5. Performance of autopsy on animals.
6. Isolation of plasmids and Conjugation experiments for transfer of drug resistance
7. Serum antibiotic assays eg. Gentamicin
8. Phage typing for staphylococci, *S.typhi etc.*
9. Bacteriocine typing eg. Pyocine, Proteocin etc.
10. Enterotoxigenicity tests like rabbit ileal loop, intragastric inoculation of mouse, Sereny's test.
11. Mouse foot pad test for *M.leprae*

09HLTH09A05-002-P

IMMUNOLOGY/ SEROLOGY

1. Collection of blood by venepuncture, seperation of serum and preservation of serum for short and long periods.
2. Preparation of antigens from bacteria or tissues for widal, Weil-Felix, VDRL, etc. and their standardisation.
3. Preparation of adjuvants like Freund's adjuvant.
4. Raising of antisera in laboratory animals.
5. Performance of serological tests viz. Widal, Brucella tube agglutination, indirect haemagglutination, VDRL, Paul-Bunnel, Rose-Waaler, IFA.
6. Immunodiffusion in gels, counter immunoelectrophoresis- visualization and interpretation of bands.
7. Performance and interpretation of Enzyme linked immunosorbant assay.
8. Latex and staphylococcal co-agglutination tests.

Desirable to acquire:

1. Leucocyte migration inhibition test.
2. T-cell rosetting.
3. Flow Cytometry
4. Radial immunodiffusion.
5. Immunoelectrophoresis.
6. Neutrophil phagocytosis.

09HLTH09A05-003-P MYCOLOGY

Must acquire:

1. Collection of specimens for mycology.
2. Direct examination of specimens by KOH, Gram, Kinyoun's, Giemsa, Lactophenol cotton blue stains.
3. Examination of histopathology slides for fungal infections.
4. Isolation and identification of pathogenic yeasts and moulds and recognition of common laboratory contaminants.
5. Special techniques like Wood's lamp examination, hair baiting, hair perforation, paraffin baiting and slide culture.
6. Maintenance of stock cultures.
7. Animal pathogenecity tests viz. Intracerebral and intraperitoneal inoculation of mice for cryptococcus.

09HLTH09A05-004-P PARASITOLOGY

Must acquire:

1. Examination of faeces for parasitic ova and cysts etc. by direct and concentration methods (salt floatation and formol – ether methods)and complete examination for other cellular features.
2. Egg counting techniques for helminths.
3. Examination of blood for protozoa and helminths by wet mount, thin and thick stained smears.
4. Examination of other specimens for e.g. urine, C.S.F., bone marrow etc. for parasites.
5. Histopathology sections – examination and identification of parasites.
6. Performance of stains – Leishman, Giemsa, Modified Acid Fast, Toluidine Blue O.
7. Identification of common arthropods and other vectors viz. Mosquito, sand fly, ticks, mite and cyclops.
8. Collection of specimens.
9. Preservation of parasites – mounting, fixing, staining etc.

Desirable to acquire:

1. In-vitro culture of parasites like entamoeba, leishmania, P.falciparum.
2. Maintainance of toxoplasma gondii in mice.
3. Preparation of media – NIH, NNN etc.
4. Copro-culture for larva of hook worms.
5. Antigen preparation viz. Entamoeba , Filarial , Hydatid for serological tests like IHA and skin test like Casoni's .
6. Permanent staining techniques like iron haematoxylin

09HLTH09A05-005-P VIROLOGY

Must acquire:

1. Preparation of glassware for tissue culture(washing, sterilization)
2. Preparation of media like Hanks, MEM.
3. Preparation of clinical specimens for isolation of viruses.
4. Serological tests-ELISA and rapid tests for HIV, RPHA for HbsAg, Haemagglutination inhibition for influenza, AGD and

couterimmunoelectrophoresis for detection of viral antigens or antiviral antibodies.

5. Chick embryo techniques- inoculation and harvesting.
6. Handling of mice, rats, guinea pigs, rabbits for collection of blood, pathogenicity test etc.

Desirable to acquire:

1. Preparation of Monkey Kidney Cells (Primary) maintenance of continuous cell lines by subcutures. Preservation of cell cultures.
2. Recognition of CPE in tissue cultures.
3. Performance of haemadsorption, haemagglutination, immunofluorescence, neutralization tests for identification of viruses.

BACK TO MAIN

BARC

Syllabus for MD (Nuclear Medicine)
(Program Code: HLTH09A06)

01HLTH09A06-001-C Paper I - Basic Sciences & Instrumentation – 100 marks

01HLTH09A06-002-C Paper II - Diagnostic Radiopharmaceuticals & In-vitro Techniques – 100 marks (includes Radiation Physics, Radiation Biology & Radiation Protection)

01HLTH09A06-003-C Paper III- Clinical Nuclear Medicine Paper I – 100 marks

01HLTH09A06-004-C Paper IV - Clinical Nuclear Medicine Paper II – 100 marks

Basic Sciences for Nuclear Medicine

01HLTH09A06-001-C

1. Atomic structure & Periodic table — 2 Lectures

Atom and sub atomic particles,Rutherford's atomic structure and its limitations,Bohr's atomic structure.Quantum numbers,Isotope, Isobar and Isotone,Periodic properties like atomic radius, ionic radius, Electro negativity, Ionisation potential, Electron affinity.

2. Introduction Human Anatomy and Physiology — 10 Lectures

Human Anatomy, Brief introductory anatomical features of: Cardiovascular system, Respiratory system, Alimentary system, Renal system, Central nervous system, Endocrine systems, Reproductive system, Musculoskeletal system. Haematology. Human Physiology and Pathophysiology.

3. General Cell Biology & Cellular Physiology — 2 Lectures

The basic structure of eukaryotic and prokaryotic cell and their internal environment. cell wall, cell membranes. Functions of endoplasmic reticulum, mitochondria, golgi complex, lysosomes. Transmembrane potential of mitochondria and its implications in transport and intramitochodrial localization of isonitrile compounds. Transport across cell membranes, Functional systems in the cells, Cell reproduction;Concept of Cell doubling time and its implication in Oncology; Warburg effect and its implications in metabolic imaging; Apoptotic pathway and role of AnnexinV.

4. Basic Electronics — 8 Lectures

Fundamentals of electricity and electronics, Coulombs law,Ohms law,Ohmic & non ohmic devices,Kirchoff"s law,regulated power supply, Semiconductor physics,PN junction diode,LED,rectifiers,transistors(PNP&NPN),Feedbacks,operational amplifiers,Oscillators,binary,octal,hexadecimal number system, logic circuits,CRO ,ADC and DAC. Defibrillator circuit and uses.

5. Basic Mathematics — 12 Lectures

Numbering system, Accuracy and Precision, Significant figures, Matrices, Mathematical Constants. Linear and Polynomial Equations, Linear and Quadratic Equations and Identities, , Slope, Roots, Relation Between Roots and Coefficients. **Logarithms** Definition, Laws of Logarithms, Rule for Change of Base, Common and Natural Logarithms, **Permutations and Combinations** Probability, Permutation and Combination, Factorials. **Calculus** Relations and functions, Limits, Definition of Derivative, Physical Significance -Differentiation of Simple Functions, Differential Equations, integration and Summation, Definition of Trigonometric Functions, Identities.

Introduction to Mathematical Transformation: Fouriers Transform, Laplace transform.

6. Chemistry relevant for radiopharmaceuticals **10 Lectures**

Concept of BOHR model, Hybridization with example of Methane, Ethylene and acetylene etc, Solvent strength, acid base , pH, buffers, titrations, Organic Chemistry, resonance effect, steric effect, dielectric constant, various type of organic solvents, mesomeric effect, determination of organic acid base strength and other organic phenomena utilizing the basic principle, various type of organic reactions, Nucleophilic Substitution reactions in details, Aromatic substitution reactions, ^{99m}Tc-chemistry, Core structures of various common ^{99m}Tc-radiopharmaceuticals, labelling techniques, importance of ^{99m}Tc-kit components, peptide chemistry with respect to ^{68}Ga/^{177}Lu-DOTATOC, DOTA-TATE etc. Principle of radionuclide choice for imaging and therapy with example of ^{68}Ga, ^{177}Lu, ^{90}Y, ^{18}F, ^{99m}Tc etc. Principle of TLC &HPLC w.r.t. radiochemical purity (RCP).

7. Introduction to Immunology: **4 Lectures**

Structure and function of immune system, Immune response – humoral and cell-mediated immune response – primary and secondary responses. antigens, antibodies, structure of Ab's, classification of antibodies, antigen-antibody interaction, and monoclonal antibodies. New generation antibodies. Implications in molecular imaging & therapy.

8. Basic Biochemistry and Molecular biology **10 Lectures**

Introduction to carbohydrates, proteins, nucleic acids, enzymes, lipids. Protein structure and protein 3-dimensional shape, structure-function relationship, proteins purification, Nature of enzyme catalyzed reactions, their regulation, inhibition and mechanisms. Structure and function of carbohydrates and their importance in central metabolism. Structures and nature of fatty acids and lipids found in biological membranes. Lipid Metabolism. Nucleic Acids and Biological Information Flow. Related Biochemical and molecular biology techniques. Aptamers with radiolabelled apatamers for Nuclear imaging and therapy.

9. BIOSTATISTICS **12 Lectures**

Basic Concepts: Probability, a Priori and posteriori Probabilities. Statistical significance of probabilities Sample and Population, Variables, Classification of Variables, Nominal, Ordinal, interval and Ratio, Fixed and Random,

Population Distributions: Binomial distributions and Poisson distributions – their properties, parameters and applications.Normal and 't' distributions – Population and Sample Parameters Measures of central tendency, measures of dispersion, Variance, degrees of freedom, confidence limits and intervals. Probability of occurrence – use of Z and t tables.

Sampling, Estimates and Hypothesis testing: Sampling methods, Random sampling and estimates of population parameters from samples. Sample statistics, Hypothesis testing. Drawing inferences and confidence limits. P values. Students t test for comparing means. General and paired t tests. Special cases where Variances are unequal. Central Limit Theorem.

Analysis of Variance:F-Distribution - Test for Homogeneity of Variance One Way ANOVA, Comparison of Means of Multiple Groups By Partitioning of the total Sum of Squares as within and between Sum of Squares, Assumptions in ANOVA, Missing Values, Two Way ANOVA; Design of Experiments.

Correlation and Regression:

Pearsons' Product Moment Correlation Coefficient, comparison of Correlation Coefficients, Partial and Multiple Correlation, Linear Regression Analysis. Interpretation of Regression Coefficients. Application of Correlation and Regression in Method Comparison and Evaluation

Nonparametric Statistics: Spearman's Coefficient of Rank Correlation, Chi Square Test. Nonparametric Methods for Hypothesis Testing Based on Ranks. Mann Whitney U Test, Wilcoxon Signed Rank T Test

Clinical Statistics: Cohort Studies, Case Control Studies, Sample Size calculations, Clinical Trials, Meta analysis.

Demonstration of application Softwares in Statistics.

10. Introduction to Biology of cancer **2 Lectures**

Neoplastic processes. Inflammatory & Degenerative processes. Classification and nomenclature of neoplasms.Concept of Cell doubling time and its implication in Oncology; Warburg effect and its implications in metabolic imaging; Apoptotic pathway and role of AnnexinV.

11. Basic Medical Terminology **2 Lectures**

Descriptive – describing shape, color, size, function, etc, and eponyms. Word root for eg. Myocarditis (prefix)(root)(suffix). Prefix change, Suffix change. -itis, -osis, -ectomy, -otomy, -ostomy, a/an -, micro -, macro -, mega -/ -megaly, -scopy/ -scopic with examples. Pathological Nomenclatures Specially For Tumours.

12.Introduction Common hospital practices **2 Lectures**

Pathogens, Disinfection methods, Sterilisation, Communicable diseases, Nosocomial infections, Hepatitis, HIV, Biohazards, Principles of asepsis - handling of contaminated swabs, used syringes and needles, Bio-waste management. Policy for management of Niddle stick injury/Exposure to blood or body fluids.

01HLTH09A06-002-C

Radiation Physics, Radiation Biology & Radiation Protection

Origin & Types of Radiation **4 Lectures**

Fundamental constituents (quarks, leptons) and interactions of matter according to the "Standard Model", Properties of Nuclear Forces, Phenomenological Nucleon-Nucleon Potentials, Stability of nuclides - binding energy forces and nuclear forces, Spin, electric and magnetic moments, Experimental Nuclear Moments, Size, Parity and Isospin of Nuclei, Laws of radioactivity, Units of radioactivity. Decay modes, Stability of atom,Mass defect,Binding energy,The basis of radioactivity (N/Z ratio).Types of radioactivity depending on N/Z ratio Types of radiation (α[one body theory of alpha decay, microscopic theories of alpha decay], β[theory of beta decay; types of weak interaction; selection rules in beta decay; parity non conservation in beta decay], γ, X-ray, n). Theory of gamma decay, Experimental gamma ray transition rates: isomeric states; Vibrational motion (theory of Nuclear vibrations); Rotational motion (theory of Nuclear roatation); Interacting Boson models; Clustering (especially in context of alpha particles); Recent developments (qantum chromodynamics, pertubation theory, meson field theory and chiral perubation theory), radionuclide chart, . Laws of successive transformations, Theories of alpha, beta and positron emission; beta particle spectrum; K shell electron capture; Cerenkov radiation, characteristic radiation, Auger effect, Bremsstrahlung radiations, Metastable state and isomeric transition, internal conversion.Nuclear reactions, Nuclear reaction cross section, neutron activation with thermal neutrons, Nuclear isomerism, nuclear fission, fission products, nuclear reactors.

1. Interaction of radiation with matter **5 Lectures**

Gamma ray interactions - Excitation, ionization, photoelectric effect, Compton effect, pair production, annihilation radiations, specific ionization and linear energy transfer; Charged Particle interactions: range of charged particles, , Interaction of neutrons with matter, Elastic scattering. Importance of these interactions in radiology and nuclear medicine.

2. **Radiation Quantities and units** **3 Lectures**

Exposure, absorbed dose, radiation weighting factor, concept of radiation weighting factor W_R, Sievert, equivalent dose, concept of tissue weighting factor W_T, effective dose, committed equivalent dose, committed effective dose, ICRP and AERB dose limits . Use of dose constraints for staff, and comforter. Annual Limit of Intake and derived air concentration. Reference levels: Recording levels, Investigation levels and Action levels.

4. Gas filled detector **3 Lectures**

Theory of ionization chamber, design consideration in an ionization chamber, operating voltage, theory and construction of condenser type of chambers and thimble chambers; gas multiplication, pulse mode detector for single ionizing events, Proportional Counters - design and characteristics, Geiger-Mueller Counters - design consideration, dead time and recovery time, characteristics of organic and inorganic quenchers, operation.

5. Scintillation detectors – (Organic and inorganic) **3 Lectures**

Atomic basis of scintillation. Scintillation process. Dopants. Inorganic and Organic Scintillators, Comparison of properties by comparison of characteristics like stability, light output, decay time, intrinsic efficiency, dead time, considerations on fabrication and cost.

6. Gamma Ray Spectrometry **5 Lectures**

Construction of a Gamma Ray Spectrometer. Components of GRS. Detection principle – light collection, light guide, and Photomultiplier tubes. Coincidence & anti coincidence circuits. Single channel analyzer, multi channel analyzer. Study of gamma ray spectrum: photopeaks, Compton valley, edge and plateau, characteristic X-ray peak, backscatter peak, Iodine escape peak, annihilation peak, coincidence peak. Gamma ray spectrometer – calibration, energy resolution, integral and differential counting, linearity, counting efficiency.

7. Statistics of counting: **3 Lectures**

Poisson distribution, Poisson approximation to radioactive decay, measures of counting error. Accuracy and precision, standard error, counting in low background and high background scenarios, net count rates and standard deviation of count rates. Gaussian distribution and propagation of errors. Distribution of counting times to minimize errors.

8. Semiconductor detectors: **2 Lectures**

Semiconductors junction and surface barrier detectors, Diode detectors, Ge(Li) detectors, High Purity Germanium detectors, their response and characteristics, energy calibration and detector efficiencies, cadmium-zinc- telluride detector.Room temperature semiconductor diodes.Advantages and disadvantages of semiconductor detectors

9.Liquid Scintillation Counters **2 Lectures**

Composition of liquid scintillator, scintillation cocktail: primary solute, secondary solute and organic solvent (toluene, 1, 4 dioxane, anthracene) and solublizing agents for tissues, PM tubes, Coincidence circuits and count display systems. Quenching, Quench corrections methods: Internal standard method, external standard method and channel ratio. Discrimination of alpha, beta by liquid scintillations.

10. Radiation Biology **10 Lectures**

Radiolysis of water, interactions of free radicals, Direct versus indirect effects. Influence of LET, oxygen and various compounds on free radical forming reactions Target Theory, Multitarget theory, Target size, Multi hit theory, Multitarget multi hit theory.

Radiation effects on macromolecules, cell membrane, chromosomes. Chromosomal type aberrations. Radiation effects on cell division. Radiation effects on microorganisms and independent cell systems.

Differential cell sensitivity. Criteria of sensitivity, Factors affecting sensitivity. Anti-oxidative enzymes: Super Oxide dismutase, Catalase, Glutathione reductase, Glutathione -S-transferase, Monoamine oxygenase, Glutathione peroxidase.

Radiation effects on major organ systems: hematopoietic system, digestive system, reproductive system, nervous system. Effects of Ionizing Radiation on the Embryo and Fetus. Teratogenic and delayed effects.

Linear Energy Transfer, Relative biological effectiveness, Dose rate effect, chronic irradiation, factors influencing radiation response - oxygen concentration, Temperature etc.

Acute radiation effects: Lethality, Stochastic and Nonstochastic effects of radiation: Late effects in normal tissue systems and organs, Radiation carcinogenesis, genetic effect of radiation, radiation induced mutations, dose effect relationship, pre-natal effects of radiation, types of genetic disorders, risk estimation, direct method, doubling dose method, uncertainties. Basis for ICRP dose limits for occupational exposure, embryo / fetus, members of the public, risks associated with recommended limits,Biodosimetry,Bioassays,Extrimity dosimetry

Low Dose Exposure to Ionizing Radiation: Medical, Natural background, Radon. Radiation Hormesis; BERT

11. Personnel monitoring devices **4 Lectures**

Film badges, Ring badges, Thermoluminescent dosimeters (TLD's), Pocket dosimeters. Characteristics of TLD phosphors, Glow curves, dose and energy response, sensitivity and application in dosimetry and personnel monitoring devices. Other types of dosimeters - radiation calorimetry, photographic dosimetery, chemical dosimetry.

12. Radiation Protection: **6 Lectures**

Types of exposure: internal and external exposure, Routes of internal exposure Principles of radiation protection, time, distance, shielding

Exposure rate & shielding calculations by defining types of materials, and thickness needed using attenuation coefficients. Concept of Half value layer and tenth value layer. Work place monitoring: Radiation field, contamination and airborne radioactivity monitoring. AERB directive for derived working levels for radioactive contamination, airborne radioactivity and Radiation field. Radiation protection in diagnostic nuclear medicine, therapeutic nuclear medicine (with AERB directives for discharge of patients) and Medical cyclotron.

13. Radiation dosimetry **7 Lectures**

Metabolic pathways of radioisotope deposition, beta particle dosimetry; Equilibrium Dose rate equation. Gamma dose calculation, Specific gamma ray constant (Γ) and average geometrical factor. MIRD method of internal dose calculation, Absorbed Fraction and calculation of absorbed dose.

14. Transport of radioactive material: **2 Lectures**

Classification of radioactive materials, general packing requirements, transport documents, Type of package, Transport Index, Category of package, approval requirements, TREMCARD.

15. Radiological emergency and preparedness **1 Lecture**

Major spillage, loss of radioactive source, Misadministration, Medical emergencies involving radioactive patients and Death of therapy in-patient. AERB directives to handle the cadaver. Radioactive decontamination.

16. Radioactive waste management: **2 Lectures**

Philosophy of radioactive waste management, Management of solid waste, liquid waste and gaseous waste. AERB directives for safe disposal of radioactive waste. Concept of Exclusion, exemption and clearance of radionuclide in solid materials.

Diagnostic Radiopharmaceuticals & In-vitro Techniques

1. **Radionuclides in Nuclear Medicine**: **3 Lectures**

Radioactive decay, Physical Half-Life, Activity, Decay Constant, Mode of radioactive decay, Alpha particle decay, Beta particle decay, Gamma ray, Requirements for Radiotracers, Radionuclides used in Nuclear Medicine, Radionuclide Considerations, Type and Energy of Emissions, Specific Activity, Radionuclidic Purity, Chemical Properties, Economics, Production of radionuclides, Radiopharmaceuticals, Ideal radiopharmaceuticals, Important characteristics of a radionuclide to be used in imaging.

2. **Production of reactor & accelerator produced radionuclides** **5 Lectures**

Successive decay and radioactivity equilibrium, Equation for radionuclide production Reactors and charged particle accelerators. Nuclear reactors: neutron energy and neutron flux, neutron cross section, targets and specific activities, mathematical principles, general radiochemistry. Charged particle accelerators: physics of linear accelerator, cyclotron, synchro-cyclotron, isochronous cyclotron. Medical cyclotron: threshold energy, nuclear cross section, q value, RF frequency, magnets, beam focusing and extraction, target design. Types and makes. Cyclotron produced radionuclides, cyclotron based generator.Chemical processing of reactor and accelerator targets; Separation techniques using precipitation, solvent extraction, distillation, gas evolution, ion exchangers; Structure of cation and anion exchangers; relative affinity of ions in exchangers; Use of exchangers in ion exchange columns; other column separation techniques.

3. Compartmental Analysis **4 Lectures**

Compartmental analysis and its applications in Nuclear Medicine, Assumptions in Compartmental model, Single compartment model, The Continuously stirred tank reactor (CSTR); Single Compartment model: The Charged Capacitor; Single Compartment model: Discrete time analogues for two compartment systems; Occupancy theorem. Application of Differential equations, Open and closed models, Single compartment, two compartment and multicompartment models, reversible and irreversible exchanges, Mammary and Caternary models, Problems on radioactive generators, biological elimination processes of radiopharmaceuticals. Distributed Models.

4. **Generator produced Radionuclides** **5 Lectures**

Need for Generator, Advantages of generator system, Definition, Properties of Ideal Generator, Basic Principle, Principles of generator system, Parent Daughter Growth –Decay Relationship, Parent Daughter Equilibrium, Transient Equilibrium, Secular equilibrium. Various generator systems.

a) Gamma emitting radionuclidic generators: ^{99}Mo - ^{99m} Tc, ^{113}Sn – ^{113m}In, Special emphasis on ^{99}Mo - ^{99m} Tc generator: Production of parent, Decay Scheme, Characteristics of Daughter Radionuclide, Types of generators – column generator, solvent extraction generator, gel generator, sublimation generator, Various generator suppliers, Applications of Daughter Radionuclide.

b) Beta emitting radionuclidic generators: ^{188}W -^{188} Re, ^{90}Sr-^{90}Y, ^{194}Os -^{194}Ir, ^{132}Te – ^{132}I. Production of parent, decay Scheme, characteristics of daughter radionuclides, generator suppliers, applications of daughter radionuclide.

c) Positron emitting radionuclidic generators: ^{68}Ge – ^{68}Ga, ^{82}Sr - ^{82}Rb : Production of parent, Decay Scheme, Characteristics of Daughter Radionuclide, Various generator suppliers, Applications of Daughter Radionuclide. d) Alpha emitting radionuclidic generators and Complex Systems: ^{225}Ac - ^{213}Bi, ^{224}Ra/^{212}Pb/^{212}Bi.

5. Radiopharmaceutical Chemistry **2 Lectures**

General physicochemical properties of radioactive compounds: distinction between radionuclide, radiochemical and radiopharmaceuticals, carrier concept (carrier-free, carrier added, no carrier added). Chemistry of tracer radionuclide metals: hydrolysis, reduction-oxidation, concentration methods, radiolytic decomposition.

Study of Phosphorous (P), Chromium (Cr), Cobalt (Co), Iron (Fe), Indium (In), Thallium (Tl), Technetium-99m (Tc), Iodine (I), Yttrium (Y), Strontium (Sr), Rhenium (Re), Samarium (Sm), Lutetium-177 (Lu), radioactive gases (i.e. Xenon Xe-133, Xe-127, Kr-81m) & positron emitting nuclides like Fluorine (F), Oxygen (O), Carbon (C), Nitrogen (N), Copper (Cu), Rubidium (Rb), Gallium (Ga)

6. Development of radiopharmaceuticals **1 Lecture**

Empirical and Rational approaches to design, charge and size of the molecule, protein binding solubility, stability and bio-distribution. Structure- activity relationship. Biological properties of radiopharmaceuticals, pharmacokinetics, distribution, metabolism, excretion.

7. **Modes of localisation:** **2 Lectures**

Mechanism of localisation with respect to each radiopharmaceutical. Ideal characteristic of RP for localisation in organ of interest for diagnostic and therapeutic purposes. Various modes of localisation: Active and passive modes of localisation. Substrate specific radiopharmaceutical localization, Receptor mediated, biochemical, metabolic trapping, enzyme substrate, antibodies to tumor associated antigens. Filtration, Phagocytosis, Cell Sequestration, Capillary blockade, ion Exchange, Chemisorption ,Cellular migration

8. **Methods of radiolabeling:** **2 Lectures**

Definition of a Radiopharmaceutical. Ideal Radiopharmaceutical. Availability. Short Effective Half-Life Particle. Emission Decay by Electron Capture or Isomeric Transition. High Target-to-Nontarget Activity Ratio.

Design of New Radiopharmaceuticals. General Considerations. Factors Influencing the Design of New Radiopharmaceuticals. Methods of Radiolabeling. Isotope Exchange Reactions . Introduction of a Foreign Label . Labeling with Bifunctional Chelating Agents. Biosynthesis . Important Factors in Labeling . Efficiency of the Labeling Process. . Chemical Stability of the Product. Denaturation or Alteration . Isotope Effect. Carrier-Free or No-Carrier-Added State . Storage Conditions . purification analysis, shelf life.

9. **Specific methods of labelling: Radioiodinated Radiopharmaceuticals: 2 lectures**

Introduction, Isotopes of Iodine, Production of Isotopes with Physical properties, Principle of radioiodination, methods of radioiodination, Iodination of organic compounds – Chemistry of Iodine, chemical properties, Oxidation, Methods to minimize oxidation, Various Radioiodinated radiopharmaecuticals –1)^{131}I-NaI, 2)^{131}I-OIH, 3) ^{131}I-Rose Bengal, 4)^{131}I-IMP (n-isopropyl, p-iodo amphetamine), 5)^{131}I-HIPDM (NNN'-trimethyl,N'(2-hydroxy,,3-methyl,5-iodobenzyl)1,3propane diamine), 6) ^{131}I-mIBG, 7)^{131}I-Fibrinogen, 8)^{131}I- lipiodol, 9)^{131}I-19-Iodocholesterol, radioiodination of peptides, proteins, antibodies/monoclonal antibodies, Methods of labeling, Applications, Advantages, Disadvantages, Dose Administration etc.

10. Specific methods of labeling – Technetium labeling (4 Lecture

Chemistry of Technetium with respect to oxidation states, reduction methods, technetium tin-ligand reactions in aqueous solution, hydrolysis, re-oxidation, complexation, carrier effects, radiolytic decomposition.

Labelling with ^{99m}Tc: formation of ^{99m}Tc-complexes by ligand exchange, structure of ^{99m}Tc-complexes, oxidation states of ^{99m}Tc in radiopharmaceuticals and kits for ^{99m}Tc-labeling-: DTPA, GHA, DMSA, MIBI, MAG_3, MDP, phytates, ECD, EC, IDA compounds and Sulfur Colloid. Dextran colloid and labeled particles. Metal chelate and congugates, ^{99m}Tc-tricarbonyl core, ^{99m}Tc-nitrido compounds, ^{99m}Tc-Hynic-TOC.
Kit formulation of radiopharmaceuticals and their classification. Additives, stabilisers and preservatives

11. Radiolabeling of Cells: **2 Lectures**

Methods of labeling for blood pool studies and detection of gastrointestinal bleeding - Tc-99m red blood cells (i.e. In-vitro, In-vivo and modified In-vivo), Tc-99m RBC's (denatured) for spleenic imaging, Tc-99m / In-111 - Leucocytes (i.e. Methods of radiolabeling for inflammation / abscess localization), Cr-51 red blood cells (i.e. Methods of radiolabeling for blood volume measurement & Splenic Sequestration studies), In-111platelets (i.e. Methods for radiolabeling).

12. Altered biodistribution related to improper preparation of Rps. **1 Lecture**

Radiopharmaceutical formulation problems, problems caused by radiopharmaceutical administration technique and procedure, changes in biochemical and phathophysiology, previous medical procedure such as surgery, radiation therapy and dialysis, drug interactions.

13. PET radiopharmaceuticals: **6 Lectures**

Positron emitters and radiochemistry to produce, ^{18}F-Sodium Fluoride, ^{18}F-Fluorodeoxyglucose (FDG) , ^{18}F-Fluorodopa , ^{18}F-Fluorothymidine (FLT), ^{18}F-MISO, ^{18}F-FAZA, ^{18}F-FET, ^{18}F-FBA, ^{11}C-Sodium Acetate, $^{13}NH_3$ and $H_2{}^{15}O$._FDG synthesis and QC Details of automated steps involved during synthesis, QC done before supply for patient's use.

14. Molecular Imaging probes: Target specific radiopharmaceuticals **1 Lecture**

Basics of molecular imaging, methodology of molecular imaging, Classification of radiopharmaceuticals, Blood flow/membrane transport rps, Metabolism based rps. Receptor & transport mediated rps. Receptors, receptor binding, design of rps, bifunctional approach, chelating agents, radiolabeling, Ideal rps, Various receptor imaging agents SSTR, Bombesin, Vasoactive intestinal peptides, α-Melanocyte-Stimulating Hormone, Neurotensin, Substance P (SP), Cholecystokinin (CCK), Neuropeptide Y (NPY) reporter genes for imaging.

15. Quality control of Radiopharmaceuticals **4 Lectures**

General Schemes, Physicochemical tests: physical characteristics, pH and ionic strength, radionuclide purity, radiochemical purity, chemical purity, radio assay,

QC of kits – radiochemical purity, sterility check, membrane filtration, chromatography, pyrogen test, bio-distribution studies, Mo break through test. Breakthrough of methyl ethyl ketone, alumina. QA of PET radiopharmaceuticals by TLC scanner, HPLC and gas chromatography (GC). QC in hospital radiopharmacy practices - includes aseptic practices & pharmaceutical safety aspects. Good manufacturing practice (GMP), ISO and ISI standards in radiopharmaceuticals. Adverse reactions to and altered biodistribution of radiopharmaceuticals, iatrogenic alterations in the biodistribution of radiopharmaceuticals Regulations, ethics and registration of radiopharmaceuticals.

16. Therapeutic applications of radionuclides **2 Lecture**

Radionuclide therapy (RNT), definition, Problems for development of therapeutic RP, Uptake Mechanisms of Therapeutic Radiopharmaceuticals, types of preparation, Properties of ideal therapeutic radiopharmaceuticals, Selection of appropriate radionuclides includes particle emission, Half-life, Sp. Activity, decay characteristics, Characteristics of the Ideal Therapeutic Radiopharmaceutical,

Ranges of Emitted Particle Radiation in the Tissue: Beta particle emitting Radionuclides: Response of beta particle radiation on tumor, Classification of b- particles, Alpha particle emitting Radionuclides, Auger-electrons emitting Radionuclides, Properties of Auger-electron-emitting radionuclides, Dosimetry in therapy by Radiopharmaceuticals: Absorbed radiation dose, Patient Specific Dosimetry.

17. Radioisotopes: Beta particle emitting radioisotopes **3 Lectures**

Phosphorus-32, Samarium-153, Holmium-166, Thulium-170, Rhenium-186, 188: Rhenium Chemistry, Rhenium-188, Production and Physical Characteristics, Issues with Column Generator Production, Uptake and Biokinetic Properties, Rhenium RPs.

Lutetium-177 : Production and Physical Characteristics, Influence of production mode for 177Lu, 176Lu-route versus 176Yb-route, Uptake and biokinetic properties, Peptide receptor radionuclide therapy, Dosimetry.

Yttrium-90: Production and physical characteristics, 90Sr/90Y generators, Uptake and Biokinetic Properties, Uses of 90Y Radiopharmaceuticals: microspheres, MAA, Antibodies, Dosimetry.

18. Alpha emitting Radioisotopes for therapy **1 Lecture**

Radium-223: Alpharadin, (Generator prod. RP 227Ac-223Ra), Bismuth-212, (212Bi is produced by chemistry generator from 224Ra), Bismuth-213 (213Bi is produced by chemistry generator from 225Ac), Astatium-211: (cyclotron produced RP. 209Bi (α, 2n) 211At), Actinium 225: Cyclotron produced RP. 226Ra (p,2n) 225Ac. Production and Physical Characteristics, Uptake and biokinetic properties, Dosimetry. **Auger-electrons emitting Radioisotopes**: Indium-111 (111In) : Production and Physical Characteristics, Uptake and biokinetic properties, Dosimetry.Application of therapeutic radiopharmaceuticals : Bone pain palliatiation, Radiosynovectomy, Radioimmunotherapy

19. Nanotechnology **2 Lectures**

Concepts and its biomedical applications, liposomes, aerosols, nanoparticles, immuno-liposomes, drug delivery systems, Introduction to Nanotechnology and their application in nuclear medicine for diagnostic and therapeutic purposes. Different types of drug delivery nanocarriers for diagnostic and therapeutic purposes (Liposomes, micelles, phytosomes, Chitosan Nanoparticles etc) and their advantages over present drug delivery systems. Methods of preparation of Nanocarriers and quality control procedures. Mechanism of localisation of nanodrug delivery systems. Future applications in Nuclear Medicine.

20. Design of Radiopharmacy laboratory: **2 Lectures**

Regulatory requirements, Pharmaceutical aspects, Radiation protection aspects, Local constraints, Design of hospital pharmacy, stocking of consumables and labels, disposable materials. Laminar airflow (LAF) hood, its testing and maintenance.

Centralized Nuclear Pharmacy, Considerations & layouts. Automated Modules.
Licenses & Procurement of Radiopharmaceuticals. Trace of delayed shipments, surveys, wipe tests, packaging, disposal, storage requirements, and record keeping logs.

21. Diagnostic In-vitro Techniques: **7 Lectures**
Principle of RIA, Immunoradiometric assay (IRMA), Enzyme linked immunosorbent assay (ELISA), Fluorescent immunoassay (FIA), Chemiluminescent Immunoassay (CLIA), Methods of receptor assays. In-vitro Uptake studies, In-vitro radiorespirometry, Quality Control Parameters and methods and Applications for hormones & drugs, example of assays for T_3, T_4, TSH, free hormones, thyroid antibodies and thyroglobulin, other hormones and drugs.

Instrumentation & Imaging Technology - Paper - IV

1. QC of Radiation Protection Instruments **2 Lectures**
QC of - Ionization chamber Type, Geiger-Muller Counter, pocket dosimeter, Dose calibrator, Scintillation type Gamma ray spectrometer, Zone monitors.

2. Medical Cyclotron-Radionuclide Production **4 Lectures**
Reactors and charged particle accelerators. Physics of linear accelerator, cyclotron, synchro-cyclotron, isochronous cyclotron. Medical cyclotron: threshold energy, nuclear cross section, q value, RF frequency, magnets, beam focusing and extraction, target design. Types and makes their advantages and limitations. Safety Concerns. Cyclotron produced radionuclides, Cyclotron based generators.

3. Collimator Systems **4 Lectures**
Counting Geometry & Need for Collimator, Types of Collimator- Parallel Hole, Slant Hole, Rotating Hole, Focusing, Convering Hole and Diverging Hole Collimators, Material design with regards to Cost, Geometric Efficiency and Resolution. Pinhole Collimator and its Adaptation in Gamma Camera. Fanbeam collimator, Slit collimator, Slit slat collimator, Collimator in 2D PET.

4. Probe systems **2 Lectures**
Thyroid uptake probe, basic components, system set-up and calibration, flat field collimator, iso-response curve and working distance. All qc parameter including iso-response curve, and working distance. Its significance or application in non imaging procedures

5. Rectilinear scanner: **2 Lectures**
Block diagram, principle of working, effect of scanning speed, dot factor, time constant, line spacing, film density, information density, photo recording display, contrast enhancement and clinical applications. Focal plane and depth of focus.

6. Gamma Camera: **5 Lectures**
Scintillation camera, Basic principles of gamma camera, collimators, NaI (T) detector, position determining circuits, Display. Gamma camera-computer interface- ADC/DAC. Correction Circuits. Criteria of Selection & installation of Gamma camera, Frontiers of Gamma Camera Technology, LSF, MTF, Avalanche photodiodes, CZT detectors.

7. Application of Computers in Nuclear Medicine **3 Lectures**

Image Acquisition Matrix, Byte Mode and Word Mode, Frame Mode Acquisition, List mode, Static, Dynamic and Gated Acquisition, Image Display methods, Image Perception and Analysis, Image Manipulations and Presentations, Background Correction Methods, Image Interpolation, Region of Interest Analysis, Time Activity Curves and General Filters and Normalization methods, Automated ROI's and Computational methods.

8. Single Photon Emission Computerized Tomography: 5 Lectures
Principles of Tomography, longitudinal and transverse or axial tomography, Theoretical aspects of image acquisition & reconstruction techniques, filters, artifacts in SPECT, effect of scatter & scatter correction, noise, role of collimators, rotating gamma camera, single or multiple detector devices, data collection, SPECT acquisition – step & shoot/continuous. Whole body SPECT. SPECT v/s planar camera, SPECT v/s other modalities (CT, MRI, Ultrasonography)

9. Positron Emission Tomography Equipment: 5 Lectures
Gamma camera for PET imaging. Dedicated and hybrid PET systems. Principles of PET imaging, detectors assembly, various corrections in PET, 2-D and 3-D acquisitions, performance of PET imagers, sensitivity, spatial resolution. PET Detectors, Attenuation correction, TOF concept, instrumentation, data collection, data correction, data storage, reconstruction, quality control, Performance characteristics, NECR, NEMA specifications, PET v/s SPECT, PET Protocols.

10. Multicrystal Gamma Camera and Intraoperative probes 2 Lectures
Emerging designs and considerations of Multicrystal Gamma Camera and Intraoperative probes. Its relevances in nuclear medicine, Discussions on Standards and Quality Control. Small animal imaging systems.

11. Overview of Whole body counting system: 1 Lecture
Whole body counting: principles of whole body counting, design of whole body counting system, stationary systems, single and multiple crystal systems, shadow shield geometry, moving systems, calibration of whole body system, clinical and other applications of whole body counters.

12. Medical Informatics: 2 Lectures
Image Formats, Concept of DICOM (Digital image communication in medicine) and DICOM-RT and etc, DICOM and interfile conversion software, Interfacing; TCP/IP protocols, PACS (Picture Archiving and Communication System); Telemedicine.

13. Biomedical Ultrasound 2 Lectures
Ultrasound generators, properties of ultrasound waves and its propagation in biological tissues, Pulse echo techniques, Scan types. Doppler principle.

14. Magnetic Resonance Imaging (MRI) 2 Lectures
Basic Magnetism, Physics of magnetic resonance, MRI equipment its advantage over CT / Ultrasound, – Image artifacts – MRI safety. Principal of FMRI (functional magnetic resonance imaging), MR spectroscopy, MRI contrast, Limitations and uses of MRI. Configuration of machines available, PET/MRI fusion problems and solutions.

15. Radiological Instrumentation - CT scanner 4 Lectures

Discovery - Production - Properties of X-rays, basic requirements for diagnostic tubes, Classification of tubes, Filters, Measurement of kV and mA, CT detectors, CT acquisition, CT reconstruction, CT attenuation correction, CT dose index, dose length product, Radiation dose, CT-PET fusion, Quality Control of CT, Scanner design, Spiral Computed Tomography, Difference between conventional single slice, multislice, spiral and electron beam CT. Comparison of patient radiation doses and effects of slice thickness.

16. **Advanced Molecular Imaging:** Optical,Molecular MR,PEM. 1 **Lecture**

01HLTH09A06-003-C

Clinical Nuclear Medicine Techniques

1. Non-imaging applications of radionuclides **4 Lectures**

^{51}Cr labeled RBC's for blood volume, red cell volume measurement, spleen uptake, red cell survival studies. Schilling's test using ^{58}Co/^{57}Co for vitamin B12 absorption, applications of ^{14}C radiorespirometry for H.Pylori ulcers, Ferrokinetic studies using radioisotopes of Iron.

Important: ***Common in all In-Vivo Techniques is a discussion on choice of radiopharmaceuticals and its dose, choice of equipment, imaging considerations, patient preparation & instruction, selection of imaging parameters, interventional approaches, quantitative data analysis, display, filming or its report generation.***

Clinical Nuclear Medicine Techniques in two parts

i) One by the technologists emphasizing the **technical part** and (ii) the other by the Clinical Staff.

2. Thyroid studies **3 Lectures**

Thyroid imaging and uptakes (^{99m}Tc and ^{131}I), Perchlorate discharge test, T_3/T_4 suppression test, TSH stimulation test. ^{131}I whole-body imaging. Post Therapy Scans.

3. Lung imaging studies **4 Lectures**

Ventilation lung imaging studies using gases (^{133}Xe, ^{81m}Kr), Inhalation imaging using aerosols, aerosols generators, mucociliary clearance, COPD, Pulmonary permeability using DTPA, perfusion imaging using MAA, Microsphere, and pulmonary embolism.

4. Liver-spleen imaging **2 Lectures**

Liver imaging for Diffuse and Focal liver diseases, Dynamic Liver studies, Quantitative methods for Hepatic Perfusion Index, Blood pool liver studies. portosystemic shunt evaluation by Per-rectal Scintigraphy.

5. Hepatobiliary imaging **3 Lectures**

Hepatobiliary imaging protocols, Neonatal hepatitis versus Biliary atresia, Gall bladder dynamic studies using IDA compounds. Deconvolution analysis, Hepatic Extraction Fraction, Interventional methods. Bile leak studies

6. Gastrointestinal studies **5 Lectures**

Conventional imaging modalities used for GI studies. Advantages and disadvantages of these modalities over scintigraphy Oesophageal transit time studies, Gastric oesophageal reflux, gastric emptying time, Duodeno-gastric reflux, Meckel's diverticulum imaging, GI bleeding with ^{99m}Tc-RBC, 99mTc-S.Collide.Advantages and disadvantages of each method

7. Cardiac studies **6 Lectures**

ECG ,First pass study (shunt detection), Importance of Electrocardiogram (ECG), gated blood pool study, MUGA, Ejection fraction,Wall motion analysis, Infarct avid imaging, Rest / Stress myocardial imaging, Gated SPECT, Pharmacological stress, Bulls Eye analysis, Severity scores. Use of ^{201}Tl, ^{18}FDG and $^{13}NH_3$ for cardiac studies.

8. Bone imaging **3 Lectures**

Routine bone (whole body and spot) imaging, bone flow study, quantitative bone scan-sacroiliac index, 3-phase bone scans, Bone SPECT. Bone imaging in Metabolic Disorders. MDP retention studies, ^{18}F-Fluoride Bone Scans.

9. Renal imaging studies **10 Lectures**

Standard Renogram, Diuretic renogram, Captopril renogram, Renal Perfusion analysis, Differential function, GFR estimation by Gates Method, Renal transplant studies, Background subtraction methods, Rutland Patlak-Plot, Plasma Sampling methods, Advantages and Disadvantages of various GFR estimation methods, Uretic reflux study, Interventional methods, Direct and indirect radionuclide cystography, Cortical Renal Scans using 99mTc-GHA &99mTc-DMSA,Differential function by Geometric Mean.

10. Brain imaging **3 Lectures**

Cerebral blood flow dynamic studies, Blood Brain Barrier imaging, Perfusion Imaging, Brain SPECT, Interventional methods, Cisternography, CSF leak,PET brain imaging.

11. Tumour Imaging: **2 Lectures**

^{18}F-FDG PET Scans for Oncologic Staging and Evaluation of Post therapy status. Imaging for Medulary Carcinoma of Thyroid, Neural Crest Tumours, Apoptotic Imaging. Post Therapy Scans. Organ specific(cold spot,hot spot),nonspecific(Ga-67 Citrate,201 Tl,MIBI,Tetrofosmine,FDG),Tumor type specific(131 I for papillary and follicular carcinoma,131ImIBG(adrenal cortex),NP59 for adrenal medulla,Mebro for hepatocellualar ca,Antibody(111In Oncoscint,99mTc CEA,111In Prostascint, 99mTc-Verluma, peptide (^{111}InSomatostatin,^{68}Ga DOTATATE).

12. Lymphoscintigraphy & Sentinel Node Scintigraphy **2 Lectures**

13. Infection and inflammation **2 Lectures**

Use of Labelled Leukocyte, ^{99m}Tc-Ciprofloxacin, ^{68}Gallium for detection of Infectious foci. Discussion of imaging preferences.

14. Salivary gland imaging **1 Lecture**

Imaging for parenchymal and obstructive diseases of salivary glands. Post Radiation Xerostomia evaluation.

15. Parathyroid Imaging **1 Lecture**

Dual isotope technique and Subtraction scans. ^{99m}Tc-MIBI wash out studies.

16. Bone marrow imaging **1 Lecture**

Imaging techniques for visualisation of Bone marrow infiltration

17. Lymphoscintigraphy & Sentinel Node Scitigraphy **2 Lectures**

Infrequently performed studies in Nuclear Medicine

18. Scrotal Imaging **1 Lecture**

19. Dacryoscintigraphy **1 Lecture**

20. Scintimammography **1 Lecture**

Early and Delayed Imaging. Special Positions and Restraining means.

21. Hysterosalphingography **1 Lecture**

22. Contrast Agents **2 Lectures**

Contrast media agents: Oral, IV – ionic/nonionic, Rectal, Intrathecal, Catheters, Types/indication/chemical makeup etc. Iodinated contrast materials, Characteristics of iodinated contrast materials, Water solubility and hydrophilicity, Osmolality, High osmolar contrast media (HOCM), Low osmolar contrast media (LOCM), Advantages of LOCM, Disadvantages of LOCM, Viscosity, Calcium binding, Iodine concentration, Adverse reactions. Substitution of barium based contrast instead of iodinated oral contrast, Indications for steroid premedication, Contraindications for steroid premedication.

23. Radiation protection in NM - Regulatory Aspects **8 Lectures**

Guidance level for diagnostic administration, misadministration and preventive measures, reporting of misadministration.

Layout of Nuclear Medicine Laboratory, Design of radiation labs, types of labs, Security of Sources and radioactive cautions signs and labels. The Atomic Energy Act, Rules issued under the Act, Surveillance procedures issued under the Rules, Notifications issued under RPR, 2004, AERB Safety Directive, Safety code for NM facility, Duties of RSO, Regulatory clearance-Approval of NM Lab, Physician & RSO, Regulatory consent, authorisation- for disposal of radioactive waste and safe transport of Radioactive materials. Radiation Safety Program, Radiation Safety Officer and duties of Radiation Safety Officer, Radiation Safety Committee, Responsibilities for Implementation of Basic Safety Standards Requirements, AERB Regulation Related to Medical Cyclotron and PET

Practicals

01HLTH09A-06-001-P

A. Practicals – Physics

1. To measure Half Value Layer of β and γ emitters and to measure the absorption coefficients of different materials with gamma rays and beta particles.
2. To study back scatter.
3. To determine the half life of a radioactive material.
4. To study the change in activity of a sample consisting of two independently decaying radioisotopes (or a mixture of isotopes)
5. To determine the plateau of GM tube and find out the dead time/ resolving time of GM counter.
6. To determine the efficiency of GM counter and find out the activity of the given unknown radioactive source.
7. Gamma ray spectrometry of ^{137}Cs with a single channel analyzer.
8. To find out the spectrum of energies emitted by a radioisotope by using gamma ray spectrometer. (e.g. ^{131}I)
9. To study the statistics of radioisotopic measurements and observe the effect of background on the counting statistics.
10. To determine the energy resolution of spectrometer
11. To study the energy linearity of given spectrometer
12. To observe gamma ray spectrum of the given two radionuclide sources (A and B) and identify composition of a tube containing mixture of these two radionuclide sources by evaluating scatter fraction.

13. To identify unknown radionuclide on the basis of its principal energy by using scintillation counter.
14. To study iso- response curve of Flat Field Collimator. To perform QC and calibration of uptake probe
15. To study the line spread function of a parallel hole collimator at various depths.
16. To perform Quality Control of Planar Gamma Camera and assess (intrinsic/extrinsic) uniformity, resolution by 4 quadrant bar phantom and assessment of linearity.
17. To study the counting errors originating from sample geometry and determine Critical Volume for counting in a well counter.
18. To estimate pipetting error and Estimation of Unknown Volume by Dilution principle
19. To perform Tomography with Jaszczak Phantom and evaluate the results.
20. Gamma Spectrometry with HPGe detector :Energy calibration,Efficiency and Identification of Unknown radionuclides
21. Biodistribution study of radiopharmaceuticals.

01HLTH09A06-002-P

Practicals - Radiopharmaceutical & *In-vitro* Techniques

1. Perform Radioimmunoassay & IRMA.
2. To perform quality control of Dose Calibrator
3. Radiopharmacy procedure: Elution of generators and Determination of Impurities (a) Radionuclidic (^{99}Mo breakthrough in ^{99m}Tc), (b) Chemical (Alumina Breakthrough) and (c) Radiochemical (TcO4 paper chromatography)
4. Q.C. of radiopharmaceuticals by paper chromatography & to determine the Rf of ^{99m}Tc and the given labeled compounds by using ascending chromatography including Rapid determination of radiochemical purity of radiopharmaceuticals.
5. QC of ^{68}Ga and ^{177}Lu labeled radiopharmaceuticals by ITLC and paper chromatography
6. Q.C. of PET radiopharmaceuticals by TLC scanner and HPLC
7. Q.C. of radiopharmaceuticals by paper chromatography & to determine the Rf of ^{99m}Tc and the given labeled compounds by using ascending chromatography.
8. Rapid determination of radiochemical purity of radiopharmaceuticals..
9. Biodistribution study of radiopharmaceuticals.

(*Demonstration*)....

1. Quality Controls of SPECT/CT system (once SPECT/CT is procured)
2. Quality Controls of PET/CT system (Uniformity, Attenuation correction, Partial volume effect, Co-registration evaluation of SPECT/CT & PET/CT, SUV measurements, CT QC)
3. Biological Quality control (a) ST (b) BET,
4. CPCR (Cardio-pulmonary & cerebral resuscitation
5. Visit to BARC(Reactor, whole body counter,TLD reader,biodosimetry),
6. Visit to BRIT.
7. Visit to NM centres to see special studies and instruments.

Apprentice Program:

Several contact hours (3 years of Apprentice in various areas of Nuclear Medicine @5hrs per day in the last last 2.5 years)

01HLTH09A06-004-C

Clinical Nuclear Medicine

1. **CNS system** **10 Lectures**
BRAIN PERFUSION AND METÀBOLISM: Evaluation of cerebrovascular disease, Presurgical localization of epileptogenic foci, Dementia, Traumatic brain injury, Inflammation, Assessment of brain death
DOPAMINE TRANSPORTER: Differentiate neurodegenerative parkinsonian syndromes from patients with parkinsonian symptoms unrelated tneurodegeneration (essential tremor, vascular parkinsonism, side effects of neuroleptica), Early diagnosis of Parkinsonian syndroms
BRAIN METABOLISM: Identify the grade of malignancy of brain tumors, suspected relapse of brain tumor, Assess transformation of low-grade glioma to high-grade
CISTERNOGRAPHY AND CSF LEAK: Hydrocephalus patients with normal-pressure hydrocephalus to determine whether the patient might benefit from CFS shunting or not. Shunt patency, Cerebrospinal fluid leak.

2. **Skeletal system** **7 Lectures**
MDP AND 18F BONE SCAN: Neoplastic disease, Post-traumatic assessment, Arthritides, Reflex sympathetic dystrophy, Osteomyelitis, Unexplained bone pain

3. **Cardiovascular system** **10 Lectures**
MYOCARDIAL PERFUSION: Depict the distribution of blood flow in the myocardium at rest and or during stress to assess myocardial ischemia and scar.
MYOCARDIAL VIABILITY: Identify myocardium with potentially reversible contractile dysfunction in patients with chronic CAD
Equilibrium radionuclide angiography: Measurement of left and right, diastolic and systolic, global and regional ventricular function. The most commonly measured parameter being the Left ventricular ejection fraction (LVEF)

4. **Respiratory system** **6 Lectures**
LUNG SCINTIGRAPHY: Pulmonary embolism diagnosis, Quantify regional lung function prior to surgery or radiation therapy, Evaluate cystic fibrosis.

5. **Gastrointestinal system** **8 Lectures**
SALIVARY GLAND SCINTIGRAPHY: Sjögren's disease, Pleomorphic adenoma, Wharton tumour, Adenoid cyctic carcinoma, Mucoepidermoid carcinoma
OESOPHAGEAL TRANSIT SCINTIGRAPHY: Achalasia, Diffuse esophageal spasm, Scleroderma, Diabetes mellitus
GASTRO-ESOPHAGEAL REFLUX SCINTIGRAPHY: Gastro-esophageal reflux evaluation IN GERD
GASTRIC EMPTYING SCINTIGRAPHY: Dumping syndromes, Gastroparesis (diabetic, post-surgical or idiopathic), Functional dyspepsia, Pyloric stenosis
GASTROINTESTINAL BLEEDING SCINTIGRAPHY: Lower or upper gastrointestinal tract bleeding assessment
MECKEL'S DIVERTICULUM SCINTIGRAPHY: Assesment of ectopic gastric mucosa (Meckel's diverticulum)

6. **Hepatobiliary system** **7 Lectures**

HEPATOBILIARY SYSTEM: Evaluating hepatic biliary system function and patency. Calculation of gallbladder ejection fraction (GBEF). Assessment of biliary enteric bypass (Kasai procedure). Bile leakage, Biliary atresia, Sphincter of Oddi dysfunction. Enterogastric (duodeno-gastric) reflux assessment. Chronic cholecystitis. Hepatic perfusion in planning selective internal radiation or drug therapy in the liver tumors.

7. **Nephro-urinary and genital system** **8 Lectures**

ASSESSMENT OF RENAL FUNCTION AND TRANSIT: Estimation of differential renal function, Assessment of renal and pyelocalyceal transits, Anterograde (descending or direct) radionuclide cystogram

RENAL CORTICAL IMAGING: Estimation of differential renal function, Assessment of renal and pyelocalyceal transits, Anterograde (descending or direct) radionuclide cystogram

RETROGRADE (ASCENDING OR DIRECT) RADIONUCLIDE CYSTOGRAM: Detection (during feeling and voiding) and quantification of vesicoureteral reflux

CLEARANCE METHODS (PLASMA AND URINARY METHODS):

Measurement of glomerular filtration rate (GFR) with 51Cr-EDTA, 99mTc-DTPA

Estimation of the plasma renal flow rate (ERPF) with 99mTc EC/MAG3.

8. **Endocrine system** **10 Lectures**

THYROID IMAGING AND FUNCTION:Evaluation of thyroid nodules (mainly in low TSH state) and goiter, Locating ectopic thyroid tissue, Determining the function of thyroglossal cyst

131I iodine: Planar imaging thyroid and/or whole body scan additional SPECT/CT when indicated

PARATHYROID LOCATION IN HYPERPARATHYROIDISM: Planar imaging of neck and mediastinum (with either co-registration or subtraction when using either 99mTc pertechnetate or 123I for double radionuclide technique) SPECT or SPECT/CT recommended. PET/CT for 11C-Methionine

ADRENAL MEDULLA TUMOR LOCATION: Pheochromocytoma, Paraganglioma, Neuroblastoma

ADRENAL CORTEX IMAGING:Cushing's syndrome, Primary aldosteronism, Hyperandrogenism

9. **Infection and Inflammation** **5 Lectures**

Osteomyelitis, Infected Joint Prosthesis, Inflammatory Bowel Disease, Pulmonary Infection

10. **Radionuclide therapy** **16 Lectures**

Thyroid disease, Neurendocrine Tumor, Neuroblastoma, Skeleton and Liver lesions, Lymphoma

11. **Oncology: Positron Emission Tomography** **16 Lectures**

Breast, Lung, Lymphoma, Melanoma, Prostate, Head and neck cancer, Colonic cancer etc

12. **Molecular Imaging and Advanced Imaging** **8 Lectures**

Hypoxia-F MISO, Angiogenesis- RGD, Hormone Receptors- FES, Apoptosis- peptide annexin V

होमी भाभा राष्ट्रीय संस्थान
Homi Bhabha National Institute

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS

OF

MD NUCLEAR MEDICINE

Under TMC
(Program code: HLTH09A06)

GUIDELINES FOR COMPETENCY BASED POSTGRADUATE TRAINING PROGRAMME FOR MD IN NUCLEAR MEDICINE

(MCI-2011-2012 FORMAT)

Preamble:

Nuclear medicine is a multi-disciplinary practice and the training of medical doctors is critical to the performance of a Nuclear Medicine department. Successful trainees are awarded a final certificate, degree or diploma that is recognized by the government, local health authority and hospital employer as an assurance of specialist competence in Nuclear Medicine. Post graduate training programme in Nuclear Medicine consists of an integrated training course of three years duration and would enable the candidate to practice nuclear medicine safely.

The **goal** of the programme is to enable the candidates to run Nuclear Medicine practice, teaching and research independently and fulfill the manpower needs of ever expanding new branch of diagnostic and therapeutic medicine.

SPECIFIC LEARNING OBJECTIVES

At the end of the training programme, the student should have achieved the following competencies:

1. Should have knowledge of basic principles of radiation physics and its subsequent applications.
2. Should have knowledge of radiation protection principles.
3. Safe handling of radionuclides and their disposal.
4. Should have knowledge of International Commission for Radiological Protection (ICRP) and National Regulatory guidelines pertaining to nuclear medicine practice.
5. Should have knowledge of diagnostic tests, interpretation of results and pitfalls.

6. Good clinical practice of therapeutic nuclear medicine and dosimetry.
7. Should be able to conduct clinical research and write a thesis/dissertation under supervision.
8. Should develop good working relationship with user specialties and handling inter-specialty referrals

CURRICULUM

Post Graduate Training will consist of:

Theoretical Training and Practical Training

SUBJECT SPECIFIC THEORETICAL COMPETENCIES

This part of the curriculum may be divided into the following four parts:

1. Basic Science aspects of Radiation Physics and its application to diagnostic/ therapeutic Nuclear Medicine
2. Diagnostic Nuclear Medicine and its applications
3. Therapeutic Nuclear Medicine and its applications
4. Recent Advances in Nuclear Medicine

09HLTH09A06-001-C: Basic Science related to Nuclear Medicine

1.1 Radiation Physics and Instrumentation

a. Structure of atom, Natural and artificial radioactivity.
b. Modes of Radioactive decay.
c. Interaction of radiation with matter.
d. Principles of radiation detection and detectors.
e. Basic principles of production of radionuclides by reactors and cyclotrons.
f. Nuclear Medicine Instrumentation including Gamma Cameras, Single Photon Computed Tomography (SPECT), Positron Emission Tomography (PET), Hybrid Imaging Systems like PET/CT and PET/MR
g. Counting Systems: Well counters, liquid scintillation counters, spectrometers, Radioactive Iodine Uptake (RAIU) probe and radiation monitoring devices.

h. Quality control of Nuclear Instruments, as in (f and g).
i. Collimation of radiation detectors and the characteristics of various collimators, their response to point, line and plane sources.
j. Electronic instruments, such as pulse amplifiers, pulse height analyzer, count rate meters and computer interfaces including gating systems.
k. Software and hardware fusion technology, Digital Imaging and Communications in Medicine (DICOM) technology and Picture Archiving and Communication System (PACS).

1.2 Mathematics, Statistics and Computer Sciences.

a. Basic Mathematical concepts, counting statistics, probability distribution, Baysian and McNemmar statistics, parametric and non-parametric statistics.
b. Compartmental analysis and mathematical models of physiologic systems.
c. Basic aspects of computer structure, function and programming.
d. Computer applications with emphasis on digital image acquisition, analysis, processing and enhancement, tomographic reconstruction, display and recordings of findings.
e. Fundamental of filters, their applications and uses.

1.3 Radiation Biology

a. The biological effects of radiation exposure with emphasis on the effects of low level exposure.
b. Methods of reducing unnecessary radiation exposure to patients, personnel and environment.
c. Dosimetry, MIRD, reference man, techniques for estimation

d. ICRP recommendations and their amendments from time to time and other international recommendations, environmental regulations. regarding limits of radiation exposure, handling of radioactive patients, transport of radioactivity material and disposal of radioactive wastes.
e. The diagnosis, evaluation and treatment of radiation over exposure in any form.

09HLTH09A06-002-C: Diagnostic Nuclear Medicine

2.1 Radiopharmaceuticals

The chemical, physical and biological properties of radiopharmaceuticals used in Nuclear Medicine investigations; production, Quality Control and Regulations of hospital based-Nuclear Pharmacy.

The emphasis will be on:

a. Physical and chemical characteristics of radionuclide used in diagnostic Nuclear Medicine
b. Criteria for selection of radionuclide for diagnostic purposes
c. Biological behavior of radiopharmaceuticals
d. Quality control
e. Mechanism of localization
f. Positron Emitting radionuclides, target reactions and their radiopharmaceuticals chemistry, various synthetic modules.
g. Specific topics on Radiopharmaceuticals: Bone seeking, hepatobiliary, brain and cerebrospinal fluid (CSF), renal, thyroid, parathyroid, infection imaging, Tumor Seeking, cardiac imaging etc.
h. Good Manufacturing Practice (GMP) and Laws pertaining to in-house manufacturing of Radiopharmaceuticals.
i. Radiopharmaceuticals for Research.

2.2 *In vivo* Diagnostic Imaging

a. General clinical Indications for organ imaging; normal and altered anatomy, physiology, biochemistry and metabolism of various organs. Must learn the technical aspects of performing the procedure including proper patient preparation and patient management before, during and after the procedure.

b. *In vivo* imaging and/or functional studies including brain Single Photon Emission Computed Tomography (SPECT), tracing of cerebrospinal fluid pathways, thyroid imaging, salivary glands, lungs, heart, gastrointestinal, hepatobiliary system, spleen, kidney, adrenal, bone and joints, bone marrow evaluation etc.

c. The use of physiologic gating techniques for functional studies and patient monitoring during intervention, both physical exercise and using pharmacological stress agents

d. Cellular kinetics, absorption and excretion analysis, nuclear hematology and metabolic balance studies using radiotracers.

e. Comparative analysis of Nuclear Medicine procedures with X-ray, Ultrasound, Echo, MRI, CT and angiography etc.

f. Nuclear Cardiology: Stress and redistribution studies using $Thallium^{201}$ and other myocardial perfusion agents; myocardial viability, Gated SPECT studies, etc.

g. Positron Emission Tomography (PET): All indications for use of PET imaging in oncology, cardiology, neurosciences and psychiatric disorders.

h. hybrid imaging with CT & MRI –protocol,interpretation & incremental value

i. IV & oral contrast for CT- techniques, safety and treatment of adverse reaction

2.3 *In vitro* Studies

a. Principles of Radioimmunoassay (RIA), quality control and data analysis for various hormones and drugs assays.
b. Glomerular Filtration Rate (GFR) estimation, Red Cell Survival, Red Cell Mass using chromium and C^{14} urea Breath test.

09HLTH09A06-003-C: Therapeutic Nuclear Medicine

3.1 Principles of Internal Dosimetry: Calculation of the radiation dose from internally administered radionuclide

3.2 Characteristics of Radionuclides/Radiopharmaceuticals for radionuclide therapy

3.3 Radiation protection in therapeutic set up: Design of Isolation ward as per the norms of Atomic Energy Regulatory Board (AERB)

3.4 Principles of OPD and in-door therapy administration

3.5 Therapy in thyroid disorders; benign thyroid diseases, aetiology of hyperthyroidism, various modalities of treatment and follow up strategy, long-term outcome and various national and international regulations pertaining to therapeutic administration of radionuclides.

Aetiopathology, classification and diagnosis of thyroid malignancy; various modalities of treatment and follow-up strategy, long-term outcome and various national and international regulations pertaining to therapeutic administration of radionuclides.

3.6 Bone pain palliation using various radionuclides such as P^{32}, Sr^{89}, Sm^{153}, Lu^{177} etc.

3.7 Radiosynevectomy

3.8 Radiopeptide therapy and Radioconjugate therapy

3.9 Radioimmunotherapy

3.10 Locoregional internal radiation therapy

3.11 Research agents in radionuclide therapy

09HLTH09A06-004-C: Recent Advances in Nuclear Medicine

Covering all aspects of the following areas:

4.1 Instrumentation

4.2 Radiopharmaceuticals

4.3 Diagnostic procedures

4.4 Therapeutic procedures

SUBJECT SPECIFIC PRACTICE BASED OR PRACTICAL COMPETENCIES

Practical Training:

09HLTH09A06-001-P: Basic Sciences Experiment:

1. Practicals related to Physics, Instrumentation and its quality Control.
2. Preparation of radiopharmaceuticals and their quality control.
3. Concept of contamination and detection.
4. Characterization of unknown isotopes.
5. Management of spillage.

09HLTH09A06-002-P: Clinical Experiment:

1. GFR Estimation.
2. Esophageal transit time.
3. Gastric emptying time.
4. Renal transplant evaluation.
5. Determination of Ejection Fraction and RWMA (wall motion).

TEACHING AND LEARNING METHODS

Theoretical Training (General Programme):

1. Didactic lectures in physics related to Nuclear Medicine, radiopharmacy, radioisotopes techniques, instrumentation, data processing and quality control.
2. Participation in the daily routine work of the department including work rounds of patients admitted for radionuclide therapy.
3. Presentation of cases in the reporting sessions of the department
4. Active participation in the combined clinical meetings with other departments for case discussions.
5. Apprenticeship in :
6. Radio-diagnosis *4months [CT 3 mo and MR 1 mo]*
7. Cardiac stress lab/i*ccu* *01 months*
8. Regular participation in department journal clubs, Seminars and other periodical CME programmes.
9. Participation in the Seminars and CME programme of allied departments.

The year-wise schedule of training would be as follows:

Year 1

(a) Scientific principles:

- Basic physics and mathematics,
- Instrumentation,
- Principles of computing,
- Basic radiation biology and radiation protection,
- Basic radiopharmacy and radiochemistry,
- Principles of tracer technology.

(b) Clinical Nuclear Medicine:

- **Diagnostic**: Normal and abnormal appearances of images, mode of pharmaceutical uptake; normal variants and common artifacts in bone, heart, lung, kidney, brain, thyroid, tumour and infection images.
- Principles of radiology including ultrasound, computerized tomography and magnetic resonance imaging
- **Therapeutic**: Basic principles of radionuclide therapy; treatment of hyperthyroidism, thyroid cancer and metastatic bone pain.
- **Principles of radiation protection**: ALARA (as low as reasonably achievable) ALARP (as low as reasonably practicable).

Year 2

(a) Requirements of Year 1 in greater depth:

- Tracer kinetics;
- Computing and image processing;
- Radiobiology including the biological effects of high and low level radiation;
- Linear hypothesis and the threshold hypothesis of the biological response to low level radiation;
- The effective dose equivalent and the calculation of radiation dose from radiopharmaceuticals.

(b) Radiopharmacy:

- Properties of commonly used diagnostic and therapeutic radiopharmaceuticals;
- Production of radionuclides by reactors, cyclotrons and radionuclide generators;
- Quality assurance and quality control of radiopharmaceuticals.

Year 3

(a) Requirements of Year 2 in greater depth:

- Advanced, computerized tomography and magnetic resonance imaging.

- Co-registration of nuclear medicine images and those from other imaging techniques.
- Diagnostic: special investigations in cardiology, lung disease, gastroenterology, hepato-biliary diseases, nephro-urology, neurology and psychiatry, endocrinology, haematology, oncology and infection.

(b) Therapeutic applications:

- Treatment of bone metastases, neural crest tumors, polycythemia, solid malignancies;
- Use of radionuclide monoclonal antibodies and radionuclide labeled peptides for tumor therapy.

(c) Further practice and experience of work accomplished in years 1 to 3:

- Legal and regulatory requirements,
- Audit,
- Departmental management,
- Research techniques and evaluation,
- Teaching and training.

Practical training

Post graduate trainees are obliged to play an active 'in-service' role in the practice of Nuclear Medicine to familiarize themselves with all the techniques required as a nuclear medicine practitioner, such as:

- Protocols of *in vivo* and therapeutic procedures;
- Data acquisition and processing with various equipments, quality control of instruments and labeled agents;
- Interventional procedures, including physiological, pharmacological, and mental stress for diagnostic application, and all therapeutic interventions;
- *In vitro* protocols and procedures, if appropriate.

Since trainees will take on the responsibilities of a nuclear physician, they must pass a qualifying test that covers both theoretical knowledge and practical abilities in the daily practice of nuclear medicine. A board of examiners selected by the university or similar form of authority will award a certificate to successful trainees.

SUGGESTED SCHEDULE FOR POST-GRADUATE TRAINING

Subject	Duration (hrs)	Suggested content of teaching	Recommended practice and time period
Nuclear physics	40	Decay features, spectrum, Radioisotope production & detection	Reactor-cyclotron generator, Radioisotope identification (5-7 days)
Radiochemistry	40	Labelling, technical design & quality control, interaction, kinetics	Synthesis, labelling, quality control, animal test (3-4 wks)
Radiobiology	40	Dosimetry, bio-modelling, tracer technology, radiation protection	Dosage-effect, molecular biology, radiation injury (4 wks)
Instrumentation	100	Scintillating camera, SPECT, imaging procedure, computer	Daily operation and quality control, trouble shooting (4 wks)
Related fields	50	Medical imaging modalities, epidemiology, statistics	Short round (6 wks)
Clinical use	240-300	Cardiology, neurology, GI tract, respiratory, endocrine, bones, haematology, tumour and infection	Clinical practice, image interpretation etc. (12-18 months)
In-vitro use	10	RAIU, RBC mass, survival, hypersplenism GFR measurements	RAIU practice (2 wks) GFR estimation (4 weeks)
Therapy	60	RIT, palliation,	Ward duty (3-4 months)

Posting in CT scan and MRI rooms is recommended as an aid to PET Scan imaging.

ASSESSMENT

FORMATIVE ASSESSMENT, ie., during the training would include:

Case presentation,
Case work-up,
Case handling/management,
Presentation at seminars and journal clubs,
Understanding the principles of procedures to be routinely evaluated by Faculty members, during each posting.
Continuous assessment is needed.
A logbook should be maintained and assessed.

END ASSESSMENT, ie., namely assessment at the end of the training

Each training programme should contain a standard against which the progress of the trainee can be assessed. For each year of training, each element of the syllabus, appropriate for that year of training should be available to the trainee. The assessor should preferably be external to the department that is providing the training, such as a consultant in nuclear medicine from another hospital or other senior person. The assessment may take the form of an interview, a written paper, an essay, a set of multiple-choice questions, or an oral examination of displayed images of various nuclear medicine techniques in clinical practice. Continuous assessment is another alternative. At the end of each year, internal assessment should carry a score that indicates how the candidate has progressed against the set target.

1. Thesis :

Each candidate has to submit a thesis which should be accepted by the Board of Examiners before appearing in the final examination.

Thesis Evaluation:

The thesis should reflect substantial work for the advancement of scientific knowledge, design or development or applied work. It should show competence in critical analysis of scientific data as well as through familiarity with background literature.

I. The evaluation of the thesis will consist of :

Thesis is to be submitted by each candidate at least 6 months before the date of commencement of the theory examination. The thesis shall be examined by a minimum of three examiners, one internal and two external examiners, who shall not be the examiners for theory and practical; on the acceptance of the thesis by two examiners, the candidate shall appear for the final examination.

a) Oral examination of the candidate on the thesis at the time of clinical and practical examinations.

II. In his/her report, each examiner should highlight the salient features of the thesis and make a clear recommendation regarding its acceptance or rejection for MD Degree. If one of the examiners has given a definite recommendation against the award of the degree, reference to a third examiner will be made. If the report from the third examiner is positive, the oral examination will be held. If his/her report is negative, the thesis will be rejected.

III. If two examiners recommended against the award of the degree, the thesis will be rejected.

Reports of Examiners:

1. Each examiner will be requested to send his report within 02 months of the receipt of the thesis to the registrar. The reports must contain a critical evaluation of the thesis and a clear recommendation as to whether it has attained the standard of MD or not.
2. In case the examiners are unable to make a definite recommendation they should indicate one of the following alternatives:
   a) Minor revisions which does not involve retyping or binding of the thesis.
   b) Major revisions involving rewriting of one or more sections but not involving additional research.
   c) Rewriting the thesis; if the candidate's work justifies another opportunity being given to him to do further research and rewriting the thesis (this will be treated as a new examination).

2. Theory papers:

There will be 4 theory papers:

Paper I: Basic Sciences related to Nuclear Medicine
Paper II: Diagnostic Nuclear Medicine
Paper III: Therapeutic Nuclear Medicine
Paper IV: Recent advances in Nuclear Medicine

3. Practicals

Final Clinical & Practical Examination: - Total 300 marks
There shall be two internal and two external examiners.
There shall be:

1. One long case and two short cases. - 100 marks

2. Two practicals consisting of one in basic science and one in clinical science. - 70 marks
3. Spots - 30 marks
4. viva-voce & scan reading - 100 marks

SYLLABUS

OF

MD PALLIATIVE MEDICINE

Under TMC

(Program code: HLTH09A07)

CURICULLAM OF MD (PALLIATIVE MEDICINE)

MD in Palliative Medicine specialty training will consist of core and higher specialty training. Core training provides the doctor:

09HLTH09A07-001-C Cognitive Domain

General Principles

- Definitions of: palliative care; general palliative care; specialist palliative care; hospice; palliative medicine; supportive care, termainl illness .
- Re-adaptation and rehabilitation.
- Societal expectations and perceptions in progressing and advanced disease, death.
- Differing concepts of what constitutes quality of life (including measurement) and a good death.
- Describe the evolving nature of palliative care over the course of an illness, including integration with active treatment, and the significance of transition points
- Demonstrate an understanding of palliative care as a generic skill and duty of all healthcare professionals; and the need for appropriate inter professional communication
- Demonstrate appropriate communication skills, breaking news and breaking bad news
- Demonstrate an awareness of the range of palliative care services available
- Discuss the history, progress and place of Palliative Medicine.
- Discuss the advantages, disadvantages and relevance of different models of palliative care in the

Indian Context:

- Hospital based services , Hospices, Home visit programmes ,National Rural Health Mission and other Community participation
- Describe the importance of Teamwork, Networking in Palliative Care

Basic sciences

- Describe the anatomical, physiologic and biochemical basis of pain including pain pathways, receptors, neurotransmitters and central sensitization.

- Anatomic and physiologic pathways and neurotransmitters involved in emesis.
- Understand the patho-physiologic basis of symptoms like constipation, malignant bowel obstruction, spinal cord compression, raised intracranial tension etc
- Discuss the pharmacology, pharmacokinetics, pharmaco-economics and drug interactions relevant to Palliative Care

Physical Care

- Initial assessment - detailed history and examination;
- Judgment of benefits and burdens of investigations,
- Patho-physiology of a symptom (due to concurrent disorders and treatment related as well as cancer related aetiology)
- Treatments options, non intervention.
- Management of adverse effects of treatment
- Need for regular review of symptom response
- Methods of assessment of symptom response
- Management of intractable symptoms – recognition and support for patients,
- Need for, and skills in reassessment and review.
- Anticipation and pre-emption of problems
- Recognition of transition points during course of illness.
- Recognition of dying process.
- Crisis management.
- Shared care with other specialties – benefits, difficulties, facilitation

Psycho-social responses to illness

At the end of the course, the student will be able to:

- Describe the psychological responses to bad news and discuss the role of coping mechanisms
- Describe the nature, stages and variations of grief
- Demonstrate an understanding of when grief becomes abnormal or complicated requiring intervention
- Describe theories of bereavement including the process of grieving, adjustment to loss and the social model of grief
- Describe the responses of children at different stages of grief and bereavement.
- Epidemiological impact of bereavement
- Risk factors for adverse outcomes of bereavement
- Discuss the difference between sadness and clinical depression
- Describe the different responses and emotions expressed by patients and caregivers, including fear, anxiety, guilt, anger, sadness and despair
- Identify psychological responses as a source of additional problems

- for patient and family and as potentially obstructing the goals of care.

- Deal with
  - Anger and strong emotions
  - Anxious preoccupation
  - Transference
  - Collusion and conspiracy of silence
  - Denial
- Demonstrate an awareness that hope is important and give hope appropriate to the stage of the illness
- Demonstrate an awareness of other disciplines who could help patients to deal with psychological issues
- Demonstrate the ability to recognize unhelpful and potentially harmful psychological responses
- Understand the impact of insensitive delivery of bad news
- List potentially therapeutic interventions: psychological techniques, drug treatment and creative therapies including behavioural therapy, counseling,
- Demonstrate strategies for dealing with difficult questions or situations including uncertainty and prognosis
- Counselling for patients with HIV and their families
- Demonstrate an awareness of the importance of good communication between team members to ensure patients receive a consistent message
- Recognize the importance of documentation of all input with patients and families to ensure good communication with all team members
- Demonstrate awareness of
  - The ill person in relation to his/her family, work and social circumstances
  - The impact of illness on interpersonal relationships
  - Impact of illness on body image, and role
  - Understanding of the concepts of resonance, family scripts, homeostasis in
  - families and the impact of illness and loss on the family system
  - Awareness of transference and counter-transference in professional
  - relationships with patients and family members
- Assess the response to illness and expectations among family members
- When and how to use family meetings
- Ways to accommodate needs of partners and families in provision of palliative care in both an inpatient unit or home setting
- Palliative care provision in relation to the homeless
  - Illness in people with dementia or pre-existing psychological or psychiatric
  - problems
  - Demonstrate an awareness of ways in which bereaved families could be supported economically
  - Accessing benefits, grants and allowances available to patients and families
- The role of the social worker and/or welfare benefits officer
- The financial implications of treatment and pharmaco-economics
- Discuss the importance of personal values and belief systems, and how these influence professional judgments and behaviours

- Recognize and manage the emotional and psychological impact of palliative care on oneself , the team and colleagues
- Discuss what makes a team work well and how to recognize when a team is struggling
- Demonstrate an awareness of healthy strategies for dealing with conflict among colleagues
- Demonstrate self awareness
- Awareness of own skills and limitations, and effect of personal loss or
- difficulties
- Ability to ask for help or hand over to others where necessary
- Potential sources of conflict in the doctor-patient relationship and how to deal with these including:
  - Over-involvement
  - Personal identification
  - Negative feelings/personality clash
  - Demands which cannot be met
  - Recognition and management of the emotional and psychological impact of
  - palliative care on oneself, the team and other colleagues
  - Being a supportive colleague to other members of staff
  - Recognition of ways staff support can be offered/co-ordinated.
  - Discuss the importance of not imposing personal beliefs and attitudes, or those of the team, on patients or their families
- Understand the importance of life review and restoration of dignity as a means of spiritual support
- Discuss the distinction between an individual's spiritual and religious needs
- Knowledge of the major cultural and religious practices that relate to death and bereavement.
- Remain present with patients as they journey through spiritual and existential distress

Spiritual Care

- Ability to distinguish between an individual's spiritual and religious needs
- Ability to elicit spiritual concerns appropriately as part of assessment
- Spirituality issues in relation to life-threatening physical illness and the role of spiritual care
- Ability to acknowledge and respond to spiritual distress, including referral to others
- Knowledge of pastoral systems within different religious groups and work with their representatives within the multidisciplinary team
- Knowledge of the major cultural and religious practices which relate to medical practice, dying and bereavement.

Culture, language, religion and spirituality

- Recognition of cultural influences on the meaning of illness for patient and

family
- Acknowledgement and accommodation of differences in belief and practice to ensure thorough assessment and acceptable care
- Awareness of personal beliefs and attitudes and the importance of not imposing these on others
- Ability to recognise and deal with conflicts of beliefs and values within the Team

SPECIFIC DISEASE PROCESSES:

Non communicable diseases

- Understand the pathological process and principles of management of Non-communicable diseases, including
  - End-stage lung disease
  - End-stage liver disease
  - End-stage renal disease
  - End-stage heart disease
  - End-stage metabolic diseases including diabetes
  - Other non-communicable diseases
  - Cancer, including principles, practices and problems associated with the principles of cancer management.
  - The presentation, paths of spread and current management of all major malignancies.
  - Radiotherapy
  - Chemotherapy
  - Surgery
  - Hormone treatment
  - Immunotherapy, hormone therapy, drugs, physical therapies,
  - Psychological interventions, complementary therapies).

Communicable diseases

- Understand the pathological process and principles of management of Communicable diseases
- HIV-AIDS, including principles and problems associated with anti-retroviral therapy (ART)
- Other communicable diseases

SPECIFIC SYMPTOMS AND THEIR MANAGEMENT

Pain

At the end of the course, the student should be able to:

- Assess pain systematically (Nature, Site, Severity, Radiation, Palliating and provoking factors, temporal factors and meaning of the pain for the patient)
- Identify common pain syndromes
- Describe the WHO analgesic ladder and identify its key components
- Discuss the relative benefits/ indications/ contra-indications of different analgesics
- Discuss the role of adjuvant analgesics

- Identify physical, psychological, social and spiritual factors influencing pain
- Understand the relevance of non-drug measures in pain management
- Enumerate steps towards management of refractory pain

Gastrointestinal symptoms

- Evaluate and manage common GI symptoms including nausea, vomiting, constipation, anorexia, bowel obstruction, hiccups, diarrhea, ascites, dysphagia and jaundice.
- Appropriate use of nasogastric tube
- Alternative methods of nutrition and hydration
- Give nutritional advice on end-of-life situation
- Understand the problems of force-feeding
- Understand the role of role of surgical procedures, GI interventions e.g stenting, NJ feed, feeding Gastrostomy and Jejunostomy.
- Understand stoma management in ostomies
- Liver failure

Cardio-respiratory symptoms

- Enumerate the common causes of breathlessness, cough, haemoptysis and orthopnoea
- Assess and manage
    - pleural and pericardial effusions
    - stridor,
    - superior venacaval obstruction
- Understand appropriate vs inappropriate use of oxygen and invasive ventilation
- Use opioids in dyspnoea
- Understand and manage terminal respiratory
- Understand breathing techniques as a therapeutic tool
- Understand the relevance of plurodesis
- Understand Prevention and management of pulmonary embolism
- COPD and common respiratory disorders
- Thromboembolic disease
- Ischaemic heart disease, heart failure, arrhythmias, hypotension
- Peripheral vascular disease

Genitourinary symptoms

- Manage vaginal discharge and bleeding per vaginum.
- Renal failure
- Diagnose rectovaginal, rectovesical and vesicovaginal fistulae, and understand indications for surgery
- Diagnose and manage bladder spasms
- Manage urgency and dysuria/anuria
- Understand the advantages and disadvantages of various methods of management of urinary retention and incontinence including
- Identify and manage issues related to sexuality

Neurological symptoms

- Early diagnosis of spinal cord compression and appropriate action
- Peripheral neuropathy
- Autonomic neuropathy
- Manage
- Raised intracranial pressure,
- Seizures,
- Delirium
- Non –invasive ventilation

Psychiatric Manifestation

- Diagnose And Manage The Following Conditions Within The Domain Of Palliative Medicine
- Depression,
- Dementia
- Anxiety,
- Panic,
- Confusional States,
- Insomnia,
- Hallucinations
- Pre-Existing Drug Dependance

Oedema

- Describe the causes, prevention and management of different types of oedema
- Diagnose and manage lymphoedema
- Diagnose and manage deep vein thrombosis,
- Diagnose and manage acute inflammatory episodes and lymphorrhoea
- Bandaging
- Use of compression garments

Other symptoms

Diagnose and plan management of

- Pathologic fractures, osteoporosis
- Itching,
- Pressure sores,
- Fungating wounds,
- Malodour,
- Candidiasis,
- Sore mouth,
- Anaemia and Fatigue
- Infections and infection control measures
- Diabetes mellitus
- Pre-existing chronic pain.
- Hyper and hypothyroidism, adrenal failure, pituitary failure
- Dermatological problems
- Anxiety and depression, psychoses

Metabolic disorders

- Assess and manage
- hypercalcemia
- hyponatremia
- SIADH
- hypokalemia
- hypoglycemia
- dehydration

Rehabilitation

- Principles of rehabilitation related to illnesses with gradually increasing disability
- Concept of maintenance of function through exercise and therapies
- Recognition of changing goals during the course of an illness
- Dealing with patient / family conflict in relation to unrealistic goals
- Facilities available for rehabilitation
- Appliances available in the home
- Use of disablement centre for artificial limbs and appliances
- Support services available in the home

Care of the elderly

- Understand, assess and manage
- Medical conditions specific to the elderly
- Psychological problems common in the elderly
- Social issues that are relevant to the care of the elderly
- Principles and practice of palliative care in the elderly
- Integration of palliative care into geriatric medicine

Pediatric Palliative Care

- Understand, assess and manage
- Reactions of children to health issues specific to various age groups including relevance of parental separation
- Medical conditions requiring palliative care in childhood including neo-nates
- Procedure related pain in children
- Pain and other symptoms in children
- Psycho-socio-spiritual issues in children
- Family support and bereavement support

Emergencies

- Assess and manage emergencies including
- Bleeding
- Spinal cord compression
- Intestinal obstruction
- Breathlessness and Others

Care of the dying patient and their family

- Recognition of the dying phase
- Initial assessment of the dying patient

- Providing ongoing care for dying patients and their families:
- Assessment of required medications
- Recognising when to discontinue further investigations and treatment
- Managing symptoms in the dying phase
- Management of mouth care and bowel care
- Psychological care of the family
- Knowledge of major cultural and religious customs which relate to medical practice, dying and bereavement
- Understanding of ethical dilemmas in the dying phase
- Understanding pharmacology in dying patients, including use of a syringe driver

Death

- Prognosticate death
- Demonstrate awareness of a care pathway
- Assess and manage end of life situations including
- Terminal delirium
- Secretions and "rattles"
- Conflicts in family regarding end-of-life decisions
- Unrelieved symptoms
- Evaluate and reduce medications as appropriate
- Prepare the family for the changes that are likely to happen
- Understand the indications, role and modalities of Palliative Sedation Therapy

PHARMACOLOGY AND THERAPEUTICS

General

- Analysis of therapeutic possibilities, weighing up benefits and burdens of treatment or intervention.
- Communication about therapeutic goals and possible adverse effects with patients and carers; enabling their input to decision making
- Communication about the above with others in the clinical team
- Compliance and non-compliance with treatments – reasons for noncompliance and ways of increasing compliance

Drug specific

- General principles of pharmacodynamics and pharmacokinetics
  - Routes of administration
  - Absorption, metabolism, excretion
  - Half-life, usual frequency of administration
  - Adverse effects and their management
  - Use in syringe drivers stability and miscibility
  - Interactions with other drugs
  - Possibility of tolerance, dependence, addiction and discontinuation reactions
- Adjustment of dosage in frail, elderly and children
- Adjustment of dosage in altered metabolism, disease progression and last few days of life.

