systems, Physical Systems. • Different types of Control Systems • Introduction to Plasma Control • ITER Instrumentation & Control • SST-1 Operation &Control • Monitoring and Control of Auxiliary Systems
High Voltage, DC& AC/ Power Supplies	EE3	Course provides detailed information on, • Overview of Electrical systems in Fusion machines i.e. Basic introduction to electrical systems in Tokamak, Stellarator and Z-machine; Tokamak as a transformer, Electrical systems for plasma formation – Ohmic discharge, Arc discharge, RF discharge, MW discharge; Electrical systems for plasma confinement. • High Voltage Generation, High AC, DC and Impulse Voltages, High Voltage Components, Basic design features of High Voltage Power Transformer: Basic design of HV Transformer, Transformer insulation requirements, dielectric strength and voltage conditions, winding arrangements, surge behavior, behavior of liquid dielectric, electrode surface phenomena, gas evolution, processing techniques, construction of EHV transformer, short circuit behavior. • Linear and switching power supplies, DC to DC converters and their operating characteristics, Selection of Power Semiconductor Devices, Power supplies for pulsed gas discharge tubes, High current power supplies. Power supplies for heating and current drive, Requirement for arc fault protection, Protection by crowbar. • Power Electronics and design through modelling & simulation i.e. AC-DC Converters; Forced commutation;

		synchronous link converters, DC-AC converters, buck, boost, buck-boost, cuk, flyback configuration, resonant converters, PWM inverters; active filters. Machine modelling, DC machines, induction motor and synchronous machines.
Signal Conditioning and EMI/EMC Aspects	EE4	Course provides detailed information on, • Analog Signal Conditioning i.e. Principles of Analog Signal Conditioning, Signal Conditioning Configuration, Signal Conditioning Functions, Amplification, Transducer Excitation, Filtering, Isolation. • Signal Processing and Applications i.e. Review of signals and systems: Introduction, advantages and limitations of Analog and Digital Signal Processing, Advantages and Disadvantages of Digital Filters over Analog Filters. • EMI/EMC i.e. Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling Inductance Coupling, Shielding. • EMI Modelling i.e. Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns.
Computer Based System Design	EE5	Course provides detailed information on, • Personal computer architecture, memory organization, industrial PC, Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications. • Asynchronous and synchronous communication, • Local Area Networks, OSI 7 layer model and TCP/IP reference model, Standards like Ethernet, Token bus, Token ring, Wireless LAN and Bluetooth, Networking hardware – cables, hub, switch, router etc. • Real-time Systems, their characteristics and applications, Real-time Operating Systems Concepts of Process and threads, Concurrency, Latency, context switching, scheduling policies.
Digital Signal Processing and Image Processing	EE6	Course provides detailed information on, • Basic elements of a digital signal processing system, Fourier series and Fourier transform, z transform Convolution, Correlation, Sampling

		theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.
		• Discrete Fourier Transform, Interpretation of DFT, Properties of DFT, DFT of real signals, Fast Fourier Transform Digital filters, DSP Applications.
		• Digital image model representation, Image sensor, Digitizer, Computer, Standard file format.
		• Image Enhancement i.e. Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Color image processing.
		• Image Segmentation and Analysis i.e. Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation, Boundary extraction and representation.
		• Morphological operations i.e. Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy based Methods, Image Compression Models, Error free compression, Lossy compression, Standards.

T4. MINI PROJECT (MP)

Name of the Course	Course code	Course Outcome
Mini Project	06ENGG01-001-MP	**Student learns ,**
		• Literature Survey
		• Study of a small section of the major project based on either simulation or fabrication to realize the criticality and requirements to build a component for plasma application.
		• Practise for thesis writing

T5. PROJECT (P)

Name of the Course	Course code	Course Outcome
Project	06ENGG01-001-P	• Complete understanding about the criticality of a particular component to be built for plasma application.
		• Development of a component for a plasma application and get hands on experience.
		• Thesis report.

BACK TO MAIN

Ph.D. in LIFE SCIENCES (Program Code: LIFE04)

Course Structure:

II. Courses at SINP

Program Code : LIFE04	Programme Specific Outcome	To introduce multi-disciplinary aspects of life science research in the first year to the students from different backgrounds (Life/Physical Sciences)
		To introduce various techniques used in life Science research
		To develop the skill of scientific writing and presentation.
		To develop the ability to carry out independent scientific research

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	PRINCIPLES OF BIOCHEMISTRY	PBC
2	PRINCIPLES OF PHYSICAL CHEMISTRY	PPC
3	STRUCTURAL AND COMPUTATIONAL BIOLOGY	SCB
4	ADVANCED LABORATORY PRACTICES	ALP
5	RESEARCH METHODOLOGY	RM
6	OPTIONAL COURSE1	OPT1
7	OPTIONAL COURSE2	OPT2
8	OPTIONAL COURSE3	OPT3
9	PROJECT	PRO

Course Outcomes:

Name of the Course	Course code	Course Outcome
PRINCIPLES OF BIOCHEMISTRY	PBC	Familiarization of the students from various backgrounds with biomolecules and metabolism.
		Introductory knowledge about different cellular processes and sub-cellular structures
PRINCIPLES OF PHYSICAL CHEMISTRY	PPC	Basic knowledge about chemical and physical perspective of life sciences
		Introductory knowledge about spectroscopy, nanomaterials and radioactivity
STRUCTURAL AND COMPUTATIONAL BIOLOGY	SCB	Understanding of structural and functional aspects of biomolecules
		Knowledge of computer programming for life science research
		Ability to do statistical analysis of biological data
ADVANCED LABORATORY PRACTICES	ALP	Introductory knowledge about various cell and molecular biological, biochemical and biophysical techniques
RESEARCH METHODOLOGY	RM	Idea about doctoral research, ethics of scientific research, scientific writing and presentation.
OPTIONAL COURSE1	OPT1	Advanced level knowledge about techniques like spectroscopy, imaging, mass spectrometry and crystallography
OPTIONAL COURSE2	OPT2	In depth understanding of various aspects cell biology
OPTIONAL COURSE3	OPT3	Knowledge about some topics in modern biology related to drug discovery, nanobiomaterials, membrane biophysics
PROJECT	PRO	Preparedness to do independent doctoral research

III. Courses at ACTREC-TMC

Program Code : LIFE04	Programme Specific Outcome	Basic understanding in cancer biology.
		Develop the ability of students to critically read and analyse the literature
		Develop analytical thinking in students with an emphasis on developing experimental design.
		Allow deeper study in specialized topics in cancer biology

(A) Research Methodology

Sr. No.	Name of the Research Methodology	Course code
1	The flow and structure of a paragraph – case study. Grammar, common unscientific terms used in writing, the common pitfalls seen - direct translation of words from mother tongue to English	RM1
2	Literature review - where to get material, the quality and quantity of content. Establishing a background for a research project	RM2
3	Laboratory notebook maintenance - Do's and don'ts, Good research practice, ethics, plagiarism	RM3
4	The art and science behind manuscript writing and successful research proposal Ideas, their formulations, what are aims and objectives, What constitutes results and discussions	RM4
5	The fine art of power point presentation	RM5
6	Preparing figures for manuscripts and grants	RM6

(B) Core courses

Sr. No.	Name of the Course	Course code
1	Cell Biology & Cancer Biology	09LIFE04-001-C
2	Cell Proliferation and Cell death	09LIFE04-002-C
3	Oncogenes and Tumor Suppressors	09LIFE04-003-C
4	Metastasis and Angiogenesis	09LIFE04-004-C
5	Cancer Epigenetics and Genetics	09LIFE04-005-C
6	Carcinogenesis	09LIFE04-006-C
7	Tumor Immunology	09LIFE04-007-C
8	Structural Biology and Biophysics	09LIFE04-008-C

(C) Elective courses

Sr. No.	Name of the Elective Course	Course code
1	Biostatistics (*Compulsory)*	09LIFE04-001-E
2	Animal Models in Cancer Research	09LIFE04-002-E
3	Cancer Therapeutics	09LIFE04-003-E
4	Carcinogenesis, Chemoprevention and DNA Repair	09LIFE04-004-E
5	Deregulation of Cell Growth in Cancer	09LIFE04-005-E
6	Structural Bioinformatics, Biophysics & Structural Biology	09LIFE04-006-E
7	Tumor Immunology	09LIFE04-007-E
8	Metastasis	09LIFE04-008-E

Course Outcomes:

(A) Research Methodology

Name of the Research Methodology	**Course code**	**Course Outcome**
The flow and structure of a paragraph – case study. Grammar, common unscientific terms used in writing, the common pitfalls seen - direct translation of words from mother tongue to English	RM1	The student is taught the importance of accurate writing and how that helps convey information to the reader.
		Basic rules of grammar are addressed.
Literature review - where to get material, the quality and quantity of content. Establishing a background for a research project	RM2	The students learn how to review the literature
		The students learn how to read the relevant literature to establish the basis for their hypothesis.
Laboratory notebook maintenance - Do's and don'ts, Good research practice, ethics, plagiarism	RM3	The students learn the basics of record keeping in the laboratory.
		How to ensure that the results observed are meaningful.
		How to analyse their data
		The students are lectured on the importance of doing ethical experiments and not plagiarising information from other sources.
The art and science behind manuscript writing and successful research proposal Ideas, their formulations, what are aims and objectives, What constitutes results and discussions The fine art of power point presentation Preparing figures for manuscripts and grants	RM4	These three lectures focus on: 1. How to design a research proposal 2. How to write a research proposal 3. How to write a research paper 4. How to prepare figures for proposals and papers. Does and don’ts of figure preparation.
	RM5	
	RM6	

(B) Core courses

Name of the Course	**Course code**	**Course Outcome**
Cell Biology & Cancer Biology	09LIFE04-001-C	Over-view on what is cancer and its causes, differences between normal and cancer cells, detailed understanding of cell organelles, intracellular protein transport.
		Understanding of normal stem cells and cancer stem cells, biomarkers to identify cancer stem cells.

		Reprogramming and pluri-potency. Demonstrations and lectures on advanced microscopy and in vivo - cell imaging using luminescence and microPET-CT
Cell Proliferation and Cell death	09LIFE04-002-C	A detailed analysis of the pathways underlying cell cycle progression and cell death. Study on animal models for understanding phenotype of cyclin and cyclin dependent kinases.
		Understanding the mechanisms of cell death and methods to detect apoptosis.
		Understanding differences between apoptosis, necrosis and autophagy. How cancer metabolism is distinct from normal cells and how this can be exploited therapeutically.
Oncogenes and Tumor Suppressors	09LIFE04-003-C	Understanding the mechanism of action of oncogenes and tumor suppressor genes and their function.
		Understand the difference between mouse and human telomeres and how this affects tumor progression in both species.
Metastasis and Angiogenesis	09LIFE04-004-C	Mechanisms underlying cell adhesion and migration and how these are altered in tumors.
		Mechanisms underlying metastatic progression. Understanding how a tumor deals with nutrient and oxygen deprivation.
		Understanding how hypoxia contributes to angiogenesis and vasculogenesis. Various models to study angiogenesis.
Cancer Epigenetics and Genetics	09LIFE04-005-C	Epigenetic mechanisms that affect tumor growth.
		Cancer as an inherited genetic disease. Understanding chromatin structure, histon varients and their modifications in cancer.
		Understanding DNA methylation and gene-regulation.
		Detailed methodology to study chromatin-biology.
		Advanced knowledge on application of proteomics, Next Generation Sequencing and Genomics

Carcinogenesis	09LIFE04-006-C	Understanding Mechanisms of carcinogenesis. DNA repair and its role in inhibiting tumor progression.
		Understanding carcinogen metabolism and activation of cellular oncogenes and their contribution to carcinogenesis.
		Understanding role of tumor viruses and micro-organisms contributing to carcinogenesis.
Tumor Immunology	09LIFE04-007-C	Basics of tumor immunology. Differences between adaptive and innate immunity.
		Cell types contributing to tumor immunity and their role in cancer immuno therapy. Applications of monoclonal antibodies, vaccines in cancer diagnosis and therapy.
		Advanced technologies to study immune biomarkers on cells, immuno deficient mouse models to study tumor development and immune responses.
Structural Biology and Biophysics	09LIFE04-008-C	Basics of spectroscopy. Principles of protein-protein interactions and protein folding.
		Understanding mechanism of action of enzymes and assays to study their function.

(C)Elective courses

Name of the Elective Course	Course code	Course Outcome
BIOSTATISTICS *(COMPULSORY)*	09LIFE04-001-E	Probability distribution (normal, Poisson, t, F, Chi-square)
		Sample size determination and justification of power estimates in a research protocol - observational studies, clinical trials (superiority, non-inferiority / equivalence), animal studies
		Hypothesis testing: analysis of categorical or continuous data
		Biostatistics pertaining to survival analysis
ANIMAL MODELS IN CANCER RESEARCH	09LIFE04-002-E	Anatomy and biology of small animals used in cancer research.
		Transgenic and knockout technology to generate animal models

		Animal models for carcinogenesis, chemoprevention and drug screening and testing.
		Using imaging to study tumor progression in animal models.
CANCER THERAPEUTICS	09LIFE04-003-E	Modules of cancer therapy – chemo, radio and targeted therapy.
		Mechanisms of resistance to chemo and radio therapeutics.
		Drug design, development and screening
		Immunotherapy and gene therapy including RNAi
CARCINOGENESIS, CHEMOPREVENTION AND DNA REPAIR	09LIFE04-004-E	Determination of carcinogen exposure and dosage
		Short term and long term assays for carcinogenesis
		The role of DNA damage, viruses and epigenetics in carcinogenesis
		Basics of chemoprevention.
DEREGULATION OF CELL GROWTH IN CANCER	09LIFE04-005-E	Detailed analysis of the molecular mechanisms underlying Rb and p53 function.
		Mechanisms underlying tumor progression upon activation of Ras, PI3K, Myc and wnt signalling.
		Checkpoint pathways and cancer
		Senescence and cancer
STRUCTURAL BIOINFORMATICS, BIOPHYSICS & STRUCTURAL BIOLOGY	09LIFE04-006-E	Spectroscopic Techniques: Absorption Spectroscopy and Fluorescence Spectroscopy Spectropolarimetry: Circular Dichroism
		Biophysical methods: Protein conformation, interactions and oligomeric properties
		X-ray Crystallography (lecture and hands-on)
		NMR Spectroscopy
		Structural Bioinformatics: Molecular Modeling (homology, threading, ab initio); small molecule/peptide design; MDS: Different tools available for these in silico studies
		Molecular Docking (protein-protein, protein-ligand/small molecules)
		Drug Designing-challenges, in-silico design-advantages, steps and tools (QSAR, 3D-QSAR etc) Application:

		How drug design leads to clinical trials with example.
		Hands-on training in Bioinformatics
TUMOR IMMUNOLOGY	09LIFE04-007-E	Basic concepts of innate and adaptive immunity and their role in tumor immunity
		Immunodiagnosis and immunotherapy of Cancer. Role of monoclonal antibodies, vaccines and cell-based therapies
		Understanding of the tumor microenvironment, cells soluble factors contributing to immunosuppressive networks
		Animal models that have immune defects used to transplant human tumors and study their application for drug development and immunotherapies
		Understanding how Flow Cytometer works. Principle and applications followed by demonstration
METASTASIS	09LIFE04-008-E	Molecular basis underlying detachment, intravasation and invasion in tumor cells.
		Survival in the bloodstream, invasion and metastatic colonization.
		Pathways contributing to the spread of metastatic disease including EMT, Hippo, Notch Wnt and CSC pathways.
		Targeted therapy and immunotherapy in metastasis and models and imaging in metastasis.

BACK TO MAIN

IV. Courses at IMSc

Program Code : LIFE04	Programme Specific Outcome	To understand biological data and the means by which they are acquired
		To communicate and collaborate with biologists
		To understand and apply quantitative techniques from mathematics, physics and data science to biological phenomena
		To comprehend, express and present scientific data
		To understand and interpret model calculations

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Biology-1	10-LIFE04-001-C
2	Protein Structure	10-LIFE04-002-C
3	Mathematics and statistics for biologists	10-LIFE04-003-C
4	Physical Methods for Biologists	10-LIFE04-004-C
5	Biology-2	10-LIFE04-005-C
6	Biological sequence analysis	10-LIFE04-006-C
7	Systems Biology	10-LIFE04-007-C

(B) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Biophysics of Macromolecular Structures	10-LIFE04-001-E
2	Simulation Techniques in Biology	10-LIFE04-002-E
3	Population Biology, Ecology and Evolution	10-LIFE04-003-E
4	Computational Neuroscience	10-LIFE04-004-E
5	Modeling of Infectious Diseases	10-LIFE04-005-E

Course Outcomes:

(A) Core Courses

Name of the Core Courses	Course code	Course Outcome
Biology-1	10-LIFE04-001-C	Learn basics of genetics, biochemistry, molecular biology and cell biology
		Learn about foundational experiments contributing to key developments in molecular biology over the last century
		Learn basics of developmental biology and molecular evolution
		Learn about biological systems where computational modelling has already made an impact
Protein Structure	10-LIFE04-002-C	Learn basics of biochemistry and protein structure (including globular, membrane proteins)
		Learn computational tools required to understand and address structural aspects of proteins
Mathematics and statistics for biologists	10-LIFE04-003-C	Learn to frame and solve simple problems in dynamics using differential equations, and understand some classic applications
		Learn basic concepts and applications of linear algebra
		Learn essentials of probability theory and statistics and applications to biological problems
		Have a basic competence in numerical methods, machine learning methods and tools, and related topics
Physical Methods for Biologists	10-LIFE04-004-C	Learn how to make biophysical estimates
		Learn about the random walk and diffusion, Ficks law and how to make related estimates
		Learn to make statistical mechanics calculations in biology, involving cooperativity, entropy and self-assembly
		Learn about biological polymers and their properties and perform force extension calculations
		Understand biological fluids, Reynolds number and the Stokes limit
Biology-2	10-LIFE04-005-C	Learn basics of DNA packaging, Chromatin structure and Epigenetics

		Learn basics of neuroscience, ecology and evolution
		Learn basic experimental techniques in biology
		Learn basics of intercellular communication, physiology, epidemiology and immunology
Biological sequence analysis	10-LIFE04-006-C	Have a basic understanding of computer science algorithms, especially related to strings and pattern-matching
		Understanding of sequence alignment algorithms, generative models, hidden Markov models
		Basic understanding of phylogenetics and related principles and algorithms
		Basics of next-generation-sequencing methods and analysis, including essential algorithms
		Ability to frame and implement algorithms for real-world bioinformatic tasks
Systems Biology	10-LIFE04-007-C	Understand the role of networks across different scales in biology
		Mathematically model the dynamics of simple networks of interacting biological entities
		Understand the basic physical mechanisms explaining how spatial patterns can emerge spontaneously
		Learn the functional role of waves in biology for transport, communication and coordination

(B) Elective Courses

Name of the Elective Courses	Course code	Course Outcome
Biophysics of Macromolecular Structures	10-LIFE04-001-E	Understand the basics of biological macromolecular structure and functions
		Understand different biophysical approaches for probing the biological macromolecular structures and the environment in which they function.
Simulation Techniques in Biology	10-LIFE04-002-E	Learn basic statistical mechanics tools for simulation methodologies probing different length and time scales
		Apply simulation technologies to understand protein structure and function in-silico

Population Biology, Ecology and Evolution	10-LIFE04-003-E	To understand the time evolution of single species population using different types of mathematical models
		Learn basic aspects of game theory to understand how cooperation can emerge
		To model trophic (predator-prey) interactions in multiple species communities
		To understand basic aspects of the mathematical theory of evolution through natural selection
Computational Neuroscience	10-LIFE04-004-E	Understand how information is processed by the nervous system
		Learn how neurons communicate with each other and with sensory, as well as, effector organs
		Derive the Hodgkin-Huxley model of action potential transmission along a nerve
		Able to simulate in computers the electrical activity in neurons and small neuronal networks
Modeling of Infectious Diseases	10-LIFE04-005-E	Understand disease, disease spread and modeling approaches
		Learn the basics of epidemiology and epidemiological methods
		Derive and solve ordinary dufferential equation based models of disease spreading
		Understand basic concepts of immunology

BACK TO MAIN

V. Courses at NISER

Program Code : LIFE04	Programme Specific Outcome	Training in carrying out research in advanced molecular biology.
		Development of man power for advanced research in bio techniques.
		Building human resource for research in bio informatics and computational biology.

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	BIOINFORMATICS AND COMPUTATIONAL BIOLOGY	B601
2	BIOTECHNIQUES	B602
3	ADVANCED MOLECULAR BIOLOGY	B701

(B) Elective Courses

Sr. No.	Name of the Elective	Course code
1	ADVANCED CELL BIOLOGY	B601
2	GENETIC ENGINEERING	B602
3	ADVANCED BIOCHEMISTRY	B701
4	ADVANCED MICROBIOLOGY	B654
5	ENZYMOLOGY	B655
6	ADVANCED NEUROBIOLOGY	B656
7	CHEMICAL BIOLOGY	B657
8	VIROLOGY	B658
9	PLANT PHYSIOLOGY	B659
10	DEVELOPMENTAL BIOLOGY	B660
11	ADVANCED IMMUNOLOGY	B751
12	INFECTIOUS DISEASE BIOLOGY	B752

13	CANCER BIOLOGY	B753
14	ADVANCED GENETICS	B754
15	IMMUNE REGULATION AND INFECTION	B755
16	MACROMOLECULAR CRYSTALLOGRAPHY	B756
17	QUANTITATIVE BIOLOGY	B757
18	ION CHANNELS	B758
19	CONCEPTS IN MECHANOBIOLOGY	B759
20	MOLECULAR ERRORS IN DISEASE	B760
21	PLANT DEVELOPMENTAL BIOLOGY	B761

(C) Project Assignments

Sr. No.	Name of the Project Assignments	Course code
1	RESEARCH PROJECT ASSIGNMENT 1	B699
2	RESEARCH PROJECT ASSIGNMENT 2	B799

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
BIOINFORMATICS AND COMPUTATIONAL BIOLOGY	B601	Application of bioinformatics knowledge in understanding relationships at sequence, structure and network-level.
		Demonstration of popularly used bioinformatics tools for research work
		Help understand the patterns of life and rhythms
BIOTECHNIQUES	B602	Basic principle behind the biophysical, and biochemical experiments. Troubleshoot the experiments, interpretation of results, plotting of graphs, design the experiments.

ADVANCED MOLECULAR BIOLOGY	B701	Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.

(B) Elective courses

Name of the Elective	**Course code**	**Course Outcome**
ADVANCED CELL BIOLOGY	B601	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
GENETIC ENGINEERING	B602	Understanding the basic principles of Recombinant DNA technology
		Knowledge of various tools and techniques used in genetic engineering
		Applications in the generation of transgenic models
ADVANCED BIOCHEMISTRY	B701	Understanding the mechanism of protein folding
		In depth knowledge about Post translational modifications of proteins
		Mechanisms and implications of protein turn over in cells
ADVANCED MICROBIOLOGY	B654	Develop understanding of bacterial responses to various stimuli
		Gain insights into bacterial biofilm formation and quorum sensing mechanisms
ENZYMOLOGY	B655	Build comprehension on nature and functioning of enzymes.
		Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
		Develop basic understanding on enzyme engineering

ADVANCED NEUROBIOLOGY	B656	Develop understanding about the central nervous system-controlled process and their mechanism of regulation.
		In-depth understanding of the neural circuits and behavior.
		Understand and analyze the recent updates in the field and significance.
CHEMICAL BIOLOGY	B657	Introducing the concept of chemical biology
		Application of chemistry to advance the study of biological systems
		Understanding biology to do new chemistry?
		How is chemical biology used to advance science and human health?
		Understanding chemical structures of bio-molecules
		Comparative understanding of biosynthesis and laboratory synthesis
		Understanding energetics of biochemical pathways and processes
		Be competent in reading and interpreting primary literature in the areas of chemical biology
VIROLOGY	B658	At completion of the course, student is expected to comprehend structural organization, and different biological processes of viruses
		Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
		Develop comprehension of tools and approaches to study viral biology.
PLANT PHYSIOLOGY	B659	Entrain the students with different hormone physiology and its interaction.
		Learning light physiology, transformation and photosynthesis.
DEVELOPMENTAL BIOLOGY	B660	Understanding the principles governing development of an organism from conception to birth.
		Key concepts in maintenance of growth of an organism and aging.
		Implications in Evolution, Health and disease.
ADVANCED IMMUNOLOGY	B751	Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-

		regulatory states of altered host immune system.
INFECTIOUS DISEASE BIOLOGY	B752	Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens
CANCER BIOLOGY	B753	Understanding basic molecular and cellular mechanisms of carcinogenesis.
		Integrating knowledge to understand therapeutic approaches.
		Stimulate research interest.
ADVANCED GENETICS	B754	Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
		Stimulate research interest.
IMMUNE REGULATION AND INFECTION	B755	Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
		Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases
MACROMOLECULAR CRYSTALLOGRAPHY	B756	Understand theory behind the X-ray diffraction to structure determination. Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.
QUANTITATIVE BIOLOGY	B757	Introducing the concepts of mathematics in biology
		Understanding the quantitative aspects of biology
		How is statistics and mathematics required and applied in the field of biology
		Understanding how mathematical models of biology are developed
		Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
		Understanding quantitative biology to do new and more insightful biology
ION CHANNELS	B758	Understanding the principles governing ion channel functions
		Biochemcial, biophysical, genetical basis of ion channel and its response
		Key concepts in maintenance of ion

		channel structure, function and ionic homeostasis of the cell
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
CONCEPTS IN MECHANOBIOLOGY	B759	Comprehend the concept that cells are complex micron-sized machines/ nano-machines.
		Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
		Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
		Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation
		Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
		Enable students of disciplines other than biology to understand how principles of mechanics and engineering
MOLECULAR ERRORS IN DISEASE	B760	Understanding the concepts of molecular pathogenesis.
		Basic understanding of the common pathologies of organ systems.
		Understanding of the recent advances in molecular explanation for such pathologies.
PLANT DEVELOPMENTAL BIOLOGY	B761	Learning molecular genetics approaches to understand plant development.
		Understanding the interaction of biotic and abiotic component is major focus.
		Designing experimental strategies understanding plant development.

Ph.D. in MATHEMATICAL SCIENCES (Program Code: MATH04)

Course Structure:

I. Courses at HRI

Program Code : MATH04	Programme Specific Outcome	The training in the programme will make the student to think abstractly.
		At the end of the program, the student will have the knowledge of problem solving methods and will be able to find new research problems in the subject.

SEMISTER I

Sr. No.	Name of the Course	Course code
1	Algebra I	08MATH04-001-C
2	Analysis I	08MATH04-002-C
3	Topology I	08MATH04-003-C
4	Seminar Course I	08MATH04-001-S

SEMISTER II

Sr. No.	Name of the Course	Course code
1	Algebra II	08MATH04-004-C
2	Analysis II	08MATH04-005-C
3	Topology II	08MATH04-006-C
4	Differential manifolds	08MATH04-007-C
5	Seminar Course II	08MATH04-002-S

SEMISTER III
(Based on the interest, a student can take a project in one of the following Topics)

Sr. No.	Name of the Course	Course code
1	Algebraic number theory	08MATH04-008-C
2	Local fields	08MATH04-009-C

3	Fourier analysis	08MATH04-010-C
4	Harmonic analysis	08MATH04-011-C
5	Introduction to number theory	08MATH04-012-C
6	Analytic number theory	08MATH04-013-C
7	Lie algebras	08MATH04-014-C
8	Representations of finite groups	08MATH04-015-C
9	Commutative algebra	08MATH04-016-C
10	Algebraic varieties	08MATH04-017-C
11	Other elective courses	08MATH04-001-E

Course Outcomes:

SEMISTER I

Name of the Course	**Course code**	**Course Outcome**
Algebra I	08MATH04-001-C	At the end of this course, the student should have a good grasp (beyond the competence that is expected of a typical master's level student) of the fundamentals of the topics in Algebra that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both routine and not-so-routine.
Analysis I	08MATH04-002-C	At the end of this course, the student should have a good grasp (beyond the competence that is expected of a typical master's level student) of the fundamentals of the topics in Analysis that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both routine and not-so-routine.
Topology I	08MATH04-003-C	At the end of this course, the student should have a good grasp (beyond the competence that is expected of a typical master's level student) of the fundamentals of the topics in Topology that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both routine and not-so-routine.
Seminar Course I	08MATH04-001-S	At the end of this course, the student should be in a position to choose a research topic to work on for a Ph. D thesis

SEMISTER II

Name of the Course	Course code	Course Outcome
Algebra II	08MATH04-004-C	At the end of this course, the student should have a good grasp of the advanced topics of the fundamentals in advanced topics in Algebra that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both not-so-routine and read research papers.
Analysis II	08MATH04-005-C	At the end of this course, the student should have a good grasp of the advanced topics of the fundamentals in advanced topics in Analysis that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both not-so-routine and read research papers.
Topology II	08MATH04-006-C	At the end of this course, the student should have a good grasp of the advanced topics of the fundamentals in advanced topics in Topology that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both not-so-routine and read research papers.
Differential manifolds	08MATH04-007-C	At the end of this course, the student should have a good grasp (beyond the competence that is expected of a typical master's level student) of the fundamentals of the topics in Differential manifolds that are listed. The student should be able to apply the abstract theory to concrete situations of interest and solve problems both routine and not-so-routine.
Seminar Course II	08MATH04-002-S	At the end of this course, the student should have progressed in choosing a research problem for Ph. D thesis.

SEMISTER III

Name of the Course	Course code	Course Outcome
Algebraic number theory	08MATH04-008-C	At the end of this course, the student should have learned and developed the fundamentals of Algebraic Number Theory which he/she will need for pursuing research work in this area.
Local fields	08MATH04-009-C	At the end of this course, the student should have learned and developed the fundamentals of Local fields which are needed for pursuing research work in this subject.

Fourier analysis	08MATH04-010-C	At the end of this course, the student should have learned and developed the fundamentals of Fourier Analysis which are needed for pursuing research work in this topic.
Harmonic analysis	08MATH04-011-C	At the end of this course, the student should have learned and developed the fundamentals of Harmonic Analysis which are needed for pursuing research work in this subject.
Introduction to number theory	08MATH04-012-C	At the end of this course, the student should have learned and developed the fundamentals of Introduction to Number Theory which are needed for pursuing research work in this subject.
Analytic number theory	08MATH04-013-C	At the end of this course, the student should have learned and developed the fundamentals of Analytic Number Theory which are needed for pursuing research work in this topic.
Lie algebras	08MATH04-014-C	At the end of this course, the student should have learned and developed the fundamentals of Lie algebras which are needed for pursuing research work in this subject.
Representations of finite groups	08MATH04-015-C	At the end of this course, the student should have learned and developed the fundamentals of Representations of finite groups which are needed for pursuing research work in this topic.
Commutative algebra	08MATH04-016-C	At the end of this course, the student should have learned and developed the fundamentals of Commutative algebra which are needed for a Ph.D thesis work in this topic.
Algebraic varieties	08MATH04-017-C	At the end of this course, the student should have learned and developed the fundamentals of Algebraic varieties which needed for pursuing research work in this topic.
Other elective courses	08MATH04-001-E	At the end of this course, the student should have learned and developed the fundamentals of (a chosen Topic) which he/she needs for a Ph.D thesis work.

Course Outcomes:

Core subjects

Name of the Course	Course code	Course Outcome
Algebra I	10MATH04-001-C	Understanding of basic group theory in the language of group actions
		Ability to apply linear algebra, in particular, canonical forms and spectral theory
		Understanding of basic category theory and tensor products

Algebra II	10MATH04-002-C	Understanding the fundamentals of Galois theory
		Familiarity with semi simplicity and its applications
		Good understanding of the representation theory of finite groups
		Knowledge of basic commutative algebra
Analysis I	10MATH04-003-C	Knowledge of measure theory
		Understanding of L^p spaces
		Familiarity with product measures and Fubini's theorem
		Understanding of the Radon-Nikodym theorem and the Lebesgue decomposition theorem
Analysis II	10MATH04-004-C	Good understanding of the basic theorems of functional analysis
		Familiarity with various kinds of topologies on function spaces
		Knowledge of Banach algebras
		Understanding of basic Hilbert space theory and C^*-algebras
Topology I	10MATH04-005-C	Solid understanding of point set topology
		Ability to use and compute fundamental groups and covering spaces
		Knowledge of basic homology theory

		Familiarity with applications of fundamental groups and homology groups
Topology II	10MATH04-006-C	Knowledge of advanced topics in homology theory
		Familiarity with cohomology theory and homotopy
		Understanding of basic notions of differential topology
		Knowledge of topics such as differential geometry, characteristic classes and Morse theory
Complex Analysis	10MATH04-007-C	Familiarity with analytic functions
		Knowledge of Cauchy's theorem, maximum modulus principle, Schwarz lemma
		Ability to apply conformal mappings and Mobius transformations
		Understanding of the Dirichlet problem and harmonic functions
Credit seminar	10MATH04-008-C	Appreciation of current research in chosen sub-area
Research Methodology	10MATH04-009-C	An introduction to the methods and techniques of academic research through a project and presentations - both oral and written.

Electives

Name of the Course	Course Code	Course Outcome
TOPICS IN ANALYTIC NUMBER THEORY	10MATH04-001-E	Possibilities for topics are: introduction to arithmetic functions, convolution and Mobius inversion formula, basic asymptotic formulas for arithmetic functions, characters and Fourier analysis on finite abelian groups, theory of Dirichlet series, primes in arithmetic progression, Riemann zeta function, Poisson summation and functional equation, The prime number theorem, error term in prime number theorem, its oscillation and the Riemann hypothesis, equivalent formulations of Riemann hypothesis, zero-free regions, explicit formula and Siegel's theorem, introduction to sieve methods, Brun and Selberg sieve, large sieve and the Bombieri-Vinogradov theorem and Vinogradov's three prime Theorem.
TOPICS IN ALGEBRAIC NUMBER THEORY	10MATH04-002-E	Possibilities for topics are: Dedekind domains, ramification, different and discriminants, decomposition and inertia groups, quadratic fields and genus theory, classification of primitive quadratic characters, Gauss sums and quadratic reciprocity, geometry of numbers, finiteness of class number and explicit computations, regulators and Dirichlet's unit theorem, cyclotomic fields and inverse Galois problem for abelian number fields, Artin symbol and splitting in cyclotomic fields, Dedekind zeta function, the analytic class number formula and introduction to the Chebotarev density theorem
TOPICS IN COMMUTATIVE ALGEBRA	10MATH04-003-E	One possibility is a course covering the second half of Matsumura's text including topics such as: regular sequences, Koszul complex, Cohen-Macaulay rings, Gorenstein rings, regular rings, UFDs, complete intersections, local flatness criterion, generic freeness, derivations and differentials, separability, I-smoothness, Cohen's structure theorems and applications of complete local rings.
TOPICS IN MODULAR FORMS	10MATH04-004-E	Possibilities include: Introduction to SL2(R) and its action on the Poincare upper half-plane H, discrete subgroups Γ of SL2(R) and their cusps, the modular group SL2(Z), Topology,

		measure theory and complex structure on H/Γ and its compactification, Modular functions, modular forms and cusp forms on SL2(Z), examples : Eisenstein Series and the delta Function, finite dimensionality of space of modular forms, the Miller basis and the Z-structure on the space of modular forms, growth of Fourier co-efficients of cusp forms, introduction to Ramanujan's conjectures, theory of Hecke operators and Petersson inner-product on the space of cusp forms, application to Ramanujan's conjectures, the L-function of modular forms, congruence subgroups, modular forms and cusp forms on congruence subgroups, spectral theory of automorphic forms, introduction to Galois representations and Deligne's theorem, Lehmer's conjecture and the Atkin-Serre Conjecture.
TOPICS IN ELLIPTIC CURVES	10MATH04-005-E	Possibilities for material to be covered include selected topics from Elliptic functions by Lang, The arith-metic of Elliptic curves by Silverman, Elliptic curves by Milne or Elliptic curves by Husemoller. Another possibility would be to prove Mazur's theorem which is a well-known and important result covering elliptic curves and abelian varieties, and the moduli of elliptic curves.
TOPICS IN ALGEBRAIC CURVES	10MATH04-006-E	Possibilities for material to be covered include selected topics from An invitation to arithmetic geometry by Lorenzini, Algebraic Curves by Fulton or lectures notes of Joseph Oesterle. Topics such as the basics of algebraic varieties over the complex numbers (with focus on dimension 1), singularities of curves (what are they and when is a curve nonsingular), desingularization of curves by normalization, the relationship between nonsingular algebraic curves and complex manifolds of dimension 1, nonsingular projective algebraic curves and function fields, the Riemann-Roch theorem, and also some of its applications.
TOPICS IN DIOPHANTINE GEOMETRY	10MATH04-007-E	Some possibilities are: introduction to Global fields, absolute values on global fields, theory of heights, rational points on conics. local-global principle and application to quadratic forms, affine and projective varieties, morphisms and rational

		maps, explicit arithmetic on function fields and their zeta-functions, divisors on curves, The Riemann-Roch theorem, elliptic curves over global fields, endomorphism rings of Elliptic curves, CM and non-CM curves, ehe Mordell-Weil group and rank of an elliptic curve and local-global principle on elliptic curves and the Tate-Shaferevich group.
TOPICS IN TRANSCENDENTAL NUMBER THEORY	10MATH04-008-E	Possibilities are: Liouville's theorem and Liouville Numbers, elements of rational approximation, transcendence of e and π, irrationality of $\zeta(3)$, introduction to algebraic independence, Lindemann-Weierstrass theorem, Schanuel's conjecture and Ax's theorem for for-mal power series, the Schneider-Lang Theorem, Hilbert's seventh problem and the Gelfond-Schneider theorem, Baker's Theorem and applications, six exponential theorem, introduction to heights and Roth's Theorem, the padic Baker theorem (by Brumer) and introduction to Leopoldt's conjecture and the padic subspace theorem and applications.
TOPICS IN ALGEBRAIC GROUPS	10MATH04-009-E	One possibility is to cover the basic theory of linear algebraic groups over an algebraically closed field up to the classification of the reductive groups by means of root data, developing the necessary background from algebraic geometry as and when needed. Thus covering preliminaries from algebraic geometry, linear algebraic groups: definition and first properties, commutative algebraic groups, derivations, differentials, and Lie algebras, topological properties of morphisms applied to this context, Parabolic subgroups, Borel subgroups, and solvable subgroups, Weyl group, roots, and root datum and reductive groups and their classification: isomorphism and existence theorems.
TOPICS IN INFINITE DIMENSIONAL LIE ALGEBRAS	10MATH04-010-E	Some possibilities are: generalized Cartan matrices and their associated Lie algebras, symmetrizability, the invariant bilinear form, the Weyl group, classification of indecomposable GCMs, finite, affine and indefinite types, affine Kac-Moody algebras, roots, the affine Weyl group, realizations of untwisted and twisted affine Kac-Moody algebras in terms of loop algebras, representation theory: integrable

		representations, category O, proof of the Weyl-Kac character formula, highest weight integrable representations, weights, representations of affine Kac-Moody algebras.
TOPICS IN FUNCTIONAL ANALYSIS	10MATH04-011-E	Some possibilities are: analytic Fredholm theory, compact and Fredholm operators, Atkinson's theorem, Gelfand duality, properties of the analytic index, Toeplitz operators on Hardy spaces, Pseudo-differential operators and Elliptic regularity, Fourier transforms and Sobolev spaces on Rn, Symbol calculus and Pseudo-differential operators, Elliptic-ity and Pseudo-differential operators on smooth manifolds, construction of para-metrices, Elliptic regularity theorem, Ellipticity and Fredholm property of Dirac operators on closed manifolds.
TOPICS IN NON-COMMUTATIVE GEOMETRY	10MATH04-012-E	Some possibilities are: Vector bundles, K-theory for topological spaces, Serre Swan theorem, K0 and K1for a C*-algebra, homotopy invariance, split exactness, half-exactness, stability of K-theory, inductive limits and K-theory, Bott periodicity, Six term exact sequences, computations with them, Pimsner-Voiculescu exact sequence, Thom isomorphism, Hilbert C*-modules, KK groups, Geometric index theory, Vector bundles, connec-tions and curvature on Riemannian manifolds, structure equations of Cartan, invari-ant forms and characteristic classes in de Rham cohomology, Chern-Gauss-Bonnet theorem and idea of proof, topological index and statement of the Atiyah-Singer index theorem
TOPICS IN LIE GROUPS	10MATH04-013-E	Some possibilities are: Introduction to Lie algebras, definitions, examples, abelian, nilpotent, solvable lie algebras, semisimple lie algebras, representation of Lie algebras, structure of general Lie algebras over characteristic zero field : statement of the Levi decomposition, statement of Ado's theorem, Introduction to real differentiable manifolds, and various standard objects associated with it, statement of the Frobenius theorem on integrability, definition of real Lie groups, examples, associated Lie algebra, the exponential map and its properties, closed subgroup theorem, continuous homomorphisms, definition of Lie subgroups and

		examples, association of lie subgroups and lie subalgebras, covering Lie groups, simply connected lie groups and association with real Lie algebras, the adjoint representation, the manifold structure of the left or right coset space with respect to a closed subgroup and the (subgroup)-principal bundle structure of the Lie group with respect to the projection to the coset space, Construction of left invariant Haar measure using left invariant differential forms, formula for modular function, compact Lie groups, Peter-Weyl theorem, embedding compact groups in linear Lie groups, Weyl group, conjugacy of maximal tori in connected compact Lie groups, Centralizers of tori, basic structure of semisimple Lie groups, existence of compact real forms of complex semi-simple Lie algebras, Cartan decomposition both at the Lie algebra and Lie group level, Iwasawa decomposition.
TOPICS IN ALGEBRAIC GEOMETRY	10MATH04-014-E	One possibility is an introduction to the language of schemes, properties of morphisms, and sheaf co-homology. So that the students gain an understanding of the basic notions and techniques of modern algebraic geometry.
TOPICS IN DIFFERENTIAL GEOMETRY	10MATH04-015-E	Some possibilities are: Definition of smooth manifolds, atlas, examples, tangent spaces, inverse and im-plicit functon theorems for manifolds, vector fields, flow, completeness of the flow function, integrability and Frobenius theorem, differential forms, pullback by func-tions, exterior derivative, orientations, manifolds with boundary, Stokes theorem, DeRham cohomology, computations using Mayer Vietoris, Riemannian metrics and geodesics.
TOPICS IN PARTIAL DIFFERENTIAL EQUATIONS	10MATH04-016-E	Some possibilities are: Examples of partial differential equations, Strategies for studying PDE., Well posed problem, Brief introduction to classical solutions, weak solution and regularity, Transport equation, Laplace's equation, Heat equation and wave equation, Problems associated to these equations, notion of fundamental solution etc., Non-linear first order PDE, Hamilton Jacobi equations, calculus of variations, Hamilton's ode, Legendre transforms, etc., Theory of linear partial differential

		equations: Sobolev spaces, weak derivative, Sobolev inequalities, Elliptic equations, Weak solutions, the existence of weak solutions, regularity, maximum principles, eigenvalues and eigenfunctions of elliptic operators, compactness, etc.
TOPICS IN MATHEMATICAL PHYSICS	10MATH04-017-E	One possibility is to cover classical and quantum mechanics covering topics such as: review of Galilean group, mechanical system with one degree of freedom, mechanical system consisting of motion of a point in three dimensional space and motion of system of n points, review of calculus of variation, Lagrange’s equation, Hamilton’s equations, Liouville’s theorem, Symplectic structures on phase spaces and Noether’s theorem, D’Alembert’s principle, Symplectic manifolds, Hamiltonian mechanics on symplectic manifolds, moment map, postulates of quantum mechanics, mathematical aspects of Schrödinger’s equation, review of Lie group, Lie algebra and their representations with main focus on groups like U(1), SO(3), SU(2), Spin groups in 3 and 4 dimensions, Spin 1/2 particle in magnetic field, review of Fourier transforms, position and momentum space, Dirac notation, Heisenberg’s uncertainty principle, Hydrogen atom, quantization, canonical quantization, The Groenewold-van Hove no-go theorem, canonical quantization in n–dimensions, quantization and symmetries.
TOPICS IN ALGEBRA	10MATH04-018-E	One possibility is a course in commutative algebra covering prime ideals and maximal ideals, nilradical and jacobson radical, prime avoidance and the Chinese remainder theorem, extension and contraction of ideals, modules, submodules and quotient modules, direct sum and direct product, finitely generated modules and Nakayama lemma, exact sequences, tensor products, restriction and extension of scalars, exactness properties of the tensor product, algebras, tensor product of algebras, localization, local properties, extended and contracted ideals in rings of fractions, primary decomposition,

		integral extensions, lying over, going-up theorems, integrally closed domains and the going-down theorem, valuation rings, Noetherian and Artinian modules, Noetherian rings, Hilbert basis theorem, primary decomposition in Noetherian rings, Artinian rings and their structure, discrete valuation rings and Dedekind domains, fractional ideals, completions, filtrations, topologies, and completions, graded rings and modules, associated graded ring, dimension theory, Hilbert functions, dimension theory of Noetherian local rings, regular local rings, transcendental dimension, relation to algebraic varieties and algebraic geometry.
TOPICS IN OPERATOR ALGEBRAS	10MATH04-019-E	Some possibilities are: Banach algebras, spectrum, spectral radius formula, C*-algebras, Gelfand Naimark theorem, continuous functional calculus, GNS construction, positivity, measurable functional calculus, von Neumann algebras, Kaplansky density theorem, double commutant theorem, finite-dimensional C*-algebras, representation theory of the C*-algebra of compact operators, Toeplitz algebra, Coburn's theorem, group C*-algebras, crossed products, amenability, groupoid C*-algebras.
TOPICS IN REPRESENTATION THEORY	10MATH04-020-E	Some possibilities are: Lie algebras: definition and basic properties, ideals, subalgebras, homomorphisms, nilpotent and solvable Lie algebras, Lie's and Engel's theorems, semisimple Lie algebras, the Killing form, Cartan's criterion, abstract Jordan decomposition, classification of finite dimensional semisimple Lie algebras, Dynkin diagrams, the Weyl group, isomorphism and conjugacy theorems, representations, Verma modules, category O, irreducible highest weight modules, complete reducibility, Weyl character formula, Freudenthal weight multiplicity formula, Kostant and Steinberg formulas.
TOPICS IN ALGEBRAIC COMBINATORICS	10MATH04-021-E	Some possibilities are: Partially ordered sets and Mobius inversion, generating functions, permutations and statistics, Robinson-Schensted correspondence, partitions, Young's lattice, hook-length formula, Representation theory of symmetric groups, similarity classes of

		matrices and orthogonal polynomials.
TOPICS IN TOPOLOGY	10MATH04-022-E	Definitions and basic construction of homotopy groups, Whitehead's theorem, Hurewicz's theorem, stable homotopy groups, fibrations and obstruction theory, Bott's periodicity theorem, H-cobordism theorem, construction and applications of characteristic classes.
TOPICS IN SYMPLECTIC GEOMETRY	10MATH04-023-E	Possibilities include: Motivations of sympletic Geometry from Hamiltonian mechanics, neighbourhood theorems, compatible almost complex structure, and the contractibility of the space of almost complex structures, integrability of almost complex structures, Newlander-Nirenberg theorem, Hamiltonian circle actions on symplectic manifolds, moment maps, Fubini-Studi form on projective space, Kähler forms as Hessians of plurisubharmonic function on complex manifolds, introduction to pseudoholomorphic curves, outline of proof of Gromov's non-squeezing theorem.
PROGRAMMING FOR MATHEMATICIANS	10MATH04-024-E	Some possibilities are: Basic python syntax, Iterables and generators, Object oriented programming, introduction to Sage, the Numpy library, the Networkx library, graphics with Sage and Matplotlib and a Programming project.

Course Structure:

III. Courses at NISER

Program Code : MATH04	Programme Specific Outcome	A solid understanding of graduate level algebra, analysis and topology.
		Using their mathematical knowledge to tackle research problems.
		Identifying unsolved yet relevant problems in a specific field.
		To be able to undertake original research on a particular topic.
		Communicate mathematics accurately and effectively in both written and oral form.
		Conducting scholarly or professional activities in an ethical manner.

Core Subjects

(A) MATHEMATICS I

Course Outcomes:

(A) MATHEMATICS I

Name of the Course	Course code	Course Outcome
Algebra I	M601	Students will learn basic properties of groups, rings, and modules and will be able to use these algebraic structures to solve research problems.
Analysis I	M603	Upon successful completion of the course, students will be familiar with various advanced concepts and techniques from functional analysis, measure theory and harmonic analysis (on the real line).
Topology and Complex Analysis	M659	Upon successful completion of the course, students will aware of various properties of topological space and various properties of functions on topological spaces. The students also learn continuous maps between topological spaces, product topology, Quotient spaces, Connectedness, Compactness, Path connected spaces, separation axioms, Tychonoff spaces, Urysohns lemma and metrization theorem. Furthermore, the student will learn various properties of functions for several variable.

Elective I	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Self-study course I	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Algebra II	M602	Students will learn basic properties of fields and Galois theory and will be able to use these results to solve other mathematical problems.
Analysis II	M604	Upon successful completion of the course, students will aware of various properties of norm linear vector spaces and topological vector spaces. They will also learn various properties of linear transformations defined on these norm liner spaces and topological vector spaces.
Advanced Probability	M632	Probability spaces, Random Variables, Independence, Zero-One Laws, Expectation, Product spaces and Fubini's theorem, Convergence concepts, Law of large numbers, Kolmogorov threeseries theorem, Levy-Cramer Continuity theorem, CLT for i.i.d. components, In_nite Products of probability measures, Kolmogorov's Consistency theorem, Conditional expectation, Discrete parameter martingales with applications.
Elective II	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Self-study course II	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) MATHEMATICS II

Name of the Course	Course code	Course Outcome
Introduction to Stochastic Processes	M615	Discrete Markov chains with countable state space; Classification of states: recurrences, transience, periodicity. Stationary distributions, reversible chains, several illustrations including the Gambler's Ruin problem, queuing chains, birth and death chains etc. Poisson process, continuous time Markov chain with countable state space, continuous time birth and death chains.
Statistical Inference I	M641	joint and conditional distributions, order statistics, group family, exponential family.

		Introduction to parametric inference, sufficiency principle and data reduction, factorization theorem, minimal sufficiency statistics, Fisher information, ancillary statistics, complete statistics, Basu's theorem. Unbiasedness, best unbiased and linear unbiased estimator, Rao-Blackwell theorem, Lehmann- Scheffe theorem and UMVUE, Cramer-Rao lower bound and UMVUE, multi-parameter cases. Location and scale invariance, principle of equivarience.
		Methods of estimation: method of moments, likelihood principle and maximum likelihood estimation, properties of MLE: invariance, consistency, asymptotic normality. Hypothesis testing: error probabilities and power, most powerful tests, Neyman-Pearson lemma and its applications, p-value, uniformly most powerful (UMP) test via Neyman- Pearson lemma, UMP test via monotone likelihood ratio property, existence and nonexistence of UMP test for two sided alternatives, unbiased and UMP unbiased tests.
		Likelihood (generalized) ratio tests and its properties, invariance and most powerful invariant tests. Introduction to confidence interval estimation, methods of fining confidence intervals: pivotal quantity, inversion of a test, examples such as confidence interval for mean, variance, difference in means, optimal interval estimators, uniformly most accurate confidence bound, large sample confidence intervals.
Regression Analysis	M644	Introduction to simple linear regression, least square estimation and hypothesis testing of model parameters, prediction, interval estimation in simple linear regression, Coefficient of determination, estimation by maximum likelihood, multiple linear regression, matrix representation of the regression model, estimation and testing of model parameters and prediction, model adequacy checking-residual analysis, PRESS statistics, outlier detection, lack of fit test, serial correlation and Durbin-Watson test, transformation and weighting to correct model inadequacies-variance-stabilizing transformation, generalized and weighted least squares, diagnostics for influential observations, Cooks D test, multicollinearity-sources and effects, diagnosis and treatment for multicollinearity, ridge regression and LASSO, bootstrap estimation, dummy variable model, variable

		selection and model buildingstepwise methods, polynomial regression and interaction regression models, nonlinear regression, generalized linear models-logistic regression and Poisson regression.
Elective I	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Self-study course I	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Advanced Probability	M632	Probability spaces, Random Variables, Independence, Zero-One Laws, Expectation, Product spaces and Fubini's theorem, Convergence concepts, Law of large numbers, Kolmogorov three-series theorem, Levy-Cramer Continuity theorem, CLT for i.i.d. components, Infinite Products of probability measures, Kolmogorov's Consistency theorem, Conditional expectation, Discrete parameter martingales with applications.
Time Series Analysis	M645	Examples and objectives of time series, stationary time series and autocorrelation function, estimation and elimination of trend and seasonal components, testing for noise sequence, moving average process, autoregressive processes and ARMA processes, estimation of autocorrelation function, methods of Forecasting-Durbin-Levinson algorithm and Innovations algorithm, the Wold decomposition, ARMA models-the auto-covariance and partial auto-covariance function, forecasting ARMA processes, spectral analysis-spectral densities, periodogram, modeling with ARMA processes, Yule-Walker estimation, maximum likelihood estimation, diagnostic checking, non-stationary time series-ARIMA models, identification techniques, forecasting ARIMA models, seasonal ARIMA models, multivariate time series, ARCH and GARCH models.
Statistical Inference II	M767	General decision problem, loss and risk function, minimax estimation, minimaxity and admissibility in exponential family. Introduction to Bayesian estimation, Bayes rule as average risk optimality, prior and posterior, conjugate families, generalized Bayes rules. Bayesian intervals and construction of credible sets, Bayesian hypothesis testing. Empirical and nonparametric empirical Bayes analysis, admissibility of Bayes and

		generalized Bayes rules, discussion on Bayes versus non-Bayes approaches. Large sample theory: review of modes of convergences, Slutsky's theorem, Berry-Essen bound, delta method, CLT for iid and non iid cases, multivariate extensions. Asymptotic level _ tests, asymptotic equivalence, comparison of tests: relative efficiency, asymptotic comparison of estimators, efficient estimators and tests, local asymptotic optimality. Bootstrap sampling: estimation and testing.
Elective II	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Self-study course II	M***	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(C) ELECTIVES

Name of the Course	Course code	Course Outcome
Representations of Finite Groups	M606	Group representations, Maschke's theorem and completely reducibility, Characters, Inner product of Characters, Orthogonality relations, Burnside's theorem, induced characters, Frobenius reciprocity, induced representations, Mackey's Irreducibility Criterion, Character table of some well-known groups, Representation theory of the symmetric group: partitions and tableaux, constructing the irreducible representations.
Commutative Algebra	M607	Commutative rings, ideals, operations on ideals, prime and maximal ideals, nilradicals, Jacobson radicals, extension and contraction of ideals, Modules, free modules, projective modules, exact sequences, tensor product of modules, Restriction and extension of scalars, localization and local rings, extended and contracted ideals in rings of fractions, Noetherian modules, Artinian modules, Primary decompositions and associate primes, Integral extensions, Valuation rings, Discrete valuation rings, Dedekind domains, Fractional ideals, Completion, Dimension theory.
Algebraic Topology	M608	Rational and Jordan canonical forms, Inner product spaces, Unitary and Normal operators, Forms on inner product spaces, Spectral

		theorems, Bilinear forms, Matrix decomposition theorems, Courant- Fischer minimax and related theorems, Nonnegative matrices, Perron- Frobenius theory, Generalized inverse, Matrix Norm, Perturbation of eigenvalues.
Advanced Functional Analysis	M612	Definition and examples of topological vector spaces (TVS) and locally convex spaces (LCS); Linear operators; Hahn-Banach Theorems for TVS/ LCS (analytic and geometric forms); Uniform boundedness principle; Open mapping theorem; Closed graph theorem; Weak and weak* vector topologies; Bipolar theorem; dual of LCS spaces; Krein-Milman theorem for TVS; Krien-Smulyan theorem for Banach spaces; Inductive and projective limit of LCS.
Advanced Linear Algebra	M613	Rational and Jordan canonical forms, Inner product spaces, Unitary and Normal operators, Forms on inner product spaces, Spectral theorems, Bilinear forms, Matrix decomposition theorems, Courant- Fischer minimax and related theorems, Nonnegative matrices, Perron- Frobenius theory, Generalized inverse, Matrix Norm, Perturbation of eigenvalues.
Algebraic Geometry	M616	Prime ideals and primary decompositions, Ideals in polynomial rings, Hilbert Basis theorem, Noether normalisation lemma, Hilbert's Nullstellensatz, A_ne and Projective varieties, Zariski Topology, Rational functions and morphisms, Elementary dimension theory, Smoothness, Curves, Divisors on curves, Bezout's theorem, Riemann-Roch for curves, Line bundles on Projective spaces.
Algebraic Graph Theory	M617	Adjacency matrix of a graph and its eigenvalues, Spectral radius of graphs, Regular graphs and Line graphs, Strongly regular graphs, Cycles and Cuts, Laplacian matrix of a graph, Algebraic connectivity, Laplacian spectral radius of graphs, Distance matrix of a graph, General properties of graph automorphisms, Transitive and Arc-tranisitve graphs, Symmetric graphs.
Algebraic Number Theory	M618	Number Fields and Number rings, prime decomposition in number rings, Dedekind domains, Ideal class group, Galois theory applied to prime decomposition, Gauss reciprocity law, Cyclotomic fields and their ring of integers, finiteness of ideal class group,

		Dirichlet unit theorem, valuations and completions of number fields, Dedekind zeta function and distribution of ideal in a number ring.
Finite Fields	M623	Structure of finite fields: characterization, roots of irreducible polynomials, traces, norms and bases, roots of unity, cyclotomic polynomial, representation of elements of finite fields, Wedderburn's theorem; Polynomials over finite field: order of polynomials, primitive polynomials, construction of irreducible polynomials, binomials and trinomials, factorization of polynomials over small and large finite fields, calculation of roots of polynomials; Linear recurring sequences: LFSR, characteristic polynomial, minimal polynomial, characterization of linear recurring sequences, Berlekamp-Massey algorithm; Applications of finite fields: Applications in cryptography, coding theory, finite geometry, combinatorics.
Information and Coding Theory	M624	Information Theory: Entropy, Huffman coding, Shannon-Fano coding, entropy of Markov process, channel and mutual information, channel capacity
		Error correcting codes: Maximum likelihood decoding, nearest neighbour decoding, linear codes, generator matrix and parity-check matrix, Hamming bound, Gilbert-Varshamov bound, binary Hamming codes, Plotkin bound, nonlinear codes, Reed-Muller codes, Cyclic codes, BCH codes, Reed-Solomon codes, Algebraic codes.
Mathematical Logic	M625	Propositional Logic, Tautologies and Theorems of propositional Logic, Tautology Theorem.
		First Order Logic: First order languages and their structures, Proofs in a first order theory, Model of a first order theory, validity theorems, Metatheorems of a first order theory, e. g., theorems on constants, equivalence theorem, deduction and variant theorems etc. Completeness theorem, Compactness theorem, Extensions by definition of first order theories, Interpretations theorem, Recursive functions, Arithmatization of first order theories, Godels first Incompleteness theorem, Rudiments of model theory including Lowenheim-Skolem theorem and categoricity.

Measure Theory	M626	σ- algebras of sets, measurable sets and measures, extension of measures, construction of Lebesgue measure, integration, convergence theorems, Radon-Nikodym theorem, product measures, Fubini's theorem, differentiation of integrals, absolutely continuous functions, Lp-spaces, Riesz representation theorem for the space C[0; 1].
Nonlinear Analysis	M627	Calculus in Banach spaces, inverse and multiplicit function theorems, fixed point theorems of Brouwer, Schauder and Tychonofi, fixed point theorems for nonexpansive and set-valued maps, predegree results, compact vector fields, homotopy, homotopy extension, invariance theorems and applications.
Operator Theory	M628	Linear programming problem and its formulation, convex sets and their properties, Graphical method, Simplex method, Duality in linear programming, Revised simplex method, Integer programming, Transportation problems, Assignment problems, Games and strategies, Two-person (non) zero-sum games, Introduction to non-linear programming and techniques.
Abstract Harmonic Analysis	M630	Topological Groups: Basic properties of topological groups, subgroups, quotient groups. Examples of various matrix groups. Connected groups. Haar measure: Discussion of Haar measure without proof on R, T, Z and simple matrix groups, Convolution, the Banach algebra L1(G) and convolution with special emphasis on L1(R), L1(T) and L1(Z).
		Basic Representation Theory: Unitary representation of groups, Examples and General properties, The representations of Group and Group algebras, C_-algebra of a group, GNS construction, Positive de_nite functions, Schur's Lemma. Abelian Groups: Fourier transform and its properties, Approximate identities in L1(G), Classical Kernels on R, The Fourier inversion Theorem, Plancherel theorem on R, Plancherel measure on R; T; Z. Dual Group of an Abelian Group: The Dual group of a locally compact abelian group, Computation of dual groups for R; T; Z, Pontryagin's Duality theorem.
Advanced Number Theory	M631	Review of Finite fields, Gauss Sums and Jacobi Sums, Cubic and biquadratic reciprocity, Polynomial equations over finite fields, Theorems of Chevally and Warning,

		Quadratic forms over prime fields. Ring of p-adic integers, Field of p-adic numbers, completion, p-adic equations, Hensel's lemma, Hilbert symbol, Quadratic forms with p-adic coe_cients. Dirichlet series: Abscissa of convergence and absolute convergence, Riemann Zeta function and Dirichlet L-functions. Dirichlet's theorem on primes in arithmetic progression. Functional equation and Euler product for L-functions. Modular Forms and the Modular Group, Eisenstein series, Zeros and poles of modular functions, Dimensions of the spaces of modular forms, The j-invariant L-function associated to modular forms, Ramanujan τ function.
Algebraic Combinatorics	M633	Catalan Matrices and Orthogonal Polynomials, Catalan Numbers and Lattice Paths, Combinatorial Interpretation of Catalan Numbers, Symmetric Polynomials and Functions, Schur Functions, Jacobi-Trudi identity, RSK Algorithm, Standard Tableaux, Young diagrams and q- binomial coefficients, Plane Partitions, Group actions on boolean algebras, Enumeration under group action, Walks in graphs, Cubes and the Radon transform, Sperner property, Matrix-Tree Theorem.
Foundations of Cryptography	M634	Introduction to cryptography and computational model, computational difficulty, pseudorandom generators, zero-knowledge proofs, encryption schemes, digital signature and message authentication schemes, cryptographic protocol.
Incidence Geometry	M635	Definitions and Example as, projective planes, affine planes, projective spaces, affine spaces, collineations of projective and affine spaces, fundamental theorem of projective and affine spaces, polar spaces, generalized quadrangles, quadrics and quadratic sets.
Lie Algebras	M636	Definitions and Examples, Derivations, Ideals, Homomorphisms, Nilpotent Lie Algebras and Engel's theorem, Solvable Lie Algebras and Lie's theorem, Jordan decomposition and Cartan's criterion, Semisimple Lie algebras, Casimir operator and Weyl's theorem, Representations of $sl(2; F)$, Root space decomposition, Abstract root systems, Weyl group and Weyl chambers, Classification of irreducible root systems, Abstract theory of weights, Isomorphism and conjugacy

		theorems, Universal enveloping algebras and PBW theorem, Representation theory of semi-simple Lie algebras, Verma modules and Weyl character formula.
Optimization Theory	M637	Linear programming problem and its formulation, convex sets and their properties, Graphical method, Simplex method, Duality in linear programming, Revised simplex method, Integer programming, Transportation problems, Assignment problems, Games and strategies, Two person (non) zero-sum games, Introduction to non-linear programming and techniques.
Random Graphs	M639	Models of random graphs and of random graph processes; illustrative examples; random regular graphs, configuration model; appearance of the giant component small subgraphs; long paths and Hamiltonicity; coloring problems; eigenvalues of random graphs and their algorithmic applications; pseudo-random graphs.
Randomized Algorithms and Probabilistic Methods	M640	Inequalities of Markov and Chebyshev (median algorithm), first and second moment method (balanced allocation), inequalities of Chernoff (permutation routing) and Azuma (chromatic number), rapidly mixing Markov chains (random walk in hypercubes, card shuffling), probabilistic generating functions (random walk in d-dimensional lattice)
Multivariate Statistical Analysis	M642	Review of matrix algebra (optional), data matrix, summary statistics, graphical representations.
		Distribution of random vectors, moments and characteristic functions, transformations, some multivariate distributions: multivariate normal, multinomial, Dirichlet distribution, limit theorems. Multivariate normal distribution: properties, geometry, characteristics function, moments, distributions of linear combinations, conditional distribution and multiple correlation.
		Estimation of mean and variance of multivariate normal, theoretical properties, James-Stein estimator (optional), distribution of sample mean and variance, the Wishart distribution, large sample behavior of sample mean and variance, assessing normality. Inference about mean vector: testing for normal mean, Hotelling T^2 and likelihood ratio test, confidence regions and simultaneous

		comparisons of component means, paired comparisons and a repeated measures design, comparing mean vectors from two populations, MANOVA. Techniques of dimension reduction, principle component analysis: definition of principle components and their estimation, introductory factor analysis, multidimensional scaling. Classification problem: linear and quadratic discriminant analysis, logistic regression, support vector machine. Cluster analysis: non-hierarchical and hierarchical methods of clustering.
Introduction to Manifolds	M643	Differentiable manifolds and maps: Definition and examples, Inverse and implicit function theorem, Submanifolds, immersions and submersions. The tangent and cotangent bundle: Vector bundles, (co)tangent bundle as a vector bundle, Vector fields, flows, Lie derivative. Differential forms and Integration: Exterior differential, closed and exact forms, Poincaré lemma, Integration on manifolds, Stokes theorem, De Rham cohomology.
Complex Analysis	M652	Review of basic Complex Analysis: Cauchy-Riemann equations, Cauchy's theorem and estimates, power series expansions, maximum modulus principle, Classification of singularities and calculus of residues; Normal families, Arzela-Ascoli theorem, Riemann mapping theorem; Weierstrass factorization theorem, Runges theorem, Mittag-Lefiers theorem; Hadamard factorization theorem, Analytic Continuation, Gamma and Zeta functions.
Discrete Mathematics	M654	Combinatorics: Counting principles, Generating functions, Recurrence relation, Polyas enumeration theory, partially ordered sets.
		Graph Theory: Graphs, Trees, Blocks, Connectivity, Eulerian and Hamiltonian graphs, Planer graphs, Graph colouring.
		Design Theory: Block Designs, Balanced incomplete block design, Difference sets and Automorphism, Latin squares, Hadamard matrices, Projective planes, Generalized quadrangles.
		Algorithm: Algorithm, Asymptotic analysis, Complexity hierarchy, NP-complete problems.
Graph Theory	M655	Basic definitions, Eulerian and Hamiltonian graphs, Planarity, Colourability, four colour problem, Matching and Halls marriage

		theorem, Max-ow Min-cut theorem, Ramsey theory, Line graphs, Enumeration, Digraphs. Matroids, Groups and Graphs, Matrices and graphs, Eigenvalues of graphs, The Laplacian of a graph, Strongly regular graphs.
Introduction to Number Theory	M656	The Fundamental Theorem of Arithmetic, Distribution of prime numbers, Congruences, Chinese remainder theorem, Congruences with prime-power modulus, Fermat's little theorem, Wilson's theorem, Euler function and its applications, Group of units, Primitive roots, Quadratic residues and Quadratic reciprocity law, Arithmetic functions, Mobius Inversion formula, Dirichlet product, Sum of squares, Introduction to Zeta function and Dirichlet Series.
Probability Theory-I	M657	Review of Basic undergraduate probability: Random variables, Standard discrete and continuous distributions, Expectation, Variance, Conditional Probability.
		Discrete time Markov chains: countable state space, classification of states Characteristic functions, modes of convergences, Borel-Cantelli Lemma, Central Limit Theorem, Law of Large numbers, Convergence Theorems in Markov Chains.
Probability Theory-II	M658	Martingale Theory: Radon-Nikoydm Theorem, Doob-Meyer decomposition.
		Weak convergence of probability measures
		Brownian motion, Markov processes and Stationary processes.
Algebraic Computation	M751	Linear algebra and lattices: Asymptotically fast matrix multiplication algorithms, linear algebra algorithms, normal forms over fields, Lattice reduction; Solving system of non-linear equations: Gröbner basis, Buchberger's algorithms, Complexity of Gröbner basis computation;
		Algorithms on polynomials: GCD, Barlekamp-Massey algorithm, factorization of polynomials over finite field, factorization of polynomials over Z and Q; Algorithms for algebraic number theory: Representation and operations on algebraic numbers, trace, norm, characteristic polynomial, discriminant, integral bases, polynomial reduction, computing maximal order, algorithms for quadratic fields; Elliptic curves: Implementation of elliptic curve, algorithms for elliptic curves.

Analytic Number Theory	M752	Arithmetic functions, Averages of arithmetical functions, Distribution of primes, finite abelian groups and characters, Gauss sums, Dirichlet series and Euler products, Reimann Zeta function, Dirichlet L-functions, Analytic proof of the prime number theorem, Dirichlet Theorem on primes in arithmetic progression.
Classical Groups	M753	General and special linear groups, bilinear forms, Symplectic groups, symmetric forms, quadratic forms, Orthogonal geometry, orthogonal groups, Clifford algebras, Hermitian forms, Unitary spaces, Unitary groups.
Ergodic Theory	M754	Measure preserving systems; examples: Hamiltonian dynamics and Liouvilles theorem, Bernoulli shifts, Markov shifts, Rotations of the circle, Rotations of the torus, Automorphisms of the Torus, Gauss transformations, Skew-product, Poincare Recurrence lemma: Induced transformation: Kakutani towers: Rokhlins lemma. Recurrence in Topological Dynamics, Birkhoffs Recurrence theorem, Ergodicity, Weak-mixing and strong-mixing and their characterizations, Ergodic Theorems of Birkhoff and Von Neumann. Consequences of the Ergodic theorem.
		Invariant measures on compact systems, Unique ergodicity and equidistribution. Weyls theorem, The Isomorphism problem; conjugacy, spectral equivalence, Transformations with discrete spectrum, Halmosvon Neumann theorem, Entropy. The Kolmogorov-Sinai theorem. Calculation of Entropy. The Shannon Mc-MillanBreiman Theorem, Flows. Birkhoffs ergodic Theorem and Wieners ergodic theorem for flows. Flows built under a function.
Harmonic Analysis	M755	Fourier series and its convergences, Dirichlet kernel, Frejer kernel, Parseval formula and its applications. Fourier transforms, the Schwartz space, Distribution and tempered distribution, Fourier Inversion and Plancherel theorem. Fourier analysis on Lp-spaces. Maximal functions and boundedness of Hilbert transform. Paley-Wiener Theorem for distribution. Poisson summation formula, Heisenberg uncertainty Principle, Wiener's Tauberian theorem.

Lie Groups and Lie Algebras-I	M756	General Properties: Definition of Lie groups, subgroups, cosets, group actions on manifolds, homogeneous spaces, classical groups. Exponential and logarithmic maps, Adjoint representation, lie bracket, Lie algebras, subalgebras, ideals, stabilizers, center Baker-Campbell-Hausdor formula, Lie's Theorems. Structure Theory of Lie Algebras: Solvable and nilpotent Lie algebras (with Lie/Engel theorems), semisimple and reductive algebras, invariant bilinear forms, Killing form, Cartan criteria, Jordan decomposition. Complex semisimple Lie algebras, Toral subalgebras, Cartan subalgebras, Root decomposition and root systems. Weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite dimensional representations, BGG resolution, Weyl character formula.
Operator Algebras	M757	Banach algebras/C*{algebras: De_nition and examples; Spectrum of a Banach algebra; Gelfand transform; Gelfand-Naimark theorem for commutative Banach algebras/ C*-algebras; Functional calculus for C*-algebras; Positive cone in a C*-algebra; Existance of an approximate identity in a C*-algebra; Ideals and Quotients of a C*-algebra; Positive linear functionals on a C*-algebra; GNS construction. Locally convex topologies on the algebras of bounded operators on a Hilbert space, von-Neumann's bi-commutant theorem; Kaplansky's density theorem. Ruan's characterization of Operator Spaces (if time permites).
Representations of Linear Lie Groups	M758	Introduction to topological group, Haar measure on locally compact group, Representation theory of compact groups, Peter Weyl theorem, Linear Lie groups, Exponential map, Lie algebra, Invariant Differential operators, Representation of the group and its Lie algebra. Fourier analysis on $SU(2)$ and $SU(3)$. Representation theory of Heisenberg group. Representation of Euclidean motion group.
Harmonic Analysis on Compact Groups	M759	Review of General Theory: Locally compact groups, Computation of Haar measure on R; T, $SU(2)$, $SO(3)$ and some simple matrix groups, Convolution, the Banach algebra L1(G). Representation Theory: General properties of representations of a locally compact group,

		Complete reducibility, Basic operations on representations, Irreducible representations. Representations of Compact groups: Unitarilzibality of representations, Matrix coefficients, Schur's orthogonality relations, Finite dimensionality of irreducible representations of compact groups. Various forms of Peter-Weyl theorem, Fourier analysis on Compact groups, Character of a representation. Schur's orthogonality relations among characters. Weyl's Chracter formula, Computing the Unitary dual of $SU(2)$; $SO(3)$; Fourier analysis on $SO(n)$.
Modular Forms of One Variable	M760	$SL2(Z)$ and its congruence subgroups, Modular forms for $SL2(Z)$, Modular forms for congruence subgroups, Modular forms and deferential operators, Hecke theory, L-series, Theta functions and transformation formula.
Elliptic Curves	M761	Congruent numbers, Elliptic curves, Elliptic curves in Weierstrass form, Addition law, Mordell-Weil Theorem, Points of finite order, Points over finite fields, Hasse-Weil L-function and its functional equation, Complex multiplication.
Brownian Motion and Stochastic Calculus	M762	Brownian Motion, Martingale, Stochastic integrals, extension of stochastic integrals, stochastic integrals for martingales, Itô's formula, Application of Itô's formula, stochastic differential equations.
Lie Groups and Lie Algebras-II	M764	General theory of representations, operations on representations, irreducible representations, Schur's lemma, Unitary representations and complete reducibility. Compact Lie groups, Haar measure on compact Lie groups, Schur's Theorem, characters, Peter-Weyl theorem, universal enveloping algebra, Poincare-Birkoff-Witt theorem, Representations of Lie (SL (2; C)). Abstract root systems, Weyl group, rank 2 root systems, Positive roots, simple roots, weight lattice, root lattice, Weyl chambers, simple reections, Dynkin diagrams, classification of root systems, Classification of semisimple Lie algebras. Representations of Semisimple Lie algebras, weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, Weyl Character formula, The representation theory of SU (3), Frobenius Reciprocity theorem, Spherical Harmonics.

Mathematical Foundations for Finance	M765	Financial market models in finite discrete time, Absence of arbitrage and martingale measures, Valuation and hedging in complete markets, Basic facts about Brownian motion, Stochastic integration, Stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem, Black-Scholes formula

PH.D. IN COMPUTER SCIENCE (PROGRAM CODE: MATH04)

Course Structure:

I. Courses at IMSc

Program Code : MATH04	Programme Specific Outcome	Original research results in chosen area of specialisation
		A thorough knowledge of the literature in chosen area
		Ability to summarize major themes and current open problems in chosen area and to critically evaluate current research
		Ability to apply acquired knowledge and learnt techniques to new areas
		Ability to communicate major principles in the field and in own work, orally and in writing

CORE SUBJECTS

Sr. No.	Name of the Course	Course code

Course Outcomes:

CORE SUBJECTS

Name of the Course	Course code	Course Outcome
Theory of computation	10MATH04-001-C-CS	A fine understanding of the robustness of finite-state automata and their properties and limitations.
		A fine understanding of the robustness and power of Turing machines as an abstract model of computation.
		Ability to generalise learned concepts to other definitions of models of computation.
Algorithms	10MATH04-002-C-CS	Familiarity with the basic building blocks of algorithm design.
		Familiarity with the techniques used to analyse their performance.
		Ability to apply these ideas to develop and analyse algorithms for previously unseen problems.
Discrete Mathematics	10MATH04-003-C-CS	A good understanding of the basic combinatorial and algebraic tools used in theoretical computer science.
		Ability to use these abstract tools in concrete settings to solve routine and not-so-routine problems.
Logic	10MATH04-004-C-CS	A good familiarity with the fundamental concepts of mathematical logic.
		Ability to comprehend issues of compactness, completeness, decidability in a variety of logics.
Computational complexity	10MATH04-005-C-CS	A good grasp of issues concerning:
		efficiency of computation

		the relationships between basic computational models and the trade-offs between various computational resources
		Various computational notions of proof.
Credit Seminar	10MATH04-006-C-CS	An appreciation of the current research in the chosen sub-area.
		An ability to critically analyse the techniques in use.

ELECTIVES

Name of the Course	Course code	Course Outcome
Advanced Data Structures	10MATH04-001-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algorithms for special classes of graphs	10MATH04-002-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Graph Theory	10MATH04-003-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Kernelization	10MATH04-004-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Mathematical foundations of computer science	10MATH04-005-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Parameterized Complexity	10MATH04-006-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Advanced Parameterized Complexity	10MATH04-007-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algorithmic Game Theory	10MATH04-008-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Computational Social Choice Theory	10MATH04-009-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algebraic Graph Theory	10MATH04-010-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Topological Graph Theory	10MATH04-011-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Machine Learning	10MATH04-012-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algebraic Graph Algorithms	10MATH04-013-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algorithms for Genomics	10MATH04-014-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Matroid Theory	10MATH04-015-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Probabilistic Method	10MATH04-016-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Exact Exponential Algorithms	10MATH04-017-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Randomized Algorithms	10MATH04-018-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Computational complexity - II	10MATH04-019-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algebraic Complexity Theory	10MATH04-020-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Analysis of Boolean functions	10MATH04-021-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Circuit complexity	10MATH04-022-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Communication Complexity	10MATH04-023-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Concrete Lower Bounds	10MATH04-024-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Expanders, PCPs, and Derandomization	10MATH04-025-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Proof Complexity	10MATH04-026-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Small Space Computation	10MATH04-027-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Incidence Theorems and their Applications	10MATH04-028-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Randomness and Computation	10MATH04-029-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algorithmic Geometry of Numbers	10MATH04-030-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algorithms for solving polynomial equations	10MATH04-031-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Computational geometry	10MATH04-032-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Computational Topology	10MATH04-033-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Convex Optimization	10MATH04-034-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Linear programming and combinatorial optimiza- tion	10MATH04-035-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algebraic theory of automata	10MATH04-036-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Automata and concurrency	10MATH04-037-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Concurrency theory	10MATH04-038-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Programming languages and correctness	10MATH04-039-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Programming language theory	10MATH04-040-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.

		Preparedness to critically read state-of-the-art research material in the subject.
Theory of computation: a second course	10MATH04-041-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Artificial intelligence	10MATH04-042-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Game theory	10MATH04-043-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Automata and games	10MATH04-044-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Distributed algorithms	10MATH04-045-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Infinite discrete structures	10MATH04-046-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.

Mathematical Logic: a second course	10MATH04-047-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Logics of programs	10MATH04-048-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Verification	10MATH04-049-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Topics in Algorithms	10MATH04-050-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Topics in Complexity Theory	10MATH04-051-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.
Algebra and Computation	10MATH04-052-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.

Algebra and Computation: a second course	10MATH04-053-E-CS	A good grasp of the topics laid out in the syllabus.
		An ability to apply learned concepts to new settings.
		Preparedness to critically read state-of-the-art research material in the subject.

BACK TO MAIN

Course Structure:

II. Courses at NISER

Program Code : MATH04	Programme Specific Outcome	The program is aimed at graduates with good academic potential and strong interest in research. With a focus on some fundamental areas of Computer Science like Algorithms, Cryptography, Complexity Theory, Machine Learning etc., the program expects to nurture researchers producing high impact research results. After the completion of the program, the doctorates will be suitable to academic and industry jobs in any part of the world.

CORE SUBJECTS

Sr. No.	Name of the Course	Course code
1	Modern Cryptology	CS651
2	Algorithmic Coding Theory	CS652
3	Complexity Theory	CS653
4	Linear Programming and Combinatorial Optimization	CS654
5	Distributed Network Algorithms	CS655
6	Cyber Forensics	CS656
7	Penetration Testing	CS657
8	Social and Information Network Analysis	CS658
9	Advanced Algorithms	CS659
10	Machine Learning	CS660
11	Randomized Algorithms and Probabilistic Analysis	CS661

SEMINAR COURSES

Sr. No.	Name of the Course	Course code
1	Seminar Course-I	CS791
2	Seminar Course-II	CS792
3	Seminar Course-III	CS793

PASS/FAIL COURSE

Sr. No.	Name of the Course	Course code
1	Research Methods	CS601

COURSE OUTCOMES:

CORE SUBJECTS

Name of the Course	Course code	Course Outcome
Modern Cryptology	CS651	Understanding basic concepts in Mathematical Cryptology
		Ability to design and analysis of security algorithms
Algorithmic Coding Theory	CS652	Students will be introduced to formalization of the notion of uncertainty of a random variable, Source coding for error-free reconstruction, channel coding and the fundamental theorem, introduction to some algebraic codes (Parity-check codes, Reed-Solomon codes).
Complexity Theory	CS653	Students would be able to Understand P vs NP arguments and corresponding proofs.
		Learn about interactive proofs and randomized computation
Linear Programming and Combinatorial Optimization	CS654	Students will learn de_nition and properties of convex sets and functions, convex and a_ne hulls, recession cones and hyperplanes, constrained optimization, Duality, Minimax Theory
Distributed Network Algorithms	CS655	Understand basics of distributed network algorithms and systems.
		Gain knowledge on applications of distributed network algorithms to real-world networks and analysis of such algorithms.
Cyber Forensics	CS656	Understand the key concepts in computer forensics across domains of systems (Windows, linux and Mac) as well as Internet artifacts.
		Investigate mobile systems and get a brief idea on intellectual property and cyber laws.
Penetration Testing	CS657	Understand the basics of penetration testing both passive and active.

		Able to test the system for exploits in system, network and web as well as run penetration test in vulnerable systems.
Social and Information Network Analysis	CS658	Learn the basics of social and information network and how to analyze them.
		Key concepts in information maximization and community detection in large graphs.
Advanced Algorithms	CS659	Augment their understanding of algorithms with hashing and online algorithms.
		Gain knowledge about parameterized algorithms and computational geometry.
		Learn to prove hardness and equivalences.
Machine Learning	CS660	Students would be able to Learn key concepts of machine learning.
		Understand and implement supervised, unsupervised learning algrithms as well as introduction to reinforcement learning.
Randomized Algorithms and Probabilistic Analysis	CS661	Understand probabilistic analysis and the manners in which it can be used in designing efficient algorithms
		Study key concepts in Probability Theory and learning about various applications to well-known problems in Computer Science.

Ph.D. in PHYSICAL SCIENCES (Program Code: PHYS04)

Course Structure:

II. Courses at IGCAR

Program Code : PHYS04	Programme Specific Outcome	Training in carring out fast reactor based research.
		Unique exposure to nuclear fuel cycle activities
		Material development for specific applications

Course Structure:

Sr. No.	**Name of the Course**	**Course code**
1	Mathematical Methods	PY1
2	Computational Methods	PY2
3	Introductory Reactor Physics and Engineering	PY3
4	Nuclear Physics and Nuclear Data	PY4
5	Engineering Drawing and Laboratory Practices and Experimental Methods	PY5
6	Reactor Materials	PY6
7	Radiation Detection and Measurements	PY7
8	Reactor Types and Advanced Reactor Concepts	PY8
9	Radiation Shielding Design and Protection	PY9
10	Reactor Dynamics and Safety Analysis	PY10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	PY11
12	Fluid Dynamics and Thermal Hydraulics	PY12
13	Advanced Computational Methods in Reactor Physics	PY13
14	Experimental and Operational Reactor Physics	PY14
15	Design Methods in Thermal and Fast Reactors and Computer codes	PY15
16	In Core of Fuel Management	PY16

Course Outcomes:

Name of the Course	Course code	Course Outcome
Mathematical Methods	PY1	Students learn vector spaces, Hilbert space, matrix methods, eigen value problems, differential and integral equations, complex variables.
Computational Methods	PY2	Since some complex equations cannot be solved analytically, numerical and computational methods are important. Students study the basics of computer architecture - hardware and software,
		Learn Various numerical methods
		Programming in Fortran and C
Introductory Reactor Physics and Engineering	PY3	Learn neutron physics, reactor physics including fast reactors; reactor kinetics and reactor control, all needed for working with nuclear reactors.
Nuclear Physics and Nuclear Data	PY4	Learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, nuclear models, nuclear data evaluation and processing which are Needed to work with nuclear reactors and for nuclear research.
Engineering Drawing and Laboratory Practices and Experimental Methods	PY5	Machine Drawings Projections, drafting, Autocad other material in this course are essential for engineers to produce accurate drawing for fabrication of small and large components for nuclear reactors and associated facilities.
Reactor Materials	PY6	Properties of nuclear fuels such as uranium, uranium oxide, plutonium, carbide and nitride fuels, MOX fuel, fuel fabrication, structural materials and clad materials, zirconium and alloys, moderators, Mechanical properties of materials, Radiation effects in materials, corrosion of metals and related topics makes this course a very important one for nuclear scientists and engineers.
		Ability to Solve unforeseen materials problems in operational reactors
		Ability to look for future candidate materials
Radiation Detection and Measurements	PY7	Required for radiation, safety workers and related scientists: Interaction of radiation with matter, radiation detectors including

		gas, semiconductor and scintillation detectors; ionization chambers; high resolution gamma spectroscopy, Monte Carlo simulations
Reactor Types and Advanced Reactor Concepts	PY8	Students will learn about different type of reactors such as Thermal reactors, fast reactors, High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR). Metal fuelled FBR and Accelerator driven systems (ADS); Indian reactors APSARA, CIRUS, DHRUVA, PHWR, FTBR AND PFBR
Radiation Shielding Design and Protection	PY9	Students will study Radiation sources, its interaction with matter; summary of basic interaction mechanisms of alpha, beta, gamma/x -rays and neutrons with matter; radiation dosimetry; Interaction of radiation with biological matter; Radiation toxicity, Risk factors; radiation protection, shielding, and nuclear emergency management
Reactor Dynamics and Safety Analysis	PY10	Neutron kinetics and thermal effects. Feedback effects; Description of main reactor systems. Coolant system behaviour. Plant dynamics; safety systems; Reliability and Probabilistic Safety Analysis and related topics are taught in this course
Fuel Cycle Physics and Introduction to Fuel Cycle	PY11	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India. Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Issues related recycling – Effective fissile content of discharged fuel for next cycle; re-fabrication of fuel for the next cycle Activity and toxicity of discharged fuel
Fluid Dynamics and Thermal Hydraulics	PY12	Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines; Navier Stokes equations; Hydrostatics – Manometry; Fluids subjected to uniform linear acceleration and uniform rotation; Thermal hydraulics.

		Important specialisation for understanding behaviour of reactor coolants (liquid sodium and water) for safe reactor operation
Advanced Computational Methods in Reactor Physics	PY13	Students will learn Methods of solving neutron Diffusion equation; Finite element method- its advantages and disadvantages. Coarse mesh rebalancing. Methods of solving neutron transport equation; (a) PN method (b) Discrete ordinates method (c) Collision probabilities methods; Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations.
Experimental and Operational Reactor Physics	PY14	In-depth exposure and develop expertise to experiential aspects of Reactor operations
		Dynamical methods to evaluate and monitor reactivity measurements
		Expertise to monitor delayed neutron counting and noble gas fission products to detect early stages of fuel failures.
		Exposure to operation aspects of various types of reactors
Design Methods in Thermal and Fast Reactors and Computer codes	PY15	Exposure to model and design of both thermal and fast reactors using neutron production, transport and reactions
		Expertise to use various design and validation codes for neutronics
In Core of Fuel Management	PY16	Develop expertise in various safety aspects of in-core fuel handling and management in different types of reactors
		Exposure to reactor specific fuel handling methods and controls
		Exposure to specialised computer codes for in-core fuel handling

III. Courses at RRCAT- PhD

Program Code : PHYS04	Programme Specific Outcome	Impart training to students to increase the knowledge base required for research work
		Enhance analytical and computational skill of the students required for carrying out research work
		Provide training to work with various scientific equipment including sophisticated lasers and radiation available from synchrotron sources Indus-1 and Indus -2

(A) Core Courses

Sr. No.	Name of the Course	Course code

2	Advanced accelerator physics	03PHYS04-002-E
3	Statistical physics	03PHYS04-003-E
4	Plasma Physics and Technology	03PHYS04-004-E
5	Materials Science and Technology	03PHYS04-005-E
6	Advanced Beam Dynamics	03PHYS04-006-E
7	Bio-photonics	03PHYS04-007-E
8	Advance Course on Atom-Photon Interaction	03PHYS04-008-E
9	Concepts in X-Ray Physics	03PHYS04-009-E
10	Physics of Semiconductor Quantum Structures	03PHYS04-010-E

(C) Laboratory Courses

Sr. No.	Name of the Course	Course code
1	Laser and Applications	03PHYS04-001-L
2	Accelerators related applications	03PHYS04-002-L
3	Electronics	03PHYS04-003-L

(D) Reading Courses

Sr. No.	Name of the Course	Course code
1	Self-Reading	03PHYS04-001-R

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Engineering Mathematics	03PHYS04-001-C	This course reviews topics in Mathematics which are usually covered at the Master's level and are essential to understand the concepts of science and engineering This Course also deals with the advanced topics needed for carrying out research work in different areas of science and engineering
Magnet Physics and Technology	03PHYS04-002-C	Basic understanding of magnetism and its application. Analytical approach of magnet design mainly for accelerator application and field measurement technique. Fabrication technique and alignment of magnets.
Laser Physics and Technology	03PHYS04-003-C	This course introduces basic mechanism and principles of lasers, beam propagation, and optical resonators Introduction to physics and technology of various types of lasers This course introduces basic nonlinear optics
Electromagnetic Theory	03PHYS04-004-C	This course is meant for physicists and engineers. It reviews the M. Sc. Level and B. Tech level electromagnetic theory, and further strengthens some of the intricate concepts, and introduces new topics It emphasizes basic concepts needed to solve the electromagnetic boundary value problems, and prepares the students to develop better understanding of the computer codes used for that Students are expected to develop a better and rigorous understanding of generation of electromagnetic radiation, typically in synchrotron radiation source. Students learn about different types of electromagnetic waves – (i) plane waves, including its reflection and refraction at dielectric surface. (ii) Gaussian beams and Bessel beams, (iii) modes in waveguides and cavities, including its transport in microwave components and (iv) modes in optical fiber.

Accelerator Physics and Beam Diagnostics	03PHYS04-005-C	The course introduces basic concepts of accelerator physics and beam diagnostics.
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Reactor Physics, Radiation Physics, and Safety Issues	03PHYS04-006-C	Awareness about natural, man-made radiation, dose contribution from various practises, units and quantities, biological effects of radiation exposure and ICRP recommendations on radiation protection
		Awareness about the radiation hazards at work place, safe practises to be followed, exposure control measures, shielding philosophy and radiation detection.
		Understanding the radiation hazards at high energy electron and proton accelerators and laser facilities. Dose build up effects due to electromagnetic and hadronic cascade and its impact on radiation safety and tackling mechanisms
		Gaining fundamental concepts in reactor physics, interaction of various kind of radiation with matter.
Numerical and Mathematical Techniques and Scientific	03PHYS04-007-C	For rigorous and correct analysis of data (which are the outcome of research work), learning numerical and mathematical techniques is absolutely essential.
		This course teaches interpolation, extrapolation, error analysis etc which are integral parts of data analysis. The finite element method is a numerical method for solving problems of applied science and engineering, for example, structural analysis, heat transfer, fluid flow, mass transport etc
		Concept of scientific computing is necessary for numerically analyzing experimental and analytical results. For the same, programming languages (C and fortran) are taught.
		Different operating systems (windows, linux etc), which are taught, also help in understanding the working of computers, in turn, different aspects of scientific computing
Materials Science and Technology- I	03PHYS04-008-C	The course reviews the master's level solid state physics with certain advanced topics
		The advanced topics covered include: nonlinear properties of optical materials,

		electronic materials for novel applications like spintronics and introduction to symmetry and ferroelectric materials
		Students learn structures of various materials including alloys, ceramics, glasses, polymers, and composites
Applications of Lasers in Nuclear Science, Industry	03PHYS04-009-C	This course covers various applications of lasers in high resolution spectroscopy in metrology and medicine
		This courses exposes application of lasers in material processing
		This course introduces application of lasers in isotope separation
Applications of Accelerators in Nuclear Science, Industry	03PHYS04-010-C	This course aims to expose students to various applications of accelerators.
		Students become aware of applications in accelerator based radiotherapy and radiation processing
Vacuum Physics and Technology	03PHYS04-011-C	This course aims to introduce the basics of theory of vacuum
		Introduces various vacuum systems and components
		Students learn how to design a vacuum system
Quantum Mechanics	03PHYS04-012-C	This course reviews master’s level quantum mechanics with more emphasis on problem solving and applications
		This course also covers advanced topics which will enhance understanding in many-electron systems and photo-atom interaction
Research Methodology	03PHYS04-013-C	Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

(B) Elective Courses

Name of the Course	Course code	Course Outcome
Modern Optics	03PHYS04-001-E	This course reviews the basic understanding of geometrical & wave optics with emphasis on topics of importance to lasers, laser-based measurements and laser-based systems.
		This course helps scholars to develop a sound understanding of optics required for designing and modelling lasers and laser-based systems.
Advanced Accelerator Physics	03PHYS04-002-E	This course discusses electron and ion sources, and the processes involved.
		This course discusses concepts related to proton and heavy ion linacs, transport of ion beams, and beam instabilities
		The course introduces advanced topics of free electron lasers, linear accelerator-based synchrotron radiation sources, laser plasma based accelerators and the concept of Accelerator Driven Systems.
Statistical Physics	03PHYS04-003-E	This course reviews master's level statistics focusing attention on quantum degenerate gases.
		This course helps scholars to develop deeper understanding of phase transition and concepts required to handle many-body systems of condensed matter and plasma physics
Plasma Physics and Technology	03PHYS04-004-E	This course aims to make students of basic plasma physics and the involved technology
		This course exposes students various aspects of plasma physics like waves in plasma, plasma production, plasma diagnostics, and plasma radiation
		This course introduces laser-plasma interaction at ultrahigh intensities
Materials Science & Technology	03PHYS04-005-E	To understand and interpret phase diagram for material synthesis.
		To learn about material synthesis by solid state and liquid phase route and methods of preparation of ceramics, thin film, nano-powder and single crystal
		To evaluate the direct & indirect band-gap, impurity & defect absorption, molecular vibrations by spectroscopic

		techniques like UV-vis-NIR spectroscopy, FTIR and Raman spectroscopy.
		To get acquainted with various spectroscopic instruments for materials like polarized light microscope, Scanning electron microscope, Transmission electron microscope and Scanning probe microscopes (AFM, STM).
Advanced Beam dynamics	03PHYS04-006-E	This course is meant for physicists, specializing in the field of particle accelerators. The selected topics on beam dynamics form the basis of design of modern particle accelerators.
		Students are expected to develop a clear understanding of how a charge particle beam evolves under the influence of applied electromagnetic field, including the self-force due to space charge
		Students learn about the physics underlying the phenomenon of emittance growth, and beam halo formation, which is a topic of current interest.
		The course prepares the students for using computational tools to address the design problems in the area of beam dynamics
Bio-photonics	03PHYS04-007-E	This course aims to introduce interaction of light with cells and tissues
		This course introduces optical imaging of tissues in turbid medium
		This course exposes the students to aspect of biomedical diagnosis and micromanipulation
Advance course on atom-photon interaction	03PHYS04-008-E	This course deals with interaction of light with matter at fully quantum and semi-classical levels
		This course exposes students to various perturbative and non-perturbative techniques to determine probabilities
		This course covers coherent dynamics of atoms in the interaction with light
		This course covers concepts of coherence of light and various quantum state of radiation field
Concepts in X-ray Physics	03PHYS04-009-E	The course deals with the basics of interaction between matter with x-rays
		The various x-ray based materials characterisation techniques like X-ray diffraction, X-ray absorption and

		photoelectron spectroscopy are dealt in details.
		This course is beyond the content matter of normal master level courses.
Physics of semiconductor Quantum structures	03PHYS04-010-E	The aim of this course is to introduce the students to various aspects of semiconductor nanostructures
		Students learn aspects of growing nanostructures
		Students learn various methods of characterising nanostructures

(C) Laboratory Courses

Name of the Course	Course code	Course Outcome
Laser and Applications	03PHYS04-001-L	Students get first-hand experience in handling various lasers and laser-based instrumentations
		Students learn various techniques to align and characterize lasers
Accelerators related applications	03PHYS04-002-L	Students get first-hand experience in handling various instruments needed for accelerator technology
Electronics	03PHYS04-003-L	Students get first-hand experience in handling various instruments required for electronics, image processing, and RF components
		Students are also expected to learn and handle GUI software and communication protocols

(D) Reading Courses

Name of the Course	Course code	Course Outcome
Self-Reading	03PHYS04-001-R	This course helps scholars to develop understanding in some of the key topics related to his/her research work

Course Structure:

IV. Courses at VECC

Program Code : PHYS04	Programme Specific Outcome	Impart knowledge in Experimental and Theoretical Nuclear Physics(and Allied Areas), Material Sciences, Theoretical Physics and High EnergyPhysics.
		Develop human resource for faculty position in physics and applied physicsin academic institutions and National Laboratories.
		Learning to work in mega-science projects through National and International collaborations.

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Mathematical Physics	04PHYS04-001-C
2	Quantum Mechanics	04PHYS04-002-C
3	Classical Mechanics	04PHYS04-003-C
4	Statistical Mechanics	04PHYS04-004-C
5	Classical Electrodynamics	04PHYS04-005-C
6	Research Methodology Computational Methods and Programming	04PHYS04-006-C
7	Experimental techniques and methods	04PHYS04-007-C
8	Basic Field Theory	04PHYS04-008-C
9	Basic Accelerator physics	04PHYS04-009-C
10	Basic Condensed Matter Physics	04PHYS04-0010-C
11	Basic Nuclear physics	04PHYS04-011-C
12	Laboratory experiments	04PHYS04-012-C
13	Advanced Nuclear Structure	04PHYS04-013-C
14	Advanced nuclear reaction	04PHYS04-014-C
15	Advanced Accelerator physics	04PHYS04-015-C
16	Advanced High Energy Physics	04PHYS04-016-C
17	Advanced Materials Science – I	04PHYS04-017-C
18	Advanced Material Science II	04PHYS04-018-C

19	Advanced High Energy Physics (Experiment)	04PHYS04-001-E
20	Project	04PHYS04-001-P

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Mathematical Physics	04PHYS04-001-C	Understanding the underlying mathematical structure of Quantum Physics
		Using the techniques of complex analysis to solve realistic physical problems
		Model the Regression Learning Models
		Understanding the Geometric ideas behind modern physics
QUANTUM MECHANICS	04PHYS04-002-C	Learn approximation methods used in quantum mechanics
		Basic understanding in Collision theory
		Exposure to relativistic quantum mechanics
		Learn Lagrangian formulation
Classical Mechanics	04PHYS04-003-C	Introduction of Lagrangian formulation
		Introduction of Hamiltonian formulation
		Connection of classical mechanics with quantum mechanics
Statistical Mechanics	04PHYS04-004-C	Detailed understanding of the different distribution functions, statistical techniques and their application to different physical systems
		Understanding of different statistical methods, thermodynamic connection and their application to different physical problems related to condensed matter physics and nuclear physics
		Learnt advance topics of equilibrium and non-equilibrium statistical mechanics (ex: phase transition kinetics, transport theory) which are extensively used in state-of-the art research problems.
Classical Electrodynamics	04PHYS04-005-C	Impart knowledge on classical field theory
		Learn the basic science of electricity and magnetism
		Develop skill in applications of electromagnetic theory invarious practical problems
		Develop mathematical skill to solve partial differential equations.

Research Methodology	04PHYS04-006-C	This is an essential course to pursue research work for PhD in Physical Sciences and Engineering Sciences
		Impart knowledge and skills to analyse data and prepare scientific manuscript.
		Learn about Ethical aspects in research
Computational Methods and Programming		Applications of the machine learning and programming in understanding the numerical approach to solve a scientific project which can hardly be solved analytically
		Use of the numerical methods for simulating detection techniques and performances a priori and check the feasibility
		Implement the machine learning and numerical approach to understand the human learning aspects.
		Implementation of numerical techniques in the analysis of experimental data and understand them in the framework of numerical modelling with associated physics.
		Machine learning and numerical methods have an important role in illustrating and predicting in the field of Bioinformatics, Linguistics, Data mining and Big data analysis both in the social and scientific paradigm
Experimental techniques and methods	04PHYS04-007-C	Imparts knowledge on laboratory safety, vacuum techniques, cryogenics and workshop practices
		Provides understanding on different material characterization techniques viz. electron microscopy, XRD, optical, electrical and magnetic measurements
		Learns about different detectors and techniques used in nuclear and high energy physics.
Basic Field Theory	04PHYS04-008-C	This course is designed to provide an elementary idea about the Lorentz invariance and Relativistic kinematics.
		Basic concepts about the classical field theory and symmetries and conservation laws are provided.
Basic Accelerator physics	04PHYS04-009-C	The Basic Accelerator Physics course focuses on the key concepts of particle accelerators and their applications. The objective of the course is to emphasize the

		knowledge of beam dynamics in Linear and circular accelerator including the effect of space charge. Exposure regarding various types of accelerators is given.
Basic Condensed Matter Physics	04PHYS04-0010-C	In the basic materials science courses the covered areas are mainly crystal structure and crystallography, defects in solids, electronic structure of solids. Also the magnetism, superconductivity, superfluidity and dielectric properties of solids have been taught.
Basic Nuclear physics	04PHYS04-011-C	Learning basic properties of nuclei like mass, charge, shape etc.
		Learning nuclear models related to nuclear collective dynamics and fission decay
		Learning microscopic many-body thoery for nucleus
Laboratory experiments	04PHYS04-012-C	Gives hands on experience and understanding on topics discussed in the experimental techniques and methods course (PHY04007L)
		Provides practical understanding on the operation and use of a different types of instrument and facility
		Get basic training for planning a goal oriented real life experiment
		Learn to prepare scientific reports
Advanced Nuclear Structure	04PHYS04-013-C	Different model calculations of nuclear structure physics
		Different modes of excitations in nuclei and associated observables
		Specific knowledge of gamma ray spectroscopy and its application to nuclear structure
		Methods of lifetime and moment measurements in nuclei
		Total absorption spectroscopy and beta-delayed neutron emission measurements and their practical application.
		A detailed and overall theoretical understanding on the ground and excited state properties in nuclei along with a detailed knowledge on the experimental know-how in the measurement of different nuclear structure quantities. Students are expected to connect the experimental observables and the deduced quantities

		with the theoretical parameters related to nuclear structure.
Advanced nuclear reaction	04PHYS04-014-C	Advanced nuclear reaction course is designed to develop basic understanding of nature around us which includes formation of stars to discovery of new elements using accelerator based research. It includes following modules
		Study of fusion –fission dynamics, deep - inelastic reactions, multi fragmentation etc.
		Nuclear Astro physics and Equation of State for dense nuclear matter
Advanced Accelerator physics	04PHYS04-015-C	The Advance Accelerator Physics course focuses on the key concepts of modern particle accelerators and their applications. The objective of the course is to emphasize the knowledge of beam dynamics in Linear and circular accelerator including the effect of space charge. Various advanced accelerator projects has also been discussed.
		It covers Advance accelerators: Free electron laser, Plasma accelerators, Spallation neutron sources, Rare ion beam facilities. Accelerators driven subcritical systems.
		It covers Storage rings and synchrotron radiation**:** Radiation from moving charges, Radiation power and angular distribution, Quantum fluctuation, Beam lifetime, beam cooling.
		It covers Beam with space charge**:** Envelope oscillations, modes and instabilities, Sources of emittance growth, Wake fields and image charge effects**.**
Advanced High Energy Physics	04PHYS04-016-C	This course is designed to provide an elementary idea about the Standard Model of particle physics with particular emphasis on Quantum Chromodynamics.
		Basic concepts about the structure of hadrons as well as relativistic heavy ion collisions are also provided
Advanced Materials Science – I	04PHYS04-017-C	Understand formation of defects due to particle irradiation in materials
		Understand effect of radiation damage on physical and mechanical properties of materials

		Correlate defects and property changes due to irradiation in materials
		Emulate neutron damage with ion irradiation in structural materials.
Advanced Material Science II	04PHYS04-018-C	In this course mainly properties of advance functional materials, e.g., multi-functional materials, nano-particle system and advanced oxide materials have been covered. Defect characterization in oxides by positron annihilation techniques and Mossbauer spectroscopy in oxides have also been covered
Advanced High Energy Physics (Experiment)	04PHYS04-001-E	Advanced EHEP course is tuned to train the students with following objectives (a) experimental techniques and methodologies used specifically in EHEP (b) detailed courses on research topics being followed in experimental high energy heavy ion collision research like, collectivity, correlation, particle production mechanism, heavy flavour production
		The students after completion of course can handle EHEP data to extract physics information after various levels of corrections and error analysis. They are also trained to handle particle detectors for HEP applications
		Students have a detailed overview on particle production mechanism both in hard and soft sector
		Students, after completion of course know about production of heavy flavours (open and hidden charm)
		Students can handle Monte-Carlo models for particle production
Project	04PHYS04-001-P	Exposure to a particular experimental or theoretical work
		Literature survey and develop expertise in problem identification
		Data collection and subsequent analysis of data , presentation of data
		Develop documentation and presentation skills

Course Structure:

V. Courses at SINP

Program Code : PHYS04	Programme Specific Outcome	Aims to fill the gaps in the understanding of students through Core course and Optional courses in advanced specialised area of research to prepares the students for future research topic.

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Computational & Numerical Methods	CNM
2	Statistical Mechanics	SM2
3	Quantum Mechanics	QM2
4	Optional course 1	OPT1
5	Research Methodology	RM
6	Optional course 2	OPT3
7	Optional course 3	OPT2
8	Optional course 4	OPT4

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Computational & Numerical Methods	CNM	These numerical techniques are aimed for use in research and Ph.D. work
		Numerical and error analysis, interpolation/extrapolation, root finding etc
		C++, phython, languages and comparison
		Differential equations Fourier transform
Statistical Mechanics	SM2	SM course prepares Ph.D. students
		Landau theory, Critical phenomenon, Ising model are taught
		2d Ising model, Onsanger relations etc.

		Hydrodynamics, Navier-Stokes theorem, heat conduction are covered.
Quantum Mechanics	QM2	Time dependant perturbation, scattering theory are taught
		Relativistic quantum mechanics and covariant approach
		Path Integral techniques are introduced
Optional course 1	OPT1	Quantum Field theory-I basic course is given to research students
		Quantization of free fields scalar, vector, spinor
Research Methodology	RM	RM course through direct participation in seminars and evaluating existing research
		A first prototype Project thesis work is given
		Psychological and social factors are introduced, through directly working with a faculty and in various Laboratory facility
		Fair research methodology
Optional course 2	OPT3	Advanced Quantum Field Theory-II course is given
		QED, QCD, Cross section and decay rates
		Path integral method, running couplings, Renormalisation group are taught
Optional course 3	OPT2	Thermal Field Theory is taught to research students.
		Astroparticle physics, nutron stars
		Dark Matter physics is also taught
		Advanced plasma physics is also taught
Optional course 4	OPT4	General relativity course to Ph.D. students
		Expanding solutions, singular FRW and black hole (charged and rotating) solutions taught
		Involves introduction to quantum gravitation and string theory as well

Course Structure:

VI. Courses at IPR

Program Code : PHYS04	Programme Specific Outcome	Trained in theoretical and experimental Plasma Physics
		Trained to do research in exotic plasmas
		Trained in Fusion Science and Technology
		Trained in Plasma technologies for societal applications.

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Fundamentals of Plasma Physics – A	FPP – A
2	Fundamentals of Plasma Physics – B	FPP – B
3	Plasma Production and Measurements-I	PPM – I
4	Mathematical Methods – I	MM – I
5	Electromagnetic Theory – I	EMT – I
6	Mechanics –I (Classical Mechanics)	MEC-I
7	Laboratory Practical – I	LAP – I
8	Advance Plasma Physics – A	APP – A
9	Advance Plasma Physics – B	APP – B
10	Plasma Production & Measurement – II	PPM – II
11	Mathematical Methods – II	MM – II
12	Electromagnetic Theory – II	EMT – II
13	Mechanics –II (Fluid & Statistical Mechanics)	MEC – II
14	Numerical Methods and Advance Computing	NMAC
15	Laboratory Practical – II	LAP – II
16	Research Methodology	RM

17	Introduction to Materials Science	MS
18	Credit Seminar	CS
19	Mini Project	PROJ

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Fundamentals of Plasma Physics – A	FPP – A	**Course provide detailed information on**
		- Plasma Physics and its applications.
		- Charged Particle interaction.
		- Particle orbit theory, polarisation drift.
Fundamentals of Plasma Physics – B	FPP – B	**Course provide detailed information on**
		- Statistical description of plasma.
		- Macroscopic Transport Equations.
		- Elementary Waves in Warm Plasma.
		- Fluid Drifts.
Plasma Production and Measurements-I	PPM – I	**Course provide detailed information on**
		- Fundamentals of Vacuum Science
		- Fundamentals of Gaseous Discharge
		- Equilibrium Discharge Properties
		- Plasma Sheaths & Discharge
Mathematical Methods - I	MM – I	**Course provide detailed information on**
		- Ordinary Differential Equations (ODE)
		- Approximate Methods for solving ODE:
		- Complex Analysis
		- Difference Equations (DE)
Electromagnetic Theory- I	EMT – I	**Course provide detailed information on**
		- Fundamentals of electrostatics and its application
		- Fundamental of magneto-statics drawing analogy to electrostatics
		- Laws of electrodynamics (Maxwell's equations) and its relevance in Plasma production, measurement.
Mechanics –I (Classical Mechanics)	MEC-I	**Course provide detailed information on**
		- Lagrangian mechanics and Central force
		- Hamiltonian mechanics and Canonical transformations (CT)
		- Hamilton Jacobi Theory and Canonical perturbation
	APP – A	**Course provide detailed information on**

Advance Plasma Physics – A		- Derivation of generalized Cold plasma dielectric constant. Electrostatic Waves, Electromagnetic Waves ,CMA Diagram
		- Kinetic Description of Plasma i.e. Many body description for plasma, The Klimontovich Dupree system of equations ,Kinetic Instability – Two Stream Instability and negative energy waves
		- Concept of Landau damping
Advance Plasma Physics – B	APP – B	**Course provide detailed information on**
		- Non-Linear Effects in Plasma
		- Magneto-hydrodynamics
		- Application of MHD and tokamak physics
Plasma Production & Measurement – II	PPM – II	**Course provide detailed information on**
		- Fundamentals of different types of Plasma Sources and its discharge circuits i.e. RF Capacitive Discharge-RF Inductive Discharge-ECR and Wave based (Helicon) discharge
		- Principles of Spectroscopic and Laser Diagnostics.
		- Microwave and Interferometric diagnostic techniques i.e. Fundamentals of Microwave interferometry and its methodology.
Mathematical Methods – II	MM – II	**Course provide detailed information on**
		- Partial Differential Equations (PDE) i.e. Introduction, Classification of PDEs , First order PDEs, complete integral and general solution,
		- Integral equations i.e. Definition, homogeneous, inhomogeneous, linear, non-linear equations and Applications of integral equations.
		- Integral Transforms i.e. Fourier Transforms, Laplace Transforms and the inverse transforms, connection to physical problems
Electromagnetic Theory – II	EMT – II	**Course provide detailed information on**
		- EM wave in bounded region and Introduction to waveguides
		- Gauges and Radiation
		- Scattering of electromagnetic waves
		- Relativistic electrodynamics
Mechanics –II (Fluid & Statistical Mechanics)	MEC – II	**Course provide detailed information on**
		- Dimensional analysis and its application:
		- Types of flow with their mathematical description and Dynamics of flow

		- Kinematics of linear flow of incompressible fluid
		- Kinematics of rotational flow of incompressible fluid
		- Classical Statistical Mechanics
		- Non-Equilibrium Phenomena and Non-equilibrium dynamics
		Numerical Statistical Mechanics and Quantum statistical Mechanics
Numerical Methods and Advance Computing	NMAC	**Course provide detailed information on**
		- Numerical methods i.e. Taylor series and its application, Eigenvalue problems, Modeling of Data, Integration of Ordinary Differential equations
		- Fast Fourier transform (FFT) and its applications
		- Programming for particle motion simulation considering large number of particles.
Research Methodology	RM	**Course provide detailed information on**
		- Meaning of Research: Objectives of Research, Motivation in Research, Defining the Research Problem
		- Documentation in doing Research; proposal writing, report writing, manuscript writing
		- Data collection and Statistical analysis techniques
Introduction to Materials Science	MS	**Course provide detailed information on**
		- Atomic Bonding and Crystal structure
		- Physical Properties of materials
		- Material Development Using Plasma
		- Common Material Characterisation Techniques

(B) Experimental and Lab Courses

Laboratory Practical – I	LAP – I	**Provides practical knowhow of**
		- Experimental Electronics i.e. Application of Operational Amplifier and various networks.
		- Characteristics of DC Discharge i.e. Operation of rotary and diffusion pumps, creating vacuum from atmosphere and back, leak detection experiment, estimation of pumping speed.
		- Computer Laboratory Practical through numerical programming i.e. Root finding, Interpolation and extrapolation

		programing, Differentiation and Integration programming.
Laboratory Practical – II	LAP – II	**Provides practical knowhow of laboratory setups,**
		- Excitation of Ion Acoustic Waves in Plasma and ion acoustic speed measurement, Electric Probe diagnostics.
		- Measurements of Space potential / Electric Field in Plasma using Emissive Probe , B-dot probe measurement and Spectroscopic measurements
		- Plasma density measurement by Microwave

BACK TO MAIN

Course Structure:

VII. Courses at IOP

Program Code : PHYS04	Programme Specific Outcome	Students are given an adequate exposition to advanced subjects relevant for their Phd studies. These courses bridge the gap between formal MSc physics courses and modern fundamental as well as applied research subjects.
		Students are trained for problem solving capability, programming skills as well as application and understanding of advanced experimental techniques.
		This course also prepare the students as better teachers in the field of higher education as they need to present seminars and presentations as part of the course work.

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Advanced Quantum Mechanics	101
2	Experimental Physics - Lab course	108
3	Mathematical methods, Numerical Methods and Research methodology	201
4	Project	214

(B) Optional Courses

Sr. No.	Name of the Course	Course code
1	Quantum Field theory-I	102
2	Advanced Statistical Mechanics	103
3	Advanced classical field theory	104
4	Many body Physics	105
5	Soft Condensed matter Physics	106

6	Advanced Experimental Techniques	107
7	Advanced Condensed Matter Physics	202
8	Advanced Nuclear Physics	203
9	Quantum Field theory II	204
10	High Energy Physics	205
11	Quantum information and computation	206
12	Nonlinear dynamics and Chaos	207
13	Special topics in Condensed Matter Physics	208
14	Special topics in High Energy Physics	209
15	Special topics in Mathematical Methods	210
16	Special topics in Quantum Mechanics	211
17	Special topics in Nuclear Physics	212
18	Special topics in Statistical Physics	213

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Advanced Quantum Mechanics	101	Mastering the approximate methods for solution of quantum mechanical problems.
		Understanding the role of symmetry in the formulation and solution of physical problems.
		Understanding relativistic effects through Dirac equation.
		Learning Geometric phase and its modern applications.
		Second quantization and its application to matter-radiation interaction.
Experimental Physics - Lab course	108	Developing the experimental skills of the students and inculcating scientific temperament in them by solving practical problems.
		Introducing students to various advanced research facilities of the institute like surface science, transport, X-ray, workshop, etc. and

		showing them how to perform experiments using them for their research work.
		Students are allowed to independently perform experiments at various facilities with the aim to build their background for future research work in this area.
Mathematical methods, Numerical Methods and Research methodology	201	Either MM or NM is chosen, depending on the interest of the instructor and students. In MM, Review of complex variable theory and ordinary differential equations through problem solving.
		Learning partial differential equations, group throry, statistics and probability theory, and basic concepts of topology and its applications.
		In NM course, students get to learn basics of various numerical methods and tools. Study applications of various numerical techniques in solving complex physical process, such as boundary value and eigenvalue problems, scattering, Monte-Carlo simulation. Understanding data analysis techniques, curve fitting and testing goodness of fit.
		Learning advanced programming languages, such as C++, python etc. and writing programmes to solve numerical problems. Learning various available software packages and libraries, such as Mathematica, for doing numerical calculations.
		In RM, students develop skills for wrting research articles, good communication and presentation of results in seminars, and reviewing research papers.
Project	214	The students choose a particular topic of his/her choice and work out in details under the guidance of a faculty.
		Learning how to survey literature and approach a problem.
		Acquire capability to understand and explain the problem to the scientific community in written as well as in verbal communication.
		Finding the relevant extension of the problem towards his/her Ph D.

(B) Optional Courses

Name of the Course	Course code	Course Outcome
Quantum Field theory-I	102	Understand concepts of fields and its quantization such as free scalar field, Dirac field, electromagnetic field. Definition of propagators, Wicks theorem, normal ordering.
		Modelling the interactions between scalar fields. Perturbation theory and calculation of basic Feynman diagram.
		Knowledge about symmetries and conservation laws
		Introduction to the path-integral quantization of scalar field theory and S-matrix formalism, symmetries and ward identity.
		Understanding concept of renormalization group. Wilsonian-RG and concept of effective low energy field theory description.
Advanced Statistical Mechanics	103	Understanding of basic ensemble theory: microcanonical, canonical and grand canonical ensembles; examples: classical ideal gas, Harmonic oscillator, statistical theory of Para magnetism etc.
		Formulation of quantum statistical mechanics: concept of density matrix, Bose-Einstein and Fermi-Dirac distribution, ideal Bose gas: understanding of Bose-Einstein condensation, Phonos, Deby theory, Black-body radiation etc., free Fermi gas: understanding of electronic specific heat, Pauli Para magnetism and Landau diamagnetism etc.
		Understanding of classical interacting systems: Ising model, exact solution and mean-field solution, Landau-Ginzburg theory, Ising universality class and basics of phase transition.
		Understanding of basics of dynamics: classical Fluctuation-Dissipation theorem, Langevin and Fokker-Planck equation etc.
Advanced classical field theory	104	Thorough understanding of electrostatistics and magnetostatics, Maxwell's laws and origin of electromagnetic waves.

		Understanding origin of electromagnetic radiation by moving charges. Interactions of radiation with matter.
		Understanding covariant formulation of electrodynamics and its application.
		Understanding basic formalism of general relativity in terms of principles of equivalence and covariance. Application to black holes, cosmology etc.
		Basic understanding of advanced topics such as hydrodynamics, Landau-Ginzberg theory and Continuum Mechanics
Many body Physics	105	Understanding of second quantization, occupation number representation, tight binding and Hubbard model as examples.
		Concept of zero temperature single particle and two particle Green's function (Bosons and Fermions), spectral function, Understanding of finite temperature Green's function; Matsubara formalism.
		Understanding of interaction picture, Dyson series, S-matrix, constructing Feynman diagrams and Feynman rules at zero and finite temperatures, concept of self-energy.
		Understanding of linear response theory, quantum version of fluctuation-dissipation theorem, computation of correlation functions: spin-spin (magnetic susceptibility) for free Fermi gas and current-current (conductivity via Kubo formula).
		Development of Feynman diagrams for random disordered potential, concept of disorder averaging, understanding of microscopic basis of Drude conductivity.
		Understanding of electron-phonon interaction, Fröhlich Hamiltonian, development of Feynman diagrams and concept of phonon self-energy.
		Understanding of microscopic origin of attractive electron-electron interaction from electron-phonon interaction: Schrieffer-Wolf transformation, Cooper problem, understanding of microscopic BCS theory of superconductivity (pairing mean-field solution), Nambu formalism and Nambu Green's function of superconductivity.

Soft Condensed matter Physics	106	Quick review of thermodynamic principles and probability theory
		Kinetic theory, Liouville's theorem, BBGKY hierarchy, Boltzmann transport equation, H-theorem, conservation laws, hydrodynamics
		Ensembles, connection to thermodynamics, quantum statistical mechanics
		Interacting particles, cumulant expansion, cluster expansion, van der Waals equation, mean field theory of condensation, critical point
		Landau-Ginzburg theory, Goldstone modes, Mermin-Wagner theorem, Ginzburg criterion
		Master equation, Langevin equation, Fokker-Planck equation, Fluctuation-dissipation relation, Onsager reciprocity
Advanced Experimental Techniques	107	Learning about materials science from bulk to nano and to thin films. Various experimental techniques are to understand the structure-property relation at the local (atomic) and global scale.
		Introduction to Crystallography. Experience on X-ray scattering and diffraction and X-ray reflection of various hybrid systems of interest.
		Introduction to Optical spectroscopy, Raman spectroscopy, Photoluminescence spectroscopy, Infrared spectroscopy
		Photo emission spectroscopy (PES) to study the electronic structure, angle integrated and angle resolved photoemission spectroscopy, electron spectroscopy for chemical analysis (ESCA)
		Learning Synchrotron radiation, application of X-ray absorption spectroscopy (XAS), X-ray (magnetic) circular and linear dichroism in absorption (XMCD,XMLD)
		Introduction to particle accelerator, Ion Implantation, Rutherford back scattering (RBS), particle induced x-ray emission (PIXE)
		Learning Resonance and its application, nuclear magnetic resonance (NMR), electron spin resonance (ESR), ferromagnetic Resonance (FMR),

		Mossbauer spectroscopy, muon spin spectroscopy (μSR)
		Introduction to Surface Science and fundamental aspects of thin film growth, and its characterization by scanning tunnelling/electron microscopy (STM/SEM), Atomic force microscopy (AFM), Low energy electron diffraction (LEED), Reflection high energy electron diffraction (RHEED), transmission electron microscopy (TEM).
		Understanding electronic/magnetic properties via transport (magneto) and magnetic measurements: Four probe resistivity (R_{xx} and R_{xy}), SQUID-VSM, electronic motion in a magnetic field and Fermi surface measurement, scanning tunneling spectroscopy (STS)
Advanced Condensed Matter Physics	202	Modelling and understanding effect of coulomb interactions among electrons in condensed matter system.
		Understanding effect of disordered potential on electron gas.
		Understanding the phenomena of superconductivity and conceive a microscopic model for it.
		Understanding the origin of magnetism and modelling various magnetic system and different type of magnetic interactions.
		Understanding effect of confinement due to potential and field in reduced dimensional system such as Quantum dots, Luttinger liquid, Quantum Hall effect.
Advanced Nuclear Physics	203	Modelling of Atomic Nuclei. It will give the structure and other properties of finite nuclei and that of Neutron stars.
		It will give knowledge for the search of various fissionable nuclei, which are very much important for the energy production.
		It will highlight the origin of the Universe and the formation of various particles.
		It will provide a bridge between the Nuclear Physics and the Astrophysics. The Nuclear Physics inputs will be given a better understanding on the Astrophysics.
		It will give insight in the nature of all four fundamental forces and their influences on Astrophysical Objects.

Quantum Field theory II	204	Learning how to do one-loop calculations
		Quantization of gauge theories
		Renormalization of gauge theories, beta function and RG
		Role and importance of anomalies
		Basics of solitons and instantons
High Energy Physics	205	Understanding the importance global and local symmetries and the language of Lie groups
		Construction of gauge theories
		Importance of spontaneous symmetry breaking
		Basics of QED and QCD and elementary processes
		Construction of the standard model and some of its consequences
Quantum information and computation	206	Understanding basic formalism of Quantum Mechanics
		Learning measures of entanglement, its detection and manipulation
		Understanding quantum operations, quantum gates, nonlocality, and quantum communication protocols
		Understanding quantum cryptography
		Understanding basic quantum algorithms
Nonlinear dynamics and Chaos	207	Introduction to the concept of fixed points, bifurcation, limit cycles for one and two dimensional non-linear system.
		Modelling interacting systems such as Predator-Prey model/Lotka-Volterra system.
		Understanding various non-linear systems such as Enzyme Kinetics, Neuron dynamics, Travelling waves etc
		Understanding the meaning of Chaos and its characterization.
		Introduction to turbulence and Kolmogorov scaling.
Special topics in Condensed Matter Physics	208	Understanding emerging topics in condensed matter system such as Topological insulator, unconventional superconductivity, many body localization, frustrated magnetism etc.
		Acquiring basic analytical and conceptual understanding of the above fields.
Special topics in High Energy Physics	209	Will depend on choice of topics.
		Topics will be at the forefront of research.
	210	Will depend on choice of topics.

Special topics in Mathematical Methods		Topics will be at the forefront of research.
Special topics in Quantum Mechanics	211	Will depend on choice of topics.
		Topics will be at the forefront of research.
Special topics in Nuclear Physics	212	Will depend on choice of topics.
		Topics will be at the forefront of research.
Special topics in Statistical Physics	213	Learning continuous phase transition, universality and scaling
		Exactly solvable models, computations of various critical exponents
		Mean field theory
		Perturbative renormalization: in position and momentum space
		Quantum Phase Transition
		Physics at the critical point: introduction to conformal field theory.

Course Structure:

VIII. Courses at HRI

Program Code : PHYS04	Programme Specific Outcome	Understanding and knowledge of physics in the classical and quantum domain.
		Understanding of mathematical methods in their applications in diverse settings.
		Understanding and application of statistical methods in physics
		Provide exposure to various specialised areas such as condensed matter, atomic physics, particle physics, astrophysics, and quantum information.
		Learning many body techniques as well as quantum field theoretic methods and applying them to solve problems.

SEMISTER – I

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Quantum Field Theory I	08PHYS04-001-C
2	Mathematical Methods II	08PHYS04-002-C
3	Project	08PHYS04-003-C

(B) Electives (choose any one)

Sr. No.	Name of the Course	Course code
1	Fluid Mechanics	08PHYS04-001-E
2	General Theory of Relativity	08PHYS04-002-E
3	Nonlinear Dynamics	08PHYS04-003-E
4	Quantum Information and Computation I	08PHYS04-004-E
5	Quantum Mechanics III	08PHYS04-005-E

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Quantum Field Theory I	08PHYS04-001-C	Acquiring knowledge of the method of second quantization for the study of many particle non-relativistic systems.
		Acquiring knowledge of the Lorentz group and its role in relativistic quantum field theory.
		Acquiring knowledge of the quantization of the Klein Gordon, Dirac and Maxwell fields.
		Acquiring knowledge of the basics of quantum electrodynamics and the study of various processes at tree level.
		Understanding of the role of gauge invariance in quantum electrodynamics.
Mathematical Methods II	08PHYS04-002-C	Ability to analyse phenomena using Fourier and Laplace transformation
		Ability to construct and solve higher order differential equation
		Understanding to apply Laplace and Poisson equation to electrostatics, Heat equation, Wave equation
		Understanding Group theory concepts and its application in Lie algebras
Project	08PHYS04-003-C	Ability to formulate a research problem
		Developing scientific skills to solve the problem
		Acquiring knowledge to interpret, discuss and communicate scientific results in written and oral form

(B) Electives

Name of the Course	Course code	Course Outcome
Fluid Mechanics	08PHYS04-001-E	Acquiring knowledge of the basic concepts in the study of ideal fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity.
		Study of viscous fluids.
		Acquiring knowledge of the basic topics in the theory of turbulence.

		Understanding of Thermal Conduction in fluids.
		Acquiring basic knowledge of Relativistic Fluid dynamics.
General Theory of Relativity	08PHYS04-002-E	Acquiring basic knowledge of differential geometry.
		Understanding of the equivalence principle and its applications.
		Acquiring knowledge of Einstein equation
		Acquiring knowledge of Schwarzschild solution along with applications.
		Acquiring knowledge of the theory of gravitational waves.
		Acquiring knowledge of the basics of Friedman-Robertson-Walker cosmology.
Nonlinear Dynamics	08PHYS04-003-E	Acquiring knowledge of long time behavior of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
		Acquiring knowledge of the nature of orbits for conservative and non-conservative systems.
		Understanding of different kinds of perturbation theory for calculating orbits.
		Understanding of maps, fixed points, cycles and stability, bifurcations.
		Basic understanding of chaos.
Quantum Information and Computation I	08PHYS04-004-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Acquiring the knowledge of the entanglement theory, and quantum correlations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.
Quantum Mechanics III	08PHYS04-005-E	Acquiring knowledge of the basics of atomic spectra in single electron atoms.

		Acquiring knowledge of atomic spectra in many electron atoms and molecules.
		Acquiring knowledge of the interaction of light and matter.
		Understanding of the basic theory involved in the study of cold atoms.
		Acquiring knowledge of the basics of atomic spectra in single electron atoms.
		Acquiring knowledge of atomic spectra in many electron atoms and molecules.

SEMISTER – II

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Statistical Mechanics	08PHYS04-004-C
2	Research Methodology and Numerical Methods	08PHYS04-005-C

(B) Electives (choose any two)

Sr. No.	Name of the Course	Course code
1	**Astrophysics**	08PHYS04-006-E
2	Condensed Matter Physics II	08PHYS04-007-E
3	Cosmology	08PHYS04-008-E
4	Introduction to Electronic Structure Calculations	08PHYS04-009-E
5	Particle Physics	08PHYS04-010-E
6	Quantum Field Theory II	08PHYS04-011-E
7	Quantum Information and Computation II	08PHYS04-012-E
8	Quantum Optics	08PHYS04-013-E
9	Soft Matter	08PHYS04-014-E
10	Ultra cold Atoms	08PHYS04-015-E

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Statistical Mechanics	08PHYS04-004-C	Acquiring knowledge of basics concepts such as phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Research Methodology and Numerical Methods	08PHYS04-005-C	Acquiring knowledge of research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers.
		Introduction to programming languages: F77, F90 or C.
		Acquiring knowledge of numerical linear algebra, interpolation techniques, generation and use of random numbers.
		Acquiring knowledge of numerical differentiation and integration (including Monte Carlo techniques).
		Acquiring knowledge of numerical methods to treat ODEs and PDEs: including FFT and finite difference methods, integral equations.

(B) Electives

Name of the Course	Course code	Course Outcome
Astrophysics	08PHYS04-006-E	Learning about magnetohydrodynamics with applications to Astrophysical systems.

		Study of stellar structure and developing detailed understanding of structure of stars.
		Developing understanding of the models of galaxies.
		Acquiring knowledge of the accretion of matter due to a point mass.
		Developing introductory understanding of cosmology.
Condensed Matter Physics II	08PHYS04-007-E	Learning the skill to study low dimensional systems.
		Understanding theories which describe charge transport in mesoscopic systems.
		Acquiring knowledge of the electronic structure in low dimensional systems.
		Learning about the effects of phonons in metals and dielectric properties of insulators.
		Learning formalism necessary to study Quantum Hall systems, quantum wires and dots.
		Acquiring knowledge of correlated electron systems.
		Learning about the Mott transition, the Kondo systems, Superconductivity and magnetism.
Cosmology	08PHYS04-008-E	Learning about the cosmological model, the cosmological constant and the dark matter.
		Developing the understanding of the thermal history of the universe and its imprints on CMB.
		Understanding the horizon problem and its resolution by inflation.
		Acquiring the knowledge of the theory of cosmological perturbations.
		Studying the implications of the cosmological perturbation on the structure formation.
Introduction to Electronic Structure Calculations	08PHYS04-009-E	Acquiring the knowledge of the first principle computation, methods like the H-F approximation.
		Learning the Density Functional theory, and various approximations within the formulation.
		Learning the pseudo potential method and its applications.
		Application of these methods to study the band structure of various materials.

Particle Physics	08PHYS04-010-E	Understanding physics of elementary particles.
		Learning about fundamental interactions in terms of gauge principle.
		Acquiring skills to carry out computation in Strong, Weak and Electromagnetic theory.
		Learning various techniques useful for particle physics phenomenology.
		Learning methods to compute physical observables which can tested in the laboratory
Quantum Field Theory II	08PHYS04-011-E	Understanding the Path Integral formulation of quantum field theory.
		Acquiring the knowledge of the regularisation methods and the renormalisation.
		Developing the understanding of spontaneous symmetry breaking and its implications.
		Learning the non-abelian gauge theories and their quantisation.
		Learning the renormalisation of the non-abelian gauge theories both in the symmetric and symmetry broken phase.
Quantum Information and Computation II	08PHYS04-012-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Acquiring the knowledge of the entanglement theory, and quantum correlations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.
Quantum Optics	08PHYS04-013-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.