- Drug formularies in palliative care
- Managing a pharmacy budget; issues of cost versus benefit
- Prescribing – legal issues, generic prescribing
- Use of drugs on a named patient basis
- Use of drugs outside their product licence
- Use of drugs in clinical trials
- Problems of polypharmacy
- Helping patients and carers to understand and manage tablets

Access to essential medicines including opioids

- WHO pain ladder
- Understand the relevance of affordability of treatment measures, particularly in the context of the developing world.
- Describe the barriers to access to controlled medications particularly those that relate to the Narcotic Drugs and Psychotropic Substances (NDPS) act
- Describe the principle of balance
- Describe the measures that can be taken to ensure uninterrupted access to controlled medications
- Opioid availability:
  - Barriers to opioid availability
  - Legal status of opioid use in India
  - Obtaining opioids under NDPS act of 1985
  - The recent action to improve opioid availability and its impact
  - Procuring opioids under amended narcotic regulations.
  - Storing, dispensing and documentation for opioid use.

Ethics

- Theoretical ethics
  - History of medical ethics, with emphasis on evolving philosophy and codes of practice.
  - Critical analysis of current theoretical approaches to medical ethics including 'four principles (beneficence, nonmaleficence, justice and respect for autonomy).
- Applied ethics in clinical practice of palliative care:
- Acknowledgement of ethical issues in daily clinical practice and teamwork
- Consent
- Giving information
- Confidentiality
- Competence to make particular decisions
- Non-autonomous or incompetent individuals
- Best interest judgements
- Conflicts of interest between patient and their relatives
- Responsibility for decisions (doctors, patients & teams)
- Resource allocation (including of oneself)
- Withholding and withdrawing of treatment (including hydration / extubation)
- Euthanasia

- Physician-assisted suicide
- Doctrine of double effect
- CPR decisions
- Research / clinical trials

Legal Frameworks

- Common laws related to health and in relation to end of life medical care including euthanasia and physician assisted suicide.
- Death
  - Certification of death procedures, including definition and procedure for confirming brain death.
  - Cremation regulations.
  - Procedures for relatives following a death.
  - Procedures around post mortems.
- Organisational
  - Corporate law relating to charities/trusts e.g responsibilities/liabilities of
  - trustees and employers
  - Laws & regulations relating to hospitals
  - Employment law
  - Discrimination – gender, race, disability, age

09HLTH09A07-002-C Psychomotor Domain

In practice a Student should be able to

- Use a syringe driver
- Use the subcutaneous route for drugs
- Perform peritoneocentesis
- Perform rectal examination
- Manage bowel in paraplegics and other bed-bound patients
- Counsel families regarding stoma management
- Perform pleurocentesis
- Manage Tracheostomy care
- Use nebulisers
- Reassure a patient and family in presence of breathlessness
- Insert urinary catheter
- Teach intermittent self-catheterisation to patient
- Perform basic neurologic examination
- Use a screening tool for identification of delirium
- Use screening tools for diagnosing depression and anxiety
- Teach the patient and family techniques for prevention and simple lymphatic drainage
- Apply compression bandages and garments
- Teach Wound care including low cost dressings, Mouth care, and pressure sore care to patient and family
- Instruct a family in using sub-cutaneous fluids in the home setting

- Counsel the patient and family in a life-threatening emergency
- Management of stomas
- Management of non-invasive ventilation
- Management of epidural catheters
- Simple nerve blocks
- TENS application

Communication skills

- Demonstrate skills in empathic listening
- Elicit concerns across physical, psychological, social, and spiritual domains
- Demonstrate the ability to deliver bad news sensitively and at an appropriate pace for the individual
- Discuss the importance of communication between professional, family and patient
- Common barriers to communication for both patients and professionals
- Management of difficult questions and information giving sensitively and as
    - appropriate to wishes and needs of the individual

Perform role plays in

- Assessment of emotional status of a patient who has just been told he has cancer or another life threatening disease
- Empathic listening
- Delivering bad news
- Dealing with collusion
- Empowering a patient in exercising autonomy in decision making
- Interviewing the patient regarding personal relationships
- Counseling regarding financial implications
- Supporting a bereaved family member
- Spiritual support for a terminally ill person of no faith or a different faith n spiritual support for a terminally ill person of no faith or a different faith
- Communicating with a patient who asks for euthanasia
- Explaining advanced care directives to a patient
- Awareness and practice of a range of structures and styles of consultations
- Critical evaluation of own consulting skills

Miscellaneous

- Demonstrate skills in empowering the patient to exercise autonomy in decision making
- Be a supportive colleague to other members of staff
- Demonstrate the ability to communicate with and support bereaved and grieving person
- Demonstrate the ability to elicit spiritual concerns and spiritual pain and respond appropriately including referrals to others if necessary.

- Discuss the importance of changing goals during the course of an illness and the need for realistic goals
- Identify important situations in which physical measures for rehabilitation will be useful and indicated
- Know how to access support for such services

- Know how to provide/access measures of social rehabilitation including vocational rehabilitation
- Recognize the special needs of children in the patients’ families including support for schooling.
- Demonstrate the ability to apply an ethical framework to issues, incorporating the following ethical frameworks:
    - respect for the patient- autonomy
    - Patient confidentiality – assessing patient competence to make decision
    - weighing up the benefits and burdens of treatment- beneficence
    - assessing the risks versus benefits of each decision- non-maleficence
    - doctrine of double effect
    - balancing the rights of individuals and of society- justice
    - Demonstrate an awareness of guidelines produced by the Indian Society of Critical Care Medicine for end of life care
    - Describe the procedures involved in verification and certification of death and management of the dead body
    - Ethical guidelines in clinical research including Good Clinical Practice guidelines.
- Describe Advanced Care Directives
- Describe when and how artificial life support measures should be and can be withheld or withdrawn
- Know when and how to obtain an informed consent for any procedure
- Have clear understanding about the concept of euthanasia and its distinction from palliative sedation

Research and Education

- Perform a literature search on a selected subject
- Prepare a PowerPoint presentation
- Demonstrate a presentation each for the public and for fellow professionals
- Prepare a research question
- Identify important peer-reviewed journals on palliative care
- Know how to access literature
- Gather knowledge related to basic and clinical trial methodology
- Understand and able to conduct-different phases of clinical trails,e.g.Phase I,II,III,IV and their implications in Palliative Medicine
- Identify the levels of evidence among published research
- Demonstrate the ability to analyze the quality and implications of medical literature and apply new knowledge in the delivery of health care

- Know important recent advances in the field
- Demonstrate understanding of different teaching methods and structure, including lecturing, problem based learning, role play, bedside teaching
- Demonstrate understanding of teaching contexts (eg. Size of group, professional or otherwise, undergraduate or postgraduate,
- Demonstrate understanding of selection, preparation and presentation of teaching materials
- Demonstrate understanding of how to make a lecture interactive
- Demonstrate understanding of the role of supervision, mentoring, learning contracts, critical appraisal and feedback, experiential learning.
- Plan learning aims, objectives, methods and outcomes.
- Demonstrate understanding of the concept of continuing professional development.
- Demonstrate understanding of framing suitable specific learning objectives.
- Conducting clinical sessions for undergraduate medical students, nurses and paramedical workers
- Prioritize core competencies in curriculum planning
- Demonstrate an interest and ability to identify future areas of inquiry in medical research
- Utilize knowledge of population based and evidence based medicine in making patient management decisions.
- Have familiarity with basic research methodology, epidemiology, basic information technology skills
- Plan the protocol of a research project, execute it and prepare final report.
- Understand the ethical principles guiding medical research
- Demonstrate knowledge of study design and relevance of sample size

Medical Statistics

- Demonstrate knowledge of:
- Basic concepts of medical statistics
- Mean, median, mode, standard deviation, analysis of variance and correlations
- Student's T test
- Chi square test
- Fisher's exact test
- Non-parametric tests of significance
- Multivariate analysis
- Survival analysis-log rank test

09HLTH09A07-003-C Affective Domain

Communication skills

- Understand the basic principles of communication including the purpose, active listening and what not to do.
- Describe the steps in effective communication
- Understand possible reactions of patients and families to bad news and respond appropriately
- Understand reasons for collusion within the family and deal with it sensitively

Team work

- Theories of teamwork, e.g. psychological, psychodynamic, managerial
- Identification of oneself in relation to these differing theoretical models of teamwork

  - Understand the importance of teamwork in this setting and have an appreciation of the skills and contributions of different members of the team
  - Identify the role and responsibilities of doctors and other members in multiprofessional teams.
  - Understand the skills and contributions of other members of the multi-professional team.
- Team dynamics in different situations and over time
- Forms of team support
- Strategies which facilitate team functioning, and those which do not.

- Understand the inevitability of conflict within a team, and strategies to manage this.
- Understand Skill mix of a team, particularly in relation to the appointment of new members.
- Know the basics of chairing of team meetings.
  - Balancing the needs of the different or overlapping teams of which the doctor may be a member at any one time
  - Wide application of teamwork to include all the professionals and organisations involved in the care of a particular patient, including nurses, statutory and voluntary organisations
  - The impact on patients and carers of the number of professionals who may be involved in their care.

Role Of Supervision And Mentoring
Leadership skills

Demonstrate understanding of:

- Management of change
- Writing a job description and person specification
- Short-listing and interviewing skills
- Writing a reference
- Induction and training
- Mentoring skills
- Assessment of trainees/junior colleagues
- Motivating and leading a team
- Management styles
- Goal setting
- Short and long term strategic planning
- Negotiating, directing and delegating
- Principles of advocacy with Government and media
- Principles of involving the community in care

Management of work

- Time management

- Working with a secretary
- Budget setting and management
- Planning, implementing and evaluating change

Information management

- Patient data collection.
- Data protection act, including rights of access for patients to information held
- on them
- Computer security and backup systems

Management structures of the organization

- Running a palliative care unit
  - Supply of drugs to hospices, stock lists, financing and regulations for
  - controlled drugs
  - registration
  - Storage and retrieval of case notes
  - Health and safety issues
  - Equipment safety and maintenance
  - Role and management of staff and volunteers
  - Disposal of bodies
  - Awareness, training and networking with the community volunteers.
- Financial management
  - Public and charitable health funding structure
  - Interacting with fundraisers
  - Understanding accounts
- Clinical Governance
  - Responsibilities of doctors; professional and organisational goals
  - Quality assurance in relation to service and organisation
  - Service review and accreditation of palliative care services

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS
OF
MD in IMMUNO-HEMATOLOGY & BLOOD TRANSFUSION MEDICINE

Under TMC
(Program code: HLTH09A08)

COURSE CONTENT (SYLLABUS)
MD IMMUNO-HEMATOLOGY & BLOOD TRANSFUSION MEDICINE

DURATION OF COURSE:

The minimum period of training shall be three calendar years and the candidates can be admitted to this training after their full registration with the Medical Council. No exemption shall be given from this period of training of three years either for doing housemanship or for any other experience or diploma.

TRAINING PROGRAMME:

The candidates joining the course must work as full time residents during the whole period of their postgraduate training. They will be required to attend a minimum of 80% of training period. Candidate shall be given full time responsibility and assignments and their participation in all facets of the educational process assured. Postgraduate students must maintain a record book of the work carried out by them and the training undergone by them during the period of training. These record books shall be checked and assessed by the faculty.

TEACHING / LEARNING METHODS:

Learning in M.D. (Immunohaematology & Blood Transfusion) will essentially be self-learning.

Following teaching-learning methods shall be followed:

Group teaching sessions:

- Journal review
- Subject seminar presentation
- Group discussion
- Clinical case presentations pertaining to transfusion therapy.
- Presentation of the findings of an exercise on any of the sub-specialities
- Participation in CME programs and conferences.

Hands on experience (practical training)

Practical training shall be imparted by posting the students in various sub-specialties (sections) as detailed in the intrinsic and extrinsic rotation. Students shall be actively involved in day to day working of all the sections.

He/She will be trained under the guidance of teachers in all the aspects of practice of transfusion therapy and basic blood banking techniques including blood collection processing, storage of blood products, component preparation, pre-transfusion testing, apheresis, screening of blood products and haemotherapy including stem cell transplantation and all emergencies related to Blood Banking.

Suggested schedule of rotation:

Intrinsic rotation:

The candidates will be rotated through various sections of the department as under:

A) Blood donor management — 6 months

Donor counseling, recruitment & motivation
Blood Donor selection
Phlebotomy
Post donation care of donor
Outdoor blood donation camps

B) Component preparation, Aphereis & Quality Management — 6 months

Preparation of various blood components
- PRBC, FFP, PC, Cryo, Leuco – poor

Irradiation of blood components
Storage & quality control
Apheresis
- Donor apheresis
- Therapeutic plasma exchange

C) Transfusion transmitted infection screening — 5 months

Screening of carious markers
- HIV, HCV, HBsAg, Syphilis

Methodology
- ELISA, Spot, Rapid, Automated analyzer

Molecular techniques

D) Immunoheamatology **6 months**

Diagnosis & Transfusion support in
- AIHA
- PNH
- Transfusion reaction
- Antenatal serology
- Multi – transfused patients

Secretor status
Minor red cell antigen typing
Antibody screening

E) Pre transfusion testing & Cross matching **6 months**

ABO grouping & Rh typing
Weak D testing,. Genotyping
Irregular antibody screening & identification
Cross – matching techniques

F) Quality control / computers / records **1 month**

G) PBSCT, Umbilical cord stem cells Bone marrow stem cells **1 month**

Harvest
CD 34 counts
Cryopreservation

Total **31 months**

Training in Allied departments

A) Dept of Pathology / Haematology **1 month**
- Complete haemogram
- Reading of peripheral smear
- Coagulation work up
- Hemolytic Anemia work up
- Bone – marrow smear – Aspiration & Trephine
- Hematological disorders – work up

B) Dept of Microbiology & Virology **1½ month**
- Isolation of lymphocytes
- CD4 / CD8 counts
- Special molecular techniques
- Bacterial culture
- Grams staining

C) Dept of Anesthesiology		**½ month**
Residents may undergo rotation in various OTs including specialized OT's Intra-operative haemodilution Blood salvage Intra-operative transfusion		
D) Dept of Clinical Haematology & BMT		**1 month**
E) Advanced Training in Immunohaematology		**1 month**
HLA Typing Immunophenotyping including flowcytometry Immunofluoresence		
	Total	**5 months**
Grand Total		**36 months**

Clinical Department, Subjects:

1. Transfusion support for thalessemia, hemophilia, hemato-oncology patients
2. Bedside management of transfusion reactions
3. Bedside management of transfusion in AIHA patients
4. Bedside transfusion support in BMT patients
5. Bedside transfusion support in Medical Emergencies

Emergency duty:

Student shall be posted for managing emergency transfusion services in the department. He/she will deal with all the emergency investigations in transfusion medicine.

Training in research methodology:

Training in research methodology shall be imparted by planning of a research project by the student under the guidance of a recognized guide to be executed and submitted in the form of a dissertation. The dissertation is aimed at training the candidate in research methods and techniques. It will include identification of a research question, formulation of a hypothesis, search and review of relevant literature, getting acquainted with recent advances, designing of research study, collection of data, critical analysis of the results and drawing conclusions. The topic shall be communicated to the university within six months of registration and atleast 12 months should be spent on the research project. The dissertation shall be completed and submitted by the student six months before appearing for the final university examination.

Teaching experience:

Student shall be actively involved in the teaching of undergraduate students / paramedical staff. He/she will be trained in teaching methods and use of audiovisual aids.

BROAD AREAS OF STUDY

09HLTH09A08-001-C: HISTORY OF TRANSFUSION MEDICINE

Scientific landmarks in its development
Impact of world wars on its development
Development of PVC bags.

09HLTH09A08-002-C: SCIENTIFIC BASIS OF TRANSFUSION

A. Biochemistry & Physiology of elements of blood

2.0. Process of cell production and life span
- 2.1. Red cells
- 2.2. White blood cells
- 2.3. Platelets

3.0 Red cells
- 3.0 Haemoglobin structure & function
- 3.1 Metabolic pathways
- 3.2 Membrane structure & function

4.0 White cells
- 4.0 Structure, function & kinetics

5.0 Platelets
- 5.0 Structure, function & kinetics

6.0 Physiology of Haemostasis
- 6.0 Role of platelets
- 6.1 Coagulation pathways
- 6.2 Fibrinolysis

7.0 Hemodynamics of blood flow & volume

8.0 Iron metabolism

9.0 Bilirubin metabolism

10.0 Immunology

- 10.0 Principles of Basic Immunology

- 10.1 Antigen, Antibody, Complement, Immunoglobulin
- 10.2 Antigen/antibody reaction
- 10.3 Lymphocytes in Humoral & Cellular immunity

11.0 Role of Hybridoma technology in Immunology

12.0 Immunology of transplantation

13.0 HLA & genetic control of immune response

14.0 Transfusion Immunology

B. Blood Group System

15.0 Blood Group System

- 15.0 Major Blood Group System

- 15.1 Minor Blood Group System

C. Genetics

16.0 Principles of basic genetics

17.0 Genetics of Blood Groups

- 17.0 Phenotypes & genotypes
- 17.1 Principles of blood group inheritance
- 17.2 Population genetics of blood groups

D. Molecular Biology

18.0 Molecular Biology

- 18.0 Molecular Biology of the cell
- 18.1 Molecular Biology of the Gene
- 18.2 Molecular Genetics

E. Microbiology

19.0 Transmissible Diseases

20.1 Sterility Testing

F. Biochemistry

20.0 Plasma Proteins – separation & purification

21.1 Immunoglobulins – estimation & typing

09HLTH09A08-003-C: ANTIGEN SYSTEMS IN FORMED ELEMENTS OF BLOOD

21.0 Red Cell antigens including

- 21.0 Lectins and their biology
- 21.1 Adsorption and Elution methods

22.0 Leucocyte antigens

23.0 Platelet antigens

09HLTH09A08-004-C: BLOOD COLLECTION, PROCESSING, COMPONENT PREPARATION

A. Management of Blood Donation

24.0 Donor recruitment

- 24.0 Voluntary blood donation system
- 24.1 Categories of blood donors
- 24.2 Education & awareness of prospective donors
- 24.3 Use of Information Technology for Donor Recruitment

25.0 Acceptability criteria of blood donors

26.0 Care of blood donors

- 26.0 Pre-donation
- 26.1 Mid-donation
- 26.2 Post-donation
- 26.3 Prevention & management of complications of blood donation

27.0 Blood collection
- 27.1 Anticoagulants & preservatives
- 27.2.1 Procedure
- 27.2.2 Blood donation camps

B. Blood Components

28 Components
- 28.1 Types
- 28.2 Methods of preparation
- 28.3 Indications, dosage & administration
- 28.4 Leuco-depletion
  - 28.4.1 Various methods
  - 28.4.2 Quality Control

29 Storage of blood & blood components
- 29.1 Whole blood
- 29.2 Red cell concentrate
- 29.3 Plasma
- 29.4 Granulocyte
- 29.5 Cryoprecipitate
- 29.6 Stem cells
  - 29.6.1 Peripheral blood stem cells
  - 29.6.2 Cord blood stem cells

30 Plasma fractionation

30.1 Viral inactivation
30.2 Newer methods

09HLTH09A08-005-C: PRE-TRANSFUSION TESTING

31 Compatibility testing
  31.1 ABO grouping & Rh typing
  31.2 Antibody screening
  31.3 Methods of cross matching
  31.4 Newer methods of cross matching
    31.4.1 Solid Phase
    31.4.2 Gel technology
  31.5 Antiglobulin testing

32 Screening for Transfusion Transmitted Infections
  32.1 Methodology
  32.2 Nucleic acid amplification techniques
  32.3 Newer emerging pathogens
    32.2.1 Prions
    32.2.2 Lyme disease
    32.2.3 Others

33 Selection of blood components & plasma products for transfusion

CLINICAL ASPECTS OF IMMUNOHAEMATOLOGY & BLOOD TRANSFUSION

09HLTH09A08-006-C: ADVERSE EFFECTS OF BLOOD TRANSFUSION (Acute and delayed complications following Blood Transfusion)

34 Clinical presentation, pathophysiology, investigations, management
  34.1 Hemolytic transfusion reaction
  34.2 Non hemolytic transfusion Reaction

35 Transfusion Transmitted Infections

36 Transfusion Associated – Graft versus Host Disease (TA-GVHD)

37 Transfusion Related Acute Lung Injury (TRALI)

38 Others

  38.1 Haemosiderosis
  38.2 Volume overload
  38.3 Other complications

09HLTH09A08-007-C: APHERESIS

39 Technology of apheresis and various machines

40 Haemapheresis (platelets, granulocytes, plasma)
- 40.1 Donor selection
- 40.2 Procedure
- 40.3 Complications

41 Therapeutic apheresis
- 41.1 Indications, procedure & complications
- 41.2 Plasma exchange, Red cell Exchange
- 41.3 Newer methods of Immunoadsorption

09HLTH09A08-008-C: AUTOLOGOUS TRANSFUSION

42 Basic principles, indications, contra-indications.
- 42.1 Pre-deposit
- 42.2 Haemodilution
- 42.3 Intra-operative blood salvage including equipment
- 42.4 Directed donation

09HLTH09A08-009-C: ANTINATAL & NEONATAL TRANSFUSION PRACTICE

43 Pathophysiology, diagnosis & management
- 43.1 Rh incompatibility
- 43.2 ABO & other blood group incompatibility

44 Exchange transfusion
- 44.1 Indications, methodology & complications
- 44.2 Intrauterine transfusion

45 Neonatal transfusion practice

09HLTH09A08-010-C: IMMUNOHEMATOLOGY

46 Classification, diagnosis and management
- 46.1 Immune haemolytic anaemia
- 46.2 Immune thrombocytopenia
- 46.3 Immune neutropenia

47 Immunohaematological problems in multi-transfused patients

09HLTH09A08-011-C: HEMOTHERAPY

48 Pathology, diagnosis and management of anaemia
- 48.1 Anaemia
- 48.2 Iron deficiency anaemia
- 48.3 Megaloblastic anaemia
- 48.4 Aplastic anaemia
- 48.5 Haemolytic anaemia including fragmentation syndrome
- 48.6 Anaemia of chronic diseases – liver disease, uremia, thyroid disease etc.

49 Haemoglobinopathies
- 49.1 Thalassaemia
- 49.2 Sickle cell anaemia
- 49.3 Other haemoglobinopathies

50 Pathophysiology, diagnosis and management of haemostatic disorders
- 50.1 Haemophilia
- 50.2 Von willebrands disease
- 50.3 Platelet disorders
- 50.4 Qualitative disorders
- 50.5 Quantitative disorders
- 50.6 DIC

51 Pathophysiology, diagnosis and transfusion support in acute blood loss
- 51.1 Shock
- 51.2 Massive transfusion

52 Transfusion support in cardiac surgery

53 Classification & transfusion support in Oncology
- 53.1 Leukaemia
- 53.2 Lymphoma
- 53.3 Marrow failure

09HLTH09A08-012-C: TRANSPLANTATION

54 Transfusion support in transplantation

55 Peripheral blood stem cell transplantation
- 55.1 Harvesting
- 55.2 Cryopreservation
- 55.3 CD34 counting

56 Bone Marrow Transplantation
- 56.1 Processing
- 56.2 Harvesting
- 56.3 Immunohaematological problems in ABO mismatched BMT

57 Transfusion support in specialized conditions
- 57.1 Renal transplantation
- 57.2 Liver transplantation
- 57.3 Umbilical cord blood transplantation
  - 58.3.1 Collection
  - 58.3.2 Processing
  - 58.3.3 HLA typing & cross matching
- 57.4 Irradiation of blood products
- 57.5 Indications, dosage, adverse effects
- 57.6 Tissue banking

09HLTH09A08-013-C: BLOOD SUBSTITUTE & HEMOPOIETIC AGENTS

58 Crystalloids & colloids

59 Oxygen carrying compounds

60 Haemopoietic growth factors

61 Albumin

09HLTH09A08-014-C: MEDICOLEGAL CONSIDERATIONS IN TRANSFUSIUON

62 Ethical & legal considerations pertaining to transfusion practice

63 Identification of blood stains

64 Paternity testing

65 Donor notification and counseling

66 Look back programme

67 Drugs & Cosmetics Act

68 Clinical, Legal and Ethical considerations in Organ Transplantation

09HLTH09A08-015-C: TOTAL QUALITY MANAGEMENT

69 Development of Standard Operating Procedures (SOP) manual

70 Quality control
- 70.1 Reagents
- 70.2 Instruments
- 70.3 Personnel
- 70.4 Blood & Components

71 Quality Assurance
- 71.1 Internal quality control
- 71.2 External quality control

72 Medical audit

73 Hospital transfusion committee

74 Good manufacturing practice

75 Turnaround time

76 ISO : 9000, Accreditation

09HLTH09A08-016-C: ORGANISATION & MANAGEMENT OF TRANSFUSION SERVICES

77 Organization & function of blood services & hospital transfusion practice
- 77.1 Donor recruitment & motivation
- 77.2 Operation of blood mobile units
- 77.3 Development of transfusion services
- 77.4 Inventory control
- 77.5 Development of forms, labels, records etc.
- 77.6 Reports & Returns

78 National Blood Transfusion Policy

09HLTH09A08-017-C: BLOOD SAFETY

79 Sterilization

80 Disposal of bio-hazardous material

09HLTH09A08-018-C: MODERN BIOLOGICAL TECHNIQUES

81 Principles, methods, relevance in transfusion medicine
- 81.1 Western blot
- 81.2 Polymerase chain reaction
  - 82.2.1 SSCP
  - 82.2.2 SSOP
- 81.3 Dot blot hybridization

09HLTH09A08-019-C: AUTOMATION & COMPUTERIZATION

82 Automated blood grouping & processing
83 Instrumentation & use of bar codes
84 Use of computers in blood banking including implementation of blood banking software

09HLTH09A08-020-C: RECENT ADVANCES IN IMMUNOHAEMATOLOGY & BLOOD TRANSFUSION

SYLLABUS

OF

MD ANAESTHESIOLOGY

(PROGRAM CODE – HLTH09A02)

SYLLABUS OF MD - HBNI

ANAESTHESIOLOGY — M D

The course content should include a fund of acquired information and the strategy evolved for acquiring the information. Most useful information should be included taking into account the limits of the time available. The contents should ensure that the candidate acquires basic skills and attitudes in the subject. It should discipline the thinking habit for problem solving and discovery of new knowledge in the field.

To this Extent the Course Content should Include Certain Facts

a) A thorough knowledge of the pharmacokinetics and pharmacodynamics of anaesthetic drugs and adjuncts.

b) Knowledge of cardiovascular, respiratory neurological, hepatobiliary, renal and endocrine homeostasis and related drugs as relevant to patients undergoing anaesthesia.

c) Relevant anatomy, physiology and biochemistry.

d) A basic idea of the relevant physical principles involved in the construction and functioning of equipment used in anaesthesia and monitoring.

e) Knowledge to attain expertise of the commonly used techniques in general, regional and local anaesthesia.

f) A clear-cut concept of unconsciousness and its implications.

g) Relevant knowledge about chronic intractable pain and its management.

h) Relevant knowledge to manage patients in intensive therapy unit.

i) Relevant knowledge of medical Statistics

j) Knowledge & Expertise in Cardiopulmonary resuscitation.

The Course content should also include ways and means of stimulating the thought processes of the candidate and ensure that the candidate can critically acquire new information from books, journals, lectures, seminars and discussions. It should include ways and means of developing reflective thinking and problem solving by critically analysing events during anaesthesia. Interpretation of these data and logical reasoning should lead to application of facts and principles in practice.

It is needless to emphasise that the course content should ensure that the candidate acquires the necessary aptitude and motor skills to become a competent anaesthesiologist, learn the art of teaching students,nurses and paramedical staff and carry out a simple research project.

1st Year Theory

Should cover the following:

a) Anatomy – Diaphragm, larynx and upper and lower airway, learn relevant, anatomy for regional anaesthesia and venous cannulations. Some Anatomical areas of interest to the anaesthetist are Orbit of the Eye, Base of skull, Vertebral Column, spinal cord, and meninges, axilla, 1st rib, Intercostal space.

b) Principles of physics and use of equipment in anaesthesia

   i) Anaesthesia machine - checking the machine and assembly of necessary items.

   ii) Airway equipment including Tracheostomy / Equipments for airway management - mask, LMA, fibreoptic laryngoscopes; other devices like Combi tube etc.

   iii) Breathing systems continuous flow systems, draw over system - Assembly and checking.

   iv) Monitoring in Anaesthesia with concepts of minimal monitoring.

   v) Safety in Anaesthesia Equipments.

   vi) Medical gases - storage and central pipeline system.

c) Physiology

   i) Theories of mechanism of production of Anaesthesia.

   Respiratory, cardiovascular, hepatobiliary, renal and endocrine system. Pregnancy, Blood Groups, Muscle & N M Junction, ECG, Regulation of temperature & Metabolism, Stress response cerebral blood flow and ICP.

d) Pharmacology

   i) General pharmacological principles.

   ii) Concepts of pharmacokinetics and pharmacodynamics.

   Uptake and distribution of inhaled anaesthesia agents.

   Drug interaction in Anaesthesiology.

   Drugs used in Anaesthesia, Drugs used for treatment of diseases and interaction of these .

e) Theoretical background of the commonly used anaesthetic techniques of general and regional anaesthesia viz.

   i) GA - Intravenous, Inhalational, Endotracheal etc. using spontaneous and controlled mode of ventilation.

   ii) RA - Spinal, epidural and local.

f) Biochemistry relevant to fluid balance & Blood Transfusions, Artificial Blood, & Perioperative fluid therapy.

   Acid base homeostasis in health and diseases.

g) Documentation and medico-legal aspects of anaesthesia.

   Stress the importance of accurate documentation.

h) Theoretical background on disorders of:
   i) Cardiovascular system.
   ii) Respiratory system
   iii) Hepatobiliary system.
   iv) Urinary system.
   v) Endocrine system. Pregnancy.

i) Cardiopulmonary Resuscitation: Theories of cardiac pump. thoracic pump
   Thoracic pump and defibrillation.
   Resuscitation of a patient with overdose of drug/poisons. Management of unconscious patients. Resuscitation of a severely injured patient.

j) Neonatal resuscitation.

k) Introduction to Research methodology. Random clinical trials etc. Basics of biostatistics.

l) Preoperative assessments and medication - general principals.

m) Introduction to anatomical. physiological. pharmacological and biochemical aspects of pain and pain management.

n) Introduction to artificial ventilation.

o) Oxygen therapy

p) Introduction to the operation theatre. recovery rooms (concepts of PACU). ICU.

q) Recovery from anaesthesia.

r) Shock - pathophysiology. clinical diagnosis and management.

s) Pulmonary function tests - principles and applications.

t) Effect of positioning.

2nd Year Theory

a) Relevant anatomy o f each system

b) Physics of equipment used in anaesthesia
   Medical gases - gas plant. central pipeline Scavenging system.
      Reducing valves
      Anaesthesia machine. Humidifiers
      Flow meters
      Vaporizers - Characteristics and functional specifications.
   Breathing systems - Assembly. functional analysis. flow. Minimum monitoring standards requirements. APL and flow directional valves.

c) Sterlization of equipment.

d) Computers. Utility. computer assisted learning and data storage. Computerised anaesthesia records.

e) Pharmacology of drugs used in cardiovascular. respiratory endocrine. renal diseases and CNS disorders.

f) Acid-base and electrolyte balance and.

g) Interpretation of blood gases and other relevant biochemical values. various function tests and basics of measurement techniques. ECG

Paediatrics – Prematurity. Physiology.anatomy of neonate NS adult

h) Principles of monitoring equipment used for assessment of

  i) Cardiac function viz. Rhythm. pulse. venous and arterial pressures. cardiac output.

  ii) Temperature

  iii) Respiratory function viz., Rate volumes. compliance. resistance. blood gases.

  iv) Intracranial pressure. depth of anaesthesia and

  v) Neuromuscular block.

i) Working principles of ventilators.

j) Special anaesthetic techniques as relevant to outpatient anaesthesia, hypotensive anaesthesia, anaesthesia in abnormal environments and calamitous situations.

k) Anaesthetic management in special situations - Emergency. ENT. Ophthalmology. Obstetrics. Obstetric analgesia. Plastic. Dental. Radio-diagnosis and Radiotherapeutic procedures and patients with systemic diseases.

l) Medical statistics relevant to data collection. analysis. comparison and estimation of significance.

m) Journal clubs.

SECOND YEAR

1. Principles of paediatric anaesthesia. management of neonatal surgical emergencies. RA in infants.
2. Associated medical disorders in surgical patients - anaesthesia implications and management.
3. Basics of orthopaedic anaesthesia.
4. Day care anaesthesia.
5. Rural anaesthesia - anaesthesia for camp surgery.
6. Anaesthesia for otorhinolaryngology with special emphasis on difficult airway management.
7. Blood and blood component therapy. Anaesthetic implications in coagulation disorders.
8. Monitored anaesthesia care.
9. Anaesthetic implication in Diabetic mellitus, thyroid and parathyroid disorders, phaeochromocytoma, cushings disease etc.
10. Management of acid-base disorders
11. Principles of geriatric anaesthesia
12. Anaesthesia outside the OR and in special situation

Principle of management in Trauma. disorders and mass casualties

3rd Year Theory

a) Anaesthesia for patients with severe cardiac, respiratory, renal and hepatobiliary disorders posted for unrelated surgery.

b) Management of patients in shock, renal failure, critically ill and/or on ventilator.

c) Chronic pain therapy and therapeutic nerve blocks.

d) Selection, purchase, maintenance and sterilization of anaesthesia and related equipment.

1. Principles of anaesthetic management of neuro/ cardiac/ thoracic / vascular/ Transplantation/ burn and plastic surgery.
2. Principles of neonatal ventilation and critical care.
3. Principles of human resources and material management.
4. General principles of medical audit
5. Principles of one lung anaesthesia

ATTITUDE DEVELOPMENT

The student should develop attitudes that lead to:

1. Life long learning and updating
2. Sympathetic Communication with relatives
3. Sympathetic Communication with patients
4. Appropriate communication with colleagues to function in a group in OR/ICU
5. Become a teacher for Technicians, Nurses, and paramedical staff. And teach undergraduates.
6. Ability to discuss. Participate in case discussion and scientific presentations

Ability to function as a leader in the Operating room

SKILL DEVELOPMENT

Trainee

Requirement of Practical Training by Junior Resident

It is felt that at the end of a 3-year training course a candidate should have the knowledge and ability to:

1. Plan and conduct anaesthesia, recovery, and postoperative pain relief for elective and emergency surgery related to all surgical specialties.
2. Carry out basic life support (BLS) and advanced life support (ALS) and train medical and paramedical staff in BLS and ALS.
3. Manage unconscious patients : Airway management and long term management of unconscious patient.
4. Manage patients admitted to an intensive care unit.
5. Manage patients suffering from chronic intractable pain.
6. Organize the Hospital environment to manage mass casualty situation
7. Critically review and acquire relevant knowledge from the journals about the new development in the speciality.
8. Should be able to participate in anesthesia audit.

Major stress will be on practical training. The Goals of postings both the general goals and of specific sub speciality postings will be fulfilled by rotating the junior resident in various operating theatres.

Intensive Care, Pain Clinic, Emergency Room (Casualty) Out Patient Department and Peripheral anaesthesia Facilities. The recommended period of stay in each area is as follows:

Speciality	*Months*
General Surgery	4
Urology	1
Eye	2
ENT	2
Dental	1
Orthopedics Trauma	3
Gynecology	2
Obstetrics	2
Pediatrics	2
Burns Plastic	1
CTVS	2
Neurosurgery	2
ICU	3
Pain	2
Recovery	1
Organ Transplant	1
Peripheral Theatre (Radiology, Radiotherapy ECT Cardiac Cath.)	1
Elective	1

The student will be instructed in preoperative preparation of the patients and discussion of the intraoperative problems of cases being conducted on the day. During these postings the students will initially observe and then perform various procedures and conduct the anesthetic procedure as listed. Each procedure observed and performed will be listed in the logbook. Which will be signed by attending faculty.

The trainee will undergo a graded training in the following manner:
1st year trainee
Orientation: ~~At the beginning of 3 Years each~~ student should be given an orientation to the hospital operation theatre and subject of anaesthesia. The candidate shall be assigned thesis guides so as to help them prepare protocols.

Introductory lectures should be aimed to familiarize the student with the a) basic anaesthesia delivery equipment and Monitors and important principles of physics that govern the functions of these equipments. b) Intravenous Anaesthetic drugs and Inhalation agents. c) Patient evaluation, interpretation of laboratory investigation as applied to the care of the patients planning and conduct of general anaesthesia, and postoperative care. The faculty should do the teaching. Students should be taught basic and advanced cardiac life support. The student should be familiarized about the principle of the sterilization and universal precautions. They should be able to ask for consultation when necessary.

The students are encouraged and taught to search literature to be able to write a thesis protocol.

1st Year Objectives

The first year resident should be taught expertise in the management of ASA I and II cases. To start with they will observe and slowly become independent in giving general anaesthesia and spinal anaesthesia to ASA I & II cases for minor and major surgery, under graded supervision. They should be posted to the following specialties ~~doing~~ during the first year, gynecology, General Surgery, Orthopedic, ENT, Recovery Room, Urology.

2nd Year Objectives

The student should be taught to give general anaesthesia, regional anesthesia to ASA I, II, III & IV under supervision they should be able to give extradural block (EDB), Spinal Block, and Peripheral Nerve Blocks under supervision. Should learn pediatric and trauma life supports and maintain skills for basic and advanced cardiac life support.

It is advised that they may be posted in the following specialties Obstetrics, Dental Surgery, Eye, ICU, Pain Clinic and Peripheral Theatres.

The student should be able to ~~be able to~~ analyze data and write a thesis. Should be able to present scientific data.

3rd Year Objectives

The student should be able to plan and administer anaesthesia to all patients under graded supervision including patients for cardiac, Neurosurgery, Pediatric surgery and for all major surgery. The aim at the end is to be competent and independent soon after the third year of ~~junior~~ residency in providing anaesthesia to elective and emergency cases. The junior resident should be able to manage critically ill patient treat intractable pain. They should also know how to organize mass casualty. The curriculum should be able to provide 1 month of elective posting.

Minimum Procedures/Cases to entered in the log book.

Regional

SAB	=	30 SAB
EDB	=	30 including continuous EDB
Caudal	=	10
Sciatic/Femoral	=	5 + 5
Bier Block	=	5
Ankle Block	=	5
Stellate Ganglion	=	3 (observe)
Brachial Plexus	=	5 observe 10 do
Sympathetic Block	=	5 (Observe)
Trigger Point injection	=	5
Other peripheral N. Block	=	10
Ophthalmic Blocks	=	5 (observe)
Field Block	=	5

Anaesthesia for:

Open Heart	=	3 – 5 observe
Closed Heart	=	5 observe
Craniotomy	=	5 observe
Spinal Surgery	=	5 observe
Joint Replacement	=	5 observe
Anesthesia for organ transplant	=	5 observe (desirable)

Procedures

Internal Jugular Cannulation	=	5 + 5 do/observe
External Jugular Cannulation	=	5
Subclavian Vein Cannulation	=	5 + 5 do/observe
Peripheral Central Line	=	15 – ?X
Arterial Line Cannulation	=	10

Conduct of Cases

ASA I	=	100
ASA II	=	50
ASA III	=	30
ASA IV	=	10
Labour Analgesia	=	5
Organ Transplant	=	5 observe – ?

DETAILED CURRICULUM FOR POSTINGS

I. GENERAL GOALS OF ALL POSTINGS

II. Objectives:

A. Learn to perform preoperative evaluation

1. Learn to collect and synthesize preoperative data and to develop a rational strategy for the perioperative care of the patient. Outpatients: Develop skills in obtaining medical information from sources outside our institution, that is, other hospital and private physicians.
2. Learn a thorough and systematic approach to preoperative evaluation of patients with systemic diseases. Perform preoperative medical evaluations of patients undergoing many different types of operations, both of inpatients and outpatients but especially elderly patients with complex medical illnesses such as alcoholism, chronic obstructive pulmonary diseases, congestive heart failure, coronary artery disease, hepatic failure, hypertension, myocardial infarction, renal failure, and stroke etc.
3. Learn to prioritize problems and to present cases clearly and systematically to attending consultants.
4. Develop working relationships with consultants in other specialities to assist in preoperative evaluation.

Learn to get a good consultation.

5. Learn to interact with preopertive patients and develop effective counseling techniques for different anesthetic techniques and perioperative procedures. Learn to assess and explain risk of procedure and take informed consent.

B. Learn anesthetic techniques and skills and understant operate different equipment used by anaesthetist, develop optimum plans depending on patients condition Know the special considerations and techniques required to anesthetize patient in locations inside and outside of the operating room, for example, the Cardiac Catheteriza-tion Laboratory, Electroconvulsive Therapy, Genitourinary Clinic, Magnetic Resonance Imager, Radiology & Radiotherapy.

1. Perform the anesthesia machine check and prepare basic equipment necessary for all anesthetic cases.
2. Prepare drug table: select appropriate drugs for a case and develop a good system for arranging the drug and work tables.
3. Place standard monitors, for example, electrocardiogram, noninvasive blood pressure device, precordial stethoscope, neuromusclar blockade monitor, pulse oximeter, and capnograph.
4. Learn proper techniques of preoxygenation.
5. Learn how to induce anesthesia, both routine induction and rapid sequence induction, and the pertinent mechanical skills and choice of drugs
6. Perform airway management by knowing various procedures and equipment:

   They should know how to use/do

   i) Direct laryngscopy using curve and straight blade
   ii) Laryngeal mask airway

   They should be familiar with

   a. Fiberoptic techniques
   b. Light wand techniques
   c. Blind techniques
   d. Combitube
7. Failed Intubation or difficult airway algorithms
   a. All techniques for endotracheal intubation
   b. Additional techniques such as retrograde wire intubation and surgical cricothyroidotomy both of which will be learned on a mannequin.
8. Awake intubation
   a. Topical/Local anaesthesia for airway
   b. Airway nerve block, for example, superior laryngeal nerve and glossopharyngeal nerve block
9. Learn anesthetic maintenance: appropriate choice and use of anesthetic drugs and adjuvant drugs such as muscle relaxants and how to monitor their effects
   a. Assessment of Anesthetic depth.
   b. Assessment of volume status

c. Replacement of intraoperative fluid losses

d. Appropriate use of blood and blood products

e. Effect of different types of surgical procedures on anesthetic management, for example, effects of aortic cross-clamping

f. Appropriate use of intraoperative laboratory tests blood gas coagulation tests etc.

10. Become skilled in catheterizing or cannulating the following vessels for sampling blood, measuring concentrations or pressures, or administering drugs of fluids:
    a. Veins: all ages and all sizes
    b. Arteries: radial and other sites
    c. Central vessels: internal jugular, subclavian, and "long-arm" routes

11. Become skilled in using and interpeting the following routine noninvasive and invasive monitors intraoperatively and others:
    a. Electrocardiogram with ST-segment analysis
    b. Noninvasive blood pressure
    c. Capnograph: values and changes in values and waveform.
    d. Pulse oximetry: values and changes in values
    e. Neuromuscular blockade monitor
    f. Invasive arterial pressure: waveform and changes in the waveform
    g. Central venous pressure: values and waveform
    h. Pulmonary artery pressure: Values and waveforms, pulmonary capillary wedge tracing
        i. Cardiac output
        ii. Mixed venous oxygen saturation
        iii. Evoked potential
        iv. transesophageal echocardiography: basic understanding

12. Become skilled in techniques for regional anesthesia
    a. Brachial plexus blockade: interscalene, supraclavicular, axillary techniques with and without nerve stimulator for localization
    b. Spinal anesthesia (including continuous spinal where appropriate)
    c. Epidural anesthesia: lumbar, caudal, and thoracic.
    d. Lower extremity blockade: femoral, sciatic, and lateral femoral cutaneous nerves
    e. Upper extremity blockade: ulnar, median, and radial nerves
    f. Bier block
    g. Cervical plexus block

13. Become skilled in discontinuing anesthesia and monitoring emergence from anaesthesia
    a. Reversal of neuromuscular blockade

b. Determination of appropriate time for extubation

c. Monitoring of airway function during and after emergence

14. Become familiar with/skilled in perioperative pain management

a. Postoperative epidural infusion (opiates, local anesthetics)

b. Patient-controlled analgesia

c. Adjunctive nerve blockade

15. Become skilled in use of techniques for conscious sedation and monitored anaesthesia care

a. Selection of patients for conscious sedation

b. Selection of drugs for use in conscious sedation

c. Monitoring techniques helpful in controlling depth of sedation

d. Recognition of when conscious sedation has become unconscious sedation

16. Know how to successfully resuscitate, and develop skill of Basic Life support and Advance Cardiac Life support.

17. Work with other members of the OR team, including surgeons and nurses, to optimally care for surgical patients, especially develop communications skill.

09HLTH09AQ2-001-C ANAESTHESIA OUT SIDE OPERATING ROOM

1. Radiology and interventional neuroradiology: Know special anaesthetic considerations in these settings:

a. Dye allergies

b. Embolization

c. Examination for magnetic resonance imaging (MRI)

i. Monitoring

ii. Equipment options in the MRI suite

iii. General anesthetic/sedation techniques

2. Electroconvulsive shock therapy (ECT)

a. Preoperative

b. Anesthetic techniques and drug effects on seizure duration

c. Hemodynamic responses and appropriate treatment

3. Cardiac catheterization

a. Preoperative evaluation of children

b. Anesthetic consideration

i. Children

ii. Electrophysiologic tests/radiofrequency ablation Cardioversion

4. UROLOGY SERVICE (This service may be in OPD or OT)

Become skilled in anesthetic techniques applicable to the Genitourinary Clinic

a. Transurethral resection of the prostate: recognize and treat hyponatermia; know different anesthetic options and advantages and disadvantages of each

b. Irrigation fluid options: know advantages and disadvantages of each

c. Anesthetic techniques for extracorporeal shock wave lithotropsy

d. Anesthetic considerations for percutaneous placement of nephrostomy

III. Evaluation to Determine Goal Achievment

a. The resident will be evaluated every 3 months end posting by all attending consultants who worked with them.The attending physicians complete a Departmental Resident Evaluation Form, which is reviewed by the Clinical Competence Committee. informs them of any problems identified. and serious problems will be discussed with them immediately after they occur.

b. Residents will complete a log book. After each posting it will be checked and signed by the faculty concerned.

Trauma & Resuscitation

All residents must achieve basic and advanced cardiac life support, advanced trauma life support, and pediatric life support training. They should start with the training of Airway breathing circulation (ABC) training and master the skills repeatedly and then procedure to advanced life support.

I. GOALS OF TRAUMA/TRAUMATISED PATIENT AND DISASTER MAAGEMENT

a. Acquire Improve ability to evaluate & triage the patient and formulate anesthetic plans, especially in the trauma patient.

b. Acquire ability to administer operative anesthesia safely and rapidly.

c. Acquire ability to identify, prevent and care for postoperative complications.

A. Manage anesthesia for severely traumatized patients by doing the following as rapidly as possible:

1. Evaluation/documentation
2. Placement of intravascular catheters
3. Airway intubation
4. Choose among anesthetic options and induce and maintain anesthesia safely

09HLTH09A02-OD2EC POST ANESTHESIA CARE UNIT (PACU)

1. Goals

Understand the importance, purpose, and components of the anesthesia record and the report from the anaesthetizing anesthesiologist.

Use information about the patient that is received and observed on admission to the PACU and during care there for the following purposes:

1. To create a care plan
2. To score the patient's condition according to the Aldrete system
3. To assess the patient's recovery and condition for a safe discharge or transfer

Observe, recognize, and learn to treat the most commonly occurring problems likely to arise in the Postaanesthesia Care Unit (PACU). Understand the parameters patients must meet for safe discharge from the PACU to the following:

1. home
2. inpatient ward
3. intensive care unit

Detection of Hypoxemia and Oxygen therapy should be learned in this posting Should be recognize.

1. Airway integrity and compromise.
2. Arrhythmia
3. Hypertension
4. Hypotension
5. Pain prevention and relief.
6. Nausea and vomiting
7. Decreased urine output
8. Emergence delirium
9. Delayed emergence from anesthesia
10. Shivering
11. Post obstructive pulmonary oedema

III. Evaluation to Determine Goal Achievement (End posting summative)

09HLTH09A02-003-C

INTENSIVE CARE UNIT

I. Goals

Understand the spectrum of critical illnesses requiring admission to ICU recognize the critically ill patient who needs intensive postoperative care from the patient who does not require such care.

PRINCIPLES OF MANAGING A CRITICALLY ILL MEDICAL PATIENT

Cardiovascular

Recognition and acute management of Shock (all forms) Cardiac arrythmiasCardiogenic pulmonary edema Acute cardiomyopathies Hypertensive emergencies,myocardial infarction.

Respiratory

Recognition and acute management of Acute and chronic respiratory failure Status asthmaticus Smoke inhalation and airway burns Upper airway obstruction, including foreign bodies and infection Near drowning Adult respiratory distress syndrome. Use of Pulmonary function tests including bedside spirometer.

Renal

Recognition and acute management of Fluid and electrolyte disturbances.

Should be able to prescribe fluids in Renal failureAcid-basis disorders. Should be able to prescribe drugs based on Principles of Drug dosing in renal failure Should know when to use Dialysis/hemofiltration.

Central Nervous System

Recognition and Acute management of Coma. Drug overdose know Glasgow Coma Scale Metabolic and Endocrine.emergencies like Diabetic ketoacidosis Hypoadrenal crisis. pheochromocytoma.

Infectious disease

Recognition and acute management of hospital acquired and opportunistic infections. including acquired immunodeficiency syndrome. Should know how to protect against cross infection Infection risks to healthcare workers.

Hematologic disorders

Recognition and acute management of Defects in hemostasis Hemolytic disorders should be able to prescribe component therapy based on the results of Coagulation profile.

Thrombotic disorders sould be able to diagnose Deep Vein thrombosis and know Principles of Anticoagulation and fibrinolytic therapy.

Know the indications of Plasmapheresis for acute disorders. including neurologic and hematologic. diseases.

Gastrointestinal disorders

Sould be able to recognize and manage Gastrointestinal bleeding hepatic failure should be able to prescribe prophylaxis against stress ulcer bleeding.

A. Should be able to do the following (ideally) at the end of the posting:
   1. Radial arterial catheters and other sites as necessary
   2. Central venous catheters
      a. Subclavian route
      b. Internal or external jugular route
   3. Pulmonary artery (PA) catheters (Observe only)

B. Understand and interpret the following PA catheter variables. initiate appropriate therapy in response to changes in them:
   1. PA waveform
      a. Normal
      b. Pathologic
      c. PA wedge
   2. Mixed venous oxygen saturation
   3. Right ventricular ejection fraction
   4. Thermodilution cardiac output
      a. Technological basis for cardiac output measurements
      b. Factors producing errors in cardiac output measurements

C. Manage cardiovascular instability
   1. Know different fluid therapy options and when to use them
   2. Know the different inotropic drugs and when to use them
   3. Know how to use invasive monitoring devices to guide therapeutic use of fluids and inotropic drugs

D. Manage respiratory failure and postoperative pulmonary complications
   1. Know how to use arterial blood gas and ventilatory variables to evaluate postoperative patients with respiratory failure
   2. Understand the operation of mechanical ventilators including different ventilatory modalities and how each is best used for management of respiratory failure and noninvasive) including modes complications and modes of weaning

      Principles & application of Oxygen therapy.

E. Pathophysiology and Clinical manifestation of septicemia and its treatment
   1. Recognize sepsis in the postoperative patient including all the typical hemodynamic findings
   2. Know the appropriate tests to diagnose sepsis. including diagnostic tests
   3. Use various monitoring devices to assist in managing sepsis: specifically understand the optimization of oxygen delivery to tissues in the septic patient and the appropriate management of fluids and vasopressors to accomplish these goals.
   4. Know the different classes of antibiotics and antifungal agents and their use in treating sepsis

F. Deliver appropriate nutritional support
   1. Learn about the use of enteral nutrition in the patient who cannot tolerate input per os
   2. Learn about the use of parenteral nutrition in the critically ill surgical patient
   3. Interact with nutrition support services in planning nutrition for the critically ill patient

G. Provide effective pain management and sedation postoperatively
   1. Learn the appropriate use of pain management modalities in the ICU including:
      a. Patient-controlled analgesia
      b. Epidural and subarachnoid narcotics
   2. Learn the use of sedative/hypnotic drugs in the ICU for:
      a. For Patient on Ventilator

Principles of Transplantation

Care of Immunosuppression Infections in the immunocompromised patient Should know Organ rejection.

Monitoring and Biostatistics

Should be able to use Prognostic indices such as acute physiology and chronic health evaluation. therapeutic intervention scoring system and know the concept of audit

Ethical and legal aspects of critical care

Know the legal importance of documentation of recordkeeping + communication

Should be able to take informed consents, not resuscitate orders: (DNR) withdrawing of therapy

Psychosocial Issues

Should be able to communicate with distressed relatives

Should be able to give the correct picture of a critical patient, but with compassion in view of critical nature of the illness

Should be able to Transport a critically ill patient/ resuscitate patient with acute traumatic injury

PEDIATRIC TRAINING

Sould be able to

Recognize and manage cardiovascular and respiratory failure in a critically ill child

Evaluate manage the critically ill neonate /infant / child

Prescribe appropriate dose of all drugs and fluid and electrolytes in a child

Core procedural skills for residents. In addition to practical training in the following procedural skills, the resident must have an understanding of the indications, contraindications, complications & pitfalls of these interventions. Due to the variability of individual training programs, practical experience may be limited for some procedures

Cardioversion

Pulmonary artery catheterization

Trancutaneous pacing

Draining of tension Pneumothorax

Insertion of chest drain

Conventional and Percutaneous Tracheostomies

09HLTH09A02-004-C CARDIOVASCULAR ANESTHESIA

I. Goals

A. Understand cardiac physiology Develop knowledge of cardiovascular anesthesia (anesthesia for the patient with cardiovascular disease). Choose appropriate anesthetic techniques for patients with different types of cardiovascular disease and the skills for lifelong continuing education

B. Develop technical and monitoring skills necessary for cardiovascular anesthesia

C. Administer anesthesia for a wide variety of cardiothoracic Cases and develop interest in further learning

D. Perform a thorough preoperative assessment of the patient undergoing cardiovascular surgery

E. Know intraoperative anesthetic management for the patient undergoing cardiopulmonary bypass. Know how cardiopulmonary bypass is instituted and discontinued Understand cardiopulmonary bypass and discuss the mechanical aspects of it as follows:

1. Different types of pumps - pulsatile and nonpulsatile
2. Physiology of hypothermia and cardiac and cerebral protection
3. Effects of bypass on volumes of distribution and clearance of anesthetic drugs and anesthetic maintenance, including amnesia

D. Know how and why to use of inotropic support, vasodilators, and antiarrhythmic drugs that may be necessary before but are especially necessary after cardiopulmonary bypass

E. Develop and understanding of the major issues involved in the perioperative care of the child with congenital heart disease

B. Insert vascular catheters or cannulas for adult and pediatric patients and obtain measurements from them as follows:

1. Arteries

Internal jugular vein and the subclavian vein

Pulmonary artery (Swan-Ganz) catheters and initiate appropriate therapy in response to changes in the following pulmonary artery (PA) variables:

a. Waveform

b. Normal tracing

c. Pathologic tracing

c. Pulmonary artery wedge tracings

2. Mixed venous oxygen saturation

3. Theromodilution cardiac output

observe/know about a Transesophageal echocardiograpy (TEE) probe and interpret TEE images

F. Manage care during cardiac surgery as follows:

1. Blood replalcement

2. Monitoring the effect of heparin

3. Postcardio:ulmonary bypass coagulopathy

Rationale for various therapies such as aprotinin designed to prevent

Coagulopathy

G. Know following procedures and anesthetic implications:

1. Aortic repairs

2. Congenital repairs - pediatric

3. Coronary artery bypass grafting and valves - adults

4. Electrophysiology

5. Thoracic surgery

6. Transplantation - heart and lungs

H. Work as a team member with fellow anesthesiologists, surgeons, perfusionists, and nurses

I. Maintain good clinical judgment under stress and act quickly and accurately in diagnosis, interpretation, and treatment of intraoperative problems

Evaluation to Determine Goal Achievement.

09HLTH09A02-005-C

NEUROANESTHESIA

I. Goals

A. Administer anesthesia safely to patients with neurologic disease who are undergoing neurologic or non-neurologic surgery, diagnostic procedures requiring anesthesia, or nonsurgical interventions requiring anesthesia.

B. Understand the basic concepts of central nervous system (CNS) physiology as they relate to neuroanesthesia, specifically, mastery of autoregulation of blood flow, blood flow response to CO2, blood flow response to cerebral oxygen ($CMRO_2$) and glucose (CMRglu) metabolic rates, and cerebrospinal fluid physiology.

C. Know the effect(s) of commonly used anesthetic agents and adjuvant agents, for example antihypertensives, on cerebral physiology.

D. Understand the anesthetic implications of the most common neurosurgical procedures, that is, what is likely to happen during neurosurgery that will affect anesthetic management.

E. Understand the basic concepts behind electrophysiologic monitoring of the brain and spinal cord.

F. Understand how concurrent medical illnesses affect anesthesia during neurologic surgery.

II. Objectives

A. Review the medical history and physical examination of patients; assess their major neurosurgical problem. Evaluate the patients Glasgow Coma Scale as well as other medical problems that may affect anesthetic care; and know what information about nervous system function and pathology as important to the anesthesiologist.

1. Recognize both the adult and pediatric patient with poor elastance of increased intracranial pressure (ICP).
2. Evaluate the patient with subarachnoid hemorrhage and intracranial aneurysm by means of the Hunt-Hess and Fischer gradings systems; recognize preoperative vasospasm; and anticipate which patients are likely to require special techniques such as barbiturate protection, hypotension, induced hypertension, or temporary vessel occlusion.
3. Differentiate between radiculopathy and myelopathy and understand the anesthetic implications of each, that is, which patients require awake intubation and positioning.
4. Know the basic differences between the following types of brain, spinal cord, and metastatic tumors of the CNS and their association with edema and intraoperative blood loss. Know the anesthetic implications of:

   a. Acoustic neuroma, Ependymoma, Gliomas, Meningioma, Pituitary tumours

   Understand the following different types of spinal operations as well as their anesthetic implications:

      a. Anterior cervican discectomy and fusions, anterior cervial corpectomies, posterior cervical fusions, laminectomies, and foramenotomy, Laminectomies for excision of spinal cord tumors, both intrameullary and extramedullar, Lumbar laminectomies, microdiscectomies, corpectomies, and fusions with instrumentatio, Thoracic laminectomies and discectomies.

6. Anticipate premedication for and anesthetic considerations during electrocorticography
7. Anticipate airway and sedation requirements for stereotactic neurosurgical procedures conducted with either general anesthesia or monitored anesthesia care

Perform the following specific procedures and monitoring techniques necessary to care for the neurosurgical patient.

1. Choose appropriate premedication and agents for anesthetic induction and maintenance based on a knowledge of their effects on cerebral physiology and on neuropathology
2. Choose and place the following monitors and monitoring devices for use during spinal and intracranial surgery:
   a. Arterial line, central venous (CVP) or pulmonary artery (PA) pressure catheters by all approaches, especially the basilic or cephalic veins
   b. observe/know about Precordial Doppler and interpretation of sounds
3. Perform techniques for awake intubation and positioning of the neurosurgical patient with either an unstable neck or myelopathic signs and symptoms
   a. Assess when awake intubation and positioning are needed
   b. Intubate an awake patient such that coughing or movement are minimal
   c. Master anesthesia for awake intubation, including but not limited to, superior laryngeal and glossopharyngeal nerve blocks and transtracheal injection of lidocaine
4. Detect and treat air embolism during neurosurgery:
   a. Know use of monitors to detect air embolism and what monitoring patterns are associated with air embolism.
   b. Recognize the relative risks of different procedures and positions for air embolism.
5. Know general priniciples of positioning the patient for neurologic surgery and the advantages and disadvantages of each position:
   a. Lateral
   b. Prone
   c. 3/4 prone
   d. Supine-head turned
   e. Sitting - theoretical knowledge only because this position is no longer used at our institution
6. Know anesthetic effects on the electroencephalogram (EEG) and evoked potentials and basic implications of and appropriate responses to changes in each.
7. Understand the basic indications and techniques, and, if possible, perform the following special procedures used during neuroanesthesia:
   a. Induced hypotension
   b. Induced hypertension
   c. Moderate Hypothermia

   Barbiturate cerebral protection, Cardiopulmonary bypass and circulatory arrest — theoretical knowledge only in most instances.
8. Know the differential diagnoses and treatment alternatives of intraoperative intracranial hypertension ("tight brain").
9. Reverse general anesthesia rapidly with a minimum of hemodynamic change to allow early postoperative assessment of the patient and recognize when failure to emerge from anesthesia is not likely an anesthetic effect.
10. Know the management of Head Trauma, and its anesthetic management

III. Evaluation to Determine Goal Achievement

A. Preparation for case and ability to carry out plan discussed the night before:

1. Recognition of intraoperative problems and communication with the attending; ability to appropriately respond to changing clinical situation; clinical judgment
2. Mechanical skills of placing lines and positioning the patient
3. Application of basic and clinical science knowledge and skills to the neurosurgical patient

B. The neuroanesthesia group will meet at the conclusion of each rotation and an overall performance evaluation will be made based on the above criteria ED.

09HLTH09A02-006-C PAIN MANAGEMENT

Acute postop pain management.

I. Goals

A. Differentiate among the different chronic pain states, for example, reflex sympathetic dystrophy and neuropathic or myofascial pain, and know what treatments are effective for each.

B. Know the types of drugs that relieve pain and their efficacy, indications, side effects and contraindications and use.

C. Know the laboratory tests, radiologic studies, and psychological tests used to help differentiate chronic pain syndromes.

D. Learn to perform a thorough, directed history and physical examination, which will emphasize and facilitate the diagnosis of different pain states.

E. Know the multidisciplinary approach to pain management.

F. Know when it is appropriate to refer patients to different specialists for definitive or adjunctive therapy, for example, neurosurgery, orthopedic surgery, neurology.

G. Manage acute and perioperative pain syndromes proficiently.

II. Objectives

A. Learn the anatomy of the sympathetic nervous systems, specifically, the anatomy of the epidural and subarachnoid spaces and the location of sympathetic and parasympathetic ganglia

B. Perform blocks and techniques in administering them that are commonly used to manage acute and chronic pain as follows (Please note: Some of these blocks may not be performed in a given month because of the patient population available during that month):

1. Epidural steroid injuction (all levels)
2. Long-term epidural catheterization — ?
3. Blocks Should observe and know about the following blocks:
   a. Celiac plexus
   b. Infraorbital nerve
   c. Intercostal nerve
   d. Lumbar sympathetic
   e. Stellate ganglion
   f. Facet blocks — ?

4. Complications associated with each blocks and appropriate treatment of each

C. Know the cutaneous dermatomal mappings

D. Diagnose myofascial pain syndromes and perform trigger point injections

E. Know the different modalities of physical therapy that may relieve both acute and chronic pain and learn how to obtain such therapy

F. Know the indications for stimulation techniques such as transcutaneous electrical nerve stimulation (TENS), dorsal column stimulation, and deep brain stimulation

G. Know the acute pain and cancer pain guidelines:

1. Treatments the WHO Treatment Ladder
   - a. Drugs: analgesics, opiates, sedatives, and stimulants
   - b. Nerve blocks
   - c. Neruolysis, surgical and chemical
2. Routes of administration and risk and benefits of each epidural
   - a. Intramuscular
   - b. Intrapleural
   - c. Intravenous
   - d. Oral
   - e. Patient controlled
   - f. Subcutaneous

H. Diagnose and know how to treat the following pain syndromes:

- a. Diabetic neuropathy
- b. Inflammatory states such as bursitis, carpal tunnel syndrome, skeletal pain, and tendonitis
- c. Phantom limb pain
- d. Post-herpetic neuralgia
- e. Reflex sympathetic dystrophy
- f. Trigeminal neuralgia
- g. Low back pain

III. Evaluation to Determine Goal Achievement

09HLTH09A02-007-C

PEDIATRIC

I. Goals

A. Administer anesthesia safely for routine surgical, diagnostic, and therapeutic procedures.

B. Recognize and treat postanesthesia problems

C. Recognize when you or your institution cannot provide adequate care for a particular problem

II. Objectives

A. Preoperative

Neonatal anatomy and physiology applied to conduct of anesthesia.

1. Review the chart, take an adequate history, assess the major systemic problems, identify special problems such as latex allergy or apnea related to prematurity, and develop a plan of care.
2. Recognize and cope with the emotional problems of parents and child, and attempt to alleviate them.
3. Know the priniciples of and medications used for preoperative sedation.
4. Induce anesthesia in an distraught or uncooperative child.
5. Recall and state the anatomic, physiologic, and pharmacologic differences and similarities in the major organ systems between children and adults.
6. Transport safely a sick pediatric patient to the operating room and be able to state and perform the solutions to any problems which may arise in the following areas:
   a. Heat maintenance
   b. Cardiovascular stability
   c. Ventilation
   d. Oxygenation
7. Record and estimate preoperatively blood volume, hourly fluid requirements, estimated fluid deficit, third space loss, red cell mass at the patient's hematocrit, acceptable red cell mass loss, and acceptable blood loss.

B. Intraoperative

1. Know appropriate endoracheal tube sizes - cuffed and uncuffed.
2. Induce and maintain anesthesia by inhalation, intravenous, intramuscular, and rectal routes and know the differences in effects of various anesthetics between adults and pediatric patients.
3. Administer mask or laryngeal mask airway anesthesia when appropriate.
4. Maintain the airway of an anesthetized pediatric patient and intubate the trachea without trauma in 98% of cases within 1 minute.
5. Perform awake intubation.
6. Recognize abnormal airways and maintain them during anesthesia.
7. Describe the appropriate management of laryngospasm.
8. Recognize the following signs of hypoxias: bradycardia, poor color, poor venous filling, distant heart tones, and abnormal elctrocardiogram.
9. Understand the various forms of breathing circuits used in pediatric anesthesia and them appropriately.
10. Apply consistently and interpret data from a blood pressure cuff, electrocardiogram, oximeter, capnograph or mass spectrometer, and a thermistor.
11. Know the indications of use of a heat lamp and heated humidifier when appropriate Answer questions concerning the importance of thermoneutrality in pediatric by demonstrating the use and abuse of the followi.ng. Heat lamp.b. Heat blanket. Heat humidifier. Room temperature.
13. Master the techniques of halothane and isoflurane/nitrous oxide/oxygen/muscle relaxant anesthesia.
14. Determine and discuss when deep or awake extubation is appropriate and apply the proper approach.
15. Understand and apply the basic concepts of neuromuscular blockade in children, know when anesthesia is adequately reversed, and know the differences between dose/effect in infants and children as compared to adult patients.

16. Apply the priniciples of fluid and blood replacement during anesthesia.
17. Understand the benefits and risks of regional anesthesia, including spinal anesthesia and regional analgesia for postoperative pain.

C. Postoperative

1. Transport safely and manage immediate postoperative care in the following areas: ventilation, oxygen administration, temperature control, cardiovascular monitoring, fluid balance, and pain relief.
2. Recognize postoperative croup and treat it.
3. Understand postanesthesia apnea, factors associated with it, the appropriate duration of monitoring, and treatment.

D. Special problems

1. Manage the following in pediatric patients undergoing anesthesia and surgery:
   a. Blood replacement
   b. Drug administration and anesthetic requirement (minimum anesthetic concentration)
   c. Fluid and electrolyte balance, glucose requirement, and renal maturation
   d. Hypocalcemia
   e. Hypoglycemia
   f. Metabolism
   g. Temperature control
   h. Vitamin K administration
2. Care of patients in the following special circumstances:
   a. Special problems
      i. Congenital heart disease
      ii. Epiglottitis
      iii. Malignant hyperyrexia
      iv. The child with the anatomically difficult airway (e.g. Pierre Robin syndrome)
   b. Special procedures
      i. Bronchoscopy (in particular for foreign body aspsiration)
      ii. Tonsillectomy (in particular for the rebleeding tonsil)
      iii. Computerized axial tomographic scan and magnetic resonance imaging
3. Know and experience management of a pediatric patient with a full stomach
4. Identify the following various problems in pediatric patients and handle them:
   a. Diaphragmatic hernia
   b. Omphalocele and gastroschisis
   c. Pierre-Robin syndrome
   d. Pyloric stenosis
   e. Tracheoesophageal fistula
5. Understand pediatric resucitation, drugs and doses used for it, and defibrillation

III. Evaulation to Determine Goal Achievment

09HLTH09A02-008-C OBSTETRIC

I. Goals

A. Learn how the physiology of normal pregnancy alters the response to anesthesia
B. Learn pertinent aspects of fetal and placental physiology
C. Learn what obstetricians may require from anesthesiologists
D. Learn how pregnancy creates special problems for the anesthesiologist learn the nature of high-risk obstetrics and how special medical problems alter the approach to obstetric anesthesia
E. Participate in morbidity mortality conference and ongoing research

II. Objectives

F. Learn how to evaluate the neonate and principles of neonatal resuscitation
G. Learn how drugs affect the neonate
H. Learn how to communicate effectively with obstetricians and with labor and deliver nurses.
A. Obtain pertinent information from the history and physical examination of the obstetric patient to assess major systemic problems
B. Understand obstetric physiology and pharmacology as follows:
   1. Alteration of maternal physiology during pregnancy
   2. Effects fo anesthesia, both general and regional, on human uteroplacental blood flow and of adjunctive medications such as vasopressors and vasodilators on uterine blood flow
   3. Perinatal pharmacology and placental transfer of drugs
   4. Effects of epidural and systemic medications on labor and delivery
   5. Learn all anesthetic techniques suitable for managing normal labor pain including:
      a. Epidural local anesthesia
      b. Epidural opiate anesthesia
      c. Inhalation analgesia
      d. Intravenous analgesia
C. Understand epidural and spinal analgesia and anesthesia as follows:
   1. Anatomy and physiology of the epidural space and spine
   2. Techniques of needle placement including midline and paramedian approaches
   3. Pharmacology of local anesthetics
   4. Complications and side effects
D. Know common problems encountered in continuous epidural infusion and how to prevent and treat them
E. Know how to use of intraspinal opiates in obstetrics:
   1. Physiology and pharmacology

2. Benefits for labor, deliver and postoperative pain
3. Side effects

F. Understand the advantages of regional and general anesthesia for cesarean section

G. Know the risk factors, prevention, and treatment of maternal aspiration

H. Evaluate difficult airways and know how to prevent the problems associated with them and to manage failed intubation

I. Be familiar with recent advances in obstetric anesthesia
1. The effect of epidural anesthesia on labor and deliver
2. Drug interaction
3. The epidural test dose
4. Anesthesia for pre-term delivery

J. Recognize high-risk factors in obstetric patients and how they affect anesthetic management as follows:
1. Morbid obesity and anesthesia: Problems and management
2. Preeclampsia: Basic considerations and controversy in management
3. Neurologic disease and pregnancy

K. Understand anesthetic choices for the pregnant patient with heart disease

L. Identify and manage common medical emergencies in the post-parturient

M. Know how the late 20th century social problems affect anesthetic care, such as perinatal human immunodeficiency virus infection and maternal substance abuse

N. Manage maternal anesthesia and the stressed fetus

O. Know current fetal monitoring techniques and how to interpret the information they provide

III. Evaluation to Determine Goal Achievement

09HLTH09A02-009-C

REGIONAL ANESTHESIA

I. GOALS

A. To teach anesthesia residents the art and sciences of regional anesthesia understand the anatomy, pathophysiology, and appropriate management of complications and side effects of regional anesthetic techniques. - the test doses; total spinal, subdural blocks - assessment and treatment; Risks of spinal, epidural hematoma and abscess - assessment and treatment; Postdural puncture headache - assessment and treatment; Pneumothorax- assessment and treatment; Physiologic side effects: sympathectomy, phrenic nerve block, intercostal nerve block - assessment and treatment; Peripheral nerve injury - assessment and follow up.

B. To understand general priniciples of local anesthetic pharmacology, including the pharmacodynamics and pharmacokinetics of various local anesthetics. This includes onset duration, motor/sensory differentiation, and toxicity profile of various local anesthetics and allergy its treatment:

C. To understand the principles and indications for various local anesthetic adjuvants including:

Epinephrine. phenylephrine. narcotics. sodium bicarbonate. carbonation. hyaluronidase. alpha agonists. anticholinesterases.

D. To be familar with the relevant anatomy for regional techniques. including: Spinal canal and its contents. neural plexuses of the limbs. major autonomic ganglia.

E. Be familiar with the physiologic changes associated with spinal and epidural anesthesia.

F. Understand the indications for and the contraindications to regional anesthetic techniques including central neuraxis blocks. peripheral nerve blocks. sympathetic nerve blocks.

B. COGNITIVE SKILLS

At the compleltion of this rotation residents should be able to demonstrate the following skills.

1. Rational selection of regional anesthesia technique and choice of local anesthetic for particular patient encounters.
2. Ability to assess adequacy of regional anesthesia before the start of surgery. and demonstrate appropriate plans for supplementation of inadequate blocks.
3. Provide effective anxiolysis and sedation of patients by both pharmacologic and interpersonal techniques.
4. Select appropriate monitors for specific patient encounters. and document performance of regional anesthetic adequately.

III. EVALUATION TO DETERMINE GOAL ACHIEVEMENT

SKILLS SHEET FOR RESIDENTS ON THE REGIONAL ANESTHESIA ROTATION

Demonstrate ability to perform/familiarity with the following regional anesthesia techniques:

- Brachial plexus blockade
- sciatic nerve block
- femoral nerve block. o or 3-in-1 block
- Caudal block – adult and peadiatric
- ankle block
- epidural block/Catheter
- spinal subarachnoid block
- Biers block
- others

OBJECTIVES OF DENTAL ANESTHESIA

Understand the principles of conscious sedation

Principles of anesthesia in a dental Chair

Local Blocks For Dental Surgery

OBJECTIVES OF TRANSPLANT ANESTHESIA

Know the basic Principles of anesthetizing An immunocompromised Patient Principles of anesthetising patient with end stage renal/liver disease Warm/Cold ischemic Time

OBJECTIVES FOR OPHTHALMOLOGY POSTING

1. Give anesthesia for intra and extraocular surgery
2. To anesthetize premature babies for ROP surgery.
3. To give Monitored Anesthesia Care to learn to sedate patients for MAC
4. To give Ophthalmic nerve blocks.

OBJECTIVES FOR ENT POSTING

1. To give topical anesthesia for awake intubation.(nasal and oral)
2. To give local block for Tonsillectomy
3. Local anesthesia for tracheostomy..
4. Local block for thyroid surgery TO give anesthesia for MLS
5. To give anesthesia for Laser surgery of airway.
   To give anesthesia for vascular malformations /tumours of noses

APPENDIX — I

Text books:

1. Miller RD. ed. Anesthesia. 5th ed.
2. Wylie Churchill Davidson
3. Nunn and Utting
4. Stoelting RK. Miller RD. eds. Basics of Anesthesia

APPENDIX (CARDIAC)

Text books:

1. JA Kaplan: Cardiac Anesthesia J Benum of: Anesthesia for Thoracic Ssurgery
   C Lake: Pediatric Cardiac Anesthesia

APPENDIX (NEURO ANAESTHESIA)

Text books include:

1. Cucchiara and Michenfelder: Clinical Neuroanesthesia. Churchill-Livingstone
2. Cottrell and Smith: Anesthesia and Neurosurgery. 3rd ed. CV Mosbyd
3. Millelr: Aanesthesia. 4th ed. Churchill-Livingstone: chapters 21. 38. and 56
4. Kirby and Gravenstein: Clinical Anesthesia Practice. WB Saunders: chapters 22. 4. and 73
5. Russell and Rodichok: Primer of Intraoperative Neurophysiologic Monitoring. Butterworth and Heinemann

APPENDIX (PEADIATRIC ANAESTHESIA)

Text books:

1. Gregory GA: Pediatric Anesthesia, 2nd ed
2. Steward D: Handbook of Pediatric Anesthesia, MD

APPENDIX (ICU)

1. ICU Book Paul Marino
2. Critical Care by Joseph Civetta, Robert W Taylor and Robert Kirby publisher Lippincott

APPENDIX (PAIN)

1. Bonica: The Management of Pain
2. Cousins and Bridenbaugh: Neural Blockade in Pain Management
3. Raj: Practical Management of Pain

ASSESSMENT METHODS

Assessment is a vital part of any course and it is element where there is frequently considerable doubt. There are 2 major components:

A) Formative Assessment: Ongoing evaluation during the course – During each posting/ Module/ End Unit

B) Summative Assessment: Final assessment after 3 years and/at the end of each semester Assessment

FORMATIVE ASSESSMENT/(Ongoing Evaluation)

Formative assessment will be conducted during each posting/module/unit. This will include the following:

TECHNICAL SKILLS COMPETENCY EVALUATIONS:

Methods to be used

1) Performing anaesthetic management on real patients (check lists of each skill and competency including log book evaluation)
2) Simulators
3) Objective Structured Clinical Examination (OSCE)

This evaluation will be done either in the OT or ICU or PAC or Postoperative wards.

PROBLEM SOLVING CASES:

Method to be used

1) Case presentations (evaluation by Peers)
2) Simulated case cards

3) OT discussions
4) OSCE

ORAL SKILLS – Attitudinal Development:

Method to be used
1) Ability to present seminars, discussion in class room (evaluation by Peers)
2) Talking to patients in pre-anaesthesia rounds
3) Operation theatre Management

CARDIOPULMONARY RESUSCITATION:

Method to be used
1) Mannequins demonstration
2) Check lists for evaluation
3) OSCE

C P R evaluation will be repeated at the end of each semester

SUMMATIVE ASSESSMENT (FINAL ASSESSMENT) and End Semester assessment

1) THEORY (Subject contents already outlined in curriculum)

Should consist of

a) Structured Essay Questions (SEQs) .
b) Short Answer questions (SAQs) minimum of 10 SAQs will be Mandatory (in all four papers taken together)
c) Problem Solving Questions ,
d) Multiple choice Questions (MCQs) MCQs of different types Shoule be included atleast in one of the 4 papers. The use of MCQs is recommended for formative/end semester evaluation.

Final Theory papers: 4 Papers

		Marks
Paper I	Basic Sciences as applied to Anaesthesiology, including ethics, statistics. Quality assurance, medicolegal Aspects.	100
Paper 2	Anaesthesia in relation Associated Systemic	100
Paper 3	Anaesthesia in relation to subspecialities such As cardiac, neuro, obstetrics and pediatrics etc.	100
Paper 4	Intensive care Medicine, Pain Medicine and Recent advances in Anaesthesiology	100

2) PRACTICAL

4 components: Marks

The practical examination should be structured and objective as possible

	1 long case	40 min	100
A) Clinical Cases			
	2 Short cases	15 min each	40 each

Structured Assessment (Long Case)

1.	Oral skills/presentation	10
2.	Diagnosis/investigations	10
3.	Preanaesthetic Preparation	20
4.	Anaesthetic management	40
5.	Post operative complications & management	20
B)	**OSCE:** At least 10 OSCE stations with checklists For objective assessment marks	20

C) VIVA-VOCE (Structured)

		TOTAL MARKS: 200
1.	Problem solving situations	40
2.	Drugs/Anaesthetic	40
3.	Equipments for Anaesthesia/In. Care	40
4.	Investigations}ECG/Xrays/MRI Endoscopy etc.	40
D) 1.	**CPR** Assessment on Mannequins	40

	Total Marks
Theory (Papers 1-4)	400
Practical (Cases, OSCE, Viva Voce)	400
Grand Total	**800**

The candidate will be required to secure minimum 50% marks in theory and 50% marks in clinicals and viva-voce separately, which is mandatory for passing the whole examination. Candidate failing in theory will not qualify to take practical examinations. There should be enough gap between theory and practical Exam. As recommended by MCI rules.

Final Assessment Marks Weightage

30% : Internal (Formative) Assessment & Thesis

70% : Summative Assessment

The committee recommends that three external and three internal examiners should conduct the clinical examination. A maximum of 4 candidates should be examined per day and if there are more than 4 candidates the examination should be conducted on 2 consecutive days.

THESIS

Objectives

1. The student would be able to demonstrate capability in research by planning and conducting systematic scientific inquiry & data analysis and deriving conclusion.
2. Communicate scientific information for health planning.

Guide for thesis

1. Chief guide will be from the department of Anaesthesiology
2. Co-guide(s) will be from the department or from other disciplines related to the thesis.

Submission of thesis protocol

It should be submitted at the end of six months after admission in the course.

1. Protocol in essence should consist of:
   a. Introduction and objectives of the research project.
   b. Brief review of literature.
   c. Suggested materials and methods, and (scheme of work)
   d. Statistician should be consulted at the time of selection of groups, number of cases and method of study. He should also be consulted during the study.
   e. Bibliography
2. The protocol must be presented in the department of Anaesthesiology before being forwarded to the Research Committee of the Institute.
3. Protocol will be approved by the research committee appointed by the Dean/Principal to scrutinise the thesis protocol in references to its feasibility, statistical validity, ethical aspects, etc.

Submission of thesis

1. The thesis shall relate to the candidate own work on a specific research problem or a series of clinical case studies in accordance with the approved plan.
2. The thesis shall be written in English, printed or typed on white bond paper 22 × 28 cms with a margin of 3.5 cm, bearing the matter on one side of paper only and bound with cloth/rexine, with the title, author's name and the name of the College printed on the front cover.
3. The thesis shall contain: Introduction, review of literature, material and methods, observations, discussions, conclusion and summary and reference as per index medicus.

Each candidate shall submit to the Dean four copies of thesis, through their respective Heads of the Departments, not later than six months prior to the date of commencement of theory examination in the subject.

Evaluation of thesis

1. The thesis shall be referred by the University evaluation to the Examiners appointed by the University. The examiners will report independently to the Controller of Examinations and recommend whether the thesis is-

a) approved

b) returned for improvements as suggested or

c) rejected

2. The thesis shall be deemed to have been accepted when it has been approved by atleast two external examiners and if the thesis is rejected by one of the external examiners it shall be referred to another external examiner (other than the one appointed for initial evaluation) whose judgement shall be final for purposes of acceptance or otherwise of the thesis.

3. Where improvements have been suggested by two or more of the examiners, the candidate shall be required to re-submit the thesis, after making the requisite improvements, for evaluation.

4. When a thesis is rejected by the examiners, it shall be returned to the candidate who shall have to write it again. The second thesis, as and when submitted shall be treated as a fresh thesis and processed.

5. Acceptance of thesis submitted by the candidate shall be a pre-condition for his/her admission to the written, oral and practical/clinical part of the examination.

   Provided that under special circumstances if the report from one or more examiners is not received by the time, the Post-graduate examination is due, the candidate may be permitted provisionally to sit for the examination but the result be kept with held till the receipt of the report subject to the condition that if the thesis is rejected then the candidate in addition to writing a fresh thesis, shall have to appear in the entire examination again.