Soft Matter	08PHYS04-014-E	Learning about what scales are involved in soft matter.
		Studying the phase transition using various techniques.
		Understanding the colloidal systems.
		Developing the intuition about polymers and membranes.
		Learning about the experimental methods.
Ultra cold Atoms	08PHYS04-015-E	Learning about the scales involved in the system.
		Understanding the experimental background, like trapping, optical lattices, Feshbach resonance, etc.
		Using many body methods to study phase transition, perturbation theory.
		Learning about the Bose condensation and its theoretical aspects.
		Developing the understanding of the BCS instability in sermonic system.
		Studying the quantum spin systems.

Course Structure:

IX. Courses at IMSc

Program Code : PHYS04	Programme Specific Outcome	Integrated Ph.D. students in Physics at IMSc need to do 1st two semesters of course work in standard Master Degree level courses in Classical Mechanics, Quantum Mechanics I & II, Classical Electromagnetism, Mathematical Methods, Statistical Mechanics, Classical Field Theory, and Condensed Matter Physics I.
		The 3rd and 4th semester courses for Integrated Ph.D. students in IMSc are respectively same as the 1st and 2nd semester courses for the Ph.D. students in Physics at IMSc.
		In their 3rd semester, the students are being taught advanced level courses (aiming to take up research problems) in Statistical Mechanics, Mathematical Methods, as well as introductory courses on Particle Physics and Quantum Field Theory (which includes a part on Many-Body Field Theory, used for advanced courses in Condensed Matter Physics).
		In their 4th semester, the students need to credit two research-level courses either in High Energy Physics (Quantum Field Theory II, Cosmology and Gravitation, Particle Physics II) or in Low Energy Physics (Advanced Condensed Matter Physics, Non-linear Dynamics, Quantum Information and Computation, Statistical Field Theory) as well as a research project, which is, generally taken up by the student towards pursuing his/her Ph.D. research work here at IMSc.
		The students do have the freedom to shift their choice of topics for Ph.D. even if they do their 4th

		semester courses entirely in High Energy Physics or Low Energy Physics – provided the students are confident enough and they can find suitable Ph.D. guides at IMSc in that directions.

(A) Semester III:

Sr. No.	Name of the Course	Course code
1	Quantum Field Theory I	31
2	Mathematical Methods II	32
3	Statistical Mechanics II	33
4	Particle Physics I	34

(B) Semester IV:

1. High Energy Physics (HEP):

Sr. No.	Name of the Course	Course code
1	Quantum Field Theory II	41
2	Cosmology-and-Gravitation Or Particle Physics	42a 42b

2. Low Energy Physics (LEP):

Sr. No.	Name of the Course	Course code
1	Advanced Condensed Matter Physics	43
2	Nonlinear Dynamics Or Quantum Information-and-Computation Or Statistical Field Theory	44a 44b 44c

Course Outcomes:

(A) Semester III:

Name of the Course	Course code	Course Outcome
Quantum Field Theory I	31	Students should develop a mastery over elementary processes in Quantum Electrodynamics (QED): electron-positron annihilation, Compton scattering, Bhabha scattering, etc.
		Students should learn and internalize different radiative corrections for scalar field theory. They also learn techniques of scalar field quantization, as well as the techniques of dealing with non-interacting electrons from field theoretic perspectives.
		In the remaining one-third of the QFT-I course, LSZ formalism, Path integral formalism, and renormalization techniques are being taught for HEP-oriented students in order that they can use these techniques for their research in HEP.
		Similarly, in the other remaining one-third of the QFT-I course, operator techniques of second quantization, Kubo formula, system of interacting bosons, techniques mean- field theory, etc. Are being taught for LEP- oriented students in order that they can use these techniques for their research in LEP.
Mathematical Methods II	32	Students are supposed to learn and thereby apply different numerical techniques : interpolation methods, numerical solutions of ordinary and partial differential equations, Monte-Carlo method, numerical optimization, numerical techniques of dealing with fast Fourier transforms, etc.
		Students should develop a thorough working knowledge (together with the corresponding theoretical development) in the representation theories of discrete as well as continuous groups used in Classical and Quantum Mechanics.
		Students should develop working knowledge (as well as theoretical understanding) in

		topics of advanced Complex Analysis: analytic continuation, branch cuts, Riemann surfaces, conformal mapping, etc.
		Students should develop working knowledge in rudiments of Probability Theory.
		Students should develop a working knowledge about critical phenomena: scaling hypothesis, self-similarity, and fractals. Moreover, they should develop a thorough knowledge regarding criticality in spin systems, classical field theory, etc.
Statistical Mechanics II	33	Students should understand, internalize, and thereby, apply techniques of renormalization group – including both perturbative as well as non-perturbative cases.
		Students should develop a very good understanding about broken symmetry, how deal with disorders in systems, and dynamics of fluctuations (including the fluctuation-dissipation theorem).
		Students should develop a thorow knowledge on standard model in Particle Physics, including symmetries & quarks, Parton model & QCD, etc.
Particle Physics I	34	Moreover, students should develop concrete ideas about different decay processes, V-A theory of weak interactions, CP violation, etc.
		They should have a very good working knowledge in the unification of electromagnetic and weak interactions.
		Working knowledge about neutrinos.

(B) Semester IV:

1. **Electives- HEP**

Name of the Course	Course code	Course Outcome
Quantum Field Theory II	10PHYS04-041-E	This advanced-level course in Quantum Field Theory (QFT) aims at training the students to the extent where they can initiate some research project in High Energy Physics.
		In this course, students are supposed to develope working expertise in topics like: functional methods in QFT, funtional integral quantization of non-Abelian gauge fields, applications of renormalization group, anomalies in abelian as well as non-abelian gauge theories, etc.
Cosmology and Gravitation	10PHYS04-042a-E	This advanced-level course in Cosmology & Gravitation aims at training the students to the extent where they can initiate some research project in Astrophysics, Cosmology, etc.
		In this course, students are supposed to develope working expertise in topics like: Einstein's field equations and their different solutions, Hamiltonian formulation of Gravity, Cosmology, singularity theorems, etc.
Particle Physics-II	10PHYS04-042b-E	This advanced-level course in Particle Physics aims at training the students to the extent where they can initiate some research project in Particle Physics.
		In this course, students are supposed to develope working expertise in topics like: basics of the Standard Model, Electroweak interaction, Quantum Chromodynamics, Neutrino Physics, CP violation, Supersymmetry, Grand unified theory, etc.

2. **Electives- LEP**

Advanced Condensed Matter Physics	10PHYS04-043-E	This advanced-level course in Condensed Matter Physics aims at training the students to the extent where they can initiate some research project in Hard/Soft Condensed Matter Physics.
		In this course, students are supposed to develope working expertise in: Correlated Electron Physics and Soft Condensed Matter Physics.

Nonlinear Dynamics	10PHYS04-044a-E	This advanced-level course in Nonlinear Dynamics (NLD) aims at training the students to the extent where they can initiate some research project in different branches of Physics where Nonlinear Dynamics plays a vital role – apart from Nonlinear Dynamics itself.
		In this course, students are supposed to develope working expertise in: Hamiltonian formulation of NLD, Deterministic NLD, Integrability of Hamiltonian Dynamics, Chaos, Semiclassical Analysis of NLD, Quantum Aspects of NLD, etc.
Quantum Information-and-Computation	10PHYS04-044b-E	This advanced-level course aims at training the students to the extent where they can initiate some research project in different branches of Physics where Information Theory plays a vital role – apart from Quantum Information & Computation itself.
		In this course, students are supposed to develope working expertise in: Entanglement Theory and its applications, Shannon's Theory of Classical Information & its Quantum generalizations, Quantum Cryptography, Quantum Computation, physical implementaions, etc.
Statistical Field Theory	10PHYS04-044c-E	This advanced-level course aims at training the students to the extent where they can initiate some research project in Statistical Mechanics or its applications in fields like Condensed Matter Physics, Particle Physics, etc.
		In this course, students are supposed to develope working expertise in: Bose-Einstein condensation, Fermions, diagrammatic techniques, self-coupled scaler field theory, Yukawa theory, spontaneous symmetry breaking & Higgs model of Quantum Chromodynamics, deconfinement phase transition, Salam-Weinberg model and symmetry restoration, early universe, nuclear matter & pion condensation, neutron stras, etc.

Course Structure:

X. Courses at NISER

Program Code : PHYS04	Programme Specific Outcome	Understanding and knowledge of physics in the classical and quantum domain.
		Understanding of mathematical methods in their applications in diverse settings.
		Understanding and application of statistical methods in physics
		Provide exposure to various specialised areas such as condensed matter, atomic physics, particle physics, astrophysics, and quantum information.
		Learning many body techniques as well as quantum field theoretic methods and applying them to solve problems.
		Introduction to methods that will be lifelong assets for careers in research and development.

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Classical Mechanics	P601
2	Mathematical Methods	P602
3	Electromagnetism	P603
4	Self-Study/Mini project/credit seminar	P698
5	Statistical Mechanics	P614
6	Quantum Mechanics	P615
7	Mini Project	P699

(B) Elective Courses:

Sr. No.	Name of the Course	Course code
1	Nuclei and Particle Physics	P648
2	Atoms Molecules and Radiation	P649
3	Introduction to Condensed Matter Physics	P650
4	Advanced Solid State Physics	P651
5	Computational Physics	P652
6	Quantum Field Theory I	P653
7	Particle Physics	P654
8	Introduction to Phase transitions and Critical phenomena	P655
9	Nonlinear Optics and Lasers	P656

10	General Relativity and Cosmology	P657
11	Soft Condensed Matter	P658
12	Applied Nuclear Physics	P659
13	Many Particle Physics	P660
14	Physics of Mesoscopic Systems	P661
15	Introduction to Quantum Optics	P662
16	Astronomy and Astrophysics	P663
17	Plasma Physics and Magnetohydrodynamics	P664
18	Biophysics	P665
19	Quantum Nanoelectronics	P666
20	Nonlinear Physics, Chaos and Turbulence	P667
21	Magnetism and Superconductivity	P668
22	Density Functional Theory of Atoms, Molecules and Solids	P669
23	Quantum Field Theory II	P670
24	Quantum Information and Quantum computation	P671
25	Experimental High Energy Physics	P672
26	Experimental Techniques	P673
27	Introduction to Cosmology	P674

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Classical Mechanics	P601	This course reviews the concepts of Masters level classical mechanics with more emphasis on the applied/problem solving aspects.
		This course is meant to prepare the students for more rigorous analytical treatment of the subject required for research.
Mathematical Methods	P602	This course reviews the important mathematical tools required for physicists for implementation in research work in all specialization of physical sciences.
Electromagnetism	P603	This course reviews masters level electricity and magnetism with more emphasis on problem solving and applications.
		This course is meant to prepare students for taking up realistic research challenges involving one of the most important class of interactions in Physics.

Self-Study/Mini project/credit seminar	P698	To meet the research requirement of the individual student.(Course content varies according to instructor's choice.)
Statistical Mechanics	P614	This course reviews masters level statistical mechanics and thermodynamics and prepares students for analyzing research problems/results in a wide variety of situations involving statistical mechanics.
Quantum Mechanics	P615	This course reviews masters level quantum mechanics and prepares students for analyzing research problems/results in a wide variety of situations involving quantum mechanics.
Mini Project	P699	To meet the research requirement of the individual student.(Course content varies according to instructor's choice.)

(B) Elective Courses:

Name of the Course	Course code	Course Outcome
Nuclei and Particle Physics	P648	Provides training in basic concepts and methods in nuclear physics, stability of nucleons and classification of interactions.
		The course prepares the student to begin working in experimental and theoretical high energy physics.
Atoms Molecules and Radiation	P649	Important topics in atomic physics, selection rules, atomic and molecular spectroscopy is taught.
		The training is imperative to work in the area of applied solid state physics and optics.
Introduction to Condensed Matter Physics	P650	This is the first course in condensed matter physics and draws on quantum and statistical mechanics to provide a foundation in basic concepts and techniques required to tackle advanced courses in the area of solid state physics.
Advanced Solid State Physics	P651	This is a course which aims to prepare students with advanced concepts, techniques and knowledge of solid state physics that allows them to start working on basic research problems in the broad area of condensed matter theory, materials theory or solid state experiments.
Computational Physics	P652	This course provides training in computation tools required in research across a wide variety of fields including condensed matter, high energy phenomenology and lattice field theories.

Quantum Field Theory I	P653	This first course on quantum field theory prepares the student for tackling future advanced courses in the area of high energy physics.
Particle Physics	P654	This course teaches the basics of particle physics and allows the student to start beginning research work in high energy phenomenology.
Introduction to Phase transitions and Critical phenomena	P655	This course teaches the students advanced concepts and methods in statistical mechanics crucial for the student to take up basic research work.
Nonlinear Optics and Lasers	P656	This course teaches the students advanced concepts and methods in modern topics in laser optics and non-linear optics necessary for the student to take up basic research work in optics.
General Relativity and Cosmology	P657	This course teaches the students, advanced concepts and methods in general relativity crucial for the student for building their background for research work in general relativity and cosmology.
Soft Condensed Matter	P658	This course teaches the students advanced concepts and methods in soft matter physics, with the aim to build their background for future research work in this area.
Applied Nuclear Physics	P659	This course teaches the students advanced concepts and methods in applied nuclear physics, with the aim to build their background for future research work in this area.
Many Particle Physics	P660	This course teaches the students advanced concepts and methods in many particle physics, with the aim to build their background for future research work in this area.
Physics of Mesoscopic Systems	P661	This course teaches the students advanced concepts and methods in mesoscopic physics, with the aim to build their background for future research work in this area.
Introduction to Quantum Optics	P662	This course teaches the students important concepts and methods in quantum optics, with the aim to build their background for future research work in this area.
Astronomy and Astrophysics	P663	This course teaches the students important concepts and methods in Astronomy and Astrophysics, with the aim to build their background for future research work in this area.

Biophysics	P665	This course teaches the students important concepts and methods in Biophysics, with the aim to build their background for future research work in this area.
Quantum Nanoelectronics	P666	This course teaches the students important concepts and methods in nanoelectronics, with the aim to build their background for future research work in this area.
Nonlinear Physics, Chaos and Turbulence	P667	This course teaches the students important concepts and methods in classical nonlinear dynamics, with the aim to build their background for future research work in this area.
Magnetism and Superconductivity	P668	This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.
Density Functional Theory of Atoms, Molecules and Solids	P669	This course teaches the students important concepts and methods in density functional theory, with the aim to build their background for future research work in this area.
Quantum Field Theory II	P670	This course teaches the students important concepts and methods in advanced quantum field theory, with the aim to build their background for future research work in this area.
Quantum Information and Quantum computation	P671	This course teaches the students important concepts and methods in quantum information and computation, with the aim to build their background for future research work in this area.
Experimental High Energy Physics	P672	This course teaches the students important concepts and methods in experimental high energy physics, with the aim to build their background for future research work in this area.
Experimental Techniques	P673	This course teaches the students important concepts and methods in experimental techniques, with the aim to build their background for future research work in this area.
Introduction to Cosmology	P674	This course teaches the students important concepts and methods in introductory cosmology, with the aim to build their background for future research work in this area.

BACK TO MAIN

Ph.D. in MEDICAL & HEALTH SCIENCES (Program Code: HLTH04)

Course Structure:

1. Courses at TMC:

Program Code: HLTH04	**Program Specific Outcomes**	To train candidates in regards to all aspects in relation to conducting scientific research.
		To make students understand basics of cancer biology.
		To understand various aspects of research methodologies; use of ethical practices in conduct of research; application of statistics in research; & how to critically read and analyze scientific literature.
		To introduce aspects of clinical and translational research in relation to oncology during the program.
		To develop analytical thinking in students and help in developing ability to raise appropriate / relevant questions for doing research.

(A) CORE COURSES:

Sr. No.	CORE COURSES	COURSE CODE
1	Cell Biology & Cancer Biology	09HLTH04-001-C
2	Cell Proliferation and Cell death	09HLTH04-002-C
3	Oncogenes and Tumor Suppressors	09HLTH04-003-C
4	Metastasis and Angiogenesis	09HLTH04-004-C
5	Cancer Epigenetics and Genetics	09HLTH04-005-C
6	Carcinogenesis	09HLTH04-006-C

7	Tumor Immunology	09HLTH04-007-C
8	Structural Biology and Biophysics	09HLTH04-008-C
9	Research Methodology	09HLTH04-009-C

(B) ELECTIVE COURSES:

Sr. No.	ELECTIVE COURSES	COURSE CODE
1	Biostatistics	09HLTH04-001-E
2	Animal Models in Cancer Research	09HLTH04-002-E
3	Cancer Therapeutics	09HLTH04-003-E
4	Carcinogenesis, Chemoprevention and DNA Repair	09HLTH04-004-E
5	Deregulation of Cell Growth in Cancer	09HLTH04-005-E
6	Structural Bioinformatics, Biophysics & Structural Biology	09HLTH04-006-E
7	Tumor Immunology	09HLTH04-007-E
8	Metastasis	09HLTH04-008-E
9	Bioinformatics	09HLTH04-009-E
10	Epidemiology & Preventive Oncology	09HLTH04-010-E
11	Medical Physics	09HLTH04-011-E
12	Nutrition	09HLTH04-012-E

(C) SPECIAL LECTURES:

Sr. No.	SPECIAL LECTURES	COURSE CODE
1	Epidemiology & Bioinformatics	09-HLTH04-001-S
2	Intellectual Property Rights	09-HLTH04-002-S

Course Outcomes:

(A) CORE COURSES:

CORE COURSES	COURSE CODE	COURSE OUTCOMES
Cell Biology & Cancer Biology	09HLTH04-001-C	Over-view on what is cancer and its causes, differences between normal and cancer cells, detailed understanding of cell organelles, intracellular protein transport.
		Understanding of normal stem cells and cancer stem cells, biomarkers to identify cancer stem cells.
		Reprogramming and pluri-potency. Demonstrations and lectures on advanced microscopy and in vivo - cell imaging using luminescence and micro PET-CT
Cell Proliferation & Cell death	09HLTH04-002-C	A detailed analysis of the pathways underlying cell cycle progression and cell death. Study on animal models for understanding phenotype of cyclin and cyclin dependent kinases.
		Understanding the mechanisms of cell death and methods to detect apoptosis.
		Understanding differences between apoptosis, necrosis and autophagy. How cancer metabolism is distinct from normal cells and how this can be exploited therapeutically.
Oncogenes & Tumor Suppressors	09HLTH04-003-C	Understanding the mechanism of action of oncogenes and tumor suppressor genes and their function.
		Understand the difference between mouse and human telomeres and how this

		affects tumor progression in both species.
Metastasis & Angiogenesis	09HLTH04-004-C	Mechanisms underlying cell adhesion and migration and how these are altered in tumors.
		Mechanisms underlying metastatic progression. Understanding how a tumor deals with nutrient and oxygen deprivation.
		Understanding how hypoxia contributes to angiogenesis and vasculogenesis. Various models to study angiogenesis.
Cancer Epigenetics & Genetics	09HLTH04-005-C	Epigenetic mechanisms that affect tumor growth.
		Cancer as an inherited genetic disease. Understanding chromatin structure, histone-variants and their modifications in cancer.
		Understanding DNA methylation and gene-regulation.
		Detailed methodology to study chromatin-biology.
		Advanced knowledge on application of proteomics, Next Generation Sequencing and Genomics
Carcinogenesis	09HLTH04-006-C	Understanding Mechanisms of carcinogenesis. DNA repair and its role in inhibiting tumor progression.
		Understanding carcinogen metabolism and activation of cellular oncogenes and their contribution to carcinogenesis.
		Understanding role of tumor viruses and micro-organisms contributing to carcinogenesis.

Tumor Immunology	09HLTH04-007-C	Basics of tumor immunology. Differences between adaptive and innate immunity.
		Cell types contributing to tumor immunity and their role in cancer immuno therapy. Applications of monoclonal antibodies, vaccines in cancer diagnosis and therapy.
		Advanced technologies to study immune biomarkers on cells, immuno deficient mouse models to study tumor development and immune responses.
Structural Biology & Biophysics	09HLTH04-008-C	Basics of spectroscopy. Principles of protein-protein interactions and protein folding.
		Understanding mechanism of action of enzymes and assays to study their function.
Research Methodology	09HLTH04-009-C	Develop understanding on various kinds of research, objectives of doing research, research process, research designs and sampling.
		Have basic knowledge on qualitative research techniques
		Have adequate knowledge on measurement & scaling techniques as well as the quantitative data analysis
		Have basic awareness of data analysis-and hypothesis testing procedures
		To develop an understanding of the ethical dimensions of conducting applied research.

(B) ELECTIVE COURSES:

ELECTIVE COURSES	COURSE CODE	COURSE OUTCOME
Biostatistics	09HLTH04-001-E	Probability distribution (normal, Poisson, t, F, Chi-square)
		Sample size determination and justification of power estimates in a research protocol - observational studies, clinical trials (superiority, non-inferiority / equivalence), animal studies
		Hypothesis testing: analysis of categorical or continuous data
		Biostatistics pertaining to survival analysis
Animal Models in Cancer Research	09HLTH04-002-E	Anatomy and biology of small animals used in cancer research.
		Transgenic and knockout technology to generate animal models
		Animal models for carcinogenesis, chemoprevention and drug screening and testing.
		Using imaging to study tumor progression in animal models.
Cancer Therapeutics	09HLTH04-003-E	Modules of cancer therapy – chemo, radio and targeted therapy.
		Mechanisms of resistance to chemo and radio therapeutics.
		Drug design, development and screening
		Immunotherapy and gene therapy including RNAi
Carcinogenesis, Chemoprevention and DNA Repair	09HLTH04-004-E	Determination of carcinogen exposure and dosage
		Short term and long term assays for carcinogenesis

		The role of DNA damage, viruses and epigenetics in carcinogenesis
		Basics of chemoprevention.
Deregulation of Cell Growth in Cancer	09HLTH04-005-E	Detailed analysis of the molecular mechanisms underlying Rb and p53 function.
		Mechanisms underlying tumor progression upon activation of Ras, PI3K, Myc and wnt-signaling.
		Checkpoint pathways and cancer
		Senescence and cancer
Structural Bioinformatics, Biophysics & Structural Biology	09HLTH04-006-E	Spectroscopic Techniques: Absorption Spectroscopy and Fluorescence Spectroscopy Spectropolarimetry: Circular Dichroism
		Biophysical methods: Protein conformation, interactions and oligomeric properties
		X-ray Crystallography (lecture and hands-on)
		NMR Spectroscopy
		Structural Bioinformatics: Molecular Modeling (homology, threading, ab initio); small molecule/peptide design; MDS: Different tools available for these in silico studies
		Molecular Docking (protein-protein, protein-ligand/small molecules)
		Drug Designing-challenges, in-silico design-advantages, steps and tools (QSAR, 3D-QSAR etc.). Application: How drug design leads to clinical trials with example.

		Hands-on training in Bioinformatics
Tumor Immunology	09HLTH04-007-E	Basic concepts of innate and adaptive immunity and their role in tumor immunity
		Immunodiagnostics and immunotherapy of Cancer. Role of monoclonal antibodies, vaccines and cell-based therapies
		Understanding of the tumor microenvironment, cells soluble factors contributing to immunosuppressive networks
		Animal models that have immune defects used to transplant human tumors and study their application for drug development and immunotherapies
		Understanding how Flow Cytometer works. Principle and applications followed by demonstration
Metastasis	09HLTH04-008-E	Molecular basis underlying detachment, intravasation and invasion in tumor cells.
		Survival in the bloodstream, invasion and metastatic colonization.
		Pathways contributing to the spread of metastatic disease including EMT, Hippo, Notch Wnt and CSC pathways.
		Targeted therapy and immunotherapy in metastasis and models and imaging in metastasis.
Bioinformatics	09HLTH04-009-E	To get introduced to the basic concepts of Bioinformatics and its significance in Biological data analysis.

		Be capable of using critical thinking and research methods in Bioinformatics to understand computational and experimental data.
		Conduct scholarly activities in a professional and ethical manner.
		Develop the ability to communicate clearly the meaning, potential impacts and risks associated with one's research activities to a non-technical audience in ways that confer a sense for its value to society.
Epidemiology & Preventive Oncology	09HLTH04-010-E	Describe population patterns of health-related risk factors & health-related outcomes in terms of person, place, & time.
		Compare the relative strengths and weaknesses of common epidemiologic study designs (e.g., cross-sectional, cohort, case-control, randomized experiments).
		Elucidate risk and prognostic factors for common and high-mortality cancers, with a focus on lifestyle, environmental and molecular exposures.
		Discover and implement prevention strategies, incorporating environmental, 'omic', and imaging approaches.
		Develop and operationalize novel bio-statistical and analytic methods for big data and personalized prevention.
Medical Physics	09HLTH04-011-E	Student will learn how different ionizing radiation effects influence biological systems.

		Student will acquire special competence within one or more academic fields. This may be radiation physics, modern radiation technology, radiobiology, radiation therapy for cancer, radio immuno-therapy
		While working on their assignments, students will, in cooperation with the academic staff, learn to develop quantitative measurement methods, plan, execute and analyse relevant experiments and model central physical, biochemical or biological processes and systems within the subject area.
		Student will train in critical thinking, ethics and accountability, problem-solving, project management and in addition be able to express themselves in a precise manner, both in writing and orally.
Nutrition	09HLTH04-012-E	Comprehensive understanding of core nutrition knowledge.
Nutrition	09HLTH04-012-E	Identify and conduct original research and scholarship in the field of nutrition.
Nutrition	09HLTH04-012-E	Effectively communicate in their field of study.
Nutrition	09HLTH04-012-E	Think critically, creatively and solve problems in their field of study. Skills in research methodologies demonstrated by conducting original scholarly research.
Nutrition	09HLTH04-012-E	Conduct research in an ethical and responsible manner.
Nutrition	09HLTH04-012-E	Demonstrate attributes of professional

		development consistent with the expectation within their field of study. Effective dissemination of research findings via peer-reviewed publications, seminars and practical applications such as teaching

(C) SPECIAL LECTURES:

SPECIAL LECTURES	COURSE CODE	COURSE OUTCOME
Epidemiology & Bioinformatics	09-HLTH04-001-S	Discuss the strengths and weaknesses of study designs (e.g., cross-sectional, cohort, case-control, randomized experiments) and the appropriate measure of association for a given study design
		Communicate clinical or translational research findings to a medical audience
		Analyze research data and interpret these results from a population health or clinical-translational perspective
		Demonstrate knowledge of regulatory requirements for clinical research
		To get introduced to the basic concepts of Bioinformatics and its significance in Biological data analysis.
		Be capable of using critical thinking and research methods in Bioinformatics to understand computational data and apply it to epidemiological data.
Intellectual Property Rights	09-HLTH04-002-S	The students once they complete their academic projects, will get awareness of acquiring the patent and copyright for their innovative works
		They also get the knowledge of plagiarism in their innovations which can be questioned legally
		Students should be able to apply intellectual property law principles

		(including copyright, patents, designs and trademarks) to real problems and analyze the social impact of intellectual property law and policy

BACK TO MAIN

INTEGRATED Ph.D. ENGINEERING SCIENCES

(DUAL DEGREE)

(Program Code: ENGG05)

Course Structure:

I. Courses at BARC

Program Code : ENGG05	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	**Name of the Course**	**Course code**
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	**Course code**	**Course Outcome**
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

	EN593	ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(B) CHEMICAL ENGINEERING COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

		Material characterization techniques
Membrane Technology	EN714	Overview of Novel Membranes
		Preparation and Characterization
		Membrane Technologies
		Applications of Membrane Technology

(B3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1

2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design

		Shallow and deep foundation design; machine foundation design
Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN5A93	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	**Name of the Course**	**Course code**
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	**Name of the Course**	**Course code**
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	**Course code**	**Course Outcome**
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics

		Understanding Transmission Lines, Waveguides, RF Amplifiers,
Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters

		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models

		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Computer Based System Design II	EN706
3	Digital Signal Processing & Image Processing	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720

(G3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(G2) Electives

Name of the Course	**Course code**	**Course Outcome**
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

Computer Based System Design II	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Digital Signal Processing & Image Processing	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(G3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(H)COMPUTER SCIENCE AND ENGINEERING

(H1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Operating Systems	EN606
2	Computer Graphics & Visualisation	EN613
3	Distributed Computing	EN616
4	Networking & Information Security	EN627
5	Reactor Control Engineering	EN637
6	Software Engineering and Formal Methods	EN640

(H2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Data Base Management System & Web Technology	EN705
3	Digital Signal Processing & Image Processing	EN706
4	Embedded Electronics Software	EN707
5	Feedback Control System	EN708
6	Image Processing & Machine Vision	EN710

(H3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Training in formulating and execution of research project.
		Training in documentation and presentation skills.

Course Structure:

II. Courses at IGCAR

Program Code: ENGG05	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	**Name of the Course**	**Course code**
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	**Course code**	**Course Outcome**
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(A) MECHANICAL ENGINEERING

(A1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Code Design for Pressure Vessels and Piping	ME1
2	High Temperature Design and Inelastic Analysis	ME4
3	Computational Fluid Dynamics	ME6
4	Finite Element Method	ME8
5	Advanced Heat and Mass Transfer	ME10
6	Reliability Engineering	ME13
7	Manufacturing Technology	ME14

(A2) ELECTIVES

Sr. No.	Name of the Course	Course code

2	Structural Integrity Assessment Methods and NDE	
3	Vibration Engineering and condition Monitoring	
4	Seismic Design of Nuclear Reactors and Facilities	ME5
5	Plant Dynamics	

6	Experimental Mechanics	
7	Process Control and Instrumentation	ME15

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles.
		The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

		design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.
Computational Fluid Dynamics	ME6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis Numerical Solution of Complete Fluid Flow and Energy Equation
Finite Element Method	ME8	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Advanced Heat and Mass Transfer	ME10	Advanced knowledge in heat and mass transfer Laminar boundary layer and forced convective heat, turbulent flow and heat transfer Heat transfer in porous media and heat transfer with phase change Radiation heat transfer
Reliability Engineering	ME13	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Manufacturing Technology	ME14	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.

(A2) ELECTIVES

Name of the Course	Course code	Course Outcome
Machine Design	ME3	Basic concepts in vibrations analysis
Structural Integrity Assessment Methods and NDE		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
Vibration Engineering and condition Monitoring		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	ME5	Introduction to earthquakes, design basis ground motion and IS 1893 spectra Introduction of earthquake engineering and analysis for multi degree freedom systems
Plant Dynamics		Analysis and design of structures, equipments and piping
Experimental Mechanics		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	Training in formulating and execution of research project.
Seminar -1,2,3	02ENGG04-001-S	Training in oral communication of research results.

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	The subject is aimed on advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	Training in formulating and execution of research project.
Seminar -1,2,3	02ENGG04-002-S	Training in oral communication of research results.

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Preparedness &Response to Nuclear Emergencies Artificial Intelligence Methods &Applications Membrane/ Separation Process and Technology	CEEL

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	Training in formulating and execution of research project.
Seminar -1,2,3	02ENGG04-003-S	Training in oral communication of research results.

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

5	Regulatory Framework for NPPs	FRE13
6	Practical’s	FRE14
7		Viva Voce

Course Outcomes:

(E1) FUNDAMENTALS

Name of the Course	**Course code**	**Course Outcome**
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(E2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for pressure vessel and piping	FRE1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tube sheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.

Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2	Advanced knowledge in heat and mass transfer
		Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
		Heat transfer in porous media and heat transfer with phase change
		Radiation heat transfer
Transport Phenomena	FRE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyse transport problems
		Analyse transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyse transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

Course Outcomes:

(F1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(F2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	FRE15	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	FRE16	Students learn about basics of interaction of radiation with matter.
		Principle & Techniques to detect and measure ionizing radiation.
		Basics of radiation counting statistics
		Introduction to Neutron Flux Measurement in FBTR and PFBR.
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Embedded System Design & Human Machine Interface	FRE17	Introduction to Microprocessor Based Hardware Design
		Computer Communication and Networks
		Fault Tolerant and Distributed Architectures
		Programmable Logic Controller Design
		Overview of plant automation and Human Machine Interface (HMI)

Process Instrumentation	FRE18	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of various process variables
		Reliability principles, Fail safe design principles
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(F3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine Turbine troubles
Mechanical and Electrical Equipments	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	Assessment of the understanding in the subject area by the students.

BACK TO MAIN

INTEGRATED Ph.D. (Dual Degree) LIFE SCIENCES (Program Code: LIFE05)

I. Courses at IMSc

Program Code : LIFE05	Programme Specific Outcome	To understand biological data and the means by which they are acquired
		To communicate and collaborate with biologists
		To understand and apply quantitative techniques from mathematics, physics and data science to biological phenomena
		To comprehend, express and present scientific data
		To understand and interpret model calculations

(A) Core Courses

Sr. No.	Name of the Course	Course code
1	Biology-1	10-LIFE05-001-C
2	Protein Structure	10-LIFE05-002-C
3	Mathematics and statistics for biologists	10-LIFE05-003-C
4	Physical Methods for Biologists	10-LIFE05-004-C

1	Biophysics of Macromolecular Structures	10-LIFE05-001-E
2	Simulation Techniques in Biology	10-LIFE05-002-E
3	Population Biology, Ecology and Evolution	10-LIFE05-003-E
4	Computational Neuroscience	10-LIFE05-004-E
5	Modeling of Infectious Diseases	10-LIFE05-005-E

Course Outcomes:

(A) Core Courses

Name of the Core Courses	Course code	Course Outcome
Biology-1	10-LIFE05-001-C	Learn basics of genetics, biochemistry, molecular biology and cell biology
		Learn about foundational experiments contributing to key developments in molecular biology over the last century
		Learn basics of developmental biology and molecular evolution
		Learn about biological systems where computational modelling has already made an impact
Protein Structure	10-LIFE05-002-C	Learn basics of biochemistry and protein structure (including globular, membrane proteins)
		Learn computational tools required to understand and address structural aspects of proteins
Mathematics and statistics for biologists	10-LIFE05-003-C	Learn to frame and solve simple problems in dynamics using differential equations, and understand some classic applications
		Learn basic concepts and applications of linear algebra
		Learn essentials of probability theory and statistics and applications to biological problems
		Have a basic competence in numerical methods, machine learning methods and tools, and related topics
Physical Methods for Biologists	10-LIFE05-004-C	Learn how to make biophysical estimates
		Learn about the random walk and diffusion, Ficks law and how to make related estimates
		Learn to make statistical mechanics calculations in biology, involving cooperativity, entropy and self-assembly
		Learn about biological polymers and their properties and perform force extension calculations
		Understand biological fluids, Reynolds number and the Stokes limit
Biology-2	10-LIFE05-005-C	Learn basics of DNA packaging, Chromatin structure and Epigenetics

		Learn basics of neuroscience, ecology and evolution
		Learn basic experimental techniques in biology
		Learn basics of intercellular communication, physiology, epidemiology and immunology
Biological sequence analysis	10-LIFE05-006-C	Have a basic understanding of computer science algorithms, especially related to strings and pattern-matching
		Understanding of sequence alignment algorithms, generative models, hidden Markov models
		Basic understanding of phylogenetics and related principles and algorithms
		Basics of next-generation-sequencing methods and analysis, including essential algorithms
		Ability to frame and implement algorithms for real-world bioinformatic tasks
Systems Biology	10-LIFE05-007-C	Understand the role of networks across different scales in biology
		Mathematically model the dynamics of simple networks of interacting biological entities
		Understand the basic physical mechanisms explaining how spatial patterns can emerge spontaneously
		Learn the functional role of waves in biology for transport, communication and coordination

(B) Elective Courses

Name of the Elective Courses	Course code	Course Outcome
Biophysics of Macromolecular Structures	10-LIFE05-001-E	Understand the basics of biological macromolecular structure and functions
		Understand different biophysical approaches for probing the biological macromolecular structures and the environment in which they function.
Simulation Techniques in Biology	10-LIFE05-002-E	Learn basic statistical mechanics tools for simulation methodologies probing different length and time scales
		Apply simulation technologies to understand protein structure and function in-silico

Population Biology, Ecology and Evolution	10-LIFE05-003-E	To understand the time evolution of single species population using different types of mathematical models
		Learn basic aspects of game theory to understand how cooperation can emerge
		To model trophic (predator-prey) interactions in multiple species communities
		To understand basic aspects of the mathematical theory of evolution through natural selection
Computational Neuroscience	10-LIFE05-004-E	Understand how information is processed by the nervous system
		Learn how neurons communicate with each other and with sensory, as well as, effector organs
		Derive the Hodgkin-Huxley model of action potential transmission along a nerve
		Able to simulate in computers the electrical activity in neurons and small neuronal networks
Modeling of Infectious Diseases	10-LIFE05-005-E	Understand disease, disease spread and modeling approaches
		Learn the basics of epidemiology and epidemiological methods
		Derive and solve ordinary dufferential equation based models of disease spreading
		Understand basic concepts of immunology

INTEGRATED Ph.D. (Dual Degree) MATHEMATICAL SCIENCES (Program Code: MATH05)

Course Outcomes:

Core subjects

Name of the Course	**Course code**	**Course Outcome**
ALGEBRA I	10MATH04-001-C	Understanding of basic group theory in the language of group actions
		Ability to apply linear algebra, in particular, canonical forms and spectral theory
		Understanding of basic category theory and tensor products
ALGEBRA II	10MATH04-002-C	Understanding the fundamentals of Galois theory
		Familiarity with semi simplicity and its applications
		Good understanding of the representation theory of finite groups
		Knowledge of basic commutative algebra
ANALYSIS I	10MATH04-003-C	Knowledge of measure theory
		Understanding of L^p spaces
		Familiarity with product measures and Fubini's theorem
		Understanding of the Radon-Nikodym theorem and the Lebesgue decomposition theorem
ANALYSIS II	10MATH04-004-C	Good understanding of the basic theorems of functional analysis
		Familiarity with various kinds of topologies on function spaces
		Knowledge of Banach algebras
		Understanding of basic Hilbert space theory and C^*-algebras

		Familiarity with applications of fundamental groups and homology groups
Topology II	10MATH04-006-C	Knowledge of advanced topics in homology theory
		Familiarity with cohomology theory and homotopy
		Understanding of basic notions of differential topology
		Knowledge of topics such as differential geometry, characteristic classes and Morse theory
Complex Analysis	10MATH04-007-C	Familiarity with analytic functions
		Knowledge of Cauchy's theorem, maximum modulus principle, Schwarz lemma
		Ability to apply conformal mappings and Mobius transformations
		Understanding of the Dirichlet problem and harmonic functions
Credit Seminar	10MATH04-008-C	Appreciation of current research in chosen sub-area
Research Methodology	10MATH04-009-C	An introduction to the methods and techniques of academic research through a project and presentations - both oral and written.

Electives

Name of the Course	Course Code	Course Outcome
TOPICS IN ANALYTIC NUMBER THEORY	10MATH04-001-E	Possibilities for topics are: introduction to arithmetic functions, convolution and Mobius inversion formula, basic asymptotic formulas for arithmetic functions, characters and Fourier analysis on finite abelian groups, theory of Dirichlet series, primes in arithmetic progression, Riemann zeta function, Poisson summation and functional equation, The prime number theorem, error term in prime number theorem, its oscillation and the Riemann hypothesis, equivalent formulations of Riemann hypothesis, zero-free regions, explicit formula and Siegel’s theorem, introduction to sieve methods, Brun and Selberg sieve, large sieve and the Bombieri-Vinogradov theorem and Vinogradov’s three prime Theorem.
TOPICS IN ALGEBRAIC NUMBER THEORY	10MATH04-002-E	Possibilities for topics are: Dedekind domains, ramification, different and discriminants, decomposition and inertia groups, quadratic fields and genus theory, classification of primitive quadratic characters, Gauss sums and quadratic reciprocity, geometry of numbers, finiteness of class number and explicit computations, regulators and Dirichlet’s unit theorem, cyclotomic fields and inverse Galois problem for abelian number fields, Artin symbol and splitting in cyclotomic fields, Dedekind zeta function, the analytic class number formula and introduction to the Chebotarev density theorem
TOPICS IN COMMUTATIVE ALGEBRA	10MATH04-003-E	One possibility is a course covering the second half of Matsumura’s text including topics such as: regular sequences, Koszul complex, Cohen-Macaulay rings, Gorenstein rings, regular rings, UFDs, complete intersections, local flatness criterion, generic freeness, derivations and differentials, separability, I-smoothness, Cohen’s structure theorems and applications of complete local rings.
TOPICS IN MODULAR FORMS	10MATH04-004-E	Possibilities include: Introduction to SL2(R) and its action on the Poincare upper half-plane H, discrete subgroups Γ of SL2(R) and their cusps, the modular group SL2(Z), Topology,

		measure theory and complex structure on H/Γ and its compactification, Modular functions, modular forms and cusp forms on SL2(Z), examples : Eisenstein Series and the delta Function, finite dimensionality of space of modular forms, the Miller basis and the Z-structure on the space of modular forms, growth of Fourier co-efficients of cusp forms, introduction to Ramanujan’s conjectures, theory of Hecke operators and Petersson inner-product on the space of cusp forms, application to Ramanujan’s conjectures, the L-function of modular forms, congruence subgroups, modular forms and cusp forms on congruence subgroups, spectral theory of automorphic forms, introduction to Galois representations and Deligne’s theorem, Lehmer’s conjecture and the Atkin-Serre Conjecture.
TOPICS IN ELLIPTIC CURVES	10MATH04-005-E	Possibilities for material to be covered include selected topics from Elliptic functions by Lang, The arith-metic of Elliptic curves by Silverman, Elliptic curves by Milne or Elliptic curves by Husemoller. Another possibility would be to prove Mazur’s theorem which is a well-known and important result covering elliptic curves and abelian varieties, and the moduli of elliptic curves.
TOPICS IN ALGEBRAIC CURVES	10MATH04-006-E	Possibilities for material to be covered include selected topics from An invitation to arithmetic geometry by Lorenzini, Algebraic Curves by Fulton or lectures notes of Joseph Oesterle. Topics such as the basics of algebraic varieties over the complex numbers (with focus on dimension 1), singularities of curves (what are they and when is a curve nonsingular), desingularization of curves by normalization, the relationship between nonsingular algebraic curves and complex manifolds of dimension 1, nonsingular projective algebraic curves and function fields, the Riemann-Roch theorem, and also some of its applications.
TOPICS IN DIOPHANTINE GEOMETRY	10MATH04-007-E	Some possibilities are: introduction to Global fields, absolute values on global fields, theory of heights, rational points on conics. local-global principle and application to quadratic forms, affine and projective varieties, morphisms and rational

		maps, explicit arithmetic on function fields and their zeta-functions, divisors on curves, The Riemann-Roch theorem, elliptic curves over global fields, endomorphism rings of Elliptic curves, CM and non-CM curves, ehe Mordell-Weil group and rank of an elliptic curve and local-global principle on elliptic curves and the Tate-Shaferevich group.
TOPICS IN TRANSCENDENTAL NUMBER THEORY	10MATH04-008-E	Possibilities are: Liouville's theorem and Liouville Numbers, elements of rational approximation, transcendence of e and π, irrationality of $\zeta(3)$, introduction to algebraic independence, Lindemann-Weierstrass theorem, Schanuel's conjecture and Ax's theorem for for-mal power series, the Schneider-Lang Theorem, Hilbert's seventh problem and the Gelfond-Schneider theorem, Baker's Theorem and applications, six exponential theorem, introduction to heights and Roth's Theorem, the padic Baker theorem (by Brumer) and introduction to Leopoldt's conjecture and the padic subspace theorem and applications.
TOPICS IN ALGEBRAIC GROUPS	10MATH04-009-E	One possibility is to cover the basic theory of linear algebraic groups over an algebraically closed field up to the classification of the reductive groups by means of root data, developing the necessary background from algebraic geometry as and when needed. Thus covering preliminaries from algebraic geometry, linear algebraic groups: definition and first properties, commutative algebraic groups, derivations, differentials, and Lie algebras, topological properties of morphisms applied to this context, Parabolic subgroups, Borel subgroups, and solvable subgroups, Weyl group, roots, and root datum and reductive groups and their classification: isomorphism and existence theorems.
TOPICS IN INFINITE DIMENSIONAL LIE ALGEBRAS	10MATH04-010-E	Some possibilities are: generalized Cartan matrices and their associated Lie algebras, symmetrizability, the invariant bilinear form, the Weyl group, classification of indecomposable GCMs, finite, affine and indefinite types, affine Kac-Moody algebras, roots, the affine Weyl group, realizations of untwisted and twisted affine Kac-Moody algebras in terms of loop algebras, representation theory: integrable

		representations, category O, proof of the Weyl-Kac character formula, highest weight integrable representations, weights, representations of affine Kac-Moody algebras.
TOPICS IN FUNCTIONAL ANALYSIS	10MATH04-011-E	Some possibilities are: analytic Fredholm theory, compact and Fredholm operators, Atkinson's theorem, Gelfand duality, properties of the analytic index, Toeplitz operators on Hardy spaces, Pseudo-differential operators and Elliptic regularity, Fourier transforms and Sobolev spaces on Rn, Symbol calculus and Pseudo-differential operators, Elliptic-ity and Pseudo-differential operators on smooth manifolds, construction of para-metrices, Elliptic regularity theorem, Ellipticity and Fredholm property of Dirac operators on closed manifolds.
TOPICS IN NON-COMMUTATIVE GEOMETRY	10MATH04-012-E	Some possibilities are: Vector bundles, K-theory for topological spaces, Serre Swan theorem, K0 and K1for a C*-algebra, homotopy invariance, split exactness, half-exactness, stability of K-theory, inductive limits and K-theory, Bott periodicity, Six term exact sequences, computations with them, Pimsner-Voiculescu exact sequence, Thom isomorphism, Hilbert C*-modules, KK groups, Geometric index theory, Vector bundles, connec-tions and curvature on Riemannian manifolds, structure equations of Cartan, invari-ant forms and characteristic classes in de Rham cohomology, Chern-Gauss-Bonnet theorem and idea of proof, topological index and statement of the Atiyah-Singer index theorem
TOPICS IN LIE GROUPS	10MATH04-013-E	Some possibilities are: Introduction to Lie algebras, definitions, examples, abelian, nilpotent, solvable lie algebras, semisimple lie algebras, representation of Lie algebras, structure of general Lie algebras over characteristic zero field : statement of the Levi decomposition, statement of Ado's theorem, Introduction to real differentiable manifolds, and various standard objects associated with it, statement of the Frobenius theorem on integrability, definition of real Lie groups, examples, associated Lie algebra, the exponential map and its properties, closed subgroup theorem, continuous homomorphisms, definition of Lie subgroups and

		examples, association of lie subgroups and lie subalgebras, covering Lie groups, simply connected lie groups and association with real Lie algebras, the adjoint representation, the manifold structure of the left or right coset space with respect to a closed subgroup and the (subgroup)-principal bundle structure of the Lie group with respect to the projection to the coset space, Construction of left invariant Haar measure using left invariant differential forms, formula for modular function, compact Lie groups, Peter-Weyl theorem, embedding compact groups in linear Lie groups, Weyl group, conjugacy of maximal tori in connected compact Lie groups, Centralizers of tori, basic structure of semisimple Lie groups, existence of compact real forms of complex semi-simple Lie algebras, Cartan decomposition both at the Lie algebra and Lie group level, Iwasawa decomposition.
TOPICS IN ALGEBRAIC GEOMETRY	10MATH04-014-E	One possibility is an introduction to the language of schemes, properties of morphisms, and sheaf co-homology. So that the students gain an understanding of the basic notions and techniques of modern algebraic geometry.
TOPICS IN DIFFERENTIAL GEOMETRY	10MATH04-015-E	Some possibilities are: Definition of smooth manifolds, atlas, examples, tangent spaces, inverse and im-plicit functon theorems for manifolds, vector fields, flow, completeness of the flow function, integrability and Frobenius theorem, differential forms, pullback by func-tions, exterior derivative, orientations, manifolds with boundary, Stokes theorem, DeRham cohomology, computations using Mayer Vietoris, Riemannian metrics and geodesics.
TOPICS IN PARTIAL DIFFERENTIAL EQUATIONS	10MATH04-016-E	Some possibilities are: Examples of partial differential equations, Strategies for studying PDE., Well posed problem, Brief introduction to classical solutions, weak solution and regularity, Transport equation, Laplace's equation, Heat equation and wave equation, Problems associated to these equations, notion of fundamental solution etc., Non-linear first order PDE, Hamilton Jacobi equations, calculus of variations, Hamilton's ode, Legendre transforms, etc., Theory of linear partial differential

		equations: Sobolev spaces, weak derivative, Sobolev inequalities, Elliptic equations, Weak solutions, the existence of weak solutions, regularity, maximum principles, eigenvalues and eigenfunctions of elliptic operators, compactness, etc.
TOPICS IN MATHEMATICAL PHYSICS	10MATH04-017-E	One possibility is to cover classical and quantum mechanics covering topics such as: review of Galilean group, mechanical system with one degree of freedom, mechanical system consisting of motion of a point in three dimensional space and motion of system of n points, review of calculus of variation, Lagrange's equation, Hamilton's equations, Liouville's theorem, Symplectic structures on phase spaces and Noether's theorem, D'Alembert's principle, Symplectic manifolds, Hamiltonian mechanics on symplectic manifolds, moment map, postulates of quantum mechanics, mathematical aspects of Schrödinger's equation, review of Lie group, Lie algebra and their representations with main focus on groups like U(1), SO(3), SU(2), Spin groups in 3 and 4 dimensions, Spin 1/2 particle in magnetic field, review of Fourier transforms, position and momentum space, Dirac notation, Heisenberg's uncertainty principle, Hydrogen atom, quantization, canonical quantization, The Groenewold-van Hove no-go theorem, canonical quantization in n–dimensions, quantization and symmetries.
TOPICS IN ALGEBRA	10MATH04-018-E	One possibility is a course in commutative algebra covering prime ideals and maximal ideals, nilradical and jacobson radical, prime avoidance and the Chinese remainder theorem, extension and contraction of ideals, modules, submodules and quotient modules, direct sum and direct product, finitely generated modules and Nakayama lemma, exact sequences, tensor products, restriction and extension of scalars, exactness properties of the tensor product, algebras, tensor product of algebras, localization, local properties, extended and contracted ideals in rings of fractions, primary decomposition,

		integral extensions, lying over, going-up theorems, integrally closed domains and the going-down theorem, valuation rings, Noetherian and Artinian modules, Noetherian rings, Hilbert basis theorem, primary decomposition in Noetherian rings, Artinian rings and their structure, discrete valuation rings and Dedekind domains, fractional ideals, completions, filtrations, topologies, and completions, graded rings and modules, associated graded ring, dimension theory, Hilbert functions, dimension theory of Noetherian local rings, regular local rings, transcendental dimension, relation to algebraic varieties and algebraic geometry.
TOPICS IN OPERATOR ALGEBRAS	10MATH04-019-E	Some possibilities are: Banach algebras, spectrum, spectral radius formula, C*-algebras, Gelfand Naimark theorem, continuous functional calculus, GNS construction, positivity, measurable functional calculus, von Neumann algebras, Kaplansky density theorem, double commutant theorem, finite-dimensional C*-algebras, representation theory of the C*-algebra of compact operators, Toeplitz algebra, Coburn's theorem, group C*-algebras, crossed products, amenability, groupoid C*-algebras.
TOPICS IN REPRESENTATION THEORY	10MATH04-020-E	Some possibilities are: Lie algebras: definition and basic properties, ideals, subalgebras, homomorphisms, nilpotent and solvable Lie algebras, Lie's and Engel's theorems, semisimple Lie algebras, the Killing form, Cartan's criterion, abstract Jordan decomposition, classification of finite dimensional semisimple Lie algebras, Dynkin diagrams, the Weyl group, isomorphism and conjugacy theorems, representations, Verma modules, category O, irreducible highest weight modules, complete reducibility, Weyl character formula, Freudenthal weight multiplicity formula, Kostant and Steinberg formulas.
TOPICS IN ALGEBRAIC COMBINATORICS	10MATH04-021-E	Some possibilities are: Partially ordered sets and Mobius inversion, generating functions, permutations and statistics, Robinson-Schensted correspondence, partitions, Young's lattice, hook-length formula, Representation theory of symmetric groups, similarity classes of

		matrices and orthogonal polynomials.
TOPICS IN TOPOLOGY	10MATH04-022-E	Definitions and basic construction of homotopy groups, Whitehead's theorem, Hurewicz's theorem, stable homotopy groups, fibrations and obstruction theory, Bott's periodicity theorem, H-cobordism theorem, construction and applications of characteristic classes.
TOPICS IN SYMPLECTIC GEOMETRY	10MATH04-023-E	Possibilities include: Motivations of sympletic Geometry from Hamiltonian mechanics, neighbourhood theorems, compatible almost complex structure, and the contractibility of the space of almost complex structures, integrability of almost complex structures, Newlander-Nirenberg theorem, Hamiltonian circle actions on symplectic manifolds, moment maps, Fubini-Studi form on projective space, Kähler forms as Hessians of plurisubharmonic function on complex manifolds, introduction to pseudoholomorphic curves, outline of proof of Gromov's non-squeezing theorem.
PROGRAMMING FOR MATHEMATICIANS	10MATH04-024-E	Some possibilities are: Basic python syntax, Iterables and generators, Object oriented programming, introduction to Sage, the Numpy library, the Networkx library, graphics with Sage and Matplotlib and a Programming project.

BACK TO MAIN

INTEGRATED Ph.D. in PHYSICAL SCIENCES (Program Code: PHYS05)

I. Courses at HRI

Program Code : PHYS05	Programme Specific Outcome	Understanding and knowledge of physics in the classical and quantum domain.
		Understanding of mathematical methods in their applications in diverse settings.
		Understanding and application of statistical methods in physics
		Provide exposure to various specialised areas such as condensed matter, atomic physics, particle physics, astrophysics, and quantum information.
		Learning many body techniques as well as quantum field theoretic methods and applying them to solve problems.

Course Outcomes:

(A) Core Courses

SEMISTER I

Name of the Course	Course code	Course Outcome
Classical Mechanics	08PHYS05-001-C	Acquiring knowledge of Lagrangian and Hamiltonian formulations of classical dynamics.
		Acquiring knowledge of basic concepts of classical mechanics such as general theory of conservation laws, phase space and Poisson brackets.
		Understanding the theory of rigid body motion.
		Acquiring knowledge of applications such as the central force problem, small oscillations, non-linear dynamics.
Quantum Mechanics I	08PHYS05-002-C	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.

		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.
		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Electrodynamics	08PHYS05-003-C	Acquiring knowledge of special theory of relativity and its role in electromagnetism.
		Acquiring knowledge of electrostatics and magnetostatics.
		Acquiring knowledge of the theory of electromagnetic radiation.
		Acquiring knowledge of scattering of electromagnetic waves.
Mathematical Methods I	08PHYS05-004-C	Acquiring knowledge of vector spaces and it applications to various physical problems.
		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Laboratory I	08PHYS05-005-C	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment

SEMISTER II

Name of the Course	Course code	Course Outcome
Numerical Methods	08PHYS05-006-C	Ability to write codes using programming languages: F77, F90 or C.
		Acquiring knowledge of numerical linear algebra, interpolation techniques, generation and use of random numbers.

		Acquiring knowledge of numerical differentiation and integration (including Monte Carlo techniques).
		Acquiring knowledge of numerical methods to treat ODEs and PDEs: including FFT and finite difference methods, integral equations
Quantum Mechanics II	08PHYS05-007-C	Understanding of the theory and applications of scattering in quantum mechanics.
		Acquiring knowledge of the method of path integrals in quantum mechanics.
		Acquiring knowledge of the concept of entanglement in quantum mechanics and it applications such as Bell's inequalities.
		Acquiring knowledge of relativistic quantum mechanics and its applications.
Statistical Mechanics	08PHYS05-008-C	Acquiring knowledge of basics concepts such as phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Electronics	08PHYS05-009-C	Acquiring basic knowledge of circuit theory: lumped circuit approximation, circuit elements, Kirchoff's current and voltage laws, resistive networks.
		Acquiring knowledge of basics of analog electronics, including that of diodes and LEDs.
		Acquiring knowledge basic knowledge of amplifiers.
		Acquiring knowledge of the basics digital electronics: logic gates, truth table,

		multiplexer, combinatorial circuits, flip-flop, and microprocessors.
Laboratory II	08PHYS05-010-C	Laboratory Experience with Coupled Oscillator Circuits:
		Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
		Laboratory Experience with Flip-flops and Microcontrollers.

SEMISTER III

Name of the Course	Course code	Course Outcome
Condensed Matter I	08PHYS05-011-C	Understanding of the basic building blocks of matter and methods to probe structure of materials.
		Acquiring knowledge of the physics of metals.
		Acquiring knowledge of the physics of phonons.
		Acquiring knowledge of the physics of superconductors.
		Acquiring knowledge of the physics of magnetism.
Quantum Mechanics III	08PHYS05-012-C	Acquiring knowledge of the basics of atomic spectra in single electron atoms.
		Acquiring knowledge of atomic spectra in many electron atoms and molecules.
		Acquiring knowledge of the interaction of light and matter.
		Understanding of the basic theory involved in the study of cold atoms.
Quantum Field Theory I	08PHYS05-013-C	Acquiring knowledge of the method of second quantization for the study of many particle non-relativistic systems.
		Acquiring knowledge of the Lorentz group and its role in relativistic quantum field theory.
		Acquiring knowledge of the quantization of the Klein Gordon, Dirac and Maxwell fields.
		Acquiring knowledge of the basics of quantum electrodynamics and the study of various processes at tree level.

		Understanding of the role of gauge invariance in quantum electrodynamics.
Mathematical Methods II	08PHYS05-014-C	Ability to analyse phenomena using Fourier and Laplace transformation
		Ability to construct and solve higher order differential equation
		Understanding to apply Laplace and Poisson equation to electrostatics, Heat equation, Wave equation
		Understanding Group theory concepts and its application in Lie algebras
Elective I	08PHYS05-015-C	Application of Advanced Statistical Mechanics/ Fluid Dynamics/General Theory of Relativity/Techniques in Nonlinear Dynamics/Quantum Information and Computation I. in solving the problems related to the study.

SEMISTER IV

Name of the Course	Course code	Course Outcome
Particle Physics	08PHYS05-016-C	Understanding physics of elementary particles.
		Learning about fundamental interactions in terms of gauge principle.
		Acquiring skills to carry out computation in Strong, Weak and Electromagnetic theory.
		Learning various techniques useful for particle physics phenomenology.
		Learning methods to compute physical observables which can tested in the laboratory.
Elective II	08PHYS05-017-C	Application of Advanced Statistical Mechanics/ Fluid Dynamics/General Theory of Relativity/Techniques in Nonlinear Dynamics/Quantum Information and Computation I. in solving the problems related to the study.
Elective III	08PHYS05-018-C	Application of Advanced Statistical Mechanics/ Fluid Dynamics/General Theory of Relativity/Techniques in Nonlinear Dynamics/Quantum Information and Computation I. in solving the problems related to the study.
Project	08PHYS05-019-C	Ability to formulate a research problem
		Developing scientific skills to solve the problem

		Acquiring knowledge to interpret, discuss and communicate scientific results in written and oral form
Laboratory III	08PHYS05-020-C	Learning about the magnetic phase transition
		Learning Raman spectroscopy using lasers.
		Carry out the experiments with radioactive samples using the GM counter and gamma-ray spectrometer.
		Studying the Bragg diffraction using microwaves, and measuring the speed of light using laser source.
		Studying the Hall effect, Electron spin resonance, and measuring earth's magnetic field using NMR.

(B) Electives I (choose any one)

Name of the Course	Course code	Course Outcome
Advanced Statistical Mechanics	08PHYS05-001-E	Acquiring knowledge of the basics of Critical phenomena.
		Understanding of the notion of Renormalization in statistical mechanics.
		Understanding of the basics of Equilibrium dynamics: Conserved and broken symmetry variables, Hydrodynamic approach, Dynamical critical phenomena.
		Acquiring basic knowledge of Non-equilibrium phenomena and stochastic thermodynamics.
Fluid Mechanics	08PHYS05-002-E	Acquiring knowledge of the basic concepts in the study of ideal fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity.
		Study of viscous fluids.
		Acquiring knowledge of the basic topics in the theory of turbulence.
		Understanding of Thermal Conduction in fluids.
		Acquiring basic knowledge of Relativistic Fluid dynamics.
General Relativity	08PHYS05-003-E	Acquiring basic knowledge of differential geometry.
		Understanding of the equivalence principle and its applications.

		Acquiring knowledge of Einstein equation
		Acquiring knowledge of Schwarzschild solution along with applications.
		Acquiring knowledge of the theory of gravitational waves.
		Acquiring knowledge of the basics of Friedman-Robertson-Walker cosmology.
Non-linear Dynamics	08PHYS05-004-E	Acquiring knowledge of long time behavior of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
		Acquiring knowledge of the nature of orbits for conservative and non-conservative systems.
		Understanding of maps, fixed points, cycles and stability, bifurcations.
		Basic understanding of chaos.
		Understanding of different kinds of perturbation theory for calculating orbits.
Quantum Information and Computation I.	08PHYS05-005-E	Understanding of the concept of entanglement: quantification and detection in bipartite and multipartite systems.
		Acquiring knowledge of the basics of quantum communication.
		Acquiring knowledge of the basics of quantum cryptography and quantum computation.
		Acquiring knowledge of the basics of the interface of quantum information with other sciences and experimental realizations.

(C) Electives II & III (choose any two)

Name of the Course	Course code	Course Outcome
Astrophysics	08PHYS05-006-E	Learning about magneto hydrodynamics with applications to Astrophysical systems.
		Study of stellar structure and developing detailed understanding of structure of stars.
		Developing understanding of the models of galaxies.
		Acquiring knowledge of the accretion of matter due to a point mass.

		Developing introductory understanding of cosmology.
Condensed Matter Physics II	08PHYS05-007-E	Learning the skill to study low dimensional systems.
		Understanding theories which describe charge transport in mesoscopic systems.
		Acquiring knowledge of the electronic structure in low dimensional systems.
		Learning about the effects of phonons in metals and dielectric properties of insulators.
		Acquiring knowledge of correlated electron systems.
		Learning about the Mott transition, the Kondo systems, Superconductivity and magnetism.
		Learning formalism necessary to study Quantum Hall systems, quantum wires and dots.
Cosmology	08PHYS05-008-E	Learning about the cosmological model, the cosmological constant and the dark matter.
		Developing the understanding of the thermal history of the universe and its imprints on CMB.
		Understanding the horizon problem and its resolution by inflation.
		Acquiring the knowledge of the theory of cosmological perturbations.
		Studying the implications of the cosmological perturbation on the structure formation.
Introduction to Electronic Structure	08PHYS05-009-E	Acquiring the knowledge of the first principle computation, methods like the H-F approximation.
		Learning the Density Functional theory, and various approximations within the formulation
		Learning the pseudo potential method and its applications.
		Application of these methods to study the band structure of various materials.
Quantum Field Theory II	08PHYS05-010-E	Understanding the Path Integral formulation of quantum field theory.
		Acquiring the knowledge of the regularisation methods and the renormalisation.

		Developing the understanding of spontaneous symmetry breaking and its implications
		Learning the non-abelian gauge theories and their quantisation.
		Learning the renormalisation of the non-abelian gauge theories both in the symmetric and symmetry broken phase
Quantum Information and Computation II	08PHYS05-011-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.
		Acquiring the knowledge of the entanglement theory, and quantum correlations.
Quantum Optics	08PHYS05-012-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.
Soft Matter	08PHYS05-013-E	Learning about what scales are involved in soft matter.
		Studying the phase transition using various techniques.
		Understanding the colloidal systems.
		Developing the intuition about polymers and membranes.
		Learning about the experimental methods.
Ultra Cold Atoms	08PHYS05-014-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.

		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.

SEMISTER V

(A) Core Courses

Name of the Course	Course code	Course Outcome
Quantum Field Theory I	08PHYS05-021-C	Acquiring knowledge of the method of second quantization for the study of many particle non-relativistic systems.
		Acquiring knowledge of the Lorentz group and its role in relativistic quantum field theory.
		Acquiring knowledge of the quantization of the Klein Gordon, Dirac and Maxwell fields.
		Acquiring knowledge of the basics of quantum electrodynamics and the study of various processes at tree level.
		Understanding of the role of gauge invariance in quantum electrodynamics.
Mathematical Methods II	08PHYS05-022-C	Ability to analyse phenomena using Fourier and Laplace transformation
		Ability to construct and solve higher order differential equation
		Understanding to apply Laplace and Poisson equation to electrostatics, Heat equation, Wave equation
		Understanding Group theory concepts and its application in Lie algebras
Project	08PHYS05-023-C	Ability to formulate a research problem
		Developing scientific skills to solve the problem
		Acquiring knowledge to interpret, discuss and communicate scientific results in written and oral form

(B) Electives

Name of the Course	Course code	Course Outcome
Fluid Mechanics	08PHYS05-015-E	Acquiring knowledge of the basic concepts in the study of ideal fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity.
		Study of viscous fluids.

		Acquiring knowledge of the basic topics in the theory of turbulence.
		Understanding of Thermal Conduction in fluids.
		Acquiring basic knowledge of Relativistic Fluid dynamics
General Theory of Relativity	08PHYS05-016-E	Acquiring basic knowledge of differential geometry.
		Understanding of the equivalence principle and its applications.
		Acquiring knowledge of Einstein equation,
		Acquiring knowledge of Schwarzschild solution along with applications.
		Acquiring knowledge of the theory of gravitational waves.
		Acquiring knowledge of the basics of Friedman-Robertson-Walker cosmology.
Nonlinear Dynamics	08PHYS05-017-E	Acquiring knowledge of long time behavior of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
		Acquiring knowledge of the nature of orbits for conservative and non-conservative systems.
		Understanding of different kinds of perturbation theory for calculating orbits
		Understanding of maps, fixed points, cycles and stability, bifurcations.
		Basic understanding of chaos.
Quantum Information and Computation I	08PHYS05-018-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Acquiring the knowledge of the entanglement theory, and quantum correlations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.
Quantum Mechanics III	08PHYS05-019-E	Acquiring knowledge of the basics of atomic spectra in single electron atoms.
		Acquiring knowledge of atomic spectra in many electron atoms and molecules.

		Acquiring knowledge of the interaction of light and matter.
		Understanding of the basic theory involved in the study of cold atoms.
		Acquiring knowledge of the basics of atomic spectra in single electron atoms.
		Acquiring knowledge of atomic spectra in many electron atoms and molecules.

SEMISTER VI

(A) Core Courses

Name of the Course	Course code	Course Outcome
Statistical Mechanics	08PHYS05-024-C	Acquiring knowledge of basics concepts such as phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Research Methodology and Numerical Methods	08PHYS05-025-C	Acquiring knowledge of research Methodology including quantitative methods, communication skills, seminar presentation and review of research papers.
		Introduction to programming languages: F77, F90 or C.
		Acquiring knowledge of numerical linear algebra, interpolation techniques, generation and use of random numbers.
		Acquiring knowledge of numerical differentiation and integration (including Monte Carlo techniques).
		Acquiring knowledge of numerical methods to treat ODEs and PDEs:

		including FFT and finite difference methods, integral equations.

(B) Electives

Name of the Course	Course code	Course Outcome
Astrophysics	08PHYS05-020-E	Learning about magnetohydrodynamics with applications to Astrophysical systems.
		Study of stellar structure and developing detailed understanding of structure of stars.
		Developing understanding of the models of galaxies.
		Acquiring knowledge of the accretion of matter due to a point mass.
		Developing introductory understanding of cosmology.
Condensed Matter Physics II	08PHYS05-021-E	Learning the skill to study low dimensional systems.
		Understanding theories which describe charge transport in mesoscopic systems.
		Acquiring knowledge of the electronic structure in low dimensional systems.
		Learning about the effects of phonons in metals and dielectric properties of insulators.
		Learning formalism necessary to study Quantum Hall systems, quantum wires and dots.
		Acquiring knowledge of correlated electron systems.
		Learning about the Mott transition, the Kondo systems, Superconductivity and magnetism.
Cosmology	08PHYS05-022-E	Learning about the cosmological model, the cosmological constant and the dark matter.
		Developing the understanding of the thermal history of the universe and its imprints on CMB.
		Understanding the horizon problem and its resolution by inflation.
		Acquiring the knowledge of the theory of cosmological perturbations.
		Studying the implications of the cosmological perturbation on the structure formation.

Introduction to Electronic Structure Calculations	08PHYS05-023-E	Acquiring the knowledge of the first principle computation, methods like the H-F approximation.
		Learning the Density Functional theory, and various approximations within the formulation.
		Learning the pseudo potential method and its applications.
		Application of these methods to study the band structure of various materials.
Particle Physics	08PHYS05-024-E	Understanding physics of elementary particles.
		Learning about fundamental interactions in terms of gauge principle.
		Acquiring skills to carry out computation in Strong, Weak and Electromagnetic theory.
		Learning various techniques useful for particle physics phenomenology.
		Learning methods to compute physical observables which can tested in the laboratory
Quantum Field Theory II	08PHYS05-025-E	Understanding the Path Integral formulation of quantum field theory.
		Acquiring the knowledge of the regularisation methods and the renormalisation.
		Developing the understanding of spontaneous symmetry breaking and its implications.
		Learning the non-abelian gauge theories and their quantisation.
		Learning the renormalisation of the non-abelian gauge theories both in the symmetric and symmetry broken phase.
Quantum Information and Computation II	08PHYS05-026-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Acquiring the knowledge of the entanglement theory, and quantum correlations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.

Quantum Optics	08PHYS05-027-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.
Soft Matter	08PHYS05-028-E	Learning about what scales are involved in soft matter.
		Studying the phase transition using various techniques.
		Understanding the colloidal systems.
		Developing the intuition about polymers and membranes.
		Learning about the experimental methods.
Ultra cold Atoms	08PHYS05-029-E	Learning about the scales involved in the system.
		Understanding the experimental background, like trapping, optical lattices, Feshbach resonance, etc.
		Using many body methods to study phase transition, perturbation theory.
		Learning about the Bose condensation and its theoretical aspects.
		Developing the understanding of the BCS instability in sermonic system.
		Studying the quantum spin systems.

II. Courses at IMSc

Program Code : PHYS05	Programme Specific Outcome	Physics at IMSc need to do 1st two semesters of course work in standard Master Degree level courses in Classical Mechanics, Quantum Mechanics I & II, Classical Electromagnetism, Mathematical Methods, Statistical Mechanics, Classical Field Theory, and Condensed Matter Physics I.
		The 3rd and 4th semester courses for Integrated Ph.D. students in IMSc are respectively same as the 1st and 2nd semester courses for the Ph.D. students in Physics at IMSc.
		In their 3rd semester, the students are being taught advanced level courses (aiming to take up research problems) in Statistical Mechanics, Mathematical Methods, as well as introductory courses on Particle Physics and Quantum Field Theory (which includes a part on Many-Body Field Theory, used for advanced courses in Condensed Matter Physics).
		In their 4th semester, the students need to credit two research-level courses either in High Energy Physics (Quantum Field Theory II, Cosmology and Gravitation, Particle Physics II) or in Low Energy Physics (Advanced Condensed Matter Physics, Non- linear Dynamics, Quantum Information and Computation, Statistical Field Theory) as well as a research project, which is, generally taken up by the student towards pursuing his/her Ph.D. research work here at IMSc.
		The students do have the freedom to shift their choice of topics for Ph.D. even if they do their 4th semester courses entirely in High Energy Physics or Low Energy Physics – provided the students are confident enough and they can find suitable Ph.D. guides at IMSc in that directions.

(A) Semester I:

Sr. No.	Name of the Course	Course code
1	Classical Mechanics	11

2	Quantum Mechanics I	12
3	Electromagnetic Theory	13
4	Mathematical methods	14

(B) Semester II:

Sr. No.	Name of the Course	Course code
1	Quantum Mechanics II	21
2	Classical Field Theory	22
3	Condensed Matter Physics I	23
4	Statistical Mechanics	24

(C) Semester III:

Sr. No.	Name of the Course	Course code
1	Quantum Field Theory I	31
2	Mathematical Methods II	32
3	Statistical Mechanics II	33
4	Particle Physics I	34

(D) Semester III:

1. High Energy Physics (HEP):

Sr. No.	Name of the Course	Course code
1	Quantum Field Theory II	41
2	Cosmology-and-Gravitation Or Particle Physics	42a 42b

2. Low Energy Physics (LEP):

Sr. No.	Name of the Course	Course code
1	Advanced Condensed Matter Physics	43
2	Nonlinear Dynamics Or Quantum Information-and-Computation Or Statistical Field Theory	44a 44b 44c

Course Outcomes:

(A) Semester I

Name of the Course	Course code	Course Outcome
Classical Mechanics	11	After successfully completing the course, the students should have mastery over Lagrangian and Hamiltonian formulations, Hamilton-Jacobi formalism, methods of dealing with constrained classical systems, canonical transformations, symmetries in the classical world, relativistic mechanics, rudiments of non-linear dynamics.
		The students should acquire the knowledge of dealing with generic dynamical systems (be it classical or quantum) using the language of Lagrangian and Hamiltonian.
		Students should develop analytical as well as numerical powers to solve problems in Mechanics – both for theoretical purpose as well as for problems of practical interests.
Quantum Mechanics I	12	Students should learn and internalize the formalism required to describe principles of Quantum Mechanics: Hilbert space formalism involving states, observables, dynamics, and measurement.
		After internalizing and maneuvering principles of Quantum Mechanics, the students should master the techniques of solving exactly (and thereafter, approximately) one, two, and three dimensional potential problems.
		They should also learn how to deal with different symmetries.
Electromagnetic Theory	13	Techniques of Electrostatics and Magnetostatics should be learnt properly.
		Students should learn, understand, and internalize Mawell's equations, their interpretations, and applications, particularly in Radiation Theory, Antenna Theory, etc.
		Students should also learn the four-vector formalism to treat Maxwell's equations in terms of Electromagnetic field.
Mathematical methods	14	Students should learn the theory of Complex Analysis as well as its applications in different problems in Physics.
		Students should develop mastery over different aspects of Linear Algebra and its applications in different branches of Physics.
		Students should develop adequate working

		knowledge (together with thorow knowledge in the corresponding theory) in solutions of ordinary differential and integral equations, different integral transforms, etc.

(B) Semester II

Name of the Course	Course code	Course Outcome
Quantum Mechanics II	21	Students should learn and thereby apply the method of second quantization – required to treat system of indistinguishable particles – while dealing with many-body quantum systems.
		WKB approximation, various variation methods, etc. Should be learnt and internalized by the students. Moreover, the students should develop clear idea about rudiments of scattering in the quantum world.
		Students should develop mastery over Path Integral Approach to Quantum Mechanics and its applications.
		Students should also develop skills to deal with the phase-space description of Quantum Mechanical systems – particularly useful to deal with the continuous-variable case.
Classical Field Theory	22	Students should develop working level understanding (together with thorough knowledge in its theoretical part also) in Continuum Mechanics, Hydrodynamics, Electrodynamics, Gravitation, and Landau-Ginzburg theory.
		The idea behind teaching this course is to bring together different classical fields into one platform.
Condensed Matter Physics I	23	Students should develop concrete ideas about length, time, and energy scales while dealing with many-body systems – both soft and hard condensed matter.
		Particularly, the students should develop mastery over different properties of crystals, electronic properties of many- body systems, lattice vibrations, rudiments of semi-conductor physics, optical properties of different materials, the notion of super-fluidity and different magnetism properties.
Statistical Mechanics	24	Students should develop thorough knowledge in fundamental principles of Statistical Mechanics: Probability Theory, Ergodicity, Mixing, etc.
		Students should have prior familiarity with

		the laws of Thermodynamics, so that they can apply their knowledge of Statistical Mechanics of the present course to derive different laws of Thermodynamics.
		The notion of Gibbs distribution should be thoroughly understood and internalized.
		Students should also develop clear understanding regarding how to deal with system of non-interacting/interacting particles.

(C) Semester III:

Name of the Course	Course code	Course Outcome
Quantum Field Theory I	31	Students should develop a mastery over elementary processes in Quantum Electrodynamics (QED): electron-positron annihilation, Compton scattering, Bhabha scattering, etc.
		Students should learn and internalize different radiative corrections for scalar field theory. They also learn techniques of scalar field quantization, as well as the techniques of dealing with non-interacting electrons from field theoretic perspectives.
		In the remaining one-third of the QFT-I course, LSZ formalism, Path integral formalism, and renormalization techniques are being taught for HEP-oriented students in order that they can use these techniques for their research in HEP.
		Similarly, in the other remaining one-third of the QFT-I course, operator techniques of second quantization, Kubo formula, system of interacting bosons, techniques mean- field theory, etc. Are being taught for LEP- oriented students in order that they can use these techniques for their research in LEP.
Mathematical Methods II	32	Students are supposed to learn and thereby apply different numerical techniques : interpolation methods, numerical solutions of ordinary and partial differential equations, Monte-Carlo method, numerical optimization, numerical techniques of dealing with fast Fourier transforms, etc.
		Students should develop a thorough working knowledge (together with the corresponding theoretical development) in the representation theories of discrete as well as continuous groups used in Classical and Quantum Mechanics.

		Students should develop working knowledge (as well as theoretical understanding) in topics of advanced Complex Analysis: analytic continuation, branch cuts, Riemann surfaces, conformal mapping, etc.
		Students should develop working knowledge in rudiments of Probability Theory.
Statistical Mechanics II	33	Students should develop a working knowledge about critical phenomena: scaling hypothesis, self-similarity, and fractals. Moreover, they should develop a thorough knowledge regarding criticality in spin systems, classical field theory, etc.
		Students should understand, internalize, and thereby, apply techniques of renormalization group – including both perturbative as well as non-perturbative cases.
		Students should develop a very good understanding about broken symmetry, how deal with disorders in systems, and dynamics of fluctuations (including the fluctuation-dissipation theorem).
Particle Physics I	34	Students should develop a thorow knowledge on standard model in Particle Physics, including symmetries & quarks, Parton model & QCD, etc.
		Moreover, students should develop concrete ideas about different decay processes, V-A theory of weak interactions, CP violation, etc.
		They should have a very good working knowledge in the unification of electromagnetic and weak interactions.
		Working knowledge about neutrinos.

(D) Semester IV:

1. **Electives- HEP**

Name of the Course	Course code	Course Outcome
Quantum Field Theory II	41	This advanced-level course in Quantum Field Theory (QFT) aims at training the students to the extent where they can initiate some research project in High Energy Physics.
		In this course, students are supposed to develope working expertise in topics like: functional methods in QFT, funtional integral quantization of non-Abelian gauge fields, applications of renormalization group, anomalies in abelian as well as non-abelian gauge theories, etc.
Cosmology and Gravitation	42a	This advanced-level course in Cosmology & Gravitation aims at training the students to the extent where they can initiate some research project in Astrophysics, Cosmology, etc.
		In this course, students are supposed to develope working expertise in topics like: Einstein's field equations and their different solutions, Hamiltonian formulation of Gravity, Cosmology, singularity theorems, etc.
Particle Physics-II	42b	This advanced-level course in Particle Physics aims at training the students to the extent where they can initiate some research project in Particle Physics.
		In this course, students are supposed to develope working expertise in topics like: basics of the Standard Model, Electroweak interaction, Quantum Chromodynamics, Neutrino Physics, CP violation, Supersymmetry, Grand unified theory, etc.

2. **Electives- LEP**

Name of the Course	Course code	Course Outcome
Advanced Condensed Matter Physics	43	This advanced-level course in Condensed Matter Physics aims at training the students to the extent where they can initiate some research project in Hard/Soft Condensed Matter Physics.
		In this course, students are supposed to develope working expertise in: Correlated Electron Physics and Soft Condensed Matter Physics.

Nonlinear Dynamics	44a	This advanced-level course in Nonlinear Dynamics (NLD) aims at training the students to the extent where they can initiate some research project in different branches of Physics where Nonlinear Dynamics plays a vital role – apart from Nonlinear Dynamics itself. In this course, students are supposed to develope working expertise in: Hamiltonian formulation of NLD, Deterministic NLD, Integrability of Hamiltonian Dynamics, Chaos, Semiclassical Analysis of NLD, Quantum Aspects of NLD, etc.
Quantum Information-and-Computation	44b	This advanced-level course aims at training the students to the extent where they can initiate some research project in different branches of Physics where Information Theory plays a vital role – apart from Quantum Information & Computation itself. In this course, students are supposed to develope working expertise in: Entanglement Theory and its applications, Shannon's Theory of Classical Information & its Quantum generalizations, Quantum Cryptography, Quantum Computation, physical implementaions, etc.
Statistical Field Theory	44c	This advanced-level course aims at training the students to the extent where they can initiate some research project in Statistical Mechanics or its applications in fields like Condensed Matter Physics, Particle Physics, etc. In this course, students are supposed to develope working expertise in: Bose-Einstein condensation, Fermions, diagrammatic techniques, self-coupled scaler field theory, Yukawa theory, spontaneous symmetry breaking & Higgs model of Quantum Chromodynamics, deconfinement phase transition, Salam-Weinberg model and symmetry restoration, early universe, nuclear matter & pion condensation, neutron stras, etc.

III. Courses at NISER

Program Code : PHYS05	Programme Specific Outcome	Doctoral program at School of Physical Sciences, NISER, in general, leads to critical thinking, effective scientific communication, scientific ethics, social interactions and ability to solve complex problems in nature.
		The Core courses of the program provide comprehensive grounding in all the basic areas of Physics which consolidate student understanding and provide foundation for future research. This set of courses which aim both at recapitulation of known concepts and an emphasis on advanced problem solving techniques help to bring students from diverse kinds of training at the Master's level up to the uniform high standards required at NISER. The Comprehensive exam at the end of the course work makes sure that students are well prepared to start their research.
		Elective courses provide advanced knowledge of specialized topics which broaden student horizon. Research projects under the guidance of faculty members give students exposure to current research areas in the department. By the end of the first year students have a clear idea of the research they want to do based on the elective courses and the projects they have done.
		Students work under our experienced faculty and use world class research labs and computational facilities to do their doctoral work. They are trained to identify, formulate and execute projects based on important problems in their chosen research field. An active group of postdoctoral fellows and several national and international collaborations are available for students to develop collaborative skills and mature into independent researchers. Most students are expected to have published work in good quality journals to get a PhD degree.
		A doctoral committee (monitoring committee in the first year) constantly monitors student progress. Students are required to give annual talks on the progress made by them in the previous year. This gives them training in

		giving academic talks and they also get regular feedback on their progress.
		Regular seminars and conferences on topics of current research interests are regularly organized in the department to expose students to cutting edge topics. Students are required to attend outside conferences and become trained in publicizing their research work through research talks or poster presentations to the community

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Classical Mechanics	P601
2	Mathematical Methods	P602
3	Electromagnetism	P603
4	Self-Study/Mini project/credit seminar	P698
5	Statistical Mechanics	P614
6	Quantum Mechanics	P615
7	Mini Project	P699

(B) Elective Courses:

Sr. No.	Name of the Course	Course code
1	Nuclei and Particle Physics	P648
2	Atoms Molecules and Radiation	P649
3	Introduction to Condensed Matter Physics	P650
4	Advanced Solid State Physics	P651
5	Computational Physics	P652
6	Quantum Field Theory I	P653
7	Particle Physics	P654
8	Introduction to Phase transitions and Critical phenomena	P655
9	Nonlinear Optics and Lasers	P656
10	General Relativity and Cosmology	P657
11	Soft Condensed Matter	P658

12	Applied Nuclear Physics	P659
13	Many Particle Physics	P660
14	Physics of Mesoscopic Systems	P661
15	Introduction to Quantum Optics	P662
16	Astronomy and Astrophysics	P663
17	Plasma Physics and Magnetohydrodynamics	P664
18	Biophysics	P665
19	Quantum Nanoelectronics	P666
20	Nonlinear Physics, Chaos and Turbulence	P667
21	Magnetism and Superconductivity	P668
22	Density Functional Theory of Atoms, Molecules and Solids	P669
23	Quantum Field Theory II	P670
24	Quantum Information and Quantum computation	P671
25	Experimental High Energy Physics	P672
26	Experimental Techniques	P673
27	Introduction to Cosmology	P674

Course Outcomes:

(A) Core Courses

Name of the Course	**Course code**	**Course Outcome**
Classical Mechanics	P601	This course reviews the concepts of Masters level classical mechanics with more emphasis on the applied/problem solving aspects.
		This course is meant to prepare the students for more rigorous analytical treatment of the subject required for research.
Mathematical Methods	P602	This course reviews the important mathematical tools required for physicists for implementation in research work in all specialization of physical sciences.
Electromagnetism	P603	This course reviews masters level electricity and magnetism with more emphasis on problem solving and applications.

		This course is meant to prepare students for taking up realistic research challenges involving one of the most important class of interactions in Physics.
Self-Study/Mini project/credit seminar	P698	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Statistical Mechanics	P614	This course reviews masters level statistical mechanics and thermodynamics and prepares students for analyzing research problems/results in a wide variety of situations involving statistical mechanics.
Quantum Mechanics	P615	This course reviews masters level quantum mechanics and prepares students for analyzing research problems/results in a wide variety of situations involving quantum mechanics.
Mini Project	P699	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) Elective Courses:

Name of the Course	Course code	Course Outcome
Nuclei and Particle Physics	P648	Provides training in basic concepts and methods in nuclear physics, stability of nucleons and classification of interactions.
		The course prepares the student to begin working in experimental and theoretical high energy physics.
Atoms Molecules and Radiation	P649	Important topics in atomic physics, selection rules, atomic and molecular spectroscopy is taught.
		The training is imperative to work in the area of applied solid state physics and optics.
Introduction to Condensed Matter Physics	P650	This is the first course in condensed matter physics and draws on quantum and statistical mechanics to provide a foundation in basic concepts and techniques required to tackle advanced courses in the area of solid state physics.

Advanced Solid State Physics	P651	This is a course which aims to prepare students with advanced concepts, techniques and knowledge of solid state physics that allows them to start working on basic research problems in the broad area of condensed matter theory, materials theory or solid state experiments.
Computational Physics	P652	This course provides training in computation tools required in research across a wide variety of fields including condensed matter, high energy phenomenology and lattice field theories.
Quantum Field Theory I	P653	This first course on quantum field theory prepares the student for tackling future advanced courses in the area of high energy physics.
Particle Physics	P654	This course teaches the basics of particle physics and allows the student to start beginning research work in high energy phenomenology.
Introduction to Phase transitions and Critical phenomena	P655	This course teaches the students advanced concepts and methods in statistical mechanics crucial for the student to take up basic research work.
Nonlinear Optics and Lasers	P656	This course teaches the students advanced concepts and methods in modern topics in laser optics and non-linear optics necessary for the student to take up basic research work in optics.
General Relativity and Cosmology	P657	This course teaches the students, advanced concepts and methods in general relativity crucial for the student for building their background for research work in general relativity and cosmology.
Soft Condensed Matter	P658	This course teaches the students advanced concepts and methods in soft matter physics, with the aim to build their background for future research work in this area.
Applied Nuclear Physics	P659	This course teaches the students advanced concepts and methods in applied nuclear physics, with the aim to build their background for future research work in this area.
Many Particle Physics	P660	This course teaches the students advanced concepts and methods in many particle physics, with the aim to build their background for future research work in this area.
Physics of Mesoscopic Systems	P661	This course teaches the students advanced concepts and methods in mesoscopic physics,

		with the aim to build their background for future research work in this area.
Introduction to Quantum Optics	P662	This course teaches the students important concepts and methods in quantum optics, with the aim to build their background for future research work in this area.
Astronomy and Astrophysics	P663	This course teaches the students important concepts and methods in Astronomy and Astrophysics, with the aim to build their background for future research work in this area.
Plasma Physics and Magnetohydrodynamics	P664	This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.
Biophysics	P665	This course teaches the students important concepts and methods in biophysics, with the aim to build their background for future research work in this area.
Quantum Nanoelectronics	P666	This course teaches the students important concepts and methods in nanoelectronics, with the aim to build their background for future research work in this area.
Nonlinear Physics, Chaos and Turbulence	P667	This course teaches the students important concepts and methods in classical nonlinear dynamics, with the aim to build their background for future research work in this area.
Magnetism and Superconductivity	P668	This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.
Density Functional Theory of Atoms, Molecules and Solids	P669	This course teaches the students important concepts and methods in density functional theory, with the aim to build their background for future research work in this area.
Quantum Field Theory II	P670	This course teaches the students important concepts and methods in advanced quantum field theory, with the aim to build their background for future research work in this area.

Quantum Information and Quantum computation	P671	This course teaches the students important concepts and methods in quantum information and computation, with the aim to build their background for future research work in this area.
Experimental High Energy Physics	P672	This course teaches the students important concepts and methods in experimental high energy physics, with the aim to build their background for future research work in this area.
Experimental Techniques	P673	This course teaches the students important concepts and methods in experimental techniques, with the aim to build their background for future research work in this area.
Introduction to Cosmology	P674	This course teaches the students important concepts and methods in introductory cosmology, with the aim to build their background for future research work in this area.

DIPLOMA in MEDICAL RADIOISOTOPE TECHNIQUES (DMRIT)
(Program Code: HLTH07)

Course Structure:

I. Courses at BARC

Program Code :HLTH07	Programme Specific Outcome	To learn and strengthen knowledge related to basic sciences applied in nuclear medicine. To learn and apply principles of radiation protection in nuclear medicine laboratories.
		To be able to understand and apply knowledge of radiation detectors and various imaging and non imagingequipments like Uptake probe, Gamma Camera, SPECT, PET, Intraoperative Probes in a nuclear medicine laboratory. Role and application of complimentary imaging devices such as USG, CT & MRI.
		To introduce and train on concepts of radionuclide generators and medical cyclotron, radiopharmacy techniques and understand the in-vivo kinetics of radiopharmaceuticals used in imaging and therapy.
		To understand quality control of instruments and radiopharmaceuticals. To understand and adopt appropriate quality assurance practices in delivery of nuclear medicine services.
		To be able to assume responsibility as Nuclear Medicine Physicist, Imaging Technologist, Radiopharmacist and give orientation to function as Radiation Safety Officer.

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	Basic Sciences For Nuclear Medicine	01HLTH07-001-C
2	Radiation Physics, Radiation Biology & Radiation Protection	01HLTH07-002-C
3	Diagnostic Radiopharmaceuticals & In-Vitro Techniques	01HLTH07-003-C
4	Instrumentation & Imaging Technology	01HLTH07-004-C
5	Clinical Nuclear Medicine Techniques	01HLTH07-005-C

(B) PRACTICLAS

Sr. No.	Name of the Course	Course code
1	Physics of Nuclear Medicine	01HLTH07-001-P
2	Clinical Nuclear Medicine Techniques	01HLTH07-002-P
3	Apprentice Program	01HLTH07-003-P

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Basic Sciences For Nuclear Medicine	01HLTH07-001-C	Understand and strengthen concepts of human anatomy and physiology, basics of –cell biology, -immunlogy, -molecular biology, -biochemistry, chemistry, electronics, mathematicsand statistics related to nuclear medicine.
		Obtain concepts on medical terminology, common hospital practices and biomedical statistics.
Radiation Physics, Radiation Biology & Radiation Protection	01HLTH07-002-C	Understand and apply nuclear medicine-related concepts of nuclear physics, detectors viz.gas filled, liquid scintillation, organic and inorganic

		scintillation, & semiconductor, counting statistics, gamma ray spectrometry, radiation biology, personnel monitoring devices, radiation protection & dosimetry, radioactive material transport & waste management, radiation emergencies & preparedness in nuclear medicine setup.
Diagnostic Radiopharmaceuticals & In-Vitro Techniques	01HLTH07-003-C	Understand and apply knowledge of various radionuclides and radiopharmaceuticals in clinical NM including the fundamentals of radiolabelling procedures, quality control, bio-distribution and clinical translation.
		Understand fundamental concepts of compartmental analysis, biomedical application of nanotechnology, and design of radiopharmacy laboratory.
		Acquire knowledge of diagnostic in-vitro techniques for detection of various drugs, hormones, or microbes using RIA, IRMA, Radiorespirometry, Radioreceptor assay, and other Immunoassays and quality control of these procedures.
Instrumentation & Imaging Technology	01HLTH07-004-C	Understand functioning of imaging & non-imaging Nuclear Medicine instruments, their quality control, and application, viz. rectilinear scanner, gamma camera, SPECT, PET-CT, uptake probe, gamma probe, whole body counter, dose calibrator and radiation monitoring instruments.
		Principle and functioning of Medical Cyclotron and complimentary imaging devices such as USG, CT & MRI. Recent advances in SPECT, PET, developments in detector systems including hybrid systems such as PET-MRI.
		Understand the role and application of Computer and Medical informatics in Nuclear Medicine.
Clinical Nuclear Medicine Techniques	01HLTH07-005-C	Understand and apply knowledge about non-imaging techniques using radionuclides.
		Understand and apply knowledge in patient preparation & instruction, interventional approaches, selection/choice of -radiopharmaceuticals and its dose, equipment, -imaging techniques, &imaging parameters for various nuclear medicine procedures. Learn specific techniques applied for various organ imaging, tumour imaging, lymphoscintigraphy, sentinel node scintigraphy, infection and inflammation.

		Learn and apply techniques in Image processing and recording, image display & report generation. To enable skillfull application of gained knowledge in performing quantitative data analysis.
		Learn and understand techniques applied in therapeutic nuclear medicine for choice of radionuclide and radiopharmaceuticals for therapy, pre therapy workup, and post therapy imaging.
		Learn and apply radiation protection measures in diagnostic and therapeutic Nuclear Medicine. Learn protection of patient, regulatory aspects like layout of laboratory, patient discharge limits, AERB directives for dose limits, Safety Code, Duties of RSO.

(B) PRACTICALS

Name of the Course	Course code	Course Outcome
Physics of Nuclear Medicine	01HLTH07-001-P	To study and perform practicals on basic aspects of instrumentsused in nuclear medicine, including performance evaluation and quality control.
		To study effect of counting statistics and errors in measurements.
		To prepare radiopharmaceuticals in a hospital radiopharmacy setup and to perform their Quality control tests (physicochemical & biological).
		To study characteristics of Geiger Mueller Counters for its application in monitoring and surveillance.
Clinical Nuclear Medicine Techniques	01HLTH07-002-P	To understand and perform nuclear medicine procedures including, -patient preparation, -radiopharmaceutical preparation & their quality control, -dose administration, -data acquisition, -data processing, -report generation, and evaluation of these techniques.
Apprentice Program	01HLTH07-003-P	To undergo one year programme that imparts extensive trainingon aspects of Scintigraphy, PET-CT, Health Physics, Radiation Monitoring and Clinical Nuclear Medicine Techniques. To learn and understand the practices adopted in a state-of-art diagnostic and therapeutic nuclear medicine setup through hands-on training.

BACK TO MAIN

M.Sc. in PHYSICAL SCIENCES

(Program Code: PHYS08)

Course Structure:

I. Courses at HRI

Program Code : PHYS08	Programme Specific Outcome	Understanding and knowledge of physics in the classical domain.
		Understanding and knowledge of physics in the quantum domain.
		Understanding and application of statistical methods in physics
		Laboratory experience so that students are exposed to modern experimental techniques.
		Understanding of mathematical methods in their applications in diverse settings.
		Provide exposure to various specialised areas such as condensed matter, nuclear physics, atomic physics, particle physics, astrophysics and quantum information
		Introduction to methods that will be lifelong assets for careers in research and development.

(A) Core Courses

SEMISTER – I

Sr. No.	Name of the Course	Course code
1	Classical Mechanics	08PHYS08-001-C
2	Quantum Mechanics I	08PHYS08-002-C
3	Electrodynamics	08PHYS08-003-C
4	Mathematical Methods I	08PHYS08-004-C
5	Laboratory I	08PHYS08-005-C

SEMISTER – II

Sr. No.	Name of the Course	Course code
1	Numerical Methods	08PHYS08-006-C
2	Quantum Mechanics II	08PHYS08-007-C
3	Statistical Mechanics	08PHYS08-008-C

4	Electronics	08PHYS08-009-C
5	Laboratory II	08PHYS08-010-C

SEMISTER – III

Sr. No.	Name of the Course	Course code
1	Condensed Matter I	08PHYS08-011-C
2	Quantum Mechanics III	08PHYS08-012-C
3	Quantum Field Theory I	08PHYS08-013-C
4	Mathematical Methods II	08PHYS08-014-C
5	Elective I	08PHYS08-015-C

SEMISTER – IV

Sr. No.	Name of the Course	Course code
1	Particle Physics	08PHYS08-016-C
2	Elective II	08PHYS08-017-C
3	Elective III	08PHYS08-018-C
4	Project	08PHYS08-019-C
5	Laboratory III	08PHYS08-020-C

(B) Electives I (choose any one)

Sr. No.	Name of the Course	Course code
1	Advanced Statistical Mechanics	08PHYS08-001-E
2	Fluid Mechanics	08PHYS08-002-E
3	General Relativity	08PHYS08-003-E
4	Non-linear Dynamics	08PHYS08-004-E
5	Quantum Information and Computation I.	08PHYS08-005-E

(C) Electives II & III (choose any two)

Sr. No.	Name of the Course	Course code
1	Astrophysics	08PHYS08-006-E
2	Condensed Matter Physics II	08PHYS08-007-E
3	Cosmology	08PHYS08-008-E
4	Introduction to Electronic Structure	08PHYS08-009-E
5	Quantum Field Theory II	08PHYS08-010-E
6	Quantum Information and Computation II	08PHYS08-011-E
7	Quantum Optics	08PHYS08-012-E
8	Soft Matter	08PHYS08-013-E
9	Ultra Cold Atoms	08PHYS08-014-E

Course Outcomes:

(A) Core Courses

SEMISTER I

Name of the Course	Course code	Course Outcome
Classical Mechanics	08PHYS08-001-C	Acquiring knowledge of Lagrangian and Hamiltonian formulations of classical dynamics.
		Acquiring knowledge of basic concepts of classical mechanics such as general theory of conservation laws, phase space and Poisson brackets.
		Understanding the theory of rigid body motion.
		Acquiring knowledge of applications such as the central force problem, small oscillations, non-linear dynamics.
Quantum Mechanics I	08PHYS08-002-C	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.
		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.

		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Electrodynamics	08PHYS08-003-C	Acquiring knowledge of special theory of relativity and its role in electromagnetism.
		Acquiring knowledge of electrostatics and magnetostatics.
		Acquiring knowledge of the theory of electromagnetic radiation.
		Acquiring knowledge of scattering of electromagnetic waves.
Mathematical Methods I	08PHYS08-004-C	Acquiring knowledge of vector spaces and it applications to various physical problems.
		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Laboratory I	08PHYS08-005-C	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment

SEMISTER II

Name of the Course	Course code	Course Outcome
Numerical Methods	08PHYS08-006-C	Ability to write codes using programming languages: F77, F90 or C.
		Acquiring knowledge of numerical linear algebra, interpolation techniques, generation and use of random numbers.
		Acquiring knowledge of numerical differentiation and integration (including Monte Carlo techniques).
		Acquiring knowledge of numerical methods to treat ODEs and PDEs: including FFT and finite difference methods, integral equations
Quantum Mechanics II	08PHYS08-007-C	Understanding of the theory and applications of scattering in quantum mechanics.
		Acquiring knowledge of the method of path integrals in quantum mechanics.

		Acquiring knowledge of the concept of entanglement in quantum mechanics and it applications such as Bell's inequalities.
		Acquiring knowledge of relativistic quantum mechanics and its applications.
Statistical Mechanics	08PHYS08-008-C	Acquiring knowledge of basics concepts such as phase space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Electronics	08PHYS08-009-C	Acquiring basic knowledge of circuit theory: lumped circuit approximation, circuit elements, Kirchoff's current and voltage laws, resistive networks.
		Acquiring knowledge of basics of analog electronics, including that of diodes and LEDs.
		Acquiring knowledge basic knowledge of amplifiers.
		Acquiring knowledge of the basics digital electronics: logic gates, truth table, multiplexer, combinatorial circuits, flip-flop, and microprocessors.
Laboratory II	08PHYS08-010-C	Laboratory Experience with Coupled Oscillator Circuits:
		Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator

		Laboratory Experience with Flip-flops and Microcontrollers.

SEMISTER III

Name of the Course	Course code	Course Outcome
Condensed Matter I	08PHYS08-011-C	Understanding of the basic building blocks of matter and methods to probe structure of materials.
		Acquiring knowledge of the physics of metals.
		Acquiring knowledge of the physics of phonons.
		Acquiring knowledge of the physics of superconductors.
		Acquiring knowledge of the physics of magnetism.
Quantum Mechanics III	08PHYS08-012-C	Acquiring knowledge of the basics of atomic spectra in single electron atoms.
		Acquiring knowledge of atomic spectra in many electron atoms and molecules.
		Acquiring knowledge of the interaction of light and matter.
		Understanding of the basic theory involved in the study of cold atoms.
Quantum Field Theory I	08PHYS08-013-C	Acquiring knowledge of the method of second quantization for the study of many particle non-relativistic systems.
		Acquiring knowledge of the Lorentz group and its role in relativistic quantum field theory.
		Acquiring knowledge of the quantization of the Klein Gordon, Dirac and Maxwell fields.
		Acquiring knowledge of the basics of quantum electrodynamics and the study of various processes at tree level.
		Understanding of the role of gauge invariance in quantum electrodynamics.
Mathematical Methods II	08PHYS08-014-C	Ability to analyse phenomena using Fourier and Laplace transformation
		Ability to construct and solve higher order differential equation
		Understanding to apply Laplace and Poisson equation to electrostatics, Heat equation, Wave equation
		Understanding Group theory concepts and its application in Lie algebras
Elective I	08PHYS08-015-C	Application of Advanced Statistical Mechanics/ Fluid Dynamics/General Theory of Relativity/Techniques in Nonlinear Dynamics/Quantum Information and Computation I. in solving the problems related to the study.

SEMISTER IV

Name of the Course	Course code	Course Outcome
Particle Physics	08PHYS08-016-C	Understanding physics of elementary particles.
		Learning about fundamental interactions in terms of gauge principle.
		Acquiring skills to carry out computation in Strong, Weak and Electromagnetic theory.
		Learning various techniques useful for particle physics phenomenology.
		Learning methods to compute physical observables which can tested in the laboratory.
Elective II	08PHYS08-017-C	Application of Astrophysics/Condensed Matter Physics / Cosmology/Electronic Structure Calculations/Quantum Field Theory/ Quantum Optics/ Soft Matter/ Ultra cold Atoms in solving the problems related to the study.
Elective III	08PHYS08-018-C	Application of Astrophysics/Condensed Matter Physics / Cosmology/Electronic Structure Calculations/Quantum Field Theory/ Quantum Optics/ Soft Matter/Ultra cold Atoms in solving the problems related to the study.
Project	08PHYS08-019-C	Ability to formulate a research problem
		Developing scientific skills to solve the problem
		Acquiring knowledge to interpret, discuss and communicate scientific results in written and oral form
Laboratory III	08PHYS08-020-C	Learning about the magnetic phase transition
		Learning Raman spectroscopy using lasers.
		Carry out the experiments with radioactive samples using the GM counter and gamma-ray spectrometer.
		Studying the Bragg diffraction using microwaves, and measuring the speed of light using laser source.
		Studying the Hall effect, Electron spin resonance, and measuring earth's magnetic field using NMR.

(B) Electives I (choose any one)

Name of the Course	Course code	Course Outcome
Advanced Statistical Mechanics	08PHYS08-001-E	Acquiring knowledge of the basics of Critical phenomena.
		Understanding of the notion of Renormalization in statistical mechanics.

		Understanding of the basics of Equilibrium dynamics: Conserved and broken symmetry variables, Hydrodynamic approach, Dynamical critical phenomena.
		Acquiring basic knowledge of Non-equilibrium phenomena and stochastic thermodynamics.
Fluid Mechanics	08PHYS08-002-E	Acquiring knowledge of the basic concepts in the study of ideal fluids: Euler equation, hydrostatics, Bernoulli equation, conservation laws, incompressible fluids, waves, irrotational flows, inviscid fluids and vorticity.
		Study of viscous fluids.
		Acquiring knowledge of the basic topics in the theory of turbulence.
		Understanding of Thermal Conduction in fluids.
		Acquiring basic knowledge of Relativistic Fluid dynamics.
General Relativity	08PHYS08-003-E	Acquiring basic knowledge of differential geometry.
		Understanding of the equivalence principle and its applications.
		Acquiring knowledge of Einstein equation
		Acquiring knowledge of Schwarzschild solution along with applications.
		Acquiring knowledge of the theory of gravitational waves.
		Acquiring knowledge of the basics of Friedman-Robertson-Walker cosmology.
Non-linear Dynamics	08PHYS08-004-E	Acquiring knowledge of long time behavior of the solutions of a system of ordinary nonlinear differential equations, fixed points and their classification according to stability.
		Acquiring knowledge of the nature of orbits for conservative and non-conservative systems.
		Understanding of maps, fixed points, cycles and stability, bifurcations.
		Basic understanding of chaos.
		Understanding of different kinds of perturbation theory for calculating orbits.

Quantum Information and Computation I.	08PHYS08-005-E	Understanding of the concept of entanglement: quantification and detection in bipartite and multipartite systems.
		Acquiring knowledge of the basics of quantum communication.
		Acquiring knowledge of the basics of quantum cryptography and quantum computation.
		Acquiring knowledge of the basics of the interface of quantum information with other sciences and experimental realizations.

(C) Electives II & III (choose any two)

Name of the Course	Course code	Course Outcome
Astrophysics	08PHYS08-006-E	Learning about magnetohydrodynamics with applications to Astrophysical systems.
		Study of stellar structure and developing detailed understanding of structure of stars.
		Developing understanding of the models of galaxies.
		Acquiring knowledge of the accretion of matter due to a point mass.
		Developing introductory understanding of cosmology.
Condensed Matter Physics II	08PHYS08-007-E	Learning the skill to study low dimensional systems.
		Understanding theories which describe charge transport in mesoscopic systems.
		Acquiring knowledge of the electronic structure in low dimensional systems.
		Learning about the effects of phonons in metals and dielectric properties of insulators.
		Acquiring knowledge of correlated electron systems.
		Learning about the Mott transition, the Kondo systems, Superconductivity and magnetism.
		Learning formalism necessary to study Quantum Hall systems, quantum wires and dots.
Cosmology	08PHYS08-008-E	Learning about the cosmological model, the cosmological constant and the dark matter.

		Developing the understanding of the thermal history of the universe and its imprints on CMB.
		Understanding the horizon problem and its resolution by inflation.
		Acquiring the knowledge of the theory of cosmological perturbations.
		Studying the implications of the cosmological perturbation on the structure formation.
Introduction to Electronic Structure	08PHYS08-009-E	Acquiring the knowledge of the first principle computation, methods like the H-F approximation.
		Learning the Density Functional theory, and various approximations within the formulation
		Learning the pseudo potential method and its applications.
		Application of these methods to study the band structure of various materials.
Quantum Field Theory II	08PHYS08-010-E	Understanding the Path Integral formulation of quantum field theory.
		Acquiring the knowledge of the regularisation methods and the renormalisation.
		Developing the understanding of spontaneous symmetry breaking and its implications
		Learning the non-abelian gauge theories and their quantisation.
		Learning the renormalisation of the non-abelian gauge theories both in the symmetric and symmetry broken phase
Quantum Information and Computation II	08PHYS08-011-E	Learning the concept of decoherence.
		Understanding the Markovian vs non-Markovian processes and their master equations.
		Learning about the resource theory.
		Developing the understanding of quantum thermodynamics.
		Relating the quantum information systems with the condensed matter systems.

		Acquiring the knowledge of the entanglement theory, and quantum correlations.
Quantum Optics	08PHYS08-012-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.
Soft Matter	08PHYS08-013-E	Learning about what scales are involved in soft matter.
		Studying the phase transition using various techniques.
		Understanding the colloidal systems.
		Developing the intuition about polymers and membranes.
		Learning about the experimental methods.
Ultra Cold Atoms	08PHYS08-014-E	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.

M.D. in PATHOLOGY
(Program Code: HLTH09A01)

Program Code : HLTH09A01	Programme Outcome	To produce a specialist who is competent to provide a high quality diagnostic opinion in a given clinical situation with an appropriate and relevant sample, able to teach undergraduate and post-graduate, capable of pursuing clinical and laboratory based research and is familiar with current developments and advances in the field of pathology.

Course Structure:

I. Courses at TMC

Program Code : HLTH09A01	Programme Specific Outcome	Experience of the diagnostic techniques required to become technically competent in Practical Laboratory Diagnostic Work
		Broad practical and theoretical knowledge of all aspects of routine surgical pathology and also specialist areas such as cytopathology, hematology, oncopathology and histopathology of specific systems in order to be able to provide specialist advice
		Experience of the practice of evidence based clinical medicine through attendance in joint clinics or multi-disciplinary teams.
		Inculcating a habit of literature searches, attendance at scientific meetings, and the presentation of scientific work
		Competency for planning, organizing and establishing pathology services / department in all types of medical establishments
		Competency to impart training to students at various levels including postgraduate level in the subject and carry out research

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	SURGICAL PATHOLOGY	09HLTH09A01-001-C
2	AUTOPSY PATHOLOGY	09HLTH09A01-002-C
3	CLINICAL PATHOLOGY and ROUTINE HEMATOLOGY	09HLTH09A01-003-C
4	HEMATOPATHOLOGY	09HLTH09A01-004-C
5	IMMUNOLOGY	09HLTH09A01-005-C
6	TRANSFUSION MEDICINE	09HLTH09A01-006-C
7	BIOCHEMISTRY / LABORATORY MEDICINE	09HLTH09A01-007-C
8	MOLECULAR PATHOLOGY	09HLTH09A01-008-C
9	CYTOGENETICS	09HLTH09A01-009-C
10	MEDICLA STATISTICS	09HLTH09A01-010-C
11	LIBRARY / INFORMATION RETRIEVAL/ WEB SEARCH ENGINES in MEDICINE	09HLTH09A01-011-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
SURGICAL PATHOLOGY	09HLTH09A01-001-C	Grossing of all surgical specimens in keeping with protocol or guidelines for handling various specimens
		Identifyand accurately describe the chief gross and microscopic alterations in the surgically removed specimens
		Correctly diagnose majority of the lesions received on an average day from the surgical service of a general hospital.
		Knowledge and incorporation of internationally approved terminology for classification of diseases e.g. WHO and TNM staging for tumors.
AUTOPSY PATHOLOGY	09HLTH09A01-002-C	To perform autopsies safely, eviscerate and dissect organs

		To liaise with clinician and identify issues to be addressed by autopsy examination
		Correctly identify all major lesions which have caused, or contributed to, the patient's death on macroscopic examination.
CLINICAL PATHOLOGY and ROUTINE HEMATOLOGY	09HLTH09A01-003-C	Establish and direct a hematopathology laboratory that includes clinical hematology, urine analysis, clinical microscopy, flow cytometry and diagnostic hematopathology
		To provide consultation to clinicians on patient problems related to hematopathology.
HEMATOPATHOLOGY	09HLTH09A01-004-C	Work up of an aspirate right from obtaining the peripheral blood smear, bone marrow aspirate smear, requesting relevant lab tests and obtaining history to microscopic examination.
		Learn normal aspirate cellular findings, approach to abnormal findings and integrate aspirate with trephine biopsy findings
		Recognize normal WBC, RBC and platelet maturation, as well as cellular dysplasia
		Diagnosis of all common hematological conditions including hemogloleukaemia and lymphomas.
		Recognize reactive bone marrow and abnormal infiltrates, effects of chemotherapy and growth factor stimulation on blood and bone marrow
		Evaluate and interpret results of flow cytometry in conjunction with morphology,cytochemistry, clinical presentation, and immunohistochemistry studies
IMMUNOLOGY	09HLTH09A01-005-C	Interpret lymphocyte subset by immunophenotyping on flow cytometry and use data to characterize leukocyte populations
		Interpret the protein electrophoresis patterns observed in normal serum, normal plasma, normal urine, and in large monoclonal gammopathies such as

		multiple myeloma and Waldenstrom'smacroglobulinemia
		Knowledge of the role of the complement system or proteins in health and disease, complement protein measurements to assess inherited and acquired deficiency states, Understand the acute phase response and acute phase proteins, such as C-reactive protein, to assess inflammatory conditions. Understand cytokines as mediators and markers of immune and inflammatory responses.
		Bone marrow and solid organ transplant – principles, GVHD types and diagnosis, chimerism
TRANSFUSION MEDICINE	09HLTH09A01-006-C	Good practice for collection of blood and bleeding donors, phlebotomy techniques.
		Procedure for correct identification of blood sample and to perform ABO and Rh Grouping (cell and reverse), cross match procedure, Direct Coombs(DCT)and Indirect Coombs Test (IAT)
		Recognize the symptoms and signs of hemolytic and non-hemolytic transfusion reactions,
		To be able to review requests for blood components and discuss with the requesting physician,
		Collect blood for component preparation and know how to store blood components
BIOCHEMISTRY / LABORATORY MEDICINE	09HLTH09A01-007-C	Plan and organize the work flow in a routine clinical pathology laboratory in keeping with good laboratory practices
		Be able to correctly interpret the laboratory data of such studies, and discuss their significance with a view to arrive at a diagnosis
MOLECULAR PATHOLOGY	09HLTH09A01-008-C	To know the basic structure of DNA / RNA, Various techniques used in molecular pathology, principles, scope and limitations
		Basics of PCR, FISH, Sequencing, NGS-Principle, steps in technique, role in diagnostic pathology and infectious

		diseases, advantages and disadvantages, modifications of technique
CYTOGENETICS	09HLTH09A01-009-C	Demonstrate familiarity with methods of tissue culture and karyotyping in medical cytogenetics and cancer cytogenetics on peripheral blood culture, amniotic fluid culture, bone marrow aspiration culture and basic cytogenetics nomenclature
		Advanced technologies of molecular cytogenetics such as FISH, CGH
		Role of cytogenetics in diagnostic pathology, hematological malignancies, solid tumors and patient management
MEDICAL STATISTICS	09HLTH09A01-010-C	Demonstrate familiarity with importance of statistical methods in assessing data from patient material and experimental studies e.g. correlation coefficients, expected versus observed, etc. and their interpretation.
		Use of SPSS program
LIBRARY / INFORMATION RETRIEVAL/ WEB SEARCH ENGINES in MEDICINE	09HLTH09A01-011-C	To get acquainted with digital library, its services and the effective use of e–resources information to further their knowledge and to supplement conventional reading

M.D. in RADIO-DIAGNOSIS
(Program Code: HLTH09A03)

Program Code : HLTH09A03	Programme Outcome	To train the residents for wholesome approach to clinical scenario and attaining the diagnosis. And to contribute in therapeutic management wherever indicated.
		Application of the knowledge gained, in service and research.
		To be able to participate and contribute in the disease management group discussion in approaching particular case.
		To understand the need to identify emergency scenario and prompt reporting to help in patient management.
		Encourage and guide the students for various paper and case presentations.

Course Structure:

I. Courses at TMC

Program Code : HLTH09A03	Programme Specific Outcome	The candidate should complete the necessary training and mandatory theory as specified in the syllabus of the MD course.
		To participate and excel in the appraisal exams held each year of both theory and practical.
		To learn the need and importance of multidisciplinary approach in patient management.
		To attend and participate in lectures, case discussions and contribute value adding points.
		Provide adequate exposure to interventional radiology and nuclear medicine to give wholesome training.

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	Basic Sciences Related To Radio-Diagnosis	09HLTH09A03-001-C
2	Respiratory System	09HLTH09A03-002-C
3	GASTROINTESTINAL(GIT) And HEPATO-BILIARY-PANCREATIC SYSTEM	09HLTH09A03-003-C

4	Genito-Urinary System	09HLTH09A03-004-C
5	Musculoskeletal System	09HLTH09A03-005-C
6	Cardiovascular Radiology/ Echo Cardiography	09HLTH09A03-006-C
7	Neuroradiology	09HLTH09A03-007-C
8	General Radiology	09HLTH09A03-008-C
9	Ultrasound	09HLTH09A03-009-C
10	Ct	09HLTH09A03-010-C
11	ANGIOGRAPHY And INTERVENTIONAL RADIOLOGY	09HLTH09A03-011-C
12	Paediatric Radiology	09HLTH09A03-012-C
13	RADIOLOGY In EMERGENCY MEDICINE	09HLTH09A03-013-C
14	Oncologic Radiology	09HLTH09A03-014-C
15	Nuclear Medicine	09HLTH09A03-015-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Basic Sciences Related To Radio-Diagnosis	09HLTH09A03-001-C	To understand the basic physics and mechanisms of the various modalities used in Radiodiagnosis and Interventional Radiology so as to plan and modify protocols on case to case basis.
		To be able to decide the modality which can be used in specific indication and execute it.
		To understand the principles and application of radiation protection to the working personnels, staffs as well as the patients. Regular monitoring of the same.
		To understand the pathogenesis and biology of various diseases so as to interpret the imaging findings and correlate with clinical scenario.
Respiratory System	09HLTH09A03-002-C	Understand the etiopathogenesis of the disease and to prioritise the differentials in accordance with the clinical presentation of the patient.
		To differentiate between oncologic and non-oncologic causes.
		To manage the diagnostic interventional procedures like biopsies with adequate pre procedure checklist and post procedure observation of the patient.
		To be able to identify the emergency findings like thromboembolism with prompt reporting and to coordinate with the parent unit for immediate management of the same.
GASTROINTESTINAL(GIT)	09HLTH09A03-003-C	To understand the etiopathogenesis to arrive in diagnosis and to suggest next line of action.
		Give adequate information in the reporting by

And HEPATO-BILIARY-PANCREATIC SYSTEM		discussing with respective parent unit in concordance with the plan of management as in curative or palliative.
		To discuss and plan drainage procedures like PTBD and stenting in necessary scenarios.
		Acquire skills in diagnosing acute conditions like GI bleed with necessary supervision if needed.
Genito-Urinary System	09HLTH09A03-004-C	To learn the anatomy and etiopathogenesis of various oncologic and non-oncologic diseases.
		Plan protocols and additional imaging sequences in required areas like 3D reconstruction images needed for surgical planning.
		To be able to advise follow ups in indeterminate lesions according to accredited guidelines.
Musculoskeletal System	09HLTH09A03-005-C	To interpret the radiographs and identify benign vs malignant conditions and advise the relevant next line of imaging like USG, CT or MRI and image guided biopsies.
		To be able to identify post trauma findings and plan adequate positioning and protocol for the same.
		To understand the mechanism, pathology and imaging findings for sports related injuries and to report the necessary points needed for management.
		To train regarding pain management techniques in patients for diagnostic imaging as well as therapeutic procedures like vertebroplasty.
Cardiovascular Radiology/ Echo Cardiography	09HLTH09A03-006-C	Learn the anatomy, etiopathogenesis and diagnostic approach of the cardiovascular diseases.
		To diagnose and inform the emergency findings in case of pericardial effusion and thrombus.
		To train in the drainage procedure with adequate supervision and necessary setup.
		To prioritise reporting and informing the findings regarding tubes and vascular lines especially in ICU setup.
Neuroradiology	09HLTH09A03-007-C	Understand the normal neuroanatomy and etiopathogenesis, molecular biology of the common conditions.
		To be able to provide prompt diagnosis and management of acute stroke patients.
		Form a diagnostic approach according to the clinical scenario and identify the oncologic, infectious and vascular pathologies. To participate and contribute in joint discussion groups to arrive at clinicoradiological diagnosis.
		Inclusion and knowledge of recent technologies like functional MRI and DTI which help in surgical planning.
General Radiology	09HLTH09A03-008-C	To learn the basic concepts and identification of emergency findings in radiograph reporting.
		To assist, learn and perform the basic

		fluoroscopic procedures. To be able to manage the complications during the same.
		Learn the concepts and reporting in preformed guidelines for mammography. To assign final category and advice the next line of management.
Ultrasound	09HLTH09A03-009-C	To understand the physics and its clinical application of ultrasound techniques.
		To learn and perform various additional techniques like Doppler study, elastography and contrast enhanced USG.
		To learn and acquire the skills of interventional procedures with adequate preparation of patient before procedure.
		Provide prompt portable ultrasound services wherever necessary in case of emergencies, especially ICU and Casualty
CT	09HLTH09A03-010-C	To understand physics and working of various generations of CT and its clinical application for adequate planning of protocols. To know the prerequisites and indication before performing CT.
		To learn about the contrast agents, its side effects and how to manage various reactions with adequate training and monitoring.
		To be able to perform CT guided interventions and learn the mechanism of action of various procedures.
ANGIOGRAPHY And INTERVENTIONAL RADIOLOGY	09HLTH09A03-011-C	To understand the indications and contraindications of a procedure. And on how to manage the complications and required follow up.
		To learn and follow specific checklists in preparation of patients with skills in attaining an informed consent.
		Observing, assisting and learning to do basic procedures routinely done in our institution and to learn the post procedure care to be given.
		Trained to follow the protocol in even emergency situations.
Paediatric Radiology	09HLTH09A03-012-C	Understand the difference in etiopathogenesis and diagnostic approach for common disease in pediatric age group as compared to adults.
		Learn to modify the imaging protocols in accordance with the age and weight of the child.
		Trained to organise and pre plan various imaging services for children under local/ general anesthesia by coordinating with anesthesia team.
		To participate and contribute in multidisciplinary approach in arriving to diagnosis and management plan.
RADIOLOGY In EMERGENCY MEDICINE	09HLTH09A03-013-C	Trained for round the clock services in case of emergencies.
		Trained to give prompt imaging, diagnosis and notifying the treating physician regarding the

		emergency findings.
		Provide prompt portable x ray and ultrasound services wherever necessary in case of emergencies, especially ICU and Casualty
Oncologic Radiology	09HLTH09A03-014-C	Pathogenesis and diagnostic approach in work up of neoplastic diseases of all specialties in oncoradiology. To form a multidisciplinary management group.
		To understand basic cell biology and molecular pathway of various cancers. To learn and follow preformed guidelines while reporting.
		To be able to identify and diagnose the emergency findings in oncologic setup as in tumour bleed, brain herniation due to mass effect.
		To learn and provide necessary image guided procedures to arrive at histopathology and subsequent management.
Nuclear Medicine	09HLTH09A03-015-C	To attain basic knowledge on the various modalities and working mechanism.
		To learn to correlate the radiologic and nuclear medicine scan findings, useful during diagnostic dilemmas and planning of interventional procedures.
		Special training with peripheral RMC posting and lectures on topics for the same are conducted.

M.D. in RADIATION ONCOLOGY
(Program Code: HLTH09)

Course Structure:

I. Courses at TMC

Program Code : HLTH09A04	Programme Specific Outcome	To acquire an understanding of the subject of clinical oncology in general and radiation oncology in particular
		After attending the course, the resident doctors should be able to carry out the diagnosis of the type of cancer
		Training in carrying out the staging of the cancer and its treatment philosophy
		Decision making with regard to the type of therapy to be imparted to the cancer patient.
		Learning practical aspects of all types of radio-therapy techniques

Course Outcomes:

(A) CORE COURSES

SEMESTER I

Name of the Course	Course code	Course Outcome
CLINICAL ONCOLOGY–I	09HLTH09A04-001-C	To gain an in-depth understanding of Clinical Oncology in being able to evaluate, diagnose, treat and follow-up a patient with cancer
		Understand the staging and evaluation of patients in the clinic
PHYSICS–I	09HLTH09A04-002-C	Gain an understanding of physics and its application in radiation oncology
		Be able to interpret and participate in basic experiments and other aspects of radiation

		physics necessary to practise radiation Oncology effectively
MEDICAL STATISTICS & EPIDEMIOLOGY–I	09HLTH09A04-003-C	To understand and apply the knowledge of biostatistics to clinical work
		To understand and interpret available literature relevant to the practice of oncology
CANCER BIOLOGY–I	09HLTH09A04-004-C	To understand the pathophysiology of cancer
		To understand the biology underlying the natural history of malignant and other neoplastic processes affecting different parts of the body
		To understand and be able to apply this knowledge in the clinic and research
		Utilise this information in utilising different treatment modalities to oncology
RADIOBIOLOGY–I	09HLTH09A04-005-C	Understand the interaction of radiation in the tissues, cells
		Radio sensitivity of various cells and its clinical implications

SEMESTER II

Name of the Course	Course code	Course Outcome
CLINICAL ONCOLOGY–II	09HLTH09A04-006-C	To gain an in-depth understanding of Clinical Oncology in being able to evaluate, diagnose, treat and follow-up a patient with cancer
		Be able to participate in the decision making process
		Identify the best treatment protocol to manage a patient
		Understand the interaction of radiation and matter and the application of this in the clinic
		To be able to apply the knowledge of medical physics in selection of the right radiotherapy technique and energy for effective and optimal radiotherapy
		Be able to participate in planning, execution, verification and follow-up of patients undergoing radiation therapy
PHYSICS–II	09HLTH09A04-002-C	Be able to interpret and participate in basic experiments and other aspects of radiation physics necessary to practise radiation Oncology effectively
		Be able to understand the application of Radiation Physics in Radiation Oncology
		Be able to choose the appropriate RT equipment for the optimal treatment in a case

		Be able to understand and plan the choice of RT equipment, both external beam and brachytherapy in establishing a RT centre
MEDICAL STATISTICS & EPIDEMIOLOGY–II	09HLTH09A04-008-C	To understand and apply the knowledge of biostatistics to clinical work
		To understand and interpret available literature relevant to the practice of oncology
		To be able to utilise this understanding/ knowledge while working on allocated dissertation/ thesis
		To be able to apply this understanding in the clinic
CANCER BIOLOGY–II	09HLTH09A04-009-C	To understand the biology underlying the natural history of malignant and other neoplastic processes affecting different parts of the body
		To understand and be able to apply this knowledge in the clinic and research
		Utilise this information in utilising different treatment modalities to oncology
RADIOBIOLOGY–II	09HLTH09A04-010-C	Radio sensitivity of various cells and its clinical implications
		Application of this knowledge to determine effective radiotherapy regimes for treatment
		Understand the impact of time, dose and fractionation in Radiotherapy
		Understand the interaction of radiation with other treatment modalities
CHEMOTHERAPY & CLINICAL PHARMACOLOGY–II	09HLTH09A04-011-C	Mechanism of action and groups of various agents used in the clinic
		Clinical application and various chemotherapy, targeted and immunotherapy protocols
		Interaction of radiotherapy and systemic agents
		Delivery of various chemotherapy protocols and managing their toxicity

SEMESTER III

Name of the Course	Course code	Course Outcome
CLINICAL ONCOLOGY–III	09HLTH09A04-012-C	To gain an in-depth understanding of Clinical Oncology in being able to evaluate, diagnose, treat and follow-up a patient with cancer
		Be able to participate in the decision making process
		Identify the best treatment protocol to manage a patient
		Understand the interaction of radiation and matter and the application of this in the clinic

		To be able to apply the knowledge of medical physics in selection of the right radiotherapy technique and energy for effective and optimal radiotherapy
		Be able to participate in planning, execution, verification and follow-up of patients undergoing radiation therapy
		Be able to carry out both external beam and brachytherapy procedures, review patients on treatment, manage radiotherapy/ treatment related toxicity
PHYSICS–III	09HLTH09A04-013-C	Be able to interpret and participate in basic experiments and other aspects of radiation physics necessary to practise radiation Oncology effectively
		Be able to understand the application of Radiation Physics in Radiation Oncology
		Be able to choose the appropriate RT equipment for the optimal treatment in a case
		Be able to understand and plan the choice of RT equipment, both external beam and brachytherapy in establishing a RT centre
		Principles and application of radiation protection and personnel monitoring
MEDICAL STATISTICS & EPIDEMIOLOGY–III	09HLTH09A04-014-C	To understand and apply the knowledge of biostatistics to clinical work
		To understand and interpret available literature relevant to the practice of oncology
		To be able to utilise this understanding/ knowledge while working on allocated dissertation/ thesis
		To be able to apply this understanding in the clinic
CANCER BIOLOGY–III	09HLTH09A04-015-C	To understand the biology underlying the natural history of malignant and other neoplastic processes affecting different parts of the body
		To understand and be able to apply this knowledge in the clinic and research
		Utilise this information in utilising different treatment modalities to oncology
		Apply the knowledge and understanding to apply to research
RADIOBIOLOGY – III	09HLTH09A04-016-C	Understand the impact of time, dose and fractionation in Radiotherapy
		Understand the interaction of radiation with other treatment modalities

CANCER BIOLOGY–II	09HLTH09A04-008-P	Participating in simple experiments in translational research
RADIOBIOLOGY–II	09HLTH09A04-009-P	Decide/ choose optimal dose/ fractionation schedules
		Calculation of Biologically Effective Doses for tumour control, acute and late effects using the LQ model.
		Clonogenic assays and Survival Fraction (SF2)
		Using Radio-sensitizers or Radio-Protectors (e.g. Amifostine, 2-Deoxy-Glucose, Curcumin).