6. A candidate whose thesis stands approved by the examiners but fails in the examination, shall not be required to submit a fresh one if he/she appears in the examination in the same branch on a subsequent occasion.

TMC

MEDICAL ONCOLOGY — D M

(Program Code: HLTH10A01)

INTRODUCTION

The practice of oncology is in a period of significant change. There is an expansion of new information regarding the molecular and cellular biology, immunology and biochemistry of cancer and a steady increase in our ability to more effectively diagnose and treat human malignancies. 'Medical Oncology' as a specialty has assumed immense importance. Institute Rotary Cancer Hospital, All India Institute of Medical Science is one of the few centers in India that provides the prestigious postgraduate super specialty course-DM Medical Oncology. It is important that the candidates interested in pursuing their career in medical oncology, besides a good clinical acumen, possess a sound understanding of the related basic sciences. They should be able to comprehend the essentials of molecular biology, genetics, signal transduction and immunology and translate the knowledge into clinical practice.

GOAL OF THE PROGRAM

To ensure adequate supply of medical oncology experts who assume leadership role in their fields.

AIMS OF THE PROGRAM

To produce a medical oncologist who:

1. Is capable of providing an excellent patient care
2. Possesses adequate knowledge base (both basic and applied) to effectively interact with medical colleagues in a wide range of disciplines.
3. Is a good researcher
4. Is a competent teacher

OBJECTIVES AND GUIDELINES TO THE CONDUCT OF PROGRAM

It is a 3-year course that imparts intense training to DM candidates into the field of medical oncology and related subjects with adequate exposure to clinical and laboratory based activities.

CLINICAL TRAINING

The objectives of the clinical training are:

1. To develop clinical judgment and technical skills in diagnosis and the total management of patients with neoplastic diseases, with various modalities of treatment individually or in combination

2. To make the student expert in handling all kinds of medical emergencies arising either due to cancer spread or problems related to therapy. The latter include: a) infections secondary to severe neutropenia, leading to respiratory distress/failure, renal insufficiency, hepatic insufficiency, and neurological disturbance, b) hemorrhagic complications, c) electrolyte disturbance, d) other toxicities.

3. To impart full knowledge concerning cancer chemotherapy, hormone therapy, biologics, gene therapy, immune therapy; their mechanism of action, side effects, mode of administration, inter-relation with other drugs and their therapeutic effects.

4. To make the candidate familiar with all the modern diagnosis aids including ultrasound, CT scan, NMR, MRI, PET scans, mammography, endoscopy, and radinuclide scans.

5. To make the candidate conversant with the indications and application of blood component therapy, newer antibiotics, newer antifungal and antiviral agents and other supportive measures.

6. To make the candidate fully conversant with and trained in various aspects of high dose chemotherapy and stem cell transplantation (both allogeneic and autologous) including schedule of treatment, indication for the use of growth factors, GVHD prophylaxis and management of various complications including acute and chronic GVHD.

7. To provide an insight into clinical trials (design, data collection, analysis and interpretation of related statistics), cancer epidemiology, preventive and community oncology.

8. To make the candidate understand the psychology of his patients, which is often disturbed with the knowledge that he or she has a cancer. The candidate will be made to learn to understand and tackle these psychological issues with compassion and gentle behaviour.

9. To teach the candidate about effective communication skills and how to impart bad news to the patients.

10. To make them expert in managing the terminally ill patients. They would be given knowledge regarding pain management and other palliative care measures.

GUIDELINES

The candidate works in the department of medical oncology as following

INDOORS POSTING

This may vary from **8 to 12 months**

The candidate is allotted certain beds and he is required to work up patients admitted on those beds. He plans out a diagnostic work up and treatment plan, discusses it with the concerned consultants, presents it on the grand rounds and assumes complete responsibility of the patients during their hospital stay. He should work in harmony with the ward nurses.

OUT PATIENT DEPARTMENT (OPD) POSTING

Duration is **16 months**. The candidate is posted to **chemotherapy evaluation clinics** and various **specialty clinics** including *breast cancer, gastrointestinal, urology, lymphoma-leukemia, pain evaluation, bone and soft tissue, pediatric tumors, head and neck, gynecology oncology, pulmonary oncology.*

The candidates posted to these clinics work under the supervision of consultants. They are expected to see new as well as follow-up patients so as to plan out the management and assess the therapeutic responses of a particular patient.

DAY CARE AND OPD PROCEDURES (MINOR OT) POSTING

Duration is 4 months. During this posting a candidate is expected to learn skills

- In introducing per cutaneous subclavian, internal jugular, and femoral vein catheters
- Familiarity with different venous access devices likes Hickman catheter, subcutaneous port etc.
- Institution of chemotherapy and supervision of side effects
- Procedures like bone marrow biopsy, liver biopsy, trucut biopsy, lumbar puncture, intrathecal chemotherapy and aspiration of fluids.

BMT UNIT POSTING

Duration is **2 months**. The candidate works under the supervision of concerned consultants and assumes responsibility of managing the patients undergoing high dose chemotherapy.

ELECTIVE POSTING

It is for **6 weeks**. The candidate selects the area of his or her interest, it may be training within the institute or at other specialized centers within or out side India. The candidate is required to seek acceptance from the concerned departments/centers where he wishes to work and also permission from the Chief IRCH.

ANCILLARY POSTING

It will be for 3 months as follows:

- Surgical oncology (3 weeks)
- Radiation oncology (3 weeks)
- Laboratory (4 weeks)
- Rotation to blood bank and nuclear medicine department (1 week each)
- Radiodiagnosis (2 weeks)

LABORATORY TRAINING

The candidate, apart from understanding the value of laboratory tests in a given malignancy must possess the basic knowledge of interpreting the laboratory data and correlating it with clinical data. For this purpose, candidate is posted in various laboratories through laboratory posting or dissertation topic.

- The candidate are posted to various laboratories, some o which are attached to medical oncology itself, such as cytogenetics laboratory, in-vitro tissue culture laboratory. In addition, candidate is posted in immunology, microbiology, HLA and pathology laboratory.
- These postings enable the candidate to understand histopathology, immunopathology, histochemsitry, cytopathology, genetics of tumors, their functional properties and modes of spread etc. He is also made familiar with the various types of stem cell mobilization, harvesting, and cryopreservation techniques.
- The candidate is required to learn the basic techniques of tissue culture, cytogenetics, staining and study of peripheral/bone marrow smears, operation of blood cell counter and cell separator machine.

RESEARCH TRAINING

The candidate is introduced to the field of research in medical oncology; both at clinical and laboratory level.

DISSERTATION

The candidate is required to work on **2 projects clinical** and **laboratory based**. The research proposals are to be submitted within 6 months of joining the course and completed report 6 months before the final exam. Every 6 months the candidate should present the progress report on the thesis work.

The candidate can either design a prospective study or do retrospective analysis related to his thesis work. The candidate should see to it that the study is published in a national or international journal.

Besides the dissertation work, the candidate is encouraged to work on and publish case series and case reports in peer reviewed journals and send papers for presentation to national and international conferences. He is also be encouraged to design new clinical as well as laboratory based protocols, to write research proposals for granting of funds and to establish new laboratory techniques.

TRAINING ORIENTED TOWARDS MAKING THE CANDIDATE AN EXPERT TEACHER

Academic schedule

Integrated teaching program to expose the candidate to various fields of oncology are provided by regular clinico-pathologic conferences, seminars, case discussion sessions, and radiology conferences. Following academic activities are planned through out the year except during summer and winter vacations. The candidate will be encouraged to actively participate in these meetings, carefully listen to the topics, ask questions, critically analyze and give his/her comments and suggestions.

Monday: Teaching program, 8-30 to 9-30AM. Faculty from IRCH and from other departments at AIIMS discusses topics related to basic and clinical oncology, biostatistics, making an effective presentation etc.

Tumor Board, 4-30 to 5-30 PM. By rotation senior resident working with each of the faculty members brings some interesting/difficult case/es for discussion. After taking into consideration view points of various members, a consensus is reached as to the best treatment plan for the patient.

Tuesday: Radioconference, 8-30 to 9-30 AM. The radiographs, CT/MRI/bone scans and GI series of patients seen in the OPD and wards are discussed with the radiologist. If present, serial films are discussed. This helps in diagnosis, staging, prognosis and response evaluation. It is preferable that the senior resident reads the films and then asks for the expert opinion.

Oncopath Conference, 12 noon to 1 PM. The senior residents provide the clinical history of the cases and the histopathology slides are discussed with the expert pathologists.

Wednesday: Journal club/mortality meeting, 8-30 to 9-30 AM. Alternatively journal club and mortality meeting are planned. In the journal club, the senior resident reviews relevant studies published in the latest journals, presents them and critically analyze the design of the study, the results, drawbacks and feasibility of carrying out the study in our set up. In the morality meeting, the treatment course and probable cause of death of the patients expired recently in the IRCH ward is discussed. The senior resident also discusses a related topic in detail.

Thursday: Seminar, 8-30 to 9-30 AM. Candidate presents a given topic and discusses it. He should be able to review the topic critically and make independent observations.

Friday: 8-30 to 9-30 AM. During this session, the candidates present their research proposals and update on their projects. Also case discussions are held, whereby the candidate presents the case history, examination and management plan of the patient.

CONDITIONS FOR CERTIFICATION

The candidate will be guided and judged as regards his/her abilities to provide competent care to his patients through various means like ward rounds, discussions held in OPD/clinics and weekly academic activities. Internal assessment through internal examination held in March and September every year will be done and this record will be made available at the time of final examination.

EXAMINATION

The examination will be conducted in there parts.

1. *Theory paper*

Paper I

Basic science in oncology: Radiation physics, Tumor biology, Biochemistry, Biometry, Immunology and Pharmacology.

Paper II

General oncology, Tumor pathology, Staging, Diagnosis, Radiology, Nuclear medicine.

Paper III

Medical Oncology including chemotherapy, epidemiology, rehabilitation, terminal care, clinical trials and prevention.

2. *Clinical and practical*

Long case I

Short cases 4

Spotters 4

3. *Viva-voce*

Grand viva, histopathology, hematology slides, CT scans and X rays.

BOARD OF EXAMINATION

Two internal and two external examiners

Assessment of Candidate

1. Assessment of the three parts of the examination shall be done jointly by the members of the respective board of examiners.
2. Assessment of theory papers will be done individually by each examiner. The average of marks will be taken into consideration
3. A candidate will be declared to have qualified for the DM degree in medical oncology if the candidate has satisfied the members of the respective boards of examiners individually and collectively that he/she had an adequate knowledge in all aspects of the three parts of examination. The candidate is required to score at least 50% of marks in theory separately and 50% of marks in clinical and viva-voce examination taken together.
4. A candidate whose thesis/research work has not been approved or who is unsuccessful in any part of the examination will be followed up as per institute rules.
5. The examination is conducted generally twice a year in the months of May and December.

SYLLABUS

09HLTH10A01-001-C

Paper I (Basic Science in Oncology)

1. Cell cycle
2. Pathology, Invasion & Metasssssstasis
3. Etiology of Cancer
   a. Viral
   b. Chemotherapy
   c. Physical
   d. Hormonal
4. Epidemiology of Cancer
5. Principles of Cancer Management – Surgical Oncology, Radiation Therapy, Chemotherapy, Biologic therapy
6. Pharmacology of Cancer Chemotherapy
7. Clinical trials in cancer

8. Cancer prevention Tobacco related cancer. Diet & Risk reduction Chemopreventive Agents, Hormones
9. Caner Screening
10. Imaging Techniques of Cancer Diagnosis & Management
11. Specialized techniques of Cancer Diagnosis and Management
12. Vascular Access and Specialised Technique of drug delivery

09HLTH10A01-002-C

Paper – II Clinical Oncology (Medical)

1. Cancer of Head and Neck
2. Cancer of Lung and Mediastinun
3. Cancer of Gastro Intestinal Track
4. Cancer of Genito Urinary System
5. Cancer of the Breast
6. Cancer of Endocrine System
7. Sarcomas of Soft Tissues & Bone
8. Benign & Malignant Mesotheliomas
9. Cancer of skin
10. Malignant Melanoma
11. Neoplasms of CNS
12. Cancers of childhood
13. Lymphomas
14. Leukemias and other Haematological Malignancies
15. Paraneoplastic Synddromes
16. Cancers of unknown primary site
17. A.I.D.S – related malignancies
18. Oncological Emergencies
19. Treatmetn of Metastatic Cancers
20. Gynaecological Cancers
21. High Dose Chemotherapy & Transplantation

09HLTH10A01-003-C

Paper – III (Recent Advances in Oncology)

1. Essentials of Molecular Biology
2. Molecular Biology of Cancer: Onccogenes Cytogenetics
3. Bone Marrow dysfunction in cancer patient
4. Infections in cancer Patients and neutropenic patients
5. Adverse effects of treatment
6. Supportive Care and Quality of Life

7. Rehabilitation of Cancer Patient
8. Newer approaches in caner treatment
9. Newer drugs in cancer treatment

Periodicals Recommended

Book	*Editor*

Curriculum & syllabus for DM in pediatric oncology

Curriculum:

Aims and Objectives:

To train a pediatrician having requisite postgraduate qualification (MD Pediatrics or its equivalent) as a specialist in Pediatric Oncology who at the completion of the program would be able to:

1. Diagnose and provide comprehensive care to children with hematological and solid malignancies
2. Is able to carry out all necessary diagnostic and therapeutic procedures as required for the care of children with hematological and solid malignancies
3. Is equipped with adequate basic and applied knowledge to deliver optimal treatment for all childhood malignant disorders
4. Counsel parents and relatives of the the patient with empathy and compassion
5. Design and execute research projects
6. Interact with medical colleagues in multiple disciplines
7. Conduct teaching sessions, bedside seminars and lectures

Eligibility:

M.D. Pediatrics or equivalent

* At present candidates with MD Pediatrics or equivalent degree are eligible for DM in Medical Oncology which is being stopped after the DM Pediatric Oncology is established .

B. Duration of the course*:*

Three years residency program (6 semesters)

C. Admission to the Course*:*

As per MCI rules

D. Proposed Training Program*:*

1. Indoor service:

a) The candidates will learn the management of various hematological and solid tumors of childhood, and their early diagnosis as well as interpretation of various tests and procedures for optimal outcome.

b) Throughout the three years of training, the candidate will maintain a weekly continuity clinic that provides the opportunity to care for patients longitudinally and to continually improve clinical skills. Candidates establish an ongoing relationship with patients and their families and, under the guidance of a faculty member in pediatric oncology, take primary responsibility for establishing chemotherapy treatment plans, participating in surgical and radiotherapy treatment decisions, and treating complications of a disease or its therapy.

c) They would perform specialized diagnostic and therapeutic procedures like bone marrow aspiration and trephine biopsy, FNAC, true cut biopsy, use and care of central venous access, lumbar puncture along with administration of intrathecal chemotherapy,pleurocentesis,pericardiocentesis,peritoniocentesis, stem cell harvest (PBSC and bone marrow) etc. wherever indicated and learn the use and maintenance of various equipment used for patient care.

2. Outdoor Service: These would be an integral part of the functioning of the Pediatric Hemato-oncology Clinic and the Pediatric solid tumor Clinic.

3. Subspeciality clinics: They will also get opportunity to be involved in the care of Pediatric Oncology patients with special needs:

a) Day Care Centre: for giving chemotherapies, blood transfusions, care of central venous lines conducting routine procedures

b) Leukemia/Lymphoma Clinic

c) Solid tumour clinic

d) Neuro-oncology Clinic

e) Bone-soft tissue tumor clinic

f) After completion of therapy (ACT) clinic: for long term follow up of patients completed chemotherapy

g) Palliative care clinic

Research

The candidate would be introduced to research methodologies and would be expected to complete an independent research project under the supervision and guidance of the faculty to be submitted as a dissertation.

Teaching Programme*:*

1. In addition to the daily instructions that candidates receive from faculty on the inpatient services, and mini-rotations, there will be daily clinical/ academic activities designed to enhance the candidate's learning experience for which they will maintain a Logbook, to be submitted at the time of final examination.

2. The candidate would participate in all teaching activities both intradepartmental as well as interdepartmental. The academic activities should include :

a) Morning in-patient rounds

b) Case presentations

c) Ward grand rounds

d) Mutidisciplinary joint meeting/round with pathologist/ haemato-pathologist ;radiolologist; radiotherapist; pediatric/ neuro/ortho surgeons

e) Seminars & Journal Clubs

Clinico-pathological conferences

f) Mortality meetings

g) Autopsy conferences

A minimum of one hour a day should be devoted for academic activity .

Syllabus:

<u>09HLTH10A02-001-C</u> General principles of pediatric oncology

- Epidemiology of Childhood Cancer
- Childhood Cancer and Heredity
- Molecular and Genetic Basis of Childhood Cancer
- Biology of Childhood Cancer
- Tumor Immunology and Pediatric Cancer
- Pathology and Molecular Diagnosis of Pediatric Malignancies
- Imaging Studies in the Diagnosis and Management of Pediatric Malignancies
- Principles of Chemotherapy
- Principles of Surgery
- Principles of Radiation Oncology
- Principles of supportive care & oncologic emergencies
- Infants and Adolescents with Cancer: Special Considerations
- Cancer Clinical Trials: Design, Conduct, Analysis, and Reporting
- Good clinical practice
- Cell and Gene Therapies – Role in pediatric oncology
- Evolving Targeted Therapies and biotherapeutics

<u>09HLTH10A02-002-C</u> Hemato-oncology: [Acute lymphoblastic leukemia;Acute Myelogenous Leukemia;Chronic Leukemias of Childhood; Myelo-proliferative and Myelodysplastic Disorders;Hodgkin lymphoma; Non-Hodgkin Lymphomas ;Lymphoproliferative Disorders and Malignancies Related to Immunodeficiencies; Histiocytoses]

- Diagnosis including morphology, cytochemistry, immuno-phenotyping & cytogenetics & participation in clinicao pathological meetings
- Inpatient and outpatient care
- Management of emergencies and treatment related complications
- Risk stratification & appropriate treatment planning
- Treatment as per clinical protocol

- Response evaluation
- Follow up guidelines
- Late effects
- Diagnosis & treatment option for relapse
- Data collection

09HLTH10A02-003-C Extra cranial solid tumour: [Retinoblastoma;Tumors of the Liver; Renal Tumors; Neuroblastoma; Rhabdomyosarcoma and soft tissue sarcomas;Ewing Family of Tumors; Osteosarcoma; Germ Cell Tumors; Endocrine Tumors &Rare Cancers of Childhood]

- Inpatient and outpatient care in conjunction with Pediatric Surgical Oncologist/Pediatric Surgeon, orthopedic Surgeon, Radiotherapist[preferably dedicated to pediatrics]Radiologist & Pathologist/Molecular Pathologist and participation in tumor boards.
- Management of emergencies and treatment related complications
- Staging, Risk stratification & appropriate treatment planning
- Treatment as per clinical protocol
- Response evaluation
- Follow up guidelines
- Late effects & Rehabilitation
- Diagnosis & treatment option for relapse
- Data collection

09HLTH10A02-004-C CNS tumours

- Inpatient and outpatient care in conjunction with Neurosurgeon, Radiotherapist[preferably dedicated to Neuro-oncology] Radiologist & Pathologist/Molecular Pathologist and participation in tumor boards.
- Management of emergencies and treatment related complications
- Staging,Risk stratification & appropriate treatment planning
- Treatment as per clinical protocol
- Response evaluation
- Follow up guidelines
- Late effects & Rehabilitation
- Diagnosis & treatment option for relapse

- Data collection

<u>09HLTH10A02-005-C</u> Haematopoietic stem cell transplant [HSCT]

- Indications for HSCT
- Tissue typing
- Principles of
  - Donor selection
  - Donor counseling
  - Conditioning regimens/stem sell manipulation/ immuno-suppression
  - Transplant immunology
- Graft versus host disease
- Other complications
- Supportive care
- Long term follow up and late effects

<u>09HLTH10A02-006-C</u> Laboratory training

- Interpretation of peripheral blood and bone marrow aspiration smears.
- Basic knowledge of bone marrow biopsy and solid tumour histopathology.
- CSF cytology
- Cytochemistry/Immunohistochemistry
- Flow cytometry & immunophenotyping
- Cytogenetics/Molecular diagnosis
- Coagulation
- Blood Transfusion & Component therapy
- Principles of infection control [microbiology]

<u>09HLTH10A02-007-C</u> Generic training in practical skills

- Optimal use of diagnostic services
- Ensuring good clinical practice
- Recognition of a critically ill child and the need for high dependency care/ICU
- Central venous access and care

- Chemotherapy drug handling, administration & management of acute side effects including intrathecal & intrcavitory chemotherapy.
- Care of infants and adolescents
- Late effects monitoring & survivorship issues
- Pain evaluation & management
- Palliative care
- Counsellling of patients and parents
- Organization & managerial skills
- Leadership of multidisciplinary team

09HLTH10A02-008-C Other issues

- Educational Issues for Children with Cancer
- Financial Issues in Pediatric Cancer
- Pediatric Cancer: Advocacy, Insurance, Education, and Employment
- Complementary and Alternative Medical Therapies in Pediatric Oncology
- Pediatric Oncology in Countries with Limited Resources
- Preventing Cancer in Adulthood: Advice for the Pediatrician
- Resources for Children with Cancer, Their Families, and Physicians
- Role of Telemedicine in Pediatric Cancer Care

09HLTH10A02-001-RA Research Activities:

In addition to prospectively following their cases for 3 years, the candidate would be encouraged to undertake independent research projects and also actively associate with the ongoing research activities. He/she would be expected to publish the results of his/her research in journals of repute.

It is expected that the candidate would have at least 1 publication at the end of 3 years in a reputed journal.

E. Assessment and Evaluation:

1. **Internal assessment**: This will be done at the end of each year and will include theory, practical and evaluation of skills. The results of internal assessment will be given due weightage in the final examination.

2. **Evaluation at the end of the course**:

a) Final theory papers: At the end of three years, theory examinations would be held like all other DM courses.

*(1) **PAPER I**: Basic and Applied Sciences as related to Pediatric Oncology*

*(2) **PAPER II**: Principles and practice of Clinical Pediatric Oncology part 1*

*(3) **PAPER III:** Principles and practice of Clinical Pediatric Oncology part 2*

*(4) **PAPER IV**: Recent advances as related to Pediatric Oncology*

b) **Practical examination**: This will include clinical cases, Pediatric Oncology ward round and viva voce. Viva voce shall include skiagrams, spots, clinical problems, investigative data, procedures etc. the candidate is also required to submit his/her Logbook, Thesis and Research works.

3. **Examiners**: There will be four examiners with two internal and two externals. For qualifications and experience of the examiners, the same rules will apply as for the examiners of any other DM courses of the Institute.

F. Course Faculty:

- **Director TMC** Dr.R.A.Badwe
- **Director Academics** Dr.K.S.Sharma
- **Core Faculty**:
- Dr.P.A.Kurkure, Prof & HOD Pediatric Oncology
- Dr.B.Arora, Associate Prof, Dept of Pediatric Oncology
- Dr.T.Vora, Assistant Prof, Dept of Pediatric Oncology
- Dr.G.Chinnaswamy, Assistant Prof,Dept of Pediatric Oncology

1. **Intra-Departmental Faculty**: Faculty of the Dept of Medical Oncology.

2. **Inter-Departmental**: Faculty of department of Hematopathology, Molecular cytogenetics, Histopathology, and Transfusion Medicine and of the Bone Marrow Transplant Unit will be involved. Related Departments of Radiodiagnosis, Pediatric Radiation Oncology, Nuclear Medicine, Pediatric Oncosurgery, Orthopedic Oncology, Neurosurgery, Head & Neck oncology will provide all necessary help for the teaching and training of the candidates undergoing the course.

3. **Extra-Institutional**: Proposed (pending MOU) for training in

   benign hematology

   Division of Pediatric Hematology

   Bai Jerbai Wadia Hospital for Children

Role of other Departments:

Bone Marrow Transplant Unit: For training of the candidate in the preparation of the patient for the procedure, methodology of the procedure, care of such patients and management of the complication which may arise during the procedure and long term follow up of such patients.

Transfusion Medicine: For training of the candidate in various aspects of blood component therapy, their storage and usage, aphaeresis and stem call separation for bone marrow transplantation.

Hematopathology: For training of the candidate in the laboratory aspects of Pediatric hematology and oncology like routine hematological investigations, interpretation and reporting of bone marrow aspirate and biopsy, flowcytometry, cytogenetics, chromosomal analysis, Hb electrophoresis, factor assay, hemolytic anemia and bleeding disorder work-up, FISH etc.

Cytopathology: For training of the candidate in the routine cytological investigations related to hematology and oncology, interpretation and reporting of FNAC, Immunocytochemistry etc.

Immunopathology: For training of the candidate in the routine immunological investigations related to Paediatric hematology and oncology, interpretation and reporting of HLA, Immunocytochemistry, PCR, chromosomal culture etc.

Histopathology: For training of the candidate in the routine histopathological investigations related to Paediatric hematology and oncology.

Microbiology: For training in relevance to Paediatric hematology and oncology.

Radiodiagnosis: For training of the candidate in interpretation of various radiologic diagnostic procedures in relevance to Paediatric hematology and oncology like X-rays, USG, CT scan, MRI, interventional radiology etc. Radiation Oncology: For training of the candidate in role of radiotherapy in childhood malignancies.

Nuclear Medicine: For training of the candidate in role of nuclear medicine in childhood malignancies, e.g. Bone scan, Gallium scan, MIBG, PET-CT scan.

Paediatric Surgery: For familiarizing the candidate with the surgical procedures in relevance to Paediatric hematology and oncology and placement of central venous catheters.

Orthopedic Oncology: For familiarizing the candidate with the orthopedic aspects in relevance to Paediatric oncology, e.g. Ewing's sarcoma, osteo-sarcoma, LCH, amputation, limb sparing surgeries, etc.

Radiation Oncology: For familiarizing the candidate with the principles & practice of radiotherapy procedures in relevance to pediatric oncology.

Proposed Time Schedule

The rotations are divided as follows:

S. No.	Rotation	Duration
1.	Clinical Hematology-Oncology 1. Hemato-oncology 2. Solid tumors	24 months 12 months 12 months
2.	Bone Marrow Transplantation	4 months
3.	Laboratory Hematology-Oncology*	4 months
4 5.	Research & Elective** Exam preparation leave	3 months 1 month

*Rotations in Transfusion Medicine, Hematopathology, Molecular cytogenetics, Cytopathology, Histopathology, Immunopathology.

**Rotations of 2-3 wks in various specialties associated with Pediatric hematology and oncology such as radiation oncology, Pediatric Oncosurgery, bioimaging, catheter clinic, Radiodiagnosis etc.

The first semester of the program is an intensive clinical experience designed to allow the candidate to develop cognitive and psychomotor skills in diagnosis and management of pediatric hematology-oncology problems. During the second and third semesters, the candidate will pursue independent clinical and laboratory based research. In addition, the candidate will take courses in biostatistics and clinical trials design offered by faculty. In the last semester, the candidate would enhance the skills related to allied specialties such as BMT, Laboratory oncology, radiation oncology, imaging & bio-imaging and molecular diagnostics.

The candidates will participate in the night and weekend call schedule as per roster in Dept of Pediatric Oncology throughout the three years of training program.

HOMI BHABA NATIONAL INSTITUTE

DEPARTMENT OF DIGESTIVE DISEASES AND CLINICAL NUTRITION

Speciality Training Curriculum

For

DIGESTIVE DISEASES

Luminal Gastroenterology, Hepatology, Biliary and Pancreatic Diseases, Gastrointestinal Oncology, Liver transplant, Endoscopy, Clinical Nutrition

SYLLABUS
OF
D.M. in GASTROENTEROLOGY
Under TMC
(Program code: HLTH10A03)

INDEX

I. INTRODUCTION

Gastroenterology is one of the major specialties of internal medicine. The specialty has grown incredibly fast over the past 30 years.

Several factors that have led to the substantial growth of gastroenterology as a specialty include, the increasing application of endoscopic and radiological intervention to replace surgery, specialized non-surgical therapies for in-operable bowel cancers and liver diseases, development of liver transplant and the need to liaison with surgeons, radiologists, nurse specialists, nutritionists, pathologists and oncologist for successful treatment of such patients. In addition a number of subspecialties of gastroenterology are now evolving such as pediatric gastroenterology, hepatology, liver transplantation and digestive oncology.

Diagnosis in gastroenterology requires a combination of the use of fundamental clinical skills along with very complex investigational approaches both radiological and endoscopic, thereby making it challenging branch to practice. While most gastroenterologists provide a broad, comprehensive service, there is a perceived need for some clinicians in the speciality to deliver a high quality service in very specific areas.

This curriculum has been drawn to meet the above challenges and is focused towards all round development of basic skills and competencies in gastroenterology.

The purpose of this curriculum is to define the process of training and the competencies required for safe and successful specialist practice in digestive disorders at basic level at also prepare trainees for sub-specialities if they wish to pursue it in future.

II. KEY FEATURES OF CURRICULUM

1. **Enhanced disease-specific training:** Focused training blocks in specific disease areas, such as motility and functional disorders, advanced inflammatory bowel training, digestive oncology, advanced endoscopy, pediatric gastroenterology (if available) and transplant hepatology will be made available during and the basic three year course.

2. **Endoscopy Training:** Competency based endoscopy training includes in depth training in diagnostic and basic therapeutic endoscopy skills and patient care along with and setting up and management of endoscopy suite and broad training with future prospect of a career in advanced endoscopy based on aptitude and skills. Technical and cognitive milestones will be periodically assessed using standard assessment parameters.

3. **Ancillary skill training:** Practical skills required to optimize patient care including basic and advanced clinical nutrition, stoma care and venous insertion device care. A basic course in research methodology and epidemiology (public health) is also provided to cover up for lack of training opportunity during undergraduate and broad speciality training.

III. TRAINING EXPOSURE:

The program consists of four main pathways of learning: clinical activities, procedural training, didactic learning and research experience. Trainees and faculty are expected to follow and complete the curriculum set for a particular year of training (as per the year-wise syllabus described) within this framework in order to ensure completion of training.

1. Academic Exposure:

A. Specialty out-patient clinics, indoor care and ward rounds, MDT meetings, grand rounds and mortality meetings: trainees are expected to attend and contribute towards the same. After initial induction, trainees will review patients in outpatient clinics and in-patients under direct supervision of training faculty. The degree of responsibility taken by the trainee will increase as competency increases.

B. Formal Didactic Teaching: Case presentations (mini-CEX and CBD can be used to assess skills during this session), seminars, journal clubs, landmark studies, evidence based management, Health Technology Assessments.

C. Training in endoscopy and other Procedures: The trainee will maintain a written log of each procedure performed. A six monthly appraisal will be conducted by the trainers for endoscopy training. .

D. Rotations in all sub-specialties in digestive diseases: A system of Inter-Hospital Rotation will be used to provide basic training in sub-specialty areas such as hepatology and transplant and motility disorders. This will be facilitated by the inter-institutional MOU.

E. Clinical research training, audits and research projects:: A dedicated block for clinical research methodology course in included in the first year curriculum to develop understanding of project design, protocol development, basics of biostatistics, manuscript writing, grant writing and bioethics of research. This is has been incorporated in the curriculum to fulfill the deficiency in training at undergraduate and broad specialty levels of training. Second and third year residents will engage in either clinical or laboratory related research project that will result in the preparation of at least one abstract for national meeting and preparation of a manuscript to be submitted for publication. In addition, trainees will participate in audits which contribute to patient care. Thesis will be completed and submitted to the university at end of 3 year training. Information generated during the research years will be presented at academic and national meetings. Dissertation will be done by the trainees.

F. Attendance at society and other educational Meetings: Each 2nd and 3rd year fellow will need to attend and do presentation at a minimum of one conference annually. The conference can be a national or local society meeting. In addition, the fellow may also attend conferences in which they are presenting research work or any other relevant educational courses approved by the program/institute faculty.

2. **Mentorship and Career Development:** Periodic meetings will be organized with national faculty members of training units in the city (country if feasible) in order to guide fellows and improve on their training and help them plan future career goals and job opportunities. This will be conducted under the auspices of the Bombay Gastroenterology Research Society. In addition to this guidance faculty can provide input in up-gradation of training infrastructure for basic training and also for development of specific sub-specialty training units in HBNI and in the country.

3. **Competency development and evaluation:** A detailed competency development guide for both generic competencies and core competencies is being drawn up. Periodical assessment and annual appraisals will be done both by trainers (and later a system set up for assessment of program and trainer by trainees as well). More details of the format has been described in the section on "Trainee Competency Development" .

4. **Curriculum monitoring:** A progress (review of successful application and appraisal) of the curriculum and training and any special needs will be periodically sent to BOS, HBNI for review.

IV. ORIENTATION/INDUCTION PROGRAMME FOR NEW TRAINEES

A half day orientation will be held by the department within the first two to six weeks of joining:

1. The orientation will familiarize the trainee with activities of the department and those of allied departments.
2. Orientation topics include but are not limited to:
   a. Overview of program
   b. Introductions of select faculty and fellows.
   c. Tour of key clinical and research areas.
   d. Review of clinical rotation schedules: Intra-department, inter-department and inter-hospital exchange program.
   e. Financial and leave allowance information.
   f. Appraisal process and schedule.
   g. Academic Meeting and national Conference information.
   h. Distribution of keys, phone, pagers.
   i. Instructions for attendance and accommodation facilities.
   j. Special topics: Clinical Ethics, DNR and autopsy policies.

All the above is described in the Residents Manual (under preparation).

V. OVERVIEW OF PROGRAM: SUBJECTS INCLUDED IN 3 YEAR FOUNDATION COURSE:

1. Main Subjects:

09HLTH10A03-001-C	Luminal Gastroenterology
09HLTH10A03-002-C	Hepatology
09HLTH10A03-003-C	Biliary and Pancreatic diseases
09HLTH10A03-004-C	Basic Endoscopy

2. Sub-specialty: Basic training to prepare to future sub-specialty tracks

09HLTH10A03-001-SS	Liver transplant
09HLTH10A03-002-SS	Gastrointestinal Oncology
09HLTH10A03-003-SS	Pediatric and Geriatric Gastroenterology
09HLTH10A03-004-SS	Advanced Endoscopy

3. Ancillary Courses: (Compulsory)

09HLTH10A03-001-A GI and liver pathology

09HLTH10A03-002-A GI imaging

09HLTH10A03-003-A Clinical Nutrition

09HLTH10A03-004-A Allied Clinical Experience: Catheter care, stoma care, consequences of abdominal surgery, management of end-stage digestive diseases.

09HLTH10A03-005-A Clinical Research Methodology

09HLTH10A03-006-A Epidemiology and Public health related to digestive diseases

09HLTH10A03-007-A Basic Sciences: Genetics, Molecular biology

VI. SUBJECT: YEARWISE DISTRIBUTION OF TEACHING PROGRAM.

SUBJECTS	I YR RESIDENT	II YR RESIDENT	III YR RESIDENT
Basics Gastroenterology	Anatomy, Physiology Approach to GI symptoms and symptom complexes	_	_
Luminal Gastroenterology	Part I: Foregut diseases Esophagus, Stomach Functional and Motility disorders of entire GIT	Part II: Mid and Hindgut diseases Small Bowel Large Bowel	-
Motility Procedure training	Part I: level I and II	-	-
Hepatobiliary and Pancreatic diseases	-	Part - I Hepatology General Topics Basic sciences	Part- II Biliary, Pancreatic diseases Liver transplant rotation
Pediatric Gastroenterology	Part – I: Luminal GI (UGIT and LGIT)	-	Part - II Specific HPB disease and pediatric transplant related issues
GI Oncology	Part – I: Basic Approach Part – II: Foregut tumors & GI Lymphomas	Part – III: Lower GI tumors Part – IV: Liver Cancer	Part - V BP cancers, Retroperitoneal tumors, GIST
Clinical Nutrition	Part – I Basic	Part – II Advanced	-
Applied (related) Pharmacology	I	II	III
Clinical Research Methods, Bio-Statistics and Epidemiology	I-II	III	-
Endoscopy	I: Basic Skills UGI, LGI, PEG, Hemostasis, Enteral feeds	II: Intermediate skills: colonoscopy, dilatation, Assist in luminal stenting, DBE, ERCP, EUS	III: Higher skills Luminal stenting EUS- indications and basic interpretation ERCP hands on for those pursue HBP fellowships
Day to Day: Clinical Care and Community outreach	Diagnostic Tests Radiology IV access, enteral access, stoma care, palliative care, familial diseases	GI Consults – hepatobiliary	-
Research	Dissertation planning Small projects/Audits	-	Dissertation submission

VII. CLINICAL ROTATIONS

VIII. TEACHING STRATEGY:

TEACHING STRATEGY: First year: Part- I – Basic Sciences and Allied Clinical Training.

Theory	Practical
Basics in GE	
Applied and Integrated Anatomy	Analysis of symptoms and symptom complexes
Applied and Integrated Physiology	
Applied Pharmacology: Drug in IBD, IBS, chemotherapy of foregut malignancy, enteral and parenteral formulae	
Basic Investigation in GE	
pH monitoring, H Pylori tests Malabsorption Tests Normal Pathology of Digestive tract Molecular Pathology and applied techniques	Clinical case studies, practicals for sampling errrors and interpretation of results. Demonstration and recognize normal histology, abnormal GI and liver pathology, aspiration cytology
Basic Sciences: Gastrointestinal Cellular and Molecular Physiology	
General concepts: Molecular biology/ Techniques/ Testing, Genetics, Cell biology, Pharmacology and cellular signaling, Host environment interaction, Immunology, Genetics,	Molecular Techniques/Testing: HTA
Imaging of the GI Tract	
Barium studies, Enteroclysis USG, CTscan, MRI, Bioimaging (PET, SPECT) Virtual imaging Specific aspects related to the diseases of GI tract	Orientation and image interpretation during the radiology posting HTA

TEACHING STRATEGY: First year: Part- I – Basic Sciences and Allied Clinical Training contd.

Allied Clinical Training: Stoma care, Catheter Care, End-stage Care	
1. Enterostomies- complications, diet, home care and counseling 2. IV Access Catheter insertions and care 3. Enteral access devices, counseling and care 4. Palliative care- palliation of GI symptoms in end stage digestive diseases and GI cancers, familiarity with, and at least limited experience with stenting, pain control, hospice and home care in advanced and terminally ill patient 5. GI and related interventions: obtaining consent, benefits and risks of procedures, post procedure care, treating complications, delayed sequele of therapy	Procedures: paracentesis, pleural tappings, liver biopsy, FNAC of cervical nodes and superficial lumps, bone marrow exam. Each procedure must be prepared for discussion by the trainee In addition, practical sessions and clinical exposure obtained during dedicated rotation Assessment of this must be included in the appraisal
Basic in Biostatistics and Clinical Research Methodology	
Sampling: concept of population and sample and need for statistics, random sampling, standard error, confidence intervals Properties of “Normal and Gaussian Distribution” Curve Types of Data: Paired unpaired; categorical continuous; numerical data (discrete & continuous), bar charts, histograms Comparing mean and median: χ student “t” test etc. Measurement and tests of association between variables: correlation and regression scatter plots, sensitivity and specificity, positive and negative predictive value	Assessment of quality of a clinical trial- exercises Guidelines for authorship and disclosures

TEACHING STRATEGY: First Year: PART II: DIGESTIVE DISEASES

TEACHING STRATEGY: First Year: PART II: DIGESTIVE DISEASES

GI Oncology Part I	
Early GI cancers : Recognition, Polyps, pre-neoplastic lesions Polypectomy, screening and surveillance Differentiating benign from malignant strictures Surveillance for IBD Familial GI cancer syndromes and related genetic/molecular testing Upper GI Cancers: Esophagus, Stomach, NHL Pathology, tumor staging, familial cancers, prognostic factors, management, surgery, drug therapy (cytotoxic chemotherapy and targeted therapy), palliative therapy, prevention and public health issues, early diagnosis and referral	Landmark articles Protocol discussion EBM
Geriatric Gastroenterology	
Normal function, drug metabolism/elimination, nutrition, specific GI conditions in the elderly	
Pediatric Gastroenterology - Part I	
General concepts and the unique aspects of pediatric GE luminal pediatric GE, Foregut diseases	Case presentations

TEACHING STRATEGY: First year: PART III: PREPARATION FOR RESEARCH

Concept sheet: Fellows are required to propose a hypothesis-based research project in the area of basic science or patient-oriented outcomes research, in the form of a 2-3 page concept sheet before the final quarter of their first year of training. This concept sheet will be submitted to the IRB for approval and includes:

1. Title of the proposal
2. Mentor: a faculty member (Principal Investigator)
3. Hypothesis to be tested and specific research plan (specific aims), including outcome parameters, sample size and statistical plan, and / or laboratory assay endpoints as appropriate.
4. References.
5. Significance to Gastroenterology
6. Relevant background information, intellectual and physical resources available locally.
7. Timeline for completion of the project.
8. Source of proposed funding for this project: training grant or other.
9. Additional training or coursework to be taken (if any) and its relevance.
10. Brief statement about career goals: "Where do you see yourself in 5 years?"
11. Brief statement regarding your commitments to other academic activities including scientific projects, chapters and reviews, etc.

TEACHING STRATEGY: Second Year: Part I – basic Sciences and Allied Clinical Training.

Theory	Practical
Basics in GE	
Applied and Integrated Anatomy – liver, portal circulation, abdominal vascular anatomy, bile duct, pancreas mid and hindgut, Anorectum	Analysis of symptoms and symptom complexes
Applied and Integrated Physiology – liver, biliary, pancreas	
Applied Pharmacology: Drug in liver, biliary and pancreatic diseases, PHT, foregut oncology, GI emergencies	
Basic Investigation in GE	
Normal Pathology of Liver, Bile ducts and pancreas Molecular Pathology and applied techniques	Normal and abnormal liver, bile ducts and pancreatic pathology Foregut tumor pathology including molecular path
Basic Sciences: Gastrointestinal Cellular and Molecular Physiology	
Specific molecular and genetic tests used in digestive diseases	Demonstrate Molecular Techniques/Tests. HTA
Imaging of the GI Tract	
Angiography: CT, MRI, DSA Assessment of Liver volume Detailed evaluation of Intra and extra hepatic BD Detailed pancreatic anatomy and its relation Pelvic MRI	Orientation and image interpretation during the radiology posting Use 3-D Anatomy Modules HTA

TEACHING STRATEGY: Second Year: Part I – basic Sciences and Allied Clinical Training contd.

Allied Clinical Training: Digestive Tract Surgery – Bowel, Liver, Portal HTN, Emergency Mx	
1.Digestive Surgery: Bowel and Liver resection Basic knowledge of surgical anatomy, especially relationships of ductile, vascular and luminal structures Endoscopic vs. interventional radiology vs. surgical procedure and when to pursue which one Indications and contraindications for surgery, bowel and liver resection Post-op care of patients after major and minor procedure Recovery and rehabilitation after major abdominal surgery Morbidity and management of post resection nutritional deficiencies and bowel disturbances Long –term rehabilitation after organ removal Pre-anesthesia Risk evaluation: Anesthesia, analgesia, sedation – in deranged liver Profiles 2.Emergencies in GE and Hepatology	Each topic must be prepared for discussion by the trainee In addition, practical sessions and clinical exposure obtained during dedicated rotation Assessment of this must be included in the appraisal

TEACHING STRATEGY: Second Year: Part I – basic Sciences and Allied Clinical Training contd.

Basic in Epidemiology, Public Health and Database Management	
Principles of statistical inference: hypothesis testing, sample size, Type I and II errors, interpretation of p-values, statistical and clinical significance. Survival analysis in cancer: types of time-to-event data, Kaplan Meier and Acturial Survival curves Comparing groups: log-rank test, use of Cox's proportional hazards regression model, hazard ratio, and their interpretation Clinical Trial Methodology: Phase I-IV trials, randomization and stratification methods, problem of non-randomized studies and historical controls, blinding/masking, design of clinical trials, content of trial protocol, ethics and informed consent, sample size calculation, interim analysis Measures of Response; Tumor regression, morbidity, local-regional recurrence, distant mets, death, quality of Life, intention to treat analysis Epidemiology: retrospective 9 case- control studies, prospective cohort studies, Odds ratio and relative risk, mortality rates, cancer registration and follow –up, trends in cancer incidence Multivariate analysis, Meta-analysis and Systematic Reviews.	Acturial Survival curves for a given data set Estimating sample size for a given type I and II error Information management: retrieving data from the internet, Medline, PubMed, Cochrane Data base searches Medical Writing: research articles for scientific journals Research Proposal: Designing a research study and protocol writing Designing and writing protocols for phase I, II and III studies Multivariate analysis Meta-analysis and Systematic Reviews Relational Databases and use of MS Access

TEACHING STRATEGY: Second Year: PART II: DIGESTIVE DISEASES

<table>

TEACHING STRATEGY: Third Year: Part I – basic Sciences and Allied Clinical Training

Theory	Practical
Basics in GE	
Applied and Integrated Anatomy – liver, portal circulation, abdominal vascular anatomy, bile duct, pancreas mid and hindgut, Anorectum	Analysis of symptoms and symptom complexes
Applied and Integrated Physiology – liver	
Applied Pharmacology: Drug in liver diseases, PHT, foregut oncology, GI emergencies	
Basic Investigation in GE	
Pathology Tumors: bile duct, pancreas, GIST, Retroperitoneal tumors	Tumor pathology including molecular path
Imaging of the GI Tract	
Applied Radiology: related to therapy planning CT, MRI, DSA, angiograms Assessment of Liver volume	Orientation and image interpretation during the radiology posting
Allied Clinical Training: Digestive Tract Surgery – Bowel, Liver, Portal HTN, Emergency Mx	
Digestive Surgery: Bowel and Liver resection	Long Case presentations based on theory knowledge learnt in first and second year Assessment of this must be included in the appraisal
Dissertation and Research Project Evaluation	

TEACHING STRATEGY: Third Year: PART II: DIGESTIVE DISEASES

Theory	Practical
Luminal Gastroenterology	
Diseases of bile ducts and pancreas- adults and children	
Hepatology	
Viral Hepatitis Drug induced LD CLD, Cirrhosis Portal circulation and portal HTN	
GI Oncology Part II	
1. Risk evaluation, screening and surveillance in GI cancers 2. Mid and Hind gut cancers: small bowel, colon rectum and Liver cancers and heaptoblastoma: Pathology, tumor staging, familial cancers, prognostic factors, management, surgery, drug therapy (cytotoxic chemotherapy and targeted therapy), palliative therapy, prevention and public health issues	Landmark articles Protocol discussion EBM
Miscellaneous	
Investigational techniques in clinical and laboratory HTA and outcome measures Economics in Gastroenetorology and GI endoscopy Setting up of GI Endoscopy, Liver Transplant and GI oncology and Nutrition therapy units	

IX. ENDOSCOPY SYLLABUS: Diagnostic and basic therapeutic endoscopy training

Educational Goals

- Learn the proper indications, contraindications, special needs, and procedural preparations for diagnostic and therapeutic gastroenterology procedures.
- Understand the role of endoscopic management in a multidisciplinary approach to various patient disorders and problems
- Practice detailed informed consent and informed refusal: Learn to interact effectively with patients and families to communicate the purpose of procedures and their results, and complications of procedures if necessary.
- Understand the system under which outpatient and inpatient endoscopic procedures are provided and collaborate with other team members in helping patients effectively negotiate the system.
- Learn management of an endoscopy unit: set-up of endoscopy suite, its management issues, learn the role and function of other members of the endoscopic procedure team and to interact effectively with other members of the endoscopy suite team in order to optimize patient care and co-ordinate working.
- Learn how to safely administer conscious sedation to provide for patient comfort during procedures, and when general anesthesia is appropriately indicated.
- Learn appropriate endoscopic surveillance regimens for various forms of upper and lower endoscopic pathology.
- Correlate visual and pathologic findings at endoscopy with clinical conditions.
- Identify areas of personal deficiency in skill and knowledge in the performance of endoscopic and other core procedures. In gastroenterology and hepatology and develop and implement strategies for correcting these deficiencies.
- Learn to identify procedure complications and formulate strategies for avoiding those complications.
- Learn to formulate comprehensive, clear and concise procedure reports to referring physicians and image capture.
- Identify and understand risk management issues in the performance of endoscopic procedures.

- **Achieve technical competence in the performance of Gastroenterology core diagnostic and basic therapeutic procedures - should be able to perform:**

1. **By completion of first year:**
    a. Diagnostic Esophago-Gastro-Duodenoscopy to the second portion of the duodenum
    b. Diagnostic Colonoscopy to the cecum with limited assistance.

2. **By completion of second year:**
    a. Complete competency-level performance of the following basic gastroenterology procedures as per the curriculum
    b. Master all Year I upper endoscopic skill requirements. Additionally, begin to develop competency in performing therapeutic maneuvers: banding and sclerosing of varices, and sclerotherapy and thermal coagulotion of bleeding vessels, luminal dilatation, enteral access (NGT, NJT)
    c. Master all Year I colonoscopic skill requirements. Additionally, perform endoscopic maneuvers, including snare polypectomy and begin to develop competency in control of GI bleeding: sclerotherapy and thermal coagulotion of bleeding vessels.

3. **By completion of Third year:**
    a. Attain trainer level proficiency in the following gastroenterology procedures pertinent to his/her career choices:
    b. Upper Endoscopy: master all Year II endoscopic skill requirements. Additionally, be able to pass a side viewing scope to identify the papilla or lesions difficult to observe with forward viewing scope and perform advanced maneuvers, such as placing clips on bleeding vessels or argon plasma laser coagulation.
    c. Colonoscopy: Master all Year II colonoscopic skill requirements. Additionally, be able to independently intubate the terminal ileum and begin to develop independent mastery of more advanced maneuvers, e.g., removal of large or complex polyps by saline assisted polypectomy or piecemeal resection and control of bleeding using clips or argon plasma laser coagulation.
    d. Learn the unique functions of the procedure assistant especially ERCP and therapeutic EUS.
    e. Expand clinically applicable knowledge base of biliary/pancreatic disorders, including patient's tolerance of ERCP in their management.

f. Expand clinically applicable knowledge for endoscopic ultrasound with respect to indication and application of the procedure for maximal impact on patient care.

Basic endoscopy training year wise schedule:

First Year Basic Skills	Second Year Intermediate Skills	Third Year Introduction to Advanced Skills	Objective performance criteria after prescribed numbers performed
General Aspects			
1. Obtaining consent for different endoscopy procedures 2. Infection control, universal precaution, cleaning and disinfection of endoscopes, reuse of accessories 3. Image capture, reporting of endoscopy procedures, endoscopy database 4. Preparation for UGI, LGI endoscopy, ERCP 5. Pre and Post Procedure care	1. Sedation and Monitoring 2. Quality Assurance in endoscopy	1. Setting up an endoscopy unit 2. Cost- evaluation in endoscopy	Appraisal evaluation
Procedures to be Perfomed			
1. UGI endoscopy examination 2. Sigmoidoscopy 3. Simple therapeutic procedures- enteric access - NGT insertion and luminal dilation 4. Hemostasis	1. Diagnostic Colonoscopy 2. Polypectomy 3. Esopahgeal Bougie Dilation 4. Enteral Access: NJT 5. Variceal therapy 6. PEG	Sideviewing scopy Chromoscopy NBI, FICE, AFI Luminal stents Pyloric and colonic dilation 1. Capsule endoscopy and its interpretation 2. EUS indications and image interpretation, applications(optional) 3. ERCP if likely to pursue second tier in hepatology	1. Intubations of different areas 2. Recognition of normal / abnormal 3. Appropriate knowledge and treatment of findings See details for endoscopy appraisal Appraisal to be taken for procedures observed

Basic endoscopy training year wise schedule:

<table>
<tr><th colspan="4">Procedures to be Observed/Assisted</th></tr>
<tr><th>First Year
Basic Skills</th><th>Second Year
Intermediate Skills</th><th>Third Year

MINIMUM NUMBER OF ENDOSCOPY PROCEDURES PERFORMED INDEPENDENTLY TO BE ELLIGIBLE FOR COMPETENCY EVALUATION

NO	Procedures	ACGME Procedure Requirement	Proposed at HBNI
1.	Esophagogastroduodenoscopy	130	200
2.	Flexible Sigmoidoscopy	25	025
3.	Colonoscopy	140	150
4.	Colonoscopy with Polypectomy	30	015
5.	Esophageal Dilation	20	025
6.	Wire Guided Enteral Access- NGT, NJT	-	NGT- 10, NJT- 10
7.	Variceal Hemostasis	20 cases, including 5 active bleeders	25 cases including 5 active bleeders
8.	Nonvariceal Hemostasis (upper & lower)	25 cases, including 10 active bleeders	025 cases including 010 active bleeders
9.	Side-viewing endoscopy and biopsy		010
10.	Other Diagnostic & Therapeutic Procedures Utilizing Enteral Intubation (Enteroscopy, Ileoscopy)	10	010
11.	Video-capsule endoscopy	10	010
12.	Luminal Stenting	-	005
13.	Percutaneous Endoscopic Gastrostomy	20	025
14.	Conscious Sedation	-	50
15.	ERCP Basic: observe and assist Advanced: Hands on training		Level 1: basic: 100 Level 2 Advanced : 150
16.	EUS Basic: observation Advanced: hands on training*	-	Level I: Minimum Mediastinal: 20 HPB: 20 Level 2 advanced training - 200
17.	Percutaneous Liver Biopsy	20	015
18.	PICC insertion		010
19.	Foreign body removal		005
20.	GI manometry and pH probe studies		010

NOTE:

The number of procedures given here, indicates the number to be performed before undertaking an assessment or appraisal. ACGME (The American Council for Graduate Medical Education) requires fellows to complete the specified number of procedures during the three training years. If there is no number provided in the following chart, this indicates that the ACGME does not require a specific number of these procedures. D.N. B has similar specification, although numbers may vary. The Society of GI Endoscopy of India and Indian Society of Gastroenterology do not have any guidelines for the same.

Proficiency is defined as understanding the clinical indications and contraindications, proper sedation techniques and intra-procedural monitoring, physical performance of the procedure, interpretation of abnormal and normal findings and proper post-procedural monitoring.

Fellows are required to maintain a written log of each procedure performed, the date, patient identification, findings and comments and to submit procedure log forms to trainer.

Program directors/ Head of Departments will sign the procedure log. The endoscopy procedure log is given in log book format section. During each of these procedure log submissions, fellows are required to submit in the following format.

- All procedures submitted since the start of their fellowship with a numerical total of each type of procedure.
- All procedures submitted since the last procedure log submission, assessment and appraisal.
- Improvement in specific areas after last appraisal.

X. PROFESIONAL COMPETENCY DEVELOPMENT AND ASSESSEMENT PARAMETERS:

A detailed guide of competency development both generic and core competencies is under preparation and will be submitted for review to the BOS, HBNI. Comptencies include both generic and core competencies as briefly outlined below:

1. **Development of Generic Competencies:** 'Generic competencies' are the knowledge, skills, attitudes and behaviors (KSA) required by physicians in all medical specialties to practice effectively. Generic competencies are therefore based on *Good Clinical Practice.* All trainees will be assessed for these periodically. These are described in the table on page no 30. These include:
   - A. **Mandatory (Level 1) Competencies:** *Good Clinical Practice* that a trainee **must** have achieved by the end of this training and is mandate for his graduation.
   - B. **Desirable (Level 2) Competencies:** In addition, it is highly desirable that Specialist trainees demonstrate acquisition of further competencies termed in the domains of Good Clinical Practice. This will help trainees to grow develop from being 'competent' to becoming an 'experts.

2. **Core Competencies in Gastroenterology: related to the speciality as proposed in the teaching strategy.**

Generic Competency to be achieved during training:

Focus Areas	**Level 1** **Mandatory CT Competency areas**	**Level 2** **Desirable CT Competency areas**
1. Good Clinical Care	1.1 History Taking	-
	1.2 Physical Examination	-
	1.3 Medical Record Keeping and Information Management Skills	-
	1.4 Diagnosis, Clinical Reasoning and Decision Making Skills	-
	1.5 Therapeutics and safe prescribing	-
	1.6 Time Management and Organizational skills	-
	1.7. Patient Centric service and Patient Education	-
	1.8 Patient Safety Concerns	-
	1.9 Infection Control	-
		1.10 Quality Improvement and Health Promotion
	1.11. Medical Ethics: Valid Consent	1.12. Medical Ethics and Legal Framework for Practice
		1.13. Managing Long Term Conditions & Promoting Patient Self- Care
2. Maintaining Good Clinical Practice	2.1. Medical Knowledge, evidence and guidelines	2.2. Clinical Audits
3. Communication Skills	3.1 Communication with Patients within a Consultation	3.2 Breaking Bad News 3.3 Complaints and Medical Error
4. Multidisciplinary Team Work	Working with Colleagues	-
5. Teaching and Training	Basic Teaching and Training skills	-
6. Professionalism	Professional Behavior	-
7. Research Ethics	Basic Ethics of Clinical Research	-

XI. TRAINEE ASSESSMENT METHODS:

Both generic and core competencies described will be assessed using an integrated package of "Workplace-based assessments" and examination of knowledge and clinical skills. The formal workplace-based assessment tools will include mini-CEX (mini- Clinical Examination) case based discussions (CBD) for clinical work, objective structure clinical examination (OSCE) for theoretical knowledge and DOPS (Direct Observation of Procedural Skills) for endoscopy and other procedures.

1. **Mini-Clinical Evaluation Exercice (Mini-CEX):** A method of assessment of skills essential for the provision of a good standard of clinical care. It will be done during monthly case presentations. A minimum of * (6 internal and 2 external) mini-CEX are recommended per year of training.

2. **Case Based Discussion (CBD):**
   - This method is designed to assess clinical judgment, decision-making and the application of medical knowledge in relation to patient care in cases for which the trainee has been directly responsible. CBD is conducted during routine case discussions during the OP clinics and ward rounds.
   - The method is particularly designed to test higher order thinking and synthesis as how trainees compile, prioritize and apply knowledge.
   - By using clinical cases that offer a challenge to the trainee, rather than routine cases, the trainee is able to explain the complexities involved and the reasoning behind choices they made. It also enables the discussion of the ethical and legal framework of practice.
   - It uses patient records as the basis for dialogue, for systematic assessment and structured feedback.
   - As the actual record is the focus for the discussion, the assessor can also evaluate the quality of record keeping and the presentation of cases. Most assessments take no longer than 15-20 minutes.
   - A minimum of 4 CBD will be conducted per year by internal faculty.

3. **Direct Observation of Procedural Skills (DOPS):**
    - This is used to assess the trainees' technical, operative and professional skills in a range of basic diagnostic and interventional procedures, or parts of procedures, during routine practice and will facilitate developmental feedback.
    - A minimum of 4 DOPS (2 internal and 2 external) can be conducted per year of training.

XII. TRAINEE APPRAISAL

1. Log Book
2. Endoscopy DOPS evaluation format
3. Annual Appraisal review format

1. **LOG BOOK: Enlists:** details of case presentations during evaluations, seminars, journal clubs, meetings and conference attendances. A log of endoscopy procedures done and assisted will be maintained separately as described below.

2. **ENDOSCOPY PROCEDURE EVALUATION**

Method: Direct Observation of Fellow by Supervising Training Faculty

The trainees performance will be evaluated Twice per year (November/December and May/June). Proficiency and competence in technique is based upon the observations from close supervision of the faculty in Endoscopy.

Year I, II and III trainees will receive a focused direct observation evaluation of procedural competency. This evaluation will be performed on one diagnostic and one therapeutic upper endoscopy and one diagnostic and one therapeutic colonoscopy twice per year. The evaluator will be the in-house consultant and may include one other external faculty. The evaluation will take place as part of the routine endoscopy procedures scheduled.

Given that competency develops over the three fellowship years, and certain aspects of procedural skills are learned with time, the task being evaluated is done according to the level of training expectation for each year. Related to the colonoscopy procedure, for example, insertion of scope into rectum should be achieved by all three years, whereas intubation of terminal ileum is expected only of Year III trainee.

At the completion of the evaluation, the faculty will provide written and verbal feedback. For any areas "not competent," the attending will discuss area(s) requiring remediation with the fellow and will repeat the evaluation at a later date after additional training has occurred (no more than eight weeks from original evaluation). If the fellow remains “not competent” in a certain area, further remediation and training will be provided by the program.

Year III trainee are only required evaluation once (July/August). If deficiencies are identified at that time, additional training will be administered by the program, and re-evaluation will occur in November/December.

Certification of procedural competence requires maintenance of a procedural log book. Log Book provides record of patient name, file numbers, diagnoses, procedure done, duration of procedure and sedation used, complications and recommendations for management based on the findings.

ENDOSCOPY PROCEDURE GENERAL EVALUATION FORM AND CHECKLIST

PART A

Trainee Name:	**Year #:**
HBNI Registration Number	
Procedure No:	**Date:**
No of Previous Procedures performed by trainee:	
Difficulty of Procedure: High Average Low

2. ENDOSCOPY PROCEDURE GENERAL EVALUATION FORM AND CHECKLIST

PART B1

Procedure Activity	Competency Skills – see guide below					
	1	2	3	4	5	6
Demonstrates understanding of indications, relevant anatomy , techniques of the procedure						
Obtains informed consent: Consents the patient for the procedure appropriately, explaining risks, benefits and alternatives of procedure (Years I, II & III)						
Demonstrates appropriate preparation for pre-procedure						
Understands the safe and proper administration of sedation (Years I, II & III) and has developed technical ability for administration and monitoring						
Aseptic technique						
Communication skills: Appropriate communication and orders given to nursing and technical staff (Year I, II & III)						
Seeks help when appropriate						
Generation of procedure report with appropriate recommendations (Year I, II & III)						
Post procedure management: Post-procedure review of findings and plan with patient and family/friend (Year I, II & III)						
Demontrates patient related professionalism						
Appropriate recognition of abnormal findings and action taken based on finding (Year II & III)						
When indicated, proper biopsy technique (Year II & III)						
Master scoping and patient manipulations to the degree that patient comfort is acceptable at						

the level of a beginning independent gastroenterologist (Year II & III)						
When indicated, proper snare polypectomy, dilation, NGT placement, EST, EVL, PEG, (Year III)						

Areas of Strength:

Areas of needing further development:

UPPER GI ENDOSCOPY EVALUATION FORM AND CHECKLIST

PART B2

Procedure Activity	Competent	Not Competent	Not Applicable
Successful and safe intubation of the esophagus (Year I, II & III)			
Evaluation of esophagus and recognition of GE junction (Year I, II & III)			
Evaluation of stomach to the pylorus (Year I, II & III)			
Evaluation of duodenum to second portion (Year I, II & III)			
Appropriate retrieval of scope (Year I, II & III)			
Retroflexion of scope in stomach (Year II & III)			
Intubation of pylorus (Year II & III)			

Areas of Strength:

Areas of Development

COLONOSCOPY EVALUATION FORM AND CHECKLIST

PART B3

Procedure Activity	Competent	Not Competent	Not Applicable
Digital rectal exam and insertion of scope into rectum (Year I, II & III)			
Passage of scope to the splenic flexure (Year I, II & III)			
Appropriate retrieval of scope and inspection of colon (Year I, II & III)			
Passage of scope to the hepatic flexure (Year II & III)			
Passage of scope to the cecum (Year II & III)			
Appropriate maneuvers utilized to reach cecum, (i.e., pressure on abdomen, rolling patient, etc.) (Year II & III)			
Retroflexion of scope in rectum (Year II & III)			
Passage of scope to the ileum (Year III)			

Areas of Strength:

Areas of Development

Trainer/Research Guide	…………………………..	………………….	…….....
H.O.D	………………………….. …	……………………	…….....

XIII. TRAINEE FEEDBACK OF PROGRAM:

The key clinical faculty of the department will review the educational effectiveness of the training program at least once in six months. Annually, a more formal review of the training program, its goals, effectiveness in achieving past objectives, and curriculum will be reviewed by the department and report will be sent to HBNI. The third year fellows and senior trainees will participate in this process. The fellows will submit a written evaluation of the program to the division chief and program faculty.

Fellows Feedback:

1. Have you received a written curriculum guide?
2. Do you feel that your professional environment promotes your education?
3. Do you feel the program prepared you sufficiently for your chosen and/or current career path - through consultative experience, clinic experience, endoscopic experience, didactic and other conference attendance - with a breadth and depth of exposure to the patient disorders, clinical problems, and technical and other skills as outlined in the curriculum?
4. Do you feel that you are progressing satisfactorily to achieving competence in the core technical procedures? Are there specific core procedures that you can identify for which you feel the need for extra attention?
4. Do you feel that the program responds flexibly to the needs and interests of the individual trainee?
5. Is the program leadership accessible to discuss your concerns?
6. Do you feel that the program is concerned about your overall practice development?
7. Has the program encouraged and supported your participation in special meetings, travel, courses, etc which are of education benefit to you?
8. Have you been provided a semi-annual review of your evaluations?
9. Have you had the chance to review and provide feedback about your faculty?
10. What issues do you identify that require serious attention in the training program?
11. Do you have any other specific recommendations to help improve the training program?

SYLLABUS

OF

DM CRITICAL CARE

(Program Code: HLTH10A04)

CURICULLAM OF DM (CRITICAL CARE)

The candidate must gain experience in the diagnosis and treatment of adult patients with acute, serious, and life-threatening medical and surgical diseases.

The present document defines the core curriculum of cognitive knowledge and procedural skills that a specialist in Critical Care Medicine is expected to be equipped with to effectively approach the complex problems encountered in the critically ill patient.

The content of this three-year training in critical care medicine deals with the learning objectives of the course focusing on acquisition of skills, knowledge, behaviour and attitude pertaining to following core domains. The list enclosed here is not comprehensive and can be modified time to time

(A) General curriculum

- Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation
- Practical Procedures
- Comfort, Pain-Relief and Recovery
- Basics of Pediatric Critical Care
- Physics & Clinical Measurement
- Research Methods
- Applied Anatomy
- Applied Physiology & Biochemistry
- Applied Pharmacology

(B) Advanced curriculum

- Resuscitation and Initial Management of the Acutely Ill Patients
- Disease Management
- Therapeutic Interventions/Organ System Support in Single or multiple organ failure
- Inter and Intra hospital Transport of critically ill
- Peri-operative Care

(C) Professional qualities curriculum

- Patient Safety and Health Systems Management
- Professionalism and Ethics
- End of Life Care

Eligibility and Admission

The person applying for the DM course must be a postgraduate possessing MD/MS in Anaesthesiology, Internal Medicine, Respiratory Medicine, Pediatric and Emergency Medicine from a university recognized by the Medical Council of India. Admission would be made through a national competitive entrance examination.

Clinical Training Programme

In order to foster the growth of Critical Care Medicine, wherever stand-alone department of Critical Care Medicine do not exist, for the first ten years MCI should accept departments of Anaesthesiology, Internal

Medicine, Respiratory Medicine and Emergency Medicine as parent departments recognized to start DM in Critical Care Medicine.

The department should have been running general purpose adult intensive care (minimum 08 beds) for medical and surgical patients for at least two years before applying for DM in CCM. It should not be mandatory for the parent department (responsible for DM in CCM) to have (or manage) super-specialty postoperative intensive care for liver transplant, cardiac surgery or neurosurgery. However the students would be rotated through these intra-departmental ICUs if they exist in the institution.

The training programme for DM in Critical Care Medicine should be of 3 years (36 months) duration. The resident doctors would be spending their time in the following clinical disciplines:

A. Three month rotation in core discipline i.e. Intensive Care Units, High Dependency Units and Outreach Services of the Department of Critical Care Medicine.

B. Three month rotation in Anaesthesiology, Trauma and Emergency Care and Intensive Care Units of other disciplines like Cardiovascular and Thoracic surgery and Neurosurgery etc.

C. Three month rotation in clinical specialties like Cardiology, Nephrology, Neurology, Medical Gastroenterology, Endocrinology, Medical Oncology and Immunology etc.

D. Three month rotation in non-clinical specialties like Microbiology, Transfusion Medicine, Radiology and Nuclear Medicine etc.

E. Three month rotation of choice to cover any deficiency in pre-designed rotations.

Year	Semester	For candidates with MD in Anaesthesiology and Emergency Medicine	For candidates with MD in Internal Medicine	For candidates with MD in Pulmonary Medicine/ Tuberculosis and Chest Diseases	For candidates with MD in Pediatrics
1st	1st 2nd 3rd 4th	1A, 1B, 1C, 1D	1A, 1B, 1C, 1D	1A, 1B, 1C, 1D	2A, 1B, ½ C, ½D
2nd	1st 2nd 3rd 4th	3 ½ A, ½ D	4A	4A	3A, 1B
3rd	1st 2nd 3rd 4th	2 ½ A, 1E, ½ C	2A, 1B, 1E	2A, 1B, 1E	2A, 1B, 1E

Educational Programme

Weekly Teaching Schedule

Days	**Mon**	**Tue**	**Wed**	**Thu**	**Fri**	**Sat**

8-9 am OR 2.30 – 3.30 pm	Clinical case/ Case study	Lecture/ Audit	Institutional Clinico-Pathological Conference	CGR/ Radiology Conference	Journal Club/ Mortality meet	Joint Academic Meet/Seminar/ Progress in Research work

- DM Program Moderator : Faculty ‘A’
- DM Program Coordinator: Faculty ‘B’
- Mortality Meets Coordinator: Faculty ‘C’
- Radiology Conference Coordinator: Faculty ‘D’
- DM Dissertation: 2 dissertation to be presented : HOD and one faculty by rotation
    - Submission of protocols: within 6 months of joining DM course
    - Submission of final dissertation: at the end of 2 and half years.

Evaluation and Mode of Examination

DM candidates should at least have two manuscripts as first author likely to be accepted for publication. Examination will be held at the end of having completed three years of supervised training and having submitted two dissertations. The work could be either clinical, laboratory or combined. Three papers each of 3 hours duration and 100 mark each. (total 300 marks) would be given . They would include either 10 short questions or 2 long and 6 short questions. In addition, a candidate will have to appear in practical and clinical examination of 350 marks, candidate will have to pass both in theory and practical examination as given below for the DM degree.

Theory Examination:
Paper I (100 marks) : Basic and applied Critical Care
Paper II (100 marks) : Paper on clinical Critical Care
Paper III (100 marks): Advances in Critical Care

Practical and Clinical examination:
Two long cases (100 marks)
Two short cases (50 marks)
Case Exercises (50 marks)
Skills (ICU procedures) (50 marks)
Spots-Data analysis (50 marks)
Viva Voce (50 marks)

Evaluation and Mode of Examination

CCM 1	Resuscitation and Initial Management of the Acutely Ill Patients							
CCM 2	Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation							
CCM 3	Disease Management							
CCM 4	Therapeutic interventions/organ							

	system support in single or multiple organ failure							
CCM 5	Practical procedures							
CCM 6	Peri-operative care							
CCM 7	Comfort and Recovery							
CCM 8	End of life care							
CCM 9	Pediatric Care							
CCM 10	Transport							
CCM 11	Patient safety and health systems management							
CCM 12	Professionalism							
CCM 13	Physics & Clinical Measurement Mathematical Concepts							
CCM 14	Research Methods							
CCM 15	Applied Anatomy							
CCM 16	Physiology & Biochemistry							
CCM 17	Pharmacology							

The List of Course Contents

1. Resuscitation and Initial Management of the Acutely Ill Patients
   Adopts a structured and timely approach to the recognition, assessment and stabilization of the acutely ill patient with disordered physiology

Manages cardiopulmonary resuscitation
Manages the patient post-resuscitation
Triages and prioritises patients appropriately, including timely admission to ICU
Assesses and provides initial management of the trauma patient
Assesses and provides initial management of the patient with burns
Describes the management of mass casualties

2. Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation

Obtains a history and performs an accurate clinical examination
Undertakes timely and appropriate investigations
Describes indications for echocardiography (transthoracic/transoesophageal)
Performs electrocardiography (ECG/EKG) and interprets the results
Obtains appropriate microbiological samples and interprets results
Obtains and interprets and results from blood gas samples
Interprets chest x-rays
Liaises with radiologists to organize and interpret clinical imaging
Monitors and responds to trends in physiological variables
Integrates clinical findings with laboratory investigations to form a differential diagnosis

3. Disease Management

Acute disease
Manages the care of the critically ill patient with specific acute medical conditions
Chronic Disease
Identifies the implications of chronic and co morbid disease in the acutely ill patient
Organ System Failure
Recognises and manages the patient with circulatory failure
Recognises and manages the patient with, or at risk of, acute renal failure
Recognises and manages the patient with, or at risk of, acute liver failure
Recognises and manages the patient with neurological impairment
Recognises and manages the patient with acute gastrointestinal failure
Recognises and manages the patient with acute lung injury syndromes (ALI/ARDS)
Recognises and manages the septic patient
Recognises and manages the patient following intoxication with drugs or environmental toxins
Recognises life-threatening maternal peri-partum complications and manages care under supervision

4. Therapeutic Interventions/Organ System Support in Single or Multiple Organ Failure

Prescribes drugs and therapies safely
Manages antimicrobial drug therapy
Administers blood and blood products safely
Uses fluids and vasoactive/inotropic drugs to support eh circulation
Describes the use of mechanical assist devices to support the circulation
Initiates, manages and weans patients from invasive and non-invasive ventilatory support
Initiates, manages and weans patients from renal replacement therapy
Recognises and manages electrolyte, glucose and acid-base disturbances
Co-ordinates and provides nutritional assessment and support

5. Practical Procedures

Respiratory system
Administers oxygen using a variety of administration devices
Performs fibreoptic laryngoscopy under supervision
Performs emergency airway management

Performs difficult and failed airway management according to local protocols
Performs endotracheal suction
Performs fibreoptic bronchoscopy and BAL in the intubated patient under supervision
Performs percutaneous tracheostomy under supervision
Performs thoracocentesis via a chest drain

Cardiovascular system

Performs peripheral venous catheterization
Performs arterial catheterization
Describes a method for surgical isolation of vein/artery
Describes ultrasound techniques for vascular localization
Performs ventral venous catheterization
Performs defibrillation and cardioversion
Performs cardiac pacing (transvenous or transthoracic)
Describes how to perform pericardiocentesis
Demonstrates a method for measuring cardiac output and derived haemodynamic variable

Central Nervous System

Performs lumbar puncture (intradural/spinal) under supervision
Manages the administration of analgesia via an epidural catheter

Gastrointestinal System

Performs nasogastric tube placement
Performs abdominal paracentesis
Describes sengstaken tube (or equivalent) placement
Describes indications for, and safe conduct of gastroscopy

Genitourinary System

Performs urinary catheterization

6. Peri-operative Care

Manages the pre and post-operative care of the high risk surgical patient
Manages the care of the patient following cardiac surgery under supervision
Manages the care of the patient following craniotomy under supervision
Manages the care of the patient following solid organ transplantation under supervision
Manages the pre and post-operative care of the trauma patient under supervision

7. Comfort, Pain-Relief and Recovery

Identifies and attempts to minimize the physical and psychosocial consequences of critical illness for patients and families
Manages the assessment, prevention and treatment of pain and delirium
Manages the administration of analgesia via an epidural catheter
Manages sedation and neuromuscular blockade
Communicates the continuing care requirements of patients at ICU discharge to health care professionals, patients and relatives
Manages the safe and timely discharge of patients from the ICU

8. End of Life Care

Manages the process of withholding or withdrawing treatment with the multidisciplinary team
Discusses end of life care with patients and their families/surrogates
Manages palliative care of the critically ill patient
Performs brain-stem death testing
Manages the physiological support of the organ donor

9. Paediatric Care

Describes the recognition of the acutely ill child and initial management of paediatric emergencies
Describes national legislation and guidelines relating to child protection and their relevance to critical care

10. Transport

Undertakes transport of the mechanically ventilated critically ill patient outside the ICU
Describes the special considerations required during patient transport by air.

11. Patient Safety and Health Systems Management
Leads a daily multidisciplinary ward round
Complies with local infection control measures
Identifies environmental hazards and promotes safety for patients & staff
Identifies and minimizes risk of critical incidents and adverse events, including complications of critical illness
Organises a case conference
Critically appraises and applies guidelines, protocols and care bundles
Describes commonly used scoring systems for assessment of severity of illness, case mix and workload
Demonstrates an understanding of the managerial & administrative responsibilities of the ICM specialist

12. Professionalism
Communication skills
Communicates effectively with patients and relatives
Communicates effectively with members of the health care team
Maintains accurate and legible records/documentation
Provides explanations and teaches multidisciplinary members of critical care team
Professional relationships with patients and relatives
Involves patients (or their surrogates if applicable) in decisions about care and treatment
Demonstrates respect of cultural and religious beliefs and an awareness of their impact on decision making
Respects privacy, dignity, confidentiality and legal constraints on the use of patient data
Professional relationships with members of the health care team
Collaborates and consults; promotes team working
Ensures continuity of care through effective hand-over of clinical information
Supports clinical staff outside the ICU to enable the delivery of effective care
Appropriately supervises and delegates to others, the delivery of patient care
Self governance
Takes responsibility for safe patient care
Formulates clinical decisions with respect for ethical and legal principles
Seeks learning opportunities and integrates new knowledge into clinical practice
Participates in multidisciplinary teaching
Participates in research or audit under supervision
Participates in the team approach with respect for team members

13. Physics & Clinical Measurement
Mathematical Concepts:
13.1 Relationships and graphs
13.2 Concepts of exponential functions and logarithms: wash-in and washout
13.3 Basic measurement concepts: linearity, drift, hysteresis, signal: noise ratio, static and dynamic response
13.4 SI units: fundamental and derived units
13.5 Other systems of units where relevant to ICM (e.g. mmHg, bar, atmospheres)
13.6 Simple mechanics: Mass, Force, Work and Power
Gases & Vapours:
13.7 Absolute and relative pressure.
13.8 The gas laws; triple point; critical temperature and pressure
13.9 Density and viscosity of gases.
13.10 Laminar and turbulent flow; Poiseuille's equation, the Bernoulli principle
13.11 Vapour pressure: saturated vapour pressure
13.12 Measurement of volume and flow in gases and liquids.
13.13 The pneumotachograph and other respirometers.
13.14 Principles of surface tension
Electricity & Magnetism:
13.15 Basic concepts of electricity and magnetism.

13.16 Capacitance, inductance and impedance
13.17 Amplifiers: bandwidth, filters
13.18 Amplification of biological potentials: ECG, EMG, EEG.
13.19 Sources of electrical interference
13.20 Processing, storage and display of physiological measurements
Bridge circuits

Electrical Safety:

13.21 Principles of cardiac pacemakers and defibrillators
13.22 Electrical hazards: causes and prevention.
13.23 Electrocution, fires and explosions.
13.24 Diathermy and its safe use
13.25 Basic principles and safety of lasers
13.26 Basic principles of ultrasound and the Doppler effect

Pressure & Flow Monitoring:

13.27 Principles of pressure transducers
13.28 Resonance and damping, frequency response
13.29 Measurement and units of pressure.
13.30 Direct and indirect methods of blood pressure measurement; arterial curve analysis
13.31 Principles of pulmonary artery and wedge pressure measurement
13.32 Cardiac output: Fick principle, thermodilution

Clinical Measurement:

13.33 Measurement of gas and vapour concentrations, (oxygen, carbon dioxide, nitrous oxide, and volatile anaesthetic agents) using infrared, paramagnetic, fuel cell, oxygen electrode and mass spectrometry methods
13.34 Measurement of H+, pH, pCO_2 , pO_2
13.35 Measurement CO_2 production/ oxygen consumption/ respiratory quotient
13.36 Colligative properties: osmometry
13.37 Simple tests of pulmonary function e.g. peak flow measurement, spirometry.
13.38 Capnography
13.39 Pulse oximetry
13.40 Measurement of neuromuscular blockade
13.41 Measurement of pain

14. Research Methods

Data Collection:

14.1 Simple aspects of study design (research question, selection of the method of investigation, population, intervention, outcome measures)
14.2 Power analysis
14.3 Defining the outcome measures and the uncertainty of measuring them
14.4 The basic concept of meta-analysis and evidence based medicine

Descriptive Statistics:

14.5 Types of data and their representation
14.6 The normal distribution as an example of parametric distribution
14.7 Indices of central tendency and variability

Deductive & Inferential Statistics:

14.8 Simple probability theory and the relation to confidence intervals
14.9 The null hypothesis.
14.10 Choice of simple statistical tests for different data types
14.11 Type I and type II errors
14.12 Inappropriate use of statistics

15. Applied Anatomy

Respiratory System:

15.1 Mouth, nose, pharynx, larynx, trachea, main bronchi, segmental bronchi, structure of bronchial tree and differences in the children's airway
15.2 Airway and respiratory tract, blood supply, innervation and lymphatic drainage

15.3 Pleura, mediastinum and its contents
15.4 Lungs, lobes, microstructure of lungs
15.5 Diaphragm, other muscles of respiration, innervation
15.6 The thoracic inlet and 1st rib
15.7 Interpretation of a chest x-ray

Cardiovascular System:

15.8 Heart, chambers, conducting system, blood and nerve supply
15.9 Congenital deviations from normal anatomy
15.10 Pericardium
15.11 Great vessels, main peripheral arteries and veins
15.12 Foetal and materno-foetal circulation

Nervous System:

15.13 Brain and its subdivisions
15.14 Spinal cord, structure of spinal cord, major ascending and descending pathways
15.15 Spinal meninges, subarachnoid and extradural space, contents of extradural space.
15.16 Cerebral blood supply
15.17 CSF and its circulation
15.18 Spinal nerves, dermatomes
15.19 Brachial plexus, nerves of arm
15.20 Intercostal nerves
15.21 Nerves of abdominal wall
15.22 Nerves of leg and foot
15.23 Autonomic nervous system
15.24 Sympathetic innervation, sympathetic chain, ganglia and plexuses
15.25 Parasympathetic innervation.
15.26 Stellate ganglion
15.27 Cranial nerves: base of skull: trigeminal ganglion
15.28 Innervation of the larynx
15.29 Eye and orbit

Vertebral Column:

15.30 Cervical, thoracic, and lumbar vertebrae
15.31 Interpretation of cervical spinal imaging in trauma
15.32 Sacrum, sacral hiatus
15.33 Ligaments of vertebral column
15.34 Surface anatomy of vertebral spaces, length of cord in child and adult

Surface Anatomy:

15.35 Structures in antecubital fossa
15.36 Structures in axilla: identifying the brachial plexus
15.37 Large veins and anterior triangle of neck
15.38 Large veins of leg and femoral triangle
15.39 Arteries of arm and leg
15.40 Landmarks for tracheostomy, cricothyrotomy
15.41 Abdominal wall (including the inguinal region): landmarks for suprapubic urinary and peritoneal lavage catheters
15.42 Landmarks for intrapleural drains and emergency pleurocentesis
15.43 Landmarks for pericardiocentesis

Abdomen:

15.44 Gross anatomy of intra-abdominal organs
15.45 Blood supply to abdominal organs and lower body

16. Physiology & Biochemistry

General:

16.1 Organisation of the human body and homeostasis
16.2 Variations with age
16.3 Function of cells; genes and their expression
16.4 Mechanisms of cellular and humoral defence

16.5 Cell membrane characteristics; receptors
16.6 Protective mechanisms of the body
16.7 Genetics & disease processes

Biochemistry:

16.8 Acid base balance and buffers Ions e.g. Na + , K+, Ca++ , Cl-, HCO3-, Mg++, PO4- Cellular and intermediary metabolism; variations between organs
16.9 Enzymes

Body Fluids:

16.10 Capillary dynamics and interstitial fluid
16.11 Oncotic pressure
16.12 Osmolarity: osmolality, partition of fluids across membranes
16.13 Lymphatic system
16.14 Special fluids: cerebrospinal, pleural, pericardial and peritoneal fluids

Haematology & Immunology:

16.15 Red blood cells: haemoglobin and its variants
16.16 Blood groups
16.17 Haemostasis and coagulation; pathological variations
16.18 White blood cells
16.19 Inflammation and its disorders
16.20 Immunity and allergy

Muscle:

16.21 Action potential generation and its transmission
16.22 Neuromuscular junction and transmission
16.23 Muscle types
16.24 Skeletal muscle contraction
16.25 Motor unit
16.26 Muscle wasting
16.27 Smooth muscle contraction: sphincters

Heart & Circulation:

16.28 Cardiac muscle contraction
16.29 The cardiac cycle: pressure and volume relationships
16.30 Rhythmicity of the heart
16.31 Regulation of cardiac function; general and cellular
16.32 Control of cardiac output (including the Starling relationship)
16.33 Fluid challenge and heart failure
16.34 Electrocardiogram and arrhythmias
16.35 Neurological and humoral control of systemic blood pressures, blood volume and blood flow (at rest and during physiological disturbances e.g. exercise, haemorrhage and Valsalva manoeuvre)
16.36 Peripheral circulation: capillaries, vascular endothelium and arteriolar smooth muscle Autoregulation and the effects of sepsis and the inflammatory response on the peripheral vasculature
16.37 Characteristics of special circulations including: pulmonary, coronary, cerebral, renal, portal and foetal

Renal Tract:

16.38 Blood flow, glomerular filtration and plasma clearance
16.39 Tubular function and urine formation
16.40 Endocrine functions of kidney
16.41 Assessment of renal function
16.42 Regulation of fluid and electrolyte balance
16.43 Regulation of acid-base balance
16.44 Micturition
16.45 Pathophysiology of acute renal failure

Respiration:

16.46 Gaseous exchange: O2 and CO2 transport, hypoxia and hyper- and hypocapnia, hyper-and hypobaric pressures
16.47 Functions of haemoglobin in oxygen carriage and acid-base equilibrium

16.48 Pulmonary ventilation: volumes, flows, dead space.
16.49 Effect of IPPV and PEEP on lungs and circulation
16.50 Mechanics of ventilation: ventilation/perfusion abnormalities
16.51 Control of breathing, acute and chronic ventilatory failure, effect of oxygen therapy
16.52 Non-respiratory functions of the lungs
16.53 Cardio-respiratory interactions in health & disease

Nervous System:

16.54 Functions of nerve cells: action potentials, conduction, synaptic mechanisms and transmitters
16.55 The brain: functional divisions
16.56 Intracranial pressure: cerebrospinal fluid, blood flow
16.57 Maintenance of posture
16.58 Autonomic nervous system: functions
16.59 Neurological reflexes Motor function: spinal and peripheral
16.60 Senses: receptors, nociception, special senses
16.61 Pain: afferent nociceptive pathways, dorsal horn, peripheral and central mechanisms, neuromodulatory systems, supraspinal mechanisms, visceral pain, neuropathic pain, influence of therapy on nociceptive mechanisms
16.62 Spinal cord: anatomy and blood supply, effects of spinal cord section

Liver:

16.63 Functional anatomy and blood supply
16.64 Metabolic functions
16.65 Tests of function

Gastrointestinal:

16.66 Gastric function; secretions, nausea and vomiting
16.67 Gut motility, sphincters and reflex control
16.68 Digestive functions and enzymes
16.69 Nutrition: calories, nutritional fuels and sources, trace elements, growth factors

Metabolism and Nutrition:

16.70 Nutrients: carbohydrates, fats, proteins, vitamins, minerals and trace elements
16.71 Metabolic pathways, energy production and enzymes; metabolic rate
16.72 Hormonal control of metabolism: regulation of plasma glucose, response to trauma
16.73 Physiological alterations in starvation, obesity, exercise and the stress response
16.74 Body temperature and its regulation

Endocrinology:

16.75 Mechanisms of hormonal control: feedback mechanisms, effect on membrane and intracellular receptors
16.76 Central neuro-endocrine interactions
16.77 Adrenocortical hormones
16.78 Adrenal medulla: adrenaline (epinephrine) and noradrenaline (norepinephrine)
16.79 Pancreas: insulin, glucagons and exocrine function
16.80 Thyroid and parathyroid hormones and calcium homeostasis

Pregnancy:

16.81 Physiological changes associated with a normal pregnancy and delivery
16.82 Materno-foetal, foetal and neonatal circulation
16.83 Functions of the placenta: placental transfer
16.84 Foetus: changes at birth

17. Pharmacology

Principles of Pharmacology:

17.1 Dynamics of drug-receptor interaction
17.2 Agonists, antagonists, partial agonists, inverse agonists
17.3 Efficacy and potency
17.4 Tolerance
17.5 Receptor function and regulation
17.6 Metabolic pathways; enzymes; drug: enzyme interactions; Michaelis-Menten

equation

17.7 Enzyme inducers and inhibitors.

17.8 Mechanisms of drug action Ion channels: types: relation to receptors.

17.9 Gating mechanisms.

17.10 Signal transduction: cell membrane/receptors/ion channels to intracellular molecular targets, second messengers

17.11 Action of gases and vapours

17.12 Osmotic effects

17.13 pH effects

17.14 Adsorption and chelation

17.15 Mechanisms of drug interactions:

17.16 Inhibition and promotion of drug uptake.

17.17 Competitive protein binding.

17.18 Receptor inter-actions.

17.19 Effects of metabolites and other degradation products.

Pharmacokinetics & Pharmacodynamics

17.20 Drug uptake from: gastrointestinal tract, lungs, nasal, transdermal, subcutaneous, IM, IV, epidural and intrathecal routes

17.21 Bioavailability

17.22 Factors determining the distribution of drugs: perfusion, molecular size, solubility, protein binding.

17.23 The influence of drug formulation on disposition

17.24 Distribution of drugs to organs and tissues:

17.25 Body compartments Influence of specialised membranes: tissue binding and solubility

17.26 Materno-foetal distribution

17.27 Distribution in CSF and extradural space

17.28 Modes of drug elimination:

17.29 Direct excretion

17.30 Metabolism in organs of excretion: phase I & II mechanisms

17.31 Renal excretion and urinary pH

17.32 Non-organ breakdown of drugs

17.33 Pharmacokinetic analysis:

17.34 Concept of a pharmacokinetic compartment

17.35 Apparent volume of distribution

17.36 Orders of kinetics

17.37 Clearance concepts applied to whole body and individual organs

17.38 Simple 1 and 2 compartmental models:

17.39 Concepts of wash-in and washout curves

17.40 Physiological models based on perfusion and partition coefficients

17.41 Effect of organ blood flow: Fick principle

17.42 Pharmacokinetic variation: influence of body size, sex, age, disease, pregnancy, anaesthesia, trauma, surgery, smoking, alcohol and other drugs

17.43 Effects of acute organ failure (liver, kidney) on drug elimination Influence of renal replacement therapies on clearance of commonly used drugs

17.44 Pharmacodynamics: concentration-effect relationships: hysteresis

17.45 Pharmacogenetics: familial variation in drug response

17.46 Adverse reactions to drugs: hypersensitivity, allergy, anaphylaxis, anaphylactoid reactions

Systemic Pharmacology

17.47 Hypnotics, sedatives and intravenous anaesthetic agents

17.48 Simple analgesics

17.49 Opioids and other analgesics; Opioid antagonists

17.50 Non-steroidal anti-inflammatory drugs

17.51 Neuromuscular blocking agents (depolarising and non-depolarising) and anti cholinesterases

17.52 Drugs acting on the autonomic nervous system (including inotropes, vasodilators, vasoconstrictors, antiarrhythmics, diuretics)

17.53 Drugs acting on the respiratory system (including respiratory stimulants and bronchodilators)
17.54 Antihypertensives
17.55 Anticonvulsants
17.56 Anti-diabetic agents
17.57 Diuretics
17.58 Antibiotics
17.59 Corticosteroids and other hormone preparations
17.60 Antacids. Drugs influencing gastric secretion and motility
17.61 Antiemetic agents
17.62 Local anaesthetic agents
17.63 Immunosuppressants
17.64 Principles of therapy based on modulation of inflammatory mediators indications, actions and limitations
17.65 Plasma volume expanders
17.66 Antihistamines
17.67 Antidepressants
17.68 Anticoagulants
17.69 Vitamins A-E, folate, B12

8. Assessment

Assessment would be comprised of (A) formative assessment during residency programme and (B) summative assessment at the completion of training.