SEMESTER III

Name of the Course	Course code	Course Outcome
CLINICAL ONCOLOGY–III	09HLTH09A04-010-P	Complex Simulation and treatment techniques e.g. asymmetric beam, TSET, Craniospinal Irradiation, Paediatric tumours, TBI.
		Treatment Planning (mixed beam, matching fields, electrons, head and neck implants)
		Intracavitary, ILRT and simple implants
		Preparing Surface Moulds
		Assisting EBRT, Head/Neck Implant, Templates
		Cytotoxic drugs (Taxenes, BCNU, High dose Methotrexate, Interferon, G-CSF, Leuprolide etc.)
PHYSICS–III	09HLTH09A04-011-P	3-Dimensional conformal planning
		Electronic portal imaging
		Networking
		Quality assurance tests in radiotherapy
MEDICAL STATISTICS & EPIDEMIOLOGY–III	09HLTH09A04-012-P	Role and function of cancer registries
		Multivariate analysis
		Meta Analysis
		Writing research articles for journals
CANCER BIOLOGY–III	09HLTH09A04-013-P	Understanding micro-array technique

BACK TO MAIN

M.D. in MICROBIOLOGY
(Program Code: HLTH09A05)

Program Code : HLTH09A05	Programme Outcome	The purpose is to create specialists who would provide high quality health care and advance the cause of science through research and training

Course Structure:

I. Courses at TMC

Program Code : HLTH09A05	Programme Specific Outcome	Student should be able to: 1. Demonstrate competence as a clinical microbiologist
		2. Interact effectively with the allied department by rendering services in basic as well as advanced laboratory investigations
		3. Demonstrate application of microbiology in a variety of clinical settings to solve diagnostic and therapeutic problems along with preventive measures
		4. Play a pivotal role in hospital infection control, including formulation of antibiotic policy and management of biomedical waste
		5. Establish good clinical microbiological services in a hospital and in the community in the fields of bacteriology, virology, parasitology, immunology and mycology
		6. Plan, execute and evaluate teaching assignment in Medical Microbiology

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	GENERAL MICROBIOLOGY	09HLTH09A05-001-C
2	IMMUNOLOGY and APPLIED ASPECTS	09HLTH09A05-002-C
3	SYSTEMATIC BACTERIOLOGY	09HLTH09A05-003-C
4	VIROLOGY	09HLTH09A05-004-C
5	PARASITOLOGY	09HLTH09A05-005-C
6	MYCOLOGY	09HLTH09A05-006-C
7	APPLIED CLINICAL MICROBIOLOGY	09HLTH09A05-007-C

(B) PRACTICALS

Sr. No.	Name of the Course	Course code
1	BACTERIOLOGY	09HLTH09A05-001-P
2	IMMUNOLOGY / SEROLOGY	09HLTH09A05-002-P
3	MYCOLOGY	09HLTH09A05-003-P
4	PARASITOLOGY	09HLTH09A05-004-P
5	VIROLOGY	09HLTH09A05-005-P

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
GENERAL MICROBIOLOGY	09HLTH09A05-001-C	Student should have acquired knowledge in the following: 1. Important historical events and developments in Microbiology 2. Basic as well as advanced knowledge in various microscopes and microscopic techniques used in Diagnostic Microbiology 3. Various isolation precautions including standard and transmission based precaution 4. Nomenclature, classification and morphology of bacteria as well as other microorganisms 5. Various types and significance of normal flora of human body in health and disease states

		6. Various antimicrobial agents and mechanisms of drug resistance 7. Applications of quality assurance, quality control in Microbiology and accreditation of laboratories
IMMUNOLOGY and APPLIED ASPECTS	09HLTH09A05-002-C	1. Components of immune system, types of immunity and immune response 2. Describes and identifies uses of various antigens, immunoglobulins (antibodies) and antigen and antibody reactions 3. Complement system and Cytokines 4. Various disorders like hypersensitivity, immunodeficiency and auto-immunity involving immune system 5. Immunological techniques and their applications in Diagnostic Microbiology as well as research
SYSTEMATIC BACTERIOLOGY	09HLTH09A05-003-C	1. Demonstrate knowledge and skills in various techniques for isolation and identification of bacteria 2. Demonstrate knowledge about epidemiology, morphology, biochemical properties, antigenic nature, pathogenesis, complications, laboratory diagnosis treatment and prevention of major bacterial pathogens of medical importance
VIROLOGY	09HLTH09A05-004-C	1. Demonstrates knowledge about general properties, classification, morphology, virus replication and genetics of viruses 2. Explain pathogenesis of viral infections 3. Demonstrates knowledge about isolation and identification of viruses 4. Demonstrate knowledge about epidemiology, morphology, genetics, antigenic nature, pathogenesis, complications, laboratory diagnosis, treatment and prevention of major DNA and RNA viruses of medical importance
PARASITOLOGY	09HLTH09A05-005-C	1. Demonstrate knowledge about general characters, classification and method of identification of parasites 2. Demonstrate knowledge about epidemiology, morphology, antigenic nature, life cycle, pathogenesis, complications, laboratory diagnosis, treatment and prevention of Protozoan parasites of medical importance

MYCOLOGY	09HLTH09A05-006-C	1. Explain general characteristics including morphology, reproduction and classification of fungi 2. Demonstrate knowledge and skills for isolation and identification of fungi 3. Demonstrate knowledge about epidemiology, morphology, biochemical properties, antigenic nature, pathogenesis, complications, laboratory diagnosis treatment and prevention of major fungal pathogens of medical importance 4. Able to identify laboratory contaminant fungi
APPLIED CLINICAL MICROBIOLOGY	09HLTH09A05-007-C	1. Demonstrate knowledge about epidemiology of infectious diseases 2. Demonstrate knowledge about antimicrobial prophylaxis and therapy 3. Demonstrate knowledge about hospital acquired infections 4. Demonstrate knowledge about management of biomedical waste 5. Effectively investigate an infectious outbreak in hospital and community 6. Demonstrate knowledge about opportunistic infections 7. Demonstrate knowledge and applications about molecular techniques in the laboratory diagnosis of infectious diseases

(B) PRACTICALS

Name of the Course	Course code	Course Outcome
BACTERIOLOGY	09HLTH09A05-001-P	1. Collection/transportation of specimens for microbiological investigations 2. Preparation, examination and interpretation of direct smears from clinical specimens 3. Plating of clinical specimens on media for isolation, purification, identification and quantification purposes 4. Preparation of stains viz Gram, Albert's, ZiehlNeelsen (ZN), silver impregnation stain and special stains for capsule and spore etc.
IMMUNOLOGY / SEROLOGY	09HLTH09A05-002-P	Perform and interpret different immunological and serological tests and clinical co-relation of the results

MYCOLOGY	09HLTH09A05-003-P	Perform different stains in Mycology and interpret and co-relate the growth of fungus
PARASITOLOGY	09HLTH09A05-004-P	Identify the ova, cyst, trophozoites of different parasites and report
VIROLOGY	09HLTH09A05-005-P	Perform and interpret different virological methods and clinically co-relate with the results

M.D. in Nuclear Medicine
(Program Code: HLTH09A06)

Program Code : HLTH09A06	Programme Outcome	To develop Human Resource (Clinical Nuclear Medicine(NM) Physicians at the postgraduate level with MD qualification), possessing specialized knowledge in Theoretical, Experimental NM techniques and Clinical Nuclear Medicine, required for routine clinical practiceencompassing Oncology, Cardiology, Nephrology, Endocrine disorders, Neurology and Skeletal Systems.
		Teaching and Training of basic and applied principles of Nuclear Medicine to study body structure and functions and use this information to diagnose and treat medical conditions, through uses of Radioactive materials called radiotracers or radiopharmaceuticals (both diagnostic & therapeutic) and Nuclear Medicine Instruments (such as PET-CT, Gamma camera and SPECT systems, Dose calibrator, radiation monitoring instruments).
		To train and introduce interdisciplinary subjects/concepts/ideas (Radiology, Cardiology, Oncology and other systems) for interdisciplinary application of Nuclear Medicine in management of specific system disorders
		To introduce the advanced concepts and emerging techniques with its applications in area of Nuclear Medicine (newer Radiopharmaceuticals, imaging techniques, newer clinical methodologies).

Course Structure:

I. Courses at BARC

Program Code : HLTH09A06	Programme Specific Outcome	Clinical Nuclear Medicine: Understand and apply principles of Clinical Nuclear Medicine for diagnosis and treatment of various diseases encompassing Oncology, Cardiology, Nephrology, Endocrine disorders, Neurology and Skeletal Systems.

		Basic Science and Instrumentation: Understand and apply Nuclear Medicine instrumental knowledge such as gamma camera, gamma probe, SPECT/CT, PET/CT, dose calibrator, radiation monitoring instruments etc for understanding and day to day functioning of these instruments in Nuclear Medicine practices
		Hospital Radiopharmacy: Understand and apply various radiopharmaceuticalpreparation techniques, mechanism of action and clearance of from human body for the understanding of various patho-physiological conditions.
		Newer Advances: (a) Provide exposure to advanced experimental/theoretical methods and train in research and life-long learning to adapt to the changing environment. (b) Understand and apply various changing guidelines for diagnosing and treating various clinical conditions.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Basic Sciences & Instrumentation	01HLTH09A06-001-C
2	Diagnostic Radiopharmaceuticals & In-vitro Techniques	01HLTH09A06-002-C
3	Clinical Nuclear Medicine Paper I	01HLTH09A06-003-C
4	Clinical Nuclear Medicine Paper II	01HLTH09A06-004-C

(B) PRACTICALS

Sr. No.	Name of the Course	Course code
1	Physics	01HLTH09A06-001-P
2	Radiopharmaceutical & In-vitro Techniques	01HLTH09A06-002-P

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Basic Sciences & Instrumentation	01HLTH09A06-001-C	Understand the concepts of Basic sciences of Nuclear Medicine for applying them in Clinical Nuclear Medicine.
		Understand and apply basic science of electronics, mathematics, chemistry and biostatistics
		Understand and apply knowledge of functioning of Nuclear Medicine instruments and their utility (gamma camera, gamma probe, SPECT/CT, PET/CT, dose calibrator, radiation monitoring instruments etc.)
Diagnostic Radiopharmaceuticals & In-vitro Techniques	01HLTH09A06-002-C	Understand and apply knowledge of various radionuclides and radiopharmaceuticals in clinical NM, including the fundamentals of radiolabelling procedure, bio-distribution and clinical applications
		Acquire knowledge of diagnostic in-vitro techniques such as RIA and IRMA and use it for T4, FT4, TSH, Tg measurement and assays for various drugs and hormones
		Understand and apply knowledge of Radiation Biology, Radiation Protection, Health Physics and radioactive waste management in Nuclear Medicine Departments
Clinical Nuclear Medicine Paper I	01HLTH09A06-003-C	**Diagnostic**: Understand all in-vivo techniques and get knowledge about applications of radiopharmaceuticals,dosimetry studies, choice of equipment, imaging protocol, patient preparation, imaging parameters, interventional methods, quality/quantitative analysis, display, filming and report generation of in-vivo technique and apply all these in clinical practices,; the procedures includePET-CT scan with various PET radiopharmaceuticals, Bone Scan, Thyroid

		scan, Brain Scan, Lung Scan, Cardiac scan and so on.
		Therapeutic: Acquire skill and knowledge onTherapeutic Nuclear Medicine (Patient selection, including the diagnostic procedures necessary to establish the need for radionuclide therapy- indications and contraindications for the use of Radionuclide. Dose administration in patient management including dosimetryofthe target organs, to the surrounding tissue and/or other organ systems and total-body exposure, special problems of patient care caused by radionuclide therapeutic procedures-potential early and late adverse reactions, Clinicalfollow-up of patients in terms of timing and parameters of assessment of response and toxicity. Apply this knowledge in clinical practices
Clinical Nuclear Medicine Paper II	01HLTH09A06-004-C	Gain knowledge about recent advances in Imaging techniques & image processing including fusion/hybrid techniques and radiological methodologiesimage guided for radiotherapy & stereotactic techniques, recent advances in SPECT, PET, recent developments in detector systems (e.g. solid state detectors) including hybrid systems such as PET-MRI

(B) PRACTICALS

Name of the Course	Course code	Course Outcome
Physics	01HLTH09A06-001-P	Learning practical knowledge on radiation, detection and measurments.
		Learning practical aspects of radiation protection.
Radiopharmaceutical & In-vitro Techniques	01HLTH09A06-002-P	Learning practical knowledge in In-vitro radiopharmaceutical techniques.

BACK TO MAIN

II. Courses at TMC

Program Code : HLTH09A06	Programme Specific Outcome	Attain MD degree in Nuclear Medicine
		Complete requisite training. Appraisal exams are held regularly to assess that the candidate attained knowledge in keeping with the objectives by year according to the syllabus of the course.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Basic Science related to Nuclear Medicine	09HLTH09A06-001-C
2	Diagnostic Nuclear Medicine	09HLTH09A06-002-C
3	Therapeutic Nuclear Medicine	09HLTH09A06-003-C
4	Recent Advances in Nuclear Medicine	09HLTH09A06-004-C

(B) PRACTICALS

Sr. No.	Name of the Course	Course code
1	Basic Sciences Experiment	09HLTH09A06-001-P
2	Clinical Experiment	09HLTH09A06-002-P

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Basic Science related to Nuclear Medicine	09HLTH09A06-001-C	Attain requisite skills, proficiency in Basic sciences and applied basic sciences related to Nuclear Medicine

Diagnostic Nuclear Medicine	09HLTH09A06-002-C	Attain requisite skills, proficiency in Diagnostic Nuclear Medicine
Therapeutic Nuclear Medicine	09HLTH09A06-003-C	Attain requisite skills, proficiency in Therapeutic Nuclear Medicine
Recent Advances in Nuclear Medicine	09HLTH09A06-004-C	Attain requisite skills, proficiency in the recent advances in all branches of Nuclear medicine

(B) PRACTICALS

Name of the Course	Course code	Course Outcome
Basic Sciences Experiment	09HLTH09A06-001-P	To thoroughly understand and execute the entire process of quality assurance in nuclear medicine i.e. quality control of radiopharmaceuticals and various instrument used in nuclear medicine as well as interoperation of quality control reports
Clinical Experiment	09HLTH09A06-002-P	To examine the patient and relevant clinical and Laboratory and other materials and come to a logical conclusion to plan, execute and report the result of relevant nuclear medicine procedures for making a clinical impact on the patients disease.

M.D. in PALLIATIVE MEDICINE
(Program Code: HLTH09A07)

Course Structure:

I. Courses at TMC

Program Code : HLTH09A07	Programme Specific Outcome	The postgraduate trainee should be able to
		1.Explain pathophysiological basis of pain and other physical symptoms, assess comprehensively, use and select investigations and pharmacological and non-pharmacological approaches for relief of pain and other symptoms
		2.Explain the role of psychosocial and spiritual-existential issues in illness and suffering, assess comprehensively,use and select appropriate measures for addressing these issues in a multidisciplinary setting and judiciously refer to specialist teams as required
		3.Able to provide good supportive care and make clinical decisions and judgements in caring for patients with advanced life-limiting illnesses and their caregivers
		4.Able to understand illness trajectory and course and available disease management options and treatments appropriate for patients
		5.Able to communicate with and understand patients' and families' wishes, preferences and goals of care and respect their values and beliefs
		6.Able to recognise the dying process and provide appropriate end of life care
		7.Able to provide specialist palliative care in all settings of clinic, inpatient, home, hospice, respite care
		8.Able to work in a multidisciplinary team with respect and cordiality and professionalism and supervise and mentor junior colleagues

		9.Able to undertake research in palliative medicine
		10.Able to provide leadership and advocacy
		11.Able to efficiently organise human resource, finances, quality control issues and data management along with professional development and self-mangagment

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Cognitive Domain	09HLTH09A07-001-C
2	Psychomotor Domain	09HLTH09A07-002-C
3	Affective Domain	09HLTH09A07-003-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Cognitive Domain	09HLTH09A07-001-C	**To acquire in-depth knowledge of**
		Introduction to Palliative Medicine
		Palliative Pharmacology
		Symptom control in Palliative Medicine
		Palliative Medicine in oncology
		Palliative Medicine in non-oncology
		Supportive care in Palliative Medicine
		Psychosocial issues in Palliative Medicine
		Paediatric and Geriatric Palliative Medicine
		End of life care, ethics and special topics in Palliative Medicine
		Nursing and rehabilitation care in Palliative Medicine
Psychomotor Domain	09HLTH09A07-002-C	**To develop procedural and non-procedural skill in the following:**
		Communication
		Decision making
		Pain and symptom management
		Supportive care and disease management
		Psychosocial support
		Interdisciplinary care and team management
		End of life care
		Procedural
		Research and education

		Leadership, advocacy and good clinical practice and quality assurance
Affective Domain	09HLTH09A07-003-C	**To acquire attitudes and values as follows:**
		Palliative care principles
		Pain and symptom management
		Clinical expert
		Psychological, social, emotional and spiritual support
		Interdisciplinary care
		Decision making
		Communication
		Pediatric and elder care
		End of life care
		Professionalism and leadership

M.D. in IMMUNO - HEMATOLOGY & TRANSFUSION MEDICINE (Program Code: HLTH09A08)

Course Structure:

I. Courses at TMC

Program Code : HLTH09A08	Programme Specific Outcome	At the end of the course a candidate must be able to: i) Understand and explain about the scientific basis of blood transfusion. ii) Understand the processes of blood collection, processing and component preparation. iii) Understand and explain the basis of pre-transfusion testing. iv) Should be able to explain and diagnose the adverse effects of blood transfusion. v) Should be able to perform apheresis technique independently. vi) Should be able to carry out the antenatal and neonatal transfusion practice. vii) Should be able to plan, perform and report specific research projects. viii) Should be able to give advice on haemotherapy including stem cell transplantation and solve the immunohaematological discrepancies in blood transfusion ix) To understand and advise on the rationale and process of use of blood & blood products to the associated clinical faculty.

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	HISTORY OF TRANSFUSION MEDICINE	09HLTH09A08-001-C
2	SCIENTIFIC BASIS OF TRANSFUSION	09HLTH09A08-002-C
3	ANTIGEN SYSTEMS IN FORMED ELEMENTS OF BLOOD	09HLTH09A08-003-C

4	BLOOD COLLECTION, PROCESSING, COMPONENT	09HLTH09A08-004-C
5	PRE-TRANSFUSION TESTING	09HLTH09A08-005-C
6	ADVERSE EFFECTS OF BLOOD TRANSFUSION	09HLTH09A08-006-C
7	APHERESIS	09HLTH09A08-007-C
8	AUTOLOGOUS TRANSFUSION	09HLTH09A08-008-C
9	ANTINATAL & NEONATAL TRANSFUSION PRACTICE	09HLTH09A08-009-C
10	IMMUNOHEMATOLOGY	09HLTH09A08-010-C
11	HEMOTHERAPY	09HLTH09A08-011-C
12	TRANSPLANTATION	09HLTH09A08-012-C
13	BLOOD SUBSTITUTE & HEMOPOIETIC AGENTS	09HLTH09A08-013-C
14	MEDICOLEGAL CONSIDERATIONS IN TRANSFUSIUON	09HLTH09A08-014-C
15	TOTAL QUALITY MANAGEMENT	09HLTH09A08-015-C
16	ORGANISATION & MANAGEMENT OF TRANSFUSION SERVICES	09HLTH09A08-016-C
17	BLOOD SAFETY	09HLTH09A08-017-C
18	MODERN BIOLOGICAL TECHNIQUES	09HLTH09A08-018-C
19	AUTOMATION & COMPUTERIZATION	09HLTH09A08-019-C
20	RECENT ADVANCES IN IMMUNOHAEMATOLOGY & BLOOD TRANSFUSION	09HLTH09A08-020-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
HISTORY OF TRANSFUSION MEDICINE	09HLTH09A08-001-C	To understand historical aspects of Transfusion Medicine and evolution
SCIENTIFIC BASIS OF TRANSFUSION	09HLTH09A08-002-C	To understand basis of the cycle from Blood Collection to Transfusion to the recipient ensuring blood safety
ANTIGEN SYSTEMS IN FORMED ELEMENTS OF BLOOD	09HLTH09A08-003-C	To understand different Blood grouping systems covering Genetics, Biochemical and clinical importance
BLOOD COLLECTION, PROCESSING, COMPONENT	09HLTH09A08-004-C	Should be able to perform donor screening, blood collection and component preparation
PRE-TRANSFUSION TESTING	09HLTH09A08-005-C	To understand principles of pre-transfusion testing.
		To perform and solve different problem cases
ADVERSE EFFECTS OF BLOOD TRANSFUSION	09HLTH09A08-006-C	To classify different adverse effects of blood transfusion.
		To identify, perform, workupand advise about the management
APHERESIS	09HLTH09A08-007-C	To understand principles of Apheresis.
		To be able to perform routine Apheresis and therapeutic Apheresis Procedures
AUTOLOGOUS TRANSFUSION	09HLTH09A08-008-C	To know indications and contraindications of Autologous transfusion and perform the same
ANTINATAL & NEONATAL TRANSFUSION PRACTICE	09HLTH09A08-009-C	To know the pathophysiology of HDFN.
		To be able to perform antenatal workup and to decide the indication, dose, special requirements for intrauterine and neonatal transfusion
IMMUNOHEMATOLOGY	09HLTH09A08-010-C	To know the principle and basis of different method to perform Immunohenatology workup including Red Cells, Platelets and Granulocytes
HEMOTHERAPY	09HLTH09A08-011-C	Should be able to give advice on Hemotherapy decisions
TRANSPLANTATION	09HLTH09A08-012-C	To understand processing, storage, quality control of stem cells.

		To advise and support transfusion requirements in HSCT and solid organ transplant
BLOOD SUBSTITUTE & HEMOPOIETIC AGENTS	09HLTH09A08-013-C	To understand role and clinical application of blood substitutes and Hemopoietic agents
MEDICOLEGAL CONSIDERATIONS IN TRANSFUSIUON	09HLTH09A08-014-C	To understand the regulatory aspects and ensure the regulatory requirements of blood centres
TOTAL QUALITY MANAGEMENT	09HLTH09A08-015-C	To know principles and scope of Quality Management System and implement Good Laboratory Practices (GLP)
ORGANISATION & MANAGEMENT OF TRANSFUSION SERVICES	09HLTH09A08-016-C	To understand the administrative aspects of organisation and management of Blood Transfusion Services.
		To know the importance of National Hemovigilance Programme
BLOOD SAFETY	09HLTH09A08-017-C	To know and implement the National and International guidelines for blood safety
MODERN BIOLOGICAL TECHNIQUES	09HLTH09A08-018-C	To know and understand the principles and applications of molecular techniques related to Transfusion Medicine
AUTOMATION & COMPUTERIZATION	09HLTH09A08-019-C	To know the importance and applications of Automation and computerisation in daily functioning of Transfusion Services
RECENT ADVANCES IN IMMUNOHAEMATOLOGY & BLOOD TRANSFUSION	09HLTH09A08-020-C	To know principles and scope of newer techniques (e.g., Flow Cytometry, Cellular Therapies, Pathogen Reduction Technology, Gene Therapy, Proteomicsand Metabolomics etc.

M.D. in ANESTHESIA
(Program Code: HLTH09A02)

Program Code : HLTH09A02	Programme Outcome	To train the candidate in skills and knowledge in various aspects of Anaesthesia – service, training & research
		This will also enable the individual to practice anaesthesia discipline
		To be able to participate in the holistic management, including preoperative assessment, risk stratification, preoperative optimization for the anaesthesia, post anaesthesia and post-surgery care, care of the critically ill patient in the intensive care unit. To Be able to manage acute post-operative pain, chronic pain management, be a part of the multidisciplinary team delivering treatment and follow-up of a patient receiving anaesthesia. The candidate should be able to implement these skills and deliver the service to patients in all age groups including paediatric, geriatric patients.
		He/ she should be able to train other anaesthesia technicians, anaesthesia assistants and junior fellow colleagues.
		Candidate should also be well versed in giving life support efficiently in cardiac arrest situations
		The candidate should engage in effective, meaningful research

Course Structure:

I. Courses at TMC

Program Code : HLTH09A02	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms
		All the necessary training and mandatory theory are specified in the syllabus of the MD Anaestheisa Course
		The student is expected to participate in the regular academic programmes (Case discussions, students' seminars, CMEs) conducted in the Institute.
		The purpose would be to acquire an understanding of the subject of anaesthesia
		The candidate's progress through the 3 years will be assessed by appraisal examinations.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Anesthesia Outside Operating Room	09HLTH09A02-001-C
2	Post Anesthesia Care Unit	09HLTH09A02-002-C
3	Intensive Care Unit	09HLTH09A02-003-C
4	Cardiovascular Anesthesia	09HLTH09A02-004-C
5	Neuroanesthesia	09HLTH09A02-005-C
6	Pain Management	09HLTH09A02-006-C
7	Pediatric	09HLTH09A02-007-C
8	Obstetric	09HLTH09A02-008-C
9	Regional Anesthesia	09HLTH09A02-009-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Anesthesia Outside Operating Room	09HLTH09A02-001-C	To gain knowledge and understanding of preoperative evaluation and optimization of patients, risk stratification and provide anaesthesia for diagnostic and therapeutic procedures at CT, MRI, Intervention radiology, cardiac cath lab, Digital Subtraction Angiography lab, Endoscopy, electroconvulsive therapy with understanding of day care anaesthesia.
Post Anesthesia Care Unit	09HLTH09A02-002-C	Candidate should be efficient in Monitoring patients recovery in post anaesthesia care unit, Detecting and diagnosing problems peculiar to PACU such as delayed recovery due to drug overdoses, haemodynamic instability, acute pain management, issues related to airway, triaging the patients as per need – to more intense monitoring, shift to floor etc.
		Management of patients who have undergone massive blood transfusion in OT, patients requiring postoperative mechanical ventilator (MV) support, setting correct ventilator parameters, diagnosing patient ventilator dyssynchrony, weaning patients from MV, getting appropriate referrals such as nutritionist reference, physiotherapy etc. Mobilisation of patient in postop care unit
		Should also understand principles of haemodynamic monitoring and efficiently manage patients with haemodynamic instability

Intensive Care Unit	09HLTH09A02-003-C	To gain knowledge of physiology of respiratory and cardiovascular system in details, acid base physiology, electrolyte disturbances and arrhythmias, basics of mechanical ventilation and management of types of shock
		To gain knowledge and skills for basic and Advanced haemodynamic monitoring
		To learn the care of unconscious patient
		To gain knowledge and skills for basic and Advanced cardiopulmonary resuscitation
		To understand basics of communications and learn how to effectively communicate with patients and their care givers
Cardiovascular Anesthesia	09HLTH09A02-004-C	To gain thorough understanding of cardiovascular and intrathoracic physiology and pathophysiology, preoperative evaluation and optimization of patients, risk stratification. Acquire skills and knowledge to provide anaesthesia for surgery for CABG, valvular heart diseases repair, congenital heart diseases and vascular repairs
Neuroanesthesia	09HLTH09A02-005-C	To gain thorough understanding of central nervous system physiology and pathophysiology, preoperative evaluation and optimization of patients, risk stratification and provide anaesthesia for elective and emergency surgeries of brain and spine in adult and children.
		To understand triaging of polytrauma patient, their neuroassessment and emergency management
		To understand basics of intracranial pressure monitoring
Pain Management	09HLTH09A02-006-C	To gain thorough understanding and knowledge of intraoperative and acute postoperative pain management.
		To acquire skills to perform techniques needed for regional pain management
		To gain thorough understanding and knowledge of pathophysiology of chronic pain and its management in brief
Pediatric	09HLTH09A02-007-C	To gain thorough understanding of neonatal, infant and children's physiology of all systems, preoperative evaluation and optimization of patients, risk stratification. Acquire skills and knowledge to provide anaesthesia and perioperative care for different surgeries and diagnostic procedures and emergencies in children
		To gain knowledge and proficiency in neonatal rescuscitation

Obstetric	09HLTH09A02-008-C	To gain thorough understanding and knowledge of physiology and pathologies of a parturient, and acquire skills needed to provide anaesthesia for conducting caesarean section., and also managing obstetric emergencies.
		To understand and learn management of massive haemorrhage and massive transfusion protocol
Regional Anesthesia	09HLTH09A02-009-C	To gain the knowledge of anatomy needed for understanding of pain management of various parts of human body
		To acquire skills to perform techniques needed for regional anaesthesia and pain management using ultrasound and nerve stimulators.
		To practice central neuraxial blockade in adults and children

BACK TO MAIN

D.M. in MEDICAL ONCOLOGY (Program Code: HLTH10A01)

Program Code : HLTH10A01	Programme Outcome	To train the candidates in training on the basics of all aspects of oncology.
		To understand the role of associated specialties, i.e., surgical and radiation oncologic principles, basics of pathology, basics of radiology and their role in the multidisciplinary management of cancer patients.
		To provide exposure to the comprehensive management, including diagnosis, planning treatment, being a part of the multidisciplinary team delivering treatment and follow-up of a patient with cancer.
		To understand and be able to practice relevant aspects of medical oncology in terms of patients selection for treatment, management of various treatment modalities including, chemotherapy, immunotherapy, targeted therapy and newer modalities
		To introduce aspects of clinical and translational research during the program
		To provide national and international platform for presentations of clinical/surgical research data
		The training should encourage trainees to become thought leaders in various aspects of practice in medical oncology across the country.

Course Structure:

I. Courses at TMC

Program Code : HLTH10A01	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms.
		All the necessary training and mandatory theory are specified in the syllabus of the DM Medical Oncology Course.
		The student is expected to participate in the regular appraisal examinations and academic programmes conducted in the institute.
		The purpose would be to acquire an understanding of the subject of medical oncology in specific and all aspects of oncology in general.
		The candidate’s progress through the 3 years will also be assessed with feedback from all stake holders, including the candidate and work-based assessment.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	BASIC SCIENCE in ONCOLOGY	09HLTH10A01-001-C
2	CLINICAL ONCOLOGY	09HLTH10A01-002-C
3	RECENT ADVAMCES in ONCOLOGY	09HLTH10A01-003-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
BASIC SCIENCE in ONCOLOGY	09HLTH10A01-001-C	To be able to understand the basics of cancer biology and molecular pathology.
		To understand the pathophysiology of various neoplastic and pre-neoplastic processes.
		To understand the newer advances in molecular diagnostics
		To develop the insight and ability to apply this knowledge in the field of clinical and translational cancer research.
CLINICAL ONCOLOGY	09HLTH10A01-002-C	To understand the multidisciplinary management of cancers and basic principles of medical oncology so as to provide the best treatment option to patients.
		To be able to provide complete oncologic care in future practice.
		To be able to grasp the basics of biostatistics and conduct of clinical research and randomised controlled trials.
		To learn the approach to evidence based surgical oncological approaches as well as principles of radiotherapy protocols so as to help and guide patients with cancer to choose appropriate modality of treatment.
		To completely understand the basics of systemic therapy, including chemotherapy, immunotherapy, targeted therapy as well as newer molecules
		To understand the applications of all aspects of systemic therapy in patient management, clinical practice, with specific emphasis on evidence based guidelines as well as management of adverse events.

RECENT ADVAMCES in ONCOLOGY	09HLTH10A01-003-C	To understand newer modalities and advances in oncology, specifically with respect to phase I/II trials, laboratory pre-clinical work and translational studies
		To have a basic working knowledge of next generation molecular biology techniques.
		To be aware of recent advances in diagnostic imaging and adjuvant modalities in cancer

BACK TO MAIN

D.M. in Paediatric Oncology under TMC (Program Code: HLTH10A02)

Program Code : HLTH10A02	**Programme Outcome**	Outcome of childhood cancers is one of the most impressive among all cancers put together, provided these cancers are treated early, diagnosed properly and treated appropriately by trained Pediatric oncologists.
		The Pediatric Oncology Program is designed to provide a diversified, organized educational environment that will allow the post graduate student to develop both the clinical and research skills necessary to become an academic Pediatric Oncologist.
		The aim is for acquisition of a fundamental knowledge base in Pediatric Hematology, Oncology and BMT and development of clinical skills in Pediatric Hematology, Oncology and BMT along with development of skills in interpreting basic laboratory tests pertinent to Pediatric Hematology, Oncology and BMT

Course Structure:

I. Courses at TMC

Program Code : HLTH10A02	**Programme Specific Outcome**	The aim is to prepare the future Pediatric Oncologists who will represent the clinical work force, educators, investigators and researchers in the field of pediatric oncology.
		Development of skills in preparing clinical presentations, discussions of cases, and case reports.
		The programme would teach the student to facilitate learning of medical/nursing students, practicing physicians, para-medical health workers and other providers as a teacher-trainer;

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	General principles of paediatric oncology	09HLTH10A02-001-C
2	Hemato-oncology	09HLTH10A02-002-C
3	Extra cranial solid tumour	09HLTH10A02-003-C
4	CNS tumours	09HLTH10A02-004-C
5	Haematopoietic stem cell transplant[HSCT]	09HLTH10A02-005-C
6	Laboratory training	09HLTH10A02-006-C
7	Generic training in practical skills	09HLTH10A02-007-C
8	Other issues	09HLTH10A02-008-C
9	Research Activities	09HLTH10A02-001-RA

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
General principles of paediatric oncology	09HLTH10A02-001-C	To be able to understand the basics of cancer biology and molecular pathology.
		To understand the pathophysiology of various haematological and solid cancers in children
		To understand the newer advances in molecular diagnostics, risk-stratifications and potentially targetable mutations in various pediatric cancers (solid and haematological)
		To develop the insight and ability to apply this knowledge in the field of clinical and translational cancer research.
Hemato-oncology	09HLTH10A02-002-C	To understand the principles of management of pediatric hemato-lymphoid malignancies so as to be able to provide the best available treatment.
		To familiarise with the diagnostic modalities used for diagnosing and risk-stratifying pediatric haematological malignancies through conventional and advanced molecular modalities
		To be able to collaborate with other disciplines in a multi-disciplinary team setting

		to provide holistic care to children affected by haematological cancer
		To be able to follow-up children treated for heamtological cancers as regards to identifying long-term issues following cancer treatment and make appropriate referrals
Extra cranial solid tumour	09HLTH10A02-003-C	To understand the principles of management of pediatric solid tumours so as to be able to provide the best available treatment.
		To familiarise with the diagnostic modalities (imaging and pathology) as well as recent advances in diagnostics and risk-stratification of pediatric solid tumours
		To familiarise with the various modalities of local therapy including surgery and radiation for treatment of solid tumours in children; to be able to make appropriate recommendations for local therapy in these children
		To be able to collaborate with other disciplines in a multi-disciplinary team setting to provide holistic care to children affected by solid cancers
		To be able to follow-up children treated for solid tumours in order to identify long-term issues following cancer treatment and make appropriate referrals
CNS tumours	09HLTH10A02-004-C	To understand the principles of management of pediatric CNS tumours so as to be able to provide the best available treatment.
		To familiarise with the diagnostic modalities (imaging and pathology) as well as recent advances in molecular diagnostics and risk-stratification of pediatric CNS tumours
		To familiarise with the various modalities of local therapy including surgery and radiation for treatment of CNS tumours in children; to be able to make appropriate recommendations for local therapy in these children
		To be able to collaborate with other disciplines including diagnostics, surgery, radiation, rehabilitation etc. in a multi-disciplinary team setting to provide holistic care to children affected by CNS tumours

		To be able to follow-up children treated for CNS tumours in order to identify late effects of treatment and make appropriate referrals
Haematopoietic stem cell transplant[HSCT]	09HLTH10A02-005-C	To gain basic knowledge on- indications for HSCT/Tissue typing/ Principles of Donor selection/Donor and recipient counselling
		To get primed to common conditioning regimens/stem sell manipulation techniques/ immuno-suppression and transplant immunology
		To be conversant with the management of graft versus host disease and other complications during peri-transplant period along with relevant supportive care.
		To be able to follow-up children undergoing HSCT in order to identify late effects of treatment and make appropriate referrals
Laboratory training	09HLTH10A02-006-C	To familiarise with basic laboratory diagnostic techniques including microscopy, flowcytometry, cytogenetics, immunohistochemistry and molecular pathology
		To be aware of the basics of high throughtput techniques in genomics
Generic training in practical skills	09HLTH10A02-007-C	To be well trained in core oncology procedures like bone marrow aspiration/biopsy, lumbar puncture and administration of intrathecal chemotherapy
		To be conversant in managing critically ill children needing intensive care and life-support
		To be familiar with techniques of chemotherapy handling and administration including handling of central venous access devices
		To get primed to pain-management and palliative care in pediatric oncology
Other issues	09HLTH10A02-008-C	To be conversant with the principles of blood transfusion and component therapy
		To be familiar with infection control practice, nutritional assessment/interventions and supportive care
		To be proficient in effective counselling

		strategies for the patient and parents
		To acquire organisational, managerial and leadership skills
		To know about advocacy, survivorship issues including pediatric oncology programmes in developing countries
Research Activities	09HLTH10A02-001-RA	To be conversant in basic research methodology, statistics and principles of good clinical practice
		To be able to independently conduct prospective studies and retrospective audits
		To be able to present, publish and evaluate research findings

BACK TO MAIN

D.M. in GASTROENTEROLOGY (Program Code: HLTH10A03)

Program Code : HLTH10A03	**Programme Outcome**	At the end of the DM course in Gastroenterology, the student should be able to: Practice the specialty of gastroenterology in keeping with the principles of professional ethics;
		The student should be able to identify social, economic, environmental, biological and emotional determinants of adult gastroenterology diseases and know the therapeutic, rehabilitative, preventive and promotion measures to provide holistic care to all patients;
		The student should be able to take detailed history, perform full physical examination and make a clinical diagnosis; Perform and interpret relevant investigations (Imaging and Laboratory); Perform and interpret important diagnostic procedures; Diagnose gastroenterological illnesses in adults based on the analysis of history, physical examination and investigative work up;
		The student should be able to plan and deliver comprehensive treatment for illness in adults using principles of rational drug therapy; Manage gastroenterological emergencies efficiently;
		The student should be able to plan and advise measures for the prevention of gastroenterological diseases;
		The student should be able to demonstrate empathy and humane approach towards patients and their families and respect their sensibilities; Demonstrate communication skills of a high order in explaining management and prognosis, providing counselling and giving health education messages to patients, families and communities.

Course Structure:

I. Courses at TMC

Program Code : HLTH10A03	**Programme Specific Outcome**	The aim is to teach the student to develop skills as a self-directed learner, recognize continuing educational needs; use appropriate learning resources, and critically analyze relevant published literature in order to practice evidence-based medicine;
		Demonstrate competence in basic concepts of research methodology and epidemiology;
		The programme would teach the student to facilitate learning of medical/nursing students, practicing physicians, para-medical health workers and other providers as a teacher-trainer;
		The programme would teach the student to function as a productive member of a team engaged in health care, research and education.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Luminal Gastroenterology	09HLTH10A03-001-C
2	Hepatology	09HLTH10A03-002-C
3	Biliary and Pancreatic diseases	09HLTH10A03-003-C
4	Basic Endoscopy	09HLTH10A03-004-C

(B) Sub-specialty: Basic training to prepare to future sub-specialty tracks

Sr. No.	Name of the Course	Course code
1	Liver transplant	09HLTH10A03-001-SS
2	Gastrointestinal Oncology	09HLTH10A03-002-SS
3	Pediatric and Geriatric Gastroenterology	09HLTH10A03-003-SS
4	Advanced Endoscopy	09HLTH10A03-004-SS

(C) ANCILLARY COURSES

Sr. No.	Name of the Course	Course code
1	GI and liver pathology	09HLTH10A03-001-A
2	GI imaging	09HLTH10A03-002-A
3	Clinical Nutrition	09HLTH10A03-003-A
4	Allied Clinical Experience: Catheter care, stoma care, consequences of abdominal surgery, management of end-stage digestive diseases.	09HLTH10A03-004-A
5	Clinical Research Methodology	09HLTH10A03-005-A
6	Epidemiology and Public health related to digestive diseases	09HLTH10A03-006-A
7	Basic Sciences: Genetics, Molecular biology	09HLTH10A03-007-A

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Luminal Gastroenterology	09HLTH10A03-001-C	To be able to understand the basics of luminal gastrointestinal anatomy and physiology
		To understand the pathophysiology of various disease processes affecting the luminal GI tract.
		To understand the principles and basis of current treatments of the same as well as newer advances
		To develop the insight and ability to apply this knowledge in the field of clinical and translational research.
Hepatology	09HLTH10A03-002-C	To be able to understand the basics of anatomy and physiology of the liver
		To understand the pathophysiology of various disease processes affecting the liver
		To understand the principles and basis of current treatments of liver disease and newer advances
		To develop the insight and ability to apply this knowledge in the field of clinical and translational research.

Biliary and Pancreatic diseases	09HLTH10A03-003-C	To be able to understand the basics of anatomy and physiology of the bilio-pancreatic system
		To understand the pathophysiology of various disease processes affecting the bile ducts and the pancreas
		To understand the principles and basis of current treatments of liver disease and newer advances
		To develop the insight and ability to apply this knowledge in the field of clinical and translational research.
Basic Endoscopy	09HLTH10A03-004-C	To understand the principles and basis of endoscopic imaging including white light endoscopy, chromoendoscopy and endoscopic ultrasound
		To understand the common indications and contraindications for endoscopic procedures
		To learn the safe and appropriate practise of endoscopy including management of emergencies
		To have thorough knowledge of the various types of endoscopes, accessories and scope reprocessing
		To learn the basic skills well that would enable the student to move on to advanced/ therapeutic endoscopy eventually

(B) Sub-specialty: Basic training to prepare to future sub-specialty tracks

Name of the Course	Course code	Course Outcome
Liver transplant	09HLTH10A03-001-SS	To learn the basic principle of liver transplantation
		To understand the common indications and contraindications for liver transplantation, drugs used in the peri-transplant period and management of post- transplant complications
		To be aware of recent updates in the field off liver transplantation
Gastrointestinal Oncology	09HLTH10A03-002-SS	To understand the multidisciplinary management of GI cancers with a focus on diagnosis, management and palliation of symptoms

		To be aware of cancer pathways and precancerous lesions of the GI tract
		To understand screening and surveillance protocols and their rationale
Pediatric and Geriatric Gastroenterology	09HLTH10A03-003-SS	To learn the basic differences in management of gastrointestinal disorders in these extreme age groups
		To be aware of common disorders in pediatric and geriatric gastroenterologic practise
Advanced Endoscopy	09HLTH10A03-004-SS	To understand the principles and basis of endoscopic imaging including chromoendoscopy and endoscopic ultrasound
		To understand the common indications and contraindications for advanced endoscopic procedures
		To learn the safe and appropriate practise of advanced endoscopic procedures like ERCP, EUS and resections including management of emergencies
		To have thorough knowledge of the various types of endoscopes, instruments, accessories and scope reprocessing
		To be aware of recent advances in therapeutic endoscopy

(C) ANCILLARY COURSES

Name of the Course	Course code	Course Outcome
GI and liver pathology	09HLTH10A03-001-A	To be aware about the normal histopathological features of different parts of the GI system/ liver
		To know the histopathological features of common disorders of the GI system/ liver
GI imaging	09HLTH10A03-002-A	To be aware about the different imaging modalities available and their principles
		To know the indications and contraindications of various imaging modalities so as to be able to prescribe them rationally
		To be aware of the standard guidelines for various diseases with the use of appropriate imaging for each
		To be able to interpret the common GI imaging modalities that are used in the clinic
Clinical Nutrition	09HLTH10A03-003-A	To have knowledge about malnutrition and

		basics of nutritional support
		To be aware of the various nutritional screening tools
		To be able to rationally prescribe nutritional supplements and TPN where needed
Allied Clinical Experience: Catheter care, stoma care, consequences of abdominal surgery, management of end-stage digestive diseases.	09HLTH10A03-004-A	To be aware of the types, indications and care of various catheters used in routine practise and the management of complications associated with the same
		To know about the types of stomas, their indications, management and complications associated with the same
		To know the basic principles of GI surgery, the common surgeries done and the short term and long term complications associated with them
		To know the management options for end stage liver disease including symptom control, palliative care and nutritional support
Clinical Research Methodology	09HLTH10A03-005-A	To be able to grasp the basics of biostatistics and conduct of clinical research and randomised controlled trials.
		To learn the approach to evidence based gastroenterology so as to help and guide patients to choose appropriate modality of treatment.
		To have knowledge about ethics of clinical research and good clinical practise
Epidemiology and Public health related to digestive diseases	09HLTH10A03-006-A	To understand basics of epidemiology and public health
		To understand the common GI disorders and their public health impact
Basic Sciences: Genetics, Molecular biology	09HLTH10A03-007-A	To develop an understanding about basic sciences including genetics and molecular biology
		To understand the basics of genetic disorders of the GI tract
		To understand the applied aspects of basic sciences

D.M. in Critical Care
(Program Code: HLTH10A04)

Program Code : HLTH10A04	Programme Outcome	To train the DM candidates in basics of clinical critical care.
		To understand underlying principles of critical illness in various patient categories, the pathophysiologic basis of mechanisms of disease, the pharmacologic principles guiding various therapies, appropriate monitoring, organ support therapies and end of life support when required.
		To provide holistic management for critically ill patients, including diagnosis, planning treatment, anticipate likelihood of development of organ failure and be a part of the multidisciplinary team delivering treatment in the role of team leader.
		To build clinical skills, obtain technical expertise in various procedures to be performed for providing oran support therapies.
		To create an understanding regarding basic principles of clinical research, and translating application to bedside management of the critically ill patients.
		To provide national and international platform for presentations of research data in the field of critical care.
		The training should produce consultants to practice all over the country, and teachers to propagate training to future generations of trainees in the field of critical care medicine.

Course Structure:

I. Courses at TMC

Program Code : HLTH10A04	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms.
		All the necessary training and mandatory theory are specified in the syllabus of the DM Critical Care Medicine Course.
		The student is expected to participate in the regular appraisal examinations and academic programmes conducted in the institute.
		The purpose would be to acquire an understanding of the subject of Critical Care Medicine
		The candidate’s progress through the 3 years will also be assessed with feedback from all stake holders, including the candidate and work-based assessment.

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	Resuscitation and Initial Management of the Acutely Ill Patients	CCM 1
2	Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation	CCM 2
3	Disease Management	CCM 3
4	Therapeutic interventions/organ system support in single or multiple organ failure	CCM 4
5	Practical procedures	CCM 5
6	Peri-operative care	CCM 6
7	Comfort and Recovery	CCM 7
8	End of life care	CCM 8
9	Pediatric Care	CCM 9
10	Transport	CCM 10
11	Patient safety and health systems management	CCM 11
12	Professionalism	CCM 12
13	Physics & Clinical Measurement Mathematical Concepts	CCM 13
14	Research Methods	CCM 14
15	Applied Anatomy	CCM 15
16	Physiology & Biochemistry	CCM 16
17	Pharmacology	CCM 17

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Resuscitation and Initial Management of the Acutely Ill Patients	CCM 1	Learn and Develop clinical skills for emergent resuscitation and acute care of critically ill, obtain technical expertise in various procedures to be performed for providing organ support therapies.
Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation	CCM 2	To understand principles of disease in various patient categories, the pathophysiologic basis of mechanisms of disease, the pharmacologic principles guiding various therapies, institution and interpretation of appropriate monitoring modalities and devices

Disease Management	CCM 3	To provide comprehensive management of critically ill patients, including diagnosis, planning treatment and interventions , anticipate likelihood of development of organ failure and take and develop leadership skills while managing care by multidisciplinary team
Therapeutic interventions/organ system support in single or multiple organ failure	CCM 4	Develop core skills and expertise in various procedures required in critically ill and provide multiple organ support therapies
Practical procedures	CCM 5	Develop core competencies and skills in various procedures required in critically ill Develop expertise in conducting diagnostic and therapeutic procedures for treatment in critically ill
Peri-operative care	CCM 6	Develop understanding in managing routine perioperative and postoperative care and develop competence and expertise in diagnosing and treating complications
Comfort and Recovery	CCM 7	Understanding the core concepts of values and ethics in providing Comfort care to patients while undergoing disease treatment
End of life care	CCM 8	Develop and understand key principles of Compassionate care while providing End of life Care and comfort care of terminally ill
Paediatric Care	CCM 9	To understand principles of diseases in paediatric patient, the pathophysiologic basis of mechanisms of disease, the pharmacologic principles guiding therapies, institution and interpretation of appropriate monitoring modalities and devices
Transport	CCM 10	Develop proficiency in transport medicine with key understanding of the risks and the nuances of transporting critically ill from one care giving location to other, with special understanding about intra-hospital and inter-hospital transports. Develop leadership qualities for orchestrating a safe transport with optimum use of logistics
Patient safety and health systems management	CCM 11	Develop and dissipate knowledge and practices regarding maintaining high safety standards to patients and care givers
Professionalism	CCM 12	Develop and practice professional and ethical care to all the critically ill as well as conducting oneself morally and ethically

Physics & Clinical Measurement Mathematical Concepts	CCM 13	Thorough knowledge of Medicine, physiology and the clinical course of disease process. To Develop knowledge regarding the working principles and key concepts of various monitoring devices
Research Methods	CCM 14	To create an understanding regarding basic principles of clinical research ,statistics and emphasis on Good Clinical Practice guidelines (GCP) and translating this knowledge application to bedside management of the critically ill patients.
Applied Anatomy	CCM 15	Develop knowledge of the anatomy and applied anatomy basics
Physiology & Biochemistry	CCM 16	Develop knowledge about basics and alteration of Physiology and Biochemistry and its use in Care of critically ill patients
Pharmacology	CCM 17	Acquire knowledge about pharmacology principles and various drugs and application of this knowledge for Care of critically ill patients

D.M. in ONCOPATHOLOGY
(Program Code: HLTH10A05)

Course Structure:

I. Courses at TMC

Program Code : HLTH10A05	Programme Specific Outcome	Understand and apply principles of oncopathology(grossing, immunohistochemistry) for rendering a meaningful oncopathology report
		Understand importance of multi-disciplinary management of patients and contribute to same effectively
		Provide exposure in various branches of oncopathology including solid tumors, cytology, fluid hematopathology and molecular diagnostics
		Engage in research and life long learning to adapt to changing needs of oncology

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	Theoretical knowledge	09HLTH10A05-001-C
2	Practical and clinical skills	09HLTH10A05-001-P
3	Writing project/ Research articles	09HLTH10A05-001-R
4	Inter-personal relationship and communication skills.	09HLTH10A05-002-C
5	Training in Research Methodology, Medical Ethics and Medicolegal aspects	09HLTH10A05-003-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Theoretical knowledge	09HLTH10A05-001-C	Pathogenesis and diagnostic approach and work up od benign and neoplastic diseases of all specialties in oncopathology

		Immunohistochemistry principle, basics, methods, [manual automated], trouble shooting and quality assurance
		Research methodology and Quality management system including quality control, quality assurance and quality indicators in laboratory medicine
		Basic cell biology, carcinogenesis and molecular pathways
Practical and clinical skills	09HLTH10A05-001-P	Grossing protocols of all common oncology surgical specimens and guidelines for handling all other specimens. Protocols for Obtaining tissues for ancillary methods
		Order and Interpret immunohistochemistry results in all cancers including flow cytomtery immunophenotyping, Be able to participate in Standardization and validation of newer antibodies and quality assurance in IHC lab
		Teaching oncopathology to postgraduates, nurses and paramedical staff including laboratory personnel
		Initiate research questions and systematically write or present a paper and publish in a journal
		Be aware of quality control and bio-safety and waste disposal issues in a laboratory
		Constantly update knowledge of recent advances in oncopathology and allied subjects
Writing project/ Research articles	09HLTH10A05-001-R	Identification of important peer reviewed journals. Demonstrate ability to search literature for information
		Evaluate levels of evidence in literature
		Demonstrate ability to critically evaluate published studies
		Demonstrate ability to design, plan and do a research study/ audit as part of curriculum
		Demonstrate ability to take informed consent before procedures
Inter-personal relationship and communication skills.	09HLTH10A05-002-C	Understanding of importance and criticality of the laboratory tests and reports

		Demonstrate objectivity in interpretation of morphology
		Understand ones limitation in interpretation of tests and knowledge and to communicate the same to patients and colleagues
		Demonstrate skills in teaching junior staff, laboratory workers and medical colleagues
		Demonstrate effective communication skills in explaining reports to patients, delay in reports and counseling them if necessary including disclosure of laboratory errors
		Demonstrate effective communication skills in interacting with clinical and multidisciplinary teams in difficult cases
Training in Research Methodology, Medical Ethics and Medicolegal aspects	09HLTH10A05-003-C	Participate and present in Slides Meetings by faculty including MAPCON
		Participate and present Multidisciplinary joint meeting and Tumour boards and Journal Clubs
		Participate and present in Gross Specimen meetings
		Acquire training in Good Clinical practice
		understand Institutional IEC protocols be able to write a study protocol for thesis
		Be able to analyse SPSS based survival analysis

D.M. in INTERVENTIONAL RADIOLOGY (Program Code: HLTH10A06)

Program Code : HLTH10A06	Programme Outcome	To train the residents in skills in various aspects vascular and non-vascular Intervention.
		To be able to participate in holistic management including diagnosis, planning treatment and performing vascular and non-vascular procedure. To contribute in multi-disciplinary team discussion in approaching particular case.
		To understand the need to identify emergency scenario and prompt reporting to help in patient management.
		Encourage and guide the residents for various paper and case presentations at national and International level.

Course Structure:

I. Courses at TMC

Program Code : HLTH10A06	Programme Specific Outcome	The candidate should complete the necessary training and mandatory theory as specified in the syllabus of the DM Interventional Radiology course.
		To participate and excel in the appraisal exams held each year of both theory and practical.
		To learn the need and importance of multidisciplinary approach in patient management.
		To attend and participate in lectures, case discussions and contribute value adding points.
		Provide adequate exposure to interventional non oncology cases in Interventional Radiology to give wholesome training.

(A) CORE COURSE

1ST YEAR

Sr. No.	Name of the Course	Course code
1	Basics of Clinical aspects	09HLTH10A06-001-C
2	Basics of interventional vascular/non-vascular catheterization laboratory	09HLTH10A06-002-C

2^{ND} YEAR

Sr. No.	Name of the Course	Course code
1	Imaging of the vascular & non-vascular system: general principles	09HLTH10A06-003-C

3^{RD} YEAR

Sr. No.	Name of the Course	Course code
1	Vascular Intervention: General	09HLTH10A06-004-C
2	Vascular Intervention: Specific territories	09HLTH10A06-005-C

Course Outcomes:

(A) CORE COURSES

1^{ST} YEAR

Name of the Course	Course code	Course Outcome
Basics of Clinical aspects	09HLTH10A06-001-C	To gain an in-depth understanding of Image Guided Intervention in being able to evaluate, diagnose, treat and follow-up a patient.
		To understand the pathogenesis and biology of various diseases so as to interpret the imaging findings and correlate with clinical scenario.
		To Understand Epidemiology including expected outcomes.
		To understand pathophysiology including aetiology – risk factors.
		To understand the relevant anatomy for all the various organ systems in the body relevant to IR practice including embryology and normal variants.
		To understand the complementary roles of the various imaging modalities in the assessment planning, treatment and overall management of patient.
		To understand the basic physics and mechanisms of the various modalities and equipment used in Interventional Radiology so as to plan and modify protocols on case to case basis. To be able to decide the modality which can be used in a specific indication.
		To understand the principles and application of radiation protection to the working personnel's, staffs as well as the patients. Regular monitoring of the same.

		The candidate's progress through the 3 years will also be assessed with feedback from all stake holders, including the candidate.
Basics of interventional vascular/non-vascular catheterization laboratory	09HLTH10A06-002-C	The candidate should know the indications, contraindications and understand the range of treatment strategies including, endovascular/interventional and alternatives treatment to a level sufficient to be able to discuss management with patients and formulate appropriate treatment plans within an MDT.
		The candidate should be able to select appropriate laboratory and imaging investigations pertinent to treatment for all the relevant organ systems.
		The candidate should know the outcomes of interventional procedures including complications, how to avoid them and their management.
		The candidate should be understanding pre-, peri- and post-procedural drug requirements including the use of chemotherapeutic drugs used in oncology and embolization.
		The resident should also understand the main characteristics, advantages and limitations of a given procedure and devices to be used: – Needle for biopsy: size and tip characteristics – Ablation devices: different energies used for achieving tissue ablation in different organs and structures (microwave ablation (MWA), radiofrequency ablation (RFA), laser ablation, cryoablation (CRYO), high-intensity focussed ultrasound (HIFU)) – Vascular and drainage catheter shapes and characteristics to be chosen according the anatomical region.
		The resident should be competent to perform following procedures: **1) Image guided biopsy:** •Demonstrate competence in safely performing percutaneous biopsy of lesions in the chest, abdomen and pelvis, bone soft tissue. • Be familiar with a variety of biopsy needles (histology, cytology) and techniques. • Be able to treat patients with post-biopsy pneumothorax including conservative management or placement of a chest drain if necessary. • Be familiar with how to treat patients with significant haemorrhage following biopsy.
		2) Image guided drainage: • Identify the safest and most expeditious route of drainage for abscess collections in various anatomic locations throughout the chest, abdomen and pelvis.

		• Demonstrate skill at image-guided puncture and drainage of a range of target lesions in common sites and conditions. • Demonstrate understanding of dilatation of established drainage tracks for placement of larger bore catheters. • Identify potentially difficult cases such as multiloculated abscess cavities that may require placement of multiple catheters for adequate drainage or instillation of fibrinolytic agents to aid in drainage. • Be familiar with a wide variety of coaxial needles drainage catheters and guide wires for the purposes of percutaneous abscess drainage.
		3) Hepato-Pancreatico-Biliary (HPB) Intervention: • Demonstrate familiarity with a wide array of percutaneous biliary access systems, and all equipment available for HPB interventional procedures including access and drainage systems, balloons, stents and stent grafts. • Demonstrate skills in percutaneous transhepatic cholangiography and biliary drainage under a combination of fluoroscopic and ultrasound guidance. • Demostrate skills in percutaneous biliary duct occlusion using a variety of embolic materials. • Organise appropriate post-procedural management following drainage procedures to assess response to the intervention and recognise and manage complications including haemorrhage, infection, drain displacement. • Arrange post-drainage procedures and interventions including, as appropriate, check cholangiography, conversion to internal drainage, biliary stenting by percutaneous or combined radiological – endoscopic methods. • Identify patients who will benefit from an expanding metal stent. • Describe the major complications associated with percutaneous transhepatic cholangiography and biliary drainage and management of them. • Recognise patients at high risk of sepsis following biliary interventions and understand how to treat post-procedural sepsis. • Manage patients with arterio-biliary fistulae or bleeding following percutaneous biliary drainage. • Demonstrate skills in treating complications of pancreatitis including recognising and treating further complications such as haemorrhage. • Demonstrate skills in treating focal liver diseases such as liver abscess.
		4) Percutaneous Nephrostomy Insertion:

		• Understand the technical aspects for diagnostic evaluation of pelvicalyceal and ureteric obstruction. • Describe the various imaging techniques for accessing the upper tracts safely and successfully: – Ultrasound (freehand and guided techniques) – Fluoroscopy – Computed tomography (freehand and guided techniques) – Blind puncture. • Demonstrate knowledge and understanding of planning access intervention. • List the relative risks related to a different choice of calyceal access. • Describe the various puncture techniques to access the upper tracts safely and successfully. • Describe the use of contrast, air and CO2 to identify appropriate calyx for puncture. • Describe and demonstrate knowledge of parallax fluoroscopy to access the upper tracts. • Understand the correct technique for placement of external drainage nephrostomy catheter. • Understand the various catheter fixation techniques available. • Describe the maintenance of long-term nephrostomy drainage, catheter exchange replacement of dislodged catheters antegrade and placement of ureteric stents.
		5) Vascular access: • Understand the standard groin anatomy, including the position of the inguinal ligament and the femoral nerve, artery and vein. • The Seldinger technique of arterial and venous puncture. • Ultrasound-guided vessel puncture. • Mechanisms for guidewire, sheath and catheter insertions into the groin. • Mechanisms of puncture site haemostasis including manual compression and the use of common closure devices. • Alternative sites of arterial puncture, such as brachial, axillary, popliteal, tibial, pedal, radial and ulnar. • Understand the roles and the advantages and disadvantages of each access.

2ND YEAR

Name of the Course	Course code	Course Outcome
Imaging of the vascular & non-	09HLTH10A06-003-C	The resident should be competent in carrying out imaging and integrating the different range of

vascular system: general principles		imaging modalities for the relevant organ systems for diagnosis, staging, follow-up and directing therapies including Ultrasound, MR Angiography, CT, PET CT and Scintigraphy.
		The resident should be able to understand the mechanisms, complementary roles and limitations of the different imaging techniques including ultrasonography, magnetic resonance angiography, computed tomography angiography, catheter angiography (including Digital Subtraction Angiography and 3-D Rotational Angiography) cone beam CT and image fusion in the investigation and treatment guidance of the different organ systems. The residents should develop understanding of different imaging with respect to the following: • Be able to interpret pre-treatment images • Be able to stage disease with reference to images • Be able to interpret post-treatment images and follow-up images with reference to posttreatment sequelae • Be able to identify local post-treatment recurrences • Be able to interpret imaging changes in post-operative patients • Be able to interpret imaging changes in patients on antiangiogenics
		The resident should be familiar with: • Guidewires, sheaths and catheters (pigtail and selective) used for common diagnostic angiographic procedures. • Digital subtraction angiographic techniques, bolus chase techniques, road mapping, smart mask and pixel shift techniques. • Standard arterial and venous anatomy and variations in anatomy throughout the body. • Peripheral vascular angiography. • Mesenteric and renal angiography. • Abdominal aortography. • Thoracic aortography. • Carotid, vertebral and subclavian angiography. • Diagnosis of atherosclerotic disease, vasculitis, aneurysmal disease, thrombosis, embolism and other vascular pathology. • Post-procedural care regimens for standard diagnostic vascular procedures.
		Resident should understand the risks associated with the different imaging modalities including: • Contrast medium related: Iodinated contrast.