(A) Formative Assessment during Residency Programme:

Integrated and coherent formative assessment of competence of the students during the residency programme shall be comprised of various suitable methods complemented by the provision of frequent and constructive feedback.

Feedback:

1. Feedback should be given to the trainees on regular basis.
2. The feedback should be about the overall integrated, coherent and longitudinal assessment of the trainee.
3. The feedback should be in the form of constructive suggestions for improvement in their performance.

Assessment shall be carried by supervising teachers with focus on:

1 Acquisition and application of knowledge and skills
2 Clinical reasoning and judgment in uncertain situations
3 Problem solving skills - Situation/Problem Based Learning
4 Skill development for diagnostic and therapeutic procedures
5 All above through departmental and extra department rotation

Formative assessment by suitable assessment method(s) should cover all competencies mentioned in the curriculum and include the following:

A. Cognitive Domain

Competence	Assessment Method(s)
1. Resuscitation and Initial Management of the Acutely Ill Patients	1 Case Presentation 2 Structured directed observation with check list 3 Objective Structured Clinical Examination (OSCE) including Problem solving skills – Problem situations and case scenario 4 Objective Structured Practical Examination (OSPE) 5 Porfolio a) Log Book (clinical cases)
2. Diagnosis : Assessment, Investigation, Monitoring and Data Interpretation	
3. Disease Management	
4. Therapeutic interventions/organ system support in single or multiple organ failure	
5. Peri-operative care	
6. Pediatric Care	

7. Transportation	b) Log Book (procedures) c) Log Book (extra-departmental rotation) 6 Structured essay
8. Research Methods	1. Short answer 2. Structured essay 3. Oral examination (viva-voce)
9. Physics & Clinical Measurement Mathematical Concepts	1. Short answer 2. Structured essay 3. Oral examination (viva-voce)
10. Applied Anatomy	
11. Physiology & Biochemistry	
12. Pharmacology	

B. **Psychomotor Domain**

Competence	Assessment Method(s)
1 Practical procedures	1. Structured directed observation with check list 2. Log Book (departmental procedures) 3. Log Book (extra-departmental procedures)

C, Affective Domain

Competence	Assessment Method(s)
1. Pain Relief, Comfort and Recovery 2. End of life care 3. Patient safety and health systems management 4. Ethics, Attitudes and Professionalism a. Integrity, Empathy & Patient Advocacy b. Self-Motivation & Time Management c. Appearance and Personal Hygiene d. Self-Confidence & Respect e. Communications f. Teamwork and Diplomacy g. Careful Delivery of Service	1. Case Presentation 2. Structured directed observation with check list 3. Objective Structured Clinical Examination (OSCE) including Problem solving skills – Problem situations and case scenario 4. Objective Structured Practical Examination (OSPE) 5. Structured essay 6. Incognito standardized method(s) 7. Oral examination (viva-voce)

.

(B) Summative Assessment at the Completion of Training:

At the completion of training, summative assessment of competence of the students should be conducted by the examiners by methods as suggested below:

Competency	Method of Evaluation	Evaluator (s)
I. Patient Care	OSCE and OSPE Clinical evaluation exercises	Examiner(s)
II. Medical Knowledge	Key-feature and problem solving Short-answer questions Structured essays Oral examination	Examiner(s)

Composition of theory assessment:

1. Structured essay questions : 15%
2. Short answer questions : 55%
3. Problem based/ analysis/ interpretation : 30%

Composition of the Practical assessment:

1. OSPE/OSCE : 30%
2. Viva voce : : 20%
3. Cases / Exercises /Projects : 50%

Weightage of formative assessment in the final result: 40%

Final result = 40% of formative assessment + 60% of Summative assessment

SYLLABUS

OF

D.M. in ONCO-PATHOLOGY

(Program Code: HLTH10A05)

Competency based Post graduate training programme for DM in Oncopathology
(Developed by MCI – Nominated Group of Experts)

1. **Preamble**

Competency based Post graduate training program for DM in Oncopathology aims to produce an Oncopathologist who after completion of training program should be able to offer adequate and timely laboratory support services in oncology diagnosis and be able to work as part of multidisciplinary team for overall management of patients with malignancies. He or she will understand all ancillary techniques used in oncology today and will be able to decide on the point of referral. He or she will also be able participatein quality management process in a histopathology laboratory.

2.Need Based assessment of Course

Cancer related morbidity and mortality forms a huge burden on the medical health care systems. Burden of oncologic diseases is increasing at an alarming rate in India. The past couple of decades have witnessed many scientific advances with an exponential expansion in our comprehension of pathobiology and tumorigenesis of malignancies leading to rapid evolution of diagnostic and treatment modalities that has led to improved outcomes. There is a huge unmet need in our country of skilled pathologists for diagnostic testing and monitoring of malignancies. Some of which are potentially curable if detected early and diagnosed accurately. The WHO classification of malignancies in new era, requires integration of clinical morphological, immunohistochemical and molecular data for diagnosis. There is currently no structured training program in India that provides training with a focus on all aspects of oncopathology. The above tests are available under one roof for training program in a handful of apex centres only whereas the requirement of these tests is in all comers of India. Every patient cannot reach these apex institutes for therapy. The oncologists treating these patients are handicapped to manage the patients without the requisite laboratory support. Lack of structured training also results in varied caliber of skilled pathologists. This leads to delay in diagnosis and management of the patients with its dire consequences. The proposed course is an attempt to bridge the gap in requirement, by training pathologists in skills related to cancer diagnosis and research.

There is a significant difference between a report signed out by a general surgical pathologist versus that signed out by a trained oncopathologist as basic training and philosophy is different. The minimal data set for histologic reporting that influences patient management based on the first surgical excision is actually generated at this first point of care. It is vital know that lack of inclusion of important criteria in a surgical pathology report to make it complete.

Over the years the Diagnostic oncopathology has grown with leaps and bounds and extended beyond morphology. The diagnostic armamentarium today includes many advanced ancillary techniques like immunohistochemistry, FISH, molecular techniques, flow cytometry etc. These tests are complex and require training of significant duration. These tests not only help in diagnosis and prognosis but also in personalization of therapy by detecting the target. The targeted therapy reduces the overall cost and toxicity of therapy and improves patient's outcome.

Current MD Pathology curriculum in majority of pathology training centres is restricted to basic and generalized pathology tests with focus on morphological training in surgical and cytological specimens. Students in MD PATHOLOGY course are mostly devoid of exposure to immunohistochemistry and/molecular tests for diagnostic work up as these centers lack facilities for such tests. This is due to requirement of high investment in infrastructure and technical expertise for establishing these tests. Recently. a number of predictive and prognostic markers in oncology are being incorporated into routine testing and are increasingly impacting treatment decision-making. These tests require close interaction between both the laboratory physician and treating physician and also understanding of therapeutic options for optimal management of the patient This is unavailable in the non-specialized training centers in India. Naturally this reflects on the training which can not be comprehensive.

Currently oncopathology is dealt by surgical pathologist and not an oncopathologist due to unavailability of formal training program. There is an evidence to show that trained oncopathologists are able to make a difference in diagnosis and overall management of malignancies world over. In fact, a dedicated oncopathology service is considered to be the back bone of cancer management as a proper and integrated diagnosis is a major determinant in outcome of the cancer patients in the era of targeted therapies. As the world of newer therapies based on molecular markers expands there will be a growing need for specialist oncopathologists in secondary and tertiary care levels of health care, in academic/government institution, large corporate hospitals, private laboratories, research laboratories and pharmaceutical companies in the next decade. There are excellent placement opportunities for trained oncopathology specialist in both private and public sector.need of centers with significant oncologic burden by providing the necessary laboratory support.

There is large pool of fresh MD pathologist who do not have any avenues for structured training for sub-specialization as the number of training posts in different fields of pathology is limited in India. This course will offer a novel avenue for further training. Young pathologists interested in cancer service or cancer research would avail of this course. After successfully completing the course, the "Oncopathology specialist' would get excellent placement opportunities in the private and public cancer centres.

-The specialists trained in DM Oncopathology will work as teachers in Medical college departments, teachingoncopathology and also sign out cancer related cases.

- The specialists trained in DM Oncopathology can also work in public or private pathology laboratories doing specialized testing for Oncopathology cases.

- The specialists trained in Oncopathology can pursue career in research in oncopathology

3. Eligibility for this Defined Course:

The trainee applying for the DM course in Oncopathology should be a postgraduate having MD degree in Pathology recognized by the Medical Council of India (MCI) or its equivalent degree recognized by Medical Council of India.

The other eligibility criteria would be as per general MCI rules/ condition. Admissions should be made through competitive examination as applicable in a particular state or medical institution and approved by the MCI.

4. Minimum Standard Requirement (Please refer PG regulation, 2000 available on MCI website)

The General minimum standard for running a postgraduate training program for DM in oncopathologyshall be as per the Post Graduate Medical Education Regulation 2000.

However on account of DM in Oncopathology being newly instituted postgraduate training program in India and resource constraints in Public – Funded Medical Institution the following relaxation would remain applicable for the initial period of about 10 years from date of approval of the course by Academic Council of MCI

Clause 11: Departmental training Facilities: There should be a department/ unit of Pathology as a stand-alone facility It should have a requisite minimum strength of full time faculty as prescribed in PG Medical Education Regulation,2000. They should have supportive department like major OT, Minor OT, ICU facility, microbiology, hematology and biochemistry laboratories.

The proposed three year degree program offers a very promising and rewarding career choice in oncopathology to post-graduates of pathology. The DM course in oncopathology should lead to a holistic growth and development of Oncopathology as a specialty in India from the academic and research point of view in addition to the basic need of offering comprehensive service.

At the end of training, the qualified resident doctor should have acquired thorough and comprehensive training in the various aspects of the specialty of Oncopathology to enable him/her to:

1. To function as a faculty/consultant in the specialty, confidently signing out report.
2. To shoulder the responsibility of an oncopathology section in a busy tertiary care hospital single handedly.
3. To understand the principle, application, interpretation and limitation of Oncopathology tests in relation to clinical problems
4. To participate actively in joint multi-disciplinary clinics making significant contribution in the patient care
5. To plan and set-up independent oncopathology service set-up catering to oncology care establishments
6. To set up, standardize and validate new test methodologies and maintain quality assurance for the same.
7. To teach, impart training and supervise students of oncopathology and junior colleagues
8. To carry out and help in conducting applied research in the field of oncopathology
9. To contribute towards growth of specialty including diagnostic, teaching and research

The curriculum, teaching and learning methodology and assessment methods shall be reassessed and reviewed every year.

Avenues available for this course

With advent in medical science, malignancies are detected early and are becoming increasingly treatable. The treatment costs are also reducing leading to more patients going in for curative intent therapy. For many cancers, specialized testing for predictive markers, for example, HER2 status, KRAS or EGFR mutation is critical for deciding choice of treatment. This has led to a pressing need for skilled pathologists trained in specialized tests essential for oncologic care. The specialists trained in DM Oncopathology will cater to the

Clause 11.1 Staff- Faculty: The minimum requirement for faculty should be 3 full time faculty members one of whom should be a Professor, one Associate Professor and one Assistant Professor. This requirement is for guidance in apex centers with extended staff managing a larger infrastructure. The minimum educational qualification for faculty is as follows.

Title	Qualification	Experience
Professor	MD in Pathology	At least 10 years Post MD experience of which 5 years at least should be as Associate Professor in a MCI recognized teaching hospital in Pathology Laboratory Minimum of 4 research publications in Indexed Journal
Associate Professor	MD in Pathology	At least 5 years Post MD experience of which 2 years at least should be as Assistant Professor in a MCI recognized leaching hospital in Pathology Laboratory Minimum of 2 research publications in Indexed Journal
Assistant Professor	MD in Pathology	At least 5 years Post MD experience of which 3 years teaching experience at MCI recognized teaching hospital in Pathology Laboratory

Clause 11.2 Minimum requirements for a Post Graduate Institution:

The department shall satisfy the minimum requirements for Post graduate training institution as per the MCI regulation.

Title	Qualification	Experience
Professor	MD in Pathology	At least 10 years Post MD experience of which 5 years at least should be as Associate Professor in a MCI recognized teaching hospital in Pathology Laboratory Minimum of 4 research publication in Indexed Journal
Associate Professor	MD in Pathology	At least 5 years Post MD experience of which 2 years at least should be as Assistant Professor in a MCI recognized teaching hospital in Pathology Laboratory Minimum of 2 research publications in Indexed Journal
Assistant Professor	MD in Pathology	At least 5 years Post MD experience of which 3 years teaching experience at MCI recognized teaching hospital in Pathology Laboratory

Clause 11.3 Bed Strength in Clinical Departments:

The department / Unit recognized for training in DM Oncopathology shall have attached training hospital with MCI recognized training for MCH in surgical oncology and / DM Medical Oncology.

Clause 11.4 Out-Patient departments:

The department / Unit recognized for training shall have minor OT for performing biopsy and OPD cubicles for fine needle aspiration procedure.

Clause 11.5 Laboratory Facilities:

The institution shall have adequate laboratory facilities for the training of the oncopathology students, and such laboratory shall provide all the facilities required for relevant investigations. These shall be regularly updated keeping in view the continuous advancement of knowledge, technology and research requirements. For training of students in non-clinical departments, proper and contemporary laboratory facilities shall be made available.

Pathology Laboratory: The laboratory should have a minimum annual work load of.

- **25000 specimens / year belonging to different systems**
- **5000 FNAC / year**
- **5000 Exfoliative cytology specimens, including Gynaec cytology / year**
- **1000 frozen sections/ year**

Haematology Laboratory: The laboratory should have a minimum work load of.

- 100 Complete blood counts/day
- 50 Peripheral Blood smears/day
- 50 Coagulation tests/day
- 1000 bone marrow aspiration smears/years
- 500 bone marrow biopsies/ years
- 100 body fluids specimens/ years

Immunohistochemistry Laboratory : Laboratory should have facility for adequate panels of immunohistochemistry for cancer diagnosis and prognostication/prediction. The laboratory should have a minimum work load of 3000 IHC tests / years

Molecular and Cytogenetics Laboratory : Laboratory should have facility for in-situ hybridization and molecular testing. There should be a minimum workload of 500 tests per year for different malignancies (solid and hematolymphoid malignancies)

Flow Cytometry Laboratory : There should be a flow cytometry laboratory processing at least 500 specimen per year for immunophenotyping.

Clause 11.5 Equipment:

The department / Unit recognized for training shall be equipped with the following Equipments.

- **Microscopes including teaching microscope**
- **Equipments for tissue processing & cutting**
- **Equipment for Immunohistochemistry**
- **Equipments for frozen section**

- **Cytocentrifuge for cytospin preparation**
- **Equipments for processing samples for molecular testing**
- **Flow cytometer**
- **Thermal cyclers and other molecular laboratory equipments including equipments for PCR, in-situ hybridization and gene sequencing**
- **Fluorescent microscopes for FISH**
- **Biosafety cabinets**

Clauses 12. Number of Post Graduate Students to be admitted.

The number of students to be admitted in case of DM Oncopathology courses shall be one student per year per MCI recognized Post Graduate teacher in department of pathology.

5. Curriculum:

The program has been designed to give the student comprehensive training in laboratory service of oncology, to enable them to follow a subsequent career pathway in either academic or oncology.

The curriculum of three years in training in DM Oncopathology includes

1. Theoretical knowledge in the subject
2. Practical and clinical skills
3. Writing Project / Research articles
4. Interpersonal relationship and communication skills.
5. Training in Research Methodology , Medical Ethics and Medico- legal aspects

09HLTH10A05-001-C: Theoretical knowledge

The course for Theoretical knowledge is under following heads normal

- Basic anatomy, embryology, physiology and immunophenotype of normal histologic tissues of different systems.
- Basic cell biology, carcinogenesis and molecular pathways.
- Proto-oncogenes and Tumor Suppressor Genes in Malignancies
- Grossing protocols of all common oncosurgical specimens and guidelines for handling all other specimens. Protocols for Obtaining tissues for ancillary methods
- Parts, working and quality assurance of important instruments like light and fluorescent microscopes, tissue processor, microtome, cryostat immunohistochemistry staining set-up (manual and automated), flow cytometer, PCR and nucleic acid sequencers.
- Types of fixatives, reagents in tissue processing, routine stains, histochemical stains and molecular techniques.
- Immunohistochemistry principle, basics, methods, [manual automated], trouble shooting and quality assurance
- Frozen section principle, technique, stains, artifacts and indication
- Principle, quality control and interpretation of data from automated counters
- Bone marrow aspiration techniques, staining, interpretation
- Flow cytometry- principles and applications
- Knowledge of evidence based guidelines and principles
- Pathogenesis and diagnostic approach and work up benign and neoplastic disease of Head and Neck, including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Breast, including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Gastrointestinal tract, including recent advances.

- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Lung and mediastinum, including recent advances.
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Female genital system, including recent advances.
- Pathogenesis and diagnosis approach and work up of benign and neoplastic diseases of Male genital system. Including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Soft tissue, including recent advances
- Pathogenesis diagnostic approach and work up of benign and neoplastic diseases of Bone, including recent advance
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Hematolymphoid organs, including recent advance
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Urinary tract, including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Endocrine organs, including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Paediatric age group, including recent advances
- Pathogenesis and diagnostic approach and work up od benign and neoplastic diseases of Central nervous system, including recent advances
- Pathogenesis and diagnostic approach and work up of benign and neoplastic diseases of Skin, including recent advances
- WHO classification of tumours
- AJCC/TNM classification of cancer
- Bone marrow and liver transplantation
- HLA and Transplant immunology
- Research methodology
- Quality management system including quality control, quality assurance and quality indicators in laboratory medicine
- Laboratory accreditation
- Safety in laboratory practices
- Medico-legal aspects and ethical guidelines in oncopathology.

09HLTH10A05-001-P: Practical and clinical skills

The trainee should be able to do the following in cognitive and psychomotor domain.

- Grossing of all types of oncopathology tissue specimens
- Interpretation and diagnosis of routine and complex clinical problems and various tests under the domain of oncopathology
- Interpret and integrate clinical and laboratory data with reasonable accuracy
- Correlate and advise further on relevant pathology data such that various
- Staining and quality control of Hematoxylin and eosin, Papanicolaou and Giemsa stains
- Staining, standardization and quality control of Histochemical stains (including Mucicarmine, Alcian Blue, Reticulin, Periodic Acid Schiff (PAS), Pearls tain, ZielNeelson stain, Gomori's Methanamine Silver, Elastic Van Gieson, Masson Trichrome stain, PTAH, Myeloperoxidase Nonspecific Esterase, Toluidine Blue stain and Congo Red stain)
- Prepare and stain peripheral blood smear, bone marrow aspiration smear, imprint cytology and squash cytology smear
- Perform Bone marrow aspirate and biopsy
- Tissue processing techniques and quality control
- Performing Fine Needle Aspiration (FNA), and preparing smears
- Performing on-site adequacy testing for image guided biopsies
- Processing all types of cytology specimens
- Interpretation of frozen section and principles.
- Standardization and validation of newer antibodies and quality assurance in IHC lab
- Technique of staining and interpretation of immunohistochemistry
- Processing and Interpretation of flow cytometry data
- Extraction of Nucleic acids from blood, bone marrow and cytology specimens
- Extraction of nucleic acids from Formalin fixed paraffin embedded tissues
- Interpretation of RT-PCR, FISH and DNA sequencing
- Familiarity with the function, handling and routine care of equipment in the laboratory
- Teaching oncopathology to postgraduates, nurses and paramedical staff including laboratory personnel
- Supervising work of subordinate laboratory staff and colleagues
- Initiate research questions and systematically write or present a paper and publish in a journal
- Be aware of quality control and bio-safety and waste disposal issues in a laboratory
- Constantly update knowledge of recent advances in oncopathology and allied subjects

09HLTH10A05-001-R: Writing project/ Research articles

- Identification of important peer reviewed journals.
- Demonstrate ability to search literature for information
- Evaluate levels of evidence in literature
- Demonstrate ability to critically evaluate published studies
- Demonstrate ability to design, plan and do a research study/ audit as part of curriculum
- Demonstrate ability to take informed consent before procedures

09HLTH10A05-002-C: Inter-personal relationship and communication skills.

- Understanding of importance and criticality of the laboratory tests and reports
- Demonstrate objectivity in interpretation of morphology
- Understand ones limitation in interpretation of tests and knowledge and to communicate the same to colleagues
- Give importance to patient safety and safety of staff in the laboratory
- Demonstrate skills in teaching junior staff, laboratory workers and medical colleagues
- Demonstrate effective communication skills in explaining reports to patients, delay in reports and counseling them if necessary including disclosure of laboratory errors
- Demonstrate effective communication skills in interacting with clinical and multidisciplinary teams indifficult cases
- Demonstrate capability to work in a team and avoid communication breakdowns
- Understanding of managerial and administrative responsibility of laboratory.
- Demonstrate leadership skills in managing laboratory
- Ability to perform root cause analysis of critical including occurring in laboratory in technical and interpretative processes
- Understand importance of maintaining and improving quality in pre and post analytical phases

09HLTH10A05-003-C: Training in Research Methodology, Medical Ethics and Medicolegal aspects

- Training in study design, power analysis, data collection and defining outcome measures
- Training in descriptive statistics and inferential statistics
- Understanding privacy and confidentiality of patient data
- Adopting ethical practices in conducting research

1. Teaching and Learning Methodology

Teaching and Learning Methodology includes

- Lectures
- Slides Meetings by faculty including MAPCON
- Slides meeting by students
- Specialty discussion/ case reviews
- Clinicopathologic conferences
- Multidisciplinary joint meeting and Tumour boards
- Journal Clubs
- Gross /Specimen meetings
- PPT of staff presentation

The trainees shall maintain a log book of their academic activities

Training schedule over 36 months

Sr.No	Rotation to specialty/ name of service	Duration
1.	Grossing of specimens	2 months
2.	Frozen section lab	1 month
3.	Surgical Pathology, specialty-wise training	24 months
4.	Techniques in immunohistochemistry and histopathology laboratory including histochemistry	2 months
5.	Molecular pathology lab	2 months
6.	Cytology lab	1 months
7.	Hematology lab	2 months
8.	Research/Thesis	2 months

- This posting includes rotation through all sub-specialties and encompasses training in surgical pathology, FNAC, exfoliative cytology, IHC and molecular pathology reporting related to each sub-speciality

  The resident shall attend joint-clinics and academic meetings of the sub-speciality in which he/she is posted

  The resident shall complete a minimum of one Institute ethics committee (IEC)-approved project/thesis during his tenure under the guidance of his teacher

  Project/ thesis plan shall be submitted to IRB within the first 4 months of joining for approval of IEC .The resident shall be trained in Good Laboratory Practices (GLP)

2. **Assessment**

   Assessment would comprise of (I) Formative Assessment during residency program and (B) Summative Assessment at the completion of training

(I) Formative Assessment (Total score- 200 Marks): This have two parts-

A) **Appraisal** (at the end of two years) (Maximum score – 100)

The assessment shall consist of a combination of Structured MCQ and Short answers [50 marks] There shall be in addition assessments by faculty for teaching ability, interpersonal communication skills and professionalism [50 marks]

B) **Academic assessment**(over 3 years course period) **(Maximum score – 100**)

- 10 points for each publication [other than a case report] in a peer reviewed journal during the 3 years course
- 5 Points for publication of a case report in peer reviewed journal
- 5 point for each state, national conference or major hospital presentation
- 10 points for each national conference paper presentation in award session
- 10 points for each international conference presentations
- 5 Points for each Case based analysis/ interpretation for morphology and approach
- 5 points for receiving an award

There shall be regular appraisal and feedback to the teachers for the formative assessments.

Candidate with a minimum of 40% score [80 marks] in the internal assessment will be allowed to appear in the Final examination

(II) Summative Assessment shall be at the end training of 3 year and shall consist of

1. Theory evaluation
2. Practical Skill evaluation

Theory evaluation : shall consist of 4 papers of 100 marks each

Paper I – Basic Cancer Biology and laboratory techniques

PaperII – Systemic Oncopathology I (Breast, Hematolymphoid, Bone and Soft tissues, neurooncopathology,Paediatric oncopathology and endocrine pathology)

Paper III – Systemic Oncopathology II (Head Neck, gastrointestinal, thoracic, Urologic, male genital and female genital tract)

Paper IV – Recent advances in Oncopathology and molecular pathology

Practical Skill Evaluation: Shall consist of following components (600 Marks):

1. Histopathology slides (250 Marks)
2. Cytology and haematology slides (150 Marks)
3. Clinicopathological exercises (25 Marks)
4. Spots (25 Marks)
5. Gross (25 Marks)
6. Lab techniques (25Marks)
7. Evaluation of Thesis/Project: (50 Marks)
8. Viva Voce (50 Marks)

The Final Assessment shall have a component from Formative assessment [200 marks] and Component from Summative Assessment [1000 marks] with total marks pf 1200.

Minimum 600 marks [with individual passing in theory and practical] need to be obtained for successfully passing the examination.

****

D.M.
INTERVENTIONAL RADIOLOGY
Under TMC
(Program code: HLTH10A06)

Curriculum for DM (Interventional Radiology)

Preamble:

The DM (Interventional Radiology henceforth referred to as IR) program is designed to provide the students with an organized, comprehensive and supervised education in the principles and practice of body, chest, musculoskeletal and cardiovascular radiology and the interventional techniques in the use of image-guided techniques in the above body systems. The course will also include in-depth training in the physical aspects of imaging, hazards of radiation and measures of protection.

Essential Requirements:

MD or DNB in Radiodiagnosis from an institution/university recognized by the Medical Council of India.

Upper Age limit: 35 years with relaxations as per the Govt. of India rules

Selection Methodology:

By a selection process, including an entrance examination pertaining to the systems listed above; and an interview/practical examination for assessment of past performance, curricular ability to imbibe training, and case presentation for assessing the examinee's communication skills and targeted problem-solving approach.

***Course Duration*: 3 years**

Scope of Services

The DM (IR) Program provides didactic and clinical experiences covering the full-spectrum of body, chest, musculoskeletal and cardiovascular radiology and the interventional techniques in the use of image-guided techniques in the above body systems. The course will also include in-depth training in the physical aspects of imaging, hazards of radiation and measures of protection. Both diagnostic and interventional vascular & non-vascular procedures will be included in the training program. The candidates will be required to obtain an in depth knowledge of imaging of vascular as well as non-vascular diseases with computed tomography, magnetic resonance imaging, conventional radiological techniques and Color Doppler Ultrasound, vascular procedures including diagnostic arteriography, vascular recanalization techniques by angioplasty/ stenting or clot lysis, embolization, endovascular stent grafts, embolotherapy, transcatheter infusion therapy, IVC filters, radiofrequency ablation, percutaneous procedures for osseous & soft tissue pathologies and venous access.

Objectives:

The main objective of the course is to rationalize the DM (IR) candidate's clinical acumen and analytical abilities so as to make him capable of taking appropriate decisions with regards to the execution of all interventional therapeutic and diagnostic procedures. This includes performance and interpretation of imaging procedures relating to the vascular (venous and arterial) systems of the body, as well as invasive (interventional) procedures for vascular & non-vascular disorders exclusive of the neurologic system (brain and spinal cord). The opportunity and skills to become a provider of top quality patient care, be a knowledgeable and inspiring teacher, and to perform clinical and experimental research in the field of vascular and interventional radiology will also be provided.

Upon completion of his training, the DM (IR) candidate should be able to:

1. Become familiar with the signs and symptoms of vascular & non-vascular disorders amenable to diagnosis and/or treatment by percutaneous methods guided by radiologic imaging.
2. Gain experience in interpreting non-invasive evaluations of vascular diseases of the arterial and venous systems.
3. Become familiar with the medical and surgical therapeutic alternatives of these disorders.
4. Become familiar with the indications and contraindications for vascular and non-vascular interventional radiologic procedures.
5. Gain experience in performing preprocedural clinical evaluation of patients and providing post procedural follow-up care
6. Perform and interpret invasive vascular interventional techniques including endovascular recanalization, reconstruction and embolization.
7. Gain exposure to new and evolving interventional techniques & technology such as Radiofrequency ablative therapy and tumor chemo & particulate embolization.
8. Become familiar with the signs and symptoms of cardiac, body, chest, musculoskeletal and peripheral system disorders that would help him to perform and interpret non-invasive investigations tailored to the clinical question.
9. Obtain an in-depth training in the physical aspects of imaging, hazards of radiation and measures of protection.

The candidate will be encouraged to inculcate relevant knowledge in anatomy, pathology, biochemistry and physiology of vascular & non-vascular diseases, imbibe patient management skills through direct patient care, and update his skills and knowledge through attending academic conferences, CMEs and hands-on workshops.

Research

Candidates will be required to participate in at least 2 research projects during the course. Clinical and experimental research oriented to understand, analyze and improve upon the existing knowledge of vascular and interventional radiological procedures should be the primary objective of this exercise. The candidate will also be introduced to the ethical and moral aspects of human and animal research through the exercise. He/she should make all efforts to publish the outcome of the projects in peer-reviewed journals, with at least one project being published. A dedicated research time will be provided in the curriculum. The candidate will be encouraged to become well versed in the techniques of research methodology by participating in the statistics courses organized at the institution.

Teaching

The candidate will be encouraged to develop his teaching skills by undertaking didactic lectures and practical demonstrations for the undergraduate and postgraduate students at the institute. The candidate will also get the opportunity to present Journal Club (one per week), case review (one per week), and academic seminar (one in 2 weeks) to peer groups. He will also get to participate regularly in the clinico-radiological conferences and multi-specialty conferences during his/her training period.

Educational Curriculum

The training program is designed to provide the candidate a closely supervised and comprehensive exposure of the clinical and radiological aspects of vascular and non-vascular diseases, through practical experience and supervised training. All aspects of image acquisition, physical aspects of the equipments and hazards of radiation & measures of protection will be taught.

The training in interventional vascular & non-vascular techniques will be provided in the angiography/fluoroscopy suites. The curriculum also includes rotations through the non-invasive imaging services to gain experience with performance and interpretation of imaging of different body parts (CT, MRI and Doppler) techniques. Special emphasis will be laid on recent advances in imaging and image-guided interventional techniques.

1st Year:

09HLTH10A06-001-C **Basics of Clinical aspects:**

- Clinical and Laboratory Considerations
    - Symptomatology and staging of vascular disease
    - Laboratory data (including non-imaging aspects of noninvasive vascular testing; for example, ankle-brachial indices for lower extremity arterial disease, impedance plethysmography for lower extremity venous disease)
- Epidemiology of vascular & non-vascular diseases
- Natural history of vascular disorders
- Vascular anatomy: arterial and venous
    - Embryology
    - Normal anatomy
    - Variant anatomy
    - Anatomy of collateral pathways
- Vascular physiology, pathology and pathophysiology: arterial system
    - Normal histology/physiology/morphology
    - Hemodynamics: normal and abnormal flow
    - Vasoactive extrinsic/pharmacologic agents
    - Disorders related to pharmacologic/extrinsic agent exposure
- Atherosclerosis
- Medial sclerosis
- Pathophysiology of arterial ischemia
- Aneurysms
- Thromboembolic disorders
- Dissection
- Congenital vascular disorders
    - Vascular malformations
    - Other congenital disorders (eg. popliteal artery entrapment)
- Arterial effects of adjacent tissues/disorders
- Arterial infection
- Vascular alterations in neoplasia: vascular supply of neoplasms, primary vascular neoplasms, vascular invasion by neoplasms
- Vascular alterations in inflammatory diseases
- Systemic vascular disorders
    - Primary systemic vascular disorders: vasculitides and others
    - Altered vascular pathology in systemic disease states
- Vascular trauma: injuries and vascular response to injury
    - Mechanical injury: acute and chronic
    - Thermal injury
- Arterial endothelium
- Alterations in coagulation status

    - Hypercoagulable states
    - Impaired coagulation
- Post-operative or post-interventional disorders
    - Synthetic and endogenous grafts
    - Myointimal hyperplasia
- Other/unclassified
- Vascular physiology, pathology and pathophysiology: venous/pulmonary arterial system
    - Normal histology/physiology/morphology
    - Hemodynamics: normal and abnormal flow
    - Vasoactive extrinsic/pharmacologic agents
        - Normal response
        - Disorders related to pharmacologic/extrinsic agent exposure
    - Thromboembolic disorders: acute and chronic
    - Venous aneurysms
    - Venous effects of adjacent tissues/disorders
    - Congenital vascular disorders
        - Vascular malformations
        - Other congenital disorders
    - Venous infection
    - Vascular alterations in neoplasia: vascular drainage of neoplasms, primary vascular neoplasms, vascular invasion by neoplasms
    - Vascular alterations in inflammatory diseases
    - Systemic vascular disorders
        - Primary systemic vascular disorders
    - Altered vascular pathology in systemic disease states
    - Vascular trauma: injuries and vascular response to injury
        - Mechanical injury—acute and chronic
        - Thermal injury
    - Venous endothelium
    - Alterations in coagulation status
        - Hypercoagulable states
        - Impaired coagulation
    - Post-operative or post-interventional disorders
        - Synthetic and endogenous grafts
        - Intimal hyperplasia
    - Other/unclassified
- Cardiac anatomy, physiology, pathology and pathophysiology

    - Normal anatomy of the pericardium and myocardium
    - Normal coronary anatomy
    - Cardiac metabolism and function
    - Cardiac hemodynamics

- Pulmonary arteries and veins
    - Pulmonary artery hemodynamics (as related to pulmonary angiography)
    - Pulmonary thromboembolic disease
    - Pulmonary arteriovenous malformations
    - Pulmonary venous disorders
- Cardiac disorders
    - Congenital heart diseases
    - Acquired heart diseases : ischemic heart diseases
    - Acquired heart diseases : valvular, endocardial, myocardial, and pericardial
    - Post-operative and post-interventional disorders including synthetic and endogenous valve prosthesis, pericardial and synthetic baffles, PTFE and endogenous shunt materials, bypass grafts, intimal hyperplasia in coronary stents

<u>09HLTH10A06-002-C</u> Basics of interventional vascular/non-vascular catheterization laboratory

- Workplace considerations
    - The vascular/interventional radiology suite
        - Equipment
        - Fluoroscopy
        - Standard angiography
        - Digital angiography
        - Image processing and recording
        - Other equipment (e.g. interventional ultrasound units)
        - Layout
    - Noninvasive vascular laboratories
        - Equipment – Color Doppler, CT and MRI
        - Management
        - Occupational Safety Issues
    - Radiation safety and hygiene
    - Infection control
    - Others
- Patient Considerations

- Pre-procedural assessment and care
- Intraprocedural monitoring
- Post-procedural follow up and care
- General pharmacologic considerations
    - Analgesia/anesthesia
    - Conscious sedation
    - Antibiotic therapy
    - Anticoagulation
    - Other

- Personnel Considerations
- The vascular/interventional radiology "team": role and relationship of nurses, technologists, trainees, other physicians

2nd Year:

09HLTH10A06-003-C **Imaging of the vascular & non-vascular system: general principles**

- Plain film
- Angiography: arteriography and venography
    - Standard angiography
    - Digital subtraction angiography
    - Contrast agents
        - Iodinated agents
        - Carbon dioxide
    - Vascular catheterization
        - Equipment: needles, guide wires, catheters, etc.
        - Vascular access
        - Selective and subselective catheterization
    - Risks and complications
        - Contrast reactions, iodinated agents
            - Anaphylactoid reactions
            - Classification
            - Prevention
                - Ionic vs. nonionic agents
                - Premedication

        - Treatment
    - Dose dependent reactions
        - Classification
            - Acute and chronic renal effects
            - Other
        - Prevention
        - Treatment

  - Procedural complications

    - Puncture site complications
    - Catheterization-related complications (apart from puncture site)
    - Systemic/generalized complications

  - Pharmacoangiography: agents and uses

    - Vasodilatation
    - Vasoconstriction
    - Other

  - Intravascular Ultrasound
- Ultrasonography

    - Gray scale
    - Duplex Doppler
    - Color flow

- Computed Tomography

    - General
    - Spiral and Multislice CT
    - CT angiography

- Magnetic Resonance Imaging

    - General-vascular & non-vascular
    - Cardiac MRI protocols
    - Blood flow evaluation and MR angiography

3rd Year:

09HLTH10A06-004-C Vascular Intervention: General

- Common Topics: vascular interventional procedures
    - Anatomic considerations
    - Indications and contraindications
    - Techniques, devices, materials
    - Results, efficacy
    - Risks and complications
    - Alternate techniques (surgical and medical therapeutic options)
- Vascular canalization/recanalization: re-establishment of flow
    - Thrombolytic therapy
        - Pharmacologic thrombolysis
            - General principles
            - Specific agents: urokinase, streptokinase, tissue plasminogen activator, others
        - Mechanical techniques
            - Fogarty balloon
            - Suction thromboembolectomy
            - Other/newer devices
    - Balloon angioplasty
    - Atherectomy
    - Laser recanalization
    - Mechanical recanalization
    - Vascular stents
    - Endovascular grafts
    - Other
- Vascular blockade: obliteration of flow
    - Embolization
        - Techniques
            - Transcatheter
            - Direct injection
        - Agents
    - Other methods
        - Ultrasound guided compression repair
- Re-routing of flow
    - Endovascular repair of aneurysms
    - Creation of new vascular channels (e.g. TIPS, fenestration of aortic dissection)
- Vascular filters

- Vascular foreign body removal
- Intravascular/transvascular biopsy
    - Transvenous liver biopsy
    - Other

<u>09HLTH10A06-005-C</u> **Vascular Intervention: Specific territories**

- Lower extremity vascular disease
    - Arterial
        - Occlusive atherosclerotic disease: recanalization
            - Aortoiliac
            - Femoropopliteal
            - Tibioperoneal
        - Intervention for peripheral arterial trauma
        - Thromboembolic disorders: recanalization
        - Peripheral arterial graft failure: recanalization
        - Iatrogenic disorders: therapy for puncture site complications
    - Venous
    - Combined: vascular malformations: obliteration
- Upper extremity vascular disease
    - Arterial
        - Thromboembolic disorders: recanalization
        - Trauma
    - Venous
        - Acute upper extremity venous thrombosis: recanalization
        - Chronic upper extremity venous thrombosis: recanalization
    - Combined: vascular malformations: obliteration
    - Venous varicose-Radiofrequency ablation
- Thoracic vascular disease
    - Hemoptysis
        - Bronchial artery embolization
        - Other techniques
    - Pulmonary arteries and veins
        - Pulmonary thromboembolic disease: thrombolytic therapy, thromboembolectomy
        - Pulmonary arteriovenous malformations: embolization
- Aortic disorders
    - Aortic aneurysm: embolization, endovascular grafting
    - Aortic dissection: endovascular grafting, fenestration
    - Aortic trauma
- Central venous intervention (SVC, IVC)
    - Central venous occlusive disorders
        - Thromboembolic disorders

        - Congenital webs
    - Caval filtration and related techniques for thromboembolic disease
- Vascular diagnosis, abdominal and pelvic viscera
    - Genitourinary system
        - Kidney
            - Renovascular hypertension: recanalization techniques
            - Renal trauma
            - Varicocoele/ Ovarian Vein embolisations
- Uterine Fibroid embolization
- GI Bleeds
- TACE for HCC

Non-vascular Interventions

- Hepatobiliary interventions
    - Hepatic carcinomas-chemoembolization or RFA
    - Common bile ducts abnormalities
    - Liver cirrhosis
    - Other miscellaneous conditions
- Pain management for neoplastic & non-neoplastic conditions by interventional techniques under image guidance (fluoroscopy, CT, USG, MRI)
- Breast imaging & Interventions
- Vertebroplasty-Using alcohol or bone cement
- Kyphoplasty
- HIFU
- GENITOURINARY INTERVENTIONS – ESWL, PCN, PCNL
- Ureteric stenting/ Ureteric occlusions/ Management of Ureteric leaks
- Radiofrequency/ Microwave ablations pf Renal tumors/ Prostate etc.
- RFA/ Microwave ablations of Lung tumors
- Fallopian tube recanalisations
- Transarterial chemo/ embolization of osteosarcomas/ retinoblastomas
- Biopsy and drainage procedures
- Newer techniques and applications of interventional radiology and Interventional Oncology -

- Quality Assurance Issues

    - Outcomes analysis
    - Practice guidelines
    - Complications: classification, documentation

- Legal Aspects of Interventional Radiology
    - Informed consent

    - Malpractice
- Regulatory agencies
    - Investigational devices and procedures
- Administrative Aspects
    - Equipment purchase
    - Inventory management

Evaluation of the Candidate

The assessment of the candidate will be a continuous process. Each candidate will be required to maintain a logbook, wherein his clinical, teaching and research activities through the entire duration of the course will be entered. Evidence of having conducted research should be presented before the candidate is permitted to appear for the DM (final) examination.

Four examiners, two of who will be external examiners, will conduct the DM examination. The general scheme of conducting the examination will be as follows:

Theory

Practical

Viva/Voce

Outcomes

The trainee successfully completing the DM (IR) course will be eligible for the award of a degree in Interventional Radiology.

होमी भाभा राष्ट्रीय संस्थान
Homi Bhabha National Institute

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS
OF
M.CH SURGICAL ONCOLOGY

(Program Code: HLTH10B01)

I. INTRODUCTION

Surgical Oncology is a recognized Super-specialty in General Surgery. With the increasing incidence of cancer in our country and with improved methods of management of cancer in the last two decades, it has become very essential to have trained Surgical Oncologists for comprehensive care of the cancer patient.

II. AIMS & OBJECTIVES

The main aim of the training program is to ensure that at the end of 3 years training, the candidate should be acquainted with comprehensive management, research methodology including medical statistics and must:

1) Be an independent Consultant / Clinician / Teacher in Surgical Oncology.
2) Be a teacher in the discipline, acquainted with current literature on relevant as pact of basic, investigation and clinical oncology.
3) Take up research projects in the discipline either clinical or basic as pects as applied to clinical trials with reference to common cancers in our country.
4) Render medical care to be the individual and the community, integrating preventive, diagnostic, curative and palliative as pects with adequate understanding of sociocultural as pects of the community and knowledge of the epidemiology of common neoplastic disorders in India.

III. NAME OF THE COURSE

M.Ch. (Surgical Oncology)

IV. ELIGIBILITY

M.S. (General Surgery)
M.S. (ENT)
M.S. (Orthopedics)
M.D. (Gynaec)

V. DURATION OF COURSE

Three Years.

VI. No of Seats

As specified from time to time

VII Selection of Candidates

An entrance test will be conducted by the Competent Authority and the admission to the course will be on the basis of merit list prepared on the basis of this test.

VIII Teacher

All eligible faculty members as prescribed by Homi Bhabha National Institute (DU) of the Dept of Surgical Oncology will be teachers in rotation, subject to approval by the University. One student will be registered under one teacher, in rotation.

IX Place of Course
The course will be conducted at affiliated Medical Colleges / Recognized Institutes.

X. TYPE OF COURSE
The selected candidates will undergo a three year residential training as Residents / Trainees at the affiliated Medical Colleges / Recognized Institutes as follows.
1. 1st year – 2 month rotation in the various major surgical specialty services in the Dept. of Surgical Oncology as a 1st year residents.
2. 2nd & 3rd year – 4 month rotation in six major surgical specialty services in the Dept. of Surgical Oncology as Senior Residents / Trainees.
3. In the 2nd & 3rd year the students will also rotate in the following specialties:
a) Medical Oncology – 3 Weeks
b) Radiation Oncology – 3 Weeks
c) Onco – Pathology – 1 Week
d) Radiology – 1 Week
e) Basic Research – 3 weeks
f) Stoma /Pain/ Rehabilitation Clinics – 1 weeks

XII. TEACHING SCHEDULE
A. Clinical:
1) **Outpatient Teaching Schedule**: The Post Graduate students will attend outpatient clinics as per the schedule of the unit assigned to them.
2) **Teaching Ward Rounds:** In addition to daily ward rounds will be conducted by the consultant.
3) **Operation Theatres:** The Post Graduate students will attend the operation theatres as per the schedule of the assigned unit where they will assist in or perform operations under supervision.
B. Academic:
The Post Graduate will attend and actively participate in the following academic activities:
1) Formal course of lectures as fixed by the Dept. for the three-year course to cover the entire syllabus.
2) Case presentations.
3) Seminar / journal club of each specialty service.
4) Weekly Hospital Clinical Meetings.
5) Mortality meetings.
6) All Seminar / Conference / Workshop conducted by the Department.

XIII. INTERNAL ASSESSMENT
1) A Postgraduate student Logbook will be maintained as prescribed by the University.
2) A Log book of operations assisted in and performed will be maintained & periodically signed by the teacher (computerized).
Internal assessment will be carried out while student rotates through each subspecialty (Head/neck, breast, thoracic, Gastro-intestinal, genitourinary,

gyanecology, bone & soft tissue, neurosurgery and paediatric oncology services)

XIV. SYLLABUS

Syllabus shall comprise in four parts:

09HLTH10B01-001-C	Basic Sciences
09HLTH10B01-002-C	Principals of oncology
09HLTH10B01-003-C	Clinical Practice of Surgical Oncology
09HLTH10B01-004-C	Recent Advances in Oncology

XV. ELIGBILITY FOR EXAMINATION

The candidate will be eligible to appear for the M. Ch. Examination in Surgical Oncology conducted by the University only after certification of the following:

1) Completion of three years of Resident training.

2) Satisfactory attendance at Clinical / Academic sessions as duly certified on the logbook by the teacher. A minimum attendance of 85 % is mandatory.

XVI. EXAMINATION

4) Board of Examiners:

Four Examiners: Two internal & two external

All examiners shall be Surgical Oncologists.

5) Assessments of candidates & Results:

a) Assessment of theory, clinical, practical and viva–voce examination shall be done jointly by all the examiners.

b) A candidates shall be declared to have passed the examination if he /she has an adequate knowledge in all subjects as answered by Theory / clinical / practical and viva–voce examination and there shall be no classification or ranking of successful candidates. However, candidates of excellent performance could be recommended for award for distinction.

c) A candidates who fails in an examination shall appear as a casual student for subsequent examination.

d) The Board of examiners shall have the power to refer failed candidates for one year or to put in attendance for one term i.e. Six months before appearing for the ext examination.

Homi Bhabha National Institute

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS
OF
M.Ch GYNAECOLOGICAL ONCOLOGY
(Program Code: HLTH10B02)

CURICULLAM OF M.CH (GYNAECOLOGICAL ONCOLOGY)

AIMS AND OBJECTIVES

The MCh in Gynecological Oncology is designed as a Subspecialty course aimed at training candidates who having obtained a primary MCI-recognized postgraduate qualification in Obstetrics & Gynecology i.e. MS/MD or equivalent (DNB) and desire to pursue a career in the subspecialty of Gynecological Oncology.

The MCh in Gynecological Oncology has been designed as a comprehensive formal 3-year training program in all aspects of gynecologic oncology. It also includes training in the allied surgical subspecialties of Urological, Gastrointestinal and Breast Oncology, as well as Preventive Oncology, Radiation and Medical Oncology.

The candidate will receive comprehensive training in the management of patients with gynecological cancers. The program is designed to provide the candidate with every opportunity to gain proficiency in the principles of prevention and early detection, diagnosis and evidence-based treatment, palliative and terminal care. The program also stresses the importance of clinical and basic research relevant to the Subspecialty.

A candidate who successfully completes the course will be expected to have gained proficiency in the following:

- Ability to function as an independent consultant clinician in Gynecological Oncology
- Understand the epidemiology of gynecological cancers as also the principles underlying screening, early detection and prevention. The candidate should acquire a high level of competency in the performance of colposcopy and LEEP procedures in the management of pre-invasive and micro-invasive lesions of the female genital tract
- Acquire a sound knowledge of gross and microscopic pathology and cytology relevant to gynecological oncology. The candidate should be capable of interpreting the details of cytopathology and histopathology reports and use this effectively in making decisions regarding treatment and prognosis
- Acquire the necessary skillset and competence to safely perform radical surgery for gynecological cancers including the ability to prevent, recognize and manage any complications arising thereof
- Understand the surgical principles and have the skills necessary to perform appropriate surgical procedures on the GI and Urinary tract as and when required in the management of gynecological cancer and its complications
- Be familiar with principles of management of diseases of the breast
- Be able to perform the following invasive diagnostic procedures i.e. cystoscopy, thoracic and abdominal paracentesis, and placement and care of central lines
- Have a detailed knowledge of relevant imaging technologies, (indications and limitations) i.e. Ultrasound, CT, MRI and FDG-PET scans
- Have a sound knowledge of the principles of peri-operative patient care
- Have a sound knowledge of the principles of pain management, palliative care and end-of-life issues

- Acquire an understanding of the principles of radiobiology and radiation physics. Be well informed in the principles and techniques of modern radiation treatments. The candidate must develop the skills necessary to recognize and treat the side-effects and complications of radiation treatment
- Acquire sound knowledge of the clinical pharmacology of cancer chemotherapy and related treatment modalities. The candidate should develop the skills necessary for the appropriate selection of patients for chemotherapy and the practical use of the available chemotherapeutic options used in the management of gynecological cancer patients. The candidate should develop skills in the recognition and management of toxic side effects and acquire the ability to administer them in an independent capacity, if necessary
- Acquire skill in the assessment of the effects of treatment and the care of complications. This includes skill in the assessment of patients after treatment and during follow-up.
- Understand cancer survivorship issues and the principles underlying the management of fertility issues in gynecological cancer patients
- Develop skills in the planning, conduct, reporting and interpretation of research in gynecological oncology
- Understand the psycho-sexual, socio-cultural and economic aspects of cancer management in the Indian setting

ELIGIBILITY

The candidate must fulfill the following requirements to be considered eligible to apply for the course:

- Hold the MBBS degree and be fully registered with either the Medical Council of India (MCI) or possess full registration with the Medical Council of the domicile State
- Hold a MCI-recognized postgraduate degree in Obstetrics & Gynecology or any other qualification declared as equivalent i.e. MD/MS, DNB

ADMISSION

Admission to the course at Tata Memorial Hospital shall be based strictly on merit and as per the guidelines laid down by the MCI & the Homi Bhabha National Institute (HBNI)

TYPE OF COURSE

The MCh in Gynecological Oncology is a Full time Subspecialty course of three years duration

GENERAL RULES

- **T**he course will be strictly in-service training in nature and the candidate will have all clinical responsibilities including emergency duties
- The candidate will actively participate in the weekly Departmental Academic Program which includes didactic lectures, clinico-pathological Meetings, Journal clubs, Case discussions and Unit Grand Rounds

- The candidate will be required to undertake one research project and be responsible for the planning, execution, analysis and presentation of the same. The research topic will be provided by the Teacher and should be approved within the first six months of commencing the course.Threehardcopies and one soft copy on a CD of the same will be submitted to the Dept. of Academics priorto the completion of the course and the number required by the Board will be forwarded for dispatch to the examiners for the evaluation of the same. The defense of the same will be required during the viva voce as a separate session. The conclusions of the study should be presented at aforum within the institution or at a suitable National forum and the same should also ideally be accepted for publication in a peer-reviewed Journal
- The candidate will maintain a daily Training Record/Logbook for recording the following:
    - Clinical attendance
    - Attendance at Departmental/Institutional Meetings
    - Record of the patients in whose management the candidate has been actively involved. This record will need to be checked and signed regularly by the Teacher. The Record Book is intended as a means of continuous self-assessment. It is designed to stimulate the Trainee towards greater efforts in areas where the assessment reveals a standard that is below par and also to record progress in skill acquisition made by the Trainee.
- Regular 6-monthly evaluation of the overall performance of the Trainee will be done by the supervisor in consultation with other departmental Faculty, according to the criteria as indicated below (vide infra). The evaluation is to be discussed with the trainee to facilitate improvements and correct deficiencies in the training system
- Additional formal internal assessments will be performed in the form of a written and oral examination conducted at 6-monthly intervals. This evaluation is independent of the 6-monthly internal assessments of Trainee performance indicated above
- The leave period sanctioned to a Trainee during the course will be as per Institutional and MCI rules. Absence during the course exceeding the number of days specified will have to be made up by the extra days of work in that particular posting in which the candidate availed of leave prior to the acceptance of the candidate for the examination and the payment of the examination fees

CLINICAL ROTATION

The Trainee will undergo a Clinical Rotation during the 3-years as a MCh Gynec. Oncology Trainee as outlined below:

Gynec. Oncology (Parent Unit)	24 months
Urologic Oncology	02 months
GI Surgical Oncology	04 months
Breast Unit	06 weeks
Radiation Oncology	04 weeks
Medical Oncology	04 weeks
Preventive Oncology	06 weeks
Lab (ACTREC)	01 month

- The Trainee will spend 24 months of the Course full-time in the Gynecological Oncology unit

- The Trainee will be expected to rotate through the various relevant clinical specialties as outlined above
- The candidate will spend 12 months of his/her training in relevant allied subspecialty units
- The Trainee will be allowed to sit the MCh examination ONLY after completing all the required formalities as specified by the MCI.

TRAINING MODULES

Specific training modules have been designed and it will be the responsibility of the Faculty and Teachers/Mentors to ensure that the Trainee is trained as per the recommendations provided within each module as given below:

I <u>Gynecological Oncology Modules</u>

<u>09HLTH10B02-001-M: General Assessment of a Gynecological Oncology Patient</u>

Objectives

To trainthe Trainee in the skills required for appropriate clinical assessments of patients with suspected or known gynecological cancers

- Obtain detailed clinical history
- Perform appropriate physical examination
- Consolidate information received from prior investigations if any
- Initiate further investigations
- Communicate clinical plan to patient and relatives

Knowledge Criteria

To Trainee should demonstrate knowledge of the following:

- Indications/limitations of screening for gynecological cancer
- Patterns of clinical presentation
- Investigations required for establishing a diagnosis
- Care pathways for suspected/proven gynecological cancer
- Pre-operative investigations (routine/specific) of patients
- Assessment of fitness for surgery

Criteria of Clinical Competence

To demonstrate clinical competency with respect to the following:

- Counseling patients appropriately about screening and interpreting screening results
- Taking an appropriate clinical history including family history and genetic susceptibility where relevant
- Correlation of presenting symptoms/co-morbid conditions
- Performance of a detailed clinical examination

- Counseling patients re: diagnosis, investigations and appropriate treatment options including adverse effects and complications
- Communicating the results of investigations and treatment
- Discussing prognosis

Professional Skills and Attitudes

- Ability to demonstrate clinical competency as indicated above
- Ability to identify the high-risk surgical patients and liaise with colleagues in anesthesia
- Ability to liaise with colleagues in Radiation and Medical Oncology as also with specialists in palliative care as when appropriate
- Ability to demonstrate counseling skills with respect to screening tests as also treatment/prognosis-related issues

09HLTH10B02-002-M: Pre-, Peri- and Post-operative Care

Objectives

To understand and demonstrate appropriate knowledge, skills and attitudes in relation to patients undergoing surgery for gynecological malignancies

- Plan appropriate surgery
- Identify risk factors if any: Surgical and Anesthetic
- Counsel patients for surgery
- Demonstrate an understanding of peri-, intra- and postoperative patient management
- Principles of peri-operative nutrition and Total Parenteral Nutrition (TPN).

Knowledge Criteria

- Thorough knowledge of the FIGO Staging and TNM staging system (where appropriate) for all gynecological cancer sites
- Type of surgery appropriate for each gynecological cancer (see separate modules)
- Principles of fluid and electrolyte balance
- Elemental feeding and TPN

Criteria of Clinical Competence

- Counsel patients regarding diagnosis, management and risks of surgical treatment
- Assessment of operability/inoperability
- Recognize and appropriately manage intra-operative complications
    - Haemorrhage
    - Unintended visceral injury
    - Planned bowel resection
    - Dealing with unexpected surgical findings
- Post-operative care and management of complications
    - Infection
    - Thrombosis and thromboembolism

    - Bowel obstruction
- Appropriately order and interpret investigations
- Inform patient of results
- Manage peri-operative fluid balance
- Order and supervise appropriate thromboprophylaxis.
- Liaise with nutritional support team and decide when TPN or enteral feeding is appropriate

Professional Skills And Attitudes

- Ability to interpret preoperative investigations and liaise with anesthesia colleagues
- Ability to counsel patients regarding extent of surgical treatment
- Ability to select and perform appropriate surgical procedures according to patient's needs
- Ability to manage postoperative care and complications thereof
- Ability to counsel patients and relatives regarding diagnosis, investigations and to discuss treatment options, advantages and disadvantages of each
- Ability to convey decisions of the multidisciplinary team to patients and relatives
- Ability to liaise with colleagues and other health professionals regarding coordinating investigations and management strategies pertinent to individual patients

<u>09HLTH10B02-003-M: Generic Surgical Skills In Gynecological Oncology</u>

Objectives

To achieve surgical skills appropriate for a subspecialist gynecological oncology surgeon:

- Anatomical knowledge
- Surgical skills
- Personal audit

Knowledge Criteria

- Detailed knowledge of the surgical anatomy of the female abdomen/pelvis
- Working knowledge of anesthesia techniques
- Principles of good surgical technique

Criteria of Clinical Competence

- Diagnosis and surgical management of gynecological cancers:
    - Uterine cervix
    - Ovary
    - Uterine Corpus: Endometrium and uterine sarcomas
    - Vulva
    - Vagina
    - Gestational trophoblastic neoplasms
- Ability to liaise with general surgical oncology colleagues for assistance in

complicated cases, when required

Professional Skills And Attitudes

The candidate should be adequately trained to independently perform the following surgical procedures:

- Fine-needle aspiration cytology (FNAC)/biopsy of superficial lymph nodes
- Trucut biopsy
- Simple hysterectomy.
- Radical hysterectomy.
- Pelvic lymph node dissection
- Para-aortic lymph node dissection
- Groin node dissections
- Infracolic and Supracolic omentectomy.

.

The candidate should also receive training in the ability to perform, with the assistance of surgical colleagues if necessary, pelvic exenterative surgery and urinary diversion in selected cases.

It is anticipated that the relevant allied surgical skills will be imparted during the candidate's planned clinical rotation in the relevant Subspecialty services i.e. GI Surgical and Urological Oncology

II <u>Site-Specific Modules</u>

<u>09HLTH10B02-004-M: Cancer of the Cervix</u>

Objectives

- Aetiopathlogy, histogenesis and principles of population screening and prevention of cervical cancer
- Ability to diagnose, investigate, counsel and manage patients with cervical cancer
- Ability to choose the most appropriate treatment approach for a given patient
- Perform appropriate surgery for cervical cancer and manage treatment complications
- Indications and choice of adjuvant treatments
- Plan appropriate follow up
- Diagnosis and management of relapsed disease
- Selection of patients for symptomatic palliation and best supportive care

Knowledge Criteria

- Understanding of the epidemiology and etiology of cervical cancer
- Understanding of the pathophysiology and management of pre-invasive cervical disease (CIN)
- Understanding of the role of human papillomavirus/HPV in the etiology and development of CIN and cervical cancer
- Knowledge of the clinical presentation and diagnosis of cervical cancer
- Knowledge of the pathology and staging of cervical cancer

- Knowledge of the management of all stages of cervical cancer including
- Detailed knowledge of the surgical anatomy of the female pelvis
- In-depth knowledge of radiotherapy principles of treatment and appropriate application to cervical cancer
- Knowledge of appropriate chemotherapy for cervical cancer
- Knowledge of complications and adverse effects of treatment, short- and long-term
- Knowledge of patterns of disease recurrence and their appropriate management
- Knowledge of the physical and psychosexual morbidity of cancer diagnosis and treatment

Criteria of Clinical Competence

- History taking and physical examination
- To obtain cervical smears, perform colposcopy and colposcopicaly-directed procedures i.e. cervical biopsy including punch biopsy, loop electrosurgical excision (LEEP) and ablative/excisional therapy in appropriate cases
- Perform clinical staging for invasive cervical cancer
- Perform appropriate surgery for cervical cancer
- Counsel patients about the diagnosis, investigations and appropriate treatments for cervical cancer, including adverse effects and complications of treatment
- Communicate results of investigations and treatment to the patient, including prognosis and palliative care
- Interpret results of radiological investigations appropriate to cervical cancer
- Assist in delivery of brachytherapy
- Assist in delivery of chemotherapy/chemoradiation
- Manage adverse effects and recognize complications of treatment
- Diagnose, investigate and manage recurrent cervical cancer
- Select patients for exenterative surgery
- Detect and manage physical and psychosexual morbidity

Professional Skills And Attitudes

- Ability to take history and examination
- Ability to perform colposcopy
- Ability to perform cervical biopsy and LLETZ
- Ability to perform clinical staging, including cystoscopy with biopsy where indicated
- Ability to perform the following surgical procedures relevant to cervical cancer:
    - Hysterectomy (abdominal/vaginal)
    - Class II and III Radical hysterectomy
    - Pelvic lymph node dissection
    - Para-aortic lymph node dissection
- Ability to assist with execution of relevant radiotherapy procedures and chemotherapy
- Ability to interpret:
    - Intravenous urograms
    - Pelvic MRI
    - Computed tomography scans (CECT)
    - FDG-PET

- Ability to perform with the assistance of surgical colleagues where necessary pelvic exenterative surgery, urinary and bowel diversion procedures
- Ability to initiate discussion of management at multidisciplinary team meetings
- Ability to counsel patients and relatives regarding diagnosis, investigations and discuss treatment options and advantages and disadvantages of each
- Ability to convey information regarding prognosis and decisions regarding selection of patients for palliative care
- In units where advanced laparoscopic surgery has been established and is offered as a matter of course, the trainee should be exposed to and be trained in the following:
    - Bilateral laparoscopic adnexectomy
    - Laparoscopic Assisted Radical Vaginal Hysterectomy (LARVH)
    - Total Laparoscopic Radical Hysterectomy (TLRH)
    - Laparoscopic pelvic lymph node dissection
    - Laparoscopic para-aortic lymph node dissection

09HLTH10B02-005-M: Ovarian Cancer

Objectives

- To demonstrate appropriate skills and attitudes in relation to clinical work-up and management of patients with all varieties of suspected/clinically overt ovarian cancer
- Initial assessment and investigations of suspected/clinically overt ovarian cancer i.e. epithelial ovarian cancer, germ cell tumors of the ovary, non-epithelial and other variants of ovarian cancer
- Plan subsequent management of patients with a suspicious adnexal mass
- Plan subsequent management of patients with clinically overt ovarian cancer
- Perform appropriate diagnostic or treatment surgery
- Communicate with multidisciplinary team and organize adjuvant treatment
- Plan follow-up

Knowledge Criteria

- Etiology and clinical presentations of ovarian cancer
- Population screening for ovarian cancer
- Pathology of ovarian cancer
- Radiological assessment for preoperative diagnosis and guided biopsy
- Indications, techniques, limitations and complications of surgical treatment of ovarian cancer
- Clinical work-up of suspected ovarian cancer
- Clinical work-up and treatment selection of clinically over ovarian cancer
- Multidisciplinary team meeting discussions and management planning.
- Role of laparoscopy in assessment
- Case selection for surgery:
    - Fertility conserving surgery
    - Primary cytoreductive surgery
    - Interval cytoreductive surgery
    - Selection of cases for secondary cytoreductive surgery

- Medical management of ascites, pleural effusions and bowel obstruction
- Consideration of all management options including best supportive and palliative care

Criteria of Clinical Competence

- Counsel patient and relatives about:
  - Diagnosis and further therapy
  - Surgical options and complications
  - Medical options
  - Prognosis.
- Discuss results of the surgery with patients, relatives and carers
- Communicate with referral doctor/unit and primary care
- Perform appropriate surgery for diagnosis and surgical management of ovarian cancer, including optimal debulking surgery
- Management of recurrent disease
- Discharge from hospital and produce appropriate follow-up plan
- Detect and manage physical and psychosexual morbidity

Professional Skills And Attitudes

- Ability to counsel patients sensitively about available treatment options available and to respect patient confidentially
- Ability to explain clearly and openly about treatments, complications and adverse effects of surgical treatment
- Ability to formulate and implement a plan of management and modify if necessary
- Ability to liaise effectively with colleagues in other disciplines, clinical and non-clinical
- Ability to appropriately stage ovarian cancer
- Ability to perform optimal debulking surgery
- Ability to decide appropriate extent of surgery including resection of bowel and formation of stoma
- Ability to select patients for conservative surgery
- Ability to perform a laparoscopic assessment and biopsy in suspected advanced ovarian cancer to obtain histology
- Ability to counsel patients regarding entry into clinical trial**s**

<u>09HLTH10B02-006-M: Cancers of the Uterine corpus</u>

Objectives

- To demonstrate appropriate skills and attitudes in relation to clinical work-up and management of patients with endometrial cancer and other malignant tumors of the uterine corpus
- Understand the principles of management of any comorbid conditions likely to impact choice and delivery of appropriate treatment
- Undertake primary surgical management
- Manage recurrent disease

Knowledge Criteria

- Epidemiology and aetiopathology of cancers of the uterine corpus
- Histological types of endometrial cancer and prognostic factors
- Preoperative investigation of patients, including assessment of fitness for surgery
- Risks of major surgery (surgical and anesthetic)
- Type of surgery appropriate for endometrial cancer
- Role of radiotherapy and chemotherapy in the treatment of endometrial cancer
- Risk factors for- and patterns of recurrence
- Management options for recurrent disease

Criteria of Clinical Competence

- Take a history, examine and investigate patients with suspected and proven endometrial cancer
- Order and interpret appropriate investigations of endometrial cancer
- Formulate a management plan
- Ability to liaise with anesthesia department
- To counsel patients regarding diagnosis, management and risks of treatment.
- Perform appropriate surgical procedures for endometrial and other uterine cancer
- Recognize and manage intraoperative complications
- Postoperative care and complications
- Inform patient of results
- Understand the indications for- and principles underlying choice of appropriate adjuvant treatments
- Planning follow-up
- Recognition of- investigation and management of disease recurrence

Professional Skills And Attitudes

- Ability to take a clinical history and appropriately work-up patients with suspected or proven uterine cancer
- Ability to recognize histological patterns of disease
- Ability to interpret preoperative investigations
- Ability to counsel patients regarding treatment options and histology
- Ability to select and perform the following surgical procedures for endometrial cancer:
    - Total abdominal hysterectomy and bilateral salpingo-oophorectomy
    - Pelvic lymph node dissection
    - Para-aortic lymph node dissection
- Ability to manage postoperative care and complications thereof
- Ability to assign a surgicopathological FIGO Stage
- Ability to decide need for adjuvant therapy
- Ability to follow up patients appropriately
- In units where advanced laparoscopic surgery has been established and is offered as a matter of course the trainee should be exposed to and be trained in the following:
    - Bilateral laparoscopic adnexectomy

    - Laparoscopic Assisted Vaginal Hysterectomy (LAVH)
    - Total Laparoscopic Hysterectomy (TLH)
    - Laparoscopic pelvic lymph node dissection
    - Laparoscopic para-aortic lymph node dissection
    - Laparoscopic omentectomy

09HLTH10B02-007-M: Cancer of the Vulva

Objectives

- To diagnose, investigate and manage a patient with cancer of the vulva
- Perform appropriate surgery in a patient with vulva cancer
- Manage complications of treatment

Knowledge Criteria

- Anatomy of the vulva, vagina and the inguino-femoral region
- Epidemiology and etiology of vulval cancer
- Histopathology and patterns of spread of vulval cancer
- Staging of vulval cancer
- Diagnosis and investigations for vulval cancer
- Principles of treatment of all stages of vulval cancer
- Complications of treatment and their appropriate management
- Patterns of recurrence of vulval cancer
- Recognition and management of recurrent cancer of the vulva
- Long-term complications of treatment of vulval cancer
- Knowledge of the psychosexual morbidity of treatment

Criteria of Clinical Competence

- Take an appropriate history and perform appropriate clinical investigations
- Perform vulval biopsies and vulvoscopy in indicated cases
- Perform appropriately tailored surgical procedures for vulval cancer
- Perform sentinel node assessment procedures for vulval cancer
- Liaise with plastic surgeons to select and manage patients requiring major skin flaps to close vulval wounds
- Perioperative management of vulval cancer patients
- Manage recurrences of vulval cancer
- Manage physical and psychosexual morbidity

Professional Skills And Attitudes

- Ability to take a clinical history and to perform appropriate physical examination and plan treatment on an individualized basis
- Ability to investigate and counsel patients regarding treatments
- Ability to select and perform competently diagnostic and therapeutic surgical procedures for vulval cancer
    - Vulval biopsy
    - Wide local excision

    - Skinning vulvectomy
    - Radical vulvectomy
    - Groin node dissection
    - Sentinel node detection.
    - Simple skin flaps.
- Ability to perform major skin flaps with assistance of plastic surgeons
- Ability to manage patient’s postoperative care
- Ability to manage complications of treatment

<u>09HLTH10B02-008-M: Vaginal Cancer</u>

Objectives

- To diagnose, investigate and manage a patient with cancer of the vulva
- Understand the indications for primary surgical management
- Understand management options to address comorbidity
- Manage recurrent disease

Knowledge Criteria

- Anatomy of the vagina
- Etiology of vaginal cancer, including sarcoma botyroides and metastatic lesions.
- Vaginal infections and benign pathology
- Pathophysiology of vaginal intraepithelial neoplasia (VAIN)
- Multifocal lower genital tract malignancy
- Clinical presentation, investigation and FIGO staging.
- Detailed management of vaginal cancer
- Physical and psychosexual morbidity of cancer

Criteria of Clinical Competence

- Take a history and perform an appropriate examination
- Perform vaginoscopy and vaginal biopsy
- Arrange staging and imaging investigations
- Arrange and aid delivery of radio- or chemotherapy
- Perform partial and radical vaginectomy
- Detect and manage physical and psychosexual morbidity

Professional Skills And Attitudes

- Ability to perform vaginal biopsy
- Ability to perform partial (Abdominal/Vaginal) and radical vaginectomy
- Ability to perform radical exenterative surgery when appropriate

III   <u>Allied Surgical Specialty Modules</u>

<u>09HLTH10B02-009-M: Uro-oncological surgery</u>

Objectives

- To understand the impact of gynecological cancer and its treatment on the renal tract.
- To be aware of possible urological complications associated with gynecological cancers and their management
- To Identify and manage urological complications.

Knowledge Criteria

- Anatomy and physiology of the female urinary tract
- Effects of gynecological cancer and its treatment (surgery, radiotherapy and chemotherapy) upon the urinary tract.
- Ability to request relevant investigations and interpret the results
- Recognition and management of injury to the urinary tract
- Principles of repair of injury to the urinary tract
- Selection of patients who would benefit from intervention surgery involving the urinary tract
- Pre- and postoperative care of patients undergoing a urological procedure

Criteria of Clinical Competence

- Ability to communicate the possible urological implications of gynecological cancer and it's treatment on the urinary tract
- Ability to appropriately investigate and diagnose disorders of the urinary tract in a gynecological cancer setting.
- Ability to request appropriate investigations in patients with a suspected involvement/injury of the urinary tract and to liaise with the urology team
- Ability to Investigate diseases of urinary tract i.e. UTI detrusor dysfunction, incontinence etc.
- Detailed knowledge of injuries to the lower urinary tract during/after surgery or radiotherapy
- Perform diagnostic cystoscopy/bladder biopsy/placement and removal of ureteric stents
- Perform suprapubic cystostomy
- Surgical repair of intraoperative injury to the bladder and ureters
- Principles of urinary diversion and ability to perform with the aid of a urology colleague, basic urinary diversion surgery i.e. ilea conduit

Professional Skills And Attitudes

- Effectively manage patients with suspected disorders of urinary tract.
- Request and interpret investigations of urinary tract.
- Appropriate selection of patients for intervention surgery involving the urinary tract.
- Ability to safely perform relevant urological surgical procedures as outlined above

Objectives

- To understand the impact of gynecological cancer and its treatment on the GI tract.
- To be aware of possible GI complications associated with gynecological cancers and their management

- To Identify and manage GI complications
- To understand the role of fluid balance and nutrition in a patient undergoing major surgery for gynecological cancer
- To understand the indications and principles of bowel resection and repair in the context of gynecological oncology
- To understand the principles of elective bowel resection in gynecological cancer surgery an the principles of management of an accidental surgical injury to the bowel

Knowledge Criteria

- Anatomy and physiology of the gastrointestinal tract
- Pathophysiology of intestinal function
- Appropriate selection of patients who will benefit from bowel surgery.
- Preoperative preparation required for a patient who may or will have bowel surgery.
- Principles of gastrointestinal surgery, including exposure and handling of the bowel
- Principles underlying repair of surgical bowel injuries
- Principles of resection and repair of intestinal tissues: Primary and secondary surgical repair/bowel diversion
- Indications to perform bowel surgery in a gynecological oncology setting

Criteria of Clinical Competence

- Counseling patients preoperatively and postoperatively regarding bowel surgery and stoma management, including benefits, risks and complications
- Order appropriate bowel preparation preoperatively.
- Select patients preoperatively and intraoperatively who will benefit from bowel surgery.
- Ability to select an appropriate location for bowel stomas
- Ability to independently perform:
    - Appendectomy
    - Primary repair of serosal/mucosal injury to the small/large bowel
    - Resection-anastomoses of small/large bowel
    - Diversion stomas: Ileostomy, transverse/end colostomy
    - Mobilization of the colon, sigmoid and rectum
    - Standard sigmoid colectomy, anterior rectal resection, abdomino-perineal rectal resection
- Manage postoperative care of patients following bowel surgery.

Professional Skills And Attitudes

- Effectively manage patients with involvement of the GI tract in the gynecological oncology setting
- Request and interpret relevant investigations
- Appropriately select patients for intervention surgery involving the GI tract.
- Ability to safely perform relevant GI surgical procedures as outlined above

<u>09HLTH10B02-011-M: Breast Cancer Surgery</u>

Objectives

- Understanding the role/limitations of screening for breast cancer
- Clinical care and counseling of women with breast symptoms and breast lumps
- Understanding hereditary breast cancer syndromes, BRCA testing and the implications
- Imaging in breast cancer
- Understanding the principles underlying the multidisciplinary management of breast cancer and evidence-based guidelines
- Understanding principles of treatment in different stages of breast cancer including metastatic breast cancer

Knowledge Criteria

- Ability to counsel women about screening issues
- Ability to conduct a comprehensive physical assessment of the female breast
- Ability to counsel patients with a breast lump and advise regarding clinical management pathways
- Ability to plan surgical management of breast cancer an be familiar with relevant surgical approaches including principles of breast reconstruction

Criteria of Clinical Competence

- To have a good overview of the relevant literature of the subject
- Ability to do a comprehensive clinical/diagnostic workup of patients with suspected or clinical breast cancer
- Ability to discuss management plans with colleagues from the Breast Cancer unit

IV <u>Allied Non-Surgical Specialties</u>

<u>09HLTH10B02-012-M: Radio-Diagnostics</u>

Objectives

- To understand the role of imaging in gynecological cancer.
- To understand the principles underlying selection of different imaging modalities.

Knowledge Criteria

- To have a working knowledge of the theory underlying the main imaging modalities used in gynecological oncology i.e. USG, CECT, MRI, FDG-PET
- Indications and limitations of each of these imaging modalities
- Principles of nuclear medicine in radiodiagnostics
- Indications for Intervention radiology procedures in gynecological oncology: Guided biopsies, percutaneous nephrosotomy/antegrade ureteric stenting

Criteria of Clinical Competence

- Ability to request appropriate imaging tests
- Ability to assessment and interpret the results with relevance to the clinical scenario

- Ability to recognize the indications for interventional radiology procedures

Professional Skills And Attitudes

- Liaising with the radiology team to discuss images with reference to a given clinical scenario

<u>09HLTH10B02-013-M: Medical Oncology</u>

Objectives

- To understand the role of chemotherapy in the management of gynecological cancers
- To understand the pharmacology of the major drugs used in chemotherapy.
- To understand the principles underlying the use of chemotherapeutic and newer targeted therapies in the management of gynecological cancers

Knowledge Criteria

- Relevant cell biology including:
    - Cell-cycle kinetics
    - Log kill hypothesis
    - Cycle and phase-specificity
- Classes of chemotherapeutic agents and their mechanisms of action
- Pharmacology of the main agents used in gynecological cancers
- Principles of dose calculation and scheduling
- Understand the benefits and limitations of single-agent and combination chemotherapy
- Principles of Phase I, II, and III drug trials in clinical research
- Understand the concepts of neoadjuvant adjuvant chemotherapy
- Short- and long-term toxicity, both general and drug-specific
- The role of hormonal therapy
- Therapeutic options for recurrent disease
- Role of newer targeted therapies in ovarian cancer

Criteria of Clinical Competence

- Take an appropriate history and perform clinical examination
- Know the indications for chemotherapy
- Principles of response assessment in patients undergoing chemotherapy
- Counsel patients about their chemotherapy regimens including adverse effects/complications of treatment
- Know when to change or stop treatment
- Ability to recognize, assess and manage acute and chronic toxicity

Professional Skills And Attitudes

- Ability to discuss management at multidisciplinary team meeting, including most appropriate chemotherapy regimen, according to patient’s disease and medical

status
- Ability to counsel patients about chemotherapy, including adverse effects and complications of treatment
- Ability to liaise with colleagues and other health professionals regarding management strategies pertinent to individual patients
- Ability to recognize, investigate and management of toxicity
- Ability to counsel patients about clinical trials

<u>09HLTH10B02-014-M: Radiation Oncology</u>

Objectives

- To be familiar with the principles and practice of radiotherapy in the management of gynecological cancer

Knowledge Criteria

- Cell-cycle kinetics
- Principles of radiobiology and radiation effects
- Principles of tissue repair and recovery
- Principles of radiation protection.
- Radiosensitivity of different organs
- Principles of radiation physics
- Principles of fractionation.
- CT planning and dosimetry.
- Types of radiation sources and techniques
- Principles of planning standard external beam radiotherapy and brachytherapy
- Principles of concurrent chemoradiation
- Side effects and toxicity of radiotherapy

Criteria of Clinical Competence

- Selecting patients for radiotherapy according to disease site, tumor type and stage
- Understand the principles of treatment planning
- Counsel patients regarding radiotherapy and it's potential side-effects and complications
- Understand the difference between curative and palliative treatment
- Management of long-term side-effects of radiotherapy:
- Recognition, investigations and management of recurrent gynecological cancer following primary radiotherapy and chemoradiation.