		• The risk factors for developing nephrogenic systemic fibrosis (NSF) with differing Gadolinium agents. • The complication rates for common diagnostic catheter procedures. • Exposure to ionising radiation, both for the patient and the IR team. • Magnetic resonance imaging including the effects of and on implanted materials, e.g. pacemakers, vascular stents and implants, prosthetic joints. • Physical injury during/as a result of arterial catheterisation.
		The resident should have image interpretation skills to be able to understand: • Normal vascular anatomy • Organ anatomy and system anatomy • Correlations between the real anatomy (surgical anatomy) and imaging anatomy (CT, magnetic resonance (MR), ultrasound (US), angiography and X-rays) • Most common distortions and changes in anatomy occurring after surgery • Most common anatomical variations • Liver segmentation and its relationship with surrounding structures • Liver parenchymal structure (the concept of “liver’s functional unit”) • Liver vascular anatomy, including arterial, portal, and venous anatomy • Biliary anatomy • Most common liver anatomical variations in vascular and biliary anatomy • Common post-operative modifications of liver anatomy and biliary route (e.g. biliary diversions) • Renal anatomy and its relationship with surrounding structures • Arterial and venous renal distribution • Anatomy of the collecting system • Most common anatomical variations of the vascular and collecting system • Post-operative anatomical variations of the vascular and collecting system (e.g. urinary diversions) • Anatomy of lungs (lobes/segments) and their relationships with surrounding structures • Vascular anatomy of the lungs (pulmonary arteries and veins, bronchial arteries) • Airways anatomy • Most common post-surgical vascular anatomy and airways variations

		• Anatomy, parenchymal structure, relationships with surrounding structures, vascular anatomy, most common anatomical variations and possible post-surgical changes of any other organs including the pancreas, adrenal glands, thyroid, lymph nodes and bones

3[RD] YEAR

Name of the Course	Course code	Course Outcome
Vascular Intervention: General	09HLTH10A06-004-C	The resident should acquire clinical, pathological and radiological understanding of diseases and conditions requiring vascular treatments. • Perform vascular treatments in emergency or elective settings. • Recognition and management of complications. • Know how to perform and handle imaging workup before and after vascular treatments. • Clinical assessment of patients before and after the treatment. • Understand the changes that will occur in different organs parenchyma after vascular treatments. • Know different agents that may be injected (delivery, side effects). • Accurately report key findings and treatment steps.
		Vascular Intervention: • Plan the vascular procedure depending on the indication. • Understand the material used for procedures, and know which one to use with reference to the indication. • Know basic and advanced guidance techniques (digital subtraction angiography (DSA), 3D imaging). • Perform diagnostic angiography. • Perform angioplasty and stent placement. • Perform embolisation (arterial and venous). • Perform basic and advanced chemoembolisation. • Perform radioembolisation. • Perform arterial or venous thrombolysis and thrombectomy. • Place access lines. • Place and retrieve superior and inferior vena cava filters. • Perform dialysis fistula interventions. • Perform foreign body retrieval. • Place closure devices

		Non-vascular Intervention: • Plan optimal procedural access, patient positioning and relevant/optional image guidance methods • Demonstrate competence in using the current technologies • Plan the procedure depending on the indication • Understand the material used for procedures (balloons, stents, drains, etc.) and know which one to use with reference to the indication • Be able to use adjunctive procedures such as hydro-dissection, CO2 dissection, ureteral stenting, etc. in order to optimise the procedural outcome • Know basic and advanced guidance techniques • Perform drainage (collection, bile, urinary, etc.) • Perform nutritional procedures (gastro and jejunostomies) • Perform conversion from drain to stent (urinary and biliary)
Vascular Intervention: Specific territories	09HLTH10A06-005-C	**Venous Intervention** **The resident should develop technical skills in the following Venous Intervention:** 1) Central venous access 2) Venous Thrombosis and Insufficiency 3) Pulmonary thromboembolic disease 4) Superior and inferior vena cava disease 5) Portal and hepatic venous interventions 6) Gonadal venous interventions 7) Venous sampling **1) Central venous access:** •Demonstrate proficiency in Doppler US for demonstrating and assessing venous anatomy • Demonstrate competence in US-guided puncture of the internal jugular, external jugular, axillary, subclavian, upper limb and femoral veins • Be competent in insertion of temporary and tunnelled lines via the jugular, subclavian and femoral approaches • Be competent in placement of arm and chest wall ports • Recognise when a central catheter is in an abnormal position on post-procedural imaging • Be aware of alternative strategies where standard routes of access are unavailable, including tunnelled femoral lines, translumbar IVC lines, transhepatic lines, US-guided puncture of the innominate veins and recanalisation of occluded central veins to facilitate access Management of complications, i.e.: • Be competent in insertion of chest drains for pneumothorax

		• Be competent in management of massive air embolus • Be competent in snare retrieval of intra-vascular catheter fragments • Know techniques for repositioning malpositioned lines • Be able to perform fibrin sheath stripping • Know the range of central venous catheters, ports, PICCs, dialysis and apheresis lines • Know maximum flow rates achievable with different catheters • Know the maximum pressures to which lines may be subjected **2) Venous Thrombosis and Insufficiency:** • Demonstrate competence in percutaneous therapies such as laser, radiofrequency ablation and foam sclerotherapy and avoidance of complications • Recognise the relative risks and benefits associated with treatment of varicose veins including DVT, infection, skin slough, etc. • Demonstrate competence in mechanical and pharmacological thrombolysis and its complications • Demonstrate knowledge of various venous stents and appropriate placement of venous stents **3) Pulmonary thromboembolic disease:** • Be familiar with a wide range of interventional equipment including guidewires, catheters, aspiration and mechanical thrombectomy catheters and permanent and optional IVC filters • Understand the potential advantages and limitations of various types of filters including the maximal caval diameter in which each type of device may be placed • Demonstrate technical competence in the performance of femoral and jugular venous access using ultrasound guidance, pulmonary angiography, pulmonary thrombolysis and mechanical thrombectomy, inferior vena cavography, IVC filter placement and retrieval • Integrate the use of intraprocedural pressure monitoring in performing pulmonary angiography • Ensure post-procedural protocols are in place, including date for retrieval of optional filters **4) Superior and inferior vena cava disease:** • Demonstrate technical competence in the performance of SVC and IVCO recanalisation, including venous access using ultrasound guidance, catheter-directed thrombolysis, balloon dilatation and stent placement

		• Be familiar with the interventional equipment including guidewires, sheaths, catheters, balloons and various types of stents/stent-grafts • Be familiar with the use of re-entry devices **5) Portal and hepatic venous interventions:** • Recognise the patterns of portal vein occlusion including cavernous transformation of the portal vein and the important collateral pathways • Be familiar with the equipment used in the TIPS procedure including guidewires, sheaths, catheters, balloons, stents, embolic materials, and transhepatic cannulation kits • Discuss the benefits of using covered stents versus bare stents • Know the normal ranges for portal venous pressures, central venous pressures, and portosystemic pressure gradients, including target ranges for post-TIPS portosystemic pressure gradients • Demonstrate knowledge of the anatomical relationship between portal vein and systemic intrahepatic veins and their impact for TIPS • Demonstrate technical competence in the performance of all procedural aspects of TIPS using fluoroscopic and ultrasound guidance • Recognise and manage intra- and post-procedural complications of TIPS, including haemoperitoneum, haemobilia, biliary-shunt fistula formation, progressive liver failure, shunt thrombosis or occlusion, right heart failure, and hepatic encephalopathy • Demonstrate competence in the performance of TIPS revision procedures, including the management of shunt stenosis or occlusion • Demonstrate competence in the performance of variceal embolisation using a variety of agents including coils, plugs, glue, Onyx, etc. • Demonstrate competence in the performance of BRTO **6) Gonadal venous interventions:** • Demonstrate technical competence in performing venous access from different routes (jugular, antecubital, femoral) under ultrasound guidance and performing venography • Be familiar with different embolic agents used in embolisation of gonadal veins and internal iliac veins in women • Be aware of complications and their management **7) Venous sampling:**

		• Demonstrate competence in performing venous sampling and peripheral venous or arterial stimulation • Be familiar with the catheters and wires used in venous sampling • Recognise and manage complications
		Neurointervention **Carotid:** **The resident should develop technical skills in carotid intervention as follows:** • Demonstrate technical competence performing carotid and supra-aortic interventions including but not limited to balloon angioplasty, stent placement and use of cerebral protection devices • Know the types and rates of expected complications of percutaneous interventions and how to manage them • Manage acute embolic complications during percutaneous carotid interventions with catheter directed thrombolysis and other techniques **Stroke:** **The resident should develop technical skills in stroke management as follows:** • Demonstrate competence in performing a mechanical thrombectomy procedure • Be familiar with the materials needed for Transarterial thrombectomy (i.e. guiding catheters, micro catheters, micro guide wires) • Know the most commonly used thrombectomy devices (stent-retrievers, hydrodynamic devices) • Know the potential risks and complications (dissection, perforation, thrombus dislodgement) and their management • Demonstrate competence in performing intra-arterial thrombolysis
		Peripheral Intervention **Aorta:** **The resident should develop technical skills in aortic intervention as follows:** • Demonstrate competence in planning stent-graft repair using cross sectional imaging on a high-quality workstation • Demonstrate competence in the techniques of endovascular repair of aortic aneurysms or dissections, including:

		– Pre-/peri-procedural transcatheter occlusion of significant branch vessels – Preparation, insertion and deployment of the current aortic stent-graft devices – Post-deployment manoeuvres required to safely remove the device introducer and close the access site • Recognise patients with anatomy unsuitable for conventional access for endovascular repair and suggest alternative methods of stent-graft placement • Recognise the complications that may arise during endovascular repair and their appropriate management: – Dissection, occlusion or rupture of the access vessels, the aorta or the aneurysm sac – Coverage of important branch vessels, e.g. the carotid, subclavian, spinal, renal or internal iliac arteries – Distal embolisation of the arch vessels or the mesenteric, renal or lower limb vessels – Contrast reactions and contrast induced nephropathy (CIN) – Cardio-respiratory complications related to prolonged general anaesthesia in patients with poor cardiovascular reserve • Demonstrate competence in the techniques for the management of endoleaks. **Peripheral Arteries:** **The resident should develop technical skills in management of peripheral arterial disease.** • Demonstrate ability to plan optimal vascular access and vascular closure • Demonstrate technical competence of puncture site management • Be able to categorise arterial lesions according to the expected outcome, e.g.: – Technical success – Complications – Clinical outcome – Restenosis • Demonstrate technical competence in the performance of peripheral vascular interventions including: – Crossing stenosis with selective catheters and guidewires – Recanalisation techniques of total occlusions including subintimal recanalisation and use of re-entry devices

		– Balloon angioplasty and stent placement – Catheter-directed thrombolysis and Percutaneous Aspiration and Mechanical Thrombectomy – Management of complications • Demonstrate correct selection and use of equipment including: – Guidewires – Catheters – Sheaths – Balloons • Atherectomy devices – Stents and stent-grafts • Understand the role of intravascular pressure gradients including the use of vasodilators to assess the outcome of vascular interventions • Differentiate between embolic occlusion and in situ thrombosis in cases of acute limb ischaemia and tailor therapy accordingly • Demonstrate ability to recognise and manage the potential complications of endovascular procedures such as balloon angioplasty, stenting, stent grafting and catheter-directed thrombolysis/percutaneous aspiration and mechanical thrombectomy • Understand the indications, contraindications and limitations of puncture site closure devices • Recognise the role of emerging treatments for restenosis including: – Local drug delivery • Percutaneous atherectomy – Endovascular brachytherapy **Visceral Arteries:** **The resident should develop technical skills in visceral arterial intervention:** **Mesenteric artery:** • Demonstrate competence in superselective catheterisation and selection of wires, catheters, stents and suitable embolic materials according to anatomical site • Demonstrate technical competence in performing angioplasty, stenting, stent-grafting and embolisation in these vascular territories • Demonstrate competence in the techniques and equipment used in embolisation for acute and chronic gastrointestinal blood loss. • Demonstrate competence in the techniques and the range of equipment used in embolisation and exclusion of visceral artery aneurysms • Demonstrate knowledge of potential complications and preventative strategies in the treatment of visceral artery aneurysms

		• Demonstrate competence in the angiographic techniques for the assessment of acute and chronic mesenteric ischaemia • Understand and evaluate suitability for endovascular treatment • Demonstrate competence in the techniques and equipment used in the endovascular management • Demonstrate competence in performing angiography in a patient with vasculitis • Demonstrate competence in the endovascular treatment of vasculitis **Renal artery:** •Demonstrate competence with the equipment and techniques used in the treatment of renal artery stenosis • Integrate the use of intra-procedural intra-arterial pressure measurements in assessing the results of renovascular interventions • Know the types and rates of complications of renovascular interventions and demonstrate competence in the management of those • Demonstrate competence in the techniques and equipment used in the treatment of renal haemorrhage secondary to iatrogenic or direct trauma. **Bronchial & Pulmonary artery:** •Demonstrate competence in catheterising and embolising the bronchial and pulmonary arteries. • Demonstrate competence and understanding in the management of complications of various visceral arterial interventions. **Uterine artery:** •Demonstrate technical competence in pelvic angiography and uterine artery catheterisation and embolisation • Know potential complications of uterine artery embolisation and their management. **Prostatic artery:** • Acquire the necessary competence to carry out prostate artery embolisation. • Understand the complications of prostate artery embolisation and how to manage them.
		Interventional Oncology:

		The resident should develop technical skills in organ specific image guided interventions: **1) Lung (Primary & Metastatic)** **The residents should develop technical skills in the treatment of primary and metastatic lung disease.** • Plan optimal procedural access, patient positioning and relevant/optional image guidance methods in accordance to the ALARA principle • Be able to use separation techniques to help create a buffer zone between the tumour and neighbouring vital structures such as pleura, mediastinum and diaphragm (e.g. artificial pneumothorax/hydrothorax, pneumomediastinum) 44 Upper GI: Stomach and Oesophagus • Be able to decide which kind of ablative technology (MWA, RFA, CRYO, IRE) to use for treatment depending on the type and location of tumour, its size and its imaging, pathology characteristics and adjacent structures (vascular, bronchi, mediastinal structures, nerves and heart) • Plan the correct positioning of the electrodes in the tumour to achieve optimal results with the least possible complications • Plan the size of the electrode to use and the number required to receive acquired ablation effect • Know when and how to avoid pleural burns • Know when to do a prophylactic infiltration of long acting local anaesthetic to prevent pain due to pleural burns • Decide when to treat bilateral disease in the same setting or in a second setting • Recognise the differences between the lung and parenchymal organs such as liver and kidney in terms of thermal and electrical conductivity which result in differences in ablation times and protocols • Be able to recognise intra-procedural pneumothorax or haemorrhage as soon as possible and be able to establish appropriate management by aspiration, placement of a chest tube, embolisation or consultation of surgical colleague for adequate treatment
		2) Upper GI (Stomach & Oesophagus): **The residents should develop technical skills to treat patients with Stomach and Oesophageal cancer requiring image guided interventions.**

		• Have knowledge on the vascular anatomy and the various anastomoses in the upper GI tract • Know the use of microcatheters and micro-guidewires for superselective embolisation • Know which size of particles can be used for tumour embolisation to diffuse gastric cancer bleeding in order to optimise bleeding control and to minimise ischemic complications • Know how to embolise macroscopic bleedings in the upper GI tract (due to vessel erosion, pseudoaneurysms) with the use of microcoils. Have knowledge on the importance to embolise distal and proximal to the bleeding due to possible retrograde distal perfusion through collaterals • Be familiar with techniques of image-guided gastrostomy and be familiar with the different available systems • Be able to place a gastrostomy with and without assistance of a nasogastric tube • Understand the role of peri-interventional antibiotics in gastrostomy placement. **3) Hepatic: Primary and Metastatic.** **The residents should develop technical skills to treat patients with primary and metastatic liver disease requiring vascular and non-vascular interventions.** **3.a) Technical skills in vascular hepatic arterial interventions:** • Know the indications and absolute and relative contraindications to chemo/radioembolisation • Demonstrate technical competence in performing lobar, segmental and targeted embolisation therapy • Know the different types of catheters, guide wires and sheaths available to make access easier • Know the use of micro catheters and micro-guide wires for super selective treatments (especially chemoembolisation) • Know when to use TACE and when to use drug-eluting Beads (DEB) TACE. • Know which size of beads to use in which size of tumours • Know which chemotherapy to charge the beads with depending upon the tumour • Understand the difference between conventional TACE (cTACE) and DEB TACE • Know how to protect adjacent structures (duodenum, stomach, skin, etc.) during radioembolisation

		• Know the differences between radioembolic microsphere in terms of size, materials and isotope • Understand how to plan a dose for radioembolisation • Know when a single lobar treatment needs to be done and when both lobes can be treated simultaneously • Understand the concept of radiation segmentectomy • Understand the concept of bland embolisation for neuroendocrine metastases • Be able to manage tumour bleeds (intra- and extratumoural) **3.b) Technical skills in portal Vein interventions:** • Recognise the anatomy of intrahepatic portal vein branches and their relationships with tumour bearing liver segments. • Know the differences and indications for ipsilateral and contralateral transhepatic approaches in PVE. • Be familiar with the equipment used in PVE including guidewires, sheaths, catheters, embolic materials and transhepatic cannulation kits. • Be competent at US-guided transhepatic puncture of intrahepatic portal vein branches. • Demonstrate technical competence in the performance of all procedural aspects of PVE, for ipsilateral and controlateral transhepatic approaches. **3.c) Technical skills in non-vascular hepatic interventions:** • Demonstrate competence in the current technologies available in IGA therapy including ethanol, radiofrequency and MWA • Understand the evolving technologies in this area including cryotherapy and irreversible electroporation (IRE) • Recognise the limitations of current ablation technologies and have knowledge of techniques used to achieve larger volumes of ablation (e.g. overlapping ablations, perfused devices and adjunctive techniques) • Recognise that energy-based IGA therapy in specific locations may cause injury to non-target areas such as the diaphragm, bowel, stomach and major bile ducts and know strategies to reduce these risks and to perform IGA therapy with greater safety, better patient tolerance and a reduced risk of treatment failures (e.g. technique of artificial ascites, bile duct cooling, artificial pneumothorax and separation of organs with CO2)

		• Be able to recognise intraoperative and post-operative complications of IGA therapy and undertake the appropriate investigation and management of complications such as haemorrhage, infection and GI perforation **3.d) Technical skills in biliary intervention:** • Demonstrate knowledge and understanding of safe biliary puncture • Show competence in decision-making in which lobar duct to access in order to achieve the best drainage • Be competent at ultrasound-guided puncture of intrahepatic biliary radicals (dilated or non-dilated) • Know how to access an intrahepatic biliary radical under fluoroscopic guidance • Have an understanding and knowledge of sheaths, guidewires, catheters, endobiliary biopsy forceps (cardiotomy or punch biopsy forceps), different types of internal-external drains and/or external drains • Understand the concept of a rendezvous with ERC through biliary drainage • Have knowledge of the types of stents available and when to use covered, partially covered, uncovered or removable stents • Recognise trauma to the adjacent vascular structure (portal vein or hepatic artery branch) with haemobilia • Demonstrate knowledge of how to manage complications secondary to biliary interventions **4) Renal Cancer:** **The residents should develop skills in vascular and non-vascular techniques to treat renal cancer** **4.a) Technical skills in renal cancer ablation:** • Demonstrate competence in the available ablation technologies including CRYO, RFA and MWA • Plan optimal procedural access to the tumour, patient positioning and relevant/optional imageguidance methods 54 Prostate Cancer • Plan the size and number of radiofrequency electrodes, cryo-probes or microwave antennas that are necessary to achieve a satisfactory ablation zone according to the tumour size, location and vascularity • Discuss with the anaesthetist the need/advantages of general anaesthesia/sedation and the utility of jet ventilation

		• Understand associated interventions (e.g. embolisation) that can be performed to improve the outcome of IGA • Recognise that energy-based image-guided ablation therapy in specific locations may cause injury to non-target areas (bowel, duodenum, pancreas, adrenal glands, ureter, etc.) • Be able to use the different thermal insulation (hydro-, CO2- and balloon-dissection, as well as pyeloperfusion) in order to protect the surrounding structures at risk • Be able to recognise intra-operative and post-operative complications of IGA therapy and undertake the appropriate investigation and management of complications such as haemorrhage, infection, urinomas, ureteral strictures and digestive fistulas **4.b) Technical skills in vascular renal cancer:** • Know the indications of palliative embolisation and arterial embolisation in combination with thermal ablation techniques • Demonstrate technical competence in performing targeted selective embolisation • Know the different types of catheters, guidewires, microcatheters and sheaths available to make access easier • Know the different embolic agents that can be used **5) Prostate Cancer:** **The residents should develop skills in treatment of prostatic cancer** • Acquire the necessary competence to carry out TRUS-guided prostate biopsies according to local protocols • Competence in guidance for brachytherapy implants • Know how to plan for cryotherapy of prostate gland • Be able to plan the number and type of electrodes needed and where to position them • Know how to create a separation plane between the rectum and the prostate to avoid rectal complications • Understand how to protect the urinary bladder during ablation procedures • Know how to monitor the progress of the ice ball and when to stop • Understanding of planning for HIFU and how to place the probe for tumour ablation

		• Understanding and planning for laser ablation • Know how many laser fibres will be needed and where to place them to achieve an effective and complete ablation **6) Musculoskeletal Cancer:** **The residents should develop skills in treatment of musculo-skeletal cancer**. • Plan optimal procedural access to vertebra and other bones, patient positioning and relevant/ optional image guidance methods • Understand adjunctive interventions (e.g. embolisation) that can be performed to improve the outcome of image-guided ablation • Discuss with the anaesthetist the need/advantages of sedation, spinal anaesthesia, regional nerve block or general anaesthesia according to the type of procedure planned, the site and extent of the disease • Be able to use separation techniques to help create a buffer zone between tumour and neighbouring vital structures (e.g. hydrodissection or dissection with CO_2) • Recognise the need to place thermocouples to monitor the temperature of sensitive structures during ablative procedures • Recognise bone lesions at risk of fracture and understand when to perform IGA therapy with cementoplasty in order to provide additional structural support • Know the type of ablation (laser, MWA, RFA and CRYO) technique optimal for the bone lesion with reference to the position of the lesion, the size of the lesion and the adjacent sensitive structures • Be able to recognise intra-procedural and post-procedural complications and arrange interventional radiological management if appropriate • Be able to monitor motor and sensory functions of the extremities in order to rule out neural damage after ablation of lesions close to major nerve bundles • Be familiar with all measures to protect and monitor sensitive neural structures in the spine (including active and passive thermoprotection by means of air or CO_2 injection, thermocouples, evoked potentials, etc.) • Be familiar with sclerotherapy for vertebral haemangioma, how to use sclersant. • To know how to monitor the patient for need of emergency decompression, or plan for simultaneous decompression procedure after the sclerotherapy • Be aware of when to plan a vertebroplasty after a sclerotherapy procedure **7) Soft Tissue Tumors (Desmoid / Fibromatosis):**

		• Know which ablation technique to use (CRYO, RFA) • Know how to use hydrodissection or dissection with CO2 to protect adjacent structures • Know and explain to the patient what to expect after the treatment, including how long the pain will last • Know how and where to correctly place the needles to get optimal ablation • Define if the treatment is with curative intent or to treat symptoms • Know how to manage the post-treatment period. **8) Endocrine Malignancies (Thyroid/Adrenal & Pancreatic):** **8.a) Thyroid:** The resident need to have basic knowledge of understanding and feasibility of thyroid ablation • Plan optimal procedural access, patient positioning and relevant/optional image guidance methods. Be able to use separation techniques to help create a buffer zone between the tumour and neighbouring vital structures such as the recurrent laryngeal nerve, carotid artery, internal jugular vein, pleura, trachea and mediastinum in the case of large tumours. • Be able to decide which kind of ablative technology (RFA, CRYO) to use for treatment depending on the type and size of tumour, as well as its imaging, pathology characteristics and adjacent structures (vascular, bronchi, mediastinal structures, nerves and heart) • Plan the correct positioning of the electrodes in the tumour to achieve optimal results • Plan the size of the electrode to use to acquire effective ablation • Know the specificities of ablation of the thyroid gland to adapt the protocol for optimal thyroid ablation. **8.b) Adrenal:** The resident need to have basic knowledge of understanding and feasibility of adrenal ablation. • Plan optimal procedural access, patient positioning and relevant/optional image-guidance methods. Be able to use separation techniques to help create a buffer zone between the tumour and neighbouring vital structures such as the pleura, kidney, IVC, liver and diaphragm

		• Be able to decide which kind of ablative technology (RFA, CRYO) to use for treatment depending on the size and type of tumour and its imaging, pathology characteristics and adjacent structures • Plan the correct positioning of the electrodes in the tumour to achieve optimal results • Plan the size of the electrode to use to acquire effective ablation • Know the difference between ablation of the pancreas and other organs such as lung, liver, etc. to adapt the protocol for optimal pancreatic tumour ablation **8.c) Gastro-entero-pancreatic neuroendocrine tumour (GEP-NET):** The resident need to have basic knowledge of understanding and feasibility of pancreas ablation. • Plan optimal procedural access, patient positioning and relevant/optional image guidance methods. • Be able to use separation techniques to help create a buffer zone between the tumour and neighbouring vital structures such as the normal pancreatic tissue, pancreatic duct and bowel • Be able to decide which kind of ablative technology (IRE, CRYO) to use for treatment depending on the size and type of tumour and its imaging, pathology characteristics and adjacent structures (stomach, bowel, pancreatic duct and splenic vein) • Plan the correct positioning of the electrodes in the tumour to achieve optimal results • Plan the size of the electrode to use to acquire effective ablation • Know the difference between ablation of the pancreas and other organs such as lung, liver, etc. to adapt the protocol for optimal pancreatic tumour ablation
		Miscellaneous Interventions **1) Vascular Malformation:** **The resident should develop technical skills in treating vascular malformation:** • Demonstrate competence and understanding of the principles, agents and techniques used in treatment of high-flow vascular malformations

		• Demonstrate competence in managing complications of treatment of high-flow vascular malformations • Demonstrate competence and understanding of the principles, agents and techniques used in treatment of low-flow vascular malformations • Demonstrate competence in managing complications of treatment of low-flow vascular malformations • Demonstrate competence and understanding of the principles, agents and techniques used in the treatment of lymphatic malformations • Demonstrate competence in managing complications of treatment of lymphatic malformations **2) Vertebral Body Compression Fracture Management:** • Demonstrate knowledge of proper vertebral body access techniques (transpedicular, parapedicular) • Be familiar with interventional equipment used in including needles, cements and cement delivery systems. • Understand when PV can be combined with other curative or palliative minimally invasive techniques of ablation • Be familiar with all measures to protect and monitor sensitive neural structures in the spine (including active and passive thermoprotection bymeans of air or CO2 injection, thermocouples, evoked potentials, etc.) • Be familiar with sclerotherapy for vertebral haemanginoma, how to use sclerosant as well as how to monitor the patient for need of emergency decompression if need be, or plan as simultaneous decompression procedure after the sclerotherapy • Be aware of when to plan a vertebroplasty after a sclerotherapy procedure **3) Enteral Tube placement.** • Demonstrate technical competence in carrying out the procedures with selection of the most appropriate image guidance • Demonstrate how to use guidewires and catheters to primarily place a gastrostomy or use these for a retrograde approach to allow placement of a pull type gastrostomy • Converting a gastrostomy to a gastrojejunostomy

		• Recognise and treat complications including pain, bleeding, tube displacement and peritonitis • Ensure clear pre-procedural and post–procedural instructions (fasting, antibiotics, etc.) and pathways for tube care • Administer adequate IV hydration and antibiotic therapy for safe and comfortable interventional procedures

M.Ch. in Surgical Oncology (Program Code: HLTH10B01)

Program Code : HLTH10B01	Programme Outcome	To train the surgical candidates in basics of clinical oncology.
		To understand the role of medical and radiation oncologic principles and their role in holistic, multidisciplinary management of cancer patients.
		To provide exposure to the comprehensive management, including diagnosis, planning treatment, be a part of the multidisciplinary team delivering treatment and follow-up of a patient with cancer.
		To build surgical skill set (open& laparoscopic) and early exposure to robotic surgery in various disciplines of oncology.
		To provide a platform for clinical and SOS translational research early in their training to generate interest.
		To provide national and international platform for presentations of clinical/surgical research data.
		The training should produce consultants to practice all over the country, and teachers to propagate training to future generations of trainees in TMC and elsewhere.

Course Structure:

I. Courses at TMC

Program Code : HLTH10B01	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms.
		All the necessary training and mandatory theory are specified in the syllabus of the MCh Surgical Oncology Course.
		The student is expected to participate in the regular appraisal examinations and academic programmes conducted in the institute.
		The purpose would be to acquire an understanding of the subject of surgical oncology in specific and clinical oncology in general.
		The candidate's progress through the 3 years will also be assessed with feedback from all stake holders, including the candidate and work-based assessment.

(A) CORE COURSE

Sr. No.	Name of the Course	Course code
1	Basic Sciences	09HLTH10B01-001-C
2	Principals of oncology	09HLTH10B01-002-C
3	Clinical Practice of Surgical Oncology	09HLTH10B01-003-C
4	Recent Advances in Oncology	09HLTH10B01-004-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Basic Sciences	09HLTH10B01-001-C	To be able to understand the basics of cancer biology and molecular pathology.
		To understand the pathophysiology of various neoplastic and pre-neoplastic processes.
		To understand the newer advances in molecular diagnostics
		To develop the insight and ability to apply this knowledge in the field of clinical and translational cancer research.
Principals of oncology	09HLTH10B01-002-C	To understand the multidisciplinary management of cancers and basic principles of medical and radiation oncology so as to provide the best treatment option to patients.
		To be able to provide complete oncologic care in future practice.
		To be able to grasp the basics of biostatistics and conduct of clinical research and randomised controlled trials.
		To learn planning of evidence based neoadjuvant and adjuvant chemo-radiation protocols so as to help and guide patients with cancer to choose appropriate modality of treatment.
Clinical Practice of Surgical Oncology	09HLTH10B01-003-C	To diagnose, stage and plan appropriate evidence based surgical procedure. To understand the principles of surgery for cancer, the radicality of the surgeries involved,
		To learn the nuances of pre-operative work up andpost-operative care
Recent Advances in Oncology	09HLTH10B01-004-C	To understand newer modalities and advances in surgical care such as use of microscopes, imaging devices, laparoscopic equipment and robotics.
		To have abasic working knowledge of next generation molecular biology techniques.
		To be aware of recent advances in diagnostic imaging and adjuvant modalities in cancer

M.Ch. in Gynaecological Oncology (Program Code: HLTH10B02)

Program Code : HLTH10B02	Programme Outcome	To train gynecologistsin basics of clinicalgynecologic oncology
		To understand medical and radiation oncologic principles and their role in holistic, multidisciplinary management of cancer patients
		To provide exposure to the comprehensive management, including diagnosis, planning treatment, be a part of the multidisciplinary team delivering treatment and follow-up of a patient with cancer.
		To build surgical skill set (open& laparoscopic) and early exposure to robotic surgery in various disciplines of oncology.
		To provide a platform for clinical and SOS translational research early in their training to generate interest.
		To provide national and international platform for presentations of clinical/surgical research data.
		The training should produce consultants to practice all over the country, and teachers to train future generations of trainees

3	Radiation Oncology	09HLTH10B02-014-M

Course Outcomes:

(A) TRAINING MODULES

GYNECOLOGICAL ONCOLOGY MODULES

Name of the Course	Course code	Course Outcome
General Assessment of a Gynecological Oncology Patient	09HLTH10B02-001-M	The candidate should be well trained in assessing the patient with an adequate history taking and clinical examination.
		The training should help the candidate to identify the appropriate diagnostic techniques needed to establish the diagnosis and establish the extent of disease.
		They should be able to stage the cancer according to the current F.I.G.O. staging for gynecological cancers and the corresponding TNM classification
		They should be able to evaluate co-existing disease which may have an important bearing on selection of and response to treatment
		They should be able to evaluate the response of cancer to treatment and communicate clinical plan to patient and relatives.
Pre-, Peri- and Post-operative Care	09HLTH10B02-002-M	The candidate should gain expertise in preoperative evaluation of gynecological oncology patients.
		To preoperatively prepare the patient on ground of pulmonary function and give adequate thrombo-prophylaxis.
		They should be able to take a valid informed consent from patient and witness after a detailed counseling.
		The candidate should get familiar with common as well as rare complications associated with commonly performed surgical procedures for gynecological cancers.
		The candidate should have sufficient training and experience in the postoperative care and aftercare management of these patients.
Generic Surgical Skills In Gynecological Oncology	09HLTH10B02-003-M	The candidate should gain sufficient expertise in the surgical anatomy comprising detailed knowledge of the pelvic abdominal and retroperitonealanatomy, including female genital tract, urinary and G.I tracts and other areas of relevance, e.g. thorax, thigh and neck
		The candidate should know the rationale, indications, complications and operative steps of various important surgical procedures in gynecological oncology.

		The candidate should have sufficient training and experience to perform surgical procedures in gynecological oncology independently.

SITE-SPECIFIC MODULES

Name of the Course	Course code	Course Outcome
Cancer of the Cervix	09HLTH10B02-004-M	The candidate should know the epidemiology &aetiology, risk and protective factors for cervical cancer.
		Sufficient training should be given regarding the role of HPV vaccination, diagnostic and primary and secondary prevention of cervical cancer
		To know the principles of colposcopy and colposcopic guided procedures
		The candidate should be trained in basic cytology, pathology, diagnosis and staging of cervical cancer.
		The candidate should be able to manage cervical precancer lesions independently
		They should be able to formulate treatment of all stages of cervical cancer with the help of surgery, radiation or chemotherapy.Alsolong and short term complications of various modalities of treatment used in cervical cancer.
		They should know the role and indications of fertility sparing treatments in cervical cancers.
		The candidate should be aware of follow up protocols, patterns of recurrence and be able to diagnose and manage them.
Ovarian Cancer	09HLTH10B02-005-M	The candidate should know the epidemiology &aetiology, risk and protective factors for ovarian cancer
		The candidate should be trained in basic pathology, pre-treatment evaluation, imaging, tumor markers, diagnosis and staging of ovarian cancer.
		They should be able to decide for management of all stages of ovarian cancer with the help of surgery or chemotherapy (Adjuvant & neoadjuvant chemotherapy).
		They should know the role of laparoscopy and fertility sparing surgery in ovarian cancer
		To be adequately trained in primary and interval debulking of ovarian cancers.
		To manage various complications: Bowel obstruction, anastomotic leak
		To learn both intravenous &intraperitoneal chemotherapy including HIPEC
		The candidate should be aware of follow up protocols, to diagnose and manage including

		indications for secondary debulking, Second line chemotherapy
		To learn various targeted therapy in the management of ovarian cancer and their mechanisms of action.
		To learn hereditary ovarian cancer syndromes, role of genetic testing, management of healthy individuals with genetic mutations including surveillance protocols and risk reducing surgeries
Cancers of the Uterine corpus	09HLTH10B02-006-M	The candidate should know the epidemiology &aetiology, risk and protective factors for uterine cancer
		The candidate should know the histological subtypes, basic pathology, use of imaging and diagnosis of uterine cancer.
		To be able to do pre-operative assessment, staging of endometrial cancer and uterine sarcomas
		The candidate should be to perform surgery for uterine cancer and know the need for lymphadenectomy and indications of use of minimal access surgery
		Should understand the role of sentinel node biopsy and how to perform it
		Should be aware of fertility sparing medical management for endometrial cancers in young women
		Should know the indications of adjuvant therapy: Radiation, Chemotherapy & Hormones and be able to decide for various patients accordingly
		The candidate should be aware of follow up protocols, patterns of recurrence and be able to diagnose and manage them.
Cancer of the Vulva	09HLTH10B02-007-M	The candidate should know the epidemiology &aetiology, risk and protective factors for vulvar cancer
		Should know the histo-pathological subtypes, patterns of spread and staging of vulvar cancer.
		Should be able to investigate, diagnose & decide for treatment of vulvar cancer including surgery and radiotherapy.
		Should know the role of sentinel node biopsy and inguinal lymphadenectomy in vulvar cancers.
		Should be aware of various flaps for wound closure in vulvar cancer

		Should be able to manage various complications such as wound breakdown, lymphocysts, lymphedema and neuralgia
		Should know the indications of adjuvant therapy: Radiation, Chemotherapy in vulvar cancer
		The candidate should be aware of follow up protocols, patterns of recurrence and be able to diagnose and manage them.
Vaginal Cancer	09HLTH10B02-008-M	The candidate should know the epidemiology &aetiology, risk and protective factors for vulvar cancer
		Should be able to diagnose carcinoma, sarcoma and metastatic lesions and do staging of vaginal cancer
		Should be able to adequately manage VAIN. Should be able to differentiate malignant from benign lesions.
		Should be able to decide and plan for partial & radical vaginectomy
		Should be able to manage the psychosexual morbidity associated with various procedures involved in treatment of vaginal cancers.
		Should be able to decide for radiation therapy for vaginal cancers.
		The candidate should be aware of follow up protocols, patterns of recurrence and be able to diagnose and manage them.

ALLIED SURGICAL SPECIALTY MODULES

Name of the Course	Course code	Course Outcome
Uro-oncological surgery	09HLTH10B02-009-M	Should know the anatomy & physiology of kidney, ureter, bladder & urethra
		Should understand the effects of gynecologic cancers and various treatments used in gynecological cancers on the urinary tract
		The candidate should be able to perform or assist urinary tract procedures related to gynaecological malignancy in collaboration with urological surgeons where necessary
		Should be able to avoid, diagnose as well as manage injuries to the urinary tract while performing surgeries in gynecological oncology.
Gastrointestinal/ Colorectal surgery	09HLTH10B02-010-M	Should know the anatomy & physiology of GI tract
		Should know the principles of bowel handling, resection & repair
		The candidate should be able to perform or assist gastrointestinal procedures related to gynaecological malignancy in collaboration with colorectal surgeons where necessary
		Should be able to avoid, diagnose as well as manage injuries to the gastrointestinal tract while performing surgeries in gynecological oncology.
		Should be be able to perform appendicectomy, repair of bowel injury, stoma, bowel resection when needed.
Breast Cancer Surgery	09HLTH10B02-011-M	Should know the anatomy of breast, axillary lymph node and patterns of spread of breast cancer.
		Should learn about hereditary breast cancer syndromes, role of genetic testing, management of healthy individuals with genetic mutations including surveillance protocols and risk reducing surgeries
		Should know the role of sentinel lymph node in surgery for breast cancer
		Should know the preoperative and postoperative use of chemotherapy and hormonal therapy in breast cancer
		The candidate should be able to perform or assist breast cancer surgeries in collaboration with breast cancer surgeons where necessary

ALLIED NON-SURGICAL SPECIALTIES

Name of the Course	Course code	Course Outcome
Radio-Diagnostics	09HLTH10B02-012-M	Should know the various modalities available for radiographic diagnosis in gynecological cancers
		Should be able toreadradiographs of chest, abdomen and skeletal system
		Should be able to advise and read ultrasonography for gynecological cancer patients when necessary
		Should be able to read CT Scan and MRI images related to gynecological oncology
		Should be able to decide for angiography, intravenous and retrograde urography, gastrointestinal and colonic radiography and mammography
Medical Oncology	09HLTH10B02-013-M	The student should understand the pharmacology and pharmacokinetics of the major drugs used in cancer chemotherapy for gynecological cancers
		Should understand cell biology including cell cycle kinetics, log kill hypothesis and cycle and phase specificity
		Should know the classes of chemotherapeutic agents, mechanism of action and pharmacology of specific agents
		Should know about the various targeted therapy drugs used in gynecological cancers, their mechanism of action and indications
		Should understand the general guidelines for clinical evaluation including the definitions of complete or partial responses, the concept of phase I, II and III drug trials and adjuvant therapy
		Should know the various short and long term complications associated with administration of chemotherapeutic drugs
Radiation Oncology	09HLTH10B02-014-M	The student should have sufficient familiarity with the principles and practice of radiation oncology in treatment planning, in the execution of intracavitary applications and in the management of irradiation induced complications.
		Should know the general principles of Radiobiology and techniques in molecular biology
		Should understand the radiotherapy treatment planning including principles of conformal therapy and intensity modulated radiation therapy
		Should understand the various radiotherapy equipments, radiation doses, techniques and principles of use.
		Should know how to diagnose irradiation induced complications and how to manage them

M.Ch. in Plastic Surgery & Reconstructive Surgery (Program Code: HLTH10B03)

Program Code : HLTH10B03	Programme Outcome	To train the M.Ch. candidates in basics of Plastic and reconstructive surgery.
		To provide holistic management for patients, including diagnosis, planning Reconstructive procedures to improve the quality of life and rehabilitation of the surgical patients.
		To build clinical skills in various Plastic Reconstructive Procedures
		To create an understanding regarding basic principles of clinical research, and translating application to various Plastic and reconstructive procedures
		To provide national and international platform for presentations of research data in the field of Plastic and reconstructive surgery.
		The training should produce consultants to practice all over the country, and teachers to propagate training to future generations of trainees in the field of Plastic and Reconstructive surgery with special emphasis on oncoreconstruction

Course Structure:

I. Courses at TMC

Program Code : HLTH10B03	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms.
		To complete the necessary training the students need to complete the rotation at Sion / Nair / KEM for a total period of one Year
		The student is expected to participate in the regular appraisal examinations and academic programmes conducted in the institute.
		The purpose would be to acquire an understanding of the subject of Plastic and Reconstructive surgery
		The candidate's progress through the 3 years will also be assessed with feedback from all stake holders, including the candidate and work-based assessment.

(A) BASIC SCIENCE

Sr. No.	Name of the Course	Course code
1	Embryology and development of human tissues	09HLTH10B03-001-BS
2	Genetics and congenital abnormalities	09HLTH10B03-002-BS
3	Mechanism of healing of tissues, factors affecting the healing	09HLTH10B03-003-BS
4	Infection and its management	09HLTH10B03-004-BS
5	General principles of Surgery	09HLTH10B03-005-BS
6	The suture materials and suture techniques	09HLTH10B03-006-BS
7	Clinical examination of various systems and clinical photography	09HLTH10B03-007-BS
8	General anesthesia pre and post-operative care for general anesthesia	09HLTH10B03-008-BS
9	Local, regional and other nerve blocks	09HLTH10B03-009-BS
10	Hypertensive and hypothermic anesthesia	09HLTH10B03-010-BS
11	Management of benign and malignant lesions	09HLTH10B03-011-BS
12	Wound healing, wound care, dressings and splints	09HLTH10B03-012-BS
13	Fluid and electrolyte balance, acid base balance	09HLTH10B03-013-BS
14	Shock and pulmonary failure, blood transfusions, ventilator support and criticalcare	09HLTH10B03-014-BS
15	Assessment of trauma, vascular emergencies embolism	09HLTH10B03-015-BS

(B) GENERAL TOPICS

Sr. No.	Name of the Course	Course code
1	History of Plastic Surgery	09HLTH10B03-001-G
2	Scope of Plastic Surgery	09HLTH10B03-002-G
3	Tissue distortion, tissue loss and its management	09HLTH10B03-003-G
4	Tissue culture, Transplantation biology and its applications	09HLTH10B03-004-G
5	Plastic Surgery instruments and equipments	09HLTH10B03-005-G
6	Maintenance of medical records, informed consent	09HLTH10B03-006-G
7	Applications of computer and related programs	09HLTH10B03-007-G
8	Social psychological, ethical and medico legal aspects communication skills	09HLTH10B03-008-G
9	Implants, orthotics and prosthesis and applied to Plastic Surgery	09HLTH10B03-009-G
10	Tissue expansion and tissue distraction	09HLTH10B03-010-G
11	Management of Leprosy, leprosy deformities and leprosy reconstructive surgery	09HLTH10B03-011-G
12	Endoscopic Plastic Surgery	09HLTH10B03-012-G
13	Advances, recent advances and current trends in Plastic Surgery	09HLTH10B03-013-G
14	Principles of surgical audit, understanding journal and review articles, text books and reference books, critical assessment of articles	09HLTH10B03-014-G
15	Research methodology and biostatistics	09HLTH10B03-015-G
16	Arteriovenous malformations, varicose veins, chronic venous insufficiency	09HLTH10B03-016-G
17	Meningomyelocoele, encephalocoele, spinal fusion defects, ventral defects,anorectal anomalies	09HLTH10B03-017-G

Course Outcomes:

(A) BASIC SCIENCE

Name of the Course	Course code	Course Outcome
Embryology and development of human tissues	09HLTH10B03-001-BS	To teach the concepts of Embryology and development of human tissues
Genetics and congenital abnormalities	09HLTH10B03-002-BS	To teach the diagnosis and management of genetic and congenital abnormalities
Mechanism of healing of tissues, factors affecting the healing	09HLTH10B03-003-BS	To teach the diagnosis and management of healing of tissues, factors affecting the healing
Infection and its management	09HLTH10B03-004-BS	To teach the diagnosis and management ofInfection
General principles of Surgery	09HLTH10B03-005-BS	To teach the general principles of surgery and their application in plastic and reconstructive surgery
The suture materials and suture techniques	09HLTH10B03-006-BS	To teach the usage of correct suture material and suturing techniques
Clinical examination of various systems and clinical photography	09HLTH10B03-007-BS	To teach proper clinical examination and documentation using clinical photography
General anesthesia pre and post-operative care for general anesthesia	09HLTH10B03-008-BS	To teach the monitoring of patients in pre and post op period after general anesthesisa
Local, regional and other nerve blocks	09HLTH10B03-009-BS	To teach the proper techniques and use of Local, regional and other nerve blocks
Hypertensive and hypothermic anesthesia	09HLTH10B03-010-BS	To teach the applications of hypertensive and hypothermic anaesthesia in plastic surgical procedures
Management of benign and malignant lesions	09HLTH10B03-011-BS	To teach the management of benign and malignant lesions and their reconstructive options.
Wound healing, wound care, dressings and splints	09HLTH10B03-012-BS	To teach the concepts of wound healing, proper wound care. Applications of various available dressings. Application of splints in trauma, burns
Fluid and electrolyte balance, acid base balance	09HLTH10B03-013-BS	To teach the Fluid and electrolyte balance, acid base balance in burns management and post op period
Shock and pulmonary failure, blood transfusions, ventilator support and criticalcare	09HLTH10B03-014-BS	To teach the basics of management of shock, pulmonary failure, blood transfusion.
Assessment of trauma, vascular emergencies embolism	09HLTH10B03-015-BS	To teach the diagnosis and management of trauma and vascular emergencies

(B) GENERAL TOPICS

Name of the Course	Course code	Course Outcome
History of Plastic Surgery	09HLTH10B03-001-G	To understand the development of various procedures and contributions of stalwarts in the field of plastic surgery
Scope of Plastic Surgery	09HLTH10B03-002-G	The spectrum of Plastic surgery is very wide.To understand the application of plastic and reconstructive surgery procedures in various aspects of patient care ranging from burns, cosmetic , hand, trauma, oncoreconstruction etc.
Tissue distortion, tissue loss and its management	09HLTH10B03-003-G	To understand the concept of tissue replacement after excision, disease, accident, congenital anamolies etc.
Tissue culture, Transplantation biology and its applications	09HLTH10B03-004-G	To develop understanding of tissue culture like skin and muscle, and their applications for reconstructive procedures.
Plastic Surgery instruments and equipments	09HLTH10B03-005-G	To teach the handling and proper use of instruments like microscopes, loupes etc. required for various procedures in plastic and reconstructive surgery.
Maintenance of medical records, informed consent	09HLTH10B03-006-G	To teach the importance of data maintenance for evaluation of results, publications and importance of consent in surgery and trials.
Applications of computer and related programs	09HLTH10B03-007-G	To develop understanding of Applications of software for making presentations, projects, statistics etc.
Social psychological, ethical and medico legal aspects communication skills	09HLTH10B03-008-G	To develop communication skills, and teach the medicolegal aspects necessary for handling surgeries
Implants, orthotics and prosthesis and applied to Plastic Surgery	09HLTH10B03-009-G	To teach the available Orthodontic treatments, prosthesis and implants and their uses in Plastic and reconstructive surgeries
Tissue expansion and tissue distraction	09HLTH10B03-010-G	To teach the uses and techniques of tissue expansions and tissue distractions in various procedures
Management of Leprosy, leprosy deformities and leprosy reconstructive surgery	09HLTH10B03-011-G	To study the deformities and their subsequent correction resulting due to leprosy.

Endoscopic Plastic Surgery	09HLTH10B03-012-G	To teach the applications of endoscopic plastic surgery eg. In muscle only harvest.
Advances, recent advances and current trends in Plastic Surgery	09HLTH10B03-013-G	To teach and study the recent advances and current practises for improving patient care and more relevant research projects.
Principles of surgical audit, understanding journal and review articles, text books and reference books, critical assessment of articles	09HLTH10B03-014-G	To evaluate our own results and constantly improvising our results through surgical audits. To apply newer modalities in clinical practise and research.
Research methodology and biostatistics	09HLTH10B03-015-G	To create an understanding regarding basic principles of clinical research ,statistics and emphasis on Good Clinical Practice guidelines (GCP) and translating this knowledge application to plastic and reconstructive procedures.
Arteriovenous malformations, varicose veins, chronic venous insufficiency	09HLTH10B03-016-G	To train in management of arteriovenous malformations, varicose veins, chronic venous insufficiency.
Meningomyelocoele, encephalocoele, spinal fusion defects, ventral defects,anorectal anomalies	09HLTH10B03-017-G	To train in management ofMeningomyelocoele, encephalocoele, spinal fusion defects, ventral defects,anorectal anomalies

M.Ch. in Head & Neck Oncology (Program Code: HLTH10B04)

Program Code : HLTH10B04	Programme Outcome	To provide holistic training to the candidates in clinical and surgical skills regarding head and neck oncology
		To train residents about the basics of oncology, medical and radiation oncology and rehabilitation in head and neck cancer management.
		Through joint clinics and disease management group meetings provide the understanding of comprehensive multidisciplinary management.
		To build in surgical skills, rigid direct laryngoscopy, micro laryngoscopy, laser excision and various aspects of robotic surgery.
		To provide exposure to national and international institutes to understand the variation in treatment approach and to understand the treatment planning in different institutes.
		To provide the platform to attend in house conferences held in the institute e.g. Oral cavity Master course, Evidence Based Medicine meetings, Post Laryngectomy rehabilitation meetings, Oncosurg, Laser workshop, Thyroid Preceptorship program, etc.
		To provide national and international platform for clinical research data presentation.
		To inculcate the habit of innovative thinking and rational and evidence based approach and translational research.

Course Structure:

I. Courses at TMC

Program Code : HLTH10B04	Programme Specific Outcome	The candidate should complete the training programme as per prespecified norms.
		The student shall follow the prespecified rotation schedule for the course to gain perspective about oncological reconstruction, radiation oncology and experience from other institutes (national/international).
		The student is expected to participate in the regular ward rounds, seminars and meetings, appraisal examinations and academic programmes conducted in the institute.
		The purpose would be to acquire an understanding of the subject of head and neck oncology in specific and clinical oncology in general.
		To update the candidate about the nuances in head and neck oncology e.g. intraoperative nerve monitoring, Transoral ultrasonic surgery etc.
		To provide platform to grasp the basics of biostatistics, clinical research and randomised consoled trials.

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Oral cavity and Oropharynx	09HLTH10B04-001-C
2	Parotid and Thyroid	09HLTH10B04-002-C
3	Nasopharynx, Paranasal sinus, Neck, other sites - Eye, Ears etc	09HLTH10B04-003-C
4	Larynx and Hypopharynx	09HLTH10B04-004-C

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Oral cavity and Oropharynx	09HLTH10B04-001-C	To be able to understand the basics of cancer of oral cavity and oropharynx.
		To understand the pathophysiology of various neoplastic and pre-neoplastic processes and to understand the newer advances.
		To be able to apply the acquired knowledge clinically and surgically.
		To be able to have insight and ability for clinical and cancer research
		To understand the multidisciplinary management of cancer and role of chemotherapy and radiation.
Parotid and Thyroid	09HLTH10B04-002-C	To be able to understand the basics of cancer of parotid and thyroid.
		To understand the pathophysiology of various benign and malignant cancers and to understand the newer advances.
		To be able to apply the acquired knowledge clinically and surgically.
		To be able to have insight and ability for clinical and cancer research
Nasopharynx, Paranasal sinus, Neck, other sites - Eye, Ears etc	09HLTH10B04-003-C	To be able to understand the basics of cancer of nasopharynx, PNS, neck and other sites.
		To understand the pathophysiology of various benign and malignant lesions and to understand the newer advances.
		To be able to apply the acquire knowledge clinically and surgically.
		To understand the basic principles of medical and radiation oncology, biostatistics and molecular biology.
		To be able to have insight and ability for clinical and cancer research
		To understand the multidisciplinary management of skull base tumors with neurosurgery, radiation oncology and pathology department during Skull Base Clinic.
Larynx and Hypopharynx	09HLTH10B04-004-C	To be able to understand the basics of cancer of larynx and hypopharynx
		To understand the pathophysiology of various neoplastic and pre-neoplastic processes and to understand the newer advances.
		To be able to apply the acquired knowledge

		clinically and surgically.
		To be able to have insight and ability for clinical and cancer research
		To learn the rehabilitation of the laryngeal and hypo pharyngeal patients i.e. olfactory, speech ad swallowing rehabilitation.

Post M. Sc. Diploma in Radiological Physics (Dip. R. P.) (Program Code: HLTH11)

I. COURSE at BARC

Program Code : HLTH11	Programme Specific Outcome	Understand and apply principles of physics for understanding the medical physics and ionising radiation safety in healthcare.
		Understand and apply mathematical techniques for describing and deeper understanding of medical physics
		Understand and apply statistical methods for describing the various radiological processes in radiation dosimetry and safety.
		Understand and apply inter-disciplinary concepts and computational skills for understanding and describing the medical physics and radiation safety.
		Understanding basic safety standards for protection from the health hazard arising due to ionising radiation exposure.
		Provide in-depth knowledge and skill in various speciality of Radiological/ Medical Physics (radiation oncology physics, diagnostic and interventional radiology physics, nuclear medicine physics, and radiation protection)
		Provide in-depth knowledge and skill in standardization and calibration of medical equipment and for the accuracy of physical methods used in clinical applications and dosimetry, including physical measurements for evaluation of the dose delivered to the patient.
		Engage in research and life-long learning to adapt to changing healthcare practices.
		Understand and apply principles of physics for understanding the medical physics and ionising radiation safety in healthcare.

Course Structure:

Sr. No.	Name of the Course	Course code
1	RADIATION PHYSICS & RADIATION GENERATORS	01HLTH11-001-C
2	APPLIED MATHEMATICS	01HLTH11-002-C
3	RADIATION DOSIMETRY AND STANDARDIZATION	01HLTH11-003-C
4	RADIATION DETECTION, MEASUREMENT AND NUCLEAR ELECTRONICS	01HLTH11-004-C
5	PRACTICALS	01HLTH11-001-P
6	CLINICAL AND RADIATION BIOLOGY	01HLTH11-005-C
7	MEDICAL IMAGING	01HLTH11-006-C
8	RADIATION THERAPY	01HLTH11-007-C
9	RADIATION SAFETY	01HLTH11-008-C
10	PRACTICALS	01HLTH11-002-P

Course Outcomes

Name of the Course	Course code	Course Outcome
RADIATION PHYSICS & RADIATION GENERATORS	01HLTH11-001-C	Refresh the knowledge of Nuclear and Radiation physics
		Understand the concept of interaction of radiation with matter
		Understand the mechanism and technology of various particle accelerators used in medicine and research
		Understand the mechanism of X-ray generation and technology of X-ray equipment used in medicine, industry and research.
APPLIED MATHEMATICS	01HLTH11-002-C	Understand the theory of probability, counting statistics and errors with special reference to radiological/medical physics
		Application of Numerical methods and Monte Carlo simulation in radiation physics
		To strengthen the knowledge and skill in use of computational techniques and tools for solving the practical problems of radiological sciences

RADIATION DOSIMETRY AND STANDARDIZATION	01HLTH11-003-C	Understanding of radiation quantities and units
		Detailed knowledge of various radiation sources including their production process application aspects
		Competency to perform absolute, reference and relative radiation dosimetry with various radiation generators and sources
		Knowledge and skill in dosimetry of neutron and standardisation of radionuclides
		Understanding radiation chemistry and use of chemical dosimetry techniques
RADIATION DETECTION, MEASUREMENT AND NUCLEAR ELECTRONICS	01HLTH11-004-C	Understanding the principles of radiation detection and measurement instrumentation
		Working and operational principle of radiation detectors used for various types of radiation
		Electronics involved in various radiation detectors and its instrumentation
		Understanding and use of various radiation monitoring instruments
PRACTICALS	01HLTH11-001-P	Understanding radiation physics and mathematical concepts applied to radiological processes
		Construction, characterisation and calibration of various radiation detectors and use of spectrometry techniques in radiological physics
		Preparation, standardisation and uses of chemical dosimeters
		Preparation, standardisation and safety aspects of sealed/unsealed radiation sources
CLINICAL AND RADIATION BIOLOGY	01HLTH11-005-C	Knowledge of cell biology, human anatomy, physiology and tumour pathology
		Understanding of mechanism and outcome of interaction of radiation with human cells and associated biological effects

		Basic knowledge of clinical aspects of medical imaging and radiation oncology and detailed knowledge of biological basis of radiotherapy
		Thorough knowledge of dose fractionation in radiotherapy and time-dose models
MEDICAL IMAGING	01HLTH11-006-C	Understanding the process of X-ray based imaging using both conventional and advanced imaging systems such as digital X-ray imaging systems (radiography and mammography), dental imaging systems and computed tomography (CT) scanners
		Knowledge of working principles and use of open isotope based imaging systems such as Gamma Camera, Single Photon Emission Tomography (SPECT), Positron Emission Tomography (PET)
		Understanding of the technology and use of medical cyclotron and Internal dosimetry techniques
		Concepts of magnetic resonance imaging (MRI) and ultrasound imaging in diagnosis of various types of cancer
RADIATION THERAPY	01HLTH11-007-C	Understanding the technology and working principles of various beam therapy equipment such as Telecobalt machine, Medical electron linear accelerators (LINAC), and medical proton accelerator
		Understanding the technology and use of brachytherapy equipment, sources and techniques as well as dosimetry and treatment planning in brachytherapy
		Competence in medical radiation dosimetry, quality assurance of various radiotherapy equipment and use of computers in radiation treatment planning including optimisation and associated radiation safety

		Thorough knowledge and competence in applying special and advanced techniques of radiation therapy such as total body irradiation (TBI), total skin electron therapy (TSET), stereotactic radiosurgery/radiotherapy (SRS/SRT), stereotactic body radiotherapy (SBRT), intensity modulated radiotherapy (IMRT), image guided radiotherapy (IGRT), volumetric modulated radiotherapy (VMAT) and associated patient specific quality assurance
RADIATION SAFETY	01HLTH11-008-C	Comprehensive knowledge of radiation protection standards and recommendations towards occupational and public safety
		Competence in radiation monitoring, evaluation of external/internal radiation hazard, assessment of safety status of a radiation facility and control of contamination
		Thorough knowledge of radiation safety in the medical uses of radiation which involves planning of medical radiation installations, evaluation of hazard and radiation waste disposal
		Understanding of applications and safety aspects of industrial, agricultural and research use of ionizing radiation such as industrial radiography, radio-tracers, planning of radiation installations and isotope laboratory, radiation protection measures and hazards evaluation in tritium monitoring
		Knowledge of the concepts of radioactive waste disposal like sources of waste including classification, treatment techniques of waste and disposal of used radiation sources and radiation generators
		Detailed knowledge in transportation of radioactive substances including packaging, documentation, shipment, emergencies and regulations
		Familiarization with National Legislations (acts, rules, standards, and guides) for the use of radiation in various applications
		Knowhow of radiation emergencies and their medical management

PRACTICALS	01HLTH11-002-P	Study and evaluation of parameters involved in X-ray diagnostic and associated radiation safety
		Practical knowledge of measuring the strength of open isotopes, thyroid uptake, patient monitoring and safety assessment of nuclear medicine imaging and therapy facilities
		Skill of radiation dose measurement in beam therapy, brachytherapy, and nuclear medicine
		Practical knowledge of architecture and capabilities of radiotherapy treatment planning systems
		Practical competence in radiation protection survey of various medical installations and safety assessment

22	Advanced Heterocyclic Chemistry	C570
23	Statistical Mechanics	C571

COURSE OUTCOMES:

1) MAJOR in CHEMISRTY

(A) SEMISTER I

Name of the Course	Course code	Course Outcome
Chemistry-I	C101	The basics of atomic and molecular structure and spectroscopy
		Thermodynamics of different chemical processes
		Kinetics of chemical reactions
Chemistry Laboratory-I	C141	Introduction to synthesis of small organic compounds
		Qualitative analysis of chemicals present in tea, coffee, fruits etc.
		Synthesis of simple drugs such as paracetamol

(B) SEMISTER II

Name of the Course	Course code	Course Outcome
Chemistry-II	C102	Apply the fundamental principles of measurement, matter, atomic theory, chemical periodicity, chemical bonding, general chemical reactivity and solution chemistry to subsequent courses in science, engineering, technology.

		Students will be able to explain why chemistry is an integral activity for addressing social, economic, and environmental problems
		Students will be able to explore new areas of research in both chemistry and allied fields of science and technology after getting their concepts clear in Basic Chemistry
Chemistry Laboratory-II	C142	Introduction to quantitative analysis in chemistry.
		Students will learn basic concepts on electrochemistry
		Students will be given hands on practice on conductometry, polarimetry and flame photometry
		They will apply these concepts to estimate binding constant, solubility product etc.

(C) SEMISTER III

Name of the Course	Course code	Course Outcome
Basic inorganic Chemistry	C201	To understand basic facts and concepts in Chemistry while retaining the exciting aspects of Chemistry so as to develop interest in the study of chemistry as a discipline.
		To develop the ability to apply the principles of Chemistry.
		To appreciate the achievements in Chemistry and to know the role of Chemistry in nature and in society.
		To develop problem solving skills.
		To be familiarized with the emerging areas of Chemistry and their applications in various spheres of Chemical sciences and to apprise the students of its relevance in future studies.

		To be exposed to the different processes used in industries and their applications
Reaction Mechanisms in Organic Chemistry	C203	Introduction of basic organic reactions (Substitutions, Additions & Eliminations) and writing organic reaction mechanisms
		Reactivity of unsaturated hydrocarbons (alkene, alkyne and aromatic)
		Understanding the role of substitutions to influence the rate of reactions
		Stereochemistry in organic chemistry: Chemoselectivity, Diastereoselectivity, Enantioselectivity, Stereospecificity, Stereoconvergence
		Introduction of asymmetric synthesis with and without asymmetric catalysts
Mathematical Methods for Chemists	C207	Introduce the standard mathematical techniques that are typically used by Chemists.
		To learn how to apply mathematics to chemistry research.
		To learn how to use Fourier transform in different spectroscopy.
		The course, mostly differential equation is useful to learn quantum chemistry and chemical kinetics.
Inorganic Chemistry Lab.	C245	Concepts used in inorganic experiments
		Laboratory procedures to perform inorganic experiments
		Characterization techniques
		Laboratory safety

(D) SEMISTER IV

Name of the Course	Course code	Course Outcome
Reagents in Organic Syntheses	C204	Design the chemical reactions based on various metals and non-metal reagents
		Application of the reagents in organic synthesis.
		Design the synthesis of unknown target molecules
Main group and Organometallic Chemistry	C205	Learn the characterization of organometallic compounds.
		Learn the synthesis, structure and application of organometallics of Li, Mg, B, Al and Si elements
		Understand the synthesis, structure and bonding aspects of selected examples of unusual main group compounds
		Organometallics of transition metal chemistry and its application in catalysis
Quantum Chemistry I	C206	Understanding the need of Quantum mechanics based on failures of Classical mechanics.
		Learning the basic building blocks of Quantum Mechanics.
		Learning to use the mathematical structure of quantum mechanics in several systems comprising one or many quantum particles.
		Understanding the bridge between the mathematical structure of quantum mechanics and different spectroscopic techniques based on that.
Physical Chemistry Lab I	C243	This is a lab. course that introduces several spectroscopic methods to the under graduate students.
		Students can learn to use UV-Vis and fluorescence spectroscopy to determine pKa.

		To learn polarimetry to study the kinetics and to check chirality of a chemical.
		Introduces different electrochemical methods that are used in chemistry research.
Biomolecular Chemistry Lab	C244	Experience about synthesis of various biologically important molecules such as peptides, nuclease modification, quantification of amino acids and sugars.
		This course enables students to visualise the different techniques, principles, difficulties involved in synthesizing biomolecules

(E) SEMISTER V

Name of the Course	Course code	Course Outcome
Physical Organic Chemistry	C301	Understanding the Woodward-Hoffmann Rules and Molecular Orbitals and their application in stereoselective organic synthesis.
		Photoinduced chemical reactions
		Radical initiated processes and radical intermediates in chemical reactions
Molecular Spectroscopy and group Theory	C302	Understand the fundamentals of Group Theory and apply it to molecular spectroscopy
		Understand the link between molecular spectroscopy, symmetry and information content of molecular spectra.
		Understanding the formation of molecular orbitals.
		Calculate/predict energy levels and spectral features using symmetry as a simplification tool
		Use symmetry arguments to possibly solve molecular Problems.
		Understand the basics of light-matter interaction.

		Understand the fundamentals of rotational, vibrational and electronic spectroscopy. Calculation of some useful parameters from spectral data. Etc
Thermodynamics and Electrochemistry	C307	Understanding the laws of Thermodynamics and Phase equilibrium of multicomponent systems.
		Understanding the thermodynamics of surfaces and different adsorption isotherms of gases on solids.
		Key concepts for the Electrochemistry and applications of Electrochemistry.
		Key concepts of Statistical Thermodynamics.
Organic Chemistry Lab I	C341	To learn basic reaction techniques
		To preform air and moisture sensitive reactions such as Grignard, Friedel Craft reactions
		To purify the organic compounds
		To learn characterization of organic molecules such as spectral and analytical data
		To perform mg to gram scale reactions
Inorganic Chemistry Lab I	C342	Learn synthesis, purification, extraction and recrystallization techniques along with various techniques for characterization viz. IR, UV-Vis Spectroscopy, CV (cyclic voltammetry), and magnetic susceptibilities.
		Learn preparation and use of ion exchange column which is used in pharmaceutical Industry.
		Able to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large

(F) SEMISTER VI

Name of the Course	Course code	Course Outcome
Coordination Chemistry	C304	Importance of crystal field theory and Molecular orbital theory with various inorganic complexes.
		Learn the concept of magnetism and also to know about single molecular magnet
		Understanding the inner and outer sphere reaction mechanisms.
		Role of metal ions in bioinorganic chemistry
		Understand the basic concepts of supramolecular chemistry
Chemical Binding	C305	Understand the quantum mechanics of molecules
		Construct molecular orbitals for polyatomic molecules
		Apply symmetry and molecular orbital theory to derive molecular terms
		Understand the theory Hartree-Fock (HF), DFT, and semi-empirical methods
Physical Methods in Chemistry I	C306	Understand the basics of absorption and fluorescence spectroscopy.
		Theoretical prediction of absorption maximum of some organic molecules.
		Identifying and distinguishing various type of electronic transition using solvent perturbation techniques.
		Understanding the concept of micropolarity and the importance of this parameter in spectroscopy
		Understanding some important photoprocessess such as electron transfer and energy transfer and their applications in energy related applications.

		Applications of fluorescence spectroscopy in detecting various analytes (Sensing applications)
Physical Chemistry Lab II	C343	Understanding the concepts of energy minimization, frequency calculations and transition state optimization.
		Practical experience in applications of quantum chemical calculations
Organic Chemistry Lab II	C344	Independent ability to set up a chemical reaction
		Understanding the reaction progress and monitoring
		Isolation and characterization of organic compounds

(G)SEMISTER VII

Name of the Course	Course code	Course Outcome
Physical Methods in Chemistry II	C401	To learn the instrument techniques such as NMR and EPR
		To interpret the data obtained from these techniques
		To understand various aspects involved in NMR, EPR, ENDOR and Mossbauer.
		To find out the radical nature of the materials.
Chemistry of Heterocycles and Natural Products	C403	Understanding nomenclature, structure and reactivity of aromatic and non-aromatic heterocycles.
		Understanding the design and application of various organic reactions for the synthesis of natural products.
		Understanding the classification, structure and synthesis of biomolecules
Chemistry project	C498	Understanding review of literature in a specified research field

		Learning basic laboratory techniques
		Formulate a minor research problem and write a report
		Ability to document and present the project results

(H)SEMISTER VIII

Name of the Course	Course code	Course Outcome
Chemical Rate Processes	C402	Students can learn verities of chemical reactions and time scale of those reactions.
		Describes different spectroscopy and analytical techniques to study chemical kinetics.
		Introduces enzyme kinetics.
		It is a useful course for chemistry and biology students to learn about chemical and biological reactions
Chemistry Project	C499	Ability to study in detail about selected research problem
		Ability to understand the mechanisms involved in the research problem
		Ability to prepare a road map for successful completion of a research problem
		Ability to collaborate

(I) SEMISTER IX

Name of the Course	Course code	Course Outcome
Chemistry Project	C598	Ability to interpret/characterize the results
		Ability to find new alternative approaches to a research problem
		Ability to find newer applications
		Ability to design future plans

(J) SEMISTER X

Name of the Course	Course code	Course Outcome
Chemistry Dissertation	C599	Ability to collate and conclude results
		Ability to have broad understanding of a research area
		Ability to develop a new research idea
		Ability to defend the project well during final presentation

2) ELECTIVES

Name of the Course	Course code	Course Outcome
Photochemistry	C351	Understanding the photoinduced reactions in chemical and biological systems.
		Understanding the photo-physical processes
		Basic principles and application of fluorescence spectroscopy
		Use the knowledge of photochemistry in materials applications
Pharmaceutical Chemistry	C352	To learn pharmacokinetics and pharmacology
		To understand pharmacores and their interactions in molecular targets
		To interpret AMDE principle of drugs (absorption, distribution, metabolism, and excretion)
		To understand drug discovery processes
Classics in Molecules	C353	To learn discovery of organic molecules and their impact on the world such as Urea, Glucose, & Penicillin
		To understand the basic organic chemistry for learning chemical biology
		To learn the small organic molecules that interaction with molecular targets

		To find the nature of drugs and their function in biological changes
Molecular Modeling	C551	Construct potential energy surfaces and force-fields for molecules
		Perform HF, DFT, and semi-empirical calculations on molecules
		Perform chemical dynamics simulations for simple reactions
		Apply molecular dynamics and Monte-Carlo simulations on large sized molecules
Solid State Chemistry	C552	Describe the principles concerning solid state structures
		Describe specific crystal structures by applying basic crystallographic concepts
		Describe the experimental use of the diffraction phenomenon
		Use powder diffraction data for characterising cubic substances
		Analyse thermograms and phase diagrams in known systems
Crystallography	C554	Define concepts such as lattice, point and space groups
		Be familiar with Bragg's Law and explain its the relation to crystal structure
		Identify and describe different diffraction methods
		Interpret and assign X-ray and electron diffraction patterns
		use crystallographic data for a validated phase analysis
Principles of Drug action	C555	To learn pharmacokinetics and pharmacology
		To understand absorption, distribution, metabolism, and excretion of drugs

		To learn various stages of drug discovery process such as clinical trails
		To find the modern drug discovery and development processes including the identification of molecular targets, High-throughput screening (HTS)
Advanced Bio-inorganic Chemistry	C556	Apply the basic principles in inorganic and general chemistry to interdisciplinary topics in the field of bioinorganic chemistry.
		Describe the main roles of metal ions in biological processes, and identify the chemical properties that are required to each particular function.
		Describe the role of metal ions in enzymes involved in acid-base reactions.
		Describe the role of metal ions that are involved in electron-transfer reactions in biological systems.
		Describe how oxygen is transported in different species and identify the metal centers involved in this task.
		Describe the different metal-activation sites in enzymes that are involved in the activation of oxygen.
		Identify the main toxicological mechanisms of metals and the biological defenses against the toxic effects.
		List some medical applications of inorganic compounds.
		Oral and written communicate using the specific language of bioinorganic chemistry and common
Nuclear Magnetic Resonance	C557	Theoretical understanding of the basic working principle of NMR spectroscopy.
		Building in-depth knowledge of the routinely performed experimental steps.

		Analysis of pulse sequence of few key one- and two-dimensional experiments to understand how certain spectra are generated.
		Understanding the theory behind common problems encountered during routine operation of an NMR spectrometer.
Advanced Functional Materials	C558	Introduction to materials in modern technology
		Learn about semiconductor and dielectric materials.
		Exploring the role of magnetic materials in inter-disciplinary sciences
		Use of polymer materials and nano-composites in chemistry and day-today life.
Supramolecular Chemistry	C559	Learn various noncovalent interactions.
		Design the synthesis of novel macrocycles
		Understand the stabilization of anions, cations and neutral substrates.
		To evaluate the binding and stability constants
Chemistry of Nanomaterials	C560	Key concepts of Bottom-up and Top down approaches
		Understanding the mechanism of formation of 0-D, 1-D, 2-D, 3-D
		nanostructured materials.
		Understanding the structure-property relationship of carbon nanomaterials and
		self-assembled monolayers.
		Application of nanomaterials for energy applications and biological applications.
Advanced Bio-organic Chemistry	C561	Introduction of Biomacromolecules, and Enzymology
		Synthesis and application of DNA, RNA and related analogues

		Attract for biosynthesis of natural products
		Impress the role biomacromoleculs in therapy.
Polymer Chemistry	C562	Different types of polymers
		Concepts of polymers
		Applications of polymers
		Challenges involved in making bio-degradable polymers
Molecular Reaction Dynamics	C563	Apply transition state theory and RRKM theory to compute rate constants
		Understand the theory of classical and quantum scattering phenomena
		Learn, how to follow the dynamics of chemical reactions experimentally and theoretically
Theory of Molecular Spectroscopy	C564	Separate the molecular motion into translations, rotations, and vibrations components
		Transform between internal and normal mode coordinates
		Understand the rovibronic spectroscopy of molecules
		Understand multiphoton processes and their application in modern spectroscopy
Advanced Organic Chemistry	C565	Understanding of important organic transformations with advanced mechanisms.
		Learning the recent advances in organic chemistry
		Enhanced ability to connect the learned topics with current research problem and envisage new research projects.
Catalysis: Reaction Mechanisms and Applications	C566	Understanding the principles of catalysis.
		Key concepts of various elementary steps which are important in catalytic cycle.