Professional Skills And Attitudes

- Ability to select patients for radiotherapy
- Ability to counsel patients regarding radiotherapy
- Ability to plan radiotherapy treatment
- Ability to counsel patients regarding complications
- Ability to recognize and manage adverse effects of radiotherapy:

- Ability to recognize and manage major complications of radiotherapy in liaison with other colleagues
- Ability to recognize and investigate tumor recurrence

CANDIDATE EVALUATON METRICS

Outlined below is a representative scheme, which could be used while evaluating the trainees during their periodic appraisals:

Metrics

- Theoretical knowledge of the subject
- Knowledge of current, relevant evidence-based literature
- Ability to practically apply his/her knowledge to clinical scenarios
- Involvement with patient care
    - Outpatient clinics
    - Inpatients
- Surgical skill set commensurate with seniority
- Keenness and aptitude to learn
- Rapport with peers/colleagues - ability to be a part of a team
- Rapport with Senior colleagues - ability to take criticism constructively
- Understanding of the of ethics of clinical medicine
- Research ability/aptitude
- Leadership and people management qualities

Grades of Evaluation

- Excellent
- Exceeds objectives
- Just meets objectives
- Needs improvement
- Below par

EXAMINATION SCHEMA

The MCh examination in Gynecological Oncology will be conducted as per the norms laid down by the Department of Academics, Tata Memorial Hospital, Mumbai. The examination has been planned along the lines of the MCh Examination in General Surgical Oncology.

The examination will have the following two components as detailed below:

Written Examination

This will consist of four written papers of three hour duration each with a total of 100 marks per paper. The candidate will have to write 10 out of 12 short notes. Each short note will carry a maximum of 10 marks.

Paper I: Basic Sciences applied to Gynecological Oncology
Paper II: General Principles of Oncology

Paper III:	Clinical Practice of Gynecological Oncology
Paper IV:	Recent Advances in Gynecological Oncology

Practical Examination

This will include two sections:

Clinical (One long case and two short cases)	200 marks
Viva Voce	200 marks

होमी भाभा राष्ट्रीय संस्थान

Homi Bhabha National Institute

TATA MEMORIAL HOSPITAL
PAREL, MUMBAI – 400 012

SYLLABUS

OF

M.Ch PLASTIC SURGERY

(Program Code: HLTH10B03)

Basic Science

09HLTH10B03-001-BS	Embryology and development of human tissues
09HLTH10B03-002-BS	Genetics and congenital abnormalities
09HLTH10B03-003-BS	Mechanism of healing of tissues, factors affecting the healing
09HLTH10B03-004-BS	Infection and its management
09HLTH10B03-005-BS	General principles of Surgery
09HLTH10B03-006-BS	The suture materials and suture techniques
09HLTH10B03-007-BS	Clinical examination of various systems and clinical photography
09HLTH10B03-008-BS	General anesthesia pre and post-operative care for general anesthesia
09HLTH10B03-009-BS	Local, regional and other nerve blocks
09HLTH10B03-010-BS	Hypertensive and hypothermic anesthesia
09HLTH10B03-011-BS	Management of benign and malignant lesions
09HLTH10B03-012-BS	Wound healing, wound care, dressings and splints
09HLTH10B03-013-BS	Fluid and electrolyte balance, acid base balance
09HLTH10B03-014-BS	Shock and pulmonary failure, blood transfusions, ventilator support and critical care
09HLTH10B03-015-BS	Assessment of trauma, vascular emergencies embolism

General Topics

09HLTH10B03-001-G	History of Plastic Surgery
09HLTH10B03-002-G	Scope of Plastic Surgery
09HLTH10B03-003-G	Tissue distortion, tissue loss and its management
09HLTH10B03-004-G	Tissue culture, Transplantation biology and its applications
09HLTH10B03-005-G	Plastic Surgery instruments and equipments
09HLTH10B03-006-G	Maintenance of medical records, informed consent
09HLTH10B03-007-G	Applications of computer and related programs
09HLTH10B03-008-G	Social psychological, ethical and medico legal aspects communication skills
09HLTH10B03-009-G	Implants, orthotics and prosthesis and applied to Plastic Surgery
09HLTH10B03-010-G	Tissue expansion and tissue distraction
09HLTH10B03-011-G	Management of Leprosy, leprosy deformities and leprosy reconstructive surgery
09HLTH10B03-012-G	Endoscopic Plastic Surgery
09HLTH10B03-013-G	Advances, recent advances and current trends in Plastic Surgery
09HLTH10B03-014-G	Principles of surgical audit, understanding journal and review articles, text books and reference books, critical assessment of articles
09HLTH10B03-015-G	Research methodology and biostatistics
09HLTH10B03-016-G	Arteriovenous malformations, varicose veins, chronic venous insufficiency
09HLTH10B03-017-G	Meningomyelocoele, encephalocoele, spinal fusion defects, ventral defects, anorectal anomalies

SYLLABUS
OF
M.CH Head & Neck Surgery
(Program Code: HLTH10B04)

I. INTRODUCTION

Head and Neck surgery is a recognized Super-specialty after M.S Otorhinolayngology/General surgery. Head and Neck cancers are most common cancers in India. With improvements in the management of cancer over the last two decades, it has become essential to have trained Head and Neck Oncologists for the comprehensive care of these patients.

II. AIMS & OBJECTIVES

The main aim of the training program is to ensure that at the end of 3 years, the candidate should be acquainted with comprehensive management and research methodology including medical statistics.

He/She must:

1) Be an independent Consultant / Clinician / Teacher in Head and Neck surgery.

2) Be acquainted with the current literature on relevant aspects of basic oncology, investigation and clinical oncology.

3) Take up clinical or basic research projects, with reference to Head and Neck cancers in our country.

4) Render medical care to be the individual and the community, integrating preventive, diagnostic, curative and palliative aspects with adequate understanding of sociocultural aspects of the community and knowledge of the epidemiology of Head and Neck cancers in India.

III. NAME OF THE COURSE

M.Ch. (Head and Neck Surgery)

IV. ELIGIBILITY

M.S. (General Surgery)

M.S. (ENT)

V. DURATION OF COURSE

Three Years.

VI. No of Seats

As specified from time to time

VII Selection of Candidates

An entrance test will be conducted by the Competent Authority and the admission to the course will be on the basis of merit list prepared on the basis of this test.

VIII Teacher

All eligible faculty members as prescribed by Homi Bhabha National Institute (DU) will be teachers in rotation, subject to approval by the University. One student will be registered under one teacher. The teacher should have minimum 8 years of experience in the field of Head and Neck surgery. He/ She should also have minimum 4 years' experience after being appointed as Assistant Professor in the department of Head and Neck Surgery.

IX Place of Course
The course will be conducted at affiliated Medical Colleges / Recognized Institutes.

X. TYPE OF COURSE
The selected candidates will undergo a three year residential training as Residents / Trainees at the affiliated Medical Colleges/Teaching Hospitals / Recognized Institutes.

XII. TEACHING SCHEDULE
A. Clinical:
1) **Outpatient Teaching Schedule**: The Post Graduate students will attend outpatient clinics as per the schedule of the assigned unit.
2) **Teaching Ward Rounds:** In addition to daily ward rounds, teaching ward rounds are conducted every Thursday morning by the consultant, for all students in the Head and Neck Surgery Department.
3) **Operation Theatres:** The Post Graduate students will attend the operation theatres as per the schedule of the assigned unit where they will assist in or perform operations under supervision.
B. Academic:
The Post Graduate will attend and actively participate in the following academic activities:
1) Formal course of lectures as fixed by the Department for the three-year course to cover the entire syllabus.
2) Case presentations.
3) Seminar / journal club.
4) Weekly Hospital Clinical Meetings.
5) Mortality meetings.
6) All Seminar / Conference / Workshops conducted by the Department.

XIII. INTERNAL ASSESSMENT
1) A Postgraduate student Logbook will be maintained as prescribed by the University.
2) A Log book of operations assisted in or performed will be maintained & periodically signed by the teacher (computerized).
Internal assessment will be carried out yearly for post-graduate students.

XIV. SYLLABUS
Syllabus shall comprise in four parts:

09HLTH10B04-001-C Oral cavity and Oropharynx
09HLTH10B04-002-C Parotid and Thyroid
09HLTH10B04-003-C Nasopharynx, Paranasal sinus, Neck, other sites - Eye, Ears etc
09HLTH10B04-004-C Larynx and Hypopharynx

This will cover all aspects of the diagnosis, management and treatment of these cancers with special emphasis on translational and molecular aspects as well as newer technologies and treatments.

XV. ELIGBILITY FOR EXAMINATION

The candidate will be eligible to appear for the M. Ch. Examination in Head and Neck surgery conducted by the University only after certification of the following:

1) Completion of three years of Resident training.

2) Satisfactory attendance at Clinical / Academic sessions as duly certified on the logbook by the teacher. A minimum attendance of 85 % is mandatory.

XVI. EXAMINATION

4) Board of Examiners:

Four Examiners: Two internal & two external

All examiners shall be Surgical Oncologists/ Head and Neck surgeon.

5) Assessments of candidates & Results:

a) Assessment of theory, clinical, practical and viva–voce examination shall be done jointly by all the examiners.

b) A candidates shall be declared to have passed the examination if he /she has an adequate knowledge in all subjects as answered by Theory / clinical / practical and viva–voce examination and there shall be no classification or ranking of successful candidates. However, candidates of excellent performance could be recommended for award for distinction.

c) A candidates who fails in an examination shall appear as a casual student for subsequent examination.

d) The Board of examiners shall have the power to refer failed candidates for one year or to put in attendance for one term i.e. Six months before appearing for the ext examination.

Homi Bhabha National Institute

(a deemed to be University)

Post M. Sc. Diploma in Radiological Physics (Dip. R. P.)

(PROGRAM CODE: HLTH11)

SYLLABUS - 2017

FIRST SEMESTER

01HLTH11-001-C: RADIATION PHYSICS & RADIATION GENERATORS (42 Lectures)

1.1 Nuclear Physics 10 Lectures

Radioactivity - General properties of alpha, beta and gamma rays - Laws of radioactivity - Laws of successive transformations - Natural radioactive series - Radioactive equilibrium - Alpha ray spectra - Beta ray spectra - Theory of beta decay - Gamma emission - Electron capture - Internal conversion - Nuclear isomerism - Artificial radioactivity - Nuclear cross sections - Elementary ideas of fission and reactors - Fusion.

1.2 Particle Accelerators 10 Lectures

Particle accelerators for industrial, medical and research applications - The Resonant transformer - Cascade generator - Van De Graff Generator - Pelletron - Cyclotron – Betatron - Synchro-Cyclotron-Linear Accelerator - Klystron and magnetron - Travelling and Standing Wave Acceleration - Microtron - Electron Synchrotron-Proton synchrotron. Details of accelerator facilities in India.

1.3 X-ray Generators 10 Lectures

Discovery - Production - Properties of X-rays - Characteristics and continuous spectra - Design of hot cathode X-ray tube - Basic requirements of medical diagnostic, therapeutic and industrial radiographic tubes - Rotating anode tubes - Hooded anode tubes - Industrial X-ray tubes - X-ray tubes for crystallography - Rating of tubes - Safety devices in X-ray tubes – Ray proof and shock proof tubes - Insulation and cooling of X-ray tubes - Mobile and dental units - Faults in X-ray tubes - Limitations on loading.

Electric Accessories for X-ray tubes - Filament and high voltage transformers - High voltage circuits - Half-wave and full-wave rectifiers - Condenser discharge apparatus - Three phase apparatus - Voltage doubling circuits - Current and voltage stabilisers - Automatic exposure control - Automatic Brightness Control-Measuring instruments - Measurement of kV and mA - timers - Control Panels - Complete X-ray circuit - Image intensifiers and closed circuit TV systems - Modern Trends.

1.4 Interaction of Radiation with Matter (oriented towards Radiology) 12 Lectures

Interaction of electromagnetic radiation with matter Exponential attenuation - Thomson scattering - Photoelectric and Compton process and energy absorption - Pair production - Attenuation and mass energy absorption coefficients - Relative importance of various processes.

Interaction of charged particles with matter - Classical theory of inelastic collisions with atomic electrons - Energy loss per ion pair by primary and secondary ionization - Dependence of collision energy losses on the physical and chemical state of the absorber - Cerenkov radiation - Electron absorption process - Scattering Excitation and Ionization - Radiative collision - Bremmstrahlung - Range energy relation - Continuous slowing down approximation (CSDA) - straight ahead approximation and detour factors - transmission and depth dependence methods for determination of particle penetration - empirical relations between range and energy - Back scattering.

Passage of heavy charged particles through matter - Energy loss by collision - Range energy relation - Bragg curve - Specific ionization - Stopping Power - Bethe Bloch Formula. Interaction of neutrons with matter - scattering - capture - Neutron induced nuclear reactions.

01HLTH11-002-C: APPLIED MATHEMATICS (48 Lectures)

2.1 Probability, Statistics and Errors 12 Lectures

Probability - addition and multiplication laws of probability, conditional probability, population, variates, collection, tabulation and graphical representation of data

Basic ideas of statistical distributions frequency distributions, averages or measures of central tendency, arithmetic mean, properties of arithmetic mean, median, mode, geometric mean, harmonic mean, dispersion, standard deviation, root mean square deviation, standard error and variance, moments, skewness and kurtosis

Application to radiation detection - uncertainty calculations, error propagation, time distribution between background and sample, minimum detectable limit

Binomial distribution, Poisson distribution, Gaussian distribution, exponential distribution - additive property of normal variates, confidence limits, Bivariate distribution, Correlation and Regression, Chi- Square distribution, t-distribution, F-distribution

2.2 Counting and Medical Statistics 6 Lectures

Statistics of nuclear counting - Application of Poisson's statistics - Goodness-of-fit tests - Lexie's divergence coefficients Pearson's chi-square test and its extension - Random fluctuations Evaluation of equipment performance - Signal-to-noise ratio - Selection of operating voltage - Preset of rate meters and recorders - Efficiency and sensitivity of radiation detectors - Statistical aspects of gamma ray and beta ray counting - Special considerations in gas counting and counting with proportional counters - Statistical accuracy in double isotope technique.

Sampling and sampling distributions - confidence intervals. Clinical study designs and clinical trials. Hypothesis testing and errors. Regression analysis.

2.3 Numerical Methods 20 Lectures

Why numerical methods, accuracy and errors on calculations - round-off error, evaluation of formulae. Iteration for Solving $x = g(x)$, Initial Approximation and Convergence Criteria, Newton-Raphson Method. Taylor series, approximating the derivation, numerical differentiation formulas. Introduction to numerical quadrature, Trapezoidal rule, Simpson's rule, Simpson’s Three-Eighth rule, Boole rule, Weddle rule. Initial value problems, Picard’s method, Taylor’s method, Euler’s method, the modified Euler’s method, Runge-Kutta method

Monte Carlo: Random variables, discrete random variables, continuous random variables, probability density function, discrete probability density function, continuous probability distributions, cumulative distribution function, accuracy and precision, law of large number, central limit theorem, random numbers and their generation, tests for randomness, inversion random sampling technique including worked examples, integration of simple 1-D integrals including worked examples.

2.4 Computational Tools & Techniques 10 Lectures

Computational packages: Overview of programming in C++, MATLAB/ Mathematica, and STATISTICA in data analysis and graphics.

01HLTH11-003-C: RADIATION DOSIMETRY AND STANDARDIZATION (55 Lectures)

3.1 Radiation Quantities and Units 6 Lectures

Radiation quantities and units – Radiometry – Particle flux and fluence – Energy flux and fluence – Cross Section – Linear and mass attenuation coefficients - Mass energy transfer and mass energy absorption coefficients - Stopping power - LET - Radiation chemical yield - W value - Dosimetry - Energy imparted - Absorbed dose - Kerma - Exposure - Air kerma rate constant - Charged particle equilibrium (CPE) – Relationship between Kerma, absorbed dose and exposure under CPE - Dose equivalent - Ambient and directional dose equivalents [(H*(d) and H'(d)] - Individual dose equivalent penetrating Hp(d) - Individual dose equivalent superficial Hs(d)

3.2 Radiation Sources 5 Lectures

Radiation sources - Natural and artificial radioactive sources - Large scale production of isotopes - Reactor produced isotopes - Cyclotron produced isotopes - Fission products - industrial uses – Telecobalt and Brachy Caesium sources – Gold seeds - Tantalum wire - ^{125}I Sources - Beta ray applicators - Thermal and fast neutron sources - Preparation of tracers and labeled compounds - Preparation of radio colloids.

3.3 Dosimetry & Standardization of X- and Gamma Ray Beams 15 Lectures

Standards - Primary and Secondary Standards, Traceability, Uncertainty in measurement. Charged Particle Equilibrium (CPE), Free Air Ion Chamber (FAIC), Design of parallel plate FAIC, Measurement of Air Kerma/ Exposure. Limitations of FAIC. Bragg-Gray theory, Mathematical expression describing Bragg-Gray principle and its derivation. Burlin and Spencer Attix Cavity theories. Transient Charged Particle Equilibrium (TCPE), Concept of D_{gas}, Cavity ion chambers, Derivation of an expression for sensitivity of a cavity ion chamber. General definition of calibration factor - N_X, N_K, $N_{D, air}$, $N_{D,W}$. IAEA TRS277: Various steps to arrive at the expression for D_W starting from N_X. TRS398: $N_{D, W, Q}$: $N_{D, W}$: $K_{Q,Q0}$:K_Q , Derivation of an expression for $K_{Q,Q0}$. Calorimetric standards - Intercomparison of standards.

Measurement of D_W for External beams from ^{60}Co teletherapy machines: Reference conditions for measurement, Type of ion chambers, Phantom, Waterproof sleeve, Derivation of an expression for Machine Timing error, Procedure for evaluation of Temperature and pressure correction: Thermometers and pressure gauges. Measurement of temperature and pressure. Saturation correction: derivation of expression for charge collection efficiency of an ion chamber based on Mie theory. Parallel plate, cylindrical and spherical ion chambers, K_{sat}, Two voltage method for continuous and pulsed beams, Polarity correction. Measurement of D_W for high-energy photon beams from Linear accelerators: Beam quality, beam quality index, beam quality correction coefficient, Cross calibration. Measurement of D_W for high energy Electron beams from linear accelerators: Beam quality, beam quality index, beam quality correction coefficient, Cross calibration using intermediate beam quality. Quality Audit Programmes in Reference and Non- Reference conditions.

Standardization of brachytherapy sources - Apparent activity - Reference Air Kerma Rate - Air Kerma Strength - Standards for HDR ^{192}Ir and ^{60}Co sources - Standardization of ^{125}I and beta sources - IAEA TECDOC 1274 - room scatter correction. Calibration of protection level instruments and monitors.

3.4 Neutron Standards & Dosimetry 9 Lectures

Neutron classification, neutron sources, Neutron standards - primary standards, secondary standards, Neutron yield and fluence rate measurements, Manganese sulphate bath system, precision long counter, Activation method. Neutron spectrometry, threshold detectors, scintillation detectors & multispheres, Neutron dosimetry, Neutron survey meters, calibration, neutron field around medical accelerators.

3.5 Standardization of Radionuclides 8 Lectures

Methods of measurement of radioactivity - Defined solid angle and 4π counting - Beta gamma coincidence counting - Standardization of beta emitters and electron capture nuclides with proportional, GM and scintillation counters - Standardization of gamma emitters with scintillation spectrometers - Ionization chamber methods – Extrapolation chamber - Routine sample measurements - Liquid counter – Windowless counting of liquid samples - Scintillation counting methods for alpha, beta and gamma emitter - Reentrant ionization chamber methods - Methods using (n, γ) and (n, p) reactions - Determination of yield of neutron sources - Space integration methods - Solid state detectors.

3.6 Radiation Chemistry and Chemical Dosimetry 12 Lectures

Definitions of free radicals and G-value-Kinetics of radiation chemical transformations - LET and dose-rate effects - Radiation Chemistry of water and aqueous solutions, peroxy radicals, pH effects - Radiation Chemistry of gases and reactions of dosimetry interest - Radiation polymerization, effects of radiation on polymers and their applications in dosimetry - Formation of free radicals in solids and their applications in dosimetry - Description of irradiators from dosimetric view point - Dosimetry principles - Definitions of optical density, molar absorption coefficient, Beer- Lambert's law, spectrophotometry - Dose calculations - Laboratory techniques - Reagents and procedures - Requirements for an ideal chemical dosimeter - Fricke dosimeter - FBX dosimeter - Free radical dosimeter - Ceric sulphate dosimeter - Other high and low level dosimeters - Applications of chemical dosimeters in Radiotherapy and industrial irradiators.

01HLTH11-004-C: RADIATION DETECTION, MEASUREMENT AND NUCLEAR ELECTRONICS

(40 Lectures)

4.1 Radiation Detection and Measurement 20 lectures

Principles of radiation detection and general properties of detectors: Principles of radiation detection, modes of detector operation, Pulse height spectra, Counting curves and plateaus, Energy resolution, Detector efficiency, Dead time, detector window.

Gas filled radiation detectors: Various regions of operation of gas filled detectors - Ionization chambers, Proportional counters and GM counters - basic detection mechanism, types of radiation detected, mode of operation, different variants of detectors (e.g. sealed, flow type, high pressure, multi-wire, position sensitive), Types of instruments which uses gas filled detectors – radiation dosimeters, survey meters, contamination monitors - Cylindrical, plane parallel, spherical and well-type ionization chambers, Extrapolation chamber.

Scintillation (organic/inorganic) and semiconductor detectors: Advantages of scintillation detectors, properties of ideal scintillatior, basic electronic blocks in scintillation detector setup. Radiation detection mechanism of organic and in-organic scintillators, types of scintillators for various applications. Radiation detection by TLD. Photon detection devices - PMT, Photo diodes. Principles of detection mechanism in semiconductor detectors and its application for gamma and alpha spectrometry, Diode and MOSFET dosimeters.

Neutron detectors: Neutron detection by activation, Nuclear track detectors, Self powered neutron detectors (SPND), BF_3, ^3He, Bubble detectors.

New types of detectors: Radiation detection by direct ion storage (DIS), OSL, Diamond, Radiation litmus, Radiographic and radiochromic films.

4.2 Nuclear Electronics and Instrumentation 20 lectures

Analog electronics: Operational amplifiers (ideal characteristics, different operational circuits - inverting, non-inverting amplifiers, adder, sub-tractor, integrator.

Interfacing concepts: Fundamental concepts of interfacing an instrument to PC/Computer, interfacing methods.

Power Supply: Low voltage and high voltage power supplies for radiation instruments, Generation of low and high voltages and their specifications, Types of batteries and their specifications.

Basic building blocks used in nuclear measurements: Pre amplifiers, types of preamplifiers and selection of proper preamplifier for specific detector, Types of amplifier - linear, bias amplifier, log amplifier, shaping amplifier, Counters, rate meters - diode pump and IC rate meters, SCA, MCA, Coincidence and anti-coincidence circuit blocks.

Radiation Monitoring Instruments:

Dosimeters based on condenser chamber, quartz fibre electrometer, dosimeter based on current measurement, secondary standard dosimeter, Farmer dosimeter, beam therapy dosimeter, clinical dosimeter, isotope calibrator, Radiation field analyzer (RFA)

Instruments for personal monitoring: TLD Reader for medical & research applications, TLD Badge Reader, OSLD badge reader, Film Badge Reader, Densitometer, Digital pocket dosimeter.

Area monitoring instruments: Portable and fixed area monitors, fixed area monitors, beta-gamma zone monitor, Survey meters, wide range survey instrument, teletector,

Contamination monitoring instruments: portable contamination monitor, hand &foot surface contamination monitor, portal monitor, laundry monitor, floor monitor

Neutron monitoring instruments, REM counter

Method of estimating activity present inside the body - whole body counter.

Calibration of Radiation Protection Instruments: Fundamental concepts of instrument calibration, Basic requirements for calibration, Various parameters checked during calibration, Selection of radioactive sources and source strength for calibration check.

01HLTH11-001-P:

1. Production and attenuation of bremsstrahlung.
2. Range of beta particles by Feather analysis.
3. Backscattering of beta particles and its applications.
4. Statistics of radioactive counting.
5. Study of voltage and current characteristics of an ion-chamber.
6. Calibration of survey instruments and pocket dosimeters.
7. Construction and calibration of a G.M. monitor.
8. Calibration of a therapy level dosimeter.
9. Calibration of TL phosphor & TLD reader and its use in dose distribution measurements.

10. Determination of plateau and resolving time of a G.M. counter and its application in estimating the shelf-ratio and activity of a beta source.
11. (a) Output measurement of a gamma chamber using Fricke dosimeter, and (b) Dose rate measurement of teletherapy machines using FBX dosimeter.
12. Calibration of a TLD personnel monitoring badge and dose evaluation.
13. Characteristics of a flow counter and beta activity measurement.
14. Calibration of Gamma ray spectrometer [NaI(Tl), HPGe] and identification of unknown sources using multichannel analyser.
15. Calibration and use of alanine dosimeter using ESR technique.
16. Preparation and standardization of unsealed sources.

****

SECOND SEMESTER

01HLTH11-005-C: CLINICAL AND RADIATION BIOLOGY (56 Lectures)

5.1 Cell Biology 6 Lectures

Cell physiology and biochemistry - Structure of the cell - Types of cells and tissue, their structures and functions - Organic constituents of cells - Carbohydrates, fats, proteins and nucleic acids - Enzymes and their functions - Functions of mitochondria, ribosomes, golgi bodies and lysosomes - Cell metabolism - DNA as concepts of gene and gene action - Mitotic and meiotic cell division - Semi conservative DNA synthesis, Genetic variation Crossing over, mutation, chromosome segregation - Heredity and its mechanisms.

5.2 Anatomy, Physiology and Pathology 10 Lectures

Anatomy and physiology as applied to radiodiagnosis and radiotherapy - Structure & function of organs and systems & their common diseases: Skin, Lymphatic system, Bone and muscle, Nervous, Endocrine, Cardiovascular, Respiratory, Digestive (Gastro-Intestinal), Urinary, Reproductive, Eye and ear.

Anatomy of human body, nomenclature & Surface anatomy, Radiographic Anatomy (including cross sectional anatomy - identify the different organs/ structures on plain x-rays, CT scans and other available imaging modalities. Normal anatomy & deviation for abnormalities.

Tumour pathology and carcinogenesis, common pathological features of cancers and interpretation of clinico-pathological data

5.3 Interaction of Radiation with Cells 6 Lectures

Action of radiation on living cells - Radiolytic products of water and their interaction with biomolecule - Nucleic acids, proteins, enzymes, fats - Influence of oxygen, temperature - Cellular effects of radiation - Mitotic delay, chromosome aberrations, mutations and recombinations - Giant cell formation, cell death - Recovery from radiation damage - Potentially lethal damage and sublethal damage recovery - Pathways for repair of radiation damage. Law of Bergonie and Tribondeau.

Survival curve parameters - Model for radiation action - Target theory - Multihit, Multitarget - Repair misrepair hypothesis - Dual action hypothesis - Modification of radiation damage - LET, RBE, dose rate, dose fractionation - Oxygen and other chemical sensitizers - Anoxic, hypoxic, base analogs, folic acid, and energy metabolism inhibitors - Hyperthermic sensitization - Radio-protective agents.

5.4 Biological Effects of Radiation 9 Lectures

Somatic effects of radiation - Physical factors influencing somatic effects - Dependence on dose, dose rate, type and energy of radiation, temperature, anoxia, - Acute radiation sickness - LD 50 dose - Effect of radiation on skin and blood forming organs, digestive tract - Sterility and cataract formation - Effects of chronic exposure to radiation - Induction of leukaemia - Radiation Carcinogenesis - Risk of carcinogenesis - Animal and human data - Shortening of life span - In-utero exposure - Genetic effects of radiation - Factors affecting frequency of radiation induced mutations - Dose-effect relationship - first generation effects - Effects due to mutation of recessive characteristics - Genetic burden - Prevalence of hereditary diseases and defects - Spontaneous mutation rate - Concept of doubling dose and genetic risk estimate.

5.5 Clinical Aspects of Medical Imaging & Radiation Oncology 15 Lectures

Radiation Therapy, Surgery, Chemotherapy, Hormone Therapy, Immunotherapy & Radionuclide therapy, Benign and malignant disease, Methods of spread of malignant disease, Staging and grading systems, Treatment intent - Curative & Palliative, Cancer prevention and public education and Early detection & Screening.

Site specific signs, symptoms, diagnosis and management: Head and Neck, Breast, Gynaecological, Gastro-Intestinal tract, Genito-Urinary, Lung & Thorax, Lymphomas & Leukemias & Other cancers including AIDS related cancers.

Patient management on treatment - side effects related to radiation and dose - Acute & Late - Monitoring and common management of side effects - Information and communication.

Professional aspects and role of medical physicists: General patient care - Principles of professional practice - Medical terminology - Research & Professional writing - Patient privacy - Ethical & cultural issues. Legal aspects - Confidentiality, Informed consent, Health and Safety.

5.6 Biological Basis of Radiotherapy 5 Lectures

Physical and biological factors affecting cell survival, tumour re-growth and normal tissue response -Non-conventional fractionation scheme and their effect of re-oxygenation, repair, redistribution in the cell cycle - High LET radiation therapy.

5.7 Time Dose Fractionation 5 Lectures

Time dose fractionation - Basis for dose fractionation in beam therapy - Concepts for Nominal Standard Dose (NSD), Roentgen equivalent therapy (RET) - Time dose fractionation (TDF) factors and cumulative radiation effects (CRE) - Gap correction, Linear and Linear Quadratic models.

01HLTH11-006-C: MEDICAL IMAGING (52 Lectures)

6.1 Principles of X-ray Diagnosis & Conventional Imaging 12 Lectures

Physical principle of diagnostic radiology: Interactions of X-rays with human body, differential transmission of x-ray beam, spatial image formation, visualization of spatial image, limitations of projection imaging technique Viz. superimposition of overlying structures and scatter, application of contrast media and projections at different angles to overcome superimposition of overlying structures

Radiography techniques: Prime factors (kVp, mAs and SID/SFD), influence of prime factors on image quality, selection criteria of prime factors for different types of imaging, different type of projection and slices selected for imaging, objectives of radio-diagnosis, patient dose Vs image quality

Filters: inherent and added filters, purpose of added filters, beryllium filter, filters used for shaping X-ray spectrum (K-edge filters: holmium, gadolinium, molybdenum).

Scatter reduction: Factors influencing scatter radiation, objectives of scatter reduction, contrast reduction factor, scatter reduction methods; beam restrictors (diaphragms, cones/cylinders & collimators), grids (grid function, different types of stationary grids, grid performance evaluation parameters, moving grids, artifacts caused by grids, grid selection criteria), air gap technique

Intensifying screens: Function of intensifying screens, screen function evaluation parameters, emission spectra and screen film matching, conventional screens Vs rare earth screens

Radiographic Film: Components of radiographic film, physical principle of image formation on film, double and single emulsion film, sensitometeric parameters of film (density, speed, latitude etc.), QA of film developer

Image quality: Image quality parameters; sources of un-sharpness, reduction of un-sharpness, factors influencing radiographic contrast, resolution, factors influencing resolution, evaluation of resolution (point spread function (PSF), line spread function (LSF), edge spread function (ESF), modulation transfer function (MTF)), focal spot size evaluation

QA of conventional diagnostic X-ray equipment: Purpose of QA, QA protocols, QA a test methods for performance evaluation of x-ray diagnostic equipment

6.2 Digital X-Ray Imaging and Computed Tomography 10 Lectures

Xero-radiography, mammography, Interventional radiology, digital radiography (CR and DR systems), digital subtraction techniques, Conventional tomography (principle only), orthopan tomography (OPG), Computed Tomography (CT), QA of CT equipment

6.3 Nuclear Medicine & Internal Dosimetry 20 Lectures

Physics of Nuclear Medicine (12 L)

Introduction to Nuclear Medicine, Unsealed Sources, Production of Radionuclide used in Nuclear Medicine; Reactor based Radionuclides, Accelerator based Radionuclides, Photonuclear activation, Equations for Radionuclide Production, Radionuclide Generators and their operation principles. Various usages of Radiopharmaceuticals.

In-vivo Non-imaging procedures; Thyroid Uptake Measurements, Renogram, Life Span of RBC, Blood Volume studies, Life Span of RBC etc. General concept of Radionuclide Imaging and Historical developments.

Radionuclide Imaging: Other techniques and Instruments; The Rectilinear Scanner and its operational principle, Basic Principles and Design of the Anger Camera / Scintillation Camera; System components, Detector System and Electronics, Different types of Collimators, Design and Performance Characteristics of the Converging, Diverging and Pin hole Collimator, Image Display and Recording Systems, Digital Image Processing Systems, Scanning Camera, Limitation of the Detector System and Electronics.

Different Imaging Techniques: Basic Principles, 2D Imaging Techniques, 3D Imaging Techniques - Basic Principles and Problem, Focal Plane Tomography, Emission Computed Tomography, Single Photon Emission Computed Tomography, Positron Emission Tomography. Various Image Reconstruction Techniques during Image formation such as Back Projection and Fourier based Techniques, Iterative Reconstruction method and their drawbacks. Attenuation Correction, Scatter Correction, Resolution Correction, Other requirements or Sources of Error.

Image Quality Parameters: Spatial Resolution, Factor affecting Spatial Resolution, Methods of Evaluation of Spatial Resolution, Contrast, Noise. NEMA Protocols followed for Quality Assurance / Quality Control of Imaging Instruments.

In-vitro Technique: RIA/IRMA techniques and its principles.

Physics of PET and Cyclotron: Principles of PET, PET Instrumentations, Annihilation Coincidence Detection, PET Detector ad Scanner Design, Data Acquisition for PET, Data corrections and Quantitative Aspect of PET, Working of Medical Cyclotron, Radioisotopes Produced and their characteristics.

Treatment of Thyrotoxicosis, Thyroid cancer with I-131, use of P-32 and Y-90 for palliative treatment, Radiation Synovectomy and the isotopes used. Concept of Delay Tank and various Waste Disposal Methods used in Nuclear Medicine.

Planning and Shielding Calculations during the installation of SPECT, PET/CT and Medical Cyclotron in the Nuclear Medicine Department.

Internal Dosimetry (8 L)

Internal Radiation Dosimetry: Different Compartmental Model; Single Compartmental Model, Two Compartmental Model with Back Transference, Two Compartmental Model without Back Transference. Classical Methods of Dose Evaluation; Beta particle Dosimetry; Equilibrium Dose Rate Equation, Beta Dose Calculation Specific Gamma Ray Constant, Gamma Ray Dosimetry, Geometrical Factor Calculation, Dosimetry of Low Energy Electromagnetic Radiation.

MIRD Technique for Dose calculations; Basic procedure and some practical problems, Cumulative Activity, Equilibrium Dose Constant, Absorbed Fraction, Specific Absorbed Fraction, Dose Reciprocity Theorem, Mean Dose per unit Cumulative Activity and Problems related to the Dose Calculations. Limitation of MIRD Technique.

6.4 Magnetic Resonance Imaging (MRI) 6 Lectures

Magnetic Resonance image - proton density, relaxation time T1 & T2 images - Image characteristics - MRI system components - Magnets, Magnetic fields, Gradients, Magnetic field shielding, Radio Frequency systems, computer functions - Imaging process – Image artifacts – MRI safety.

6.5 Ultrasound Imaging 4 Lectures

Interaction of sound waves with body tissues, production of ultrasound - transducers – acoustic coupling - image formation - modes of image display - colour Doppler.

01HLTH11-007-C: RADIATION THERAPY (66 Lectures)

7.1 Beam Therapy 30 Lectures

Description of low kV therapy x-ray units - spectral distribution of kV x-rays and effect of filtration - thoraeus filter - output calibration procedure.

Construction and working of telecobalt units - source design - beam collimation and penumbra - trimmers and breast cones. Design and working of medical electron linear accelerators - beam collimation - asymmetric collimator - multileaf collimator - dose monitoring - electron contamination. Output calibration of ^{60}Co gamma rays, high energy x-rays and electron beams using IAEA TRS 398, AAPM TG 51 and other dosimetry protocols. Relative merits and demerits of kV x-rays, gamma rays, MV x-rays and electron beams. Radiotherapy simulator and its applications. CT and virtual simulations.

Central axis dosimetry parameters - Tissue air ratio (TAR) Back scatter/ Peak scatter factor (BSF/PSF) - Percentage depth doses (PDD) - Tissue phantom ratio (TPR) - Tissue maximum ratio (TMR) - Collimator, phantom and total scatter factors. Relation between TAR and PDD and its applications - Relation between TMR and PDD and its applications. SAR, SMR, Off axis ratio and Field factor. Build-up region and surface dose. Tissue equivalent phantoms. Radiation filed analyzer (RFA). Description and measurement of isodose curves/charts. Dosimetry data resources.

Beam modifying and shaping devices - wedge filters - universal, motorized and dynamic wedges- shielding blocks and compensators. Treatment planning in teletherapy - target volume definition and dose prescription criteria- ICRU 50 and 62 - SSD and SAD set ups - two and three dimensional localization techniques - contouring - simulation of treatment techniques - field arrangements - single, parallel opposed and multiple fields - corrections for tissue inhomogeneity, contour shapes and beam obliquity - integral dose. Arc/ rotation therapy and Clarkson technique for irregular fields - mantle and inverted Y fields. Conventional and conformal radiotherapy. Treatment time and Monitor unit calculations.

Clinical electron beams - energy specification - electron energy selection for patient treatment - depth dose characteristics (D_s, D_x, R_{100}, R_{90}, R_{50}, R_p etc.) - beam flatness and symmetry - penumbra - isodose plots - monitor unit calculations - output factor formalisms - effect of air gap on beam dosimetry - effective SSD.

Particulate beam therapy - Relative merits of proton, electron, neutron, x-ray and gamma ray beams - Neutron capture therapy - Heavy ion therapy.

Quality assurance in radiation therapy - precision and accuracy in clinical dosimetry - quality assurance protocols for telecobalt, medical linear accelerator and radiotherapy simulators - IEC requirements - acceptance, commissioning and. quality control of telecobalt, medical linear accelerator and radiotherapy simulators. Portal and in-vivo dosimetry. Electronic portal imaging devices.

7.2 Brachytherapy 12 Lectures

Definition and classification of brachytherapy techniques - surface mould, intracavitary, interstitial and intraluminal techniques. Requirement for brachytherapy sources - Description of radium and radium substitutes - ^{137}Cs, ^{60}Co, ^{192}Ir, ^{125}I and other commonly used brachytherapy sources. Dose rate considerations and classification of brachytherapy techniques - Low dose rate (LDR), high dose rate (HDR) and pulsed dose rate (PDR). Paterson Parker and Manchester Dosage systems. ICRU 38 and 58 protocols. Specification and calibration of brachytherapy sources – RAKR/AKS and Absorbed Dose to Water calibration - IAEA TECDOC 1274 and ICRU 72 recommendations – Point and line source dosimetry formalisms - Sievert Integral - AAPM TG-43/43U1 and other dosimetry formalisms.

Afterloading techniques - Advantages and disadvantages of manual and remote afterloading techniques. AAPM and IEC requirements for remote afterloading brachytherapy equipment. Acceptance, commissioning and quality assurance of remote after loading brachytherapy equipment. ISO requirements and QA of brachytherapy sources. Integrated brachytherapy unit.

Brachytherapy treatment planning - CT/MR based brachytherapy planning - GEC ESTRO recommendations - forward and inverse planning – DICOM image import / export from OT - Record & verification. Brachytherapy treatment for Prostate cancer. Ocular brachytherapy using photon and beta sources. Intravascular brachytherapy - classification - sources - dosimetry procedures - AAPM TG 60 protocol. Electronic brachytherapy (Axxent, Mammosite, etc.).

7.3 Computers in Treatment Planning 12 Lectures

Scope of computers in radiation treatment planning - Review of algorithms used for treatment planning computations - Pencil beam, double pencil beam, Clarkson method, convolution superposition, lung interface algorithm, fast Fourier transform, Inverse planning algorithm, Monte Carlo based algorithms.

Treatment planning calculations for photon beam, electron beam, and brachytherapy - Factors to be incorporated in computational algorithms. Plan optimization - direct aperture optimization - beamlet optimization - simulated annealing - dose volume histograms - Indices used for plan comparisons - Hardware and software requirements - beam & source library generation. Networking, DICOM and PACS. Acceptance, commissioning and quality assurance of radiotherapy treatment planning systems using IAEA TRS 430 and other protocols.

7.4 Special and Advanced Techniques of Radiotherapy 12 Lectures

Special techniques in radiation therapy - Total body irradiation (TBI) - large field dosimetry - total skin electron therapy (TSET) - electron arc treatment and dosimetry - intraoperative radiotherapy.

Stereotactic radiosurgery/radiotherapy (SRS/SRT) - cone and mMLC based X-Knife - Gamma Knife - immobilization devices for SRS/SRT - dosimetry and planning procedures - Evaluation of SRS/SRT treatment plans - QA protocols and procedures for X- and Gamma Knife units - Patient specific QA. Physical, planning, clinical aspects and quality assurance of stereotactic body radiotherapy (SBRT) and Cyber Knife based therapy.

Intensity modulated radiation therapy (IMRT) - principles - MLC based IMRT - step and shoot and sliding window techniques - Compensator based IMRT - planning process - inverse treatment planning - immobilization for IMRT - dose verification phantoms, dosimeters, protocols and procedures - machine and patient specific QA. Concept of Intensity Modulated Arc Therapy (IMAT e.g. Rapid Arc), Image Guided Radiotherapy (IGRT), and Volumetrically Modulated Arc Therapy (VMAT) - Imaging modality, kV cone beam CT (kVCT), MV cone beam CT (MVCT), image registration, plan adaptation, QA protocol and procedures - special phantom, 4DCT. Tomotherapy - principle - commissioning - imaging - planning and dosimetry - delivery - plan adaptation - QA protocol and procedures.

01HLTH11-008-C: RADIATION SAFETY (64 Lectures)

8.1 Radiation Protection Standards 7 Lectures

Radiation dose to individuals from natural radioactivity in the environment and man-made sources. Basic concepts of radiation protection standards - Historical background - International Commission on Radiological Protection and its recommendations – The system of Radiological Protection – Justification of Practice, Optimisation of Protection and individual dose limits – Radiation and tissue weighting factors, equivalent dose, effective dose, committed equivalent dose, committed effective dose – Concepts of collective dose- Potential exposures, dose and dose constraints – System of protection for intervention - Categories of exposures – Occupational, Public and Medical Exposures - Permissible levels for neutron flux
- Factors governing internal exposure - Radionuclide concentrations in air and water - ALI, DAC and contamination levels

8.2 Principles of Monitoring and Protection 6 Lectures

Evaluation of external radiation hazards - Effects of distance, time and shielding - Shielding calculations - Personnel and area monitoring - Internal radiation hazards – Radio toxicity of different radionuclides and the classification of laboratories – Control of contamination – Bioassay and air monitoring – chemical protection – Radiation accidents – disaster monitoring

8.3 Safety in the Medical Uses of Radiation 15 Lectures

Planning of medical radiation installations – General considerations – Design of diagnostic, deep therapy, telegamma and accelerator installations, brachytherapy facilities and medical radioisotope laboratories.

Evaluation of radiation hazards in medical diagnostic and therapeutic installations - Radiation monitoring procedures - Protective measures to reduce radiation exposure to staff and patients - Radiation hazards in brachytherapy departments and teletherapy departments and radioisotope laboratories - Particle accelerators Protective equipment - Handling of patients - Waste disposal facilities - Radiation safety during source transfer operations Special safety features in accelerators, reactors.

8.4 Applications & Safety in the Industrial, Agricultural and Research uses of Radiation (**18 L**)

Physical principles of industrial radiography - Comparison of X-ray radiography and gamma radiography - Choice of source - Exposure containers - Photographic film technique - Radiographic contrast Definition of sensitivity - Intensifying screens - Penetrameters.

Industrial Fluoroscopy - Comparison of fluoroscopy and radiography - Image intensifier. Special techniques - Microradiography, flash radiography_ stereo - radiography - X-ray diffraction - Neutron radiography and electron radiography.

Physical principles in the industrial application of radioisotopes - Use of sealed sources - Radioisotope gauges – Use of transmission and scattering gauges for measurement of thickness, density and composition - Level indicators - Bremsstrahlung gauges Beta and gamma backscattering gauges and their applications - Neutron scattering gauges - Principles and applications of X-ray fluorescence techniques.

Applications in agriculture and research – Radioisotope tracer applications - General principles - Selection of radiotracer Dilution technique - Some examples of applications in agriculture, biology and research areas.

Planning of radiation installations and isotope laboratories in industry - Facilities for storage, handling and field operations, Planning of radioisotope laboratories for agriculture and research Institutions - Design of gamma gardens for agriculture.

Radiation protection measures and hazards evaluation in industrial and agricultural establishments - X and gamma ray radiography - X-ray diffraction apparatus - Radioisotope gauges - Tracer applications for radioisotopes in agriculture and industry Gamma chamber - Radiation sterilization - Irradiation of food and drugs - PANBIT and ISOMED - Luminising industry - Radiation protection in Industrial Radiographic Installations - Enclosed, open top, open field and sky shine.

Tritium and C-14 monitoring – Monitoring of Spillage - Contamination and control.

8.5 Radioactive Waste Disposal 4 Lectures

Radioactive wastes – sources of radioactive wastes - Classification of waste - Treatment techniques for solid, liquid and gaseous effluents – Permissible limits for disposal of waste - Sampling techniques for air, water and solids – Geological, hydrological and meteorological parameters – Ecological considerations.

Disposal of radioactive wastes - General methods of disposal - Management of radioactive waste in medical, industrial, agricultural and research establishments.

8.6 Transport of Radioisotopes 4 Lectures

Transportation of radioactive substances - Historical background - General packing requirements - Transport documents - Labeling and marking of packages - Regulations applicable for different modes of transport - Transport by post - Transport emergencies - Special requirements for transport of large radioactive sources and fissile materials - Exemptions from regulations – Shipment approval – Shipment under exclusive use – Transport under special arrangement – Consignor’s and carrier’s responsibilities

8.7 Legislation 5 Lectures

Physical protection of sources - Safety and security of sources during storage, use, transport and disposal – Security provisions: administrative and technical – Security threat and graded approach in security provision

National legislation – Regulatory framework – Atomic Energy Act – Atomic Energy (Radiation Protection) Rules – Applicable Safety Codes, Standards, Guides and Manuals – Regulatory Control – Licensing, Inspection and Enforcement – Responsibilities of Employers, Licensees, Radiological Safety Officers and Radiation Workers – National inventories of radiation sources – Import, Export procedures

8.8 Radiation Emergencies and their Medical Management 5 Lectures

Radiation accidents and emergencies in the use of radiation sources and equipment in industry and medicine - Radiographic cameras and teletherapy units - Loading and unloading of sources - Loss of radiation sources and their tracing - Typical accident cases. Radiation injuries, their treatment and medical management - Case histories. Prophylaxis and decorporating agents

01HLTH11-002-P:

17. Quality assurance of a diagnostic x-ray machine.
18. Evaluation of characteristics of a radiographic image.
19. Study and calibration of thyroid uptake measurement unit.
20. Dose output measurement of photon (^{60}Co gamma rays and high energy x-rays) beams used in radiotherapy treatment.
21. Dose output measurement of electron beams used in radiotherapy treatment.
22. Determination of percentage depth dose of photon and electron beams.
23. Integrity check and calibration of low activity brachytherapy sources.
24. AKS/ RAKR measurement of an HDR brachytherapy source using well type and cylindrical ionisation chambers.
25. In-phantom dosimetry of a brachytherapy source.
26. Familiarisation with treatment planning procedure using a computerised radiotherapy treatment planning system.
27. Survey of a radioisotope laboratory and study of surface and air contamination.
28. Protection survey of neutron installations - Calibration and evaluation of neutron badge.
29. Protection survey of industrial radiography camera.
30. Absorption and backscattering of gamma rays - Determination of HVT.
31. Radiation protection survey of teletherapy installations.
32. Radiation protection survey of diagnostic radiology installations.

SYLLABUS

Integrated MSc. in Chemistry

Applicable from the Admission Year 2016 onwards

SCHOOL OF CHEMICAL SCIENCES

NATIONAL INSTITUTE OF SCIENCE EDUCATION AND RESEARCH

JATNI, BHUBANESWR

Course Structure for Integrated MSc. in Chemistry

Year/Semester	Course No.	Credits	Course
1/Semester I	C101	3	Chemistry-I
	C141	2	Chemistry Laboratory-I
	M101	3	Mathematics-I
	CS141	2	Programming & Data Structure Lab-I
	B101	3	Biology-I
	B141	2	Biology Laboratory-I
	P101	3	Physics-I
	P141	2	Physics Laboratory-I
	H109	2	Technical Communication-I
	H125	2	Introduction to Psychology
1/Semester II	C102	3	Chemistry-II
	C142	2	Chemistry Laboratory-II
	M102	3	Mathematics-II
	CS142	2	Programming & Data Structure Lab-II
	B102	3	Biology-II
	B142	2	Biology Laboratory-II
	P102	3	Physics-II
	P142	2	Physics Laboratory-II
	H110	2	Technical Communication-II
	H133	2	Introduction to Sociology
2/Semester III	C201	4	Basic inorganic Chemistry
	C203	4	Reaction Mechanisms in Organic Chemistry
	C207	4	Mathematical Methods for Chemists
	C245	4	Inorganic Chemistry Lab.
	****	4	Elective-I
	****	2	Elective-II(Humanities)
	****	2	Elective-III(Humanities)
2/Semester IV	C204	4	Reagents in Organic Syntheses
	C205	4	Main group and Organometallic Chemistry
	C206	4	Quantum Chemistry I
	C243	2	Physical Chemistry Lab I
	C244	2	Biomolecular Chemistry Lab
	****	4	Elective-IV
	****	2	Elective-V(Humanities)
	****	2	Elective-VI(Humanities)

3/Semester V	C301 C302 C307 C341 C342 ****	4 4 4 4 4 4	Physical Organic Chemistry Molecular Spectroscopy and group Theory Thermodynamics and Electrochemistry Organic Chemistry Lab I Inorganic Chemistry Lab I Elective-VII
3/Semester VI	C304 C305 C306 C343 C344 ****	4 4 4 4 4 4	Coordination Chemistry Chemical Binding Physical Methods in Chemistry I Physical Chemistry Lab II Organic Chemistry Lab II Elective-VIII
4/Semester VII	C401 C403 C498 ****	4 4 12 4	Physical Methods in Chemistry II Chemistry of Heterocycles and Natural Products Chemistry project Elective-IX
4/Semester VIII	C402 C499 **** ****	4 12 4 4	Chemical Rate Processes Chemistry Project Elective-X Elective-XI
5/Semester IX	C598 **** ****	16 4 4	Chemistry Project Elective-XII Elective-XIII
5/Semester X	C599 ****	20 4	Chemistry Dissertation Elective-XIV

Out of 48 credits as Electives, at least 8 credits from the School of Humanities and Social Sciences and at least 16 credits from other science schools must be taken.

Course Structure for a Minor in Chemistry

1. To obtain a chemistry minor degree, a student has to accumulate 34 credits from the courses offered by SCS, including the courses in the first year.

2 The list of courses that required to be credited are:

Code	Credits	Course Name
C101	3	Chemistry-I
C141	2	Chemistry Laboratory-I
C102	3	Chemistry-II
C142	2	Chemistry Laboratory-II
C201	4	Basic Inorganic Chemistry
C203	4	Reaction Mechanism in Organic Chemistry
C206	4	Quantum Chemistry-I
C207	4	Mathematical methods for Chemists
C306	4	Physical Methods in Chemistry-I
C307	4	Thermodynamics and Electrochemistry
Total	34	

The total credit points for the above mentioned courses are 26. The rest 8 credit points are to be accumulated by crediting any other two theory courses of students' choice, provided pre-requisite criteria are duly fulfilled for the courses.

The list of pre-requisites for SCS courses are given below

Code	Course Name	Pre-requisite Course Code
C204	Reagents in Organic Synthesis	C203
C205	Main Group and Organometallic Chemistry	C201
C301	Physical Organic Chemistry	C204
C302	Molecular Spectroscopy and Group Theory	C206
C304	Coordination Chemistry	C201
C305	Chemical Binding	C206
C402	Chemical rate Process	C206
C403	Chemistry of Heterocycles and Natural Products	C204
C557	Nuclear Magnetic Resonance	C206
C561	Advanced Bio-organic Chemistry	C204
C562	Polymer Chemistry	C201, C203
C568	Advanced Fluorescence Spectroscopy	C206, C306
C570	Advanced Heterocyclic Chemistry	C204
C571	Statistical Mechanics	C307

List of Compulsory Courses

Year/Semester	Course No.	Credits	Course Name
1/Semester I	C101 C141	3 2	Chemistry I Chemistry Lab I

4/Semester VII	C401 C403 C498	4 4 12	Physical Methods in Chemistry II Chemistry of Heterocycles and Natural Products Chemistry project
4/Semester VIII	C402 C499	4 12	Chemical Rate Processes Chemistry Project
5/Semester IX	C598	16	Chemistry Project
5/Semester X	C599	20	Chemistry Dissertation

List of elective Courses

Year/Semester	Course No.	Credits	Course Name
3rd or 4th year students of other streams	C351 C352 C353	4 4 4	Photochemistry Pharmaceutical Chemistry Classics in Molecules
	C551	4	Molecular Modeling
	C552	4	Solid State Chemistry
	C554	4	Crystallography
	C555	4	Principles of Drug action
	C556	4	Advanced Bio-inorganic Chemistry
	C557	4	Nuclear Magnetic Resonance
	C558	4	Advanced Functional Materials
	C559	4	Supramolecular Chemistry
	C560	4	Chemistry of Nanomaterials
	C561	4	Advanced Bio-organic Chemistry
	C562	4	Polymer Chemistry
	C563	4	Molecular Reaction Dynamics
	C564	4	Theory of Molecular Spectroscopy
	C565	4	Advanced Organic Chemistry
	C566	4	Catalysis: Reaction Mechanisms and Applications
	C567	4	Advanced Main group Chemistry
	C568	4	Advanced Fluorescence Spectroscopy
	C569	4	Biomacromolecules
	C570	4	Advanced Heterocyclic Chemistry
	C571	4	Statistical Mechanics

Compulsory Courses

L	P	T	C
2	0	1	3

C101: Chemistry I

1. **Thermodynamics and Chemical equilibrium:** Laws of thermodynamics; Thermochemistry; Joule-Thompson Effect; entropy, Helmholtz and gibbs free energies, Maxwell Relations, partial molar quantities, chemical potential, Gibbs-Duhem equation. [5]

   Equilibrium constant and its relation with free energy changes, variation of chemical equilibrium constant with temperature and pressure, vant Hoff equation, applications of Gibbs-Helmholtz equation. [5]

2. **Elementary Chemical Kinetics:** Rate laws for first, second and third order reactions, reversible, parallel and consecutive reactions, steady state approximation, enzyme kinetics (Michaelis-Menten equation). [4]

3. **Rate Theories and Dynamics:** Temperature dependence of the rates of chemical reactions, Collision theory, qualitative concepts of transition state theory, introduction to reaction dynamics. [5]

4. **Atomic and molecular Structure:** introduction to quantum mechanics: particle in a box, atomic structure: H atom, concept of atomic orbitals and wave functions, many electron atoms, Spin and pauli principle. Molecules: Bonding in homo and heteronuclear diatomic molecules. [5]

5. **Spectroscopy:** interaction of light with matter, Electronic spectroscopy, Beer- Lamberts law, Fluorescence, phosphorescence, Rotation and vibrational spectroscopy, introduction to nuclear magnetic resonance, application of spectroscopy to biomolecules. [6]

Recommended Books:

1. Physical Chemistry, I. Levine, Tata Mcgraw Hill, 5th Edn., 2007.
2. Physical Chemistry: A Molecular approach, D. a. McQuarrie and J. D. Simon, University Science Books, 1997.
3. Physical Chemistry, G. M. Barrow, Mcgraw Hill, 5th Edn., 2007
4. Chemical Kinetics, K.J. Laidler, 3rd Edn., Harper and Row, 1987.

C141: Chemistry Laboratory I

L	P	T	C
1	3	0	2

1. Determination of acid-neutralizing power of commercial antacids.
2. Estimation of phosphoric acid in cola drinks by molybdenum blue method.
3. Element detection and characterization of organic compounds.
4. Extraction of Caffeine, an alkaloid, from Tea Leaves.
5. Synthesis of aspirin.
6. Identification of unknown mixtures containing 4 radicals, by dry and wet tests.
7. photochemical reduction of ferric oxalate in cyanotype blue printing.
8. Synthesis of hexamminenickel(ii) chloride.
9. Synthesis of paracetamol.
10. Estimation of acid strength in a citrus fruit.

Recommended Books:

1. The Systematic Identification of Organic Compounds, R. L. Shriner, C. K. F. Hermann, T. C. Morrill, D. Y. Curtin and R. C. Fuson, John Wiley, 8th Edn., 2004.
2. practical Organic Chemistry, a. i. Vogel, ELBS, 2002.
3. Laboratory Manual in Organic Chemistry, R. K. Bansal, Wiley Eastern, 1980.
4. Comprehensive practical Organic Chemistry: Qualitative analysis, V. K. ahluwalia and S.Dhingra, Universities press (india) Ltd, 2000.
5. A Collection of general Chemistry Experiments, a. J. Elias, Universities press, 2007.

C102: Chemistry II

L	*P*	*T*	*C*
2	0	1	3

1. Structure of simple inorganic molecules; VSEPR theory; Coordination complexes; Brief description of VBT, CFT and MO theory; Distortion in Octahedral complexes. [6]

2. Organometallic chemistry; metal carbonyls; metal nitrosyls; 18 electron rule; Ferrocene and its basic reactions; Catalysis of organometallic complexes; Hydrogenation and other industrially important reactions. [6]

3. Chemistry of biological systems; Hemoglobin, Myoglobin and Heme containing systems. [2]

4. Structure of organic molecules (Lewis structures, acid-Base, HSaB principles, Hybridization, Resonance, Hyper- conjugation, aromaticity, Functional groups, nomenclature, isomerism). [8]

5. Conformational analysis of acyclic and cyclic systems; Molecular chirality; Cohn- ingold-prelog R-S notational system; Optical activity; Chiral induction; importance of chirality in chemical biology. [8]

Recommended Books:

1. S. H. pine, Organic Chemistry, 5th Ed. Tata Mcgraw Hill Book Co., 2007.
2. T. W. G. Solomons, C. B. Fryhle, Organic Chemistry, 8th Ed. Wiley, 2007.
3. T. W. G. Solomons, C. B. Fryhle, R. g. Johnson, Study guide and Solutions Manual to accompany: Organic Chemistry, 8th Ed. John wiley & Sons, 2005.
4. J. Karty, The Nuts and Bolts of Organic Chemistry: a Student's guide to Success, pearson, 2008.
5. R. J. Morrison and R. N. Boyd, Organic Chemistry, 6th Ed. prentice Hall, 2007.
6. J. E. Huheey, E. A. Keiter, R. L. Keiter, O. K. Medhi, Inorganic Chemistry: principles of Structure and Reactivity, 4th Ed. Pearson, 2007.
7. P. Atkins, T. Overton, J. Rourke, M. Weller, F. Armstrong, Shriver & Atkins Inorganic Chemistry, 4th Ed. Oxford, 2009.
8. B. D. Gupta, A. J. Elias, Basic Organometallic Chemistry: Concepts, Syntheses and applications, Universities press, 2010

References

1. Physical Chemistry, R. S. Berry, S. A. Rice and J. Ross, Oxford Univ. Press, 2nd Edn., 2000.
2. Physical Chemistry, R. J. Silby and R. A. Alberty, Wiley, New York, 3rd Edn., 2000.

C142: Chemistry Laboratory II

L	P	T	C
1	3	0	2

1. Determination of Critical Solution Temperature (CST) of phenol-Water system. Study the effect of added impurity (naCl) on CST.
2. Determine the solubility of oxalic acid (benzoic acid) in water at different temperatures. Calculate the heat of solubilization (.6H).
3. Determination of partition coefficient of acetic acid in water and butanol.
4. Study the kinetics of acid catalysed hydrolysis of methyl acetate in the presence of HCl and H2SO4. Determine the order with respect to [acid], and compare the strengths of the two acids.
5. Standardization of pH meter. Titration of strong acid against strong base, using the pH meter.
6. (i) Calibrate the conductometer by using standard KCl solution. (ii) Titrate a solution of a strong acid; weak acid; and a mixture of the two acids, conductometrically, against a standard alkali.
7. Verification of Debye-Huckel-Onsager equation $\Lambda = \Lambda 0 - S\sqrt{C}$ for strong univalent electrolytes.
8. Estimation of calcium in milk powder through EDTa complexometry.
9. Verification of Beer - Lamberts Law: Determination of the concentration of coloured solutions of copper sulfate and potassium dichromate.
10. Estimation of potassium ions in coconut water, by Flame photometry.
11. Estimation of cane sugar by polarimetry.

Recommended Books:

1. Experimental physical Chemistry, R. C. Das and B. Behera, Tata Mcgraw Hill, 1983.
2. practical physical Chemistry, a. Findlayand J. a. Kitchener, 8th Edn., Longmans, 1967.
3. A Collection of interesting general Chemistry Experiments, a. J. Elias, Universities press, 2007.

C201: Basic Inorganic Chemistry

L	*P*	*T*	*C*
3	0	1	4

1. **Basic Solid State Chemistry:** The ionic bond, Lattice Energy, Size effects, Covalent character in predominantly in ionic bonds, Structures of complex solids, imperfections in Crystals, Conductivity in ionic solids, Solids held together by Covalent bonding. [6]

2. **Molecular Structure and Chemical Forces:** Molecular symmetry, point groups and introduction to Character Tables; Types of Chemical forces covalent bonding, Hydrogen bonding, Effects of Chemical forces. [4]

3. **Basic Main Group Chemistry:** First and Second Row anomalies, Use of porbitals in pi bonding, Use (or not) of dorbitals by nonmetals, reactivity of dorbital participation, periodic anomalies of the nonmetals and post-transition metals, Chains catenation, Rings, Cages, Boron cage compounds. [8]

4. **Coordination Chemistry:** Structure, isomerism, stability, Reactions, Kinetics and Mechanisms: Coordination number 1 - 8, Higher coordination number, Types of isomerism, Thermodynamic stability, Chelate Effect, Substitution reactions in Square planar complexes, Thermodynamic and Kinetic stability, Kinetics of Octahedral substitution and Mechanisms of redox reactions. [7]

5. **Oxidation and Reduction:** Reduction potentials; Redox half reactions; Trends in standard potentials, Electrochemical series, the nernst equation, Redox stability in water; Representation of electrode potential data diagrammatically. Latimer- Frost Diagrams, Chemiical extraction of the elements through oxidation, reduction and electrochemical extraction. [7]

6. **Introduction to f-block Elements:** Special features of f-block elements, lanthanide contraction, coordination number, structures, and simple reactions. [3]

7. **Nuclear Chemistry:** nuclear reactions and their characteristics, radioactivity, detecting and measuring radioactivity, radioactive decay rates, nuclear stability, energy changes during nuclear reactions, nuclear fission and fusion, nuclear transmutation, biological effects of radiation; Some applications of nuclear Chemistry: Dating with radioisotopes, medical uses therapeutic and imaging procedures. [7]

Recommended Books:

1. Inorganic Chemistry- principles of Structure and Reactivity, J.E. Huheey, E. a. Keiter, R.L. Keiter and O. K. Medhi, pearson Education, 2007.
2. Concise inorganic Chemistry, J. D. Lee, 4th Edn., ELBS, 1991.
3. Advanced inorganic Chemistry, F. A. Cotton, C. A. Murillo, and M. Bochmann, Wiley interscience, 2001.
4. Inorganic Chemistry, D. F. Shriver and P. W. atkins, Oxford University, 1999.
5. Molecular Symmetry and Group Theory: A Programmed Introduction to Chemical

Applications, A. Vincent, John Wiley, 2001.

References:

1. Chemistry of the Elements, N. N. greenwood and A. Earnshaw, 2nd Edition, Elsevier, 2005.
2. Chemistry, J. McMurry, R. C. Fay, 4th Edition, pearson Education, 2005.
3. Group Theory and Chemistry, D. M. Bishop, Dover publications, new York, 1973.
4. Chemical Applications of Group Theory, F. A. Cotton, John Wiley and Sons, 2003.

C203: Reaction mechanisms in Organic Chemistry

L	*P*	*T*	*C*
3	0	1	4

1. **Structural effects on Stability and Reactivity:** Thermodynamic Stability; Chemical Kinetics; Thermodynamic Stability vs Reaction Rates; Electronic Substituent Effects on Reaction intermediates; Kinetic isotope Effects; Linear Free- Energy Relationships for Substituent Effects; Catalysis; Solvent Effects; HighlyStrained Molecules. [5]

2. **Nucleophilic Substitution Reaction:** Nucleophiles, Electrophiles and Leaving groups; Mechanisms for nucleophilic Substitution; Kinetic and Stereochemical analysis; Substituent Effects on Reactivity; Sn 2 Reaction vs Sn 1 Reaction; neighboring group participation; Sn i Reactions; preparatively Useful Sn 2 Reactions; Carbocationic Rearrangements. [9]

3. **Addition Reactions:** The Concept of cis- and trans-addition; Electrophilic addition of alkenes; Selected examples- Hydrohalogenation, Halogenations, Hydration, Epoxidation, Dihydroxylation, Sulfenylation, Halolactonization, Metal ions, Hydroboration, Cyclopropanation; Electrophilic addition of alkynes and allenes; Vocabulary of Chemoselectivity, Diastereoselectivity, Enantioselectivity, Stereospecificity, Stereoconvergence; Asymmetric Catalysis-Sharpless Oxidations of allylic alcohols and Dihydroxylation; noyori Hydrogenation. [9]

4. **Elimination Reactions:** Concepts of Elimination Reactions; Mechanism of E2, E1 and E1cb Reactions; Regioselectivity and Stereoselectivity of Elimination Reactions; the Competition between Elimination and nucleophilic Substitution Reactions-Substrate Effects, Base Effects, Stereoelectronic Effect; Heck Reaction, Carbene, nitrene. [9]

5. **Aromatic Substitution:** Aromaticity; annulenes; Electrophilic aromatic Substitution Reactions; Substituent Effects on Reactivity; nucleophilic aromatic Substitution; Ortho Metallation; Cross Coupling Reactions. [7]

Recommended Books:

1. F. A. Carey, R. J. Sundberg “Advanced Organic Chemistry part A and B: Structure and Mechanisms” 5th Edition, Springer, 2007.
2. R. Bruckner “Organic Mechanisms: Reactions, Stereochemistry and Synthesis” Springer, 2010.
3. J. Clayden, N. Greeves, S. Warren, P. Wothers “Organic Chemistry” Oxford University press, 2001.
4. M. B. Smith, J. March “March’s advanced Organic Chemistry” 6th Edition, Wiley-VCH, 2007.
5. E. V. Anslyn, D. A. Dougherty “Modern physical Organic Chemistry” California University Science Books, 2006.

L	P	T	C
3	0	1	4

C207: Mathematical Methods for Chemists

1. **Matrix Algebra:** Matrices, determinants, matrix rank, orthogonal and unitary transformations, eigenvalues and eigenvectors, diagonalization of matrices, spectral theorem, few applications. [6]

2. **Vectors and Tensors:** Introduction to vectors; vector operations; coordinate system transformation; covariant and contravariant vector components; few applications; Vector spaces, inner products, linear independence, bases Brief introduction to tensors, tensor algebra. [9]

3. **Ordinary Differential Equations:** Linear first and second order ODEs, homogeneous and inhomogeneous ODEs with constant coefficients, system of linear ODEs, power series solution of differential equations and special functions. [12]

4. **Fourier Series and Integral Transforms:** Fourier series and transform, properties and theorems, multi-dimensional FT, complex FT, discrete and digital FT, few applications. Brief introduction to Laplace transform, inverse Laplace transform convergence of Laplace integral, few applications. [9]

5. **Data and Error Analysis:** Interpolation and extrapolation, errors in physical system, random errors in measurements, uncertainties as probabilities, error propagation, normal distribution, curve fitting. [6]

Recommended Books:

1. Maths for Chemists: Graham Doggett, Martin Cockett, E Abel: RSC (Tutorial Chemistry Texts), 2012
2. Basic Mathematics for Chemists: Peter Tebbutt: Wiley-Blackwell, 1998
3. Mathematical Methods in the Physical Sciences: Mary L. Boas, Wiley,2005
4. A student’s guide to vectors and tensors, Daniel Fleisch, Cambridge Univ Press, 2008
5. Measurements and their uncertainties, Ifan G. Hughes and Thomas P. A. Hase, Oxford Univ press, 2010

References:

1. Mathematical Methods for Physicists: Arfken and Weber, Elsevier Academic Press, 2005
2. The Fourier transform and its applications, 3rd Ed, Ronald N. Bracewell, McGraw Hill Intl. editions, 2000

C245: Inorganic Chemistry Laboratory

L	P	T	C
2	6	0	4

1. Praparation of metallic nanoparticles by chemical reduction method
2. Preparation of an organic light emitting diode from a ruthenium complex $[Ru(bpy)_3](BF_4)_2$.
3. Fabrication of a battery and the chemistry involved in it.
4. Nickel dihalide phosphine complexes
5. A carbene transfer agent:Preparation of $[(C_6Me_3H_2)_2N_2(CH)_2C]AgCl$
6. Inorganic (Carbon-Free) Chelate rings: A Dithioimdodiphosphinato ligand and some of its metal complexes
7. Nano-chemistry: Preparation of manganese dioxide nanoparticles
8. Non-metal complex: Synthesis and characterization of bispyridine iodide nitrate
9. Solid phase synthesis of trans-bis glycinato copper(II).
10. Synthesis of $[Ti(urea)_6]I_3$: An air stable d^1 Complex
11. Synthesis, Electrochemistry and Luminescence of $[Ru(bpy)_3]^{2+}$
12. Synthesis and Characterization of a Macrocyclic Nickel(II) Complex
13. Synthesis and Electrochemistry of Ferrocene and its Derivitives
14. Standardisation of sodium thiosulphate solution and volumetric estimation of Cu(II) iodometrically.
15. Volumetric estimation of Zn (II), Ca(II) and Mg(II) by EDTA titration, using Eriochrome black-T indicator.
16. Gravimetric estimation of nickel(II), using dimethylglyoxime.
17. Estimation of : (a) total manganese content in manganese ore (pyrolusite); (b) total iron content in Fe_2O_3 (haematite).
18. Study of the composition of ferric-sulfosalicylic acid complex by Jobs method of continuous variation, and to determine the stability of the complex, spectrophoto- metrically.
19. Determination of the composition of a binary mixture (potassium Dichromate and potassium permanganate), spectrophotometrically.
20. To study the luminescence behaviour of quantum dots using photoluminescence Spectrophotometer.
21. Synthesis of 3,5-dimethyl pyrazole.
22. Synthesis of antipyrene from ethyl acetoacetate.
23. Synthesis of 1,3-disubstituted bulky aryl thiourea.
24. Extraction and identification of DNA from green peas and onions
25. Synthesis of Rinecke Salt, $NH_4[Cr(NCS)_4(NH_3)_2].H_2O$, and study of its UV-Visible and IR spectra.

26. TLC activity i: Selection of solvent for TLC (known compound/unknown compound). Activity ii: Separation of compounds using TLC (e.g. o- and p- nitroaniline) separation using appropriate solvent systems. Activity iii: Separation of components present in Turmeric powder extract (alcohol) or spinach extract using TLC and Column Chromatography (silica columns at microscale level can be prepared; 10 ml syringe can be used).

***Recommended Books*:**

Vogels Text Book of Qualitative Chemical analysis, G. H. Jeffery, J. Bassett, J. Mendham and R. C. Denny, 5th Edn., ELBS, 1991.

C204: Reagents in Organic Syntheses

L	P	T	C
3	0	1	4

1. **Chemistry of Carbonyl Groups:** Nucleophilic addition to Carbonyl groups; nucleophilic Substitution at Carbonyl groups and with Complete Removal of Carbonyl Oxygen; Carbanions and Enolisation; Building Organic Molecules from Carbonyl Compounds (including Well-known name Reactions); nitrogen, phosphorus and Sulfur Ylides; Micheal addition. [20]

2. **Oxidation Reactions:** Transition Metal-based Oxidation Reagents; DMSO-based Oxidation Reactions; Other Oxidation Reagents; Oxidation of Functional groups; Oxidative Cleavage of C=C bonds and glycols; Ozonolysis; Barton Reaction; Oxidations at Unfunctionalized CH Bonds. [7]

3. **Reduction Reactions:** Reduction of Carbonyl groups: Conformational Effects; Stereochemistry of Hydride Reduction Reactions-aluminum Hydride and Borohydride Reducing agents; Hydride Reductions of Functional groups; Dissolving Metal Reductions; Other Reduction Methods; Corey-Bakshi-Shibaki Reduction. [8]

4. **Retrosynthesis:** Principles and applications; Target-Oriented and Diversity-Oriented Organic Synthesis; Selected Examples. [7]

Recommended Books:

1. F. A. Carey, R. J. Sundberg “Advanced Organic Chemistry part B: Structure and Mechanisms” 5th Edition, Springer, 2007.
2. R. Bruckner “Organic Mechanisms: Reactions, Stereochemistry and Synthesis” Springer, 2010.
3. J. Clayden, N. greeves, S. Warren, P. Wothers “Organic Chemistry” Oxford University press, 2001.
4. M. B. Smith, J. March “March’s advanced Organic Chemistry” 6th Edition, Wiley-VCH, 2007.
5. E. J. Corey, X.-M. Cheng “The Logic of Chemical Synthesis” Wiley-interscience, 1995.
6. T. Hudlicky, J. W. Reed “The Way of Synthesis: Evolution of Design and Methods for natural products” Wiley-VCH, 2007.

C205: Main-Group and Organometallic Chemistry

L	P	T	C
3	0	1	4

1. Basic Characterization techniques of main-group and organometallic compounds (nMR, Mass, iR). **[5]**

2. Representative chemistry of main group elements : [14]

a. Organometallic chemistry of lithium and magnesium: synthesis, structures andreactivity

b. Chemistry of boron: Boranes, bonding in boranes, topology of boranes, synthesis and reactivity, Carboranes and metallacarboranes. new Lewis acids based on boron; polymer-supported Lewis acids.

c. Chemistry of Aluminum: Aluminum alkyls. Use of aluminum alkyls in polymerization of olefins.

d. C_{60} and carbon nanotubes: discovery, preparation and selected reactions.

e. Chemistry of Silicon: Organosilicon compounds, Silicates and aluminosilicates.

3. Unusual compounds of main group elements: [6]

a. Chemistry of multiple bonding: Multiple bonding in heavier main-group elements. Unusual compound of main group elements: Si=Si, Si≡Si, P=P double bond, Bi=Bi double bond. Synthesis, Structure and reactivity. Controversies.

b. Chemistry of low valent compounds: Synthesis, Structure and bonding models and reactivity examples of al(i), Si(ii) low valent compounds.

c. Low oxidation state main group metal hydrides: synthesis and reactivity studies.

d. Inorganic rings and polymers. Cyclo and heterocyclophosphazenes and the polymers derived from them. polysilanes. Borazine and boron nitride.

e. Chemistry of halogens and noble gases-recent trends. CFCs and ozone layer.

4. Organometallic Chemistry : [17]

a. σ - bonded ligands : Metal alkyls, aryls and hydrides. Stability, preparation and reactivity. Metal- carbonyls / Metal- phosphines / metalnitrosyls / metal iso- cyanide: structures, reactivity and bonding. Metalcarbenes, metal-carbynes, Fischer carbenes, Schrock carbenes, N-heterocyclic carbenes, olefin metathesis.

b. π- bonded ligands: Metal-olefins, metal alkynes, metal-dienes, Metal-Cp Metal- Cp* complexes. Synthesis, structure, bonding and reactivity.

c. applications of organometallics in organic synthesis: C-C bond coupling reactions (Heck, Sonogoshira, Suzuki etc). C-n bond coupling reactions. Reduction reactions using transition metal hydrides; asymmetric hydrogenation.

Recommended Books:

1. Organometallics: A Concise Introduction, C. Elschenbroich and a. Salzer, 3rd Edn. 1999.
2. Chemistry of the Elements, N. N. Greenwood and A. Earnshaw, 2nd Edn., Elsevier, 2005.

3. Modern Inorganic Chemistry, W. L. Jolly, Mcgraw Hill, New York, 2nd Edn., 1991.

4. Concepts and Models of Inorganic Chemistry, B. Douglas, D. McDaniel and J. Alexander, John Wiley, New York, 3rd Edn., 1993.

5. Organometallic Chemistry of the Transition Metals, R. H. Crabtree, Wiley, New York, 1988.

C206: Quantum Chemistry I

L	P	T	C
3	0	1	4

1. **Origin of quantum mechanics:** Historical perspective, The photoelectric effect, Wave-particle duality, electron diffraction, black body radiation, uncertainty principle. [5]

2. **Wave Functions:** Concepts of wave function, operators, eigen values and eigen functions, commutation relations, introduction to linear algebra and matrix representation of operators.[6]

3. **Basic postulates of quantum mechanics:** Time dependent Schrdinger equation, Stationary states, time independent Schrodinger equation, concept of quantization. [6]

4. **Simple exactly solvable systems:** particle in one dimensional box and extensions to two and three dimensions, One dimensional harmonic oscillator, Rigid rotor, an- gular momentum, concept of space quantization. [8]

5. **Applications to atomic systems:** Hydrogen atom, orbitals, shapes of orbitals, radial distribution function, and electron spin. [6]

6. **Many electron atoms:** Helium atom and many electron wave functions, concept of screened nuclear charge, spin orbitals, Pauli Exclusion Principle and Slater determinants to represent many-electron wave functions, introduction to variational and perturbation methods. [11]

Recommended Books:

1. Physical Chemistry : A Molecular approach, D. a. McQuarrie and J. D. Simon, Viva Books, new Delhi, 1998.

2. Introduction to Quantum Chemistry, a. K. Chandra, Tata Mcgraw Hill, 1997.

3. Molecular Quantum Mechanics, P. W. atkins and R. S. Freidman, 3rd Edn., Oxford University press, 1997.

4. Quantum Chemistry, D. A. McQuarrie and J. D. Simon, Viva Books, new Delhi, 1998.

5. Quantum Chemistry, I. N. Levine, 5th Edn., Pearson Education, 2003.

2	6	0	4

1. Study of the pH dependence of uv-visible spectrum of 4-nitrophenol/methyl orange and determination of its pK by spectrophotometric method.
2. Study of the kinetics of inversion of cane sugar, catalyzed by acid, polarimetrically.
3. Study of the dimerization of benzoic acid by partition method.
4. Adsorption of acetic acid on activated charcoal, and verification of Freundlich / Langmuir adsorption isotherm.
5. Verification of Beer-Lambert's Law and determination of the dissociation constant (pKa) of methyl red, spectrophotometrically.
6. Study of the phase diagram of a two-component system (diphenylamine-benzophenone) with congruent melting point.
7. Determination of the isotherm for a three-component system (diphenylamine-acetic acid-water).
8. Determination of glass transition tempertature of hydrated calcium nitrate, conductometrically.
9. Estimation of halides in a mixture of halides by potentiometric titrations.
10. Study of the Solvent Effects on the fluorescence of fluoroscein and other fluorescent molecules.
11. Synthesis and chemiluminescence of Luminol.
12. Estimation of halides in a mixture of halides, by potentiometric titrations. 13.Study of the kinetics of the iodide - hydrogen peroxide clock reaction.
13. Study of the photochromic and kinetic behaviour of a nitrospiropyran derivative.
14. Determination of the bond lengths of diatomic and triatomic molecules, and functional group determination of small molecules, using the FT-iR spectrometer.
15. Laser : Measurement of wave length of light emitted by He-neon laser from the interference spectrum of Fresnels biprism and mirror.

Recommended Books:

1. Experimental physical Chemistry, R. C. Das and B. Behera Tata Mcgraw-Hill, 1983.
2. practical physical Chemistry, a. Findlay and J. a. Kitchener, 8th Edn., Longmans, 1967.

C302: Molecular Spectroscopy and Group Theory

L	P	T	C
3	0	1	4

1. **Group Theory:** Symmetry Elements, Symmetry Operations, point groups, Symmetry Representations, applications of symmetry to Molecular Orbital diagrams of simple molecules (examples: H_2O, BeH_2, BF_3 ($\sigma + \pi$)). Definition of a group and basic theorems, molecular symmetry groups and classes, great orthogonality theorem, Matrix representation of groups, irreducible representations and Character Tables. Symmetry properties of wave functions, orbitals as basis sets for irreducible representations, symmetry adapted linear combinations. assignment of symmetry representations of d-orbitals for specific geometries. [12]

2. **Introduction to Spectroscopy:** interaction of light with matter, transition moments and transition probabilities, Einsteins coefficients, oscillator strength. [2]

3. **Diatomic molecules:**

   a. Electronic Spectra: Born-Oppenheimer approximation, potential energy curves of diatomic molecules, Frank-Condon principle, electronic transitions in homonuclear and heteronuclear diatomics. [4]

   b. Microwave and infrared Spectroscopy: Simple harmonic oscillator and rigid rotor model, Rotational spectra of diatomic molecules, Stark effect, vibrational spectra of diatomic molecules, anharmonic corrections, selection rules, fundamental and overtone bands, isotope effects, vibrational rotational coupling. [6]

4. **Polyatomic molecules:**

   a. Electronic Spectra: Electronic structure, electronic spectra of polyatomic molecules - linear conjugated molecules, aromatic molecules, transition metal compounds, fluorescence, phosphorescence, internal conversion and charge trans- fer. [9]

   b. Rotational, Vibrational and Electronic Spectroscopy of polyatomic Molecules : Symmetric and asymmetric top molecules, normal modes of vibration and their classification by group theory, coupling between rotational and vibrational degrees of freedom. Symmetry and normal modes of vibration. Rovibrationic spectra, Concept of anisotropic polarizability and Raman spectra. [9]

Recommended Books:

1. Chemical applications of group Theory, F. A. Cotton, John Wiley, 3rd Edn., 2003.
2. Symmetry and Spectroscopy: an introduction to Vibrational and Electronic Spectroscopy, D. C. Harris and M. D. Ber- tolucci.
3. Fundamentals of Molecular Spectroscopy, C. N. Banwell and E. M. McCash, Tata Mcgraw Hill, 1995.
4. Molecular Spectroscopy, G. M. Barrow, Mcgraw Hill, 1985.
5. Spectra of atoms and Molecules, P. F. Bernath, Oxford Univ. press, 2005.
6. Modern Spectroscopy, J. M. Hollas, John Wiley, 4th Edn., 2004.
7. Molecular Symmetry and group Theory, R. L. Carter, John Wiley and Sons, 1998.

C307: Thermodynamics and Electrochemistry

L	P	T	C
3	0	1	4

6. **Recap:** Review of thermodynamics and chemical equilibrium. Phase equilibrium: Multicomponent systems, Ideal solution, Vapor-liquid equilibrium, Raoults law, Henrys law, colligative properties. [7]

7. **Surfaces:** Thermodynamics of surfaces and interfaces, surface tension, vapour pressure; surface films on liquids, Gibbs adsorption equation; adsorption of gases on solids: Freundlich, Langmuir and BET adsorption isotherms; determination of surface areas; colloids. [7]

8. **Electrochemistry:** Arrehnius theory of electrolytic dissociation, Conductance of electrolytes in solutions, Debye-Huckel theory of electrolytes; ionic strength principle, activities of ions and activity coefficients, Debye-Huckel-Onsager theory of electrolytic conductance, ion association in electrolytic solution. [10]

   Electrochemical cells and Electromotive Force(EMF), thermodynamics of cell reactions, Applications of EMF measurements: equilibrium constant, thermodynamic parameters, potentiometric titrations; basic principles of ion-selective membrane electrodes, batteries, bioelectrochemistry. [8]

9. **Statistical Thermodynamics:** The Canonical Ensemble, Canonical Partition Function for a System of Noninteracting Particles, Canonical Partition Function of a Pure Ideal Gas, The Boltzmann Distribution Law for Noninteracting Molecules, Statistical Thermodynamics of Ideal Monoatomic and Diatomic Gases, Statistical Thermodynamics of Ideal Polyatomic Gases, Equilibrium Constants, Entropy and the Third Law of Thermodynamics. [10]

Recommended Books

1. Physical Chemistry, I. Levine, Tata McGraw Hill, 5th Edn., 2007.
2. Physical Chemistry of Surfaces, A. W. Adamson and A. P. Gast, John Wiley and Sons, Inc., 1997.
3. Modern Electrochemistry, J.OM. Bockris and A. K. N. Reddy, Springer, 2006.
4. Physical Chemistry, R. S. Berry, S. A. Rice and J. Ross, Oxford Univ. Press, 2nd Edn., 2000.

2	6	0	4

Organic Synthesis and analysis

1. Separation of organic compounds from a mixture of compounds using the techniques of solvent extraction, preparative TLC and column chromatography and identification of the individual components by spectroscopic techniques(IR, NMR, UV-ViS), preparation of dry solvents.
2. Synthesis of the following compounds using name reactions :
   a. Diels-alder reaction of anthracene and Maleic anhydride
   b. Synthesis of Cinnamic acid from Benzaldehyde (perkin reaction)
   c. Synthesis of Triphenyl Carbinol (grignard Reaction)
   d. Synthesis of 2-hydroxy-5-methyl benzophenone (Fries rearrangement)
   e. Synthesis of Benzilic acid from Benzil (Benzil- Benzilic acid rearrangement)
   f. Synthesis of p-methoxycinnamic acid (Knoevenagel reaction).
3. Synthesis of Benzanilide from benzophenone oxime (Beckman rearrangement)
4. Synthesis of 2-phenylindole from acetophenone phenylhydrazone (Fischer-indole synthesis)
5. protection and deprotection technique: Synthesis of a ketal of cyclohexanone with ethylene glycol and regeneration of the ketone from the intermediate.
6. Esterification of p-methoxycinnamic acid.
7. preparation of o-benzoylbenzoic acid from phthalic anhydride and benzene. The following activities also will be included. Use of chemical data base (from Merck or CRC Handbook); use of iSiS/Chemdraw or any other software for drawing structures and indicating mechanisms; use of models for drawing various projections.

Recommended Books:

1. Vogels Textbook of Quantitative Chemical analysis, g. H. Jeffery, J. Bassett, J. Mendham and R. C. Denny, 5th Edn., ELBS, 1991.
2. Spectrometric Identification of Organic Compounds, R. M. Silverstein, G. C. Bassler and T. C. Morrill, 6^{th} Edn., Wiley, 1998.
3. A Collection of interesting general Chemistry Experiments, anil J. Elias, Universities press, 2007.
4. Laboratory Manual of Organic Chemistry, B. B. Dey and M. V. Sitaraman, allied publishers, 1992.
5. Laboratory Manual of Organic Chemistry, R. K. Bansal, new age international publishers, 2006.

C342: Inorganic Chemistry Laboratory I

L	P	T	C
2	6	0	4

1. a) Synthesis of Mn(acac)3 and Fe(salen)Cl Complexes.

   b) Elucidation of Redox behavior of the Mn(iii) and Fe(iii).

   c) Elucidation of magnetic properties

2. preparation and characterization of (mesitylene) tricarbonyl molybdenum (0).

3. a) Synthesis and characterization of 2,6-bis(diphenylmethyl)-4-methylaniline.

   b) Synthesis and characterize compound n,n-bis(2,6-bis(diphenylmethyl) 4-methylphenyl) diazabutadiene.

4. Synthesis and characterization of the monoanionic and bidentate amidine ligand.

5. a) Synthesis of meso tetratolul porphyrin from pyrrole and p-tolualdehyde.

   b) Synthesis and characterization of zinc-porphyrin(meso-tetratolyl porphyrin) complex.

6. a) preparation of dimethyl ester of pyridine 2,6-dicarboxylic acid. b) Synthesis and Characterization of 7E n-(1-3(E- 1-(2,6-diisopropylphenylimino)ethyl)phenyl)ethylidene)2,6 diisopropyl- benzenamine

7. Separation of the chromium complexes by using ion exchange column.

8. Synthesis and study of Mni i i (Salen)Cl by Cyclic Voltammetry and Differential pulse Voltammetry (DpV), and determination of the following: the formal reduction potential (Eo!); the number of electrons transferred in the redox process (n); the diffusion coefficient (D); electrochemical reversibility; and the effects of varying concentration (C) and scan rate.

9. Synthesis and analysis of nanoparticles by using Disc Centrifuge.

10. Preparation and determination of the effective magnetic moment and number of unpaired electrons in Mn(acac)3.

11. Preparation and determination of the aquation rate of [Co(nH3)5Cl]Cl2.

12. Preparation and resolution of the optically active compound Co(en)3+.

Recommended Books:

1. Handbook of preparative inorganic Chemistry, Vol. i & ii (edited by g. Brauer), academic press, 1963.

2. Experimental Electrochemistry for Chemists, D.T. Sawyer and J. L. Roberts, Jr., John Wiley & Sons, new York, 1974.

3. Vogels Textbook of Quantitative Chemical analysis, g. H. Jeffery, J. Bessett, J. Medham and R. C. Denny, 5th Edn., ELBS, 1999.

4. Electron paramagnetic Resonance: Elementary Theory and practical applications, J. a. Weil, J. R. Bolton and J. E. Wertz, Wiley interscience, new York, 1994.
5. physical Methods in Chemistry, R. S. Drago, 2nd Ed., Saunders, 1992.
6. Mossbauer Spectroscopy : an introduction for inorganic Chemists and geochemists, Mcgraw Hill, UK, 1973.
7. Mossbauer Spectroscopy, n. n. greenwood and T. C. gibb, Chapman & Hall, 1971.
8. Electron Spin Resonance : Elementary Theory and practical applications, J. E. Wertz and J. R. Bolton, Mcgraw Hill, 1984.

C403: Chemistry of Heterocycles and Natural Products

L	*P*	*T*	*C*
3	0	1	4

1. **Chemistry of Heterocycles:** introduction and application of Heterocycles; nomenclature of aromatic and non-aromatic Heterocycles; Synthesis and Reactivity of 5&6-membered aromatic Heterocycles with One or Two Hetero atoms.
   [12]
2. **Chemistry of Natural Products:** introduction and application of Carbohydrates; Steroids, Terpenoids, Fatty Lipids, prostaglandins and alkaloid; Biogenesis and Total Synthesis of Selected natural products. [20]
3. **Chemistry of Biomolecules:** Classification and Structures of Amino Acids; Pipe- tides, Proteins and Nucleic Acids; Solid phase Synthesis; nucleic acids Synthesizer.
   [10]

Recommended Books:

1. J. a. Joule, K. Mills "Heterocyclic Chemistry" 5th Edition, Blackwell, 2010.
2. T. Eicher, S. Hauptmann "The Chemistry of Heterocycles" 2nd Edition, Wiley-VCH, 2003.
3. R. J. Simmonds, "Chemistry of Biomolecules: an introduction" RSC, 1992.
4. i. L. Finar, "Organic Chemistry" Vol. ii, ELBS, 1990.
5. S. V. Bhat, B. a. nagasampagi, M. Sivakumar "Chemistry of natural products" Springer, 2005.
6. E. J. Corey, X.-M. Cheng "The Logic of Chemical Synthesis" Wiley-interscience, 1995.
7. T. Hudlicky, J. W. Reed "The Way of Synthesis: Evolution of Design and Methods for natural products" Wiley-VCH, 2007.

C402: Chemical Rate Processes

L	P	T	C
3	0	1	4

1. **Kinetic Measurements:** General features of fast reactions; study of fast reactions by flow techniques, relaxation methods (T-Jump, P-Jump, ultrasonic, pulse radiolysis, NMR); flash photolysis; salt and solvent effects on reactions in solutions. [5]
2. **Chain Reactions :** Features of chain reactions; thermal and photochemical reactions (hydrogen-bromine reaction, decomposition of aldehydes and ketones). [5]
3. **Kinetics of oscillatory reactions :** introduction to oscillatory reactions; Belousov-Zhabotinsky and Field-Koros-noyes models. [4]
4. **Rate Theory:** Concept of potential energy surfaces, transition state theory including its statistical mechanical treatment, phenomenological theories of unimolecular reactions (Lindemann, Hinshelwood), statistical mechanical theories of unimolecular reactions (RRKM). [10]
5. **Chemical Dynamics:** Collision theory and Reaction Dynamics, Reaction Cross section and rate constant, Brief idea of Molecular Beam Scattering, Dynamics in condensed phase. [10]
6. **Femtochemistry :** Concepts and perspectives; applications to studies of dynamics and control of chemical reactions. [6]

Recommended Books:

1. Physica Chemistry, i. Levine, Tata Mcgraw Hill, 5th Edn., 2007.
2. Physical Chemistry : a Molecular approach, D. a. McQuarrie and J. D. Simon, University Science Books, 1997.
3. Chemical Kinetics and Dynamics, J. i. Steinfeld, J. S. Francisco and W. L. Hase, prentice Hall, 1999.
4. Chemical Dynamics in Condensed phases: Relaxation, Transfer and Reactions in Condensed Molecular Systems, a. nitzan, Oxford Univ. press, 2006.

References:

1. Basic Chemical Kinetics, H. Eyring, S. H. Lin and S. M. Lin, John Wiley & Sons, new York, 1980.
2. The World of physical Chemistry, K. J. Laidler, Oxford University press, 1993.

Elective Courses

C351: Photochemistry

L	P	T	C
3	0	1	4

1. **Introduction:** importance of photochemistry; Electromagnetic Radiation; Colour perception and the Colour Circle; Beer- Lambert Law; Electronic Configurations: Multiplicity, S0, S1, T1 etc.; Electronic Transitions and Solvent Effects: π to π^*, n to π^* etc. Molecular Orbitals (FMO Approach). [6]

2. **Unimolecular Photophysical Processes:** Jablonski Diagram; Frank-Condon principle; Fluorescence; inter-System Crossing; phosphorescence; Delayed Fluorescence; Quantum Yield. [6]

3. **Bimolecular Photophysical Processes:** Thermodynamics and Kinetics of Excited State Bimolecular interactions; Excimer and Exciplex; photosensitization and Quenching; Heavy atom Effect; photoinduced Electron and Charge Transfer; Resonance Energy Transfer: Coulombic and Exchange mechanisms. [8]

4. **Fluorescence Spectroscopy:** Characteristics of Excitation and Emission Spectra; Basic Theories involving Various Fluorescence Spectral parameters; Fluorescence anisotropy; introduction to Fluorescence probing Techniques and applications; Fluorescent Molecular Sensors of ions and Molecules. [10]

5. **Photochemistry of Organic Compounds:** photochemistry of alkenes; pericyclic Reactions; photo-oxidation and photo-reduction; photochemistry of Carbonyl Compounds. [8]

6. **Applied Photochemistry:** Chemistry of Vision; photochemistry in nature; photochemistry in atmosphere; Supramolecular photochemistry; Solar Cell; Fuel cell. [4]

Recommended Books:

1. Fundamentals of photochemistry, K. K. Rohatgi Mukherjee, Wiley Eastern Ltd., 1978.
2. Modern Molecular photochemistry, n. J. Turro, University Science Books, 1991.
3. Molecular Fluorescence, B. Valeur, Wiley-VCH, 2002.
4. principles of Molecular photochemistry: an introduction, p. Walsh, n. J. Turro, V. Ramamurthy, J. C. Scaiano, University Science Books, 2008.
5. Organic photochemistry, J. M. Coxon and B. Halton, Cambridge University press, 1974.
6. Molecular Reactions and photochemistry, C. H. Depuy and O. L. Chapman, prentice Hall of india.
7. photochemistry and pericyclic Reactions, J. Singh and J. Singh, new age international publishers, 2003.
8. pericyclic Reactions, ian Fleming, Oxford Science publications 1998.

C352: Pharmaceutical Chemistry

L P T			C
3	0	1	4

1. **Drug discovery and development:** The why and wherefore of drugs; Stereochemistry and solubility factors; principles of drug design (molecular and biochemical); 'Lead' modification approach, SAR/QSAR; Computer-aided drug design; natural products drug discovery.[15]
2. **Basic Principles of medicinal chemistry:** Drug action at enzymes; Drug action at receptors; physico-chemical aspects of drug molecules; Selected examples of drugs and natural products. [15]
3. **Pharmacodynamics and Pharmacokinetics:** Drug distribution and survival; Concept of prodrug; pharmacokinetic models; Drug metabolism. [10]

Recommended Books:

1. Essentials of pharmaceutical Chemistry, D. Cairns, pharmaceutical press, 2nd Edition 2003.
2. Fundamentals of Medicinal Chemistry, g. Thomas, Wiley-Blackwell, 1st Edition, 2003.

C353: Classics in Molecules

L	P	T	C
3	0	1	4

1. introduction, Understanding Structural Diagrams of Organic Molecules, protein and Three-Dimensional protein Structure, nucleic acids, Synthesis, Biosynthesis. [7]
2. Urea & acetic acid, glucose, aspirin, Camphor, Terpineol, Tropinone, Haemin, Quinine, Morphine, Steroids & the pill, Strychnine, penicillin, Longifolene, prostaglandins & Leukotrienes, Vitamin B12, Erythronolide B & Erythromycin a, Monensin, Avermectin, Amphotericin B, Ginkgolide B, Cyclosporin, FK506 & Rapamycin, Calicheamicin γ1, Palytoxin, Taxol, Mevacor, Zaragozic acids & Cp Molecules, Brevetoxin B, Ecteinascidin 743, Epothilones, Resiniferatoxin, Vancomycin, Thiostrepton. [20]
3. Modern Drug Discovery and Developments, Designed Small Drug Molecules for Mental illness, Viral infections, gastrointestinal Disorders, Heart diseases and Sexual Dysfunction [12]
4. Dna Technologies, Vaccines, antibodies, Diabetes, anemia, Rheumatoid arthritis, Breast Cancer, Biologics. [7]

Recommended Books:

1. K.C. nicolaou and Tamsyn Montagnon, "Molecules that Changed the World", VCH, 2008.
2. E.J. Corey, L´aszl´o Ku¨rti and Barbara Czak´o, "Molecules and Medicine", VCH, 2008.
3. J. Block and J. M. Beale "Wilson and gisvold's Textbook of Organic Medicinal and pharmaceutical Chemistry", 11th Ed., Lippincott Williams & Wilkins, 2003.

C551: Molecular Modeling

L	P	T	C
3	0	1	4

1. **Introduction:** What is molecular modeling? Computable quantities. [1]

2. **Concept of Potential energy Surface:** Stationary points, Born-Oppenheimer approximation, geometry optimization, normal modes of vibration. [3]

3. **Molecular mechanics:** Basic principles, properties that can be calculated, Strengths and weaknesses. [3]

4. **Quantum mechanics:** Hartree-Fock-Self-Consistent-Field theory, post-Hartree- Fock (Electron correlation) methods, Density functional theory, Semi-empirical methods. [7]

5. **Chemical Dynamics:** Unimolecular and Bimolecular reactions, Reaction path and transition states, Classical trajectories, Direct dynamics, Quantum dynamics. [6]

6. **Simulations of molecular ensembles:** properties as ensemble and time averages, Molecular dynamics simulations, Monte Carlo simulations. [10]

7. **Modeling Lab:** Hands-on experience for using different simulations methods and algorithms pertaining to the course. [10]

Recommended Books:

1. C. J. Cramer, Essentials of Computational Chemistry, Wiley, 2004.
2. i. n. Levine, Quantum Chemistry, prentice-Hall of india, 2006.
3. p. W. atkins, Molecular Quantum Mechanics, Oxford, 2008.
4. M. p. allen and D. J. Tildesley, Computer Simulation of Liquids, Oxford, 1987.
5. a. R. Leach, Molecular Modelling, prentice Hall, 2001.
6. F. Jensen, introduction to Computational Chemistry, John Wiley & Sons, 2007.

C552: Solid State Chemistry

L	P	T	C
3	0	1	4

1. **Crystal Chemistry:** a brief introduction to crystallography, Lattices, unit cells, symmetry, point groups, space groups. packing: CCp, HCp, voids, radius ratio rules. Bonding in crystals: ionic, covalent, metallic, van der Waals, hydrogen bonds. Description of crystal structures: metallic & nonmetallic structures, aB, aB2, aB3 (ReO3), spinels, pyrochlores, perovskites, K2niF4 etc. paulings rules for ionic crystal structures and the concept of bond valence. Methods of crystallography: powder, single crystals, X-ray, neutron and electron diffraction. [7]

2. **Defects in solids:** Origin of defects in crystals; perfect and imperfect crystals; thermodynamics of defect formation; types of defects : point defects, line defects, plane defects;Schottky and Frenkel defects; thermodynamics of Schottky and Frenkel defect formation; crystal classifications; Madelung constant and lattice energy. [7]

3. **Electronic structure of solids:** atoms to molecules to crystals; orbitals to bonds to bands; Electronic structure of crystalline solids, elementary band theory: metals, insulators and semi-conductors., Solid

state ionics; intrinsic and extrinsic semiconductors. Transport property measurement techniques: electrical resistivity, thermopower, Hall effect Magnetism of d vs. f metal compounds. [8]

4. **Critical Phenomena:** phase transitions (Order-disorder, Martensite-austenite, Spinoidal decompositions); liquid crystals; structure-property relations (magnetic, electrical, superconductivity, optical and thermal). powder synthesis by conventional and modern chemical methods, reactivity of solids, decomposition mechanisms, powder processing (sintering and diffusion processes), tailoring of solids, special methods for single crystal growth and thin film depositions. [10]

5. **Synthesis of solids:** Chemistry behind synthesis; intercalations; synthesis/preparation of single crystals; hydrothermal methods. Framework Solids; Zeolites, aluminophosphates and related structures; Metal-organic framework compounds - their structures and properties. [6]

6. **Superconductivity:** Superconductivity : General aspects of superconductivity; effects of magnetic field; BCS Theory; oxide Superconductors. [4]

Recommended Books:

1. Solid State Chemistry and its applications, a. R. West, John Wiley, 1987.
2. Solid State Chemistry, L. Smart and E. Moore, Chapman and Hall, 1992.
3. principles of the Solid State, H. V. Keer, Wiley Eastern Ltd., 1994.
4. new directions in solid state chemistry, C.n.R. Rao and J. gopalakrishnan, Cambridge University press, 2008.
5. The Electronic Structure and Chemistry of Solids, p.a. Cox, Oxford University press, 2005.
6. ionic crystal, lattice defect and non-stoichiometry, n.n. greenwood, Chemical pub. Co., new York, 1970.
7. an introduction tocrystal chemistry, R.C. Evans, Cambridge Universitypress, 1964.

L	*P*	*T*	*C*
3	0	1	4

C554: Crystallography

1. Origin of X-rays, Filters, monochromators, sealed tube, rotating anode synchroton radiation, safety considerations. [5]
2. Crystals and their properties- Concepts of symmetry, direct and reciprocal lattice, planes, indices, unit cell, Braggs law in direct and reciprocal lattices. primitive and non-primitive lattices, point and space groups, equivalentpositions, systematic absences and space group determination, occupancy factors.[15]
3. Theory of structure factors, argand diagram and its use, Lorentz and polarization corrections, absorption corrections, absolute scale of intensities; unit cell determination, data collection parameters, data reduction, phase problem and structure solution by patterson and direct methods. [15]
4. Structure refinement techniques, presentation and interpretation of structural data, examination of CIF file and critical evaluation of a structure. Errors and pitfalls, twinning and disorder, Renninger effect, extinctions, anomalous scattering andits use. [10]

Recommended Books:

1. X-raystructuredetermination: apractical guide, g.H. Stout and L.H. Jensen, Springer, 1992.
2. Fundamentals of crystallography, C giacavazzo, Oxford University press
3. X-ray analysis and the structure of organic molecules, Jack. D. Dunitz, Wiley,1996.
4. Crystal Structure Determination, Werner Massa, Springer.
5. Structural inorganic Chemistry, a. F. Wells, Clarendon press, 1986.

L	*P*	*T*	*C*
3	0	1	4

C555: Principles of Drug Action

1. **Pharmacodynamic Phase in Drug action:** introduction to pharmacodynamics, Biochemical Basis of Drug action, Drug absorption, distribution and bioavailability, passive diffusion, active transport mechanisms, Excretion and reabsorption of drugs. [7]
2. **Pharmacokinetic Phase in Drug action:** General classification of pharmacokinetic properties, Pharmacokinetic models, intravascular administration, Extravascular administration, Estimation of pharmacokinetic parameters, The use of pharmacokinetics in drug design. [7]
3. **Novel Therapeutic agents: Synaptic Pharmacology:** Cholinergic- and adrenergic systems, CnS agents: antipsychotics, antidepressants, CVS Agents: Antihypertensives, Antineoplastic agents, Analgesic and anti-inflammatory agents, Drug toxicity. [12]
4. **Concepts in Drug metabolism:** Basic principles and factors affecting drug metabolism, Secondary pharmacological implications of metabolism, phase i metabolic reactions, phase ii metabolic reactions, Drug metabolism and drug design, prodrugs, Metabolic pathways for common drugs. [7]
5. **Stability of Drugs and medicines:** Oxidation and stability of free-radicals, prevention of oxidative deterioration, autoxidation of fats and oils, Examples of drugs susceptible to ageing and hydrolysis, Other mechanisms of degradation. [6]
6. **Drug Development:** Clinical trials (phase-i to phase-iV), Formulation development, Quality control aspects (methods of assay). [6]

Recommended Books:

1. Thomas g. (2003) Fundamentals of Medicinal Chemistry, Wiley.
2. Cairns D. (2008) Essentials of pharmaceutical Chemistry (3rd Ed.), pharmaceutical press.
3. Block J and Beale JM. (2003) Wilson and gisvold's Textbook of Organic Medicinal and pharmaceutical Chemistry (11th Ed.), Lippincott Williams &Wilkins.
4. Rang Hp, Dale MM et al. (2007) Rang & Dale's pharmacology (6th Ed.), Churchill Livingstone.
5. Hardman Jg, Limbird LE et al. (2001) goodman & gilman's The pharmacological Basis of Therapeutics, Mcgraw-Hill professional.

L	P	T	C
3	0	1	4

C556: Advanced Bio-inorganic Chemistry

1. rinciples of bioinorganic chemistry (Justification of why certain protein/enzyme contains a particular metal ion) [3]
2. **Heme Proteins:** Types, function and mechanisms , Myoglobin, Hemoglobin, Cytochrome c, Cytochrome p450, peroxidases (Horseradish peroxidase, Chloroperoxidase), Catalase, Cytochrome c Oxidase, Synthetic porphyrins of biological relevance. [5]
3. **Iron-Sulfur Proteins:** Types, function and mechanisms , Rubredoxin, Ferredoxins, aconitase [3]
4. **Non-Heme Proteins:** Types, function and mechanisms, Mononuclear Systems (Catechol-1,2-Dioxygenases, Transferrin, Ferretin, Superoxide Dismutase, isopenicillinn- Synthase) Dinuclear Systems (Hemerythrin, Ribonucleotide Reductase, Methane Monooxygenase, purple acid phosphatases) [6]
5. **Copper Proteins (Type i, ii, and iii):** Types, function and mechanisms, Blue Copper proteins; Hemocyanin, Tyrosinase, Catechol Oxidase; Superoxide Dismutase; ascorbase Oxidase, Laccase; galactose oxidase [5]
6. **Molybdenum enzymes:** Types, function and mechanisms, Oxo-Transfer Enzymes; Xanthine Oxidase; nitrogenase. [5]
7. **Manganese:** photosynthesis (photosystem i and photosystem ii); function and mechanisms.[4]
8. **Zinc enzymes:** function and mechanisms, Hydrolytic Enzymes (Carbonic anhydrase; Carboxy peptidase a; alkaline phosphatase). [5]
9. **DNa/RNa:** Types, function and mechanisms, Dna nicking enzymes; Dna polymerase; Ribozymes. [5]
10. **Environmental & medicinal aspects:** acid-rain; green-house Effect etc. Radiopharmaceuticals; photo-Dynamic Therapy; anti-Tumor Drugs (cis-platin, Carboplatins; Bleomycins); ion-pumps. [5]

Recommended Books:

1. principles of Bioinorganic Chemistry; S. J. Lippard and J. M. Berg, panima publications, new Delhi, 1997.
2. Bioinorganic Chemistry ; inorganic Elements in the Chemistry of Life; W. Kaim, B. Schwederski Wiley, 1994
3. Biological inorganic Chemistry: Structure and Reactivity; Harry B. gray, Edward i. Stiefel, Joan Selverstone Valentine, ivano Bertini, University Science Book; 2006
4. Specific Review Articles to be collected from Internet.

L	P	T	C
3	0	1	4

C557: Nuclear Magnetic Resonance

1. **Classical NMR Spectroscopy:** nuclear magnetism, Bloch equations, chemical shift, linewidth, scalar coupling [4]
2. **Theoretical description of NMR spectroscopy:** Expectation value of magnetic moment, density matrix, pulses and rotation operator, chemical shift and coupling Hamiltonians, concept of coherence, one pulse experiment. [5]
3. **Product Operator Formalism:** Operator spaces, basis operators, free precision, pulses, single and multiple quantum coherences, application of pOF to study spin echo and standard polarization transfer protocols like inEpT. [6]
4. **Practical aspects of NMR spectroscopy:** Tuning, matching, shimming, temperature calibration, spectrum referencing, sampling theorem, quadrature detection, Fourier transformation, zero filling, apodization, phasing, signal to noise ratio, spin decoupling, pulse field gradients, water suppression, one dimensional experiments. [14]
5. **Two dimensional NMR experiments:** Two dimensional spectroscopy, coherence transfer, COSY, double quantum filtered COSY, TOCSY, NOESY, HSQC, HMQC, sensitivity enhanced HSQC. [10]
6. **Higher dimensional NmR experiments:** need for higher dimensional experiments, HNCA, HN(CO)CA, introduction to the new trend of fast multidimensional experiments: GFT, spatially spatial encoding. [3]

Recommended Books:

1. protein nMR Spectroscopy, 2nd Ed, John Cavanagh, W. J. Fairbrother, a. g. palmer iii, M. Rance and n. J. Skelton, Elsevier academic press, 2007
2. Spin dynamics 2nd Ed., Malcolm H. Levitt, John Wiley and sons Ltd., 2008

C558: Advanced Functional Materials

L	P	T	C
3	0	1	4

1. **Introduction to materials in modern Technology:** Materials as an enabling element of technological progress. Functions that materials perform. The properties - structure -processing connection. [2]
2. **Semiconductor materials:** intrinsic semiconductors, Band Structure of Semi- conductors, impurity Semiconductors, ii-V and ii-Vi compounds, Hall effect, SC devices. Charge carrier dynamics in semiconductor nanomaterials. [10]
3. **Dielectric materials:** Dielectric constant and polarizibility, insulating materials, Ferroelectrics, piezoelectrics, Measurement of Dielectric properties, applications. [6]
4. **Nanosized magnetic materials:** Basic concepts of magnetism. Types of magnetic behavior, Magnetic domains, soft and hard magnets, Classification Magnetic Nanomaterials, Ferrofluids, Single-domain particles, Physical Properties of Magnetic nanostructures, nanomagnetism for Biological applications. [6]
5. **Polymer materials and nano-composites:** Classification of Polymers, Structure- Property Correlation, Molecular weights, Conduction in polymers, natural composities, incorporation of nanomaterials into polymer Media, Organic polymer nanocomposites, Metal and Ceramic composites, Clay nanocomposite Materials, polymer- Clay nanocomposites, polymer/ graphite nanocomposites, polymer Composites with Carbonnanotubes. [10]
6. **Amorphous and Porous materials:** Crystalline vs. amorphous Solids, glass Formation, Structural Models of amosphous Materials, properties of Metglasses, Evolution and Development of porous Materials, Chemistry of Microporous Materials, Mesoporous Materials, Semiconductor nanoparticles in Zeolites, polymers and Carbon Materials in Zeolites. [10]

Recommended Books:

1. Fundamental of nanotechnology, gabor L. Hornyak, John J. Moore, Harry F. Tibbals, Joydeep Dutta, CRC press, Taylor & Francis group, 2009
2. Optical Properties and Spectroscopy of Nanomaterials, Jin Zhng Zhang, World Scientific Publishing Co. Pte. Ltd, 2008.
3. Science of Engineering Materials and Carbon nanotubes, C. M. Srivastava, C. Srinivasan, new age international pub- lishers.
4. Optimization of polymer nanocomposite properties, Edited by Vikas Mittal, WiLEY-VCH Verlag gmbH & Co. Kgaa, Weinheim, 2009.
5. Chemistry of Zeolites and Related porous Materials: Synthesis and Structure RUREn XU, WEn-Qin pang, JiHOng YU, QiSHEng HUO, JiESHEng CHEn, John Wiley & Sons(asia) pte Ltd, 2007.
6. polymer nanocomposites Handbook Rakesh K. gupta Elliot Kennel Kwang-Jea Kim, CRC press, Taylor & Francis group, 2008.

C559: Supramolecular Chemistry

P		T	C
			4

1. **Introduction:** Understanding of Supramolecular Chemistry (Multidisciplinary nature, Complementarities in biology); Selectivity; Supramolecular interactions; Chelate and Macrocyclic Effects; Characterizing Supramolecular Systems; Structural, Kinetic and Thermodynamic. [6]

2. **Molecular Self-assembly:** Non-Covalent Interactions: Electrostatic, Hydrogen Bonding, $\pi - \pi$ Stacking, Dispersion and Induction Forces, Hydrophobic or Solvophobic Effects, π-Electron Donor-Acceptor Systems, Catenanes and Rotaxanes, Tran-sition Metal Directed assemblies; Molecular Macrocycles and Boxes: Locked and Unlocked Molecular Boxes, Ladders and grids, Cages; Hydrogen Bond Directed assemblies: Rosettes and Ribbons, peptide nanotubes; Self- Replicating Molecular Systems. [12]

3. **Synthesis of macrocycles:** High Dilution Technique; Coordination Template Effects; Cation Binding and De-Metallation; porphyrins; Corrins; Crown Ethers; Cryptands; Spherands; Sepulchrates; Siderophores; Calixarenes. [4]

4. **Molecular Sensors of ions and molecules:** anions, Cations and neutral Molecules Receptor Design principles: Recognition by Electrostatic and Hydrogen Bonding, Lewis acidic Hosts interactions etc.; introduction to Fluorescence probing Techniques and applications: Fluorescent Molecular Sensors of ions and Molecules, Logic gate etc.; Expanded porphyrins, amide Functionalized Metallo Compounds, Cyclophanes, Electrostatics and Hydrophobicity, Hydrogen Bond Receptors, Chiral Recognition; Hydrophobic Effect: Recognition in Water; Solvent Effect; Cyclodextrins; Calixarenes; Metallo Receptor For nucleic acid Bases; Boronic acid Receptors for Sugars. [20]

Recommended Books:

1. D. J. Cram and J. M. Cram, Container Molecules and their guest, Monographs in Supramolecular Chemistry, Ed. J. F. Stoddart, The Royal Society of Chemistry, Cambridge, 1994.
2. J. M. Lehn, Supramolecular Chemistry: Concepts and perspectives, VCH, Weinheim, 1995.
3. Comprehensive Supramolecular Chemistry, Ed. J. L. atwood, J. E. D. Davies, D. D. Macnicol, F. Vogtle, Volumes 2 and 3, Elsevier Science, Oxford, 1996.
4. Supramolecular Chemistry ofanions, Ed. a. Bianchi, K. Bowman-James, E. garcia-Espana, John Wileyand Sons, new York, 1997.
5. Supramolecular Chemistry, p. D. Beer, p. a. gale and D. K. Smith, Oxford University press, 1999.
6. apractical guide to Supramolecular Chemistry, peter J. Cragg, John Wiley & Sons Ltd, England, 2005.

C560: Chemistry of Nanomaterials

L	P	T	C
3	0	1	4

1. **Introduction:** nano and nature, Fascination and Motivation of nanoparticle Research, Bottom-up and Top-down approaches [3]
2. **Zero and One-Dimensional Nano structures:** introduction, aqueous and non- aqueous Sol-gel Chemistry, Surfactant- assisted Synthesis, Solvent-Controlled nanoparticles, assembly: introduction, Oriented attachment and Mesocrystals, Superlattices, Core-Shell nanoparticles: introduction, Types of Systems, Characterization, properties. [10]
3. **Carbon Nanomaterials:** Fullerenes and their Derivatives, Carbon nanotubes: Structure and properties, nanocrystalline Diamond [8]
4. **Self assembled Monolayers**: introduction, Monolayers on gold, growth process, phase transitions, patterning monolyers, Mixed Monolayers Structure, Electrochemistry and applications of Self-assembled Monolayers of Thiols [4]
5. **Nano and Micro-elumsion**: Surface active agents, Micellization, Mechanism of emulsion, Characterization of Microemulsion [8]
6. **Application of nanomaterials**: Solar Energy Conversion, Molecular and nano-electronics, nanocatalyis, Biological applications and other applications. [12]

Recommended Books:

1. nanoparticles: Synthesis, Stabilization, passivation, and Functionalization, Edited by R. nagarajan, T. alan Hatton, aCS SYMpOSiUM SERiES 996.
2. Metal Oxide nanoparticles in Organic Solvents, Markus niederberger and nicola pinna, Markus niederberger and nicola pinna, Springer-Verlag London Limited 2009 .
3. Fundamental of nanotechnology, gabor L. Hornyak, John J. Moore, Harry F. Tibbals, Joydeep Dutta, CRC press, Taylor & Francis group, 2009.
4. Carbon nanomaterials, advanced Materials Series, Edited by Yury gogotsi, Taylor and Francis group, LLC, 2006.
5. Carbon Nanotubes and Related Structures, Edited by Dirk M. Guldi and Nazario Mart´ın, WILEY- VCH Verlag GmbH

& Co. Kgaa, Weinheim, 2010.

6. nano: The essential, Understanding nanoscinece and nanotechnology, T. pradeep, Tata Mcgraw- Hill publishing Company Limited.
7. applied Surfactants, Thrwat F. Tadros, WiLEY-VCH Verlag gmbH & Co. Kgaa, Weinheim, 2006.

C561: Advanced Bio-organic Chemistry

L	P	T	C
3	0	1	4

1. **Enzymology:** Mechanistic studies of enzymatic reactions. Studies of enzyme kinetic for substrate/inhibitors (reversible/ irreversible) and their future aspects in drug design. The role of cofactors and hormones in enzymatic reactions. Enzymes as Catalysts in organic chemistry reaction (group Transfer Reactions, Reduction and Oxidation; Monooxygenation; Dioxygenation Substitutions, addition/Elimination; Carboxylations; Decarboxylation; isomerizations; aldol and Claisen Reactions; and Retroreactions; Formylations, Hydroxymethylations, and Methylations; Rearrangements. [12]

   Application of enzyme Kinetics: Substrate Kinetics; Kinetics of Enzyme inhibition; Substrate inhibition; nonproductive Binding; Competing Substrates; Multi- substrate Systems; allosterism and Cooperativity. [5]

2. **Biosynthesis of secondary metabolites:** polyketide Biosynthesis; Saccharide Biosynthesis; Shikimate pathway (pDF); Shikimate pathway Flavonoids ; alkaloid Biosynthesis; alkaloid Bioynthesis: Tyrosine Derivatives; Terpene Biosynthesis with example-Taxol, vancomycine, penicillin and other recent discovered natural products. Design and synthesis of modified secondary metabolites analogues. isotope labeling (radioactive/non radioactive) and their application in biosynthetic pathways. [12]

3. **Non-natural bio-active molecules:** Synthesis and importance of these amino acids (β, γ&δ), non-ribosomal peptides and nucleotides (pna, Lna, Tna & other stable analogues).[5]

4. **Introduction of vital bio-macromolecule secondary structures:** g-Quadruplex, i-motif, Rnai (mi-Rna & si-Rna) & Collagen and their application in therapeutics. [5]

Recommended Books:

1. Organic Chemistry of Enzyme-Catalyzed Reactions, Revised Edition by Richard Silverman published: FEB-2002. iSBn 10: 0-12-643731-9. aCaDEMiC pRESS
2. Structure and Mechanism in protein Science: aguide to Enzyme Catalysis and protein Folding by alan Fersht, publisher: W. H. Freeman; 1st edition (September 15, 1998)
3. Evaluation of Enzyme inhibitors in Drug Discovery: a guide for Medicinal Chemists and pharmacologists (Methods of Biochemicalanalysis); by Robert a. Copeland, publisher: Wiley-interscience; 1 edition (March 28, 2005).
4. Dewick, paul M. Medicinal natural products: a Biosynthetic approach. 2nd ed. new York, nY: John Wiley & Sons, inc., 2001. iSBn: 9780471496410 (paperback);
5. Structural Diversity of g-Quadruplex Scaffolds; Stephen neidle and Shankar Balasubramanian, CRC press Copyright Year-2006.
6. gene Silencing by Rna interference: Technology and application, by Muhammad Sohail (Editor), CRC press; 1 edition (July 26, 2004).
7. Modified Nucleosides: in Biochemistry, Biotechnology and Medicine (ed P. Herdewijn), Wiley-VCH Verlag GmbH &Co. Kgaa, Weinheim, germany.
8. natural products: The Secondary Metabolites , James R. Hanson Copyright Year:2003. iSBn: 978-1-84755-153-5

C562: Polymer Chemistry

L	P	T	C
3	0	1	4

1. Classification of polymers, Nomenclature of polymers, Synthesis of polymers using different methods, viz chain polymerization, step polymerization, ring-opening polymerization etc. polymerization techniques, viz Bulk polymerization, Solution polymerization, Suspension polymerization, Emulsion polymerization etc. [10]
2. Polymer characterization, Molecular weight-number average, weight average; significance of molecular weight; methods of characterizing molecular masses, gpC, Viscosity, Mass analysis, end-group analysis, Thermal properties - melting point, glass transition temperature (Tg), factors influencing Tg, relation between Tg and molecular weight. Crystallinity in polymers - degree of crystallinity in polymers, structural regularity and crystallinity. [15]
3. Kinetics of polymerization, free-radical, cationic and anionic polymerization and polycondensation. [5]
4. Copolymerization, free-radical and ionic copolymerization and copolycondensation [5]
5. Steriochemistry of polymerization, types of stereoisomerism in polymers, properties of stereoregular polymers, different methods for the synthesis of steroregular polymers. Less traditional approaches: aTRp, RaFT, ROMp, Surface functionalization of polymers [5]
6. Biodegradable polymers: Synthesis and challenges [3]

Recommended Books:

1. Odian, g. principles of polymerization. 4th ed. Hoboken, nJ: Wiley-interscience, 2004.
2. allcock, H. R., Lampe, F. W. in Contemporary polymer Chemistry; prentice-Hall: Engelwood Cliffs, nJ, 1990
3. Billmeyer Jr. F. W. Textbook of polymer Science Wiley - inter Science.

C563: Molecular Reaction Dynamics

L	P	T	C
3	0	1	4

1. **Introduction:** The rate constant - History and current view. What is molecular reaction dynamics? [2]
2. **Theoretical methods i:** Transition State Thoery (TST), RRKM Theory. [5]
3. Theoretical Methods ii: Rate and cross-section, Classical scattering theory, Quantum scattering theory (reactive and non- reactive), Connection to TST and RRKM. [10]
4. **Experimental methods:** newton's diagrams, Molecular Beams, State-resolved spectroscopic techniques, imaging techniques. [8]
5. **Applications:** photoselective chemistry - photodissociation and photoisomerization dynamics, Dynamics in real time (ps, fs and attosecond regimes), Molecular energy transfer, Control of chemical reactions, Condensed phase dynamics, Dynamics of gas-surface reations.

[15]

Recommended Books:

1. R. D. Levine, Molecular Reaction Dynamics Cambridge University press, nY 2005.
2. J. I. Steinfield, J. S. Fransisco and W. L. Hase, Chemical Kinetics and Dynamics, Prentice Hall Inc., NJ,1999.
3. Journal articles.

C564: Theory of Molecular Spectroscopy

L	*P*	*T*	*C*
3	0	1	4

1. Recap: introduction and review of basic quantum mechanics, molecular symmetry [3]

2. Rovibronic Hamiltonian - Coordinates and momenta: Euler angles, axis systems, rotational and vibrational angular momentum, normal and internal coordinates, the g matrix, the gF matrix. [8]

3. Rovibronic wavefunctions: Classification of rotational, vibrational, rotation- vibration, and electronic wavefunctions, Hund's cases. [6]

4. Energy levels and interaction: Rotation-vibration interactions, vibronic and rovibronic interactions, Renner-Teller and Jahn-Teller effect, Rydberg states, spin effects. [8]

5. Transition intensities and Optical selection rules. Electric - magnetic dipole electric quadrapole transitions, multiphoton processes and Raman effect. [7]

6. Advanced topics: Spectroscopy at high energies, intramolecular vibrational energy redistribution (iVR), wave-packet approach to spectroscopy. [8]

Recommended Books:

1. p. R. Bunker and p. Jensen, Molecular Symmetry and Spectroscopy, nRC Research press, Ottawa.
2. J. D. graybeal, Molecular Spectroscopy, Mcgraw-Hill.
3. p. F. Bernath, Spectra of atoms and Molecules, Oxford University press, nY, 1995.
4. E. B. Wilson, J. C. Decius and p. C. Cross, Molecular Vibrations: The Theory of infrared and Raman Vibrational Spectra,Dover, nY, 1955.

C565: Advanced Organic Chemistry

L	P	T	C
3	0	1	4

Review of Basic Bonding Concepts; Conformational analysis; Stereochemistry; Kinetics and Thermodynamics of Organic Reactions; Reaction Mechanisms and Con- formational Effects on Reactivity; Oxidation Reactions; Reductions Reactions; Enolate Chemistry; Metalation Reactions; Key Ring Forming Reactions; Olefin Synthesis; Conjugate Additions; Synthetic analysis and Design; Total Synthesis of natural products; asymmetric Synthesis; Combinatorial Chemistry.

Recommended Books:

1. E. V.anslyn, D. a. Dougherty "Modern physical Organic Chemistry" California University Science Books, 2006.
2. E. L. Eliel, S. H. Wilen "Stereochemistry of Organic Compounds" Wiley-interscience, 1994.
3. R. Bruckner "Organic Mechanisms: Reactions, Stereochemistry and Synthesis" Springer, 2010.
4. F. a. Carey, R. J. Sundberg "advanced Organic Chemistry partsa & B: Structure and Mechanisms" 5th Edition, Spring- er, 2007.
5. M. B. Smith, J. March "Marchs advanced Organic Chemistry" 6th Edition, Wiley-VCH, 2007.
6. E. J. Corey, X.-M. Cheng "The Logic of Chemical Synthesis" Wiley-interscience, 1995.
7. T. Hudlicky, J. W. Reed "The Way of Synthesis: Evolution of Design and Methods for natural products" Wiley-VCH, 2007.
8. p. Wyatt, S. Warren "Organic Synthesis: Strategy and Control" Wiley, 2007.
9. M. Christmann, S, Br¨ase Eds "asymmetric Synthesis- The Essentials" 2nd Edition, Wiley-VCH, 2008.
10. 10. K. C. nicolaou, R. Hanko, W. Hartwig Eds. "Handbook of Combinatorial Chemistry", VCH-Wiley, Weinheim 2002.

C566: Catalysis: Reaction Mechanisms and Applications

L	P	T	C
3	0	1	4

1. Introduction to catalysis: fundamental concepts. [5]
2. Survey of ligands: Characteristics of the transition-metal in the complexes; Elementary steps. [10]
3. Reaction mechanisms and applications: Carbonylation, Hydroformylation, Hydrogenation, metathesis reactions, oxidation reactions, isomerization reactions, Cross- Coupling reactions, and C-H functionalization reactions. [20]
4. Examples of synthetic and industrial applications. [5]

Recommended Books:

11. The Organometallic Chemistry of the Transition Metals. R. H. Crabtree, John Wiley & Sons, 2005.
12. industrial Catalysis. J. Hagen, Wiely-VCH, 2006.
13. Homogeneous Catalysis. p. W. n. M. van Leeuwen, Kluwer academic publishers, 2004.

14. Homogeneous Catalysis. S. Bhaduri, D. Mukesh, John Wiley & Sons, 2000.
15. Metal-Catalyzed Cross-Coupling Reactions a. de Meijere, F. Diederich (Eds.), 2004.
16. Catalysts for Fine Chemical Synthesis. S. M. Roberts, g. poignant, John Wiley & Sons, 2002.
17. Catalysis of Organic Reactions, S.R. Schmidt, CRC press, 2007

C567: Advanced Main Group Chemistry

L	*P*	*T*	*C*
3	0	1	4

1. **(a) Direct bonds between metal atoms:** Mg and Ca compounds with metal-metal bonds (b) Multiple bonded group 13, 14 and 15 elements: Synthesis, reactivity and bonding [12]
2. NHC stabilized low oxidation state main group metal complexes [4]
3. **Low oxidation state main group metal hydrides:** synthesis and reactivity [4]
4. **NHCs analogues with low valent group 13 and 14 elements:** Synthesis, structure and reactivity studies; (a) Boron(i), aluminum(i), gallium(i), indium(i) and Thallium(i) heterocycles (b) Silicon(ii), germanium(ii), Tin(ii), and Lead(ii) hetero cylces [8]
5. Role of main group compounds in catalysis, organic synthesis and medicinal chemistry [8]
6. **inorganic New materials:** nanomaterials, polymers and chemical sensors [6]

Recommended Books:

1. inorganic Chemistry-principles of Structure and Reactivity. 4th Edn. Huheey J. E.; Keiter, E. a.; and Keiter, R. L. Harper-Collins, nY, 1993
2. Concepts and Models of inorganic Chemsitry. 3rd Edn. Douglas, B.; McDaniel, D.; and alexander, J. John Wiley, new York. 1993
3. Chemistry of the Elements. 2nd Edn. greenwood, n. n.; and Earnshaw, a. pergamon, Oxford, 1989
4. Organometallics: a Concise introduction, C. Elschenbroich and a. Salzer, 3rd Edn. 1999
5. Inorganic and Organometallic polymers. Chandrasekhar, V. Springer-Verlag, Heidelberg, 2005

C568: Advanced Fluorescence Spectroscopy

L	*P*	*T*	*C*
3	0	1	4

1. **Phenomena of Fluorescence and instrumentaion for Fluorescence Spectroscopy:** introduction. Jablonski Diagram, Characteristics of Fluorescence Emission, Fluorescence Lifetimes and Quantum Yields. Spectrofluorometers, Light Sources, Monochromators, Optical Filters, photomultiplier Tubes, polarizers. [5]
2. **Fluorophores:** intrinsic or natural Fluorophores; Fluorescence Enzyme Cofactors, Extrinsic Fluorophores; protein- Labeling Reagents, Membrane probes, Red and near-infrared (niR) Dyes, Dna probes, Chemical Sensing probes, Viscosity probes, green

Fluorescent proteins, Long-Lifetime probes. Quantum Dots. [4]

3. **Life-Time measurements:** Time-Domain and Frequency- Domain Measurements. Time-Correlated Single-photon Counting; principle and instrumentation, alternative Methods for Time-Resolved Measurements; Streak Cameras, Upconversion Methods. Data analysis. [6]

4. **Some important Photo-processes:** Dynamics of Solvent and Spectral Relaxation: Measurement of Time-Resolved Emission Spectra (TRES), Theory for Time-Dependent Solvent Relaxation, Fluorescence Quenching: Theory, Fractional Accessibility to Quenchers, Applications of Quenching to Proteins; Fluorescence Anisotropy: Origin of the Definitions of polarization and anisotropy, Measurement of Fluorescence anisotropies, Causes of Depolarization, Biochemical applications. Energy Transfer: Theory of Energy Transfer for a Donoracceptor pair, Distance Measurements Using Resonance Energy Transfer (RET), Biochemical applications of RET. [12]

5. **Multiphoton excitation:** introduction to Multiphoton Excitation, Two-photon absorption Spectra, Cross Section for Multi-photon absorption. [3]

6. **Single-molecule Detection (SmD):** Delectability of Single Molecules, instrumentation for SMD, Single-Molecule photophysics, Biochemical applications of SMD. [3]

7. **Fluorescence Correlation Spectroscopy(FCS):** principles of Fluorescence Correlation Spectroscopy, Theory of FCS, Examples of FCS Experiments. [3]

8. **Fluorescence-Lifetime imaging microscopy(FLim):** Early Methods for Fluorescence-Lifetime imaging, Laser Scanning TCSpC FLiM, Lifetime imaging of Cellular Biomolecules. [3]

9. **Radiative Decay engineering:** introduction to Radiative Decay Engineering, Review of Metal Effects on Fluorescence, Surface Plasmon-Coupled Emission(SPCE), Applications of Metal-Enhanced fluorescence, Application of SPCE. [3]

Recommended Books:

1. principles of Fluorescence Spectroscopy, Joseph R. Lakowicz, 3rd Edition, Springer, 2006
2. advanced Time-correlated Single photon Counting Techniques, W. Becker, Springer, 2005
3. Molecular Fluorescence principles and applications, B. Valeur, WiLEY-VCH, 2002
4. Single-Molecule Detection in Solution. Methods and applications, C. Zander, R. a. Keller, and J. Enderlein, WiLEY- VCH, 2001

C569: Biomacromolecules

L	*P*	*T*	*C*
3	0	1	4

1. Buffers (their use in study of biomolecules), pH, pKa of amino acids, D and L amino acid nomenclature [1]

2. Biophysical techniques to purify and study proteins: Dialysis, salting out and precipitation by organic solvents, ion exchange, gel filtration, reversed phase, affinity chromatography, ultracentrifugation, gel electrophoresis [3]

3. **Proteins:** protein sequencing by chemical and mass & nMR spectroscopic methods, Use of spectroscopic tools in studying biomolecules. primary (single letter amino acid codes), Ramachandran plot, secondary structures like helices, parallel and antiparallel -sheets, circular dichroism of secondary structures, tertiary (motifs and domains: some important motifs like Rossman fold, helix turn helix, 4 helix bundles, beta barrel), quaternary structure (Hemoglobin and Myoglobin) and Enzymes [21]

4. **Nucleic acids:** a, B and Z-Dna structures, Method of replication, sequencing of nucleic acids (Chemical, dideoxy and fluorescence), Transcription, Translation, genetic code, genomes, Genes, over expression of recombinant proteins, mutagenesis (random and site directed). polymerase chain reaction (pCR) [9]

5. Carbohydrates and glycoproteins, proteoglycans, Membranes and lipids, bacteial cell wall synthesis and mechanism of some important antibiotics like penicllin, antibiotic resistance [4]

6. **Metabolism:** photosynthesis, Calvins cycle, glycolysis, Krebs cycle, electron transport, cofactors. [4]

Recommended Books:

1. Voet, D, Voet, Jg, pratt, CW Fundamentals of biochemistry: life at the molecular level, 2nd Edition, 2006
2. Berg J.M, Tymoczko J.L. and Stryer L. Biochemistry, 6th Edition,2007
3. Creighton, TE, proteins: structure and molecular properties, 2nd edition, 1993
4. Lewin B. genes iX, 2008
5. Branden C and Tooze J., introduction to protein structure, 2nd Edition, 1999.
6. Fersht a., Structure and mechanism in protein science: a guide to enzyme catalysis and protein folding, 1999

C570: Advanced Heterocyclic Chemistry

L	*P*	*T*	*C*
3	0	1	4

1. **Introduction:** Heterocyclic Chemistry introduction to heterocycles: nomenclature, spectral characteristics, reactivity and aromaticity. [2]
2. Synthesis and reactivity of three and four membered heterocycles e.g., aziridine, azirine, azetidine, oxiranes, thiarines, oxetenes and thietanes. [4]
3. Synthesis and reactivity of five membered rings with two heteroatoms: pyrazole, imidazole, oxazole, thiazole, isothiazole and benzofused analogs; Benzofused five membered heterocycles with one heteroatom, e.g., indole, benzofuran, benzothiophene. [8]

4. Synthesis and reactivity of benzofused six membered rings with one, two and three heteroatoms: benzopyrans, quinolines, isoquinoline, quinoxazaline, acridine, phenoxazine, phenothiazine, benzotriazine, pteridines. [8]

5. Synthesis and reactivity of seven and large membered heterocycles: azepines, oxepines, thiepines; spiro heterocycles; bicyclic compounds containing one or more heteroatoms[4]

6. Recent methods of C-H functionalization/activations of heterocyclic derivatives. [16]

Recommended Books:

1. Carey, F.a. & Sundberg, R. J. advanced Organic Chemistry, parts a & B, plenum: U.S. 2004
2. Thomas. L. gilchrist, Heterocyclic chemistry, (3rd Edition) 1997
3. Joules, J. a; Mills, K.; Smith, g. F. Heterocyclic Chemistry, 3rd Ed.
4. advances in Heterocyclic Chemistry, Book series Elsevier Edited by alan Katritzky
5. Branden C and Tooze J., introduction to protein structure, 2nd Edition, 1999.
6. Journal articles

C571: Statistical Mechanics

L	*P*	*T*	*C*
3	0	1	4

1. Basic assumptions, concept of microscopic and macroscopic states, ensembles and averages. Calculation of distribution functions in canonical ensemble and the canonical partition function. Relations between the canonical partition function and thermodynamic functions. Calculations in other ensembles like micronanonical and grand canonical ensembles. [4]

2. Calculations of partition functions and thermodynamic properties for ideal systems of monatomic and diatomic molecules.
3. Calculations of fluctuations and equivalence of ensembles. [7]

4. Calculation of heat capacity of solids, Einstein and Debye theories, study of chemical equilibrium in terms of partition functions. [4]

5. **Quantum Statistics:** Maxwell-Boltzmann, Bose-Einstein, and Fermi-Dirac statistics. Systems of Fermions and Bosons in weak and strong degenerate limits. [7]

6. **Classical Statistical mechanics:** partition functions as integrals over phase space coordinates, Systems of interacting particles, imperfect gases, concept of radial distribution functions of liquids and applications to ionic solutions using Debye-Huckel theory. [6]

7. **Non-equilibrium Statistical mechanics:** Onsager regression hypothesis and fluctuation-dissipation theorem, calculations of transport coefficients like diffusion, conductivity.[6]

Recommended Books:

1. Physical Chemistry: A Molecular Approach, D. A. McQuarrie and J. D. Simon, Viva Books, New Delhi, 1998.
2. Statistical Mechanics, D. A. McQuarrie, University Science Books, 2nd Edn., 2000.
3. Introduction to Modern Statistical Mechanics, D. Chandler, Oxford Univ. press, 1987.
4. Statistical Thermodynamics of non-Equilibrium processes, J. Kaizer, Springer, 1st Edn., 1987.
5. Statistical Physics II: non-Equilibrium Statistical Mechanics, R. Kubo, M. Toda and N. Hashitsume, Springer, 2003.

SCHOOL OF HUMANITIES

DETAILED COURSE STRUCTURE

FOR

INTEGRATED M.Sc. COURSE

Revised Jan 2017

National Institute of Science Education and Research (HBNI)

Humanities courses for integrated M.Sc.

Year/Semester	Course no.	Credits	Course Name
CORE COURSES			
1/Semester I	H109	2	Technical Communication I
1/Semester I	H133	2	Introduction to Sociology
1/Semester II	H110	2	Technical Communication
1/Semester II	H101	2	Introduction to Economics
ELECTIVE COURSES			
2/Semester III	H225	2	Introduction to Psychology
	H201	2	Environmental Economics and Environmental Impact Assessment
	H239	2	Introduction to Innovation System
	H238	2	Life and Community in Urban World.
2/Semester IV	H227	2	Organizational Behaviour
	H235	2	Sociology of Science and Technology
	H236	2	Perspectives on Indian Society
	H237	2	Science Communication and Citizen

SEM- I	**H 109**	+	**H 133**
SEM – II	**H 110**	+	**H 101**
SEM – III			**2 Electives**
SEM-I V			**2 Electives**

Economics

H101:Course title: Introduction to Economics

Instructor/Proposed by: Dr Amarendra Das
Prerequisite: None

Course Content:

1. Role of Government in Organised Society [1 class]
2. Expenditure Obligation of Union, State and Local Government [2 classes]
3. Sources of Revenue for Union, State and Local Governments [4 Classes]
4. Concepts of Budget, and Different deficits [1 class]
5. Channels of Resource Transfer from Union to State Governments [2, classes]
6. Balance of Payment [3 classes]
7. Laws of Demand and Supply [3 classes]
8. Equilibrium Price Determination [1 class]
9. Exchange rate Determination [2 classes]
10. Consumer's Equilibrium [2 classes]
11. Producer's Equilibrium [2 classes]
12. Current Economic events [3 classes]

References:

Government of India (2017) Economic Survey-2016-17

H201: Environmental Economics and Environmental Impact Assessment
Instructor/Proposed by: Dr Amarendra Das
Prerequisite: None

Course Content:

12. Definition of Environmental Economics, Ecological Economics and Natural Resource Economics [1 class]
13. Key environmental problems faced by humanity [2 classes]
14. Limits to Growth [2 classes]
15. Sustainable Development: Strong and weak sustainability [2 classes]
16. Indicators of sustainability [1 class]
17. Market Failure: Causes and Remedies [3 classes]
18. Perspective on Environmental Policy/Regulation [2 classes]
19. Informal Regulation [1 class]
20. Population, Poverty and Economic Growth [1 class]
21. Climate Change, Causes and Consequences [2 classes]
22. Principles of using Renewable resources [2 classes]
23. Principles of using Non-renewable resources [2 classes]
24. Environmental Kuznets Curve [2 classes]
25. Mainstreaming of Environment [2 classes}
26. Environmental Impact Assessment [2 classes}
27. Environmental Regulations in India [1 class]
28. Green Accounting, Concepts, Integrated Economic and Environmental
29. Accounting [2 classes]

H109: Technical Communication I

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **Ideations of Science** (4 classes)
   Categorization and social perspective.

2. **Inscription and the material arts** (4 classes)
   Scientific representation and the figural social.

3. **Mechanics of Writing** (6 classes)
   Structure and compositional logic

4. **The Rhetorical Process** (6 classes)
   Building the argument

5. **Cultural Context and the Sciences** (4 classes)
   Literature and the aesthetic of science.

H110: Technical Communication II

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **The logic of Critique** (4 classes)
   Notions of evidence, proof and fact.

2. **Humanities and empiricism** (4 classes)
   Empirical fallacy and social intervention.

3. **Mechanics of Writing II** (6 classes)
   The forms of knowledge production. Understanding readership.

4. **The Rhetorical Process II** (6 classes)
   Staging the argument. Perspective and Institutional / Disciplinary norms.

5. **Narrativizing the Sciences** (4 classes)
   Scientific correspondence and reflections. Popular science and Science fiction.

Psychology

H 225: Introduction to Psychology
Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1.	Introduction: perspectives, methods, issues.	(3 classes)
2.	Perceptual Process.	(4 classes)
3.	Learning Process	(3 classes)
4.	Memory	(2 classes)
5.	Intelligence	(2 classes)
6.	Emotion	(2 classes)
7.	Personality	(4 classes)
8.	Motivation	(4 classes)
9.	Attitude	(3 classes)

References:

Morgan, C.T., King, R.A., Weisz, J.R., Scopler, J. **Introduction to Psychology** (7th ed). Tata McGraw-Hill.

Baron, R.A. **Psychology** (5th ed) PHI New Delhi

Feldman, R.S. **Introduction to Psychology** (6th ed) Tata McGraw-Hill.

H 226: Applied Behavioural Science
Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1.	Introduction: Personality	(1 class)
2.	Interpersonal Relationship and Personal Effectiveness	(5 classes)
3.	Social Perception: errors, biases, impression management	(3 classes)
4.	Emotional Intelligence: managing emotions.	(3 classes)
5.	Group and Team Dynamics.	(5 classes)
6.	Effective Communication.	(4 classes)
7.	Values and Value System	(3 lectures)
8.	Stress: coping and managing stress	(4 classes)

References

Organizational Behaviour by Stephen Robbins, 11th edn, Prentice-Hall India
Understanding Organizations by Udai Pareek, Oxford University Press.
Handouts will be given as and when required.

H 227: Organizational Behaviour

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. **Introduction to Organizational Behaviour** (2 classes)
   Nature of Organizations, what is OB, contributing disciplines, Functions, role and skills of a manager, environmental challenges.
2. **Individual Decision-making process** (3classes)
   Rational decision-making, creativity, bounded rationality, errors and biases, constraints, ethics in decision-making.
3. **Work attitudes** (2 classes)
   Job satisfaction, job involvement, organizational commitment, cognitive dissonance theory.
4. **Motivation** (3 classes)
   Hierarchy of needs theory, two factor theory, ERG theory, equity theory, goal setting and expectancy theory, MBO in practice, other applications.
5. **Power and Politics** (3 classes)
   Bases of power, the general dependency postulate.
6. **Leadership** (3 classes)
   Behavioural theories, contingency theories, contemporary theories, issues in leadership studies.
7. **Groups and team dynamics** (3 classes)
   Stages of group development, group structure, group decision-making, Types of teams, creating effective teams.
8. **Conflict and conflict resolution** (2 classes)
   Functional and dysfunctional conflict, the conflict process, negotiation.
9. **Organizational Structure** (2 classes)
   Elements of organizational structure, common organizational designs, why do structures differ?
10. **Organizational Culture** (2 classes)
    Functions of culture, creating and sustaining culture.
11. **Organizational Change** (3 classes)
    Forces for change, resistance to change, approaches to managing planned change.

Sociology

H 237: Science Communication & the Citizenship

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course content:

1. Introduction, citizenship and Science (4 classes)
2. Science in public, the public understanding of science (4 classes)
3. Public engagement with science (5 classes)
4. Science, communication, ethical codes & scientific norms (4 classes)
5. Patents and dissemination of scientific knowledge (4 classes)
6. Science communication in age of innovation (4 classes)

H 238: Life &Community in Urban world

Proposed by: Debashis Pattanaik

Prerequisite: None

Course content:

1. Introduction, urban space and urban thought, urbanization (4 classes)
2. Emergence and evolution of cities (4 classes)
3. Urban life, urban communities (online and offline) (4 classes)
4. The city in context, migration, sorting and niches (4 classes)
5. Markets and networks (5 classes)
6. Urban ecology, suburbia, urban design, policy and planning (4 classes)

H239: Introduction to Innovation System

By: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course Content:

1.	Nature of innovation	(4 classes)
2.	The innovative firm	(2 classes)
3.	Innovation processes	(4 classes)
4.	Regional innovation system	(3 classes)
5.	Innovation and IPR	(4 classes)
6.	Education, universities and national innovation system	(2 classes)
7.	Multinational enterprises and innovation processes	(2 classes)
8.	Science and innovation policy	(4 classes)

H 133: Introduction to Sociology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Origin and Growth of Sociology (2 Lectures)
   Origin and development of sociology as a separate discipline,
   Nature and Scope of Sociology,
   Sociology as a Scientific Discipline.

2. Sociological Perspectives (2 Lectures)
   Conflict, Functionalism and Interactionsim

3. Basic Sociological Concepts (6 Lectures)

Society, Community, Association, Institution, Status and Role, Types of Society: From early hunting gathering to industrial development and globalization, Culture: Components of culture; Norms, values, folkways, mores, Cultural unity and diversity.

Socialization: Agents of Socialization, Early development of infant, stages of socialization

4. Social Groups (4 Lectures)

Meaning of Social Groups and Types: Primary Group, Secondary Group, In-Groups, Out- Group, Quasi- Group, Reference Group

5. Structure and Stratification (4 Lectures)

Structure, System and Function, caste and class and Racial and Ethnic group inequalities Social Stratification: Meaning and Types, Functionalist and Conflict Perspectives of Stratification, Social mobility: Meaning, horizontal and vertical mobility

6. Social Institutions (4 Lectures)

Family, marriage and kinship, religion, economy, polity and education. Functionalist and Conflict Perspectives of institutions.

7. Social processes and Change (4 Lectures)

Social Processes: Co-operation, accommodation, integration, competition and conflict;

Social Change: Meaning and Definition, Factors of change.

8. Social Problems and Social Control (2 Lectures)

Social Problems and Social disorganization

Social control : Meaning and Types

H 235: Sociology of Science and Technology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Social significance of science and technology (4 Lectures)
   a. Contextual nature of science
   b. Scientist as Indexical and Analogical reasoner
2. Robert Merton's approach to science (3 Lectures)
   a. Ethos of science;
   b. Thomas Theorem and Matthew Effect
3. Perspectives on scientific knowledge (8 Lectures)
   a. Karl Marx, Emile Durkheim, Karl Manheim's sociology of knowledge,
   b. Thomas Kuhn's structures of scientific revolutions
   c. Karl Popper's theory of falsification
4. Recent trends in Sociology of Science (8 Lectures)
   a. Science and technology in developing and developed countries,
   b. Indian context,
   c. Information Technology and globalization,
   d. Manuel Castell's network society, internet and social inequality
5. Case Study Discussions (4 Lectures)

H 236: Perspectives on Indian Society

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content:

1. Indian Social Structure (2 Lectures)
    - a- Traditional Social Organizations
    - b- Culture and Tradition
2. Caste System and Class Structure (7 Lectures)
    - a- Cultural and Structural Views about Caste System
    - b- Inequality, Differentiation and Hierarchy
    - c- Dominant Caste, Sanskritization
    - d- Change and Persistence of Caste system in Modern India
    - e- Caste in Indian Politics
    - f- Backward Caste Movements
    - g- Social Backwardness and Social Justice
3. Class Structure (3 Lectures)
    - a- Class Structure in India
    - b- Agrarian and Industrial Class Structure
    - c- Emergence of Middle Class and Elites

4. Social Institutions: Marriage, Kinship and Family (2 Lectures)

5. Rural and Urban Social Structure: Poverty, Unemployment, etc. (2 Lectures)

6. Changing faces of Rural society/economy/market, Green revolution (2 Lectures)

6. Political processes: Political system and Governance (2 Lectures)

7. Education (2 Lectures)

8. Religion and Society (2 Lectures)

9. Social Change and Development Sustainable and Inclusive (2 Lectures)
   Development, Basic developmental issues: Health, Education and Livelihood

10. Contemporary Social Issues (2 Lectures)

SCHOOL OF COMPUTER SCIENCES

A proposal for minor in Computer Science

1 Structure of the curriculum

The curriculum is divided in two category of courses, core courses and optional courses.

1.1 Core Courses

The following courses have been recommended by the steering committee as core courses. The Programming and Data Structure course are proposed to be two lab courses (2 credit each).

1. CS141 and CS142: Programming and Data Structures Lab
2. CS201: Theory of Computation
3. CS202: Discrete Structures and Computation[1]
4. CS301: Design and Analysis of Algorithms

1.2 Elective Courses

For the initial years, we shall offer the following optional courses. A student has to do three courses from the following list to obtain minor.

- CS451: Modern Cryptology
- CS452: Algorithmic Coding Theory
- CS453: Complexity Theory
- CS454: Linear Programming and Combinatorial Optimization
- CS455: Distributed Network Algorithms

In future, more elective courses will be offered based on the interests of the faculties.

1.3 Similarity with other courses

School of Mathematical Sciences offer some courses which are similar to the courses listed above. We make the following observations regarding this.

- Programming and Data Structure course can be merged with the existing Computational Laboratory courses (M141 and M142). I141 and I142 are the two lab courses, which may be offered instead of M141 and M142. The major difference in syllabus is the inclusion of different data structures which are core concepts in Computer Science.

[1] This course was originally titled Discrete Mathematics for Computer Science. We have renamed the course to capture the spectrum of the topics covered, and to avoid any confusion.

- School of Mathematical Sciences also offer Algorithms, Theory of Computation, Cryptology, Information and Coding Theory as PG optional courses. However, in Computer Science, Algorithms and Theory of Computation are fundamental courses, and need to be offered to the undergraduate students. The syllabus of Modern Cryptology, as well as Algorithmic Coding Theory has been designed from Computer Science point of view and significantly different from the SMS courses.

  However, to avoid repetition, we propose, students who take M462 (Cryptology) and M464 (Information and Coding Theory) will not be allowed to take CS451 (Modern Cryptology), and CS452 (Algorithmic Coding Theory) respectively.

2 Syllabi

Syllabi of the courses are given in the following pages. For each subject, the syllabus is organized as follows

1. prerequisite
2. topics
3. references

3 Core Courses

3.1 CS141: Programming and Data Structures Lab-I

Credit : 2

Prerequisite: None

Classes per week: 3P+1L.

Topics Module 0: (6P+2L): Introduction to Computers, Notion of Algorithm, Linux Bash Shell, Simple Shell Programs.
Module 1 (12P+4L): Introduction to Programming: Variables, operators and expressions, input and output statements, Conditions and loops. Functions and recursions.
Module 2 (12P+4L): Arrays, Pointers, Structures, Classes and Objects.
Module 3 (9P+3L): File i/o, command line arguments.
Module 4 (6P+2L). Abstract data type. Linked lists.

- D. Knuth: The Art of Computer Programming. Vol. 1, 2nd ed. Narosa/Addison-Wesley, New Delhi/London, 1973

3.2 CS142: Programming and Data Structures Lab-II

Credit : 2

Prerequisite: CS141 **Classes per week**: 3P+1L. **Topics**

Module 0 (9P+3L): Review of programming, Arrays and Linked List. Bubble Sort and Quick Sort. Binary Search.
Module 1 (12P+4L): Circular Linked Lists, Doubly Linked Lists, Stacks, Queues.
Module 2 (12P+4L): Trees. Binary Search Trees, Tree traversal, Balanced Binary trees. Module 3 (6P+2L): Heap, Priority Queues.

Module 4 (3P+1L). Strings and Searching for Phrases.
Module 6:(Optional) (3P+1L) Dictionaries: universal, k-wise independent, simple tabulation hashing; chaining, dynamic perfect hashing, linear probing, cuckoo hashing

3.3 CS201: Theory of Computation

Credit : 4

Prerequisite: None **Classes per week**: 3L+1T. **Topics**

Module 1 (12L+4T): Introduction to Finite State Automata; DFA,NFA, and their equivalence, Regular Ex- pressions and equivalence with finite state automata.Regular Languages and Properties, Pumping Lemma and applications, Myhill-Nerode Theorem, State Minimization.
Module 2 (12L+4T): Context Free Languages (CFL) and grammars, parse trees, Chomsky Normal Form. Pushdown Automata (PDA), Equivalence of acceptance by final state and empty stack. Equivalence of CFL and PDA, Pumping Lemma for CFL.
Module 3 (12L+4T): Turing Machines and equivalence of different models. Universality. Decidability, Recog- nizability, Enumeration, and Undecidability. Reductions. Rice’s Theorem, recursion theorem.
Module 4 (9L+3T): Notions of P,NP,co-NP, hierarchy theorem, NP completeness, Cook-Levin Theorem, NP completeness proofs of some NP complete problems.

3.4 CS202: Discrete Structures and Computation

Credit 4
Prerequisite: none **Classes per week**:
3L+1T. **Topics**

Module 1 (6L+2T): Review of Sets, Operations, Principles of Inclusion and Exclusion. Functions, relations, Equivalence relations. Countable and uncountable sets. Review of Pigeonhole principle.

Module 2 (6L+2T): Introduction to Propositional Logic, Equivalence and Implications. Truth tables, De Mor- gan's Law, Quantifiers, Inference and Proofs. Introduction to First Order Logic, Syntax and Semantics, Soundeness and Completeness.

Module 3 (6L+2T): Mathematical Induction, Recursions, First order linear recurrence, Geometric series, Re- cursion trees and growth rates of solutions to recurrences, Master Theorem. Generating Functions.

Module 4 (6L+2T): Introduction to counting, sum and product principles, counting subsets. Binomial coefficients and Pascal's triangles. Polya's theory of counting (optional).

Module 5 (3L+1T): Arithmetic Algorithms: Computing GCD, primality testing, RSA.

Module 6 (12L+4T): Graph Theory: Graphs, representations, connectivity, cycles, trees, Spanning tree of a graph, Algorithms to find minimum spanning trees. Eulerian Cycle and Hamiltonian paths, independence number and clique number, chromatic number, Dominating Sets, and Covering Sets. Planar Graphs. Directed Graphs and tournaments.

Module 7(3L+1T) Probabilistic tools, Tail Bounds and Applications.
Module 8 (3L+1T)(optional): Linear Algebraic tools in Combinatorics.

3.5 CS301: Design and Analysis of Algorithms

Credit 4

Prerequisite: CS201, CS202
Classes per week: 3L+1T.
Topics

Module 1 (4L+1T). Introduction and basic concepts - mathematics of algorithm analysis, asymptotic notations, worst case and average case complexity. Review of Searching and Union Find.

Module 2 (8L+3T): Divide and conquer- Motivating algorithms that leads into recurrences, solving recurrences, merge sort and its recurrence, Median computation. Analysis of quicksort.

Module 3 (9L+3T). Greedy algorithms- Greedy choice, optimal structure property, minimum spanning tree, knapsack

Module 4 (8L+2T). Dynamic programming- Integral knapsack, longest increasing subsequence, edit distance, independent sets in trees

Module 5 (8L+3T). Graph algorithms- Recall of representation of graphs, BFS, DFS, shortest path, connected components, topological sort of DAGs, biconnected components and strongly connected components in directed graphs

Module 6. (Optional)(3L+1T) Randomization- Median, randomized quicksort, probabilistic primality testing.

Algebraic Algorithms. Karatsuba's algorithm and the Fast Fourier transform

4 Optional Courses

4.1 CS451: Modern Cryptology

Credit 4

Prerequisite: CS202, CS301.

Classes per week: 3L+1T.

Topics

Module 1: (3L+1T) Introduction and Classical Cryptography, Perfect Secrecy, One Time Pad.

Module 2: (9L+3T) Symmetric Key Encryption. Computational Security, Concrete vs Asymptotic Approach. Semantic Security. Pseudorandom generators and Stream ciphers, Pseudorandom Functions and Block Ciphers. Practical Constructions.

Module 3: (6L+2T) Hash Functions and Message Authentication Codes. Notions of Security, Generic Attacks, Domain Extension techniques, CBC MAC, HMAC, PMAC, Idea of Authenticated Encryption.

Module 4: (6L+2T) Review of Basic Number Theory. Hardness Assumptions. One-way functions, Trapdoor Permutations, RSA assumptions, Discrete Log and Diffie Hellman Assumptions, SIS and LWE Assumptions. Introduction to Elliptic Curves (Optional)

Module 5. (3L+1T) Key Exchange Protocols and Key Management.

Module 6. (6L+2T) Public Key Encryption, Semantic Security, El Gamal Encryption, Padded RSA PKCS#1 v1.5. Random Oracle Technique, OAEP.

Module 7. (6L+2T) Digital Signatures, Hash and Sign paradigm, Schnorr Signature, Forking Lemma, DSA. SSL/TLS.

Module 8. (6L+2T) (Optional) Idea of some of the following notions, Protocols and Zero Knowledge Proofs, Multiparty Computations and Oblivious Transfers, Secret Sharing. Algorithms for factoring and computing discrete logarithms, Linear and Differential Cryptanalysis, Crypto Currencies.

References

- J. Katz and Y. Lindell, Introduction to Modern Cryptography. CRC, 2014.

Possible Instructor: Rishiraj Bhattacharyya.

4.2 CS452: Agorithmic Coding Theory

Credit 4

Prerequisite: CS202

Classes per week: 3L+1T.

Topics Module 1: (9L+3T) Entropy, Characterization and Properties. Application to Combinatorics. Mutual Information and KL Divergence.

Module 2: (6L+2T) Source coding theorem, lossless compression of data, Lempel-Ziv Algorithm, Optimal lossless coding.

Module 3 (6L+2T) Communication channels (binary symmetric, erasure) and channel capacity, channel coding theorem.

Module 3: (6L+2T) Introduction to Error Correcting Codes. Hamming Codes and Hamming Bounds. BCH Codes, Maximum likelihood decoding and syndrome decoding; coding theory bounds.

Module 4: (9L+3T) Reed-Solomon codes and the Berlekamp-Welch decoding algorithm with Analysis. List Decoding of Reed-Solomon Codes.

Module 5. (6L+2T)Reed-Muller Code and Local decoding. Module 6.

(3L+1T) (Optional) Lovasz Local lemma and proof.

Possible Instructor: Rishiraj Bhattacharyya.

4.3 CS453: Complexity Theory

Credit 4

Prerequisite: CS201, CS202, CS301

Classes per week: 3L+1T.

Topics

Module 1 (9L+3T): Introduction, P and NP - Review of Turing machines, universal Turing machines, and uncomputable functions, P vs. NP, NP vs. co-NP, and NP-completeness, EXP, NEXP

Module 2: (3L) Cook Levin's Theorem

Module 3 (12L+4T): Diagonalization, Space complexity, Polynomial Hierarchy

Module 4 (9L+3T): Interactive Proofs - PCP theorem and its application to approximability Module 5 (4L+1T): Circuit complexity and lower bounds

Module 6 (6L+2T): Hardness vs. Randomness - Randomized Computation, derandomization, Pseudo-random generators

Module 7 (3L+1T): Polynomial identity testing vs Lower bounds for arithmetic circuits

Possible Instructor: Anisur Rahaman Molla.

4.4 CS454: Linear Programming and Combinatorial Optimization

Credit 4

Prerequisite: CS202, CS301
Classes per week: 3L+1T.

Topics

Module 1: (10L+3T) Basic geoemetry and linear algebra related to Linear Programming. Simplex-method and Duality theorem (leading to Von Neumann's minmax principle) and complimentary slackness.

Module 2: (8L+3T) Ellipsoid algorithm. separation oracles.

Module 3: (9L+3T) Semidefinite programming as an extension of linear programming.

Module 4: (9L+3T) LP relaxation. Examples of problems where LP relaxation achieves optimum. Examples where LP/SDP relaxation achieves approximate solution. Integrality gaps.

Module 5: (6L+2T) Rounding, probabilistic roundings, iterative rounding, primal dual methods.

Module 6 (Optional): (3L+1T) Gale-Shapley algorithm, Connection of LP to Cooperative Game Theory core, nucleolus, combinatorial optimization games.

Possible Instructor: Rishiraj Bhattacharyya, Anisur Rahaman Molla.

4.5 CS455: Distributed Network Algorithms

Credit 4

Prerequisite: CS202, CS301

Classes per week: 3L+1T. **Topics** Module 1: (9L+3T) Foundations of distributed network algorithms - Broad- cast, converge-cast, maximal independent set, coloring, leader election, spanning tree algorithms, shortest paths, and routing.

Module 2:(9L+3T) Fundamental concepts in distributed algorithms - Symmetry breaking, locality, synchronizers Module 3:(9L+3T) Basics of distributed network systems - Communication, synchronization, fault-tolerance,

and resource allocation

Module 4:(9L+3T) Applications to real-world networks - Internet, peer-to-peer networks, wireless networks, sensor networks and dynamic networks

Module 5:(9L+3T) Lower bounds using communication complexity, distributed computation of large-scale data, dynamic network algorithms.

DETAILED SYLLABUS – COMPULSORY COURSES

1st Year, Semester I

Science of Life (B101)

Course Title : Science of Life
Course Code : B101
Credits : 3 Credits
Course Category : Core
Course Prerequisites : No prerequisites
Contact Hours (28/42/56) : 42 (including tutorials)

Outcome of the Course:

- Understanding the origin and evolution of life.
- Fundamental understanding of the structure and function of the molecules of life.
- Fundamental understanding of the structure & function of cellular organelles.

Course Contents:

1) Origin of life: Bioenergetics and concepts of evolution (10 Lectures + 5 Tutorials)
- What is life?
- Origin(s) of life on planet earth.
- First cellular forms to current day view of 'Tree of life'.
- Basics of evolution – natural selection, adaptive evolution, genetic drift, neutral evolution, molecular clock and molecular systematics.

2) Molecules of life: (11 Lectures + 5 Tutorials)
- Nucleic acids – architecture (structure), physico-chemical properties and importance in biology.
- Proteins – structure, biochemical properties, functions as major biological workhorses.
- Lipids – membrane architecture, composition and lipid constituents of membranes, importance of membrane lipids and proteins in cellular function.
- Brief introduction to metabolism and energy cycles in cellular forms.

3) Unit of life: (7 Lectures + 4 Tutorials)
- Basic unit of life (introduction to architecture and composition).
- Structure & function of organelles.
- Cytoskeleton
- Extracellular matrix

Recommended Books:

a) Biology by Campbell and Reece, Eighth Edition.
b) Lehninger Principles of Biochemistry, by DL Nelson and Michael M Cox., Sixth Edition.
c) Molecular biology of the Cell by Albert et.al, Sixth Edition.

Suggested References:
Class notes, handouts and other reading relevant to contemporary research problems and recent findings in the context of the course will be provided from time to time whenever necessary.

1st Year, Semester II

Biology II - Cellular and Genetic basis of life (B102)

Course Title : Biology II - Cellular and Genetic basis of life
Course Code : B102
Credits : 3 Credits
Course Category : Core
Course Prerequisites : B101
Contact Hours (28/42/56) : 42
(including tutorials)

Outcome of the Course:

- Understanding the principles of cellular mechanisms driving development of an organism
- Key evolutionary concepts in Lamarckism, Darwinism and Speciation
- Understanding the genetic basis of inheritance
- Fundamental understanding of molecular Biology

Course Contents:

1. Cellular Mechanisms of Development (7 Lectures + 3 Tutorials)
   - Cell Cycle
   - Cell-Cell communication
   - Cell differentiation

2. Evolutionary concepts (6 Lectures + 3 Tutorials)
   - Lamarckism
   - Darwinism
   - Speciation

3. Basis of Inheritance (9 Lectures + 3 Tutorials)
   - Chromosomal patterns of inheritance
   - Molecular patterns of inheritance

4. Molecular Biology (8 Lectures + 3 Tutorials)
   - Basics of Replication
   - Basics of Transcription
   - Basics of Translation
   - Basics of DNA manipulation

Recommended Books:

a) Biology by Campbell and Reece

Suggested References:

Class notes, handouts and other reading as suggested during the class.

2nd Year, Semester III

Microbiology (B201)

Course Title : Microbiology
Course Code : B201
Credits : 4 Credits
Course Category : Core
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Microbiology as a science.
- Key concepts in Microbes in health & disease.
- Overview of role of microbes in nutrient cycling
- Implications in Evolution, Health and disease.

Course Contents:

1. Development Microbiology as a science and Microbial world (6 Lectures + 2 Tutorials)
   - Microbial diversity: Microbial evolution and systematic, Eukaryotic microorganisms – Protists, Fungi, Unicellular red & green algae. Overview of viruses and their classification, overview of viral replication, Prions – non-microbial infectious agent
   - Cell structure and function of bacteria, archaea and eukaryotic microorganisms
   - Role of microorganisms in understanding biological systems
2. Microbial nutrition and physiology: (7 Lectures + 2 Tutorials)
   - Metabolic diversity – Phototrophy, Autotrophy, Chemolithotrophy and Nitrogen fixation
   - Catabolism of organic compounds – fermentations, anaerobic respiration & aerobic chemorganotrophic processes.
   - Microbial growth
3. Microbial genetics: Overview (6 Lectures + 2 Tutorials)
   - Bacterial genetics – chromosomes, plasmids & incompatibility, mutation, genetic exchange in prokaryotes – transformation, conjugation, transduction
4. Microbes in health & disease: (8 Lectures + 2 Tutorials)
   - Beneficial microbial interactions with humans,
   - Harmful microbial interactions with humans: host-parasite interactions, overview of host defense system, pathogenesis & infection establishment, Virulence factors & toxins.
   - Brief overview of antibiotics, antibiotic resistance & their mechanism of action
5. Microbes in agriculture: Overview (5 Lectures + 2 Tutorials)
   - Microbial diseases of economically important plants
   - Agrobacterium and crown gall disease, Transformation
6. Microbes in environment: (6 Lectures + 2 Tutorials)
   - Brief overview of role of microbes in nutrient cycling
   - Microbial bioremediation: leaching of ores, mercury & heavy metal transformation, petroleum degradation, biodegradation of xenobiotics
   - Animal-microbial symbiosis: rumen and ruminant animals,

- Plant-microbial symbiosis: Lichens- mycorrhizae, Agrobacterium and crown gall disease, Legume-root nodule symbiosis

7. Microbes in industry: Brief over view of their roles in: (4 Lectures + 2 Tutorials)

- Food, health and fermentation sectors

Recommended Books:-

a) Brock's Biology of Microorganisms by Madigan et al.
b) Microbiology by Prescott et al.
c) Class notes, handouts and other reading as suggested during the class.

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Biochemistry (B202)

Course Title : Biochemistry
Course Code : B202
Credits : 4 Credits
Course Category : Core
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding the principles governing Protein structure & function
- Basic concepts on metabolism and their implications in living organisms
- Concept on signal transduction
- Implications in Evolution, Health and disease.