		Understanding the development of various catalysts in many important catalytic reactions.
		Implications and applications of catalysis in industry and academia.
Advanced Main group Chemistry	C567	Understanding the structure and bonding aspects of metal-metal single or multiple bond of main group elements
		Soluble main group metal hydrides: synthesis and their reactivity studies.
		Group 13 and Group 14 low valent metallacylces: synthesis and reactivity studies
		Application of Main group compounds in homogeneous catalysis.
Advanced Fluorescence Spectroscopy	C568	Describes basic principles and application of fluorescence spectroscopy.
		To learn, how fluorescence spectroscopy is used for frequency and time domain studies of important chemical process.
		To learn to use fluorescence spectroscopy in biological related molecules.
		It also introduces fluorescence imaging**.**
Biomacromolecules	C569	Basic understanding of biomolecules with respect to their structure
		Structure and function relation of biologically important molecules
		In-depth understanding of various biological processes such as DNA replication, protein synthesis
Advanced Heterocyclic Chemistry	C570	Introduction of Heterocyclic Chemistry: Nomenclature, spectral characteristics, reactivity and aromaticity of heterocycles (three and four membered)

		Synthesis and reactivity of five membered rings, benzofused six membered rings with one, two and three heteroatoms, seven and large membered
		Recent methods of C-H functionalization/activations of heterocyclic derivatives.
		Beneficial to synthesized therapeutic drugs
Statistical Mechanics	C571	Understanding the concepts of ensembles, energy partition and probability distribution
		Learning of classical and quantum statistical mechanics
		Application of statistical mechanics to study the thermodynamic properties of simple gases and solids.

3) MINOR SUBJECTS in LIFE SCIENCES

Sr. No.	Course Name	Course No
1	Biology I: Science of Life	B101
2	Biology Laboratory-1	B141
3	Biology II: Cellular and Genetic basis of life	B102
4	Biology Laboratory-2	B142
5	Biochemistry	B202
6	Cell Biology	B204
7	Genetics	B205
8	Molecular Biology	B304
9	Evolutionary Biology	B306

10	Any one course from biology subjected to qualified prerequisite	Bx5x

COURSE OUTCOME OF MINOR SUBJECTS in LIFE SCIENCES

Course Name	Course No	Course Outcome
Biology I: Science of Life	B101	Understanding the origin and evolution of life.
		Fundamental understanding of the structure and function of the molecules of life.
		Fundamental understanding of the structure & function of cellular organelles.
Biology Laboratory-1	B141	Introduce to students analytical tools/approaches to study biomolecules and cell structure.
		Build basics of experimentation and data recording in biology labs
Biology II: Cellular and Genetic basis of life	B102	Understanding the principles of cellular mechanisms driving development of an organism.
		Key evolutionary concepts in Lamarckism, Darwinism and Speciation
		Understanding the genetic basis of inheritance
		Fundamental understanding of molecular Biology
Biology Laboratory-2	B142	Understand a microscope and various staining and microscopic techniques
		Knowledge of the basis of human blood groups (ABO)
		Experimental approaches to study cell growth and differentiation and Gene regulation
		Use of microscope to know various stages of cell division in mitosis and meiosis
Biochemistry	B202	Understanding the principles governing Protein structure & function
		Basic concepts on metabolism and their implications in living organisms
		Concept on signal transduction

<table>
<tr><td></td><td></td><td>Implications in Evolution, Health and disease.</td></tr>
<tr><td rowspan="4">Cell Biology</td><td rowspan="4">B204</td><td>Understanding the basic principles governing cell structure and functions</td></tr>

4) MINOR SUBJECTS in MATHEMATICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Mathematics-I	M101
2	Mathematics-II	M102
3	Real Analysis	M201
4	Group Theory	M202
5	Metric Spaces	M204
6	Linear Algebra	M205
7	Probability Theory	M206
8	Differential Equations	M303

COURSE OUTCOME OF MINOR SUBJECTS in MATHEMATICAL SCIENCES

Name of the Course	Course code	Course Outcome
Mathematics-I	M101	Expects students to learn how to prove theorems, expressing mathematical objects, and understand the construction of natural numbers and symmetry of plane figures.
Mathematics-II	M102	Upon successful completion of the course students will become aware of some basic properties of real line and real valued functions.
Real Analysis	M201	Knowledge on Continuity differentiable and Riemann integration theory. Sequence and series and it's application to numerical analysis.
Group Theory	M202	Upon successful completion of the course students will be able to understand the notion of symmetries in the language of groups. Furthermore, students will become aware of various properties of groups and subgroups.
Metric Spaces	M204	Upon successful completion of the course students will become aware about generalisation of euclidean distance on arbitrary sets and various properties of functions defined on them.
Linear Algebra	M205	Upon successful completion of the course students will learn the relation between linear transformations and matrices. Moreover, student will also learn various fundamental results of matrices, namely, diagonalisa-tion, triangulation and primary decomposition theorem.

Probability Theory	M206	Students will be introduced to the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.
Differential Equations	M303	This course starts with the origin and applications of differential equations and discusses many solution techniques such as separation of vari-able, variation of parameter, annihilator method and Frobenious method, etc. Then it introduces basic theory of existence and uniqueness for the sys-tem of first order ODEs which is essential for many branches of mathematics. This course also gives a glimpse how to analyze the behavior of solutions (maximum principle, stability, asymptotic stability, etc.).
		This course ends with an introduction to partial differential equations and method of charac-teristics, a technique to solve first order partial differential equations. Upon successful completion of this course the student will be able to model some practical situations into ordinary differential equations or partial differential equations and analyze the solution to get information about the parameters involved in the model.

5) MINOR SUBJECTS in PHYSICAL SCIENCES

Sr. No.	Course Name	Course No
1	Physics I (Mechanics and Thermodynamics)	P101
2	Physics Laboratory I	P141
3	Physics II (Electricity, Magnetism and Optics)	P102
4	Physics Laboratory II	P142
5	Classical Mechanics I	P201
6	Mathematical Methods I	P202
7	Electromagnetism I	P204
8	Quantum Mechanics I	P206

9	Statistical Mechanics	P302
10	Any one of the other theory courses	

COURSE OUTCOME OF MINOR SUBJECTS in PHYSICAL SCIENCES

Course Name	Course No	Course Outcome
Physics I (Mechanics and Thermodynamics)	P101	Builds understanding of basic classical mechanics and thermodynamics.
Physics Laboratory I	P141	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment
Physics II (Electricity, Magnetism and Optics)	P102	Builds basic understanding of electro and magneto static phenomena and processes. Introduces important concepts of polarization, electromagnetic waves, interference and diffraction.
Physics Laboratory II	P142	Laboratory Experience with Coupled Oscillator Circuits:
		Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
		Laboratory Experience with Flip-flops and Microcontrollers.
Classical Mechanics I	P201	Training in basic classical mechanics, prepares the student for advanced mechanics courses.
Mathematical Methods I	P202	Acquiring knowledge of vector spaces and it applications to various physical problems.

		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Electromagnetism I	P204	Trains the student in detailed computations involved in electrostatics and magnetostatics, solving Maxwell's equations. Introduces to the idea of energy momentum tensor and Gauge invariance.
Quantum Mechanics I	P206	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.
		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.
		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Statistical Mechanics	P302	space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.

		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Any one of the other theory courses		To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SCHOOL OF HUMANITIES

(A) Core Courses:

1. Semester I

Sr.No.	Name of the Course	Course code
1	Technical Communication I	H109
2	Introduction to Sociology	H133

2. Semester II

Sr.No.	Name of the Course	Course code
1	Technical Communication II	H110
2	Introduction to Economics	H101

(A) Electives:

Sr.No.	Name of the Course	Course code
1	Introduction to Psychology	H225
2	Environmental Economics and Environmental Impact Assessment	H201
3	Introduction to Innovation System	H239
4	Life and Community in Urban World	H238
5	Organizational Behaviour	H227
6	Sociology of Science and Technology	H235
7	Perspectives on Indian Society	H236
8	Science Communication and Citizen	H237
9	The City in Modern Fiction	HS 210
10	Speculative Fiction	H 209

Course Outcome:

(A) Core Courses

1. Semester I

Name of the Courses	Courses Code	Course Outcome
Technical Communication I	H109	Connecting Language and cultural contexts.
		Understand the process behind writing.
		Learn to critically engage with texts.
Introduction to Sociology	H133	Sociological insights that are meaningful and of practical importance to students
		Meaningfully relate with the immediate social environment.
		From a sociological perspective, observe those features which are common to all cultures and be able to assess them in the context of one's own unique setting.
		develop an objective view of social reality
		understand the structure and functioning of the society and its consequent processes of social change

2. Semester II

Name of the Courses	Courses Code	Course Outcome
Technical Communication II	H110	be familiar with the essentials of effective communication
		know the different tools of effective technical communication
		understand the importance of staging the argument, and know various institutional / disciplinary norms
Introduction to Economics	H101	familiarity with the basic concepts of economy such as: Price determination, policies for controlling inflation, role of government, sources of revenue and expenditure of the Union, State and Local government and Balance of Payment

(A) Electives

Name of the Courses	Courses Code	Course Outcome
Introduction to Psychology	H225	better understanding of human behavior.
		differentiate between scientific and non-scientific information about human behavior and mental processes.
		understand the working of their own conscious behavior and interpersonal relationship.
		apply psychological principles everyday life situations.
Environmental Economics and Environmental Impact Assessment	H201	Students would get to know the interaction between economy and environment
		Economic tools used for controlling environmental degradation
		Understanding the need for environmental impact assessment of developmental projects and its procedure
Introduction to Innovation System	H239	Appreciate the imperative of innovation within society.
		Critically analyze different types of innovation.
		Use evidence to critically challenge innovation practices. Identify possible changes in innovation system.
Life and Community in Urban World	H238	Formulate effective argumentation on city life.
		Explain and evaluate historical and contemporary urbanization processes.
		Demonstrate understanding of the diverse nature of urban populations and social problems these populations.
		Identify ways of creating sustainable, and efficient built environments.
Organizational Behaviour	H227	demonstrate knowledge organizational behavior theories and concepts.
		explain the challenges that managers and leaders face in contemporary organizations
		critically evaluate organizational practices and the impact on work behavior and performance.
		describe how the individual, groups and organization level variables interact and influence major organizational outcomes.

Sociology of Science and Technology	H235	Familiarization with the societal perspective in study of science and technology
		provide a basic understanding of issues that fall under broader spectrum of inter-relationship between science & technology and society
Perspectives on Indian Society	H236	Understanding of the basic features of Indian Society: both past and contemporary.
		To acquaint the Students about some of the major social Institutions from Sociological Perspectives
		Understanding of various processes of Social Change and Problems of Indian Society.
Science Communication and Citizen	H237	Evaluate the role of communication in science.
		Provide constructive analysis of popular science communication in a variety of real-world settings.
		Identify target audience and define applicable message.
		Develop a sense of the social and political context for science communication.
The City in Modern Fiction	HS 210	To learn to read critically.
		To learn to contextualize concepts and themes using the framework of the 'modern.'
		To learn structural elements, such as plot, setting, characters, techniques of exposition, that underpins fiction.
Speculative Fiction	H 209	the literary, social, political and genre importance of Speculative Fiction in the contemporary times as well as historically
		a detailed overview of the way Speculative Fiction has developed historically,
		some important works in Speculative Fiction , and the rich diversity in the field,
		not just the Western tradition of Speculative Fiction, but also the Indian tradition of Speculative Fiction, from ancient times to the present
		some of the oft-occurring themes such as utopias, dystopias, and issues of gender, class, environment, multiculturalism, technology, myth-making, alternate history, etc.

SCHOOL of COMPUTER SCIENCES

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Programming and Data Structures Lab – I	CS141
2	Programming and Data Structures Lab – II	CS142
3	Theory of Computation	CS201
4	Discrete Structures and Computation	CS202
5	Design and Analysis of Algorithms	CS301

(B) Electives:

Sr. No.	Name of the Course	Course code
1	Modern Cryptology	CS451
2	Algorithmic Coding Theory	CS452
3	Complexity Theory	CS453
4	Linear Programming and Combinatorial Optimization	CS454
5	Distributed Network Algorithms	CS455

Course Outcome:

(A) Core Courses

Name of the Courses	Courses Code	Course Outcome
Programming and Data Structures Lab – I	CS141	Learn the fundamentals of programming.
		Write code for basic programming tasks.
		Create new data types suitable to the requirements
Programming and Data Structures Lab – II	CS142	Learn the fundamentals of data structures
		Write efficient codes for a wide range of programming tasks.
Theory of Computation	CS201	Learn the Mathematical Foundations of computers
		Construct abstract computational machines for basic tasks.
		Understand principles of programming languages and compilers
Discrete Structures and	CS202	Solve problems related to fundamentals of mathematical logic.

Computation		Model and solve practical problems using graph-theoretic techniques.
		Solve problems related to counting and combinatorics.
Design and Analysis of Algorithms	CS301	Learn the basics of algorithms.
		Measure the efficiency of candidate algorithms.
		Write new algorithms for basic computational tasks.

(B) Electives

Name of the Courses	Courses Code	Course Outcome
Modern Cryptology	CS451	Learn the basics of information security
		Write codes for implementing security protocols.
		Analyze candidate information security solutions.
Algorithmic Coding Theory	CS452	Learn the fundamentals of information theory.
		Write a new data compression algorithm
		Create error resilient storage solutions.
Complexity Theory	CS453	Learn the efficiency limits of computations.
		Derandomizing randomized algorithms
Linear Programming and Combinatorial Optimization	CS454	Solve linear optimization problems
		Model certain game theoretic problems as linear programming problems.
Distributed Network Algorithms	CS455	Design new algorithms for distributed networks
		Find the efficiency limit of distributed algorithms.

INTEGRATED M.Sc. in LIFE SCIENCES

(Program Code: LIFE13)

I. Courses at NISER:

Program Code: LIFE13	Programme Specific Outcome	Ability to think independently and write short research proposals
		Application of bioinformatics knowledge in understanding relationships at sequence, structure and network-level
		Application of physics and statistical concepts to understand biological phenomena.
		Acquire problem solving skills in the domain of biophysics and biostatistics
		Ability to apply the knowledge of biostatistics and biophysics in health and diseases.

(A) Core Courses

1st Year

1. SEMISTER I

Sr. No.	Name of the Course	Course code
1	Chemistry-I	C101
2	Chemistry Laboratory-I	C141
3	Mathematics-I	M101
4	Programming & Data Structure Lab-I	CS141
5	Biology-I	B101
6	Biology Laboratory-I	B141
7	Physics-I	P101
8	Physics Laboratory-I	P141

9	Technical Communication-I	H109
10	Introduction to Psychology	H125

2. SEMISTER II

Sr. No.	Name of the Course	Course code
1	Chemistry-II	C102
2	Chemistry Laboratory-II	C142
3	Mathematics-II	M102
4	Programming & Data Structure Lab-II	CS142
5	Biology-II	B102
6	Biology Laboratory-II	B142
7	Physics-II	P102
8	Physics Laboratory-II	P142
9	Technical Communication-II	H110
10	Introduction to Sociology	H133

2ND YEAR

1. SEMISTER III

Sr. No.	Name of the Course	Course code
1	Microbiology	B201
2	Biochemistry	B202
3	Biophysics and Biostatistics	B203
4	Laboratory-3 (Microbiology)	B241
5	Laboratory-4 (Biochemistry)	B242

2. SEMISTER IV

Sr. No.	Name of the Course	Course code
1	Cell Biology	B204
2	Genetics	B205

3	Elective-1	B251-255
4	Laboratory-5 (Cell Biology)	B243
5	Laboratory-6 (Genetics)	B244

3RD YEAR

1. **SEMISTER V**

Sr. No.	Name of the Course	Course code
1	Physiology-I (Animal)	B301
2	Physiology-II (Plant)	B302
3	Ecology	B303
4	Laboratory-7 (Plant physiology)	B342
5	Elective-2	B351-355

2. **SEMISTER VI**

Sr. No.	Name of the Course	Course code
1	Molecular Biology	B304
2	Immunology	B305
3	Evolutionary Biology	B306
4	Laboratory-8 (Molecular Biology)	B343
5	Laboratory-9 (Immunology)	B344
6	Elective-3	B351-355

4TH YEAR

1. **SEMISTER VII**

Sr. No.	Name of the Course	Course code
1	Bioinformatics	B403
2	Developmental Biology	B402
3	Biology Project	B498
4	Elective-4	B451-460
5	Elective-5	B451-460

2. **SEMISTER VIII**

Sr. No.	Name of the Course	Course code
1	Bio-techniques	B405
2	Elective-6	B551-B562
3	Elective-7	B551-B562
4	Biology Project	B499

5TH YEAR

1. **SEMISTER IX**

Sr. No.	Name of the Course	Course code
1	Biology Project /Dissertation	B598

2. **SEMISTER X**

Sr. No.	Name of the Course	Course code
1	Biology Project /Dissertation	B599

(B) ELECTIVES

2ND & 3RD YEAR

Sr. No.	Name of the Course	Course code
1	Principles of Drug Design	B351
2	Endocrinology	B352
3	Plant Developmental Biology	B353
4	Neurobiology	B354
5	Structural Biology	B355

4TH YEAR

Sr. No.	Name of the Course	Course code
1	Advanced Cell Biology	B451

2	Genetic engineering	B452
3	Advance Biochemistry	B453
4	Advance Microbiology	B454
5	Enzymology	B455
6	Advance Neurobiology	B456
7	Chemical Biology	B457
8	Virology	B460

5^TH YEAR

Sr. No.	Name of the Course	Course code
1	Advanced Molecular Biology	B551
2	Advanced Immunology	B552
3	Infectious Disease Biology	B553
4	Cancer Biology	B554
5	Advanced Genetics	B555
6	Immune regulation and Infection immunity	B556
7	Macromolecular crystallography	B557
8	Quantitative Biology	B558
9	Ion Channels	B559
10	Concepts in Mechanobiology	B561
11	Molecular errors in disease pathogenesis	B562

Course Outcomes:

(A) Core Course

1^ST YEAR

1. SEMISTER I

Name of the Course	Course code	Course Outcome
Biology I: Science of Life	B101	Understanding the origin and evolution of life.
		Fundamental understanding of the structure and function of the molecules of life.
		Fundamental understanding of the structure & function of cellular organelles.

Biology Laboratory-1	B141	Introduce to students analytical tools/approaches to study biomolecules and cell structure.
		Build basics of experimentation and data recording in biology labs

2. SEMISTER II

Name of the Course	Course code	Course Outcome
Biology II: Cellular and Genetic basis of life	B102	Understanding the principles of cellular mechanisms driving development of an organism.
		Key evolutionary concepts in Lamarckism, Darwinism and Speciation
		Understanding the genetic basis of Inheritance
		Fundamental understanding of molecular Biology
Biology Laboratory-2	B142	Understand a microscope and various staining and microscopic techniques
		Knowledge of the basis of human blood groups (ABO)
		Experimental approaches to study cell growth and differentiation and Gene regulation
		Use of microscope to know various stages of cell division in mitosis and meiosis

2ND YEAR

1. SEMISTER III

Name of the Course	Course code	Course Outcome
Microbiology	B201	Microbiology as a science.
		Key concepts in Microbes in health & disease.
		Overview of role of microbes in nutrient Cycling
		Implications in Evolution, Health and disease.
Biochemistry	B202	Understanding the principles governing Protein structure & function
		Basic concepts on metabolism and their implications in living organisms
		Concept on signal transduction
		Implications in Evolution, Health and disease.

Biophysics and Biostatistics	B203	Introducing the concepts of Biophysics and Biostatistics
		Understanding the laws and tools of physics that are applied to understand biology
		How is statistics required and applied in the field of biology
		Evolution of the subject Biophysics and its Application
		Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of biophysics and biostatistics
		Understanding Biophysics to do new and more insightful biology
		Understanding details of biostatistics to understand a) the quality of the data, b) the validity of comparative biological analysis, and classification and grouping of data for better insight of the underlying biological principles
Laboratory-3 (Microbiology)	B241	Culturing of microbes as pure culture, growth disinfection & sterilization.
		Microscopic examination of microbial
		Identification of unknown bacterial Cultures
		Antibiotic susceptibility testing.
Laboratory-4 (Biochemistry)	B242	Understanding the principles and methodology to isolate, purify, quantitate and separate various biomolecules such as protein, DNA, RNA
		Concept and practical experience about the enzyme kinetics, enzyme activity and effect of temperature and pH

2. **SEMISTER IV**

Name of the Course	Course code	Course Outcome
Cell Biology	B204	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell Structure

		Evolution of cell organelles, importance in health and disease.
Genetics	B205	Understanding the basic principles of Inheritance
		Knowledge of genetic disease mechanism
		Comprehension of monogenic, polygenic and multifactorial diseases
		Application in health and diseases
Elective-1	B251-255	To meet the research requirement of the individual student. (Course content varies according to instructor’s choice.)
Laboratory-5 (Cell Biology)	B243	Direct exposure to different types of plant and animal cells
		Direct labelling of different cell organelles and visualization.
		Direct exposure to different cell biology related techniques and high-end instruments
		Learning of research methodology and conducting experiments
Laboratory-6 (Genetics)	B244	Understanding the basic principles of inheritance
		Knowledge of basic techniques used in population genetics and cytogenetics

3RD YEAR

1. **SEMISTER V**

Name of the Course	Course code	Course Outcome
Physiology-I (Animal)	B301	Learning molecular, chemical and physical principles of animal body plan.
		Understanding structure-function relationships and how various physiological systems work.
		Integrating knowledge to understand health and disease.
Physiology-II (Plant)	B302	Entrain the students with different hormone physiology and it’s interaction.
		Learning light physiology, transformation and photosynthesis.
Ecology	B303	Understanding biotic and biotic factors governing the distributions of organisms

		Understanding the biosphere from the viewpoint of organism, population, community and ecosystem
		Understand organismal diversity and functional diversity of organisms in a landscape or ecosystem
Laboratory-7 (Plant physiology)	B342	Train students with tissue culture techniques and plant physiology experiments.
		Aims to bring physiology, biochemistry and molecular biology together.
Elective-2	B351-355	As an interdisciplinary course, the students will be introduced to the different concepts of drug discovery and development.
		Understanding the concepts of hormones and endocrine regulation.
		Knowledge about the structure and function of different endocrine glands and evolutionary significance.
		Applying the knowledge of endocrine regulation to analyze disorders associates with hormonal imbalance.
		Learning molecular genetics approaches to understand plant development.
		Understanding the interaction of biotic and abiotic component is major focus.
		Designing experimental strategies understanding plant development.
		Understanding the organization of nervous system, structure and function of neuron and glial cells.
		Knowledge about the ion basis of action potential, synapse, neurotransmitter release, neural circuits, and behavior.
		Leaning the key techniques in neuroscience research, organization and evolution of the brain.
		Analyzing the neural basis of behavior and neurological disorders.
		Understanding the protein structures in modular approach, correlating the structure to function, and deducing the mechanistic models for the functioning, methods for 3D-structure determination, validation of structures

2. SEMISTER VI

Name of the Course	Course code	Course Outcome
Molecular Biology	B304	Understanding the key components of cell involved in central dogma of molecular biology.
		Understanding of structure-function of genetic material, replication, repair, transcription and translation.
Immunology	B305	Understating the basics of the immune system and the immunological processes during infection, tumor progression, inflammation and immunogenic responses of various cases of altered host physiological functions and phenotypes
Evolutionary Biology	B306	Understanding how life originated on the planet
		Understanding the formation of species and underlying genetic diversity
		Understanding biology from an organismal point of view and why some species evolve slowly while others evolve rapidly
		Understanding systematic relationships between organisms using phylogenetic tools
Laboratory-8 (Molecular Biology)	B343	Hands on training of techniques used in Molecular biology research
		Understanding the working principles by experimental verification
Laboratory-9 (Immunology)	B344	Understating the basic concepts and training of immunological techniques associated to experimentation in the field of immunology
Elective-3	B351-355	As an interdisciplinary course, the students will be introduced to the different concepts of drug discovery and development.
		Understanding the concepts of hormones and endocrine regulation.
		Knowledge about the structure and function of different endocrine glands and evolutionary significance.

		Applying the knowledge of endocrine regulation to analyze disorders associates with hormonal imbalance.
		Learning molecular genetics approaches to understand plant development.
		Understanding the interaction of biotic and abiotic component is major focus.
		Designing experimental strategies understanding plant development.
		Understanding the organization of nervous system, structure and function of neuron and glial cells.
		Knowledge about the ion basis of action potential, synapse, neurotransmitter release, neural circuits, and behavior.
		Leaning the key techniques in neuroscience research, organization and evolution of the brain.
		Analyzing the neural basis of behavior and neurological disorders.
		Understanding the protein structures in modular approach, correlating the structure to function, and deducing the mechanistic models for the functioning, methods for 3D-structure determination, validation of structures

4TH YEAR

1. **SEMISTER VII**

Name of the Course	Course code	Course Outcome
Bioinformatics	B403	Understanding the principles governing development of an organism from conception to birth.
		Key concepts in maintenance of growth of an organism and aging.
		Implications in Evolution, Health and disease.
Developmental Biology	B402	Application of bioinformatics knowledge in understanding relationships at sequence, structure and network-level.
		Demonstration of popularly used bioinformatics tools for research work

		Help understand the patterns of life and rhythms
Biology Project	B498	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-4	B451-460	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
		Understanding the basic principles of Recombinant DNA technology
		Knowledge of various tools and techniques used in genetic engineering
		Applications in the generation of transgenic models
		Understanding the mechanism of protein folding
		In depth knowledge about Post translational modifications of proteins
		Mechanisms and implications of
		protein turn over in cells
		Develop understanding of bacterial responses to various stimuli
		Gain insights into bacterial biofilm formation and quorum sensing mechanisms
		Build comprehension on nature and functioning of enzymes.
		Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
		Develop basic understanding on enzyme engineering
		Develop understanding about the central nervous system-controlled process and their mechanism of regulation.

		In-depth understanding of the neural circuits and behavior.
		Understand and analyze the recent updates in the field and significance.
		Introducing the concept of chemical biology
		Application of chemistry to advance the study of biological systems
		Understanding biology to do new chemistry?
		How is chemical biology used to advance science and human health?
		Understanding chemical structures of bio-molecules
		Comparative understanding of biosynthesis and laboratory synthesis
		Understanding energetics of biochemical pathways and processes
		Be competent in reading and interpreting primary literature in the areas of chemical biology
		At completion of the course, student is expected to comprehend structural organization, and different biological processes of viruses.
		Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
		Develop comprehension of tools and approaches to study viral biology.
Elective-5	B451-460	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
		Understanding the basic principles of Recombinant DNA technology

		Knowledge of various tools and techniques used in genetic engineering
		Applications in the generation of transgenic models
		Understanding the mechanism of protein folding
		In depth knowledge about Post translational modifications of proteins
		Mechanisms and implications of protein turn over in cells
		Develop understanding of bacterial responses to various stimuli
		Gain insights into bacterial biofilm formation and quorum sensing mechanisms
		Build comprehension on nature and functioning of enzymes.
		Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
		Develop basic understanding on enzyme engineering
		Develop understanding about the central nervous system-controlled process and their mechanism of regulation.
		In-depth understanding of the neural circuits and behavior.
		Understand and analyze the recent updates in the field and significance.
		Introducing the concept of chemical biology
		Application of chemistry to advance the study of biological systems
		Understanding biology to do new chemistry?
		How is chemical biology used to advance science and human health?
		Understanding chemical structures of bio-molecules
		Comparative understanding of biosynthesis and laboratory synthesis
		Understanding energetics of biochemical pathways and processes
		Be competent in reading and interpreting primary literature in the areas of chemical biology

		At completion of the course, student is expected to comprehend structural organization, and different biological processes of viruses
		Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
		Develop comprehension of tools and approaches to study viral biology.

2. SEMISTER VIII

Name of the Course	Course code	Course Outcome
Bio-techniques	B405	Basic principle behind the biophysical, and biochemical experiments. Troubleshoot the experiments, interpretation of results, plotting of graphs, design the experiments.
Elective-6	B551-B562	Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.
		Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-regulatory states of altered host immune system.
		Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens
		Understanding basic molecular and cellular mechanisms of carcinogenesis.
		Integrating knowledge to understand therapeutic approaches.
		Stimulate research interest.
		Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
		Stimulate research interest.

		Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
		Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases
		Introducing the concepts of mathematics in biology
		Understanding the quantitative aspects of biology
		How is statistics and mathematics required and applied in the field of biology
		Understanding how mathematical models of biology are developed
		Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
		Understanding quantitative biology to do new and more insightful biology
		Understand theory behind the X-ray diffraction to structure determination. Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.
		Understanding the principles governing ion channel functions
		Biochemcial, biophysical, genetical basis of ion channel and its response
		Key concepts in maintenance of ion
		channel structure, function and ionic homeostasis of the cell
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
		Comprehend the concept that cells are complex micron-sized machines/ nano-machines.

		Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
		Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
		Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation.
		Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
		Enable students of disciplines other than biology to understand how principles of mechanics and engineering can be applied to biological systems and problems.
		Understanding the concepts of molecular pathogenesis.
		Basic understanding of the common pathologies of organ systems.
		Understanding of the recent advances in molecular explanation for such pathologies.
Elective 7	B551-B562	Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.
		Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-regulatory states of altered host immune system.
		Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens

		Understanding basic molecular and cellular mechanisms of carcinogenesis.
		Integrating knowledge to understand therapeutic approaches.
		Stimulate research interest.
		Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
		Stimulate research interest.
		Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
		Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases
		Introducing the concepts of mathematics in biology
		Understanding the quantitative aspects of biology
		How is statistics and mathematics required and applied in the field of biology
		Understanding how mathematical models of biology are developed
		Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
		Understanding quantitative biology to do new and more insightful biology
		Understand theory behind the X-ray diffraction to structure determination.
		Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.
		Understanding the principles governing ion channel functions
		Biochemcial, biophysical, genetical basis of ion channel and its response

		Key concepts in maintenance of ion channel structure, function and ionic homeostasis of the cell
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
		Comprehend the concept that cells are complex micron-sized machines/ nano-machines.
		Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
		Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
		Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation.
		Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
		Enable students of disciplines other than biology to understand how principles of mechanics and engineering can be applied to biological systems and problems.
		Understanding the concepts of molecular pathogenesis.
		Basic understanding of the common pathologies of organ systems.
		Understanding of the recent advances in molecular explanation for such pathologies.

Biology Project	B499	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

5TH YEAR

1. **SEMISTER IX**

Name of the Course	Course code	Course Outcome
Biology Project /Dissertation	B598	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

2. **SEMISTER X**

Name of the Course	Course code	Course Outcome
Biology Project /Dissertation	B599	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) ELECTIVES

2ND & 3RD YEAR

Name of the Course	Course code	Course Outcome
Principles of Drug Design	B351	As an interdisciplinary course, the students will be introduced to the different concepts of drug discovery and development.
Endocrinology	B352	Understanding the concepts of hormones and endocrine regulation.
		Knowledge about the structure and function of different endocrine glands and evolutionary significance.
		Applying the knowledge of endocrine regulation to analyze disorders associates with hormonal imbalance.
Plant Developmental Biology	B353	Learning molecular genetics approaches to understand plant development.
		Understanding the interaction of biotic and abiotic component is major focus.
		Designing experimental strategies understanding plant development.

Neurobiology	B354	Understanding the organization of nervous system, structure and function of neuron and glial cells.
		Knowledge about the ion basis of action potential, synapse, neurotransmitter release, neural circuits, and behavior.
		Leaning the key techniques in neuroscience research, organization and evolution of the brain.
		Analyzing the neural basis of behavior and neurological disorders.
Structural Biology	B355	Understanding the protein structures in modular approach, correlating the structure to function, and deducing the mechanistic models for the functioning, methods for 3D-structure determination, validation of structures

4^{TH} YEAR

Name of the Course	Course code	Course Outcome
Advanced Cell Biology	B451	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
		Importance of ion channels in health and disease, pharmacology and applications
		Advanced knowledge of details of microscopy
		Bridging the gap between theory and research methodology
Genetic engineering	B452	Understanding the basic principles of Recombinant DNA technology
		Knowledge of various tools and techniques used in genetic engineering
		Applications in the generation of transgenic models
Advance Biochemistry	B453	Understanding the mechanism of protein folding
		In depth knowledge about Post translational modifications of proteins
		Mechanisms and implications of protein turn over in cells

Advance Microbiology	B454	Develop understanding of bacterial responses to various stimuli
		Gain insights into bacterial biofilm formation and quorum sensing mechanisms
Enzymology	B455	Build comprehension on nature and functioning of enzymes.
		Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
		Develop basic understanding on enzyme engineering
Advance Neurobiology	B456	Develop understanding about the central nervous system-controlled process and their mechanism of regulation.
		In-depth understanding of the neural circuits and behavior.
		Understand and analyze the recent updates in the field and significance.
Chemical Biology	B457	Introducing the concept of chemical biology
		Application of chemistry to advance the study of biological systems
		Understanding biology to do new chemistry?
		How is chemical biology used to advance science and human health?
		Understanding chemical structures of bio-molecules
		Comparative understanding of biosynthesis and laboratory synthesis
		Understanding energetics of biochemical pathways and processes
		Be competent in reading and interpreting primary literature in the areas of chemical biology
Virology	B460	At completion of the course, student is expected to comprehend structural organization, and different biological processes of viruses
		Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
		Develop comprehension of tools and approaches to study viral biology.

5^{TH} YEAR

Name of the Course	Course code	Course Outcome
Advanced Molecular Biology	B551	Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.
Advanced Immunology	B552	Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-regulatory states of altered host immune system.
Infectious Disease Biology	B553	Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens
Cancer Biology	B554	Understanding basic molecular and cellular mechanisms of carcinogenesis.
		Integrating knowledge to understand therapeutic approaches.
		Stimulate research interest.
Advanced Genetics	B555	Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
		Stimulate research interest.
Immune regulation and Infection immunity	B556	Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
		Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases
Macromolecular crystallography	B557	Understand theory behind the X-ray diffraction to structure determination. Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.
Quantitative Biology	B558	Introducing the concepts of mathematics in biology
		Understanding the quantitative aspects of biology

		How is statistics and mathematics required and applied in the field of biology
		Understanding how mathematical models of biology are developed
		Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
		Understanding quantitative biology to do new and more insightful biology
Ion Channels	B559	Understanding the principles governing ion channel functions.
		Biochemcial, biophysical, genetical basis of ion channel and its response.
		Key concepts in maintenance of ion channel structure, function and ionic homeostasis of the cell.
		Importance of ion channels in health and disease, pharmacology and applications. Advanced knowledge of details of microscopy.
		Bridging the gap between theory and research methodology.
Concepts in Mechanobiology	B561	Comprehend the concept that cells are complex micron-sized machines/ nano-machines.
		Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
		Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
		Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation

		Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
		Enable students of disciplines other than biology to understand how principles of mechanics and engineering can be applied to biological systems and problems.
Molecular errors in disease pathogenesis	B562	Understanding the concepts of molecular pathogenesis.
		Basic understanding of the common pathologies of organ systems.
		Understanding of the recent advances in molecular explanation for such pathologies.

(C) MINOR SUBJECTS in CHEMICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Chemistry-I	C101
2	Chemistry Laboratory-I	C141
3	Chemistry-II	C102
4	Chemistry Laboratory-II	C142
5	Basic Inorganic Chemistry	C201
6	Reaction Mechanism in Organic Chemistry	C203
7	Quantum Chemistry-I	C206
8	Mathematical methods for Chemists	C207
9	Physical Methods in Chemistry-I	C306
10	Thermodynamics and Electrochemistry	C307

COURSE OUTCOME OF MINOR SUBJECTS in CHEMICAL SCIENCES

Name of the Course	Course code	Course Outcome
Chemistry-I	C101	The basics of atomic and molecular structure and spectroscopy

		Thermodynamics of different chemical processes
		Kinetics of chemical reactions
Chemistry Laboratory-I	C141	Introduction to synthesis of small organic compounds
		Qualitative analysis of chemicals present in tea, coffee, fruits etc.
		Synthesis of simple drugs such as paracetamol
Chemistry-II	C102	Apply the fundamental principles of measurement, matter, atomic theory, chemical periodicity, chemical bonding, general chemical reactivity and solution chemistry to subsequent courses in science, engineering, technology.
		Students will be able to explain why chemistry is an integral activity for addressing social, economic, and environmental problems
		Students will be able to explore new areas of research in both chemistry and allied fields of science and technology after getting their concepts clear in Basic Chemistry
Chemistry Laboratory-II	C142	Introduction to quantitative analysis in chemistry.
		Students will learn basic concepts on electrochemistry
		Students will be given hands on practice on conductometry, polarimetry and flame photometry
		They will apply these concepts to estimate binding constant, solubility product etc.
Basic Inorganic Chemistry	C201	To understand basic facts and concepts in Chemistry while retaining the exciting aspects of Chemistry so as to develop interest in the study of chemistry as a discipline.
		To develop the ability to apply the principles of Chemistry.

		To appreciate the achievements in Chemistry and to know the role of Chemistry in nature and in society.
		To develop problem solving skills.
		To be familiarized with the emerging areas of Chemistry and their applications in various spheres of Chemical sciences and to apprise the students of its relevance in future studies.
		To be exposed to the different processes used in industries and their applications
Reaction Mechanism in Organic Chemistry	C203	Introduction of basic organic reactions (Substitutions, Additions & Eliminations) and writing organic reaction mechanisms
		Reactivity of unsaturated hydrocarbons (alkene, alkyne and aromatic)
		Understanding the role of substitutions to influence the rate of reactions
		Stereochemistry in organic chemistry: Chemoselectivity, Diastereoselectivity, Enantioselectivity, Stereospecificity, Stereoconvergence
		Introduction of asymmetric synthesis with and without asymmetric catalysts
Quantum Chemistry-I	C206	Understanding the need of Quantum mechanics based on failures of Classical mechanics.
		Learning the basic building blocks of Quantum Mechanics.
		Learning to use the mathematical structure of quantum mechanics in several systems comprising one or many quantum particles.
		Understanding the bridge between the mathematical structure of quantum mechanics and different spectroscopic techniques based on that.

Mathematical methods for Chemists	C207	Introduce the standard mathematical techniques that are typically used by Chemists.
		To learn how to apply mathematics to chemistry research.
		To learn how to use Fourier transform in different spectroscopy.
		The course, mostly differential equation is useful to learn quantum chemistry and chemical kinetics.
Physical Methods in Chemistry-I	C306	Understand the basics of absorption and fluorescence spectroscopy.
		Theoretical prediction of absorption maximum of some organic molecules.
		Identifying and distinguishing various type of electronic transition using solvent perturbation techniques.
		Understanding the concept of micropolarity and the importance of this parameter in spectroscopy
		Understanding some important photoprocessess such as electron transfer and energy transfer and their applications in energy related applications.
		Applications of fluorescence spectroscopy in detecting various analytes (Sensing applications)
Thermodynamics and Electrochemistry	C307	Understanding the laws of Thermodynamics and Phase equilibrium of multicomponent systems.
		Understanding the thermodynamics of surfaces and different adsorption isotherms of gases on solids.
		Key concepts for the Electrochemistry and applications of Electrochemistry.
		Key concepts of Statistical Thermodynamics.

(D) MINOR SUBJECTS in MATHEMATICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Mathematics-I	M101
2	Mathematics-II	M102
3	Real Analysis	M201
4	Group Theory	M202
5	Metric Spaces	M204
6	Linear Algebra	M205
7	Probability Theory	M206
8	Differential Equations	M303

COURSE OUTCOME OF MINOR SUBJECTS in MATHEMATICAL SCIENCES

Name of the Course	Course code	Course Outcome
Mathematics-I	M101	Expects students to learn how to prove theorems, expressing mathematical objects, and understand the construction of natural numbers and symmetry of plane figures.
Mathematics-II	M102	Upon successful completion of the course students will become aware of some basic properties of real line and real valued functions.
Real Analysis	M201	Knowledge on Continuity differentiable and Riemann integration theory. Sequence and series and it's application to numerical analysis.
Group Theory	M202	Upon successful completion of the course students will be able to understand the notion of symmetries in the language of groups. Furthermore, students will become aware of various properties of groups and subgroups.
Metric Spaces	M204	Upon successful completion of the course students will become aware about generalisation of euclidean distance on arbitrary sets and various properties of functions defined on them.

Linear Algebra	M205	Upon successful completion of the course students will learn the relation between linear transformations and matrices. Moreover, student will also learn various fundamental results of matrices, namely, diagonalisa-tion, triangulation and primary decomposition theorem.
Probability Theory	M206	Students will be introduced to the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.
Differential Equations	M303	This course starts with the origin and applications of differential equations and discusses many solution techniques such as separation of vari-able, variation of parameter, annihilator method and Frobenious method, etc. Then it introduces basic theory of existence and uniqueness for the sys-tem of first order ODEs which is essential for many branches of mathematics. This course also gives a glimpse how to analyze the behavior of solutions (maximum principle, stability, asymptotic stability, etc.).
		This course ends with an introduction to partial differential equations and method of charac-teristics, a technique to solve first order partial differential equations. Upon successful completion of this course the student will be able to model some practical situations into ordinary differential equations or partial differential equations and analyze the solution to get information about the parameters involved in the model.

(E) MINOR SUBJECTS in PHYSICAL SCIENCES

Sr. No.	Course Name	Course No
1	Physics I (Mechanics and Thermodynamics)	P101
2	Physics Laboratory I	P141
3	Physics II (Electricity, Magnetism and Optics)	P102
4	Physics Laboratory II	P142
5	Classical Mechanics I	P201
6	Mathematical Methods I	P202
7	Electromagnetism I	P204

8	Quantum Mechanics I	P206
9	Statistical Mechanics	P302
10	Any one of the other theory courses	

COURSE OUTCOME OF MINOR SUBJECTS in PHYSICAL SCIENCES

Course Name	Course No	Course Outcome
Physics I (Mechanics and Thermodynamics)	P101	Builds understanding of basic classical mechanics and thermodynamics.
Physics Laboratory I	P141	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment
Physics II (Electricity, Magnetism and Optics)	P102	Builds basic understanding of electro and magneto static phenomena and processes. Introduces important concepts of polarization, electromagnetic waves, interference and diffraction.
Physics Laboratory II	P142	Laboratory Experience with Coupled Oscillator Circuits:
		Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
		Laboratory Experience with Flip-flops and Microcontrollers.
Classical Mechanics I	P201	Training in basic classical mechanics, prepares the student for advanced mechanics courses.
Mathematical Methods I	P202	Acquiring knowledge of vector spaces and it applications to various physical problems.

Mathematical Methods I	P202	Acquiring knowledge of vector spaces and it applications to various physical problems.
		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Electromagnetism I	P204	Trains the student in detailed computations involved in electrostatics and magnetostatics, solving Maxwell's equations. Introduces to the idea of energy momentum tensor and Gauge invariance.
Quantum Mechanics I	P206	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.
		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.
		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Statistical Mechanics	P302	space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.

		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Any one of the other theory courses		To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SCHOOL OF HUMANITIES

(A) Core Courses:

1. Semester I

Sr.No.	Name of the Course	Course code
1	Technical Communication I	H109
2	Introduction to Sociology	H133

2. Semester II

Sr.No.	Name of the Course	Course code
1	Technical Communication II	H110
2	Introduction to Economics	H101

(A) Electives:

Sr.No.	Name of the Course	Course code
1	Introduction to Psychology	H225
2	Environmental Economics and Environmental Impact Assessment	H201
3	Introduction to Innovation System	H239
4	Life and Community in Urban World	H238
5	Organizational Behaviour	H227
6	Sociology of Science and Technology	H235
7	Perspectives on Indian Society	H236
8	Science Communication and Citizen	H237
9	The City in Modern Fiction	HS 210
10	Speculative Fiction	H 209

Course Outcome:

(A) Core Courses

1. Semester I

Name of the Courses	Courses Code	Course Outcome
Technical Communication I	H109	Connecting Language and cultural contexts.
		Understand the process behind writing.
		Learn to critically engage with texts.
Introduction to Sociology	H133	Sociological insights that are meaningful and of practical importance to students
		Meaningfully relate with the immediate social environment.
		From a sociological perspective, observe those features which are common to all cultures and be able to assess them in the context of one's own unique setting.
		develop an objective view of social reality
		understand the structure and functioning of the society and its consequent processes of social change

2. Semester II

Name of the Courses	Courses Code	Course Outcome
Technical Communication II	H110	be familiar with the essentials of effective communication
		know the different tools of effective technical communication
		understand the importance of staging the argument, and know various institutional / disciplinary norms
Introduction to Economics	H101	familiarity with the basic concepts of economy such as: Price determination, policies for controlling inflation, role of government, sources of revenue and expenditure of the Union, State and Local government and Balance of Payment

(A) Electives

Name of the Courses	Courses Code	Course Outcome
Introduction to Psychology	H225	better understanding of human behavior.
		differentiate between scientific and non-scientific information about human behavior and mental processes.
		understand the working of their own conscious behavior and interpersonal relationship.
		apply psychological principles everyday life situations.
Environmental Economics and Environmental Impact Assessment	H201	Students would get to know the interaction between economy and environment
		Economic tools used for controlling environmental degradation
		Understanding the need for environmental impact assessment of developmental projects and its procedure
Introduction to Innovation System	H239	Appreciate the imperative of innovation within society.
		Critically analyze different types of innovation.
		Use evidence to critically challenge innovation practices. Identify possible changes in innovation system.
Life and Community in Urban World	H238	Formulate effective argumentation on city life.
		Explain and evaluate historical and contemporary urbanization processes.
		Demonstrate understanding of the diverse nature of urban populations and social problems these populations.
		Identify ways of creating sustainable, and efficient built environments.
Organizational Behaviour	H227	demonstrate knowledge organizational behavior theories and concepts.
		explain the challenges that managers and leaders face in contemporary organizations
		critically evaluate organizational practices and the impact on work behavior and performance.
		describe how the individual, groups and organization level variables interact and influence major organizational outcomes.

Sociology of Science and Technology	H235	Familiarization with the societal perspective in study of science and technology
		provide a basic understanding of issues that fall under broader spectrum of inter-relationship between science & technology and society
Perspectives on Indian Society	H236	Understanding of the basic features of Indian Society: both past and contemporary.
		To acquaint the Students about some of the major social Institutions from Sociological Perspectives
		Understanding of various processes of Social Change and Problems of Indian Society.
Science Communication and Citizen	H237	Evaluate the role of communication in science.
		Provide constructive analysis of popular science communication in a variety of real-world settings.
		Identify target audience and define applicable message.
		Develop a sense of the social and political context for science communication.
The City in Modern Fiction	HS 210	To learn to read critically.
		To learn to contextualize concepts and themes using the framework of the 'modern.'
		To learn structural elements, such as plot, setting, characters, techniques of exposition, that underpins fiction.
Speculative Fiction	H 209	the literary, social, political and genre importance of Speculative Fiction in the contemporary times as well as historically
		a detailed overview of the way Speculative Fiction has developed historically,
		some important works in Speculative Fiction , and the rich diversity in the field,
		not just the Western tradition of Speculative Fiction, but also the Indian tradition of Speculative Fiction, from ancient times to the present
		some of the oft-occurring themes such as utopias, dystopias, and issues of gender, class, environment, multiculturalism, technology, myth-making, alternate history, etc.

SCHOOL of COMPUTER SCIENCES

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Programming and Data Structures Lab – I	CS141
2	Programming and Data Structures Lab – II	CS142
3	Theory of Computation	CS201
4	Discrete Structures and Computation	CS202
5	Design and Analysis of Algorithms	CS301

(B) Electives:

Sr. No.	Name of the Course	Course code
1	Modern Cryptology	CS451
2	Algorithmic Coding Theory	CS452
3	Complexity Theory	CS453
4	Linear Programming and Combinatorial Optimization	CS454
5	Distributed Network Algorithms	CS455

Course Outcome:

(A) Core Courses

Name of the Courses	Courses Code	Course Outcome
Programming and Data Structures Lab – I	CS141	Learn the fundamentals of programming.
		Write code for basic programming tasks.
		Create new data types suitable to the requirements
Programming and Data Structures Lab – II	CS142	Learn the fundamentals of data structures
		Write efficient codes for a wide range of programming tasks.
Theory of Computation	CS201	Learn the Mathematical Foundations of computers
		Construct abstract computational machines for basic tasks.
		Understand principles of programming languages and compilers
Discrete Structures and	CS202	Solve problems related to fundamentals of mathematical logic.

Computation		Model and solve practical problems using graph-theoretic techniques.
		Solve problems related to counting and combinatorics.
Design and Analysis of Algorithms	CS301	Learn the basics of algorithms.
		Measure the efficiency of candidate algorithms.
		Write new algorithms for basic computational tasks.

(B) Electives

Name of the Courses	Courses Code	Course Outcome
Modern Cryptology	CS451	Learn the basics of information security
		Write codes for implementing security protocols.
		Analyze candidate information security solutions.
Algorithmic Coding Theory	CS452	Learn the fundamentals of information theory.
		Write a new data compression algorithm
		Create error resilient storage solutions.
Complexity Theory	CS453	Learn the efficiency limits of computations.
		Derandomizing randomized algorithms
Linear Programming and Combinatorial Optimization	CS454	Solve linear optimization problems
		Model certain game theoretic problems as linear programming problems.
Distributed Network Algorithms	CS455	Design new algorithms for distributed networks
		Find the efficiency limit of distributed algorithms.

INTEGRATED M.Sc. in MATHEMATICAL SCIENCES
(Program Code: MATH13)

Course Structure:

I. Courses at NISER

Program Code: MATH13	**Programme Specific Outcome**	The core courses of the program provide a basic understanding in all areas of Mathematics which will be a foundation for further study of advanced topics.
		The electives courses provide knowledge in specialized topics and interconnection between different areas of Mathematics.
		Projects/Dissertation under the guidance of the faculty members give students exposure to current research in different areas of Mathematics and imbibe effective scientific and/or technical communication in both oral and writing.

COURSE OUTCOMES:

(A) Core Courses

SEMISTER I

Name of the Course	**Course code**	**Course Outcome**
Mathematics-I	M101	Expects students to learn how to prove theorems, expressing mathematical objects, and understand the construction of natural numbers and symmetry of plane figures.

SEMISTER II

Name of the Course	**Course code**	**Course Outcome**
Mathematics-II	M102	Upon successful completion of the course students will become aware of some basic properties of real line and real valued functions.

SEMISTER III

Name of the Course	**Course code**	**Course Outcome**
Real Analysis	M201	Knowledge on Continuity differentiable and Riemann integration theory. Sequence and series and it's application to numerical analysis.

Group Theory	M202	Upon successful completion of the course students will be able to understand the notion of symmetries in the language of groups. Furthermore, students will become aware of various properties of groups and subgroups.
Discrete Mathematics	M203	Learning different combinatorial techniques to solve many counting problems and understanding some mathematical structures
Number Theory	M207	Expects students to learn elementary properties of rings of integers including divisibility, congruences, continued fractions and Gauss reciprocity laws.
Elective-I	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-II	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER IV

Name of the Course	**Course code**	**Course Outcome**
Metric Spaces	M204	Upon successful completion of the course students will become aware about generalisation of euclidean distance on arbitrary sets and various properties of functions defined on them.
Linear Algebra	M205	Upon successful completion of the course students will learn the relation between linear transformations and matrices. Moreover, student will also learn various fundamental results of matrices, namely, diagonalisation, triangulation and primary decomposition theorem.
Probability Theory	M206	Students will be introduced to the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.
Graph Theory	M208	Understanding the fundamentals of graph theory and learning the structure of graphs and techniques used to analyze different problems
Elective-III	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-IV	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER V

Name of the Course	Course code	Course Outcome
Calculus of Several Variables	M306	Upon successful completion of the course students will learn the notion of limits, continuity, differentiation and integration in the higher dimensional euclidean spaces.
Rings and Modules	M302	Expects students to learn structure and various properties of rings and modules, structure of finitely generated modules over PID.
Differential Equations	M303	This course starts with the origin and applications of differential equations and discusses many solution techniques such as separation of variable, variation of parameter, annihilator method and Frobenious method, etc. Then it introduces basic theory of existence and uniqueness for the system of first order ODEs which is essential for many branches of mathematics. This course also gives a glimpse how to analyze the behavior of solutions (maximum principle, stability, asymptotic stability, etc.). This course ends with an introduction to partial differential equations and method of characteristics, a technique to solve first order partial differential equations. Upon successful completion of this course the student will be able to model some practical situations into ordinary differential equations or partial differential equations and analyze the solution to get information about the parameters involved in the model.
Topology	M304	This course builds the foundations of point set topology and also covers basic algebraic topology (basics of covering spaces and fundamental group). After taking this course the students will be proficient in the abstract notion of a topological space, where continuous functions are defined in terms of open sets (and not the traditional $\varepsilon - \delta$ definition used in analysis). The students will appreciate some of the most important concepts in analysis from a topological perspective. For example, they will realize Intermediate value theorem is a statement about connectedness, Bolzano Weirstrass Theorem is a statement about compactness and so on. They will also get a solid grasp of quotient topology (which is a fundamentally new concept that is not an extension of the things already taught in analysis).

		The students will then be taught deeper concepts such as Ursysohn Lemma, Tietze extension theorem and Tychonoff Theorem. These topics will be of great use to anyone pursuing further studies in Topology, Functional Analysis, PDE and Probability.
		The students will also learn the basics of fundamental group and covering spaces; they will be able to compute the fundamental group of a circle (but not much more beyond that in this course). After this course, they will be fully ready to study a more advanced course in Algebraic Topology that gets into the intricate details of fundamental group and singular homology. This course will also be very useful to anyone pursuing further studies in Differential Geometry (theory of manifolds).
Statistics	M305	Students will be introduced to the discipline of statistics, learn about descriptive statistics of data sets including graphical representation using some statistical software. The focus is to learn about basic theory of point estimation, interval estimation, hypothesis testing and linear regression.
Elective-V	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER VI

Name of the Course	**Course code**	**Course Outcome**
Lebesgue Integration	M301	Upon successful completion of the course students will learn the concept of measures and measurable functions. Students also learn Lebesgue integration and their various properties
Field Theory	M307	Expects students to learn basic properties of fields including the fundamental theorem of Galois theory.
Complex Analysis	M308	Upon successful completion of the course students will learn the concept of (complex) differentiation and integration of functions defined on the complex plane and their properties.
Geometry of Curves and Surfaces	M310	Knowledge on curve and surfaces, manifold and vector field some application on geometry of surfaces.
Numerical Analysis	M311	Upon successful completion of the course students will learn prac-tical use of some

		important results from real analysis and linear algebra.
Elective-VI	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER VII

Name of the Course	Course code	Course Outcome
Functional Analysis	M401	Upon successful completion of the course students will learn the concept of normed linear space and various properties of operators defined on them.
Commutative Algebra	M403	Expects students to understand various properties of commuta-tive rings, various class of commutative rings, and dimension theory.
Project-I	M498	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-VII	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-VIII	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-IX	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER VIII

Name of the Course	Course code	Course Outcome
Algebraic Topology	M404	This course lays down the foundations of fundamental group ($\pi 1$) and singular homology. The students will get a good in-depth knowledge of covering spaces. To begin with, they will study covering spaces as a tool to compute fundamental group (such as the circle, torus etc). Later on, they will study covering spaces in much greater depth; they will get an understanding of the correspondence between conjugacy classes of $\pi 1$ and the different covering spaces they correspond

		to. They will also learn that this correspondence is bijective if and only if the space is reasonable (path connected, locally path connected and semi-locally simply connected). Students will also learn different techniques to compute the fundamental group such as homotopy invariance and Van-Kampen Theorem.
		The students will also learn about the basics of singular homology. They will learn different techniques to compute singular homology of a space, including homotopy invariance, Mayer-Vietoris, excision, long exact sequence etc. The students will also learn about the degree of a map. They will be able to use these concepts to prove non-trivial theorems such as invariance of domain, hairy ball theorem etc.
Representations of Finite Groups	M402	This course gives an introduction to the representation of finite groups via character theory.
Project-II	M499	Learning formulation and execution of research project.
Elective-X	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-XI	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-XII	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER IX

Name of the Course	**Course code**	**Course Outcome**
Dissertation	M598	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective-XIII	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SEMISTER X

Name of the Course	Course code	Course Outcome
Dissertation	M599	Learning effective communication of research results in writing and ethics in publication.
Elective-XIV	****	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) ELECTIVES

Name of the Course	Course code	Course Outcome
Advanced Complex Analysis	M451	Students will learn some important theorems in complex analysis such as Riemann mapping theorem, Weirstrass factorization theorem, Runges theorem, Hardamard factorization theorem, Little Picards theorem and Great Picards theorem. They will also learn some basic techniques of harmonic functions and characterization of Dirichlet Region. These results are very useful in many branches of mathematics such as Number Thoery, Differential Geometry, Operator theory, Partal Differential Equations etc.
Advanced Functional Analysis	M452	Upon successful completion of the course students will become aware of the concept of topological vector space, as a generalisation of normed linear spaces, and various properties of operators defined on them.
Advanced Linear Algebra	M453	Upon successful completion of the course students will become aware of various decomposition results of matrices and their applications.
Partial Differential Equations	M454	Students will learn explicit representations of solutions of four important classes of PDEs, namely, Transport equations, Heat equation, Laplace equation and wave equation for initial value problems. They will study the properties of solutions of these equations such as mean value property, maximum principles and regularity. They will also study Cauchy-Kowalevski Theorem and uniqueness theorem of Holmgreen for quasilinear equations.

Introduction to Stochastic Processes	M455	Students will be introduced to the theory of both discrete time and continuous time Markov chains.
Algebraic Geometry	M456	This course will introduce the students to the fundamentals of classical algebraic geometry. They will learn about the theory of Riemann surfaces, divisors, line bundles, Chern Classes and the Riemann Roch Theorem.
Algebraic Graph Theory	M457	Learning the different algebraic techniques used in the study of the graphs
Algebraic Number Theory	M458	This course gives an introduction to the basic properties of number fields, computation of class numbers and zeta functions.
Algorithm	M460	Students will learn (i) Data structure, (ii) design and analysis algorithms and (iii) some important algorithms like sortings, graph theoretics, polynomial related and optimization
Cryptology	M462	It introduces the basics of Cryptography and cryptanalysis. Stu-dents learn theory and design of cryptographic schemes like stream ciphers, block ciphers and public key ciphers like RSA, El-Gamal, elliptic curve cryptosystem. Further, they learn about data authentication, integrity and secret sharing.
Finite Fields	M463	This course gives a structure of finite fields, factorization of polynomials, some applications towards cryptography, coding theory and combinatorics.
Information and Coding Theory	M464	It introduces information theory and coding theory. In information theory, students learn how to measure information and encoding of information. In coding theory, students learn theory and techniques of error correcting codes like Reed-Muller codes, BCH codes, Reed- Solomon codes, Algebraic codes.
Mathematical Logic	M465	Students will learn Mathematical logic. It starts from the propositional logic and then first order theory. Then introduces the completeness and compactness theorems with Godels incompleteness theorem.
Measure Theory	M466	Upon successful completion of the course students will learn the concept of measures and measurable functions. Students also learn integration and their various properties.

Nonlinear Analysis	M467	Students will learn Calculus in Banach Spaces and degree theory. As an application of degree theory, they will study fixed point theorems of Brouwer and Schauder. Students will also learn homotopy, homotopy extension and invariance theorems and its applications. This course is very useful for the students who want to specialize in Partial Differential Equations.
Operator Theory	M468	Upon successful completion of the course students will become familiar with concepts of C*-algebra, von-Neuman algebra and toeplitz operators and the notion of index for Fredholm operators.
Theory of Computation	M469	It introduces the theory of computer science. Here, the students learn (i) Automata and Language Theory by studying automata and context free language (ii) Computability theory by studying Turing machine and halting problem (iii) Complexity theory by studying P and NP class problems
Abstract Harmonic Analysis	M470	Knowledge on Haar measure, convolution structure on Lie group with emphasize to harmonic analysis on the groups Circle and real line.
Advanced Number Theory	M471	This advanced course gives a brief introduction to p-adic numbers, quadratic forms, Dirichlet series and modular forms.
Advanced Probability	M472	Students will learn about measure theoretic probability starting from probability spaces to theory of martingales.
Algebraic Combinatorics	M473	Learning the use of different algebraic technique to study the combinatorial problems
Foundations of Cryptography	M474	The theoretical study of cryptography which puts foundation for the study and design of real-life cryptography.
Incidence Geometry	M475	Understanding different kinds of incidence structures such as projective spaces, affine spaces, generalized quadrangles, polar spaces and quadratic sets.

Lie Algebras	M476	This course serves two purposes. (i) To introduce the basics of Lie algebras to the students who are interested in algebra and pursue further in the studies of infinite dimensional Lie algebras like Kac-Moody Lie algebras on one hand and finite dimensional Lie algebras and their representations over any field on the other hand. (ii) As Lie algebras play infinitesimal part of Lie groups, they play important role in understanding Lie groups. The theory of semisimple Lie algebras is extremely rich thanks to Cartan, Weyl without which, one cannot understand the geometry of semisimple Lie groups and their representations and also compact Lie groups.
		After having done this course, one can pursue the studies on either Lie algebras or Representation theory of Lie groups.
Optimization Theory	M477	Understanding the different techniques used to solve the linear and non-linear programming problem
Advanced Partial Differential Equations	M478	Students will learn basics of distribution Theory, Sobolev Spaces and their properties. Using Sobolev space Theory, students will learn existence theory of solutions for Dirichlet, Neuman and oblique derivative problems for second order elliptic partial differential equations. They will also learn weak and strong maximum principles, Hopf Maximum Principle and Alexandrof- Bakelmann-Pucci estimate for the solutions. This course is very useful for the students who want to specialize in Partial
Random Graphs	M479	The aim is to learn random graphs and its applications.
Randomized Algorithms and Probabilistic Methods	M480	The aim is to learn how to use probabilistic techniques to different areas of mathematics and computer science.
Statistical Inference I	M481	The outcome of this course is to learn about parametric statistical inference to be applicable to almost all branches of statistics. Students will learn various methods of estimation and hypothesis testing and their large sample and small sample properties.

Multivariate Statistical Analysis	M482	Students will learn about various modern statistical tools to analyze and draw inference from multivariate data sets. Starting from multivariate normal distribution, students will learn inference about multivariate sample mean and variance, techniques of dimension reduction, introductory factor analysis, cluster analysis and statistical pattern recognition.
Introduction to Manifolds	M483	This course lays the foundations of modern Differential Geometry. After taking this course, the students will get a good knowledge of smooth manifolds, tangent and cotangent spaces, vector bundles, (co)tangent bundles, vector fields, differential forms, exterior differentiation, De-Rham co-homology, integration on manifolds, homotopy invariance of De-Rham coho-mology and the statement of Poincare Duality. After studying this course, students will be fully prepared to pursue further studies in (complex) algebraic geometry, theory of Riemann surfaces and Riemannian Geometry. Students will also be fully equipped to pursue further studies in analysis on manifolds, particularly the theory of Elliptic operators on smooth manifolds and Hodge Theory (which culminates in the proof of Poincare Duality). Students who are interested in either Topology, Differential Geometry,
		Algebraic Geometry and certain topics in analysis and PDE, with a geometric flavor (i.e. Geometric Analysis) will find this course very useful.
Algebraic Computation	M551	It is a unique style of course where the mathematics students having interest in computation can learn to compute different algebraic problems in computer. Here students will learn the computation of the problems related (i) linear algebra, (ii) non-linear system of quations like Grobner bases, (iii) polynomial, (iv) Algebraic number theory and (v) elliptic curve.
Analytic Number Theory	M552	Expects students to learn elementary properties of Dirichlet series and distribution of primes.
Classical Groups	M553	Understanding the basic facts about classical groups defined over fields such as General Linear groups, Special Linear groups, Symplectic groups, Orthogonal groups and

Ergodic Theory	M554	The origin and motivation of studies of Ergodic theory comes from the statistical physics. One of the main branches in Analysis, it aims to give a formal mathematical treatment of movements of particles in a measure space. The important application is to study the behaviours of atoms and molecules in the ambit of aggregate systems. So, naturally the probability theory lies in the undercurrent of Ergodic theory. This theory emerged as a bridge between Probability theory, Physics and Functional analysis. It has a lot of applications in Statistical physics and mathematical biology.
Harmonic Analysis	M555	Knowledge on Fourier Series, Fourier transforms and celebrated differentiation theorem and important operators like Hilbert transform and Maximal function.
Lie Groups and Lie Algebras-I	M556	Understanding the technique used for constructing combinatorial designs and its relation with linear codes Outcomes: The aim of this course and M564- Lie groups and Lie algebras II is to give a strong foundation on the study of Lie groups and their infinitesimal version viz., Lie algebras. The prominent role played by Lie groups in the study of Geometry and theoritical physics needs no further emphasis. This course is tremendously beneficial for the mathematics students and physics students as well.
		It begins with the rudiments of Lie groups and finally ends with irreducible representations of compact Lie groups parametrised by Weyl Character formula.
Operator Algebras	M557	Upon successful completion of the course students will become familiar with concepts and various structure theorems of C*-algebra and von-Neuman algebra.
Representations of Linear Lie Groups	M558	This course is a more basic than M556 and M564 laying founda-tion for the students who want to take up one of the branches of mainstream mathematics namely, non-abelian harmonic analysis. The prototype of the complications that might arise in the study of non-abelian harmonic anal-ysis, is amply found in the study of Linear Lie groups. Yet, these linear Lie groups are plausible to understand as they are concrete examples of non-compact non-abelian Lie groups.