Course Contents:

1. Overview of Biochemistry (1 lecture)
2. Protein structure & function, Protein Folding, Protein Degradation (3 lectures + 1 tutorial)
3. Enzymes: Classification, Mode of action, kinetics, regulation and inhibition, examples of enzymatic reactions and regulatory enzymes (2 lectures + 1 tutorial)
4. Lipids: Transmembrane lipids, receptors, lipids as signals, co-factors and pigments (3 lectures + 1 tutorial)
5. Membrane (3 lectures + 1 tutorial)
6. Intermediary Metabolism and Energetics: (3 lectures + 1 tutorial)
7. CarbohydrateMetabolism: Glycolysis, TCA cycle, Gluconeogensis, Pentose phosphate pathway, Glycogenesis and Glycogenolysis, co-ordianted regulation of glycolysis and gluconeogensis, Phosphorylation and bioenergetics of above processes. (6 lectures + 2 tutorials)
8. Electron Transport Chain and Oxidative Phosphorylation (3 lectures + 1 tutorial)
9. Fatty acid biosynthesis and degradation, Synthesis of Cholesterol, Steroid Hormones and Eicosanoids (3 lectures + 1 tutorial)
10. Amino acid biosynthesis and degradation (3 lectures + 1 tutorial)
11. Nucleotide biosynthesis and degradation (3 lectures + 1 tutorial)
12. Hormones: Mechanism of action, regulation and integration in mammalian metabolism (3 lectures + 1 tutorial)
13. Biochemistry of signal Transduction (3 lectures + 1 tutorial)

Recommended Books:
a) Lehninger Principles of Biochemistry, Fourth Edition by David L. Nelson, Michael M. Cox
b) Biochemistry by Berg and Stryer
c) Biochemistry by Voet and Voet
d) Harper’s book of Biochemistry

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

B203: Biophysics & Biostatistics

Course Title : Biophysics and Biostatistics
Course Code : B203
Credits : 4 Credits
Course Category : Core
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Introducing the concepts of Biophysics and Biostatistics
- Understanding the laws and tools of physics that are applied to understand biology
- How is statistics required and applied in the field of biology
- Evolution of the subject Biophysics and its application
- Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of biophysics and biostatistics
- Understanding Biophysics to do new and more insightful biology
- Understanding details of biostatistics to understand a) the quality of the data, b) the validity of comparative biological analysis, and classification and grouping of data for better insight of the underlying biological principles

Course Contents:

Biostatistics

1. Simple Statistics & Effect Statistics (2 Lectures)
2. Precision of Measurement (1 Lecture + 1 Tutorial)
3. Generalizing to a Population (2 Lectures)
    a. Confidence Limits, Statistical Models
4. Models: Important Details (2 Lectures +1 Tutorial)
    a. Complex Models
5. Repeated-Measures ANOVA (2 Lectures +1 Tutorial)
6. Dimension Reduction (2 Lectures + 1 Tutorial)
    a. Principal Components · Factor Analysis · Cluster Analysis
7. Estimating Sample Size (2 Lectures +1 Tutorial)
8. On the Fly: Miscellaneous (1 Lecture)
9. Simulation for Sample Size (2 Lectures)

Biophysics

1. Introduction: What is biophysics (3 Lectures +1 Tutorial)
2. Basic techniques in life sciences (6 Lectures + 2 Tutorials)
3. Energetics and Thermodynamics (6 Lectures + 2 Tutorials)
    a. reversible and irreversible (6 Lectures + 2 Tutorials)
4. Kinetics & Catalysis mechanisms
    a. (emphasis on enzymes)
5. Structure-function relationship (2 Lectures +1 Tutorial)
6. Models in evolution and agricultural sciences (2 Lectures +1 Tutorial)
7. Recent advances in biophysics (2 Lectures + 1 Tutorial)

a. an overview of Omics and systems biology

Recommended Books:

a) Class notes, handouts
b) Statistics at the Bench: A Step-by-Step Handbook for Biologists by Martina Bremer
c) Introductory Biophysics by V. Pattabhi & N. Gautham
d) Biophysical Chemistry, Part 1, 2, 3. by Cantor & Schimmel
e) Principles of Fluorescence Spectroscopy by J. R. Lacowicz
f) Physical Biochemistry by David Freifelder.
g) Biological Spectroscopy by Iain D. Campbell, Raymond A. Dwek

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

2nd Year, Semester IV

Cell Biology (B204)

Course Title	:	Cell Biology
Course Code	:	B204
Credits	:	Credits – 4
Course Category	:	Core/
Course Prerequisite	:	Successful completion of All 1st year courses B201 (Microbiology), B202 (Biochemistry), B203 (Biophysics and Biostatistics)
Contact Hours (28/42/56) (including tutorials)	:	56

Outcome of the Course:
* Understanding the basic principles governing cell structure and functions
* Biochemcial, biophysical, genetical basis of cell and its response
* Key concepts in maintenance of cell structure
* Evolution of cell organelles, importance in health and disease.

Course Contents:

1. Overview of Cell biology (1 lecture)
2. Universal features of cells (2 lectures + 1 Tutorial)
5. Basic microscopy, Visualization of cell, its fine structure, molecules and different functions (3 lectures)
6. The cell membrane, its structure and its dynamics (2 lectures + 1 Tutorial)
7. Transport across membrane (3 lectures)
8. Ion channels (2 lectures + 1 Tutorial)
9. Cellular compartments and function, protein sorting (3 lectures)
10. Vesicular traffic inside the cells (2 lectures + 1 Tutorial)
11. Mitochondria and chloroplast and their genetic system, fission and fusion of mitochondria

12. Cellular communication and cell signaling (2 lectures + 1 Tutorial)
13. Cytoskeleton of cells, cytoskeleton filaments, molecular motors, cell junction, extra cellular matrix, cell adhesion (5 lectures + 2 Tutorials)
14. Cell cycle, Cell division- Mitosis, meiosis and the mechanism of cell division (2 lectures)
15. Cell biology of nucleus and chromatin (2 lectures + 1 Tutorial)
16. Cell biology of Germ cells, neuronal cells, stem cells, gametes, immune cells (2 lectures + 1 Tutorial)
17. Cell biology of cancer cells (2 lectures + 1 Tutorial)
18. Cell survival and cell death (2 lectures + 1 Tutorial)
19. Cell biology of model organisms and plant cells (2 lectures + 1 Tutorial)
20. Advancement in microscopic techniques (3 lectures + 1 Tutorial)

Recommended Books:
"Molecular biology of the Cell" by Albert et.al

Suggested References:
Important research articles and reviews as suggested in the class by the instructor

Genetics (B205)

Course Title : Genetics
Course Code : B205
Credits : 4 Credits
Course Category : Core
Course Prerequisites : Successful completion of 1st year courses
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding the basic principles of inheritance
- Knowledge of genetic disease mechanism
- Comprehension of monogenic, polygenic and multifactorial diseases
- Application in health and diseases

Course Contents:

1. Overview of Genetics and terminology (1 Lecture)
2. Model Genetic systems (1 Lecture)
3. Mendelian Inheritance (1 Lectures + 1 Tutorial)
4. Deviations from Mendelian Inheritance- Linkage and Sex linked Inheritance, Gene Interactions, Maternal and Extranuclear Inheritance (6 Lectures + 2 Tutorials)
5. Recombination, Recombination mapping and mechanism of recombination (3 lectures + 1 Tutorial)
6. Transposable Elements (3 lectures + 1 Tutorial)
7. Mechanisms of Genetic Diseases- Chromosome number variation, changes in chromosome structure, Gene mutation, mutagenesis and mutant selection, X-chromosome inactivation, Genetic imprinting (6 lectures + 2 Tutorials)
8. Elements of human genetics-genetic disorders, patterns of inheritance, molecular diagnosis (3 lectures + 1 Tutorial)
9. Cytogenetics (2 lectures + 1 Tutorial)
10. Prenatal Diagnosis and Genetic Counseling (3 lectures + 1 Tutorial)
11. Epigenetics (3 lectures + 1 Tutorial)
12. Cancer Genetics (1 lecture)
13. Population Genetics (6 lectures + 2 Tutorials)
14. Developmental Genetics (1 lecture)
15. Immunogenetics (1 lecture)
16. Genes and Evolution (1 lecture + 1 Tutorial)

Recommended Books:
a) “Genetics” by M. W. Strickberger
b) “Principles of Genetics” by E. J. Gardner, M. J. Simmons, D. P. Snudstad
c) “Human Genetics” by A. Gardner, R.T. Howell, and T. Davis

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor.

3rd Year, Semester V

Physiology I (Animal) (B301)

Course Title : Animal Physiology
Course Code : B301
Credits : 4 Credits
Course Category : Core
Course Prerequisites : Cell Biology, Biochemistry
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Learning molecular, chemical and physical principles of animal body plan.
- Understanding structure-function relationships and how various physiological systems work.
- Integrating knowledge to understand health and disease.

Course Contents:

1. Overview of animal anatomy and body plan (3 Lectures + 1 Tutorial)
   - Animal kingdom and classification
   - Relationships between phyla
   - Body plan, symmetry and cavities

2. Fundamentals of animal physiology (3 Lectures + 1 Tutorial)
   - Adaptation
   - Acclimatization, acclimation
   - Conformity and regulation

3. Homeostasis (3 Lectures)
   - *Milieu internae*, Feedback and control systems
   - Feedforward systems
   - Nonpysiological homeostasis

4. Biomembranes & transport across membrane (2 Lectures + 1 Tutorial)
   - Membrane composition, models
   - Transmembrane movement of ions, diffusion, osmosis

5. Membrane potential (2 Lectures + 1 Tutorial)
   - Electrical properties of membrane and resting membrane potential
   - Action potential

6. Neurophysiology (2 Lectures + 1 Tutorial)
   - Neurons and synapses
   - Neurotransmitters: classification and receptors

7. Sensory physiology (3 Lectures + 1 Tutorial)
   - Photoreception, olfaction
   - Taste, hearing

- Mecahnoreception and heat reception

8. Physiology of muscle (4 Lectures + 1 Tutorial)
   - Skeletal muscle and mechanism of contraction
   - Cardiac muscle and mechanism of contraction
   - Smooth muscle and mechanism of contraction

9. Cardiovascular systems or cardiac physiology (2 Lectures + 1 Tutorial)
   - Open and closed circulation
   - Heart: electrical and mechanical properties
   - Regulation of the cardiovascular system

10. Respiratory system across animal phyla & gas exchange (2 Lectures)
    - Lungs and other systems, lung volumes and capacities
    - Regulation of respiration

11. Excretory systems (2 Lectures + 1 Tutorial)
    - Excretory organs in aquatic and terrestrial animals
    - Urine-concentrating mechanisms, countercurrent mechanism

12. Osmoregulation (2 Lectures)
    - Osmotic responses of animals
    - Vertebrate and invertebrate osmoregulation

13. Fluid and acid base balance (3 Lectures + 1 Tutorial)
    - Regulation of acid-base balance by blood buffers, lungs and kidneys.
    - Hormonal and renal regulation of body fluids and electrolyte balance.

14. Digestive system (2 Lectures + 1 Tutorial)
    - Anatomy of the digestive system, variations
    - Digestion and absorption
    - Gastric hormones and reflexes

15. Endocrine system (3 Lectures + 1 Tutorial)
    - Glands, hormones and classification
    - Regulation of endocrine secretion
    - Mechanisms of hormonal action, receptors

16. Reproductive system (2 Lectures + 1 Tutorial)
    - Male and female reproductive systems
    - Fertilization and embryogenesis

17. Lymphatics and immune system (2 Lectures + 1 Tutorial)
    - Lymphatic system: organization and function
    - Organization of immune system

Recommended Books:
"Animal Physiology", Hill R, Wise G A & Anderson M Sinauer.

Suggested References:
Relevant articles from journals.

Physiology II (Plant) (B302)

Course Title : Physiology II (Plant)
Course Code : B302
Credits : 4 Credits
Course Category : Core
Course Prerequisites : Genetics, Cell Biology, Biochemistry
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Entrain the students with different hormone physiology and it's interaction.
- Learning light physiology, transformation and photosynthesis.

Course Contents:

1. Gross anatomy of plants and Plant Cell architecture (3 Lectures + 1 Tutorials)
2. Transpiration (1 Lecture)
3. Mendelian Genetics (1 Lecture)
4. Plant transformation (1 Lectures + 1 Tutorials)
5. Photosynthesis (2 Lectures + 1 Tutorials)
6. Respiration (2 Lectures + 1 Tutorial)
7. Protein trafficking in plants, (1 Lecture)
8. Macromolecular complexes in plants (1 Lecture)
9. Gene expression and transgene Silencing mechanisms in plant (3 Lectures + 1 Tutorial)
10. Phytochrome, Photomorphogenesis (3 Lectures + 2 Tutorials)
11. Cryptochromes, Phtotrophins and UV light responses (3 Lectures + 1 Tutorial)
12. Plant growth regulators: auxins, gibberellins, cytokinins, ethylene abscisic acid (7 Lectures + 2 Tutorials)
13. Plant photoreceptors and light signaling in plants (4 Lectures + 1 Tutorial)
14. Control of flowering time (4 Lectures + 2 Tutorials)
15. Ethylene signaling and fruit ripening (2 Lectures + 1 Tutorial)
16. Stress response in plants (1 Lecture)
17. Plant pathogen interaction, Symbiosis vs. Parasitic (1 Lecture)

18. Leaf Senescence (1 Lecture)

19. Medicinal plants and its importance (1 Lecture)

Recommended Books:

a) “Plant Physiology” by Taiz & Zeiger Sinaue,

b) “Plant Physiology” by Salisbury and Ross

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

<u>Ecology (B303)</u>

Course Title **: Ecology**
Course Code **: B303**
Credits **: 4 credits**
Course Category **: Core**
Course Prerequisite **: Introductory Biology**
Contact Hours (28/42/56) **: 56**
(including tutorials)

Outcomes of the Course:

- Understanding biotic and biotic factors governing the distributions of organisms
- Understanding the biosphere from the viewpoint of organism, population, community and ecosystem
- Understand organismal diversity and functional diversity of organisms in a landscape or ecosystem

Course Contents (with both Lectures + Tutorials marked:

1. General principles (4 Lectures +1 tutorial)
    - Geographical variation in climate on Earth
    - Major ecological patterns in relation to climate
    - Major biomes and their geographic distributions
2. Ecology and Society (3 Lectures +2 tutorials)
    - Human society and environment: past and present
    - History of ecology as a science
    - Relevance of ecology in the modern world
3. Ecology as a quantitative science (4 Lectures +1 tutorial)
    - What are data?
    - How are data collected, summarized and interpreted?
    - Basic statistical techniques used for making inference
    - Computer applications
4. Ecology of populations (3 Lectures + 2 tutorials)
    - Single-species population dynamics under unrestricted resources
    - Single-species population dynamics under limited resources
5. Species interactions (4 Lectures + 1 tutorial)
    - Various types of species interactions
    - Dynamics of two-species competition
    - Multi-species coexistence and the ‘niche’ concept
    - Succession
    - Dynamics of predator-prey interaction
6. Food-webs (3 Lectures + 2 tutorials)
    - Trophic dynamics and energy transfer
    - Interaction between competition and predation

- Trophic cascades

7. Behavioural Ecology (4 Lectures + 1 tutorial)
    - Behaviour and natural selection
    - Behaviour and sexual selection
    - Co-evolution
8. Ecosystems (3 Lectures + 2 tutorials)
    - Material and energy flow
    - Biogeochemical cycles
    - Case study of a grazing ecosystem
9. Biodiversity (4 Lectures +1 tutorial)
    - Different levels of biological diversity
    - How to measure species diversity
    - Threats to biodiversity
    - Principles of Conservation
    - Conservation in practice
10. Global change (4 Lectures +1 tutorial)
    - Various aspects of global change
    - Climate and the earth's geological history
    - Mitigating the effects of ongoing global change: science and policy

11. Field Methods and Field trips (*tentative*) (6 Lectures)

Recommended Books:

a) Ecology-Principles and Applications by *Chapman and Reiss Cambridge*
b) Essentials of Ecology by Townsend C, Begun M and Harper
c) Fundamentals of Ecology *by M. C. Dash*

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

3^{rd} Year, Semester VI

Molecular Biology (B304)

Course Title : Molecular Biology
Course Code : B304
Credits : 4 Credits
Course Category : Core
Course Prerequisites : B101, B102
Contact Hours (28/42/56) : 56

Outcome of the Course:

- Understanding the key components of cell involved in central dogma of molecular biology.
- Understanding of structure-function of genetic material, replication, repair, transcription and translation.

Course Contents:

1. Molecular biology an overview, discovery of DNA as genetic material (2 Lectures)
    - Genes, proteins and function
    - Historic perspectives and identification of DNA as genetic material
    - Central Dogma of Molecular Biology

2. Model organism used in molecular biology (2 Lectures)
    - *Escherichia coli*, *Saccharomyces cerevisiae*, *Caenorhabdits elegans*, *Drosophila melanogaster*, *Danio rerio*, *Arabdiopsis thaliana*, *Mus musculus*,
    - Virus and Tissue culture.

3. Nucleic acid structure and function (4 lectures + 1 tutorial)
    - Structure and components of nucleic acids
    - Chemical and physical properties of nucleic acids
    - Enzymes in DNA topology

4. Chromosome, chromatin structure and function (3 lectures + 1 tutorial)
    - Nucleosome structure
    - Chromatin remodeling complexes
    - Histone code
    - Structural maintenance of chromosome

5. DNA replication (4 lectures + 1 tutorial)
    - Components of DNA replication
    - Regulation of DNA replication
    - End replication problem, teleomere and telomerase

6. Mutations and DNA repair (3 lectures + 1 tutorial)

- Different types of mutations
- Chemical and physical agents of mutation
- Mechanism of mutations
- Repair system, components and their mechanism

7. Recombination and Transposons (4 lectures + 1 tutorial)

- Homologous recombination: Holliday junction and its resolution
- Components of homologous recombination system
- Cre recombinase and its mechanism
- Gene conversion
- Transposable elements
- LINEs and SINEs

8. Transcription and Gene Regulation (8 lectures + 2 tutorial)

- Historic perspective of gene regulation: PaJaMo experiment
- Lac and Trp Operon
- Techniques used in studying transcription: ChIP, foot-printing, yeast two hybrid system
- Architecture of eukaryotic gene regulation machinery
- Transcription factors, activators and repressors
- RNA polymerase in prokaryote and eukaryotes: initiation and elongation
- Transcription termination Rho dependent and Rho independent
- Post transcription RNA processes in eukaryotes Capping; RNA binding proteins; Poly-adenylation; mRNA splicing; Spliceosome complex; regulation at splicing level drosophila sex determination; RNAi; siRNA, miRNA; RISC complexes; RNA degradation and P-body; stress granules

9. Genetic code (4 lectures + 1 tutorial)

- The information problem
- Experimental evidence that genetic code is triplet, identification of different codons, start and stop codon, genetic code table and AA classification,
- The decoding system, necessity of adaptor molecule in translation
- tRNA structure, aminoacyl synthetase mechanism of tRNA charging

10. Protein translation (9 lectures + 3 tutorial)

- Introduction to protein translation apparatus
- Difference between prokaryote and eukaryotic translation initiation
- Cap binding complex, 43S, 48S scanning complex, Kozak consensus sequence and its importance in scanning
- Mechanism of ORF selection, structure-function studies
- Ribonucloproteins involved in translation process, factors involved in and mechanism of elongation cycle, peptidyl transferase reaction,
- Factors involved in and mechanism of translation termination
- Ribosome recycling

- Quality control mechanism in translation: breakage mRNA (tmRNA rescue), nonstop mediated decay, Nonsense mediated decay, antibiotics and toxins useful in translation study.

11. Gene Family and Developmental regulation (2 lectures)

- Evolution of concept of gene, gene families, simple and complex multigene family, gene alteration, gene evolution, regulatory sequences in developmental decisions.

Recommended Books:

1) Molecular Biology of Gene by Watson et.al *Pearson*.

2) Biochemistry, by Voet and Voet.

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Immunology (B305)

Course Title **: Immunology**
Course Code **: B305**
Credits **: 04**
Course Category **: Core**
Course Prerequisite **: Cell Biology, Biochemistry, Animal Physiology, Microbiology, Molecular Biology**
Contact Hours (28/42/56) **: 56**
(including tutorials)

Outcome of the Course:

Understating the basics of the immune system and the immunological processes during infection, tumor progression, inflammation and immunogenic responses of various cases of altered host physiological functions and phenotypes

Course Contents (with both Lectures + Tutorials marked:

1. Overview of the Immune system (3 Lectures + 1 Tutorial)
2. Cells and organs of the immune system (6 Lectures + 2 Tutorials)
3. Innate immunity (3 Lectures + 1 Tutorial)
4. Adaptive immunity (3 Lectures + 1 Tutorial)
5. MHC, Antigen processing & presentation (3 Lectures + 1 Tutorial)
6. Cell mediated Immunity: T cell response and its diversity. (6 Lectures + 2 Tutorials)
7. Humoral Immunity: B cell response and its diversity . (4 Lectures + 2 Tutorials)
8. Cytokines and Chemokines (4 Lectures + 1 Tutorial)
9. Self Non-self immune response (3 Lectures + 1 Tutorial)
10. Altered Immune response and disease pathology: Autoimmunity, Transplantation Immunity, Tumor Immunity, Infection Immunity. (4 Lectures + 2 Tutorials)
11. Translational Immunology: Animal models, Vaccine and Immunotherapy (3 Lectures + 2 Tutorials)

Recommended Books:

Kuby IMMUNOLGY 6th Edition by Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. Publisher: W.H. Freeman

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor

Evolutionary Biology (B306)

Course Title : **Evolutionary Biology**
Course Code : **B306**
Credits : **4 credits**
Course Category : **Core**
Course Prerequisite : **Introductory Biology, Genetics, Molecular Biology**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcomes of the Course:

- Understanding how life originated on the planet
- Understanding the formation of species and underlying genetic diversity
- Understanding biology from an organismal point of view and why some species evolve slowly while others evolve rapidly
- Understanding systematic relationships between organisms using phylogenetic tools

Course Contents (with both Lectures + Tutorials marked:

1. Introduction to evolutionary Biology	(2 Lectures)
2. Classification, Phylogeny & the tree of life	(2 lectures + 1 Tutorial)
3. Patterns of evolution	(2 lectures + 1 Tutorial)
4. Evolution & fossil record	(2 lectures + 1 Tutorial)
5. History of life on earth	(2 lectures)
6. Geography of evolution	(2 lectures + 1 Tutorial)
7. Evolution of biodiversity	(2 lectures)
8. Genetic variation	(2 lectures + 1 Tutorial)
9. Phenotypic variation	(2 lectures)
10. Genetic drift	(2 lectures + 1 Tutorial)
11. Natural selection and adaptation	(2 lectures)
12. Genetic theory of natural selection	(2 lectures + 1 Tutorial)
13. Evolution of phenotypic traits	(2 lectures)
14. Conflict and cooperation	(2 lectures + 1 Tutorial)
15. Species and speciation	(2 lectures)
16. Reproductive success	(2 lectures + 1 Tutorial)
17. Co-evolution- interactions amongst species	(2 lectures)
18. Evolution of genes and genomics	(2 lectures + 1 Tutorial)
19. Evolution and development	(2 lectures)
20. Macroevolution	(2 lectures + 1 Tutorial)
21. Evolution & society	(2 lectures)
22. Human evolution	(2 lectures + 1 Tutorial)

Recommended Books:
a) "Evolution" by *D. J. Futuyma*.

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor.

4^{th} Year, Semester VII

Developmental Biology (B402)

Course Title : Developmental Biology
Course Code : B402
Credits : 4 Credits
Course Category : Core
Course Prerequisites : Genetics, Cell Biology, Molecular Biology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding the principles governing development of an organism from conception to birth.
- Key concepts in maintenance of growth of an organism and aging.
- Implications in Evolution, Health and disease.

Course Contents:

1. Key concepts and techniques (6 Lectures + 2 Tutorials)
    - Principles and excitements of Developmental biology
    - Developmental events and differential gene expression
    - Developmental Genetics - approaches & techniques
    - Cell fate determination in *C. elegans*

2. Early embryonic development (9 Lectures + 3 Tutorials)
    - Gametogenesis
    - Fertilization
    - Cleavage
    - Gastrulation

3. Axial patterning (9 Lectures + 3 Tutorials)
    - Axis formation in Amphibian
    - Anterior posterior patterning in Amphibians
    - Anterior posterior patterning in Drosophila
    - Homeotic gene regulation
    - Early mammalian development
    - Left right patterning

4. Later embryonic development (9 Lectures + 3 Tutorials)
    - Patterning in Central nervous system
    - Ectoderm
    - Mesoderm
    - Endoderm

5. Post embryonic development (6 Lectures + 2 Tutorials)
    - Sex determination in Drosophila, mammals and other species

- Regeneration
- Aging & Senescence

6. Implications of Developmental Biology (3 Lectures + 1 Tutorial)
   - Medical implications
   - Cancer as a developmental disease
   - Environmental regulation and development
   - Developmental mechanisms and evolutionary change

Recommended Books:

a) “Developmental biology” by *Scott Gilbert*
b) “Principles of Development” by *Lewis Wolpert*

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

<u>Bioinformatics (B403)</u>

Course Title : Bioinformatics
Course Code : B403
Credits : 4 Credits
Course Category : Core
Course Prerequisites : Biochemistry, Molecular Biology, Genetics, Biostatistics
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Application of bioinformatics knowledge in understanding relationships at sequence, structure and network-level.
- Demonstration of popularly used bioinformatics tools for research work
- Help understand the patterns of life and rhythms

Course Contents:

1. Introduction to bio-informatics (2 Lectures)
   - Introduction,
   - History and importance
   - Field and scope

2. Databases and Database searching (2 Lecture + 1 demo)
   - Importance, classification
   - Annotation and File formats
   - Demo : NCBI, SWISS-PROT, PDB

3. Locating Coding regions and Gene prediction (3 Lecture)
   - 6-frame translation,
   - parameters governing prokaryotic and eukaryotic translation,
   - Concept, neural networks and its importance in gene prediction as example

4. Alignments (2 Lectures)
   - Significance and importance, types, classification
   - Dot-plot matrix

5. Substitution Matrices (3 Lectures + tutorial)
   - Significance, types,
   - derivation of BLOSUM and PAM
   - Application of Substitution Matrices

6. Algorithms behind pairwise sequence alignments (6 Lecture + 1 demo + 1 tutorial)
   - Dynamic programming,
   - Smith-Watermann,
   - Needleman-Wunsch,
   - Heuristic, BLAST, FastA
   - applications, statistical parameters governing BLAST results

- Demo : database searching using BLAST

7. Multiple sequence alignments (1 Lecture + 1 demo)
   - Importance, progressive sequence alignment, ClustalW, statistical parameters governing clustalW, applications
   - Demo : ClustalW

8. Phylogenetic tree construction and different approaches (5 Lecture + 1 demo)
   - Introduction, importance, classification and parts of tree,
   - predicting number of root and unrooted trees, orthologs and paralogs, transitions and transversions, susbstitutions matrices,
   - different methods to construct phylogenetic tree,
   - Neighbour-Joining (star decomposition method),
   - Bootstrapping
   - Demo : MEGA software

9. Pattern matching/position specific scoring matrices (1 Lecture + 1 demo)
   - Importance of patterns, motifs, deriving PSSM, sequence logo
   - Demo : Prosite, Pfam

10. Structural Bioinformatics (5 Lecture + 2 demo)
   - Introduction to structural bioinformatics and protein structure, Ramachandrean plot
   - Secondary structure prediction and methods
   - Hydropathy plot, helical wheel, signal peptide prediction, transmembrane prediction,
   - Demo :
   - Tertiary structure prediction : RMSD and Homology modelling
   - Demo : Swiss Model and evaluation
   - Concepts related to Drug design : Lipinski Rule of 5 and Molecular docking

11. Systems Biology (4 Lecture + 1 demo)
   - Introduction, need for computers in system biology
   - High-throughput and *omic* approaches, difference and application
   - Graph theory
   - Gene Ontology
   - Demo: KEGG and gene ontology

Text Books (if any):

a) Introduction to bioinformatics – Arthur M. Lesk
b) Bioinformatics – David Mount
c) Essential bioinformatics – Jin Xiong

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

4th Year, Semester – VIII

Biotechniques (B405)

Course Title : **Biotechniques**
Course Code : **B405**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **NIL**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

Basic principle behind the biophysical, and biochemical experiments. Troubleshoot the experiments, interpretation of results, plotting of graphs, design the experiments.

Course Contents (with both Lectures + Tutorials marked:

1. Techniques use in DNA characterization: Construction of genomic & cDNA library; Agarose gel electrophoresis; Northern blotting; Southern blotting; RFLP; AFLP; microarray. (6 Lectures + 2 Tutorials)
2. Techniques use in DNA manipulations: PCR and its application; Restriction digestion; Ligation; Site directed mutagenesis. (3 Lectures + 1 Tutorial)
3. Enzymes used in genetic engineering experiments: DNA polymerases; Ligase; Reverse transcriptase; Restriction endonucleases and other enzymes. (3 Lectures + 1 Tutorial)
4. Techniques use in protein characterization: SDS-Gel electrophoresis; Western blotting; IEF-2D gel electrophoresis; FRET; Co-Immunoprecipitation; CHIP; Protein-ligand interactions and affinity studies by Surface Plasmon resonance; Density gradient separation. (3 Lectures + 1 Tutorial)
5. Spectrophotometry (UV-Vis, CD, Fluorescence). (3 Lectures + 1 Tutorial)
6. Principles of Centrifugation. (3 Lectures + 1 Tutorial)
7. Uses of radioactive isotopes and autoradiography. (3 Lectures + 1 Tutorial)
8. Biophysical techniques: X-ray crystallography; NMR; ORD. (3 Lectures + 1 Tutorial)
9. Principals of chromatography: Ion exchange; Gel filtration; Affinity; Reverse flow; HPLC (6 Lectures + 2 Tutorial)
10. Immunological techniques: Generation of hybridoma and production of Ab; FACS; ELISA. (3 Lectures + 1 Tutorial)
11. Microscopy (light, Fluorescence, UV, Atomic absorption; Confocal). (3 Lectures + 1 Tutorial)
12. Cell culture and developmental biology techniques (FISH); Genetic crosses in model organism. (3 Lectures + 1 Tutorial)

Text Books (if any):

a) “Immunology Laboratory Manual” by Myers and Richard L

b) “Molecular Cloning” by Sambrook and Russel

c) “Genetic Engineering” by Reece

d) “The tools of Biochemistry” by Terrance G. Cooper

e) “Biophysical Chemistry” by Alan Cooper

f) Wilson and Walker’s Principles and Techniques of Biochemistry and Molecular Biology

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

B498 Biology Project Credits-4

<u>4th Year, Semester VIII</u>

B499: Biology Project, Credits-8

<u>5th Year, Semester - XI</u>

B598: Biology Project, Credits – 24

<u>5th Year, Semester - X</u>

B599: Biology Dissertation, Credits –24

Laboratory Courses Integrated-MSc

Revised May 2015

Biology Laboratory (B141)

Course Title : Biology Laboratory
Course Code : B141
Credits : 2 Credits
Course Category : core
Course Prerequisites :
Contact Hours (28/42/56) : 28
(including tutorials)

Outcome of the Course:

- Introduce to students analytical tools/approaches to study biomolecules and cell structure.
- Build basics of experimentation and data recording in biology labs

Course Contents:

1. Diversity of life forms & evolution of body plans using stored specimens and deduction of evolutionary relationship.

2. Preparation of Buffer and titration curve

3. Spectrophotometry: Introduction to Beer-Lambert Law; Demonstration of Beer's law

4. Amino acids: Separation of amino acid and their detection

5. Proteins: Comparison of Bradford assay, Folin-Lowry assay and UV absorption methods for protein estimation

6. Carbohydrates: Benedict's test for reducing sugars

7. Iodine test for polysaccharides

8. Estimation of carbohydrate by Anthrone method

9. Isolation and quantification of DNA by agarose gel electrophoresis

10. Lipids: Separation of lipids by TLC / Paper Chromatography

11. DNA melting/Protein folding

Suggested References:

Relevant resources with updates in knowledge as decided by the Instructor.

Biology Laboratory - II (B142)

Course Title: Biology Laboratory - II
Course Code : B142
Credits : 2 Credits
Course Category : Core
Course Prerequisites: Not applicable
Contact Hours (28/42/56): 28
(including tutorials)

Outcome of the Course:

- Understand a microscope and various staining and microscopic techniques
- Use of microscope to know various stages of cell division in mitosis and meiosis
- Knowledge of the basis of human blood groups (ABO)
- Experimental approaches to study cell growth and differentiation and Gene regulation

Course Contents:

1. Use of microscope [3 lectures]
2. Study of various organelles using staining and microscopic techniques [3 lectures]
[6 lectures + 1 tutorial]
3. Trypan blue exclusion – cell viability assay [3 lectures]
4. Onion root tip as a model to see various stages of cell division [3 lectures]
[6 lectures + 1 tutorial]
5. Cell division: Meiosis [3 lectures]
6. Determination of human blood groups (ABO) Precipitin/Agglutination reaction [3 lectures]
[6 lectures + 1 tutorial]
7. Plant cell growth and differentiation [3 lectures]
8. Gene regulation experiments by using Drosophila mutants [3 lectures]
[6 lectures + 1 tutorial]

Suggested References:

Laboratory hand outs and study material as suggested during the class.

Microbiology Laboratory (B241)

Course Title : Microbiology
Course Code : B201
Credits : 2 Credits
Course Category : Core
Course Prerequisites : None
Contact Hours (28/42/56) : 28
(including tutorials)

Outcome of the Course:

- Culturing of microbes as pure culture, growth disinfection & sterilization.
- Microscopic examination of microbial communities.
- Identification of unknown bacterial cultures
- Antibiotic susceptibility testing.

Course Contents:

1. Culture media preparation, Control of microbial growth disinfection & sterilization.
2. Enrichment and isolation and characterization of pure culture, use of selective and differential media
3. Microscopic examination of fresh culture with different staining procedures
4. Culture dependent analysis of microbial communities
5. Culture independent analysis of microbial communities
6. Identification of genus of unknown bacterial cultures
7. Antibiotic susceptibility testing: (i) Disk diffusion (ii) MIC by tube dilution

Suggested References:

Laboratory hand outs and study material as suggested during the class.

Biochemistry Laboratory (B242)

Course Title : Biochemistry Laboratory
Course Code : B242
Credits : 2 Credits
Course Category : Core
Course Prerequisites : None
Contact Hours (28/42/56) : 28
(including tutorials)

Outcome of the Course:

- Understanding the principles and methodology to isolate, purify, quantitate and separate various biomolecules such as protein, DNA, RNA
- Concept and practical experience about the enzyme kinetics, enzyme activity and effect of temperature and pH

Course Contents:

1. Isolation, Estimation and purification of protein
2. SDS-PAGE
3. Enzyme kinetics (catalase, peroxidase)
4. Isolation of genomic DNA
5. Estimation and quantification of DNA
6. Agarose gel electrophoresis for DNA
7. Isolation of Plasmid DNA
8. Isolation and estimation of RNA
9. Thin layer Chromatography

Recommended Books:

a) Principle and techniques of Biochemistry and Molecular Biology by K. Wilson & J. Walker

b) Introduction to Practical Biochemistry by S. K. Sawhney and Randhir Singh

c) Introduction to Practical Biochemistry by David T. Plummer

Suggested References:

Class notes, handouts and other reading as suggested during the class.

Cell Biology Laboratory (B243)

Course Title	:	Cell Biology Laboratory
Course Code	:	B243
Credits	:	Credits – 2
Course Category	:	Core
Course Prerequisite	:	Successful completion of All 1st year courses B201 (Microbiology), B202 (Biochemistry), B203 (Biophysics and Biostatistics)
Contact Hours (28/42/56) (including tutorials)	:	28

Outcome of the Course:
* Direct exposure to different types of plant and animal cells
* Direct labelling of different cell organelles and visualization.
* Direct exposure to different cell biology related techniques and high-end instruments
* Learning of research methodology and conducting experiments

Course Contents:

1. Staining of haploid and diploid cell nucleus (sperm and mammalian cell)
2. Antibody Staining: Visulatization of Histone, Vimentin, Lamin in mammalian cells
3. Cell splitting and Counting of cells by using haemocytometer (Mammalian cells as model system)
4. Visualisation of Actin and Tubulin cytoskeleton in mammalian cells after stabilization or destabilization of cytoskeleton
5. Visualisation of mitochondria, lysosome and nuclei by Mitotracker Red, Lysotracker Red and DAPI in mammalian cells (with/without treatment with disruptors)
6. Analysis of cell adhesion using mammalian cells (after stabilization or destabilization of cytoskeleton)
7. Analysis of endocytosis and exocytosis in mammalian cells (Using Alexa-labelled Transferrin incorporation assay)
8. Culturing of plant cells and visualization of chloroplast (moss cells as a model system)
9. Image analysis and extracting information from images
10. Visualization of a Fluorescent tagged protein in mammalian cells
11. Visualization of Intracellular Metal concentration fluctuations in real time in Osteoblasts and Osteoclasts

Suggested References:
Class notes, handouts and other reading materials as suggested during the class.

Genetics Laboratory (B244)

Course Title : Genetics Laboratory
Course Code : B244
Credits : 2 Credits
Course Category : Core
Course Prerequisites : Successful completion of 1st year courses
Contact Hours (28/42/56) : 28

Outcome of the Course:

- Understanding the basic principles of inheritance
- Knowledge of basic techniques used in population genetics and cytogenetics

Course Contents:

1. Introduction to a model genetic system: Drosophila and demonstration of laws of inheritance

2. Demonstration of linkage and crossing over through genetic crosses

3. Squash preparation of polytene chromosomes from Drosophila larvae

4. Induction and characterization of insertional mutations in Drosophila

5. Mutation Detection- Sequencing, RFLP, insertion-deletion, VNTR, AFLP

6. Karyotyping of Human chromosomes

7. Banding Techniques

8. Pedigree Analysis

Suggested References:

Laboratory hand outs and study material as suggested during the class.

Plant Physiology Laboratory

Course Title : Plant Physiology Laboratory
Course Code : B342
Credits : 2 Credits
Course Category : Core
Course Prerequisites : Successful completion of 1st year courses
Contact Hours (28/42/56) : 28

Outcome of the Course:

- Train students with tissue culture techniques and plant physiology experiments.
- Aims to bring physiology, biochemistry and molecular biology together.

Course Contents:

1. To study the phenomenon of plasmolysis

2. Measurement of imbibitions

3. Measurement of transpiration by using photometer

4. To compare the rate of photosynthesis under different environmental condition

5. Quantification of pigment content in leaves.

6. Measurement of Chl a fluorescence

7. Isolation and quantification of anthocyanin components in plants.

8. Isolation of chloroplast and observation of absorption spectra

9. Phototropism

10. Genetic control of light signaling: Photoreceptor mutants and Over-expressors

11. Purification of plant nuclei and observation of Phytochrome nuclear complexes in them.

12. Genetic control of Flowering time: mutants in these pathways

Recommended Books:-

a. “Experimental Plant Physiology” by Joseph Arditti and Arnold Dunn

b. “Human Anatomy and Physiology Laboratory Mannual” by Elaine and Blinda

c. Class notes, handouts and other reading materials as suggested during the class.

Molecular Biology Laboratory (B343)

Course Title : Molecular Biology Laboratory
Course Code : B343
Credits : 2 Credits
Course Category : Core
Course Prerequisites : B304 (Molecular Biology)
Contact Hours (28/42/56) : 28

Outcome of the Course:

- Hands on training of techniques used in Molecular biology research
- Understanding the working principles by experimental verification

Course Contents:

1. Preparation of competent cell by $CaCl_2$ method and testing its transformation efficiency. (3 contact hours)
2. Plasmid DNA isolation by alkaline lysis method (3 contact hours)
3. Analysis of DNA gyrase and topoisomerase properties. (2 contact hours)
4. Restriction digestion and cloning of DNA into a given vector. (4 contact hours)
5. To study the importance of the 3` nucleotide of the primer in DNA polymerization (PCR). (2 contact hours)
6. Confirmation of DNA fragment by Southern Hybridization. (8 contact hours)
7. Protein-Protein interaction study by Yeast-two hybridization techniques. (6 contact hours)

Suggested References:

Class notes, handouts and other reading materials as suggested during the class.

Immunology Laboratory (B344)

Course Title : Immunology Laboratory
Course Code : B344
Credits : 02
Course Category : Core
Course Prerequisite : Cell Biology, Animal Physiology, Biochemistry, Microbiology, Molecular Biology, Immunology
Contact Hours (28/42/56) : 28
(including tutorials)

Outcome of the Course: Understating the basic concepts and training of immunological techniques associated to experimentation in the field of immunology

Course Contents:

1. Isolation and characterization of lymphocytes from human blood samples and mouse spleen cells (3 Lectures + 1 Tutorial)

2. Estimation of antigen content by ELISA (3Lectures + 1 Tutorial)
3. Immuno-diffusion (2Lectures + 1 Tutorials)
4. Immuno- fluorescence staining of lymphocytes and cell lines (1Lectures + 1 Tutorial)
5. Flow Cytometric analysis of lymphocytes, cell lines (6Lectures + 2 Tutorials)
6. *In vitro* Immune assay(s) with T cell line, Macrophage cell line and lymphocytes (6Lectures + 2 Tutorials)

Text Books (if any):

Kuby IMMUNOLGY 6th Edition by Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. Publisher: W.H. Freeman

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor

DETAILED SYLLABUS – ELECTIVE COURSES

Principles of Drug Design (B351)

Course Title : **Principles of Drug Design**
Course Code : **B351**
Credits : **4 Credits**
Course Category : **Elective**
Course Prerequisites : **Biochemistry, Cell Biology, Molecular Biology**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- As an interdisciplinary course, the students will be introduced to the different concepts of drug discovery and development.

Course Contents:

1.	Introduction to the Drug Discovery	(4 Lectures + 2 Tutorials)
2.	Source of Drugs	(5 Lectures + 1 Tutorials)
3.	Drug Development	(5 Lectures + 2 Tutorials)
4.	Development of prodrugs	(2 lectures)
5.	Lead Identification and optimization	(3 Lectures + 1 Tutorials)
6.	Pharmacology of drug action	(5 Lectures + 2 Tutorials)
7.	Identification of target for drug discovery	(5 Lectures + 2 Tutorials)
8.	Approaches towards drug design	(5 Lectures + 2 Tutorials)
9.	Drug interactions	(2 lectures)
10.	Computer-aided drug design	(3 Lectures + 1 Tutorials)
11.	High throughput technologies in drug discovery	(3 Lectures + 1 Tutorials)

Recommended Books:

a. Principles of Drug Action: The Basis of Pharmacology. William B. Pratt, Palmer Taylor.

b. High-Throughput Screening in Drug Discovery (Methods and Principles in Medicinal Chemistry). Jörg Hüser, Raimund Mannhold, Hugo Kubinyi, Gerd Folkers.

c. Drug Design: Structure- and Ligand-Based Approaches. Kenneth M. Merz, Dagmar Ringe, Charles H. Reynolds.

d. Burger′s Medicinal Chemistry, Drug Discovery, and Development: 8 Volume Set.

e. Biopharmaeutics and pharmacokinetics – A treatise. Brahmankar DM and Jaiswal SB.

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Endocrinology (B352)

Course Title : **Endocrinology**
Course Code : **B352**
Credits : **4 Credits**
Course Category : **Elective**
Course Prerequisites : **Animal Physiology (B301)**
Contact Hours (including tutorials) : **56**

Outcome of the Course:

- Understanding the concepts of hormones and endocrine regulation.
- Knowledge about the structure and function of different endocrine glands and evolutionary significance.
- Applying the knowledge of endocrine regulation to analyze disorders associates with hormonal imbalance.

Course Contents:

1. Introduction to endocrine glands, hormones and their classification. (2 lectures)

2. Hormone biochemistry, mechanism of hormone synthesis and their transport to target organs or tissues. (3 lectures + 1 Tutorial)

3. Hormone receptors and mechanism of hormone action, Methods of measurement of hormones. (3 Lectures +1 Tutorial)

4. Hypothalamus; Neuroendocrinology: Neurohormones and Neurotransmitters. (6 lectures +2 tutorial)

5. Structure, function, hormones and clinical disorders of following mammalian endocrine glands. Pituitary, Pineal, Adrenal, Thyroid, Parathyroid, Pancreas, Gonads, Gastro intestinal tract, Thymus (9 lectures + 3 Tutorial)

6. Endocrine control of sexual differentiation (3 lectures + 1 Tutorial).

7. Endocrine control of appetite and feeding. (3 lectures + 1 Tutorial)

8. Calcium homeostasis: role of PTH, Vitamin D and calcitonin. (3 lectures + 1 Tutorial)

9. Growth hormone and Insulin like growth factor (IGF) (3 lectures + 2 Tutorial)

10. Important facts of vertebrate endocrinology. (2 lectures)

11. Invertebrate endocrinology. (2 lectures + 1 Tutorial)

12. Environmental endocrinology: endocrine disrupting chemicals (3 lectures + 1 Tutorial).

Text Books (if any)

a) AM Etgen and DW Pfaff (2009): Molecular Mechanisms of Hormone Action on Behaviour. Academic Press, USA

b) Bentley, PJ (1998): Comparative Vertebrate Endocrinology. Cambridge University Press. 3rd Edition

c) Hall J. (2011). Guyton and Hall: Textbook of Medical Physiology, Saunders Publishers, 12th Edition

e) Larsen P., Kronenberg HM, Melmed S, Polonsky KS, Wilson JD, Foster D. (2002) Williams Test Book of Endocrinology. Saunders Publishers, 10th Edition.

Suggested References:

a) Lechan RM and Fekete C. (2010) Neuroendocrine and Metabolic Adaptations in the Central Nervous System that Facilitate Weight Regain. In: Freemark MS (Ed). Pediatric Obesity: Etiology, Pathogenesis and Treatment, Humana Press 2010. Pp 405-421
b) Relevant research/review articles as decided by the Instructor to update the knowledge in the field.

Plant Developmental Biology (B353)

Course Title : Plant Developmental Biology
Course Code : B353
Credits : 4 Credits
Course Category : Core
Course Prerequisites : B302
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Learning molecular genetics approaches to understand plant development.
- Understanding the interaction of biotic and abiotic component is major focus.
- Designing experimental strategies understanding plant development.

Course Contents:

1. Plant Development overview	(1 Lecture)
2. Hormones influencing plant organogenesis and signaling	(7-8 Lectures + 5 Tutorials)
3. Light and plant development and photomorphogenesis	(10 Lectures + 2 Tutorials)
4. Leaf and flower development	(10 Lectures + 2 Tutorials)
5. Circadian clock and plant development	(7-8 Lectures + 2 Tutorials)
6. Epigenetics, siRNA world and plant development	(8 Lecture + 2 Tutorials)

Recommended Books:

a) Plant Physiology Taiz and Zeiger: 5th Ed, 2010, Sinauer Associates Inc. Publishers

b) Plant Biology by Alison M. Smith et al., 2010, Garland Science, Taylor and Francis Gp.
"Research articles"

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

<u>Neurobiology (B354)</u>

Course Title	**: Neurobiology**
Course Code	**: B354**
Credits	**: 4 Credits**
Course Category	**: Elective**
Course Prerequisites	**: Basic cell biology (B204)**
Contact Hours (including tutorials)	**: 56**

Outcome of the Course:

- Understanding the organization of nervous system, structure and function of neuron and glial cells.
- Knowledge about the ion basis of action potential, synapse, neurotransmitter release, neural circuits, and behavior.
- Leaning the key techniques in neuroscience research, organization and evolution of the brain.
- Analyzing the neural basis of behavior and neurological disorders.

Course Contents:

1. Organization of the nervous system (3 Lectures + 1 Tutorial).

2. Introduction to Neurons, the neuron doctrine, components of neurons, types, organization of a neuron, and functions (3 Lectures + 1 Tutorial).

3. Glial cells: structure and function, types, glial neuronal relationship, importance of astrocytes in glutamate uptake and blood-brain barrier, role of tanycytes in the hypothalamus (4 Lectures + 2 Tutorials)

4. Membrane channels, ionic basis of resting potential and action potential (6 Lectures + 2 Tutorials)

5. Neurotransmitters, neurotransmitter receptors, chemical transmission, electrical synapses (4 Lectures + 1 Tutorial)

6. Autonomic nervous system (6 Lectures + 2 Tutorials).

7. Neurobiology of sensory systems: taste, olfaction, vision, auditory perception (4 Lectures + 1 Tutorial)

8. Neuroanatomy of the hypothalamus and neuroendocrine regulation. Central regulation of feeding, appetite, stress and Circadian rhythms, neurobiology of behavior (6 Lectures + 2 Tutorials)

9. Learning and memory, Neurological disorders, Techniques in neuroscience

(6 Lectures + 2 Tutorials)

Text Books (if any):

a) J Hall (2011): Guyton and Hall: Text book of Medical Physiology, Saunders Publishers, 12th Edition.

b) MJ Zigmond, FE Bloom, SC Landis, JL Roberts, LR Squire. (2008). Fundamental Neuroscience. Academic Press.

c) E Kandel, J Schwartz, T Jessell. (2000). Principles of Neural Science. McGraw Hill.

Suggested References:

Relevant research/review articles as decided by the Instructor to update the knowledge in the field.

Structural Biology B306

Course Title : Structural Biology
Course Code : B355
Credits : 4
Course Category : Core/Elective
Course Prerequisite : Basic Biochemistry
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

Understanding the protein structures in modular approach, correlating the structure to function, and deducing the mechanistic models for the functioning, methods for 3D-structure determination, validation of structures

Course Contents (with both Lectures + Tutorials marked:

Prerequisite: Basic understanding of Biochemistry,

1. Introduction to Structural Biology: Scope and definition of Structural Biology. (3 Lectures + 1 Tutorial)
2. Methodologies: (12 Lectures + 4 Tutorials)
3. Macromolecular Structure: Structure of proteins (including protein folding), nucleic acids; membranes, action of other biologically important molecules and molecular assemblies like ribosomes, nucleosomes; functional significance of structure. (14 Lectures + 5 Tutorials)

4. Conformational analysis: Van der Waals radii of atoms (equilibrium separation between non covalently bonded atoms) – contact distance criteria; Noncovalent forces determining biopolymer structure; dispersion; forces; electrostatic interactions; van der Waals interactions; hydrogen bonds; hydrophobic interactions; distortional energies; description of various interactions by potential functions; principles of minimization of conformational energy.
(13 Lectures + 4 Tutorials)

Text Books (if any):

a) "Proteins: structures and molecular properties" by T.E. Creighton

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Cell Biology (B451)

Course Title	**:**	Advanced Cell Biology
Course Code	**:**	B451
Credits	**:**	Credits – 4
Course Category	**:**	Elective
Course Prerequisite	**:**	Successful completion of All 1st year courses B204 (Cell biology) B201 (Microbiology), B202 (Biochemistry), B203 (Biophysics and Biostatistics)
Contact Hours (28/42/56) (including tutorials)	**:**	56

Outcome of the Course:

* Understanding the basic principles governing cell structure and functions
* Biochemcial, biophysical, genetical basis of cell and its response
* Key concepts in maintenance of cell structure
* Evolution of cell organelles, importance in health and disease.
* Importance of ion channels in health and disease, pharmacology and applications
* Advanced knowledge of details of microscopy
* Bridging the gap between theory and research methodology

Course Contents (with both Lectures + Tutorials marked:

A: **Understanding the cell** (7 Lectures + 2 Tutorials)
1) Various cell types as model systems
2) Different sub-cellular structures and their function
3) Ultra structure of subcellular organelles
4) Others

B)Microscopy as tools for understanding cellular structure function (7 Lectures + 2 Tutorials)
1) Biological sample preparation. Difficulties and advancements
2) Various fluorescence proteins and their applications
3) Other fluorescence probes
4) Autofluorescence and its application
5) Others

C) Principle, uniqueness and application of different microscopes (7 Lectures + 2 Tutorials)
1) Fluorescence microscope
2) Phase contrast microscope,
3) DIC microscope
4) Confocal microscope, Spectral detection
5) Total internal reflection fluorescence microscope (TIRF),
6) Electron microscope,
7) Atomic force microscope,
8) Others

D) Application of microscopes (7 Lectures + 2 Tutorials)
1) Live cell imaging difficulties and advantages
2) FLIM application
3) FRET

4) FRAP
5) Photo-activation
6) Metal imaging
7) Others

E) <u>Understanding cellular dynamics</u> (10 Lectures + 3 Tutorials)

a) Cell division
b) Cytoskeletal reorganization, microtubule and actin cytoskeleton
c) Vesicle trafficking and recycling, endocytosis and exocytosis
d) Nuclear dynamics
e) Efflux and influx of ions and others
e) Others

F) <u>Super resolution</u> (4 Lectures + 1 Tutorials)

a) STED
b) PALM
c) STROM
d) Others

Text Books (if any):
Molecular Biology of the Cell: Alberts, Bruce; Johnson, Alexander; Lewis, Julian; Raff, Martin; Roberts, Keith; Walter, Peter, New York and London: Garland Science

Suggested References:
Important research articles and reviews as suggested in the class by the instructor. Nature cell biology, Journal of cell Biology, Journal of cell Science

Genetic Engineering (B452)

Course Title : **Genetic Engineering**
Course Code : **B452**
Credits : **4 Credits**
Course Category : **Elective**
Course Prerequisites : **Molecular Biology, Cell Biology, Genetics**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Understanding the basic principles of Recombinant DNA technology
- Knowledge of various tools and techniques used in genetic engineering
- Applications in the generation of transgenic models

Course Contents:

1. Growth and maintenance of bacterial cultures, bacteriophages plasmids (1 Lecture + 1 Tutorial)
2. Growth and maintenance of animal cells and viruses (2 Lectures)
3. Mutation, mutagenesis and mutant screening (3 Lectures + 1 Tutorial)
4. Enzymes used in genetic engineering experiments, DNA, polymerases, ligase, reverse transcriptase, restriction endonucleases and other enzymes (3 Lectures + 1 Tutorial)
5. Oligonucleotides synthesis & purification (1 Lecture)
6. Antisense DNA/RNA in genetic engineering (2 Lectures + 1 Tutorial)
7. Radiolabelling of nucleic acids (2 Lectures)
8. Transformation & transfection (1 Lecture + 1 Tutorial)
9. Construction of genomic & cDNA library (3 Lectures + 1 Tutorial)
10. Genomic DNA & cDNA cloning (3 Lectures + 1 Tutorial)
11. Analysis of DNA of cloned genes (3 Lectures + 1 Tutorial)
12. Analysis of protein sequencing products & cloned genes (3 Lectures + 1 Tutorial)
13. Nucleic acid & protein sequencing technology (3 Lectures + 1 Tutorial)
14. Protein nucleic interaction and the methods to study those (3 Lectures + 1 Tutorial)
15. Polymerase Chain Reactions, types of PCRs and analysis of PCR, products; Application of PCRs. (3 Lectures + 1 Tutorial)
16. Site directed mutagenesis (1 Lecture)
17. Recombination, site specific recombination (2 Lectures + 1 Tutorial)
18. Transgenic plants (1 Lecture)
19. Transgenic animals (1 Lecture + 1 Tutorial)
20. Other transgenic life forms (1 Lecture)
21. Ethics and economics of GM crops and GM organisms (2 Lectures + 1 Tutorial)

Recommended Books:-

a) “Genetic Engineering” by Reece

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Biochemistry (B453)

Course Title : Advanced Biochemistry
Course Code : B453
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Biochemistry
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding the mechanism of protein folding
- In depth knowledge about Post translational modifications of proteins
- Mechanisms and implications of protein turn over in cells

Course contents:

1. Protein secretion	(8 Lectures + 3 Tutorials)
2. Protein folding: In vivo - In vitro	(8 Lectures + 3 Tutorials)
3. Conditional enzyme kinetics	(10 Lectures + 3 Tutorials)
4. Post translational modification	(8 Lectures + 3 Tutorials)
5. Protein degradation	(8 Lectures + 2 Tutorials)

Recommended Books:

a) Lehninger Principles of Biochemistry, Fourth Edition by David L. Nelson and Michael M. Cox

b) "Fundamentals of Biochemistry" *by Voet and Voet*

c) "Biochemistry" *by JM Berg, JL Tymoozko, L Stryer*

Suggested References:

Journals
Annual review of Biochemistry, Trends in Biochemical Sciences, Other suggested Journal.

Advanced Microbiology

Course Title : Advanced Microbiology
Course Code : B454
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Genetics, Molecular Biology, Immunology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the course:

- Develop understanding of bacterial responses to various stimuli
- Gain insights into bacterial biofilm formation and quorum sensing mechanisms

Course Contents:

1. Molecular microbial genetics (10 Lectures + 4 Tutorials)
2. Molecular medical microbiology: microbial pathogenesis & infectious diseases, study of selected pathogenic organisms with emphasis on recent insights into their mechanism of pathogenesis (10 Lectures + 4 Tutorials)
3. Environmental microbiology (11 Lectures + 4 Tutorials)
4. Microbial interactions: Quorum sensing, Biofilms (11 Lectures + 4 Tutorials)

Recommended Books:

a) Brock's Biology of Microorganisms by Madigan et al.;
b) Fundamental bacterial genetics by Trun & Trumphy;
c) Molecular medical microbiology by Sussman M;
d) Microbiology: diversity, disease and the environment Salyers, AA;
e) Colonization of mucosal surfaces by Nataro JP;
f) Medical microbiology by Murray PR;
g) Environmental microbiology by Maier RM;
h) Environmental microbiology by Varnam, AH;
i) Annual review of microbiology by Gottesman, Susan,
j) Marine microbiology: ecology and applications by Munn, CB

Suggested References:

Journals
Nature Review's Microbiology,
Trends in Microbiology,
Critical Reviews in Microbiology,
PNAS,
Molecular Microbiology,
ASM Journals and others

Enzymology (B455)

Course Title : **Enzymology**
Course Code : **B455**
Credits : **4 Credits**
Course Category : **elective**
Course Prerequisites : **Successful completion of biochemistry course**
Contact Hours (28/42/56) : **56**
(including tutorials)

Outcome of the Course:

- Build comprehension on nature and functioning of enzymes.
- Make students understand kinetics of enzyme mediated reactions and enzyme inhibition kinetics
- Develop basic understanding on enzyme engineering

Course Contents:

1. General properties of enzymes (3 Lectures + 1 Tutorial)
2. Enzyme nomenclature (3 Lectures + 1 Tutorial)
3. Activation energy and reaction coordinates (3 Lectures + 2 Tutorials)
4. Denaturation of Enzyme (3 Lectures + 1 Tutorial)
5. Enzyme purification (4 Lectures + 1 Tutorial)
6. Enzyme kinetics: Michaelis Menten Equation, Line-Weaver Burk plot (4 Lectures + 1 Tutorial)
7. Enzyme catalytic mechanism: Acid-Base catalysis, covalent catalysis, Metal ion catalysis (3 Lectures + 1 Tutorial)
8. Enzymes in food technology (3 Lectures + 1 Tutorial)
9. Immobilization of enzyme, biosensor, Bioreactor (3 Lectures + 1 Tutorial)
10. Structure and function of specific enzymes: Lysozyme, serine protease (3 Lectures + 1 Tutorial)
11. Enzyme inhibition: Competitive inhibition, non-competitive inhibition, uncompetitive inhibition (4 Lectures + 1 Tutorial)
12. Allosteric regulation of enzyme activity: Carbonic anhydrase, Chymotrypsin, ATCase (3 Lectures + 1 Tutorial)
13. Allosteric enzyme inhibition (3 Lectures + 1 Tutorial)

Recommended Books: -

a) “Fundamentals of Biochemistry” *by Voet and Voet*
b) “Biochemistry” *by JM Berg, JL Tymoozko, L Stryer*

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Neurobiology (B456)

Course Title	**: Advanced Neurobiology**
Course Code	**: B456**
Credits	**: 4 Credits**
Course Category	**: Elective**
Course Prerequisites	**: Neurobiology (B354)**
Contact Hours (including tutorials)	**: 56**

Course Outcome:

- Develop understanding about the central nervous system-controlled process and their mechanism of regulation.
- In-depth understanding of the neural circuits and behavior.
- Understand and analyze the recent updates in the field and significance.

Course Contents:

1. Autonomic nervous system and regulation of body functions (6 Lectures + 2 Tutorials)
2. Somatic sensory system and Neurobiology of pain (6 Lectures + 2 Tutorials)
3. Regulation of sleep and wakefulness (3 Lectures + 1 Tutorial)
4. Reproductive brain, sex difference and age-related changes in the brain and neural circuitry (9 Lectures + 3 Tutorials)
5. Neurodegenerative disorders (6 Lectures + 2 Tutorials)
6. Neural basis of learning and memory (3 Lectures + 1 Tutorial)
7. Basal ganglia and the neural control of movement (3 Lectures + 1 Tutorial)
8. Blood supply to the brain and cerebrovascular attack, ventricular system in the brain (3 Lectures + 1 Tutorial)
9. Neuro-immune interaction and nonthyroidal illness syndrome (3 Lectures + 1 Tutorial)

Text book (if any):

a) Zigmond, M.J., Bloom, F.E., Landis, S.C., Roberts, J.L., Squire L.R. (2008) Fundamental Neuroscience. Academic Press.

b) Kandel, E., Schwartz, J., Jessell, T. (2000) Principles of Neural Science. McGraw Hill.

c) Guyton, A. and Hall, J. (2006) Text book of medical physiology. Elsevier

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Chemical Biology (B457)

Course Title : Chemical Biology
Course Code : B457
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Introducing the concept of chemical biology
- Application of chemistry to advance the study of biological systems
- Understanding biology to do new chemistry?
- How is chemical biology used to advance science and human health?
- Understanding chemical structures of bio-molecules
- Comparative understanding of biosynthesis and laboratory synthesis
- Understanding energetics of biochemical pathways and processes
- Be competent in reading and interpreting primary literature in the areas of chemical biology

Course Contents:

- Introduction: (3 Lectures + 1 Tutorial)
  - Structure
  - Chemistry and the Synthesis of Life
  - Central Dogma
  - What is Chemical Biology?
- Proteins and protein folding (6 Lectures + 3 Tutorials)
  - Describe different strategies for the production and isolation of proteins
  - Experimentally determine the physicochemical and functional properties of proteins including laws of photochemistry
  - Analyse and interpret protein sequences and structures and use such information to predict protein function
  - Protein folding--an overview
- Peptide sequencing (6 Lectures + 3 Tutorials)
  - Peptide sequencing, principles and biological databases
  - Pairwise, motifs and domains
  - Mass spectrometric analysis
- Peptide synthesis (6 Lectures + 3 Tutorials)
  - peptide design, synthesis and execution
- Protein synthesis (6 Lectures + 2 Tutorials)
  - genetic code, amino acids, polypeptides
  - nucleotide sequence and mutations

- Natural product synthesis (6 Lectures + 2 Tutorials)
    - Intro, NRPS & PKS
- Nucleic acids and DNA synthesis (2 Lectures + 1 Tutorial)
    - Oligonucleotide synthesis
    - Bioconjugate synthesis
- Molecular Evolution & Chemical Genetics (2 Lectures + 1 Tutorial)
    - classical genetic and chemical genetic procedures, genotype-based and phenotype-based genetic methods
    - explain and contrast how gene expression is controlled by both proteins and small molecules, including regulatory RNA molecules
    - biology and chemistry of RNA
- Protein-protein interactions & proteomics (2 Lectures + 1 Tutorial)
    - introduction, databases
    - principles, methodologies and applications of proteomics and synthetic biology

Suggested reading:

- Blackburn, G.M. & Gait, M.J. Nucleic Acids in Chemistry and Biology. Oxford (1996)
- Branden, C. & Tooze, J. Introduction to Protein Structure.
- Garland (1999) Creighton, T.E. Proteins: Structures and Molecular Properties.
- Freeman (1993) Fersht, A. Structure and Mechanism in Protein Science. Freeman (1999)
- Miller and Tanner (2008). Essentials of Chemical Biology, Wiley

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Virology (B460)

Course Title : Virology
Course Code : B460
Credits : 4 Credits
Course Category : elective
Course Prerequisites :
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

At completion of the course, student is expected to

- comprehend structural organization, and different biological processes of viruses
- Develop basic knowledge of biology and pathological manifestation of few important human and animal viral pathogens
- Develop comprehension of tools and approaches to study viral biology.

Course Contents:

1. Scope and outline of the course, history and introduction to virology (1 lecture)
2. Virus structure and classification: viral genome, capsid and envelope; different classification schemes and ICTV database (4 lectures +1 tutorial)
3. Techniques in virology (2 lectures +1 tutorial)
4. Viral biology: entry to egress (4 lectures +1 tutorial)
5. Virus-host interactions: cell receptors for viral entry, host proteins for replication, translation and processing of viral proteins (3 lectures +1 tutorial)
6. Host cell response to virus infection (2 lectures +1 tutorial)
7. Pathogenesis of viral infection and epidemiology (2 lectures)
8. Cell transformation by viruses (2 lectures +1 tutorial)
9. Vaccines and antiviral drugs (2 lectures +1 tutorial)
10. Use of viruses in gene delivery, molecular biology & as oncolytic agents (2 lectures)
11. Plant viruses and important plant pathogens of relevance to India (1 lecture +1 tutorial)
12. Bacteriophages and insect viruses (2 lectures +1 tutorial)
13. Specific virus families of importance: (13 lectures + 5 tutorials)
    i. Orthomyxoviridae (Influenza virus)
    ii. Paramyxoviridae (Measles, Mumps, New Castle disease viruses and Respiratory syncytial virus)
    iii. Togaviridae/Alphavirus genus (Chikungunya virus)
    iv. Flaviviridae (Dengue, Japanese encephalitis, Tickborne encephalitis, West Nile and Hepatitis C viruses)
    v. Coronaviridae (SARS virus)
    vi. Retroviridae (HIV)
    vii. Papillomaviridae (Human Papilloma viruses)
    viii. Reoviridae (Rotavirus)
    ix. Picornoviridae (common cold and Polio viruses)
    x. Herpesviridae (Herpes Simplex, Chickenpox, Kaposi’s sarcoma and Epstein-Barr viruses)
14. Emerging viruses: SARS, Chikungunya, Dengue, Hendra and Nipah viruses and Crimean-Congo hemorrhagic fever virus (2 lectures)

Reference books:

1. Basic Virology, 3rd edition by Edward K. Wagner, Martinez J. Hewlett, David C. Bloom, David Camerini. Year: 2007; Publisher: Wiley-Blackwell. ISBN: 978-1-4051-4715-6

2. Principles of virology, 3rd edition (vol.1) by S. Jane Flint, Lynn W. Enquist, Vincent R. Racaniello and Anna Marie Skalka. Year: 2008; Publisher:ASM press.ISBN: 978-1-55581-443-4

3. Virology: Molecular Biology and Pathogenesis by Leonard Norkin. Year: 2010; Publisher: ASM press. ISBN: 978-1-55581-453-3

4. Fields Virology, 5th edition. Edited by David. M. Knipe and Peter M. Howley. Year: 2007;Publisher: Lippincott Williams & Wilkins. ISBN/ISSN: 9780781760607

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

Advanced Molecular Biology (B551)

Course Title : Advanced Molecular Biology
Course Code : B551
Credits : 4 Credits
Course Category : Core
Course Prerequisites : B304 (Molecular biology) B205 (Genetics)
Contact Hours (28/42/56) : 56
Outcome of the Course:

Understand the recent advancements in molecular biology, structure-function analysis and regulation. Reading research articles, designing experiment and data analysis.

Course Contents:

1. Signaling pathways and regulation (8 Lectures + 2 Tutorials)

- Translation initiation, translation control in metabolic
- Genetic disorders and development.

2. Importance of cis regulatory elements (8 Lectures + 2 Tutorials)

- mRNA, CAP, 5'UTR, 3'UTR Poly A tail
- IRES structure and function
- trans-acting factors in protein expression, examples of Iron homeostasis.

3. General amino acid control mechanism, translation in developmental decision, GAIT mediated translational silencing, translation silencing by microRNA. (6 Lectures + 2 Tutorials)

4. Yeast mating type switch: Mating type locus, experimental evidence for cis regulatory elements, experimental evidence for transacting factors in mating type switch, donor preference, recombinant enhancers. (7 Lectures + 2 Tutorials)

5. Long term evolution experiment: Evolution of Cit+ function, potentitation of Cit+ function, actualization of Cit+ function, refinement of Cit+ function and molecular mechanism. (5 Lectures + 1Tutorials)

6. Molecular mechanism of PRK action and host-virus evolution. Role of dimerization domain, kinase domain activation independent of dimerization domain, substrate recognition motif, evolutionary pressure on PRK and pox virus pseudosubstrate. (5 Lectures + 1 Tutorials)

7. How do new protein arise: Minimal sequence code for switching protein structure-function, domain rearrangement give rise to new function, horizontal gene transfer between the genome, intergenic region as a potential site for new gene, gene duplication and refinement of its function. (5 Lectures + 1 Tutorials)

Recommended Books:

a) "Molecular Cell Biology" 6th Edition By Lodish
b) "Gene X" By Lewin

c) “Translational Control in Biology and Medicine” By Michael B. Mathews, Nahum Sonenberg, John W.B. Hershey. CSH press
d) “Prokaryotic Gene Expression (Frontiers in Molecular Biology)” Oxford University Press, USA; First edition (July 29, 1999)
e) Class notes and research articles.

Suggested References:

Relevant research articles with updates in knowledge as decided by the Instructor.

<u>**Advanced Immunology**</u>

Course Title : Advanced Immunology
Course Code : B552
Credits : 04
Course Category : Elective
Course Prerequisite : Cell Biology, Animal Physiology, Biochemistry, Microbiology, Molecular Biology, Immunology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

Understating the current concepts of immunological processes associated to infection immunity, tumor immunity, autoimmunity and other immuno-regulatory states of altered host immune system.

Prerequisite: Basic understanding of cell biology, animal physiology, molecular biology, biochemistry, microbiology, immunology

Course Contents:

1. Basics of Immune system: Cells and organs of Immune system; Innate and Adaptive Immune Response (5 Lectures + 1 Tutorial)

2. Humoral and Cell Mediated immune response (6 Lectures + 2 Tutorials)

3. MHC and Antigen presentation (6 Lectures + 2 Tutorials)

4. Cellular interaction in immune system (6 Lectures + 3 Tutorials)

5. Signal transduction in immune system (4 Lectures + 2 Tutorials)

6. Cooperation of Innate and Adaptive immunity (6 Lectures + 2 Tutorials)

7. Immune-regulation (6 Lectures + 2 Tutorials)

8. Translational Immunology: Immuno-therapy and Vaccine strategy for Infection Immunity, Cancer Immunity and regulation of Autoimmunity. (3 Lectures + 2 Tutorials)

Text Books (if any):

a) Kuby IMMUNOLGY 6th Edition by Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. Publisher: W.H. Freeman

b) Cellular and Molecular Immunology by Abul K. Abbas, Andrew H. Lichtman, Shiv Pillai. Publisher: Saunders/Elsevier

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor

Infectious Disease Biology (B553)

Course Title : Infectious Disease Biology
Course Code : B553
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Basic courses in cell biology, immunology and microbiology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Develop understanding infection process, infection epidemiology, host-pathogen interactions and evolution of pathogens

Course Contents:

1. Introductory lectures to IDB – (4 classes + 1 tutorial)
What is infection, what is disease, Microbes Causing Infectious Diseases- bacteria, viruses, fungi, protozoa, helminthes, prions. Present scenario of IDs worldwide. (General lectures based on journals)

2. Host pathogen interactions (6 classes, 2 tutorials)
Host-pathogen relationship, Toxins, Disease establishment, Disease transmission- zoonotic, nosocomial , epidemiology, Molecular Aspects of Host-Pathogen Interactions, Effect of nutrition on infectious diseases, Viruses and cancer

3. Host defense & Immunopathology (5 classes, 2 tutorials)
Microbial Flora of the Healthy Human Host, Natural Resistance and Nonspecific Defense Mechanisms, Basic and Theoretical Aspects of the Immune Response

4. Evolutionary Biology of Infectious Diseases- (6 classes + 2 tutorials)
Emerging, Reemerging and Deliberately introduced infectious diseases, Factors that Contribute to the Emergence of a New Pathogens- role of evolution, ecology, genetics- HGT or LGT, clustered, regularly interspaced, short palindromic repeats (CRISPER), some EIDs and REIDs- malaria, Tb,influenza (SWINE flu), SARS, chikunguniya, HIV, west nile virus, marburg virus, bioterrorism, anthrax, CJD.

5. Bacterial infections- (5 classes, 1 tutorial)
This willfocus on the major bacterial infections. The infections can be considered in groups related to the body systems infected.

6. Viral infections- (5 classes, 2 tutorials)
Molecular biology of the different types of virus, the different strategies that are involved in their replication and the ways in which they cause disease. Consideration is given to the prevention, treatment and control of virus infections.

7. Parasitic infections- (5 classes, 1 tutorial)
Biology of parasites and the ways that they can cause disease. The organisms responsible for the major parasitic diseases will provide the main focus for instruction as they have also been the main focus for research.

8. Molecular Epidemiology and control of infectious diseases (6 classes, 2 tutorials)

Topics include analytic methods, study design, outbreak investigations, surveillance, vaccine development and evaluations, screening, modeling, and infectious causes of cancer or chronic diseases. Background on important infectious diseases will be presented.

Recommended Books:

a) Alcamo's fundamentals of Microbiology by Jeffrey C. Pommerville,
b) General Microbiology by Roger E Stanier et al.,
c) Brock Biology of Microorganisms by Michael T Madigan
d) General Microbiology by Roger Y Stanier et al.
e) Microbiology 5th ed, Michael Z Pelczar Jr.

Suggested References:

Relevant Journals

Cancer Biology (B554)

Course Title : Cancer Biology
Course Code : B554
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Cell Biology, Biochemistry, Molecular Biology, Immunology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Understanding basic molecular and cellular mechanisms of carcinogenesis.
- Integrating knowledge to understand therapeutic approaches.
- Stimulate research interest.

Course Contents:

1. Cancer origin and terminology (3 lectures + 1 tutorial)
   - Molecular and cellular origin of cancer
   - Clonal vs. mutational origin of cancer
   - Stem cells and cancer

2. Different classes of cancers (3 lectures + 1 tutorial)
   - Carcinoma, Sarcoma
   - Leukemia, Lymphoma and myeloma
   - Central nervous system cancers

3. Malignant transformation of cells (6 lectures + 2 tutorials)

   - General causes of cancer, mechanisms
   - Characteristics and phenotypes of cancer cells
   - Process of metastasis and its significance

4. Cancer induction and oncogenes (6 lectures + 2 tutorials)

   - Stages in the development of tumorigenesis: initiation and promotion
   - Tumor-suppressor genes and oncogenes and their differences
   - The connection between oncogenes and proto-oncogenes
   - Cancer stem cells

5. Cellular response to Tumors (6 lectures + 2 tutorials)

   - Signal transductions in cancer, G protein coupled-receptors and secondary messengers
   - Receptor tyrosine kinases and SH2-containing proteins
   - Ras protein and the MAP kinase cascade in the control of cell function and aberrations in cancer
   - Convergence, divergence and crosstalk among different signaling pathways
   - Concept of apoptosis and its role in cancer

6. Tumor Antigens and tumor immunity (6 lectures + 2 tutorials)

- Tumor-specific transplantation antigens (TSTAs) and tumor-associated transplantation antigens (TATAs)
- Tumor induced altered Immune response and immune-suppression.

7. Tumor Evasion mechanism (6 lectures + 2 tutorials)

- Changes in tumor cells
- Alteration in antigen presenting cells
- Dysfunction of host effector cells

8. Cancer Therapy (6 lectures + 2 tutorials)

- Chemotherapy
- Radiation therapy
- Surgery
- Cancer immuno-therapy
- Other treatment methods including targeted therapy

Text Books (if any):

1. “Molecular Biology of the Cell” by Alberts, Bruce; Johnson, Alexander; Lewis, Julian; Raff, Martin; Roberts, Keith; Walter, Peter
2. “Molecular Cell Biology” by Lodish, Harvey; Berk, Arnold; Zipursky, S. Lawrence; Matsudaira, Paul; Baltimore, David; Darnell, James E
3. “The Biology of Cancer” by Weinberg, Robert A

Suggested References:

Relevant articles from cancer journals.

Advanced Genetics (B555)

Course Title : Advanced Genetics
Course Code : B555
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Genetics, Cell Biology, Molecular Biology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Integrating knowledge of Basic genetics, molecular biology and genomics to understand advances in the field of Genetics.
- Stimulate research interest.

Course Contents:

1. Overview of Genetics and terminology (3 lectures + 1 tutorial)

2. Human Genome- Structure, mapping and sequencing (6 lectures + 2 tutorials)

3. Advanced Principles of Inheritance: Genetic variation and heterogeneity, Gene interaction, Polygenic inheritance, Penetrance and expressivity, Epigenetic Inheritance, Genetic Imprinting, Cytoplasmic Inheritance and Maternal Effects (9 lectures + 2 tutorials)

4. Gene Discovery approaches using Model Organisms: Mutant screens and selections, Tools for testing gene function, Mutagenesis and Transgenics (9 lectures + 3 tutorials)

5. Molecular diagnosis of human diseases: Cytogenetics and Molecular cytogenetics, Molecular genetics (6 lectures + 2 tutorials)

6. Identification of genetic component of diseases: Molecular basis of human diseases, Identifying genes for Mendelian traits, Linkage disequilibrium and haplotype analysis, Identifying genes for complex traits (6 lectures + 3 tutorials)

7. Gene therapy (3 lectures + 1 Tutorial)

Text Books (if any):
a)*Concepts of Genetics* (8th Edition) By William S. *Klug*, Michael R. *Cummings*Publisher: Prentice Hall
b)*Human Molecular Genetics* (2nd edition) by Peter Sudbery, published by Pearson/Prentice Hall
c)*Human Genetics* (2nd edition) by A. Gardener and T. Davies Publisher: Scion

Suggested References:
Human Genetics, Clinical Genetics, Nature Genetics, Nature Reviews Genetics

Immune regulation and Infection immunity (B556)

Course Title : Immune Regulation and Infection Immunity
Course Code : B556
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : Cell Biology, Microbiology, Biochemistry, Molecular Biology, Immunology
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Comprehensive understanding on Immune regulation, immune deviation in bacterial, viral and parasitic infections
- Insights in to Translational aspects of Immunology such as vaccines, immunomodulatory agents in infectious as well as autoimmune diseases

Course Contents:

1. Introduction to Infectious Diseases and its worldwide scenario. (3 Lectures + 1 Tutorial)
2. Overview of Host cell immune response (3 Lectures + 1 Tutorial)
3. Outline of immuno- regulatory response and its role in infectious diseases (6 Lectures + 2 Tutorials)
4. Immuno-regulatory response to viral infection (6 Lectures + 2 Tutorials)
5. Immuno-regulatory response to bacterial infection (6 Lectures + 2 Tutorial)
6. Immuno-regulatory response to protozoan infection (6 Lectures + 2 Tutorial)
7. Immuno-regulatory response to helminth infection (6 Lectures + 2 Tutorial)
8. Immuno-therapeutic strategies targeting immuno-regulatory cells in Infectious diseases (6 Lectures + 2 Tutorials)

Suggested Books:

a) Kuby Immunology. Thomas J. Kindt, Richard A. Goldsby, Barbara Anne Osborne, Janis Kuby. W.H. Freeman, 2007
b) Infection and Immunity. Huw Davies, D. H. Davies. Taylor & Francis, 1999

Suggested Journals:

Infection Immunity, Journal of Experimental Medicine, Journal of Infectious Diseases, Immunology Immunotherapy, Nature Medicine, Nature Immunology, Journal of Immunology, Immunity, etc.

Quantitative Biology (B558)

Course Title : Quantitative Biology
Course Code : B558
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : None
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

- Introducing the concepts of mathematics in biology
- Understanding the quantitative aspects of biology
- How is statistics and mathematics required and applied in the field of biology
- Understanding how mathematical models of biology are developed
- Didactic methodology of teaching is used to make the students think more analytically and get oriented to develop problem solving skills in the domain of quantitative biology
- Understanding quantitative biology to do new and more insightful biology

Course Contents:

1. Recent Trends in Biology and Health Research (3 Lectures + 1 Tutorial)
    a. Modern tools of health research
    b. Existing and emerging health and biological problems
2. Modern Biotechnology (6 Lectures + 2 Tutorials)
    a. Recombinant technology and genetic engineering
    b. Application of biotechnology
3. Integrative and Systems Biology (10 Lectures + 2Tutorials)
    a. Comparative understanding of systems and integrative biology
    b. Concepts and high-throughput techniques of systems Biology
    c. Application of and advances in systems biology
4. Quantitative and Non-linear Biology (10 Lectures + 2Tutorials)
    a. Mathematical modelling and applications in Biology
    b. Lotka-Volterra Model
    c. B-Z reaction, population genetics
5. Statistics-Introduction (3 Lectures + 1 Tutorial)
    a. Simple and effect statistics
    b. Correlation and distribution
6. Univariate Analysis (6 Lectures + 2 Tutorials)
    a. Parametric and non-parametric analysis

    b. t-test, ANOVA, MANOVA

7. Multivariate Analysis (4 Lectures + 2 Tutorials)
    a. Classification and grouping
    b. Clustering, PCA, LDA, DCA
8. Sample size and power of calculation (3 Lectures + 1 Tutorial)

Recommended Books:-

a) Class notes, handouts

b) Systems Biology: A Textbook, Edda Klipp (Author), Wolfram Liebermeister (Author), Christoph Wierling (Author), Axel Kowald (Author), Hans Lehrach (Author), Ralf Herwig (Author)

c) Systems Biology: Properties of Reconstructed Networks by Bernhard O. Palsson, University of California, San Diego; ISBN: 9780521859035; DOI: 10.2277/0521859034

d) Statistics at the Bench: A Step-by-Step Handbook for Biologists by Martina Bremer

e) Nonlinear dynamics and chaos:with applications to physics, biology, chemistry, and engineering; Steven Henry Strogatz

Macromolecular Crystallography (B557)

Course Title : Macromolecular Crystallography
Course Code : B557
Credits : 4
Course Category : Core/Elective
Course Prerequisite : Biochemistry
Contact Hours (28/42/56) : 56
(including tutorials)

Outcome of the Course:

Understand theory behind the X-ray diffraction to structure determination. Data collection strategy, processing, interpretation of data statistics, structure solution methods, refinement methods, interpretation of electron density map.

Course Contents (with both Lectures + Tutorials marked:

Introduction to X-ray crystallography, highlights from 54 years of macromolecular crystallography, future directions [1]

Basics of crystals, symmetry and crystal growth: Crystals, Crystal Systems, Crystal Lattice, Symmetry Elements, Point groups, Space groups, Unit cells, asymmetric units, Matrix representation of Symmetry, physical and energetic principles, Strategies and approaches for growing crystals (protein, DNA) [4 lectures + 2 tutorial]

X-ray sources and detectors: Sealed Tube, Rotating Anode, Synchrotron, Point detector, Area detectors, [3 lectures + 1 tutorial]

Theory of X-ray diffraction: Scattering by an Atom, Diffraction from a Crystal: one dimensional, two-dimensional, and three-dimensional array of atoms, Structure Factor, Reciprocal Lattice, Bragg's law, Ewald Sphere, Resolution [6 lectures + tutorial 2]

Theory of Structure factor, Fourier Syntheses and Electron density: The structure factor in exponential, and vector forms, Temperature factor, Fourier series, Fourier transform, Fourier synthesis, electron density equation, Fridel's law, Anomalous scattering [6 lectures + 2 tutorial]

Data collection: Rotation and oscillation theory, Diffractometer theory, Goniometer, Data collection Strategy, Partial and fully recorded reflections, Wide and fine slicing, Blind region, Total range of data collection, interpretation of diffraction images, Cryo data, Single/Multiple wavelength anomalous dispersion data collection [6, lectures + 2 tutorial]

Data Indexing, integration, scaling (Data reduction), and statistics: Indexing,Integration, Theory of Lorentz and Polarization corrections, Scaling, R-factors, I/sigma (I), completeness, X-ray data quality indicators, Space Group determination [6, lectures + 2 tutorial]

Electron density maps, Refinement and Model building: Difference Fourier map, locating heavy atoms, and anomalous scatter, locating water, ligand molecules, Refinement at atomic resolution: Refinement by Fourier syntheses, Series termination, Locating Hydrogen atoms, Optimization methods, Least-square refinement, full matrix solution, Maximum likelihood, Target function for refinement, Bulk solvent, A prior knowledge, Restrains and Constrains, Non-crystallographic symmetry, Cross-validation, R-factors (Rwork & Rfree) Density modification, Good practice for refinement [10 lectures + 4 tutorial]

Text Books (if any):

X-ray structure determination, a practical guide edited by G. H. Stout and L. H. Jensen ISBN-10: 0471607118

Internal tables for crystallography Vol. F Crystallography of biological macromolecules

Internal tables for crystallography Vol. A Space Group Symmetry

Crystallization of Biological Macromolecules by Alexander MacPherson ISBN-13: 978-0879695279

An introduction to X-ray Crystallography M.M. Woolfson

Biomolecular Crystallography by Bernard Rupp ISBN-13: 978-0815340812

Internal tables for crystallography Vol. F Crystallography of biological macromolecules

Original research articles and reviews for each topic will be provided in the classes

Fundamentals of crystallography” by Giacovazzo,

<u>Ion Channels (B559)</u>

Course Title	**:**	Ion channels
Course Code	**:**	B559
Credits	**:**	Credits – 4
Course Category	**:**	Elective
Course Prerequisite	**:**	Successful completion of All 1st year courses B202 (Biochemistry), B203 (Biophysics and Biostatistics) B204 (Cell biology) B354 (Neurobiology)
Contact Hours (28/42/56) (including tutorials)	**:**	56

Outcome of the Course:
* Understanding the principles governing ion channel functions
* Biochemcial, biophysical, genetical basis of ion channel and its response
* Key concepts in maintenance of ion channel structure, function and ionic homeostasis of the cell
* Importance of ion channels in health and disease, pharmacology and applications
* Advanced knowledge of details of microscopy
* Bridging the gap between theory and research methodology

Course Contents (with both Lectures + Tutorials marked:

1. Introduction to different ion channels (3 Lectures +1 Tutorial)
(Difference between ion channels with pumps and carriers, ion channels in prokaryotes, Fungus, animal and plant systems, selective and non-selective ion channels)

2. Expression of different ion channels in different systems. (3 Lectures +1 Tutorial)
(Why channel expression are specific in certain tissues, Examples: neurons, sperm, bones, keratinocytes, immune cells, retina, pancreas, cardiac muscle, other specific tissues, Pharmacological advantages/disadvantages of expression, useful systems to study ion channels)

3. Importance of ion channels in evolution (3 Lectures +1 Tutorial)
(Evolution of different structural parts such as transmembrane regions, cytosolic domains, loop regions, ligand binding regions, voltage-sensor regions, selection pressure on the ion channels, ion channels and toxins: Pray predator relationship, ion channels and environmental cues, ion channels in reproduction)

4. Structural and functional uniqueness of ion channels (6 Lectures +2 Tutorials)
(Q10 values, thermodynamic properties behind channel opening and closing, conformational changes, ionic filter, voltage gating, ligand gating, voltage sensor, examples of high-resolution ion channel structures)

5. Organization in membranous environment, effect of lipid bilayer and specific lipids on ionic functions (3 Lectures +1 Tutorial)
(Need of specific lipid microenvironments for proper channel functions)

6. Different types of ion channels (6 Lectures +2 Tutorials)

(Different anion and cation channels, basics of Na+, K+, Cl-, Ca^{2+}, transport of other heavy metals)

7. Heteromeric and homomeric ion channels (3 Lectures +1 Tutorials)
(Organization of different polypeptides)

8. How natural and synthetic activators and inhibitors modulate ion channels. (3 Lectures + 1 Tutorials)
(Importance of different metabolites, Chemistry and pharmacology of different activators and inhibitors, effect on metabolism)

9. Measuring ionic conductivity by electrophysiology and imaging (3 Lectures + 1 Tutorial)
(Electrophysiological parameters and methods to analyze channel function, different types of channel recording, Cell biological parameters and methods to analyze channel function, metal imaging and different sensors)

10. Trafficking of ion channels (3 Lectures + 1 Tutorial)
(Different modes of trafficking of ion channels to ER to Golgi, Golgi to plasma membrane, to Lysosomes, Other organelles, prerequisites for such trafficking)

11. Channelopathy and human diseases, potential remedy (6 Lectures + 2 Tutorials)
(Genetic variations in ion channel sequences, information from recent genome sequencing data sets, penetrance effect of mutations)

Text Books (if any): Principles of biochemistry, Channels journal, other journals, distributed hand outs, notes, specific reviews and papers.