		The course starts from the first principles of representations and goes upto understanding the important examples of 3 different types of groups, viz., compact, nilpotent and solvable groups. It is quite beneficial for the students who want to get into representation theory.
Harmonic Analysis on Compact Groups	M559	Knowledge on representaion on compact lie groups with examples SU(2), SO(n).
Modular Forms of One Variable	M560	This course gives an introduction to modular forms over 2 and their congruence subgroups, and their Hecke theory.
Elliptic Curves	M561	This course gives an introduction to elliptic curves and the struc-ture of their rational points.
Brownian Motion and Stochastic Calculus	M562	Students will learn about the theory of Brownian motion and it applications to stochastic differential equations.
Differentiable Manifolds and Lie Groups	M563	This course will introduce the students to the fundamentals of Lie groups and Lie Algebras. After studying this course, students will get a working knowledge of smooth manifolds, but unlike M483, this course will get into an in depth study of Lie Groups. The students will study about (bi)invariant vector fields, integration on Lie Groups, Cartan's Theorem etc. After studying this course, students will be fully equipped to study Abstract Harmonic Analysis on Lie Groups (and the construction of Haar Measure).
Lie Groups and Lie Algebras-II	M564	This course is the sequel of M556 - Lie groups and Lie algebras I. It mostly deals with the representation theory of Lie groups. Lie groups that are studied in this course, are compact Lie groups and the group SL(2,C) . Another aspect of this course is to classify all simple Lie algebras through root system. As it is well known, the study of subatomic particles depend on the irreducible representations of certain Lie groups that are contained in GL(n, R). This course gives a vivid account of mathematics that is needed to understand these representations. To sum up, it is a gateway for the students of mathematics to pursue harmonic analysis of Lie groups.
Mathematical Foundations for Finance	M565	Students will learn about the mathematical modeling of simple stock markets and techniques to analyze them.
Designs and Codes	M566	Understanding the technique used for constructing combinatorial designs and its relation with linear codes.

Statistical Inference II	M567	Students will be introduced to decision theory and learn about Bayesian estimation and testing. Moreover, students will learn about large sample theory including asymptotic tests, confidence intervals, asymptotic efficiency and optimality of estimators and tests.

(A) MINOR SUBJECTS in CHEMICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Chemistry-I	C101
2	Chemistry Laboratory-I	C141
3	Chemistry-II	C102
4	Chemistry Laboratory-II	C142
5	Basic Inorganic Chemistry	C201
6	Reaction Mechanism in Organic Chemistry	C203
7	Quantum Chemistry-I	C206
8	Mathematical methods for Chemists	C207
9	Physical Methods in Chemistry-I	C306
10	Thermodynamics and Electrochemistry	C307

COURSE OUTCOME OF MINOR SUBJECTS in CHEMICAL SCIENCES

Name of the Course	Course code	Course Outcome
Chemistry-I	C101	The basics of atomic and molecular structure and spectroscopy
		Thermodynamics of different chemical processes
		Kinetics of chemical reactions
Chemistry Laboratory-I	C141	Introduction to synthesis of small organic compounds
		Qualitative analysis of chemicals present in tea, coffee, fruits etc.
		Synthesis of simple drugs such as paracetamol

Chemistry-II	C102	Apply the fundamental principles of measurement, matter, atomic theory, chemical periodicity, chemical bonding, general chemical reactivity and solution chemistry to subsequent courses in science, engineering, technology.
		Students will be able to explain why chemistry is an integral activity for addressing social, economic, and environmental problems
		Students will be able to explore new areas of research in both chemistry and allied fields of science and technology after getting their concepts clear in Basic Chemistry
Chemistry Laboratory-II	C142	Introduction to quantitative analysis in chemistry.
		Students will learn basic concepts on electrochemistry
		Students will be given hands on practice on conductometry, polarimetry and flame photometry
		They will apply these concepts to estimate binding constant, solubility product etc.
Basic Inorganic Chemistry	C201	To understand basic facts and concepts in Chemistry while retaining the exciting aspects of Chemistry so as to develop interest in the study of chemistry as a discipline.
		To develop the ability to apply the principles of Chemistry.
		To appreciate the achievements in Chemistry and to know the role of Chemistry in nature and in society.
		To develop problem solving skills.
		To be familiarized with the emerging areas of Chemistry and their applications in various spheres of Chemical sciences and to apprise the students of its relevance in future studies.
		To be exposed to the different processes used in industries and their applications

Reaction Mechanism in Organic Chemistry	C203	Introduction of basic organic reactions (Substitutions, Additions & Eliminations) and writing organic reaction mechanisms
		Reactivity of unsaturated hydrocarbons (alkene, alkyne and aromatic)
		Understanding the role of substitutions to influence the rate of reactions
		Stereochemistry in organic chemistry: Chemoselectivity, Diastereoselectivity, Enantioselectivity, Stereospecificity, Stereoconvergence
		Introduction of asymmetric synthesis with and without asymmetric catalysts
Quantum Chemistry-I	C206	Understanding the need of Quantum mechanics based on failures of Classical mechanics.
		Learning the basic building blocks of Quantum Mechanics.
		Learning to use the mathematical structure of quantum mechanics in several systems comprising one or many quantum particles.
		Understanding the bridge between the mathematical structure of quantum mechanics and different spectroscopic techniques based on that.
Mathematical methods for Chemists	C207	Introduce the standard mathematical techniques that are typically used by Chemists.
		To learn how to apply mathematics to chemistry research.
		To learn how to use Fourier transform in different spectroscopy.
		The course, mostly differential equation is useful to learn quantum chemistry and chemical kinetics.
Physical Methods in Chemistry-I	C306	Understand the basics of absorption and fluorescence spectroscopy.
		Theoretical prediction of absorption maximum of some organic molecules.

		Identifying and distinguishing various type of electronic transition using solvent perturbation techniques.
		Understanding the concept of micropolarity and the importance of this parameter in spectroscopy
		Understanding some important photoprocessess such as electron transfer and energy transfer and their applications in energy related applications.
		Applications of fluorescence spectroscopy in detecting various analytes (Sensing applications)
Thermodynamics and Electrochemistry	C307	Understanding the laws of Thermodynamics and Phase equilibrium of multicomponent systems.
		Understanding the thermodynamics of surfaces and different adsorption isotherms of gases on solids.
		Key concepts for the Electrochemistry and applications of Electrochemistry.
		Key concepts of Statistical Thermodynamics.

(B) MINOR SUBJECTS in LIFE SCIENCES

Sr. No.	Course Name	Course No
1	Biology I: Science of Life	B101
2	Biology Laboratory-1	B141
3	Biology II: Cellular and Genetic basis of life	B102
4	Biology Laboratory-2	B142
5	Biochemistry	B202
6	Cell Biology	B204
7	Genetics	B205

8	Molecular Biology	B304
9	Evolutionary Biology	B306
10	Any one course from biology subjected to qualified prerequisite	Bx5x

COURSE OUTCOME OF MINOR SUBJECTS in LIFE SCIENCES

Course Name	Course No	Course Outcome
Biology I: Science of Life	B101	Understanding the origin and evolution of life.
		Fundamental understanding of the structure and function of the molecules of life.
		Fundamental understanding of the structure & function of cellular organelles.
Biology Laboratory-1	B141	Introduce to students analytical tools/approaches to study biomolecules and cell structure.
		Build basics of experimentation and data recording in biology labs
Biology II: Cellular and Genetic basis of life	B102	Understanding the principles of cellular mechanisms driving development of an organism.
		Key evolutionary concepts in Lamarckism, Darwinism and Speciation
		Understanding the genetic basis of inheritance
		Fundamental understanding of molecular Biology
Biology Laboratory-2	B142	Understand a microscope and various staining and microscopic techniques
		Knowledge of the basis of human blood groups (ABO)
		Experimental approaches to study cell growth and differentiation and Gene regulation
		Use of microscope to know various stages of cell division in mitosis and meiosis

Biochemistry	B202	Understanding the principles governing Protein structure & function
		Basic concepts on metabolism and their implications in living organisms
		Concept on signal transduction
		Implications in Evolution, Health and disease.
Cell Biology	B204	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
Genetics	B205	Understanding the basic principles of inheritance
		Knowledge of genetic disease mechanism
		Comprehension of monogenic, polygenic and multifactorial diseases
		Application in health and diseases
Molecular Biology	B304	Understanding the key components of cell involved in central dogma of molecular biology.
		Understanding of structure-function of genetic material, replication, repair, transcription and translation.
Evolutionary Biology	B306	Understanding how life originated on the planet
		Understanding the formation of species and underlying genetic diversity
		Understanding biology from an organismal point of view and why some species evolve slowly while others evolve rapidly
		Understanding systematic relationships between organisms using phylogenetic tools
Any one course from biology subjected to qualified prerequisite	Bx5x	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(C) MINOR SUBJECTS in PHYSICAL SCIENCES

Sr. No.	Course Name	Course No
1	Physics I (Mechanics and Thermodynamics)	P101
2	Physics Laboratory I	P141
3	Physics II (Electricity, Magnetism and Optics)	P102
4	Physics Laboratory II	P142
5	Classical Mechanics I	P201
6	Mathematical Methods I	P202
7	Electromagnetism I	P204
8	Quantum Mechanics I	P206
9	Statistical Mechanics	P302
10	Any one of the other theory courses	

COURSE OUTCOME OF MINOR SUBJECTS in PHYSICAL SCIENCES

Course Name	Course No	Course Outcome
Physics I (Mechanics and Thermodynamics)	P101	Builds understanding of basic classical mechanics and thermodynamics.
Physics Laboratory I	P141	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment
Physics II (Electricity, Magnetism and Optics)	P102	Builds basic understanding of electro and magneto static phenomena and processes. Introduces important concepts of polarization, electromagnetic waves, interference and diffraction.

Physics Laboratory II	P142	Laboratory Experience with Coupled Oscillator Circuits: Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
		Laboratory Experience with Flip-flops and Microcontrollers.
Classical Mechanics I	P201	Training in basic classical mechanics, prepares the student for advanced mechanics courses.
Mathematical Methods I	P202	Acquiring knowledge of vector spaces and it applications to various physical problems.
		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Electromagnetism I	P204	Trains the student in detailed computations involved in electrostatics and magnetostatics, solving Maxwell's equations. Introduces to the idea of energy momentum tensor and Gauge invariance.
Quantum Mechanics I	P206	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.
		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.
		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Statistical Mechanics	P302	Space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.

		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non- ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Any one of the other theory courses		To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

SCHOOL OF HUMANITIES

(A) Core Courses:

1. Semester I

Sr.No.	Name of the Course	Course code
1	Technical Communication I	H109
2	Introduction to Sociology	H133

2. Semester II

Sr.No.	Name of the Course	Course code
1	Technical Communication II	H110
2	Introduction to Economics	H101

(A) Electives:

Sr.No.	Name of the Course	Course code
1	Introduction to Psychology	H225
2	Environmental Economics and Environmental Impact Assessment	H201
3	Introduction to Innovation System	H239
4	Life and Community in Urban World	H238
5	Organizational Behaviour	H227
6	Sociology of Science and Technology	H235
7	Perspectives on Indian Society	H236
8	Science Communication and Citizen	H237
9	The City in Modern Fiction	HS 210
10	Speculative Fiction	H 209

Course Outcome:

(A) Core Courses

1. Semester I

Name of the Courses	Courses Code	Course Outcome
Technical Communication I	H109	Connecting Language and cultural contexts.
		Understand the process behind writing.
		Learn to critically engage with texts.
Introduction to Sociology	H133	Sociological insights that are meaningful and of practical importance to students
		Meaningfully relate with the immediate social environment.
		From a sociological perspective, observe those features which are common to all cultures and be able to assess them in the context of one's own unique setting.
		develop an objective view of social reality
		understand the structure and functioning of the society and its consequent processes of social change

2. Semester II

Name of the Courses	Courses Code	Course Outcome
Technical Communication II	H110	be familiar with the essentials of effective communication
		know the different tools of effective technical communication
		understand the importance of staging the argument, and know various institutional / disciplinary norms
Introduction to Economics	H101	familiarity with the basic concepts of economy such as: Price determination, policies for controlling inflation, role of government, sources of revenue and expenditure of the Union, State and Local government and Balance of Payment

(A) Electives

Name of the Courses	Courses Code	Course Outcome
Introduction to Psychology	H225	better understanding of human behavior.
		differentiate between scientific and non-scientific information about human behavior and mental processes.
		understand the working of their own conscious behavior and interpersonal relationship.
		apply psychological principles everyday life situations.
Environmental Economics and Environmental Impact Assessment	H201	Students would get to know the interaction between economy and environment
		Economic tools used for controlling environmental degradation
		Understanding the need for environmental impact assessment of developmental projects and its procedure
Introduction to Innovation System	H239	Appreciate the imperative of innovation within society.
		Critically analyze different types of innovation.
		Use evidence to critically challenge innovation practices. Identify possible changes in innovation system.
Life and Community in Urban World	H238	Formulate effective argumentation on city life.
		Explain and evaluate historical and contemporary urbanization processes.
		Demonstrate understanding of the diverse nature of urban populations and social problems these populations.
		Identify ways of creating sustainable, and efficient built environments.
Organizational Behaviour	H227	demonstrate knowledge organizational behavior theories and concepts.
		explain the challenges that managers and leaders face in contemporary organizations
		critically evaluate organizational practices and the impact on work behavior and performance.
		describe how the individual, groups and organization level variables interact and influence major organizational outcomes.

Sociology of Science and Technology	H235	Familiarization with the societal perspective in study of science and technology
		provide a basic understanding of issues that fall under broader spectrum of inter-relationship between science & technology and society
Perspectives on Indian Society	H236	Understanding of the basic features of Indian Society: both past and contemporary.
		To acquaint the Students about some of the major social Institutions from Sociological Perspectives
		Understanding of various processes of Social Change and Problems of Indian Society.
Science Communication and Citizen	H237	Evaluate the role of communication in science.
		Provide constructive analysis of popular science communication in a variety of real-world settings.
		Identify target audience and define applicable message.
		Develop a sense of the social and political context for science communication.
The City in Modern Fiction	HS 210	To learn to read critically.
		To learn to contextualize concepts and themes using the framework of the 'modern.'
		To learn structural elements, such as plot, setting, characters, techniques of exposition, that underpins fiction.
Speculative Fiction	H 209	the literary, social, political and genre importance of Speculative Fiction in the contemporary times as well as historically
		a detailed overview of the way Speculative Fiction has developed historically,
		some important works in Speculative Fiction , and the rich diversity in the field,
		not just the Western tradition of Speculative Fiction, but also the Indian tradition of Speculative Fiction, from ancient times to the present
		some of the oft-occurring themes such as utopias, dystopias, and issues of gender, class, environment, multiculturalism, technology, myth-making, alternate history, etc.

SCHOOL of COMPUTER SCIENCES

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Programming and Data Structures Lab – I	CS141
2	Programming and Data Structures Lab – II	CS142
3	Theory of Computation	CS201
4	Discrete Structures and Computation	CS202
5	Design and Analysis of Algorithms	CS301

(B) Electives:

Sr. No.	Name of the Course	Course code
1	Modern Cryptology	CS451
2	Algorithmic Coding Theory	CS452
3	Complexity Theory	CS453
4	Linear Programming and Combinatorial Optimization	CS454
5	Distributed Network Algorithms	CS455

Course Outcome:

(A) Core Courses

Name of the Courses	Courses Code	Course Outcome
Programming and Data Structures Lab – I	CS141	Learn the fundamentals of programming.
		Write code for basic programming tasks.
		Create new data types suitable to the requirements
Programming and Data Structures Lab – II	CS142	Learn the fundamentals of data structures
		Write efficient codes for a wide range of programming tasks.
Theory of Computation	CS201	Learn the Mathematical Foundations of computers
		Construct abstract computational machines for basic tasks.
		Understand principles of programming languages and compilers
Discrete Structures and	CS202	Solve problems related to fundamentals of mathematical logic.

Computation		Model and solve practical problems using graph-theoretic techniques.
		Solve problems related to counting and combinatorics.
Design and Analysis of Algorithms	CS301	Learn the basics of algorithms.
		Measure the efficiency of candidate algorithms.
		Write new algorithms for basic computational tasks.

(B) Electives

Name of the Courses	Courses Code	Course Outcome
Modern Cryptology	CS451	Learn the basics of information security
		Write codes for implementing security protocols.
		Analyze candidate information security solutions.
Algorithmic Coding Theory	CS452	Learn the fundamentals of information theory.
		Write a new data compression algorithm
		Create error resilient storage solutions.
Complexity Theory	CS453	Learn the efficiency limits of computations.
		Derandomizing randomized algorithms
Linear Programming and Combinatorial Optimization	CS454	Solve linear optimization problems
		Model certain game theoretic problems as linear programming problems.
Distributed Network Algorithms	CS455	Design new algorithms for distributed networks
		Find the efficiency limit of distributed algorithms.

BACK TO MAIN

INTEGRATED M.Sc. in PHYSICAL SCIENCES
(Program Code: PHYS13)

I. Courses at NISER

Program Code : PHYS13	Programme Specific Outcome	Understanding and knowledge of physics in the classical domain.
		Understanding and knowledge of physics in the quantum domain.
		Understanding and application of statistical methods in physics
		Laboratory experience so that students are exposed to modern experimental techniques.
		Understanding of mathematical methods in their applications in diverse settings.
		Provide exposure to various specialised areas such as condensed matter, nuclear physics, atomic physics, particle physics, astrophysics and quantum information
		Introduction to methods that will be lifelong assets for careers in research and development.

23	Experimental Technique	P473
24	Introduction to Cosmology	P474
25	Soft Condensed Matter	P451

Course Outcomes:

(A) Core Courses

1ST YEAR

1. SEMISTER I

Name of the Course	Course code	Course Outcome
Physics I (Mechanics and Thermodynamics)	P101	Builds understanding of basic classical mechanics and thermodynamics.
Physics Laboratory I	P141	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment

2. SEMISTER II

Name of the Course	Course code	Course Outcome
Physics II (Electricity, Magnetism and Optics)	P102	Builds basic understanding of electro and magneto static phenomena and processes. Introduces important concepts of polarization, electromagnetic waves, interference and diffraction.
Physics Laboratory II	P142	Laboratory Experience with Coupled Oscillator Circuits:
		Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors
		Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator
		Laboratory Experience with Flip-flops and Microcontrollers.

2ND YEAR

1. SEMISTER III

Name of the Course	Course code	Course Outcome
Classical Mechanics I	P201	Training in basic classical mechanics, prepares the student for advanced mechanics courses.

Mathematical Methods I	P202	Acquiring knowledge of vector spaces and it applications to various physical problems.
		Acquiring knowledge of complex analysis and it applications to various physical problems.
		Acquiring knowledge of the theory of ordinary differential equations and it applications in various physical problems.
		Acquiring basic knowledge of the theory of statistics and its applications in interpretation of data
Electronics	P203	Acquiring basic knowledge of circuit theory: lumped circuit approximation, circuit elements, Kirchoff's current and voltage laws, resistive networks.
		Acquiring knowledge of basics of analog electronics, including that of diodes and LEDs.
		Acquiring knowledge basic knowledge of amplifiers.
		Acquiring knowledge of the basics digital electronics: logic gates, truth table, multiplexer, combinatorial circuits, flip-flop, and microprocessors.
General Physics Laboratory	P241	Expands the training of the students, building on P141 and P142 to train them in experimental methods in basic solid state experiments.
Basic Electronics laboratory	P242	This final basic training in experimental physics equips the student with concepts and methods for doing advanced experiments in electronics.

2. SEMISTER IV

Name of the Course	Course code	Course Outcome
Electromagnetism I	P204	Trains the student in detailed computations involved in electrostatics and magnetostatics, solving Maxwell's equations. Introduces to the idea of energy momentum tensor and Gauge invariance.

Mathematical Methods II	P205	Prepares the student in important advanced mathematical concepts and tools. This is needed for advanced physics courses such as applications of quantum mechanics in solid state physics quantum field theory and particle phenomenology
Quantum Mechanics I	P206	Acquiring working knowledge of the basic concepts of quantum mechanics: states, operators and time evolution.
		Understanding of the role of symmetries in quantum mechanics.
		Understanding of the theory of angular momentum in quantum mechanics.
		Acquiring knowledge of applications such as the hydrogen atom, charged particle in a magnetic field and a particle in a periodic potential.
		Acquiring knowledge of perturbation theory in quantum mechanics and applications such as Stark and Zeeman effect.
Modern Physics I & Optics Laboratory	P243	The course, though experiments introduces to fundamental findings that lead to the discoveries of special relativity and quantum mechanics. In the process the course also teaches them how to use interferometers and diffraction gratings required in future courses.
Advanced Electronics Laboratory	P244	In this course the students learn advanced electronic experimentations. This includes transistors, operational amplifiers digital circuits and counters and are crucial to carrying our future experimental research.

3RD YEAR

1. **SEMISTER V**

Name of the Course	Course code	Course Outcome
Electromagnetism II	P301	Provides training in advanced concepts and methods for understanding advanced electromagnetic phenomena. Important concepts of radiation retardation, multipole expansions, covariant formulation of classical mechanics and relativistic kinematics are taught.

Statistical Mechanics	P302	space, distributions, notion of equilibrium, ensembles, Boltzmann distribution, partition function, calculating observables.
		Understanding of Statistical Mechanics of non-interacting classical systems: few level systems, ideal gases, oscillators.
		Understanding of Statistical Mechanics of non-interacting quantum systems: electrons in metals, relativistic electron systems, photons, blackbody radiation, Bose condensation.
		Acquiring knowledge of the basics of interacting classical systems: non-ideal gases, van der Waals gas, cluster expansion, classical spin models - Ising and Heisenberg, outline of exact solutions.
		A basic understanding of the theory of phase transitions.
Quantum Mechanics II	P303	Understanding of the theory and applications of scattering in quantum mechanics.
		Acquiring knowledge of the method of path integrals in quantum mechanics.
		Acquiring knowledge of the concept of entanglement in quantum mechanics and it applications such as Bell's inequalities.
		Acquiring knowledge of relativistic quantum mechanics and its applications.
Special Theory of Relativity	P304	Trains the student in basic and advanced concepts in special relativity and introduces the basic ideas up on which General relativity is based on. Also provides in depth training in applications of group theory in relativity. Prepares the student for studying general relativity in future.
Nuclear Physics & Instrumentation Laboratory	P341	This course teaches the students about basic experimentation in nuclear physics. It in conjunction with theory course on Nuclear physics P307 builds a background to carry our basic research in the field of experimental particle physics.
Computational Physics Laboratory	P342	The course provides a basic training in numerical and statistical methods used in all branches of physics though programming and hands on tutorial sessions.

2. SEMISTER VI

Name of the Course	Course code	Course Outcome
Atoms, Molecules and Radiation	P305	Important topics in atomic physics, selection rules, atomic and molecular spectroscopy is taught. The training is imperative to work in the area of applied solid state physics and optics.
Introduction to Condensed Matter Physics	P306	Understanding of the basic building blocks of matter and methods to probe structure of materials.
		Acquiring knowledge of the physics of metals.
		Acquiring knowledge of the physics of phonons.
		Acquiring knowledge of the physics of superconductors.
		Acquiring knowledge of the physics of magnetism.
Nucei and Particles	P307	Provides training in basic concepts and methods in nuclear physics, stability of nucleons and classification of interactions. Course prepares the student to begin working in experimental and theoretical high energy physics.
Physics Project I	P398	Introduces the students to basic methods in experimental techniques, statistics and error analysis. The focus is on basic mechanics and little amount of solid state physics experiments.
Modern Physics II Laboratory	P343	This course provides further experience to the students in experiments in modern quantum mechanics including highly specialized experiments on electron spin resonance and introduces them to cutting edge research area of solar cells.
Solid State Physics I Laboratory	P344	In this course the student is introduced to a variety of basic experiments in solid state physics. This prepares them for taking up more challenging experiments in this are in future courses.

4TH YEAR

1. SEMISTER VII

Name of the Course	Course code	Course Outcome
Classical Mechanics II	P401	This is an advanced course introducing the students to concepts and techniques in mechanics of continuous media. It prepares them to tackle a variety of problems in many areas such as fiber optics, fluid dynamics and structural stability of materials.
Solid State Physics II Laboratory	P441	This course exposes the student to advanced solid state experiments. It, in part, prepares them in both areas to take on further advanced experiments in future courses.
Lasers and Spectroscopy Laboratory	P442	This course exposes the student to basic laser optics and spectroscopy experiments. It, in part, prepares them in both areas to take on further advanced experiments in future courses.
Elective 1	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 2	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 3	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

2. SEMISTER VIII

Name of the Course	Course code	Course Outcome
Integrated Physics Laboratory I	P443	Performing experiments involving oscillators such as the Pohl's pendulum and chaotic oscillators.
		Performing experiments involving interferometers such as the Michelson interferometers and Mach Zehnder interferometers.
		Performing spectroscopic experiments such as the Zeeman effect.
		Performing the Millikan Oil drop experiment

Integrated Physics Laboratory II	P444	Laboratory Experience with Coupled Oscillator Circuits: Laboratory Experience with OpAmps, Diodes, Clamps, Rectifiers, Power supplies and Transistors Laboratory experience with Logic Gates: NAND gate, OR, AND, NOT; Adder, Oscillator Laboratory Experience with Flip-flops and Microcontrollers
Elective 4	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 5	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 6	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 7	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

5TH YEAR

1. **SEMISTER IX**

Name of the Course	Course code	Course Outcome
Physics Dissertation project I	P598	This is the first half of a year-long project that the final year Int. MSc student has to do. This involves preparing adequate reading material that will allow the student to take up challenging reach problem with a supervisor in a specific area of work.
Elective 8	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 9	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

Elective 10	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

2. SEMISTER X

Name of the Course	Course code	Course Outcome
Physics Dissertation project II	P599	In the final semester project, the student is expected to be able to build on the background in the ninth semester to work on a research problem. Many times this typically leads to a publication of a paper is a reputed international journal.
Elective 11	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 12	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Elective 13	*	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) ELECTIVES

Name of the Course	Course code	Course Outcome
Advanced Solid State Physics	P451	This is a course which aims to prepare students with advanced concepts, techniques and knowledge of solid state physics that allows them to start working on basic research problems in the broad area of condensed matter theory, materials theory or solid state experiments.
Computational Physics	P452	This course provides training in computation tools required in research across a wide variety of fields including condensed matter, high energy phenomenology and lattice field theories.

Quantum Field theory I	P453	Quantization for the study of many particle non-relativistic systems.
		Acquiring knowledge of the Lorentz group and its role in relativistic quantum field theory.
		Acquiring knowledge of the quantization of the Klein Gordon, Dirac and Maxwell fields.
		Acquiring knowledge of the basics of quantum electrodynamics and the study of various processes at tree level.
		Understanding of the role of gauge invariance in quantum electrodynamics.
Particle Physics	P454	Understanding physics of elementary particles.
		Learning about fundamental interactions in terms of gauge principle.
		Acquiring skills to carry out computation in Strong, Weak and Electromagnetic theory.
		Learning various techniques useful for particle physics phenomenology.
		Learning methods to compute physical observables which can tested in the laboratory.
Introduction to Phase Transition and Critical Phenomena	P455	This course teaches the students advanced concepts and methods in statistical mechanics crucial for the student to take up basic research work.
Biophysics	P456	This course teaches the students advanced concepts and methods in biophysics, with the aim to build their background for future research work in this area.
General Relativity and Cosmology	P457	This course teaches the students, advanced concepts and methods in general relativity crucial for the student for building their background for research work in general relativity and cosmology.
Soft Condensed Matter	P458	This course teaches the students advanced concepts and methods in soft matter physics, with the aim to build their background for future research work in this area.
Applied Nuclear Physics	P459	This course teaches the students advanced concepts and methods in applied nuclear physics, with the aim to build their background for future research work in this area.

Many Particle Physics	P460	This course teaches the students advanced concepts and methods in many particle physics, with the aim to build their background for future research work in this area.
Physics of Mesoscopic Systems	P461	This course teaches the students advanced concepts and methods in mesoscopic physics, with the aim to build their background for future research work in this area.
Introduction to Quantum Optics	P462	Learning about the coherent states, squeezed states and atom-photon interaction.
		Acquiring the knowledge of coherence and developing the quantum theory of atom-photon interaction.
		Developing the understanding of the quantum theory of dissipation.
		Understanding the quantum information in continuous variable systems.
		Learning the quantum state engineering.
		Learning about the cavity QED.
Astronomy and Astrophysics	P463	Learning about magnetohydrodynamics with applications to Astrophysical systems.
		Study of stellar structure and developing detailed understanding of structure of stars.
		Developing understanding of the models of galaxies.
		Acquiring knowledge of the accretion of matter due to a point mass.
		Developing introductory understanding of cosmology.
Plasma Physics and Magnetohydrodynamics	P464	This course teaches the students important concepts and methods in plasma physics and magneto hydrodynamics, with the aim to build their background for future research work in this area.
Biophysics	P465	Course is in the formulation stage
Quantum and Nanoelectronics	P466	This course teaches the students important concepts and methods in Nano electronics, with the aim to build their background for future research work in this area.

Nonlinear Physics, Chaos and Turbulence	P467	This course teaches the students important concepts and methods in classical nonlinear dynamics, with the aim to build their background for future research work in this area.
Magnetism and Superconductivity	P468	This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.
Density Functional Theory of Atoms, Molecules and Solids	P469	This course teaches the students important concepts and methods in density functional theory, with the aim to build their background for future research work in this area.
Quantum Field Theory II	P470	Understanding the Path Integral formulation of quantum field theory.
		Acquiring the knowledge of the regularisation methods and the renormalisation.
		Developing the understanding of spontaneous symmetry breaking and its implications.
		Learning the non-abelian gauge theories and their quantisation.
		Learning the renormalisation of the non-abelian gauge theories both in the symmetric and symmetry broken phase.
Quantum Information and Quantum Computation	P471	This course teaches the students important concepts and methods in quantum information and computation, with the aim to build their background for future research work in this area.
Experimental High Energy Physics	P472	This course teaches the students important concepts and methods in experimental high energy physics, with the aim to build their background for future research work in this area.
Experimental Technique	P473	This course teaches the students important concepts and methods in experimental techniques, with the aim to build their background for future research work in this area.
Introduction to Cosmology	P474	Learning about the cosmological model, the cosmological constant and the dark matter.
		Developing the understanding of the thermal history of the universe and its imprints on CMB.

		Understanding the horizon problem and its resolution by inflation.
		Acquiring the knowledge of the theory of cosmological perturbations.
		Studying the implications of the cosmological perturbation on the structure formation.
Soft Condensed Matter	P451	This course teaches the students advanced concepts and methods in soft matter physics, with the aim to build their background for future research work in this area.

(C) MINOR SUBJECTS in CHEMICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Chemistry-I	C101
2	Chemistry Laboratory-I	C141
3	Chemistry-II	C102
4	Chemistry Laboratory-II	C142
5	Basic Inorganic Chemistry	C201
6	Reaction Mechanism in Organic Chemistry	C203
7	Quantum Chemistry-I	C206
8	Mathematical methods for Chemists	C207
9	Physical Methods in Chemistry-I	C306
10	Thermodynamics and Electrochemistry	C307

COURSE OUTCOME OF MINOR SUBJECTS in CHEMICAL SCIENCES

Name of the Course	Course code	Course Outcome
Chemistry-I	C101	The basics of atomic and molecular structure and spectroscopy
		Thermodynamics of different chemical processes
		Kinetics of chemical reactions
Chemistry Laboratory-I	C141	Introduction to synthesis of small organic compounds

		Qualitative analysis of chemicals present in tea, coffee, fruits etc.
		Synthesis of simple drugs such as paracetamol
Chemistry-II	C102	Apply the fundamental principles of measurement, matter, atomic theory, chemical periodicity, chemical bonding, general chemical reactivity and solution chemistry to subsequent courses in science, engineering, technology.
		Students will be able to explain why chemistry is an integral activity for addressing social, economic, and environmental problems
		Students will be able to explore new areas of research in both chemistry and allied fields of science and technology after getting their concepts clear in Basic Chemistry
Chemistry Laboratory-II	C142	Introduction to quantitative analysis in chemistry.
		Students will learn basic concepts on electrochemistry
		Students will be given hands on practice on conductometry, polarimetry and flame photometry
		They will apply these concepts to estimate binding constant, solubility product etc.
Basic Inorganic Chemistry	C201	To understand basic facts and concepts in Chemistry while retaining the exciting aspects of Chemistry so as to develop interest in the study of chemistry as a discipline.
		To develop the ability to apply the principles of Chemistry.
		To appreciate the achievements in Chemistry and to know the role of Chemistry in nature and in society.
		To develop problem solving skills.

		To be familiarized with the emerging areas of Chemistry and their applications in various spheres of Chemical sciences and to apprise the students of its relevance in future studies.
		To be exposed to the different processes used in industries and their applications
Reaction Mechanism in Organic Chemistry	C203	Introduction of basic organic reactions (Substitutions, Additions & Eliminations) and writing organic reaction mechanisms
		Reactivity of unsaturated hydrocarbons (alkene, alkyne and aromatic)
		Understanding the role of substitutions to influence the rate of reactions
		Stereochemistry in organic chemistry: Chemoselectivity, Diastereoselectivity, Enantioselectivity, Stereospecificity, Stereoconvergence
		Introduction of asymmetric synthesis with and without asymmetric catalysts
Quantum Chemistry-I	C206	Understanding the need of Quantum mechanics based on failures of Classical mechanics.
		Learning the basic building blocks of Quantum Mechanics.
		Learning to use the mathematical structure of quantum mechanics in several systems comprising one or many quantum particles.
		Understanding the bridge between the mathematical structure of quantum mechanics and different spectroscopic techniques based on that.
Mathematical methods for Chemists	C207	Introduce the standard mathematical techniques that are typically used by Chemists.
		To learn how to apply mathematics to chemistry research.
		To learn how to use Fourier transform in different spectroscopy.

		The course, mostly differential equation is useful to learn quantum chemistry and chemical kinetics.
Physical Methods in Chemistry-I	C306	Understand the basics of absorption and fluorescence spectroscopy.
		Theoretical prediction of absorption maximum of some organic molecules.
		Identifying and distinguishing various type of electronic transition using solvent perturbation techniques.
		Understanding the concept of micropolarity and the importance of this parameter in spectroscopy
		Understanding some important photoprocessess such as electron transfer and energy transfer and their applications in energy related applications.
		Applications of fluorescence spectroscopy in detecting various analytes (Sensing applications)
Thermodynamics and Electrochemistry	C307	Understanding the laws of Thermodynamics and Phase equilibrium of multicomponent systems.
		Understanding the thermodynamics of surfaces and different adsorption isotherms of gases on solids.
		Key concepts for the Electrochemistry and applications of Electrochemistry.
		Key concepts of Statistical Thermodynamics.

(D) MINOR SUBJECTS in LIFE SCIENCES

Sr. No.	Course Name	Course No
1	Biology I: Science of Life	B101
2	Biology Laboratory-1	B141
3	Biology II: Cellular and Genetic basis of life	B102

4	Biology Laboratory-2	B142
5	Biochemistry	B202
6	Cell Biology	B204
7	Genetics	B205
8	Molecular Biology	B304
9	Evolutionary Biology	B306
10	Any one course from biology subjected to qualified prerequisite	Bx5x

COURSE OUTCOME OF MINOR SUBJECTS in LIFE SCIENCES

Course Name	Course No	Course Outcome
Biology I: Science of Life	B101	Understanding the origin and evolution of life.
		Fundamental understanding of the structure and function of the molecules of life.
		Fundamental understanding of the structure & function of cellular organelles.
Biology Laboratory-1	B141	Introduce to students analytical tools/approaches to study biomolecules and cell structure.
		Build basics of experimentation and data recording in biology labs
Biology II: Cellular and Genetic basis of life	B102	Understanding the principles of cellular mechanisms driving development of an organism.
		Key evolutionary concepts in Lamarckism, Darwinism and Speciation
		Understanding the genetic basis of inheritance
		Fundamental understanding of molecular Biology
Biology Laboratory-2	B142	Understand a microscope and various staining and microscopic techniques

		Knowledge of the basis of human blood groups (ABO)
		Experimental approaches to study cell growth and differentiation and Gene regulation
		Use of microscope to know various stages of cell division in mitosis and meiosis
Biochemistry	B202	Understanding the principles governing Protein structure & function
		Basic concepts on metabolism and their implications in living organisms
		Concept on signal transduction
		Implications in Evolution, Health and disease.
Cell Biology	B204	Understanding the basic principles governing cell structure and functions
		Biochemcial, biophysical, genetical basis of cell and its response
		Key concepts in maintenance of cell structure
		Evolution of cell organelles, importance in health and disease.
Genetics	B205	Understanding the basic principles of inheritance
		Knowledge of genetic disease mechanism
		Comprehension of monogenic, polygenic and multifactorial diseases
		Application in health and diseases
Molecular Biology	B304	Understanding the key components of cell involved in central dogma of molecular biology.
		Understanding of structure-function of genetic material, replication, repair, transcription and translation.
Evolutionary Biology	B306	Understanding how life originated on the planet
		Understanding the formation of species and underlying genetic diversity
		Understanding biology from an organismal point of view and why some species evolve slowly while others evolve rapidly
		Understanding systematic relationships between organisms using phylogenetic tools

Any one course from biology subjected to qualified prerequisite	Bx5x	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(E) MINOR SUBJECTS in MATHEMATICAL SCIENCES

Sr. No.	Name of the Course	Course code
1	Mathematics-I	M101
2	Mathematics-II	M102
3	Real Analysis	M201
4	Group Theory	M202
5	Metric Spaces	M204
6	Linear Algebra	M205
7	Probability Theory	M206
8	Differential Equations	M303

COURSE OUTCOME OF MINOR SUBJECTS in MATHEMATICAL SCIENCES

Name of the Course	Course code	Course Outcome
Mathematics-I	M101	Expects students to learn how to prove theorems, expressing mathematical objects, and understand the construction of natural numbers and symmetry of plane figures.
Mathematics-II	M102	Upon successful completion of the course students will become aware of some basic properties of real line and real valued functions.
Real Analysis	M201	Knowledge on Continuity differentiable and Riemann integration theory. Sequence and series and it's application to numerical analysis.
Group Theory	M202	Upon successful completion of the course students will be able to understand the notion of symmetries in the language of groups. Furthermore, students will become aware of various properties of groups and subgroups.

Metric Spaces	M204	Upon successful completion of the course students will become aware about generalisation of euclidean distance on arbitrary sets and vari-ous properties of functions defined on them.
Linear Algebra	M205	Upon successful completion of the course students will learn the relation between linear transformations and matrices. Moreover, student will also learn various fundamental results of matrices, namely, diagonalisa-tion, triangulation and primary decomposition theorem.
Probability Theory	M206	Students will be introduced to the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.
Differential Equations	M303	This course starts with the origin and applications of differential equations and discusses many solution techniques such as separation of vari-able, variation of parameter, annihilator method and Frobenious method, etc. Then it introduces basic theory of existence and uniqueness for the sys-tem of first order ODEs which is essential for many branches of mathematics. This course also gives a glimpse how to analyze the behavior of solutions (maximum principle, stability, asymptotic stability, etc.).
		This course ends with an introduction to partial differential equations and method of charac-teristics, a technique to solve first order partial differential equations. Upon successful completion of this course the student will be able to model some practical situations into ordinary differential equations or partial differential equations and analyze the solution to get information about the parameters involved in the model.

SCHOOL OF HUMANITIES

(A) Core Courses:

1. Semester I

Sr.No.	Name of the Course	Course code
1	Technical Communication I	H109
2	Introduction to Sociology	H133

2. Semester II

Sr.No.	Name of the Course	Course code
1	Technical Communication II	H110
2	Introduction to Economics	H101

(A) Electives:

Sr.No.	Name of the Course	Course code
1	Introduction to Psychology	H225
2	Environmental Economics and Environmental Impact Assessment	H201
3	Introduction to Innovation System	H239
4	Life and Community in Urban World	H238
5	Organizational Behaviour	H227
6	Sociology of Science and Technology	H235
7	Perspectives on Indian Society	H236
8	Science Communication and Citizen	H237
9	The City in Modern Fiction	HS 210
10	Speculative Fiction	H 209

Course Outcome:

(A) Core Courses

1. Semester I

Name of the Courses	Courses Code	Course Outcome
Technical Communication I	H109	Connecting Language and cultural contexts.
		Understand the process behind writing.
		Learn to critically engage with texts.
Introduction to Sociology	H133	Sociological insights that are meaningful and of practical importance to students
		Meaningfully relate with the immediate social environment.
		From a sociological perspective, observe those features which are common to all cultures and be able to assess them in the context of one's own unique setting.
		develop an objective view of social reality
		understand the structure and functioning of the society and its consequent processes of social change

2. Semester II

Name of the Courses	Courses Code	Course Outcome
Technical Communication II	H110	be familiar with the essentials of effective communication
		know the different tools of effective technical communication
		understand the importance of staging the argument, and know various institutional / disciplinary norms
Introduction to Economics	H101	familiarity with the basic concepts of economy such as: Price determination, policies for controlling inflation, role of government, sources of revenue and expenditure of the Union, State and Local government and Balance of Payment

(A) Electives

Name of the Courses	Courses Code	Course Outcome
Introduction to Psychology	H225	better understanding of human behavior.
		differentiate between scientific and non-scientific information about human behavior and mental processes.
		understand the working of their own conscious behavior and interpersonal relationship.
		apply psychological principles everyday life situations.
Environmental Economics and Environmental Impact Assessment	H201	Students would get to know the interaction between economy and environment
		Economic tools used for controlling environmental degradation
		Understanding the need for environmental impact assessment of developmental projects and its procedure
Introduction to Innovation System	H239	Appreciate the imperative of innovation within society.
		Critically analyze different types of innovation.
		Use evidence to critically challenge innovation practices. Identify possible changes in innovation system.
Life and Community in Urban World	H238	Formulate effective argumentation on city life.
		Explain and evaluate historical and contemporary urbanization processes.
		Demonstrate understanding of the diverse nature of urban populations and social problems these populations.
		Identify ways of creating sustainable, and efficient built environments.
Organizational Behaviour	H227	demonstrate knowledge organizational behavior theories and concepts.
		explain the challenges that managers and leaders face in contemporary organizations
		critically evaluate organizational practices and the impact on work behavior and performance.
		describe how the individual, groups and organization level variables interact and influence major organizational outcomes.

Sociology of Science and Technology	H235	Familiarization with the societal perspective in study of science and technology
		provide a basic understanding of issues that fall under broader spectrum of inter-relationship between science & technology and society
Perspectives on Indian Society	H236	Understanding of the basic features of Indian Society: both past and contemporary.
		To acquaint the Students about some of the major social Institutions from Sociological Perspectives
		Understanding of various processes of Social Change and Problems of Indian Society.
Science Communication and Citizen	H237	Evaluate the role of communication in science.
		Provide constructive analysis of popular science communication in a variety of real-world settings.
		Identify target audience and define applicable message.
		Develop a sense of the social and political context for science communication.
The City in Modern Fiction	HS 210	To learn to read critically.
		To learn to contextualize concepts and themes using the framework of the 'modern.'
		To learn structural elements, such as plot, setting, characters, techniques of exposition, that underpins fiction.
Speculative Fiction	H209	the literary, social, political and genre importance of Speculative Fiction in the contemporary times as well as historically
		a detailed overview of the way Speculative Fiction has developed historically,
		some important works in Speculative Fiction , and the rich diversity in the field,
		not just the Western tradition of Speculative Fiction, but also the Indian tradition of Speculative Fiction, from ancient times to the present
		some of the oft-occurring themes such as utopias, dystopias, and issues of gender, class, environment, multiculturalism, technology, myth-making, alternate history, etc.

SCHOOL of COMPUTER SCIENCES

(A) Core Courses:

Sr. No.	Name of the Course	Course code
1	Programming and Data Structures Lab – I	CS141
2	Programming and Data Structures Lab – II	CS142
3	Theory of Computation	CS201
4	Discrete Structures and Computation	CS202
5	Design and Analysis of Algorithms	CS301

(B) Electives:

Sr. No.	Name of the Course	Course code
1	Modern Cryptology	CS451
2	Algorithmic Coding Theory	CS452
3	Complexity Theory	CS453
4	Linear Programming and Combinatorial Optimization	CS454
5	Distributed Network Algorithms	CS455

Course Outcome:

(A) Core Courses

Name of the Courses	Courses Code	Course Outcome
Programming and Data Structures Lab – I	CS141	Learn the fundamentals of programming.
		Write code for basic programming tasks.
		Create new data types suitable to the requirements
Programming and Data Structures Lab – II	CS142	Learn the fundamentals of data structures
		Write efficient codes for a wide range of programming tasks.
Theory of Computation	CS201	Learn the Mathematical Foundations of computers
		Construct abstract computational machines for basic tasks.
		Understand principles of programming languages and compilers
Discrete Structures and	CS202	Solve problems related to fundamentals of mathematical logic.

Computation		Model and solve practical problems using graph-theoretic techniques.
		Solve problems related to counting and combinatorics.
Design and Analysis of Algorithms	CS301	Learn the basics of algorithms.
		Measure the efficiency of candidate algorithms.
		Write new algorithms for basic computational tasks.

(B) Electives

Name of the Courses	Courses Code	Course Outcome
Modern Cryptology	CS451	Learn the basics of information security
		Write codes for implementing security protocols.
		Analyze candidate information security solutions.
Algorithmic Coding Theory	CS452	Learn the fundamentals of information theory.
		Write a new data compression algorithm
		Create error resilient storage solutions.
Complexity Theory	CS453	Learn the efficiency limits of computations.
		Derandomizing randomized algorithms
Linear Programming and Combinatorial Optimization	CS454	Solve linear optimization problems
		Model certain game theoretic problems as linear programming problems.
Distributed Network Algorithms	CS455	Design new algorithms for distributed networks
		Find the efficiency limit of distributed algorithms.

M.Sc. NURSING

(PROGRAM CODE: HLTH15)

1. Course under TMC

Program code: HLTH15	**Program Specific Outcome**	Designed to develop nurse leaders who will assume roles as Nurse Specialist, Nurse Educator, Administrator and Researcher.
		Develop ability to contribute to the knowledge of profession through research development and validation of nursing theories.

Core courses

Sr. no	Course Name	Course code
1	ADVANCED NURSING PRACTICE	09HLTH15-001-C
2	CLINICAL SPECIALITY – I MEDICAL SURGICAL NURSING	09HLTH15-002-C
3	NURSING EDUCATION	09HLTH15-003-C
4	NURSING MANAGEMENT	09-HLTH15-004-C
5	NURSING RESEARCH AND STATISTICS	09HLTH15-005-C
6	CLINICAL SPECIALITY- II MEDICAL SURGICAL NURSING – ONCOLOGY NURSING	09HLTH15-006-C

Course Outcome

Course Name	Course code	Course outcome
ADVANCED NURSING PRACTICE	09HLTH15-001-C	Designed to develop an understanding of concepts and constructs and theoreticalbasis of advanced nursing practice
		Ability to critically analyse different theories of nursing and otherdisciplines.
		Develop advance Nurse Practitioner who is assumeexpanded and extended role.
CLINICAL SPECIALITY – I MEDICAL SURGICAL NURSING	09HLTH15-002-C	Designed to assist students in developing expertise and in depth knowledge in the field of Medical Surgical Nursing.
		It will help students to appreciate the patient as a holistic individual and develop skill to function as a specialized Medical-Surgical Nurse.
		Enable the students to function as educator, manager and researcher in the field of Medical Surgical Nursing.

NURSING EDUCATION	09HLTH15-003-C	Designed to assist students to develop a broad understanding of fundamental principles, trends and issues related to education and nursing education.
		Provide opportunity to students to understand, appreciate and acquire skills in teaching and evaluation, curriculum development, implementation, maintenance of standards and accreditation of various nursing educational programs.
		Develop and/or adopt model of nursing service and nursing education collaboration
NURSING MANAGEMENT	09-HLTH15-004-C	Designed to assist students to develop a broad understanding of Principles, concepts, trends and issues related to nursing management.
		Provide opportunity to students to understand, appreciate and acquire skills in planning, supervision and management of nursing services at different levels to provide quality nursing service.
NURSING RESEARCH AND STATISTICS	09HLTH15-005-C	Designed to assist the students to acquire an understanding of the research methodology and statistical methods as a basis for identifying research problem, planning and implementing a research plan.
		Enable the students to evaluate research studies and utilize research findings to improve quality of nursing practice, education and management.
		Develop skills in preparing research proposal and implementation of scientificresearch process.
CLINICAL SPECIALITY- II MEDICAL SURGICAL NURSING – ONCOLOGY NURSING	09HLTH15-006-C	Designed to assist students in developing expertise and in-depth understandingin the field of oncology Nursing.
		Develop advanced skills for Nursingintervention in various oncological conditions.
		Enable the student to function as oncologynurse practitioner/specialist and provide quality care.

BACK TO MAIN

POST GRADUATE DIPLOMA IN FUSION IMAGING TECHNOLOGY
(PGDFIT)
UNDER TMC
(PROGRAM CODE: HLTH16)

Course Structure:

I. Courses at TMC

Program Code : HLTH16	Programme Specific Outcome	To develop highly skilled human resource with specialization in Nuclear medicine and fusion imaging science and technology to render quality patient service and related research in nuclear medicine.

(A) CORE COURSES
Paper 1: Basic Sciences in Nuclear Medicine

Sr. No.	Name of the Course	Course code
1	Basic physics in nuclear medicine	09-HLTHI6-001-C
2	Basic chemistry in nuclear medicine	09-HLTHI6-002-C
3	Basic mathematics and statistics in nuclear medicine	09-HLTHI6-003-C
4	Basic computer relevant in nuclear medicine	09-HLTHI6-004-C
5	Basic biology in nuclear medicine	09-HLTHI6-005-C

Paper 2: Radiation Safety, Radiation biology and Radiopharmacy

Sr. No.	Name of the Course	Course code
1	Radiation Biology	09-HLTHI6-006-C
2	Radiation protection	09-HLTHI6-007-C
3	Radio pharmacy and radiopharmaceuticals	09-HLTHI6-008-C

Paper 3: Instrumentation in Nuclear Medicine and Fusion Imaging

Sr. No.	Name of the Course	Course code
1	Non imaging equipment used in Nuclear medicine	09-HLTHI6-009-C
2	Imaging equipment used in Nuclear Medicine	09-HLTHI6-010-C
3	Calibration and Quality Control Of Imaging Equipments Used In Nuclear Medicine	09-HLTHI6-011-C
4	Computer and Computer system used in Nuclear Medicine	09-HLTHI6-012-C

Paper 4: Clinical Nuclear Medicine and Fusion Technology

Sr. No.	Name of the Course	Course code
1	Human anatomy and physiology relevant in nuclear medicine	09-HLTHI6-013-C
2	Scintigraphy Study and data processing	09-HLTHI6-014-C
3	Therapeutic Nuclear Medicine technique	09-HLTHI6-015-C
4	Hospital administration and patient care	09-HLTHI6-016-C

(B) PRACTICALS

Sr. No.	Name of the Course	Course code
1	Practical in radiation protection, radiopharmacy and instrumentation in Nuclear medicine	09-HLTHI6-001-P
2	Practical in clinical Nuclear Medicine and Fusion Technology	09-HLTHI6-002-P

Course Outcomes:

(A) CORE COURSES

Paper 1: Basic Sciences in Nuclear Medicine

Name of the Course	Course code	Course Outcome
Basic physics in nuclear medicine	09-HLTHI6-001-C	At the end of the program, the student will be able to apply principles of basic science concepts in understanding, analysis and prediction of physical systems.
Basic chemistry in nuclear medicine	09-HLTHI6-002-C	At the end of the program, the student will be able to apply principles of basic science concepts in understanding, analysis and prediction of Chemical systems.
Basic mathematics and statistics in nuclear medicine	09-HLTHI6-003-C	At the end of the program, the student will be able to apply principles of basic science concepts in understanding, analysis and prediction of Mathematical systems.
Basic computer relevant in nuclear medicine	09-HLTHI6-004-C	At the end of the program, the student will be able to apply principles of basic science concepts in understanding, analysis and prediction of computational systems.
Basic biology in nuclear medicine	09-HLTHI6-005-C	At the end of the program, the student will be able to apply principles of basic science concepts in understanding, analysis and prediction of Biological systems.

Paper 2: Radiation Safety, Radiation biology and Radiopharmacy

Name of the Course	Course code	Course Outcome
Radiation Biology	09-HLTHI6-006-C	To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application radiation induced effects to the biological systems.
Radiation protection	09-HLTHI6-007-C	To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application of radiation protection concepts in medicine in general and nuclear medicine in particular.
Radio pharmacy and radiopharmaceuticals	09-HLTHI6-008-C	To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application of chemical sciences with pharmaceutical science applied in radiation medicine.

Paper 3: Instrumentation in Nuclear Medicine and Fusion Imaging

Name of the Course	Course code	Course Outcome
Non imaging equipment used in Nuclear medicine	09-HLTHI6-009-C	To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application of Physics and instrumentation used in radiation counting and measurment.
Imaging equipment used in Nuclear Medicine	09-HLTHI6-010-C	To introduce interdisciplinary subjects/concepts/ideas for interdisciplinary application of physics and instrumentation used in radiation enabled medical imaging using various equipments like CT, PET. SPECT, MRI ect.
Calibration and Quality Control Of Imaging Equipments Used In Nuclear Medicine	09-HLTHI6-011-C	To introduce subjects/concepts/ideas for implementation and performance of quality control of various medical imaging devices like CT, PET. SPECT, MRI and fusion equipments ect.
Computer and Computer system used in Nuclear Medicine	09-HLTHI6-012-C	To introduce concepts and architecture of computers used in nuclear medicine for the purpose of image acquisition, image reconstruction, image processing, quantification, archival and retrieval of images.

Paper 4: Clinical Nuclear Medicine and Fusion Technology

Name of the Course	Course code	Course Outcome
Human anatomy and physiology relevant in nuclear medicine	09-HLTHI6-013-C	To understand and apply the basic concepts of human anatomy and physiology related to nuclear medicine enabled diagnosis and treatment of various clinical conditions.
Scintigraphy Study and data processing	09-HLTHI6-014-C	To thoroughly understand the entire process of nuclear medicine imaging i.e. patient preparation, radiation safety, image acquisition, image processing and pitfalls in imaging and image interpretation for various Nuclear medicine imaging procedures.
Therapeutic Nuclear Medicine technique	09-HLTHI6-015-C	To thoroughly understand the entire process of nuclear medicine therapy i.e. patient preparation, radiation safety, dose administration, post therapeutic complications etc. in various Nuclear medicine therapeutic procedures.
Hospital administration and patient care	09-HLTHI6-016-C	To develop human resource with specialization in theoretical and practical aspect of hospital administration, patient care and ethics related to patient care to enable him/her to deliver quality healthcare services to the patient

(B) PRACTICALS

Name of the Course	Course code	Course Outcome
Practical in radiation protection, radiopharmacy and instrumentation in Nuclear medicine	09-HLTHI6-001-P	To thoroughly understand and execute the entire process of quality assurance in nuclear medicine i.e. quality control of radiopharmaceuticals and various instrument used in nuclearmedicine as well as interoperation of quality control reports.
Practical in clinical Nuclear Medicine and Fusion Technology	09-HLTHI6-002-P	To thoroughly understand and execute the entire process of nuclear medicine diagnostic and therapeutic procedure.

BACK TO MAIN

M. Sc. in CLINICAL RESEARCH (Program Code: HLTH17)

I. Courses at TMC

Program Code : HLTH17	Programme Specific Outcome	Each student should complete the training programme as per the modules planned.
		All the necessary training imparted by classroom lectures and on the job training while being posted in various DMGs in TMH and ACTREC, and external postings are mandatory.
		The student is expected to participate in the regular evaluation exams after each module and university exams at end of 1 year and 2 years of the program to be followed by 1 year of compulsory Internship.
		The training would help the student to acquire an understanding of clinical research and drug development process in general and specific in oncology clinical research.
		Feedback is received from the stakeholders in the 3 years of training and internship. Students are also engaged in giving us their feedback of the program.

Course Structure:

1. **MODULE – 1**

Sr. No.	Name of the Course	Course code
1	BASICS OF PHARMACY, DRUG DISCOVERY AND DEVELOPMENT	09-HLTH17-001-C
2	ETHICS	09-HLTH17-002-C

2. **MODULE – 2**

Sr. No.	Name of the Course	Course code
1	CLINICAL TRIAL DESIGN	09-HLTH17-003-C

3. MODULE – 3

Sr. No.	Name of the Course	Course code
1	Roles and Responsibilities of various Stakeholders in Clinical Research.	09-HLTH17-004-C

4. MODULE – 4

Sr. No.	Name of the Course	Course code
1	Quality Control/Quality Assurance in Clinical Research and Pharmacovigilance.	09-HLTH17-005-C

5. MODULE – 5

Sr. No.	Name of the Course	Course code
1	Clinical Data Management	09-HLTH17-006-C

6. MODULE – 6

Sr. No.	Name of the Course	Course code
1	EPIDEMIOLOGICAL STUDIES	09-HLTH17-007-C

7. SPECIAL MODULE

Sr. No.	Name of the Course	Course code
1	Newer techniques in Clinical research	09-HLTH17-008-C
2	Communication Skills	09-HLTH17-009-C
3	Clinical Research in Vaccines, Medical Devises.	09-HLTH17-0010-C
4	Investigator-initiated studies – special issues	09-HLTH17-0011-C
5	Studies in alternative systems – Ayurveda.	09-HLTH17-0012-C

Course Outcomes.

1. **MODULE 1**

Name of the Course	**Course code**	**Course Outcome**
BASICS OF PHARMACY, DRUG DISCOVERY AND DEVELOPMENT	09-HLTH17-001-C	To gain basic knowledge about general medicine, various cancers and its management, how drugs are discovered in the laboratory and in the clinics, what is the importance of conducting research, how clinical research is conducted. Students also learn of important medical terminologies and are introduced to treatment modalities and pharmacological concepts in treatment and management of various diseases.
ETHICS	09-HLTH17-002-C	This topic introduces the events in history that led to evolution of Ethics in Clinical Research. It also trains the students on various ethical principles and guidelines which are mandatory to be followed by every clinical research profession.
		It trains the students to rules and regulations to be followed in India and also international guidelines for conducting ethical research, including the informed consent process.
		This module prepares the background knowledge base for becoming a trained clinical research person who can support all types of research activities.
		Students are also taught the Indian regulations and some international regulations in the conduct of clinical trials.

2. MODULE 2

Name of the Course	Course code	Course Outcome
CLINICAL TRIAL DESIGN	09-HLTH17-003-C	This module introduces the students to the study protocol and how to write a protocol, what are the elements of a good protocol.
		The sessions on statistics prepares the students with basic knowledge of statistical designs and tests which are applied while generating clinical trial data.
		Sessions are devoted to evaluation of safety parameters in a clinical trial.
		Students are assigned protocols for which they have to design the Informed Consent Documents, in the format which meets the guidelines and regulations.
		To understand and apply the knowledge of biostatistics to clinical work To understand and interpret available literature relevant to the clinical trials.

3. MODULE 3

Name of the Course	Course code	Course Outcome
Roles and Responsibilities of various Stakeholders in Clinical Research	09-HLTH17-004-C	To understand the roles of Ethics Committee members and their responsibilities while reviewing the protocol proposals. The need to have SOPs for their functioning and how to document minutes of the meeting and responses to Investigators.
		To understand the role and responsibilities for Good Clinical Practices while being an Investigator for a clinical trial. The role and responsibilities of the Clinical Research Coordinator.
		How to initiate a study at a site, how to monitor the clinical trials, document their findings of the activities and take corrective and preventive actions.
		To understand how to write a monitoring visit report.

4. MODULE 4

Name of the Course	Course code	Course Outcome
Quality Control/Quality Assurance in Clinical Research and Pharmacovigilance	09-HLTH17-005-C	To understand what is a study Audit. How audits are conducted and reported.
		To understand how to Audit all study related documents, including study files, essential documents, and informed consents.
		To understand and learn how to take corrective and preventive actions on findings of an Audit (CAPA process)
		To understand how to plan for an inspection and actions needed to facilitate the inspection.
		To learn and understand how to conduct Pharmacovigilance (PV) during clinical trials and in the post- marketing period of a new drug. To learn how to evaluate various adverse events which get reported in clinical trials and after marketing of a drug. Management of reporting timelines for serious adverse events, as per Indian Regulations.

5. MODULE 5

Name of the Course	Course code	Course Outcome
Clinical Data Management in Clinical Research	09-HLTH17-006-C	To understand various aspects of data management after clinical trial data is generated.
		They learn of the various standards to be applied for data management, quality controls and assurance of the data that is generated.
		How to write a study report after data is generated.
		How to prepare a report for publication in journals or poster presentations or conference presentations.

6. **MODULE 6**

Name of the Course	Course code	Course Outcome
EPIDEMIOLOGICAL STUDIES	09-HLTH17-007-C	To understand various types of Epidemiological studies.
		To learn how the data helps in disease prevention.
		To understand the importance of screening and public health studies

7. **SPECIAL MODULE**

Name of the Course	Course code	Course Outcome
Newer techniques in Clinical research	09-HLTH17-008-C	Students get to know of newer developments in clinical research tools that can be used.
Communication skills	09-HLTH17-009-C	Clinical research professionals require skills in verbal and written communications. They also need to learn how to present themselves at hospitals and with site study team members.
		To learn how to present at conferences by using various techniques for making a presentation, e.g. power-point presentations.
		Clinical Research professionals learn how to interact with peers, juniors, doctors and other site staff. Some skills are required while interacting with patients too. All this is covered in this class.
Clinical Research in Vaccines, Medical Devices	09-HLTH17-0010-C	To appraise and sensitise students of how clinical research needs to be conducted with Vaccines, Medical Devices.
		To learn what rules and regulations and guidelines govern studies with vaccines and medical devices.
Investigator-initiated studies – special issues	09-HLTH17-0011-C	To learn and understand how academic studies are conducted.
		How to conduct multi-centre academic studies.
		How to manage such investigator initiated studies, including planning for adequate funds for such studies.
Studies in alternative systems – Ayurveda.	09-HLTH17-0012-C	To appraise and sensitise students of how clinical research needs to be conducted with Herbal/Ayurvedic medicines.
		To learn what rules and regulations and guidelines govern studies with herbal and Ayurvedic drugs.

BACK TO MAIN

INTEGRATED Ph.D. ENGINEERING SCIENCES

(SINGLE DEGREE)

(Program Code: ENGG18)

Course Structure:

I. Courses at BARC

Program Code : ENGG18	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

MiniProject	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(B) CHEMICAL ENGINEERING COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

		Material characterization techniques
Membrane Technology	EN714	Overview of Novel Membranes
		Preparation and Characterization
		Membrane Technologies
		Applications of Membrane Technology

(B3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1

2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design

		Shallow and deep foundation design; machine foundation design
Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN5A93	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics

		Understanding Transmission Lines, Waveguides, RF Amplifiers,
Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters

		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models

		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Computer Based System Design II	EN706
3	Digital Signal Processing & Image Processing	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720

(G3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(G2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life

Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

BACK TO MAIN

Course Structure:

II. Courses at IGCAR

Program Code: ENGG18	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(A) MECHANICAL ENGINEERING

(A1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Code Design for Pressure Vessels and Piping	ME1
2	High Temperature Design and Inelastic Analysis	ME4
3	Computational Fluid Dynamics	ME6
4	Finite Element Method	ME8
5	Advanced Heat and Mass Transfer	ME10
6	Reliability Engineering	ME13
7	Manufacturing Technology	ME14

(A2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Machine Design	ME3
2	Structural Integrity Assessment Methods and NDE	
3	Vibration Engineering and condition Monitoring	
4	Seismic Design of Nuclear Reactors and Facilities	ME5
5	Plant Dynamics	

6	Experimental Mechanics	
7	Process Control and Instrumentation	ME15

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping. In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

		design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.
Computational Fluid Dynamics	ME6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis Numerical Solution of Complete Fluid Flow and Energy Equation
Finite Element Method	ME8	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Advanced Heat and Mass Transfer	ME10	Advanced knowledge in heat and mass transfer Laminar boundary layer and forced convective heat, turbulent flow and heat transfer Heat transfer in porous media and heat transfer with phase change Radiation heat transfer
Reliability Engineering	ME13	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Manufacturing Technology	ME14	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.

(A2) ELECTIVES

Name of the Course	Course code	Course Outcome
Machine Design	ME3	Basic concepts in vibrations analysis
Structural Integrity Assessment Methods and NDE		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
Vibration Engineering and condition Monitoring		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	ME5	Introduction to earthquakes, design basis ground motion and IS 1893 spectra Introduction of earthquake engineering and analysis for multi degree freedom systems
Plant Dynamics		Analysis and design of structures, equipments and piping
Experimental Mechanics		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-001-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	The subject is aimed on advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-002-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Preparedness &Response to Nuclear Emergencies Artificial Intelligence Methods &Applications Membrane/ Separation Process and Technology	CEEL

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-003-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

2	Turbine Generator Fundamentals	FRE10
3	Mechanical and Electrical Equipments	FRE11
4	Maintenance Engineering	FRE12
5	Regulatory Framework for NPPs	FRE13
6	Practical's	FRE14
7		Viva Voce

Course Outcomes:

(E1) FUNDAMENTALS

Name of the Course	**Course code**	**Course Outcome**
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(E2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for pressure vessel and piping	FRE1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tube sheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.

Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2	Advanced knowledge in heat and mass transfer
		Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
		Heat transfer in porous media and heat transfer with phase change
		Radiation heat transfer
Transport Phenomena	FRE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyse transport problems
		Analyse transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyse transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

Course Outcomes:

(F1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(F2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	FRE15	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	FRE16	Students learn about basics of interaction of radiation with matter.
		Principle & Techniques to detect and measure ionizing radiation.
		Basics of radiation counting statistics
		Introduction to Neutron Flux Measurement in FBTR and PFBR.
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Embedded System Design & Human Machine Interface	FRE17	Introduction to Microprocessor Based Hardware Design
		Computer Communication and Networks
		Fault Tolerant and Distributed Architectures
		Programmable Logic Controller Design
		Overview of plant automation and Human Machine Interface (HMI)

Process Instrumentation	FRE18	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of various process variables
		Reliability principles, Fail safe design principles
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(F3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