Suggested References: Important research articles and reviews as suggested in the class by the instructor

Concepts in Mechanobiology (B561)

Course Title : Concepts in Mechanobiology
Course Code : B561
Credits : 4 Credits
Course Category : Elective
Course Prerequisites : None
Contact Hours (28/42/56): 56
(including tutorials)

Outcome of the Course:

- Comprehend the concept that cells are complex micron-sized machines/ nano-machines.
- Understanding of the mechanical behavior of cell and tissues and the biological responses of these biological systems to mechanical stimuli.
- Gain knowledge on how cells generate and sustain mechanical forces within their environment, as part of their normal physiology.
- Ability to visualize that cells are active materials that can detect mechanical stimulation by the activation of mechanosensitive signaling pathways, and respond to physical cues through cytoskeletal re-organization and force generation
- Competence in reading and interpretation of primary literature in the area of mechanobiology and address research questions relating to cell processes using mechanobiological approaches.
- Enable students of disciplines other than biology to understand how principles of mechanics and engineering can be applied to biological systems and problems.

Course Contents:

Curriculum: (3 lectures [L] + 1 tutorial [T] per week)

Introduction
1. Mechanical framework for understanding biological systems
2. Cell mechanics in basic cellular and pathological processes.

[1 lecture]

Cell architecture
2. Cytoskeletal structure and dynamics

[2 lectures]

Cell mechanics
Basics of Mechanics
Viscoelasticity / basic rheology

[3 lectures + 1 tutorial]

3. Mechanics of cell membrane
4. Mechanics of cellular polymers
5. Controlling Cell and nuclear Morphology

[3 lectures + 1 tutorial]

6. Polymers Networks
7. Molecular motors
8. Tensegrity

[3 lectures + 1 tutorial]

9. Foams

10. Soft Glassy Material
11. Biphasic models of cells

[3 lectures + 1 tutorial]

[Total = 12 lectures + 4 tutorials]

Mechanosensing and Mechanotransduction
12. Mechanical Signals
13. Mechanosensing organelles and structures

[3 lectures + 1 tutorial]

14. Mechanics of receptor binding
15. Intracellular signaling
16. Mechano-chemical coupling

[3 lectures + 1 tutorial]

17. Cellular interactions with biomaterials
18. Mechanical regulation of cell fate

[3 lectures + 1 tutorial]
[Total = 9 lectures + 3 tutorials]

Mechanics of cell proliferation
19. Cytokinesis

[2 lectures]

20. Cancer cells and stem cells

[2 lectures]

21. Apoptosis

[2 lectures]
[Total = 6 lectures + 2 tutorials]

Mechanics of cell adhesion & migration
22. Adhesion proteins
23. Cytoskeletal structures & Forces

[3 lectures + 1 tutorial]

24. Molecular motors
25. Extracellular matrix mechanics

Mechanobiology in tissue engineering - Biomimetics and Cell-like Materials

[3 lectures + 1 tutorial]
[Total = 6 lectures + 2 tutorials]

Mechanical testing of cells
26. instrumentation tools used for mechanical characterization of cells – Microneedles, Micropipette Aspiration, Atomic Force Microscopy, Microrheology, Magnetic Twisting Cytometry, Optical Tweezers, Traction Force Microscopy, Nanofabrication – introduce to MEMS tools, Microfluidics & Lab-on-chip concepts.

[Total = 6 lectures + 2 tutorials]

Other relevant research articles and lecture material will be made available by the instructor during the course from time to time.

Molecular errors in disease pathogenesis (B562)

Course Title : **Molecular errors in disease pathogenesis**
Course Code : **B562**
Credits : **4 Credits**
Course Category : **Elective**
Course Prerequisites : **Basic knowledge of Biochemistry, Genetics, Molecular Biology and Cell biology. Having taken some of the biology core courses of SBS will be advantageous**
Contact Hours (28/42/56) : **56 (including tutorials)**

Outcome of the Course:

- Understanding the concepts of molecular pathogenesis.
- Basic understanding of the common pathologies of organ systems.
- Understanding of the recent advances in molecular explanation for such pathologies.

Course Contents:

1. General introduction to concepts of molecular pathogenesis (3 Lectures + 1 Tutorial)

2. Cardiovascular system (6 Lectures + 2 Tutorials)
   - Heart failure
   - Genetic cardiac diseases
   - Cholesterol metabolism and vascular diseases
   - Sudden cardiac death
   - Gender and cardiovascular system diseases

3. Respiratory system (3 Lectures + 1 Tutorial)
   - Novel pathways in pathogenesis of asthma
   - Cell signalling in asthma
   - Chronic Obstructive Pulmonary Disease
   - Lung matrix remodelling disorders

4. Infectious diseases (3 Lectures + 1 Tutorial)
   - Anti-malarial resistance
   - General vaccine strategies
   - Vaccine development against malaria
   - HIV, SARS, Dengue pathogenesis
   - Biofilms and chronic bacterial infections
   - Quorum sensing, its pharmacological inhibition and quorum sensing as an intervention target
   - Bacterial vaccines
   - Puzzles in sepsis pathogenesis

5. Oncology (3 Lectures + 1 Tutorial)
   - Oncogenes
   - Tumour suppressors
   - Specific example cancers

- Receptor Tyrosine kinases in cancer
- Cellular stress and cancer
- Integrins, Cadherins, Catenins,
- Polarity and cancer
- Relationship between cellular senescence and cancer
- Cancer vaccines

6. Neurological diseases (3 Lectures + 1 Tutorial)
   - Pathogenesis of neuro-degenerative disorders
   - Ageing
   - Mitochondrial dysfunction
   - Oxidative stress and neuro-degeneration
   - Genetics of psychiatric disorders eg. Schizophrenia

7. Genetics (3Lectures + 1Tutorial)
   - Complex genetic diseases
   - Gene therapy
   - Human embryonic stem cell applications, associated issues and debates

8. Ageing and Regeneration (6 Lectures + 2 Tutorials)
   - Pathophysiology of tissue ageing
   - Cellular reprogramming
   - Regeneration of □ cells

9. Haematology (3 Lectures + 1 Tutorial)
   - Genomics and proteomics of blood cells in disease
   - Platelets, inflammation and atherosclerosis, thromboses
   - Issues associated with cord blood banking

10. Endocrinology (3 Lectures + 1 Tutorial)
    - Diabetes mellitus pathogenesis
    - Cell biology and signalling
    - Islet transplantation
    - Gestational diabetes
    - Metabolic syndrome.

11. Musculoskeletal system (3 Lectures + 1 Tutorial)
    - Osteoporosis
    - Menopause and bone metabolism
    - Muscle dystrophies
    - Stem cells in muscle degeneration

12. Summary discussions (3 Lectures + 1 Tutorial)
    - Analyses and review of future perspectives in the field of molecular pathogenesis

Text Books (if any):

a) Introduction to Molecular Medicine, by Dennis W. Ross (ISBN 0-387-95372-8)

b) Principles of Molecular Medicine, by M. S. Runge and C. Patterson

c) Robbins and Cotran Pathologic basis of disease

Suggested References:
Instructor notes, additional reading suggestions and relevant URLs will be provided to the students during the course of the classes. Instructor will be available for individual meetings when required.

Translational Control in Biology (B563)

Course Title **: Translational Control in Biology**
Course Code **: B563**
Credits **: 4 Credits**
Course Category **: Core**
Course Prerequisites **: B304 (Molecular biology) B205 (Genetics)**
Contact Hours (28/42/56) **: 56**

Outcome of the Course:

This course is design to understand the recent advancements in the fundamentals of protein translation and its control. Translation is a fundamental step in the central dogma of molecular biology. The regulation of translation is key to all basic cellular processes. Metabolic pathways, signaling, developmental decisions are tightly linked with the regulation of translation. Any defects associated with this process and its repercussion in cancer, metabolic disorders and human diseases will be covered.

Course contents:

1) Recent advances in the general translation (structure-function and genetics). (6 lectures + 2 tutorial)

2) IRES elements and control of viral translation. (3 lectures)

3) IRES elements in cellular translation control. (3 lectures + 1 tutorial)

4) Cis-acting element and trans-activing factors in translation regulation (3 lectures + 1 tutorial)

5) Role of microRNA in translation control. (3 lectures)

6) Signaling in translation. (3 lectures + 1 tutorial)

7) Role of eIF2α kinase in translational control. (3 lectures + 1 tutorial)

8) Translational control in cancer development. (3 lectures + 1 tutorial)

9) Translational control during apoptosis. (3 lectures)

10) Translational control in metabolic disorder. (3 lectures + 1 tutorial)

11) Translational control in synaptic plasticity, memory and learning. (3 lectures)

12) Translational control in development. (3 lectures)

13) mRNA localization and turnover. (3 lectures + 1 tutorial)

14) Mitochondrial translation and human diseases. (3 lectures + 1 tutorial)

Recommended reading:

1) Translational control in Biology and Medicine (Mathews, Sonenberg, Hershey, CSHL press)

2) Translational control in gene expression (Sonenberg, Hershey, Mathews, CSHL press)

3) Class notes and research articles

Suggested References:
Relevant research articles with updates in knowledge as decided by the Instructor

SEM-I V			**2 Electives**

Economics

H101:Course title: Introduction to Economics

Instructor/Proposed by: Dr Amarendra Das

Prerequisite: None

Course Content:

1. Role of Government in Organised Society [1 class]
2. Expenditure Obligation of Union, State and Local Government [2 classes]
3. Sources of Revenue for Union, State and Local Governments [4 Classes]
4. Concepts of Budget, and Different deficits [1 class]
5. Channels of Resource Transfer from Union to State Governments [2, classes]
6. Balance of Payment [3 classes]
7. Laws of Demand and Supply [3 classes]
8. Equilibrium Price Determination [1 class]
9. Exchange rate Determination [2 classes]
10. Consumer's Equilibrium [2 classes]
11. Producer's Equilibrium [2 classes]
12. Current Economic events [3 classes]

Government of India (2017) Economic Survey-2016-17

H201: Environmental Economics and Environmental Impact Assessment
Instructor/Proposed by: Dr Amarendra Das
Prerequisite: None

Course Content:

12. Definition of Environmental Economics, Ecological Economics and Natural Resource Economics [1 class]
13. Key environmental problems faced by humanity [2 classes]
14. Limits to Growth [2 classes]
15. Sustainable Development: Strong and weak sustainability [2 classes]
16. Indicators of sustainability [1 class]
17. Market Failure: Causes and Remedies [3 classes]
18. Perspective on Environmental Policy/Regulation [2 classes]
19. Informal Regulation [1 class]
20. Population, Poverty and Economic Growth [1 class]
21. Climate Change, Causes and Consequences [2 classes]
22. Principles of using Renewable resources [2 classes]
23. Principles of using Non-renewable resources [2 classes]
24. Environmental Kuznets Curve [2 classes]
25. Mainstreaming of Environment [2 classes}
26. Environmental Impact Assessment [2 classes}
27. Environmental Regulations in India [1 class]
28. Green Accounting, Concepts, Integrated Economic and Environmental
29. Accounting [2 classes]

H109: Technical Communication I

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **Ideations of Science** (4 classes)
   Categorization and social perspective.

2. **Inscription and the material arts** (4 classes)
   Scientific representation and the figural social.

3. **Mechanics of Writing** (6 classes)
   Structure and compositional logic

4. **The Rhetorical Process** (6 classes)
   Building the argument

5. **Cultural Context and the Sciences** (4 classes)
   Literature and the aesthetic of science.

H110: Technical Communication II

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **The logic of Critique** (4 classes)
   Notions of evidence, proof and fact.

2. **Humanities and empiricism** (4 classes)
   Empirical fallacy and social intervention.

3. **Mechanics of Writing II** (6 classes)
   The forms of knowledge production. Understanding readership.

4. **The Rhetorical Process II** (6 classes)
   Staging the argument. Perspective and Institutional / Disciplinary norms.

5. **Narrativizing the Sciences** (4 classes)
   Scientific correspondence and reflections. Popular science and Science fiction.

Psychology

H 225: Introduction to Psychology

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. Introduction: perspectives, methods, issues.	(3 classes)
2. Perceptual Process.	(4 classes)
3. Learning Process	(3 classes)
4. Memory	(2 classes)
5. Intelligence	(2 classes)
6. Emotion	(2 classes)
7. Personality	(4 classes)
8. Motivation	(4 classes)
9. Attitude	(3 classes)

H 226: Applied Behavioural Science

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. Introduction: Personality	(1 class)
2. Interpersonal Relationship and Personal Effectiveness	(5 classes)
3. Social Perception: errors, biases, impression management	(3 classes)
4. Emotional Intelligence: managing emotions.	(3 classes)
5. Group and Team Dynamics.	(5 classes)
6. Effective Communication.	(4 classes)
7. Values and Value System	(3 lectures)
8. Stress: coping and managing stress	(4 classes)

References

Organizational Behaviour by Stephen Robbins, 11th edn, Prentice-Hall India

Handouts will be given as and when required.

H 227: Organizational Behaviour

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. **Introduction to Organizational Behaviour** (2 classes)
   Nature of Organizations, what is OB, contributing disciplines, Functions, role and skills of a manager, environmental challenges.
2. **Individual Decision-making process** (3classes)
   Rational decision-making, creativity, bounded rationality, errors and biases, constraints, ethics in decision-making.
3. **Work attitudes** (2 classes)
   Job satisfaction, job involvement, organizational commitment, cognitive dissonance theory.
4. **Motivation** (3 classes)
   Hierarchy of needs theory, two factor theory, ERG theory, equity theory, goal setting and expectancy theory, MBO in practice, other applications.
5. **Power and Politics** (3 classes)
   Bases of power, the general dependency postulate.
6. **Leadership** (3 classes)
   Behavioural theories, contingency theories, contemporary theories, issues in leadership studies.
7. **Groups and team dynamics** (3 classes)
   Stages of group development, group structure, group decision-making, Types of teams, creating effective teams.
8. **Conflict and conflict resolution** (2 classes)
   Functional and dysfunctional conflict, the conflict process, negotiation.
9. **Organizational Structure** (2 classes)
   Elements of organizational structure, common organizational designs, why do structures differ?
10. **Organizational Culture** (2 classes)
    Functions of culture, creating and sustaining culture.
11. **Organizational Change** (3 classes)
    Forces for change, resistance to change, approaches to managing planned change.

Sociology

H 237: Science Communication & the Citizenship

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course content:

1. Introduction, citizenship and Science (4 classes)
2. Science in public, the public understanding of science (4 classes)
3. Public engagement with science (5 classes)
4. Science, communication, ethical codes & scientific norms (4 classes)
5. Patents and dissemination of scientific knowledge (4 classes)
6. Science communication in age of innovation (4 classes)

H 238: Life &Community in Urban world

Proposed by: Debashis Pattanaik

Prerequisite: None

Course content:

1. Introduction, urban space and urban thought, urbanization (4 classes)
2. Emergence and evolution of cities (4 classes)
3. Urban life, urban communities (online and offline) (4 classes)
4. The city in context, migration, sorting and niches (4 classes)
5. Markets and networks (5 classes)
6. Urban ecology, suburbia, urban design, policy and planning (4 classes)

H239: Introduction to Innovation System

By: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course Content:

1. Nature of innovation (4 classes)
2. The innovative firm (2 classes)
3. Innovation processes (4 classes)
4. Regional innovation system (3 classes)
5. Innovation and IPR (4 classes)
6. Education, universities and national innovation system (2 classes)
7. Multinational enterprises and innovation processes (2 classes)
8. Science and innovation policy (4 classes)

H 133: Introduction to Sociology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Origin and Growth of Sociology (2 Lectures)

    Origin and development of sociology as a separate discipline,
    Nature and Scope of Sociology,
    Sociology as a Scientific Discipline.

2. Sociological Perspectives (2 Lectures)

    Conflict, Functionalism and Interactionsim

3. Basic Sociological Concepts (6 Lectures)

Society, Community, Association, Institution, Status and Role, Types of Society: From early hunting gathering to industrial development and globalization, Culture: Components of culture; Norms, values, folkways, mores, Cultural unity and diversity.

Socialization: Agents of Socialization, Early development of infant, stages of socialization

4. Social Groups (4 Lectures)

Meaning of Social Groups and Types: Primary Group, Secondary Group, In-Groups, Out- Group, Quasi- Group, Reference Group

5. Structure and Stratification (4 Lectures)

Structure, System and Function, caste and class and Racial and Ethnic group inequalities Social Stratification: Meaning and Types, Functionalist and Conflict Perspectives of Stratification, Social mobility: Meaning, horizontal and vertical mobility

6. Social Institutions (4 Lectures)

Family, marriage and kinship, religion, economy, polity and education. Functionalist and Conflict Perspectives of institutions.

7. Social processes and Change (4 Lectures)

Social Processes: Co-operation, accommodation, integration, competition and conflict;

Social Change: Meaning and Definition, Factors of change.

8. Social Problems and Social Control (2 Lectures)

Social Problems and Social disorganization

Social control : Meaning and Types

H 235: Sociology of Science and Technology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Social significance of science and technology (4 Lectures)
   a. Contextual nature of science
   b. Scientist as Indexical and Analogical reasoner
2. Robert Merton's approach to science (3 Lectures)
   a. Ethos of science;
   b. Thomas Theorem and Matthew Effect
3. Perspectives on scientific knowledge (8 Lectures)
   a. Karl Marx, Emile Durkheim, Karl Manheim's sociology of knowledge,
   b. Thomas Kuhn's structures of scientific revolutions
   c. Karl Popper's theory of falsification
4. Recent trends in Sociology of Science (8 Lectures)
   a. Science and technology in developing and developed countries,
   b. Indian context,
   c. Information Technology and globalization,
   d. Manuel Castell's network society, internet and social inequality
5. Case Study Discussions (4 Lectures)

H 236: Perspectives on Indian Society

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content:

1. Indian Social Structure (2 Lectures)
    - a- Traditional Social Organizations
    - b- Culture and Tradition
2. Caste System and Class Structure (7 Lectures)
    - a- Cultural and Structural Views about Caste System
    - b- Inequality, Differentiation and Hierarchy
    - c- Dominant Caste, Sanskritization
    - d- Change and Persistence of Caste system in Modern India
    - e- Caste in Indian Politics
    - f- Backward Caste Movements
    - g- Social Backwardness and Social Justice
3. Class Structure (3 Lectures)
    - a- Class Structure in India
    - b- Agrarian and Industrial Class Structure
    - c- Emergence of Middle Class and Elites
4. Social Institutions: Marriage, Kinship and Family (2 Lectures)
5. Rural and Urban Social Structure: Poverty, Unemployment, etc. (2 Lectures)

6. Changing faces of Rural society/economy/market, Green revolution (2 Lectures)

6. Political processes: Political system and Governance (2 Lectures)

7. Education (2 Lectures)

8. Religion and Society (2 Lectures)

9. Social Change and Development Sustainable and Inclusive (2 Lectures)
   Development, Basic developmental issues: Health, Education and Livelihood

10. Contemporary Social Issues (2 Lectures)

SCHOOL OF COMPUTER SCIENCES

A proposal for minor in Computer Science

1 Structure of the curriculum

The curriculum is divided in two category of courses, core courses and optional courses.

1.1 Core Courses

The following courses have been recommended by the steering committee as core courses. The Programming and Data Structure course are proposed to be two lab courses (2 credit each).

1. CS141 and CS142: Programming and Data Structures Lab
2. CS201: Theory of Computation
3. CS202: Discrete Structures and Computation[1]
4. CS301: Design and Analysis of Algorithms

1.2 Elective Courses

For the initial years, we shall offer the following optional courses. A student has to do three courses from the following list to obtain minor.

- CS451: Modern Cryptology
- CS452: Algorithmic Coding Theory
- CS453: Complexity Theory
- CS454: Linear Programming and Combinatorial Optimization
- CS455: Distributed Network Algorithms

In future, more elective courses will be offered based on the interests of the faculties.

1.3 Similarity with other courses

School of Mathematical Sciences offer some courses which are similar to the courses listed above. We make the following observations regarding this.

- Programming and Data Structure course can be merged with the existing Computational Laboratory courses (M141 and M142). I141 and I142 are the two lab courses, which may be offered instead of M141 and M142. The major difference in syllabus is the inclusion of different data structures which are core concepts in Computer Science.

[1] This course was originally titled Discrete Mathematics for Computer Science. We have renamed the course to capture the spectrum of the topics covered, and to avoid any confusion.

- School of Mathematical Sciences also offer Algorithms, Theory of Computation, Cryptology, Information and Coding Theory as PG optional courses. However, in Computer Science, Algorithms and Theory of Computation are fundamental courses, and need to be offered to the undergraduate students. The syllabus of Modern Cryptology, as well as Algorithmic Coding Theory has been designed from Computer Science point of view and significantly different from the SMS courses.

  However, to avoid repetition, we propose, students who take M462 (Cryptology) and M464 (Information and Coding Theory) will not be allowed to take CS451 (Modern Cryptology), and CS452 (Algorithmic Coding Theory) respectively.

2 Syllabi

Syllabi of the courses are given in the following pages. For each subject, the syllabus is organized as follows

1. prerequisite
2. topics
3. references

3 Core Courses

3.1 CS141: Programming and Data Structures Lab-I

Credit : 2

Prerequisite: None

Classes per week: 3P+1L.

Topics Module 0: (6P+2L): Introduction to Computers, Notion of Algorithm, Linux Bash Shell, Simple Shell Programs.
Module 1 (12P+4L): Introduction to Programming: Variables, operators and expressions, input and output statements, Conditions and loops. Functions and recursions.
Module 2 (12P+4L): Arrays, Pointers, Structures, Classes and Objects.
Module 3 (9P+3L): File i/o, command line arguments.
Module 4 (6P+2L). Abstract data type. Linked lists.

- D. Knuth: The Art of Computer Programming. Vol. 1, 2nd ed. Narosa/Addison-Wesley, New Delhi/London, 1973

3.2 CS142: Programming and Data Structures Lab-II

Credit : 2

Prerequisite: CS141 **Classes per week**: 3P+1L. **Topics**

Module 0 (9P+3L): Review of programming, Arrays and Linked List. Bubble Sort and Quick Sort. Binary Search.
Module 1 (12P+4L): Circular Linked Lists, Doubly Linked Lists, Stacks, Queues.
Module 2 (12P+4L): Trees. Binary Search Trees, Tree traversal, Balanced Binary trees. Module 3 (6P+2L): Heap, Priority Queues.

Module 4 (3P+1L). Strings and Searching for Phrases.
Module 6:(Optional) (3P+1L) Dictionaries: universal, k-wise independent, simple tabulation hashing; chaining, dynamic perfect hashing, linear probing, cuckoo hashing

3.3 CS201: Theory of Computation

Credit : 4

Prerequisite: None **Classes per week**: 3L+1T. **Topics**

Module 1 (12L+4T): Introduction to Finite State Automata; DFA,NFA, and their equivalence, Regular Ex- pressions and equivalence with finite state automata.Regular Languages and Properties, Pumping Lemma and applications, Myhill-Nerode Theorem, State Minimization.

Module 2 (12L+4T): Context Free Languages (CFL) and grammars, parse trees, Chomsky Normal Form. Pushdown Automata (PDA), Equivalence of acceptance by final state and empty stack. Equivalence of CFL and PDA, Pumping Lemma for CFL.

Module 3 (12L+4T): Turing Machines and equivalence of different models. Universality. Decidability, Recog- nizability, Enumeration, and Undecidability. Reductions. Rice’s Theorem, recursion theorem.

Module 4 (9L+3T): Notions of P,NP,co-NP, hierarchy theorem, NP completeness, Cook-Levin Theorem, NP completeness proofs of some NP complete problems.

3.4 CS202: Discrete Structures and Computation

Credit 4
Prerequisite: none **Classes per week**: 3L+1T. **Topics**

Module 1 (6L+2T): Review of Sets, Operations, Principles of Inclusion and Exclusion. Functions, relations, Equivalence relations. Countable and uncountable sets. Review of Pigeonhole principle.

Module 2 (6L+2T): Introduction to Propositional Logic, Equivalence and Implications. Truth tables, De Mor- gan's Law, Quantifiers, Inference and Proofs. Introduction to First Order Logic, Syntax and Semantics, Soundeness and Completeness.

Module 3 (6L+2T): Mathematical Induction, Recursions, First order linear recurrence, Geometric series, Re- cursion trees and growth rates of solutions to recurrences, Master Theorem. Generating Functions.

Module 4 (6L+2T): Introduction to counting, sum and product principles, counting subsets. Binomial coefficients and Pascal's triangles. Polya's theory of counting (optional).

Module 5 (3L+1T): Arithmetic Algorithms: Computing GCD, primality testing, RSA.

Module 6 (12L+4T): Graph Theory: Graphs, representations, connectivity, cycles, trees, Spanning tree of a graph, Algorithms to find minimum spanning trees. Eulerian Cycle and Hamiltonian paths, independence number and clique number, chromatic number, Dominating Sets, and Covering Sets. Planar Graphs. Directed Graphs and tournaments.

Module 7(3L+1T) Probabilistic tools, Tail Bounds and Applications.
Module 8 (3L+1T)(optional): Linear Algebraic tools in Combinatorics.

3.5 CS301: Design and Analysis of Algorithms

Credit 4
Prerequisite: CS201, CS202
Classes per week: 3L+1T.
Topics

Module 1 (4L+1T). Introduction and basic concepts - mathematics of algorithm analysis, asymptotic notations, worst case and average case complexity. Review of Searching and Union Find.

Module 2 (8L+3T): Divide and conquer- Motivating algorithms that leads into recurrences, solving recurrences, merge sort and its recurrence, Median computation. Analysis of quicksort.

Module 3 (9L+3T). Greedy algorithms- Greedy choice, optimal structure property, minimum spanning tree, knapsack

Module 4 (8L+2T). Dynamic programming- Integral knapsack, longest increasing subsequence, edit distance, independent sets in trees

Module 5 (8L+3T). Graph algorithms- Recall of representation of graphs, BFS, DFS, shortest path, connected components, topological sort of DAGs, biconnected components and strongly connected components in directed graphs

Module 6. (Optional)(3L+1T) Randomization- Median, randomized quicksort, probabilistic primality testing.

Algebraic Algorithms. Karatsuba's algorithm and the Fast Fourier transform

4 Optional Courses

4.1 CS451: Modern Cryptology

Credit 4

Prerequisite: CS202, CS301.

Classes per week: 3L+1T.

Topics

Module 1: (3L+1T) Introduction and Classical Cryptography, Perfect Secrecy, One Time Pad.

Module 2: (9L+3T) Symmetric Key Encryption. Computational Security, Concrete vs Asymptotic Approach. Semantic Security. Pseudorandom generators and Stream ciphers, Pseudorandom Functions and Block Ciphers. Practical Constructions.

Module 3: (6L+2T) Hash Functions and Message Authentication Codes. Notions of Security, Generic Attacks, Domain Extension techniques, CBC MAC, HMAC, PMAC, Idea of Authenticated Encryption.

Module 4: (6L+2T) Review of Basic Number Theory. Hardness Assumptions. One-way functions, Trapdoor Permutations, RSA assumptions, Discrete Log and Diffie Hellman Assumptions, SIS and LWE Assumptions. Introduction to Elliptic Curves (Optional)

Module 5. (3L+1T) Key Exchange Protocols and Key Management.

Module 6. (6L+2T) Public Key Encryption, Semantic Security, El Gamal Encryption, Padded RSA PKCS#1 v1.5. Random Oracle Technique, OAEP.

Module 7. (6L+2T) Digital Signatures, Hash and Sign paradigm, Schnorr Signature, Forking Lemma, DSA. SSL/TLS.

Module 8. (6L+2T) (Optional) Idea of some of the following notions, Protocols and Zero Knowledge Proofs, Multiparty Computations and Oblivious Transfers, Secret Sharing. Algorithms for factoring and computing discrete logarithms, Linear and Differential Cryptanalysis, Crypto Currencies.

References

- J. Katz and Y. Lindell, Introduction to Modern Cryptography. CRC, 2014.

Possible Instructor: Rishiraj Bhattacharyya.

4.2 CS452: Agorithmic Coding Theory

Credit 4

Prerequisite: CS202

Classes per week: 3L+1T.

Topics Module 1: (9L+3T) Entropy, Characterization and Properties. Application to Combinatorics. Mutual Information and KL Divergence.

Module 2: (6L+2T) Source coding theorem, lossless compression of data, Lempel-Ziv Algorithm, Optimal lossless coding.

Module 3 (6L+2T) Communication channels (binary symmetric, erasure) and channel capacity, channel coding theorem.

Module 3: (6L+2T) Introduction to Error Correcting Codes. Hamming Codes and Hamming Bounds. BCH Codes, Maximum likelihood decoding and syndrome decoding; coding theory bounds.

Module 4: (9L+3T) Reed-Solomon codes and the Berlekamp-Welch decoding algorithm with Analysis. List Decoding of Reed-Solomon Codes.

Module 5. (6L+2T)Reed-Muller Code and Local decoding. Module 6.

(3L+1T) (Optional) Lovasz Local lemma and proof.

Possible Instructor: Rishiraj Bhattacharyya.

4.3 CS453: Complexity Theory

Credit 4

Prerequisite: CS201, CS202, CS301

Classes per week: 3L+1T.

Topics

Module 1 (9L+3T): Introduction, P and NP - Review of Turing machines, universal Turing machines, and uncomputable functions, P vs. NP, NP vs. co-NP, and NP-completeness, EXP, NEXP

Module 2: (3L) Cook Levin's Theorem

Module 3 (12L+4T): Diagonalization, Space complexity, Polynomial Hierarchy

Module 4 (9L+3T): Interactive Proofs - PCP theorem and its application to approximability Module 5 (4L+1T): Circuit complexity and lower bounds

Module 6 (6L+2T): Hardness vs. Randomness - Randomized Computation, derandomization, Pseudo-random generators

Module 7 (3L+1T): Polynomial identity testing vs Lower bounds for arithmetic circuits

Possible Instructor: Anisur Rahaman Molla.

4.4 CS454: Linear Programming and Combinatorial Optimization

Credit 4

Prerequisite: CS202, CS301
Classes per week: 3L+1T.

Topics

Module 1: (10L+3T) Basic geoemetry and linear algebra related to Linear Programming. Simplex-method and Duality theorem (leading to Von Neumann's minmax principle) and complimentary slackness.

Module 2: (8L+3T) Ellipsoid algorithm. separation oracles.

Module 3: (9L+3T) Semidefinite programming as an extension of linear programming.

Module 4: (9L+3T) LP relaxation. Examples of problems where LP relaxation achieves optimum. Examples where LP/SDP relaxation achieves approximate solution. Integrality gaps.

Module 5: (6L+2T) Rounding, probabilistic roundings, iterative rounding, primal dual methods.

Module 6 (Optional): (3L+1T) Gale-Shapley algorithm, Connection of LP to Cooperative Game Theory core, nucleolus, combinatorial optimization games.

Possible Instructor: Rishiraj Bhattacharyya, Anisur Rahaman Molla.

4.5 CS455: Distributed Network Algorithms

Credit 4

Prerequisite: CS202, CS301

Classes per week: 3L+1T. **Topics** Module 1: (9L+3T) Foundations of distributed network algorithms - Broad- cast, converge-cast, maximal independent set, coloring, leader election, spanning tree algorithms, shortest paths, and routing.

Module 2:(9L+3T) Fundamental concepts in distributed algorithms - Symmetry breaking, locality, synchronizers Module 3:(9L+3T) Basics of distributed network systems - Communication, synchronization, fault-tolerance,

and resource allocation

Module 4:(9L+3T) Applications to real-world networks - Internet, peer-to-peer networks, wireless networks, sensor networks and dynamic networks

Module 5:(9L+3T) Lower bounds using communication complexity, distributed computation of large-scale data, dynamic network algorithms.

	****	-	4	-	Elective-VIII
	****	-	4	-	Elective-IX
Semester VIII	M404	-	4	-	Algebraic Topology
	M402	-	4	-	Representations of Finite Groups
	M499	-	4	-	Project-II
	****	-	4	-	Elective-X
	****	-	4	-	Elective-XI
	****	-	4	-	Elective-XII
Semester IX	M598	-	20	-	Dissertation
	****	-	4	-	Elective-XIII
Semester X	M599	-	20	-	Dissertation
	****	-	4	-	Elective-XIV

Out of 56 credits as Electives, at least 8 credits from the School of Humanities and Social Sciences and at least 16 credits from other science schools must be taken.

Course Structure for a Minor in Mathematics

All the following courses are compulsory to get a Minor in Mathematics.

1. M101 - Mathematics-I
2. M102 - Mathematics-II
3. M201 - Real Analysis
4. M202 - Group Theory
5. M204 - Metric Spaces
6. M205 - Linear Algebra
7. M206 - Probability Theory
8. M303 - Differential Equations

A student may have the following two options to cover the last six courses from the above list of courses during his/her stay at NISER based on the present syllabus.

1.
   - Semester 3: Group Theory
   - Semester 4: Linear Algebra
   - Semester 5: Real Analysis
   - Semester 6/8/10: Metric Spaces/ Probability Theory
   - Semester 7/9: Differential Equations
2.
   - Semester 3: Real Analysis
   - Semester 4/6/8/10: Metric Spaces/ Linear Algebra/ Probability Theory
   - Semester 5/7/9: Group Theory/ Differential Equations

List of Courses from School of Mathematical Sciences

Compulsory Courses

Course No.		Credits		Course Name
M101	-	3	-	Mathematics-I
M102	-	3	-	Mathematics-II
M201	-	4	-	Real Analysis
M202	-	4	-	Group Theory
M203	-	4	-	Discrete Mathematics
M207	-	4	-	Number Theory
M204	-	4	-	Metric Spaces
M205	-	4	-	Linear Algebra
M206	-	4	-	Probabilty Theory
M208	-	4	-	Graph Theory
M306	-	4	-	Calculus of Several Variables
M302	-	4	-	Rings and Modules
M303	-	4	-	Differential Equations
M304	-	4	-	Topology
M305	-	4	-	Statistics
M301	-	4	-	Lebesgue Integration
M307	-	4	-	Field Theory
M308	-	4	-	Complex Analysis
M310	-	4	-	Geometry of Curves and Surfaces
M311	-	4	-	Numerical Analysis
M401	-	4	-	Functional Analysis
M403	-	4	-	Commutative Algebra
M404	-	4	-	Algebraic Topology
M402	-	4	-	Representations of Finite Groups

Elective Courses

Course No.		Credits		Course Name
M451	-	4	-	Advanced Complex Analysis
M452	-	4	-	Advanced Functional Analysis
M453	-	4	-	Advanced Linear Algebra
M454	-	4	-	Partial Differential Equations
M455	-	4	-	Introduction to Stochastic Processes
M456	-	4	-	Algebraic Geometry
M457	-	4	-	Algebraic Graph Theory
M458	-	4	-	Algebraic Number Theory
M460	-	4	-	Algorithm
M462	-	4	-	Cryptology
M463	-	4	-	Finite Fields
M464	-	4	-	Information and Coding Theory
M465	-	4	-	Mathematical Logic
M466	-	4	-	Measure Theory
M467	-	4	-	Nonlinear Analysis
M468	-	4	-	Operator Theory
M469	-	4	-	Theory of Computation
M470	-	4	-	Abstract Harmonic Analysis
M471	-	4	-	Advanced Number Theory
M472	-	4	-	Advanced Probability
M473	-	4	-	Algebraic Combinatorics
M474	-	4	-	Foundations of Cryptography
M475	-	4	-	Incidence Geometry
M476	-	4	-	Lie Algebras
M477	-	4	-	Optimization Theory
M478	-	4	-	Advanced Partial Differential Equations
M479	-	4	-	Random Graphs
M480	-	4	-	Randomized Algorithms and Probabilistic Methods
M481	-	4	-	Statistical Inference I
M482	-	4	-	Multivariate Statistical Analysis
M483	-	4	-	Introduction to Manifolds

Course No.		Credits		Course Name
M551	-	4	-	Algebraic Computation
M552	-	4	-	Analytic Number Theory
M553	-	4	-	Classical Groups
M554	-	4	-	Ergodic Theory
M555	-	4	-	Harmonic Analysis
M556	-	4	-	Lie Groups and Lie Algebras-I
M557	-	4	-	Operator Algebras
M558	-	4	-	Representations of Linear Lie Groups
M559	-	4	-	Harmonic Analysis on Compact Groups
M560	-	4	-	Modular Forms of One Variable
M561	-	4	-	Elliptic Curves
M562	-	4	-	Brownian Motion and Stochastic Calculus
M563	-	4	-	Differentiable Manifolds and Lie Groups
M564	-	4	-	Lie Groups and Lie Algebras-II
M565	-	4	-	Mathematical Foundations for Finance
M566	-	4	-	Designs and Codes
M567	-	4	-	Statistical Inference II

Program outcome: Integrated M.Sc. in Mathematics

The Integrated M.Sc. Program in Mathematics aims to provide comprehensive training to the students so that they will be able to build a carrier in Mathematics for themselves. The program aims to train people who are oriented towards research and teaching in both basic and advanced areas of Mathematical sciences. The core courses of the program provide a basic understanding in all areas of Mathematics which will be a foundation for further study of advanced topics. The electives courses provide knowledge in specialized topics and interconnection between different areas of Mathematics. Projects/Dissertation under the guidance of the faculty members give students exposure to current research in different areas of Mathematics and imbibe effective scientific and/or technical communication in both oral and writing. After successful completion of this program students will be able to apply knowledge of Mathematics in different fields of science and technology.

Syllabus of Compulsory Courses

M101: Mathematics-I

L	P	T	C
2	0	1	3

Outcome: Expects students to learn how to prove theorems, expressing mathematical objects, and understand the construction of natural numbers and symmetry of plane figures.

Contents: Method of Mathematical Proofs: Induction, Construction, Contradiction, Contrapositive. Set: Union and Intersection of sets, Distributive laws, De Morgan's Law, Finite and infinite sets. Relation: Equivalence relation and equivalence classes. Function: Injections, Surjections, Bijections, Composition of functions, Inverse function, Graph of a function. Countable and uncountable sets, Natural numbers via Peano arithmetic, Integers, Rational numbers, Real Numbers and Complex Numbers. Matrices, Determinant, Solving system of linear equations, Gauss elimination method, Linear mappings on $\mathbb{R}^2$ and $\mathbb{R}^3$, Linear transformations and Matrices. Symmetry of Plane Figures: Translations, Rotations, Reflections, Glide-reflections, Rigid motions.

References:

1. G. Polya, "How to Solve It", Princeton University Press, 2004.
2. K. B. Sinha et. al., "Understanding Mathematics", Universities Press (India), 2003.
3. M. Artin, "Algebra", Prentice-Hall of India, 2007 (Chapters 1, 4, 5).
4. J. R. Munkres, "Topology", Prentice-Hall of India, 2013 (Chapter 1).

M102: Mathematics-II

L	P	T	C
2	0	1	3

Outcome: Upon successful completion of the course students will become aware of some basic properties of real line and real valued functions.

Contents: Concept of ordered field, Bounds of a set, ordered completeness axiom and characterization of $\mathbb{R}$ as a complete ordered field. Archimedean property of real numbers. Modulus of real numbers, Intervals, Neighbourhood of a point. Sequences of Real Numbers: Definition and examples, Bounded sequences, Convergence of sequences, Uniqueness of limit, Algebra of limits, Monotone sequences and their convergence, Sandwich rule. Series: Definition and convergence, Telescopic series, Series with non-negative terms. Tests for convergence [without proof]: Cauchy condensation test, Comparison test, Ratio test, Root test, Absolute and conditional convergence, Alternating series and Leibnitz test. Limit of a function at a point, Sequential criterion for the limit of a function at a point. Algebra of limits, Sandwich theorem, Continuity at a point and on intervals, Algebra of continuous functions. Discontinuous functions, Types of discontinuity. Differentiability: Definition and examples, Geometric and physical interpretations, Algebra of differentiation, Chain rule, Darboux Theorem, Rolle's Theorem, Mean Value Theorems of Lagrange and Cauchy. Application of derivatives: Increasing and decreasing functions, Maxima and minima of functions. Higher order derivatives, Leibnitz rule, L'Hopital rule.

Text Book:

1. R. G. Bartle, D. R. Sherbert, “Introduction to Real Analysis”, John Wiley & Sons, 1992.

References:

2. S. K. Berberian, “A First Course in Real Analysis”, Undergraduate Texts in Mathematics, Springer-Verlag, 1994.

M201: Real Analysis

Prerequisites: M102

L	P	T	C
3	0	1	4

Outcome: Knowledge on Continuity differentiable and Riemann integration theory. Sequence and series and it’s application to numerical analysis.

Contents: Countability of a set, Countability of rational numbers, Uncountability of real numbers. Limit point of a set, Bolzano-Weirstrass theorem, Open sets, Closed sets, Dense sets. Subsequence, Limit superior and limit inferior of a sequence, Cauchy criterion for convergence of a sequence, Monotone subsequence. Tests of convergence of series, Abel’s and Dirichlet’s tests for series, Riemann rearrangement theorem. Continuous functions on closed and bounded intervals, Intermediate value theorem, Monotone functions, Continuous monotone functions and their invertibility, Discontinuity of monotone functions. Uniform continuity, Equivalence of continuity and uniform continuity on closed and bounded intervals, Lipschitz condition, Other sufficient condition for uniform continuity. Riemann Integration: Darboux’s integral, Riemann sums and their properties, Algebra of Riemann integrable functions, Class of Riemann integrable functions, Mean value theorem, Fundamental theorems of calculus, Change of variable formula (statement only), Riemann-Stieltjes integration (definition). Taylor’s theorem and Taylor’s series, Elementary functions. Improper integral, Beta and Gamma functions.

Text Books:

1. R. G. Bartle, D. R. Sherbert, “Introduction to Real Analysis”, John Wiley & Sons, 1992.
2. K. A. Ross, “Elementary Analysis”, Undergraduate Texts in Mathematics, Springer, 2013.

References:

1. T. M. Apostol, “Calculus Vol. I”, Wiley-India edition, 2009.
2. S. K. Berberian, “A First Course in Real Analysis”, Undergraduate Texts in Mathematics, Springer-Verlag, 1994.

M202: Group Theory

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will be able to understand the notion of symmetries in the language of groups. Furthermore, students will become aware of various properties of groups and subgroups.

Contents: Groups, subgroups, normal subgroups, quotient groups, homomorphisms, isomorphism theorems, automorphisms, permutation groups, group actions, Sylow’s theorem, direct products, finite abelian groups, semidirect products, free groups.

Text Book:

1. D. S. Dummit, R. M. Foote, "Abstract Algebra", Wiley-India edition, 2013.

References:

1. I. N. Herstein, "Topics in Algebra", Wiley-India edition, 2013.
2. M. Artin, "Algebra", Prentice-Hall of India, 2007.

M203: Discrete Mathematics

Prerequisites: M101

L	*P*	*T*	*C*
3	0	1	4

Outcome: Learning different combinatorial techniques to solve many counting problems and understanding some mathematical structures

Contents: Pigeonhole principle, Counting principles, Binomial coefficients, Principles of inclusion and exclusion, recurrence relations, generating functions, Catalan numbers, Stirling numbers, Partition numbers, Schröder numbers, Block designs, Latin squares, Partially ordered sets, Lattices, Boolean algebra.

Text Books:

1. R. A. Brualdi, "Introductory Combinatorics", Pearson Prentice Hall, 2010.
2. J. P. Tremblay, R. Manohar, "Discrete Mathematical Structures with Application to Computer Science", Tata McGraw-Hill Edition, 2008.

References:

3. R. P. Stanley, "Enumerative Combinatorics Vol. 1", Cambridge Studies in Advanced Mathematics, 49, Cambridge University Press, 2012.

M204: Metric Spaces

Prerequisites: M201

L	*P*	*T*	*C*
3	0	1	4

Outcome: Upon successful completion of the course students will become aware about generalisation of euclidean distance on arbitrary sets and various properties of functions defined on them.

Contents: Metric spaces, open balls and open sets, limit and cluster points, closed sets, dense sets, complete metric spaces, completion of a metric space, Continuity, uniform continuity, Banach contraction principle, Compactness, Connectedness, pathconnected sets. Sequences of functions, Pointwise convergence and uniform convergence, Arzela-Ascoli Theorem, Weierstrass Approximation Theorem, power series, radius of convergence, uniform convergence and Riemann integration, uniform convergence and differentiation, Stone-Weierstrass theorem for compact metric spaces.

Text Books:

1. G. F. Simmons, "Introduction to Topology and Modern Analysis", Tata McGraw-Hill, 2013.
2. S. Kumaresan, "Topology of Metric Spaces", Narosa Publishing House, 2005.

References:

1. R. R. Goldberg, "Methods of Real Analysis", John Wiley & Sons, 1976.
2. G. B. Folland, "Real Analysis", Wiley-Interscience Publication, John Wiley & Sons, 1999.

M205: Linear Algebra

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will learn the relation between linear transformations and matrices. Moreover, student will also learn various fundamental results of matrices, namely, diagonalisation, triangulation and primary decomposition theorem.

Contents: System of Linear Equations, Matrices and elementary row operations, Row-reduced echelon form of matrices, Vector spaces, subspaces, quotient spaces, bases and dimension, direct sums, Linear transformations and their matrix representations, Dual vector spaces, transpose of a linear transformation, Polynomial rings (over a field), Determinants and their properties, Eigenvalues and eigenvectors, Characteristic polynomial and minimal polynomial, Triangulation and Diagonalization, Simultaneous Triangulation and diagonalization, Direct-sum decompositions, Primary decomposition theorem.

Text Book:

1. K. Hoffman, R. Kunze, "Linear Algebra", Prentice-Hall of India, 2012.

References:

1. S. H. Friedberg, A. J. Insel, L. E. Spence, "Linear Algebra", Prentice Hall, 1997.

3. M. Artin, "Algebra", Prentice-Hall of India, 2007.

M206: Probability Theory

Prerequisites: M102

L	P	T	C
3	0	1	4

Outcome: Students will be introduced to the basic theory of probability starting from axiomatic definition of probability up to limit theorems of probability.

Contents: Combinatorial probability and urn models; Conditional probability and independence; Random variables – discrete and continuous; Expectations, variance and moments of random variables; Transformations of univariate random variables; Jointly distributed random variables; Conditional expectation; Generating functions; Limit theorems; Simple symmetric random walk.

Text Books:

1. S. Ross, "A First Course in Probability", Pearson Education, 2012.
2. D. Stirzaker, "Elementary Probability", Cambridge University Press, Cambridge, 2003.

References:

1. K. L. Chung, F. AitSahlia, "Elementary Probability Theory", Undergraduate Texts in Mathematics. Springer-Verlag, 2003.
2. P. G. Hoel, S. C. Port, C. J. Stone, "Introduction to Probability Theory", The Houghton Mifflin Series in Statistics. Houghton Mifflin Co., 1971.
3. W. Feller, "An Introduction to Probability Theory and its Applications Vol. 1 and Vol. 2", John Wiley & Sons, 1968, 1971.

M207: Number Theory

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: Expects students to learn elementary properties of rings of integers including divisibility, congruences, continued fractions and Gauss reciprocity laws.

Contents: Divisibility, Primes, Fundamental theorem of arithmetic, Congruences, Chinese remainder theorem, Linear congruences, Congruences with prime-power modulus, Fermat's little theorem, Wilson's theorem, Euler function and its applications, Group of units, primitive roots, Quadratic residues, Jacobi symbol, Binary quadratic form, Arithmetic functions, Möbius Inversion formula, Dirichlet product, Sum of squares, Continued fractions and rational approximations.

Text Book:

2. G. A. Jones, J. M. Jones, "Elementary Number Theory", Springer Undergraduate Mathematics Series. Springer-Verlag, 1998.

M208: Graph Theory

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: Understanding the fundamentals of graph theory and learning the structure of graphs and techniques used to analyze different problems

Contents: Graphs, subgraphs, graph isomorphisms, degree sequence, paths, cycles, trees, bipartite graphs, Hamilton cycles, Euler tours, directed graphs, matching, Tutte's theorem, connectivity, Menger's theorem, planar graphs, Kuratowski's theorem, vertex and edge colouring of graphs, network flows, max-flow min-cut theorem, Ramsey theory for graphs, matrices associated with graphs.

Text Book:

1. R. Diestel, "Graph Theory", Graduate Texts in Mathematics, 173. Springer, 2010.

References:

1. B. Bollobás, "Modern Graph Theory", Graduate Texts in Mathematics, 184. Springer-Verlag, 1998.

3. J. A. Bondy, U. S. R. Murty, "Graph Theory", Graduate Texts in Mathematics, 244. Springer, 2008.

M301: Lebesgue Integration

Prerequisites: M201

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will learn the concept of measures and measurable functions. Students also learn Lebesgue integration and their various properties

Contents: Outer measure, measurable sets, Lebesgue measure, measurable functions, Lebesgue integral, Basic properties of Lebesgue integral, convergence in measure, differentiation and Lebesgue measure. L_p Spaces, Holder and Minkowski inequalities, Riesz-Fisher theorem, Radon-Nykodin theorem, Riesz representation theorem. Fourier series, L_2-convergence properties of Fourier series, Fourier transform and its properties.

Text Books:

1. H. L. Royden, “Real Analysis”, Prentice-Hall of India, 2012.
2. G. B. Folland, “Real Analysis”, Wiley-Interscience Publication, John Wiley & Sons, 1999.

References:

1. G. de Barra, “Measure Theory and Integration”, New Age International, New Delhi, 2003.
2. W. Rudin, “Principles of Mathematical Analysis”, Tata McGraw-Hill, 2013.

M302: Rings and Modules

Prerequisites: M202, M205

L	P	T	C
3	0	1	4

Outcome: Expects students to learn structure and various properties of rings and modules, structure of finitely generated modules over PID.

Contents: Rings, ideals, quotient rings, ring homomorphisms, isomorphism theorems, prime ideals, maximal ideals, Chinese remainder theorem, Field of fractions, Euclidean Domains, Principal Ideal Domains, Unique Factorization Domains, Polynomial rings, Gauss lemma, irreducibility criteria.
Modules, submodules, quotients modules, module homomorphisms, isomorphism theorems, generators, direct product and direct sum of modules, free modules, finitely generated modules over a PID, Structure theorem for finitely generated abelian groups, Rational form and Jordan form of a matrix, Tensor product of modules.

Text Book:

1. D. S. Dummit, R. M. Foote, “Abstract Algebra”, Wiley-India edition, 2013.

References:

1. I. N. Herstein, “Topics in Algebra”, Wiley-India edition, 2013.
2. M. Artin, “Algebra”, Prentice-Hall of India, 2007.

M303: Differential Equations

Prerequisites: M201, M205

L	P	T	C
3	0	1	4

Outcome: This course starts with the origin and applications of differential equations and discusses many solution techniques such as separation of variable, variation of parameter, annihilator method and Frobenious method, etc. Then it introduces basic theory of existence and uniqueness for the system of first order ODEs which is essential for many branches of mathematics. This course also gives a glimpse how to analyze the behavior of solutions (maximum principle, stability, asymptotic stability, etc.). This course ends with an introduction to partial differential equations and method of characteristics, a technique to solve first order partial differential equations. Upon successful completion of this course the student will be able to model some practical situations into ordinary differential equations or partial differential equations and analyze the solution to get information about the parameters involved in the model.

Contents: Classifications of Differential Equations: origin and applications, family of curves, isoclines. First order equations: separation of variable, exact equation, integrating factor, Bernoulli equation, separable equation, homogeneous equations, orthogonal trajectories, Picard’s existence and uniqueness theorems. Second order equations: variation of parameter, annihilator methods. Series solution: power series solutions about regular and singular points. Method of Frobenius, Bessel's equation and Legendre equations. Wronskian determinant, Phase portrait analysis for 2nd order system, comparison and maximum principles for 2nd order equations. Linear system: general properties, fundamental matrix solution, constant coefficient system, asymptotic behavior, exact and adjoint equation, oscillatory equations, Green's function. Sturm-Liouville theory. Partial Differential Equations: Classifications of PDE, method of separation of variables, characterstic method.

Text Books:

1. S. L. Ross, "Differential Equations", Wiley-India Edition, 2009.
2. E. A. Coddington, "An Introduction to Ordinary Differential Equations", Prentice-Hall of India, 2012.

References:

1. G. F. Simmons, S. G. Krantz, "Differential Equations", Tata Mcgraw-Hill Edition, 2007.
2. B. Rai, D. P. Choudhury, "A Course in Ordinary Differential Equation", Narosa Publishing House, New Delhi, 2002.
3. R. P. Agarwal, D. OŔegan, "Ordinary and Partial Differential Equations", Universitext. Springer, 2009.

M304: Topology

Prerequisites: M204

L	*P*	*T*	*C*
3	0	1	4

Outcome: This course builds the foundations of point set topology and also covers basic algebraic topology (basics of covering spaces and fundamental group). After taking this course the students will be proficient in the abstract notion of a topological space, where continuous functions are defined in terms of open sets (and not the traditional $\varepsilon - \delta$ definition used in analysis). The students will appreciate some of the most important concepts in analysis from a topological perspective. For example, they will realize Intermediate value theorem is a statement about connectedness, Bolzano Weirstrass Theorem is a statement about compactness and so on. They will also get a solid grasp of quotient topology (which is a fundamentally new concept that is not an extension of the things already taught in analysis). The students will then be taught deeper concepts such as Ursysohn Lemma, Tietze extension theorem and Tychonoff Theorem. These topics will be of great use to anyone pursuing further studies in Topology, Functional Analysis, PDE and Probability.
The students will also learn the basics of fundamental group and covering spaces; they will be able to compute the fundamental group of a circle (but not much more beyond that in this course). After this course, they will be fully ready to study a more advanced course in Algebraic Topology that gets into the intricate details of fundamental group and singular homology. This course will also be very useful to anyone pursuing further studies in Differential Geometry (theory of manifolds).

Contents: Topological Spaces, Open and closed sets, Interior, Closure and Boundary of sets, Basis for Topology, Product Topology, Subspace Topology, Metric Topology, Compact Spaces, Locally compact spaces, Continuous functions, Open map, Homeomorphisms, Function Spaces, Separation Axioms: T1, Hausdorff, regular, normal spaces; Uryshon's lemma, Tietze

Extension Theorem, One point compactification, Connected Spaces, Path Connected Spaces, Quotient Topology, Homotopic Maps, Deformation Retract, Contractible Spaces, Fundamental Group, The Brouwer fixed-point theorem.

Text Books:

1. J. R.Munkres, "Topology", Prentice-Hall of India, 2013.
2. M. A. Armstrong, "Basic Topology", Undergraduate Texts in Mathematics, Springer-Verlag, 1983.

References:

2. K. Jänich, "Topology", Undergraduate Texts in Mathematics. Springer-Verlag, 1984.

M305: Statistics

Prerequisites: M206

L	P	T	C
3	0	1	4

Outcome: Students will be introduced to the discipline of statistics, learn about descriptive statistics of data sets including graphical representation using some statistical software. The focus is to learn about basic theory of point estimation, interval estimation, hypothesis testing and linear regression.

Contents: Descriptive Statistics, Graphical representation of data, Curve fittings, Simple correlation and regression, Multiple and partial correlations and regressions, Sampling, Sampling distributions, Standard error. Normal distribution and its properties, The distribution of $\overline{X}$ and S^2 in sampling from a normal distribution, Exact sampling distributions: χ^2, t, F. Theory and Methods of Estimation: Point estimation, Criteria for a good estimator, Properties of estimators: Unbiasedness, Efficiency, Consistency, Sufficiency, Robustness. A lower bound for a variance of an estimate, Method of estimation: The method of moment, Least square method, Maximum likelihood estimation and its properties, UMVU Estimator, Interval estimation. Test of Hypothesis: Elements of hypothesis testing, Unbiased test, Neyman-Pearson Theory, MP and UMP tests, Likelihood ratio and related tests, Large sample tests, Test based on χ^2, t, F.

Text Books:

1. H. J. Larson, "Introduction to Probability Theory and Statistical Inference", John Wiley & Sons, 1982.
2. V. K. Rohatgi, "Introduction to Probability Theory and Mathematical Statistics", John Wiley & Sons, 1976.

References:

1. I. Miller, M. Miller, "John E. Freund's Mathematical Statistics with Applications", Pearson, 2013.

M306: Calculus of Several Variables

Prerequisites: M201, M204

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will learn the notion of limits, continuity, differentiation and integration in the higher dimensional euclidean spaces.

Contents: Differentiability of functions from an open subset of $\mathbb{R}^n$ to $\mathbb{R}^m$ and properties, chain rule, partial and directional derivatives, Continuously differentiable functions, Inverse function theorem, Implicit function theorem, Interchange of order of differentiation, Taylor's series, Extrema of a function, Extremum problems with constraints, Lagrange multiplier method with applications, Integration of functions of several variables, Change of variable formula (without proof) with examples of applications of the formula, spherical coordinates, Stokes theorem (without proof), Deriving Green's theorem, Gauss theorem and Classical Stokes theorem.

Text Books:

1. W. Fleming, "Functions of Several Variables", Undergraduate Texts in Mathematics. Springer-Verlag, 1977.
2. T. M. Apostol, "Calculus Vol. II", Wiley-India edition, 2009.

References:

1. W. Kaplan, "Advanced Calculus", Addison-Wesley Publishing Company, 1984.
2. T. M. Apostol, "Mathematical Analysis", Narosa Publishing House, 2013.

M307: Field Theory

Prerequisites: M205, M302

L	*P*	*T*	*C*
3	0	1	4

Outcome: Expects students to learn basic properties of fields including the fundamental theorem of Galois theory.

Contents: Field extensions, algebraic extensions, Ruler and compass constructions, splitting fields, algebraic closures, separable and inseparable extensions, cyclotomic polynomials and extensions, automorphism groups and fixed fields, Galois extensions, Fundamental theorem of Galois theory, Fundamental theorem of algebra, Finite fields, Galois group of polynomials, Computations of Galois groups over rationals, Solvable groups, nilpotent groups, Solvability by radicals, Transcendental extensions.

Text Book:

1. D. S. Dummit, R. M. Foote, "Abstract Algebra", Wiley-India edition, 2013.

References:

1. I. N. Herstein, "Topics in Algebra", Wiley-India edition, 2013.
2. M. Artin, "Algebra", Prentice-Hall of India, 2007.
3. J. Rotman, "Galois Theory", Universitext, Springer-Verlag, 1998.

M308: Complex Analysis

Prerequisites: M306

L	*P*	*T*	*C*
3	0	1	4

Outcome: Upon successful completion of the course students will learn the concept of (complex) differentiation and integration of functions defined on the complex plane and their properties.

Contents: Algebraic and geometric representation of complex numbers; elementary functions including the exponential functions and its relatives (log, cos, sin, cosh, sinh, etc.); concept of holomorphic (analytic) functions, complex derivative and the Cauchy-Riemann equations; harmonic functions. Conformal Mapping, Linear Fractional Transformations, Complex line integrals and Cauchy Integral formula, Representation of holomorpic functions in terms of power series, Morera's theorem, Cauchy estimates and

Liouville's theorem, zeros of holomorphic functions, Uniform limits of holomorphic functions. Behaviour of holomorphic function near an isolated singularity, Laurent expansions, Counting zeros and poles, Argument principle, Rouche's theorem, Calculus of residues and evaluation of integrals using contour integration. The Open Mapping theorem, Maximum Modulus Principle, Schwarz Lemma.

Text Books:

M310: Geometry of Curves and Surfaces

Prerequisites: M306

L	P	T	C
3	0	1	4

Outcome: Knowledge on curve and surfaces, manifold and vector field some application on geometry of surfaces.

Contents: Curves in two and three dimensions, Curvature and torsion for space curves, Existence theorem for space curves, Serret-Frenet formula for space curves, Jacobian theorem, Surfaces in $\mathbb{R}^3$ as 2-dimensional manifolds, Tangent spaces and derivatives of maps between manifolds, Geodesics, First fundamental form, Orientation of a surface, Second fundamental form and the Gauss map, Mean curvature, Gaussian Curvature, Differential forms, Integration on surfaces, Stokes formula, Gauss-Bonnet theorem.

Text Books:

1. M. P. Do Carmo, "Differential Geometry of Curves and Surfaces", Prentice Hall, 1976.
2. Andrew Pressley, "Elementary Differential Geometry", Springer, 2010.

References:

1. M. P. Do Carmo, "Differential Forms and Applications", Springer, 1994.
2. J. A. Thorpe, "Elementary Topics in Differential Geometry", Undergraduate texts in mathematics, Springer, 2011.

M311: Numerical Analysis

Prerequisites: M201, M303

L	P	T	C
2	1	1	4

Outcome: Upon successful completion of the course students will learn practical use of some important results from real analysis and linear algebra.

Contents: Errors in computation: Representation and arithmetic of numbers, source of errors, error propagation, error estimation. Numerical solution of non-linear equations: Bisection method, Secant method, Newton-Raphson method, Fixed point methods, Muller's method. Interpolations: Lagrange interpolation, Newton divided differences, Hermite interpolation, Piecewise polynomial interpolation. Approximation of functions: Weierstrass and Taylor expansion, Least square approximation. Numerical Integration: Trapezoidal rule, Simpson's rule, Newton-Cotes rule, Guassian quadrature. Numerical solution of ODE: Euler's method, multi-step methods, Runge-Kutta methods, Predictor-Corrector methods. Solutions of systems of linear equations: Gauss elimination, pivoting, matrix factorization, Iterative methods – Jacobi and Gauss-Siedel methods. Matrix eigenvalue problems: power method.

Text Book:

M401: Functional Analysis

Prerequisites: M204, M205

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will learn the concept of normed linear space and various properties of operators defined on them.

Contents: Normed linear spaces and continuous linear transformations, Hahn-Banach theorem (analytic and geometric versions), Baire's theorem and its consequences – three basic principles of functional analysis (open mapping theorem, closed graph theorem and uniform boundedness principle), Computing the dual of wellknown Banach spaces, Hilbert spaces, Riesz representation theorem, Adjoint operator, Compact operators, Spectral theorem for self adjoint compact operators.

Text Books:

1. J. B. Conway, "A Course in Functional Analysis", Graduates Texts in Mathematics 96, Springer, 2006.
2. B. Bollobás, "Linear Analysis", Cambridge University Press, 1999.

References:

M402: Representations of Finite Groups

Prerequisites: M202, M205, M302

L	P	T	C
3	0	1	4

Outcome: This course gives an introduction to the representation of finite groups via character theory.

Contents: Group representations, Maschke's theorem and completely reducibility, Characters, Inner product of Characters, Orthogonality relations, Burnside's theorem, induced characters, Frobenius reciprocity, induced representations, Mackey's Irreducibility Criterion, Character table of some wellknown groups, Representation theory of the symmetric group: partitions and tableaux, constructing the irreducible representations.

Text Book:

1. G. James, M. Liebeck, "Representations and Characters of Groups", Cambridge University Press, 2010.

M403: Commutative Algebra

Prerequisites: M302

L	P	T	C
3	0	1	4

Outcome: Expects students to understand various properties of commutative rings, various class of commutative rings, and dimension theory.

Contents: Commutative rings, ideals, operations on ideals, prime and maximal ideals, nilradicals, Jacobson radicals, extension and contraction of ideals, Modules, free modules, projective modules, exact sequences, tensor product of modules, Restriction and extension of scalars, localization and local rings, extended and contracted ideals in rings of fractions, Noetherian modules, Artinian modules, Primary decompositions and associate primes, Integral extensions, Valuation rings, Discrete valuation rings, Dedekind domains, Fractional ideals, Completion, Dimension theory.

Text Book:

1. M. F. Atiyah, I. G. Macdonald, "Introduction to Commutative Algebra", Addison-Wesley Publishing Co., 1969.

References:

M404: Algebraic Topology

Prerequisites: M302, M304

L	P	T	C
3	0	1	4

Outcome: This course lays down the foundations of fundamental group (π_1) and singular homology. The students will get a good in-depth knowledge of covering spaces. To begin with, they will study covering spaces as a tool to compute fundamental group (such as the circle, torus etc). Later on, they will study covering spaces in much greater depth; they will get an understanding of the correspondence between conjugacy classes of π_1 and the different covering spaces they correspond to. They will also learn that this correspondence is bijective if and only if the space is reasonable (path connected, locally path connected and semi-locally simply connected). Students will also learn different techniques to compute the fundamental group such as homotopy invariance and Van-Kampen Theorem.

The students will also learn about the basics of singular homology. They will learn different techniques to compute singular homology of a space, including homotopy invariance, Mayer-Vietoris, excision, long exact sequence etc. The students will also learn about the degree of a map. They will be able to use these concepts to prove non-trivial theorems such as invariance of domain, hairy ball theorem etc.

Contents: Homotopy Theory: Simply Connected Spaces, Covering Spaces, Universal Covering Spaces, Deck Transformations, Path lifting lemma, Homotopy lifting lemma, Group Actions, Properly discontinuous action, free groups, free product with amalgamation, Seifert-Van Kampen Theorem, Borsuk-Ulam Theorem for sphere, Jordan Separation Theorem. Homology Theory: Simplexes, Simplicial Complexes, Triangulation of spaces, Simplicial Chain Complexes, Simplicial Homology, Singular Chain Complexes, Cycles and Boundary, Singular Homology, Relative Homology, Short Exact Sequences, Long Exact Sequences, Mayer-Vietoris sequence, Excision Theorem, Invariance of Domain.

Text Books:

1. J. R. Munkres, "Topology", Prentice-Hall of India, 2013.
2. A. Hatcher, "Algebraic Topology", Cambridge University Press, 2009.

References:

1. G. E. Bredon, "Topology and Geometry", Graduates Texts in Mathematics 139, Springer, 2009.

Syllabus of Elective Courses

M451: Advanced Complex Analysis

Prerequisites: M308

L	P	T	C
3	0	1	4

Outcome: Students will learn some important theorems in complex analysis such as Riemann mapping theorem, Weirstrass factorization theorem, Runges theorem, Hardamard factorization theorem, Little Picards theorem and Great Picards theorem. They will also learn some basic techniques of harmonic functions and characterization of Dirichlet Region. These results are very useful in many branches of mathematics such as Number Thoery, Differential Geometry, Operator theory, Partal Differential Equations etc.

Contents: Review of basic Complex Analysis: Cauchy-Riemann equations, Cauchy's theorem and estimates, power series expansions, maximum modulus principle, Classification of singularities and calculus of residues. Space of continuous functions, Arzela's theorem, Spaces of analytic functions, Spaces of meromorphic functions, Riemann mapping theorem, Weierstrass Factorization theorem, Runge's theorem, Simple connectedness, Mittag-Leffler's theorem, Analytic continuation, Schwarz reflection principle, Mondromy theorem, Jensen's formula, Genus and order of an entire function, Hadamard factorization theorem, Little Picard theorem, Great Picard theorem, Harmonic functions.

References:

3. W. Rudin, "Real and Complex Analysis", Tata McGraw-Hill, 2013.
4. R. Remmert, "Theory of Complex Functions", Graduate Texts in Mathematics 122, Springer, 2008.

M452: Advanced Functional Analysis

Prerequisites: M401

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will become aware of the concept of topological vector space, as a generalisation of normed linear spaces, and various properties of operators defined on them.

Contents: Definition and examples of topological vector spaces (TVS) and locally convex spaces (LCS); Linear operators; Hahn-Banach Theorems for TVS/ LCS (analytic and geometric forms); Uniform boundedness principle; Open mapping theorem; Closed graph thoerem; Weak and weak* vector topologies; Bipolar theorem; dual of LCS spaces; Krein-Milman theorem for TVS; Krien-Smulyan theorem for Banach spaces; Inductive and projective limit of LCS.

References:

3. J. B. Conway, "A Course in Functional Analysis", Graduates Texts in Mathematics 96, Springer, 2006.

M453: Advanced Linear Algebra

Prerequisites: M205

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will become aware of various decomposition results of matrices and their applications.

Contents: Rational and Jordan canonical forms, Inner product spaces, Unitary and Normal operators, Forms on inner product spaces, Spectral theorems, Bilinear forms, Matrix decomposition theorems, Courant- Fischer minimax and related theorems, Nonnegative matrices, Perron-Frobenius theory, Generalized inverse, Matrix Norm, Perturbation of eigenvalues.

M454: Partial Differential Equations

Prerequisites: M301, M303, M306

L	P	T	C
3	0	1	4

Outcome: Students will learn explicit representations of solutions of four important classes of PDEs, namely, Transport equations, Heat equation, Laplace equation and wave equation for initial value problems. They will study the properties of solutions of these equations such as mean value property, maximum principles and regularity. They will also study Cauchy-Kowalevski Theorem and uniqueness theorem of Holmgreen for quasilinear equations.

Contents: Classification of Partial Differential Equations, Cauchy Problem, Cauchy-Kowalevski Theorem, Lagrange-Green identity, The uniquness theorem of Holmgren, Transport equation: Initial value problem, nonhomogeneous problem. Laplace equation: Fundamental solution, Mean Value formula, properties of Harmonic functions, Green's function, Energy methods, Harnack's inequality. Heat Equation: Fundamental solution, Mean value formula, properties of solutions. Wave equation: Solution by spherical means, Nonhomogeneous problem, properties of solutions.

M455: Introduction to Stochastic Processes

Prerequisites: M206

L	P	T	C
3	0	1	4

Outcome: Students will be introduced to the theory of both discrete time and continuous time Markov chains.

Contents: Discrete Markov chains with countable state space; Classification of states: recurrences, transience, periodicity. Stationary distributions, reversible chains, Several illustrations including the Gambler's Ruin problem, queuing chains, birth and death chains etc. Poisson process, continuous time Markov chain with countable state space, continuous time birth and death chains.

M456: Algebraic Geometry

Prerequisites: M205, M302

L	*P*	*T*	*C*
3	0	1	4

Outcome: This course will introduce the students to the fundamentals of classical algebraic geometry. They will learn about the theory of Riemann surfaces, divisors, line bundles, Chern Classes and the Riemann Roch Theorem.

Contents: Prime ideals and primary decompositions, Ideals in polynomial rings, Hilbert Basis theorem, Noether normalisation lemma, Hilbert's Nullstellensatz, Affine and Projective varieties, Zariski Topology, Rational functions and morphisms, Elementary dimension theory, Smoothness, Curves, Divisors on curves, Bezout's theorem, Riemann-Roch for curves, Line bundles on Projective spaces.

M457: Algebraic Graph Theory

Prerequisites: M205, M208

L	*P*	*T*	*C*
3	0	1	4

Outcome: Learning the different algebraic techniques used in the study of the graphs

Contents: Adjacency matrix of a graph and its eigenvalues, Spectral radius of graphs, Regular graphs and Line graphs, Strongly regular graphs, Cycles and Cuts, Laplacian matrix of a graph, Algebraic connectivity, Laplacian spectral radius of graphs, Distance matrix of a graph, General properties of graph automorphisms, Transitive and Arc-tranisitve graphs, Symmetric graphs.

M458: Algebraic Number Theory

Prerequisites: M207, M307, M403

L	P	T	C
3	0	1	4

Outcome: This course gives an introduction to the basic properties of number fields, computation of class numbers and zeta functions.

Contents: Number Fields and Number rings, prime decomposition in number rings, Dedekind domains, Ideal class group, Galois theory applied to prime decomposition, Gauss reciprocity law, Cyclotomic fields and their ring of integers, finiteness of ideal class group, Dirichlet unit theorem, valuations and completions of number fields, Dedekind zeta function and distribution of ideal in a number ring.

6. J. Neukirch, “Algebraic Number Theory”, Springer-Verlag, 1999.

M460: Algorithm

Prerequisites: M208

L	P	T	C
3	0	1	4

Outcome: Students will learn (i) Data structure, (ii) design and analysis algorithms and (iii) some important algorithms like sortings, graph theoretics, polynomial related and optimization related.

Contents: Algorithm analysis, asymptotic notation, probabilistic analysis; Data Structure: stack, queues, linked list, hash table, binary search tree, red-black tree; Sorting: heap sort, quick sort, sorting in linear time; Algorithm design: divide and conquer, greedy algorithms, dynamic programming; Algebraic algorithms: Winograd’s and Strassen’s matrix multiplication algorithm, evaluation of polynomials, DFT, FFT, efficient FFT implementation; Graph algorithms: breadth-first and depth-first search, minimum spanning trees, single-source shortest paths, all-pair shortest paths, maximum flow; NP-completeness and approximation algorithms.

4. D. E. Knuth, “The Art of Computer Programming Vol. 1, Vol. 2, Vol 3”, Addison-Wesley Publishing Co., 1997, 1998, 1998.

M462: Cryptology

Prerequisites: M202, M207

L	P	T	C
3	0	1	4

Outcome: It introduces the basics of Cryptography and cryptanalysis. Students learn theory and design of cryptographic schemes like stream ciphers, block ciphers and public key ciphers like RSA, El-Gamal, elliptic curve cryptosystem. Further, they learn about data authentication, integrity and secret sharing.

Contents: Overview of Cryptography and cryptanalysis, some simple cryptosystems (e.g., shift, substitution, affine, knapsack) and their cryptanalysis, classification of cryptosystems, classification of attacks; Information Theoretic Ideas: Perfect secrecy, entropy; Secret key cryptosystem: stream cipher, LFSR based stream ciphers, cryptanalysis of stream cipher (e.g., correlation attack, algebraic attacks), block cipher, DES, linear and differential cryptanalysis, AES; Public-key cryptosystem: Implementation and cryptanalysis of RSA, ElGamal public-key cryptosystem, Discrete logarithm problem, elliptic curve cryptography; Data integrity and authentication: Hash functions, message authentication code, digital signature scheme, ElGamal signature scheme; Secret sharing: Shamir's threshold scheme, general access structure and secret sharing.

2. A. J. Menezes, P. C. van Oorschot, S. A. Vanstone, "Handbook of Applied Cryptography", CRC Press, 1997.

M463: Finite Fields

Prerequisites: M307

L	P	T	C
3	0	1	4

Outcome: This course gives a structure of finite fields, factorization of polynomials, some applications towards cryptography, coding theory and combinatorics.

Contents: Structure of finite fields: characterization, roots of irreducible polynomials, traces, norms and bases, roots of unity, cyclotomic polynomial, representation of elements of finite fields, Wedderburn's theorem; Polynomials over finite field: order of polynomials, primitive polynomials, construction of irreducible polynomials, binomials and trinomials, factorization of polynomials over small and large finite fields, calculation of roots of polynomials; Linear recurring sequences: LFSR, characteristic polynomial, minimal polynomial, characterization of linear recurring sequences, Berlekamp-Massey algorithm; Applications of finite fields: Applications in cryptography, coding theory, finite geometry, combinatorics.

4. Z-X. Wan, "Finite Fields and Galois Rings", World Scientific Publishing Co., 2012.

M464: Information and Coding Theory

Prerequisites: M205, M307

L	P	T	C
3	0	1	4

Outcome: It introduces information theory and coding theory. In information theory, students learn how to measure information and encoding of information. In coding theory, students learn theory and techniques of error correcting codes like Reed-Muller codes, BCH codes, Reed-Solomon codes, Algebraic codes.

Contents: Information Theory: Entropy, Huffman coding, Shannon-Fano coding, entropy of Markov process, channel and mutual information, channel capacity;
Error correcting codes: Maximum likelihood decoding, nearest neighbour decoding, linear codes, generator matrix and parity-check matrix, Hamming bound, Gilbert-Varshamov bound, binary Hamming codes, Plotkin bound, nonlinear codes, Reed-Muller codes, Cyclic codes, BCH codes, Reed-Solomon codes, Algebraic codes.

References:

1. R. W. Hamming, "Coding and Information Theory", Prentice-Hall, 1986.

5. S. Lin, "An Introduction to Error-Correcting Codes", Prentice-Hall, 1970.

M465: Mathematical Logic

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: Students will learn Mathematical logic. It starts from the propositional logic and then first order theory. Then introduces the completeness and compactness theorems with Godels incompleteness theorem.

Contents: Propositional Logic, Tautologies and Theorems of propositional Logic, Tautology Theorem. First Order Logic: First order languages and their structures, Proofs in a first order theory, Model of a first order theory, validity theorems, Metatheorems of a first order theory, e. g., theorems on constants, equivalence theorem, deduction and variant theorems etc. Completeness theorem, Compactness theorem, Extensions by definition of first order theories, Interpretations theorem, Recursive functions, Arithmatization of first order theories, Godels first Incompleteness theorem, Rudiments of model theory including Lowenheim-Skolem theorem and categoricity.

References:

1. J. R. Shoenfield, "Mathematical logic", Addison-Wesley Publishing Co., 1967.
2. E. Mendelson, "Introduction to Mathematical Logic", Chapman & Hall, 1997.

M466: Measure Theory

Prerequisites: M301

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will learn the concept of measures and measurable functions. Students also learn integration and their various properties.

Contents: $\sigma-$algebras of sets, measurable sets and measures, extension of measures, construction of Lebesgue measure, integration, convergence theorems, Radon-Nikodym theorem, product measures, Fubini's theorem, differentiation of integrals, absolutely continuous functions, L_p-spaces, Riesz representation theorem for the space $C[0, 1]$.

6. K. R. Parthasarathy, "Introduction to probability and measure", The Macmillan Co. of India, Ltd., 1977.

M467: Nonlinear Analysis

Prerequisites: M306, M401

L	P	T	C
3	0	1	4

Outcome: Students will learn Calculus in Banach Spaces and degree theory. As an application of degree theory, they will study fixed point theorems of Brouwer and Schauder. Students will also learn homotopy, homotopy extension and invariance theorems and its applications. This course is very useful for the students who want to specialize in Partial Differential Equations.

Contents: Calculus in Banach spaces, inverse and multiplicit function theorems, fixed point theorems of Brouwer, Schauder and Tychonoff, fixed point theorems for nonexpansive and set-valued maps, predegree results, compact vector fields, homotopy, homotopy extension, invariance theorems and applications.

References:

1. S. Kesavan, "Nonlinear Functional Analysis", Texts and Readings in Mathematics 28, Hindustan Book Agency, 2004.

M468: Operator Theory

Prerequisites: M401

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will become familiar with concepts of C*-algebra, von-Neuman algebra and toeplitz operators and the notion of index for Fredholm operators.

Contents: Compact operators on Hilbert Spaces. (a) Fredholm Theory (b) Index, C*-algebras - noncommutative states and representations, Gelfand-Neumark representation theorem, Von-Neumann Algebras; Projections, Double Commutant theorem, L^∞ functionalCalculus, Toeplitz operators.

4. V. S. Sunder, "An invitation to von Neumann algebras", Universitext, Springer-Verlag, 1987.

M469: Theory of Computation

Prerequisites: M101

L	P	T	C
3	0	1	4

Outcome: It introduces the theory of computer science. Here, the students learn (i) Automata and Language Theory by studying automata and context free language (ii) Computability theory by studying Turing machine and halting problem (iii) Complexity theory by studying P and NP class problems

Contents: Automata and Language Theory: Finite automata, regular expression, pumping lemma, context free grammar, context free languages, Chomsky normal form, push down automata, pumping lemma for CFL; Computability: Turing machines, Churh-Turing thesis, decidability, halting problem, reducibility, recursion theorem; Complexity: Time complexity of Turing machines, Classes P and NP, NP completeness, other time classes, the time hierarchy.

M470: Abstract Harmonic Analysis

Prerequisites: M301, M308, M401

L	P	T	C
3	0	1	4

Outcome: Knowledge on Haar measure, convolution structure on Lie group with emphasize to harmonic analysis on the groups Circle and real line.

Contents: Topological Groups: Basic properties of topological groups, subgroups, quotient groups. Examples of various matrix groups. Connected groups. Haar measure: Discussion of Haar measure without proof on $\mathbb{R}$, $\mathbb{T}$, $\mathbb{Z}$ and simple matrix groups, Convolution, the Banach algebra $L^1(G)$ and convolution with special emphasis on $L^1(\mathbb{R})$, $L^1(\mathbb{T})$ and $L^1(\mathbb{Z})$. Basic Representation Theory: Unitary representation of groups, Examples and General properties, The representations of Group and Group algebras, C^*-algebra of a group, GNS construction, Positive definite functions, Schur's Lemma. Abelian Groups: Fourier transform and its properties, Approximate identities in $L^1(G)$, Classical Kernels on $\mathbb{R}$, The Fourier inversion Theorem, Plancherel theorem on $\mathbb{R}$, Plancherel measure on $\mathbb{R}$, $\mathbb{T}$, $\mathbb{Z}$. Dual Group of an Abelian Group: The Dual group of a locally compact abelian group, Computation of dual groups for $\mathbb{R}$, $\mathbb{T}$, $\mathbb{Z}$, Pontryagin's Duality theorem.

M471: Advanced Number Theory

Prerequisites: M207, M307, M308

L	P	T	C
3	0	1	4

Outcome: This advanced course gives a brief introduction to p-adic numbers, quadratic forms, Dirichlet series and modular forms.

Contents: Review of Finite fields, Gauss Sums and Jacobi Sums, Cubic and biquadratic reciprocity, Polynomial equations over finite fields, Theorems of Chevally and Warning, Quadratic forms over prime fields. Ring of p-adic integers, Field of p-adic numbers, completion, p-adic equations, Hensel's lemma, Hilbert symbol, Quadratic forms with p-adic coefficients. Dirichlet series: Abscissa of convergence and absolute convergence, Riemann Zeta function and Dirichlet L-functions. Dirichlet's theorem on primes in arithmetic progression. Functional equation and Euler product for L-functions. Modular Forms and the Modular Group, Eisenstein series, Zeros and poles of modular functions, Dimensions of the spaces of modular forms, The j-invariant L-function associated to modular forms, Ramanujan τ function.

M472: Advanced Probability

Prerequisites: M206, M301

L	P	T	C
3	0	1	4

Outcome: Students will learn about measure theoretic probability starting from probability spaces to theory of martingales.

Contents: Probability spaces, Random Variables, Independence, Zero-One Laws, Expectation, Product spaces and Fubini's theorem, Convergence concepts, Law of large numbers, Kolmogorov three-series theorem, Levy-Cramer Continuity theorem, CLT for i.i.d. components, Infinite Products of probability measures, Kolmogorov's Consistency theorem, Conditional expectation, Discrete parameter martingales with applications.

M473: Algebraic Combinatorics

Prerequisites: M202, M203

L	P	T	C
3	0	1	4

Outcome: Learning the use of different algebraic technique to study the combinatorial problems

Contents: Catalan Matrices and Orthogonal Polynomials, Catalan Numbers and Lattice Paths, Combinatorial Interpretation of Catalan Numbers, Symmetric Polynomials and Functions, Schur Functions, Jacobi-Trudi identity, RSK Algorithm, Standard Tableaux, Young diagrams and q-binomial coefficients, Plane Partitions, Group actions on boolean algebras, Enumeration under group action, Walks in graphs, Cubes and the Radon transform, Sperner property, Matrix-Tree Theorem.

M474: Foundations of Cryptography

Prerequisites: M102, M206

L	P	T	C
3	0	1	4

Outcome: The theoretical study of cryptography which puts foundation for the study and design of real-life cryptography.

Contents: Introduction to cryptography and computational model, computational difficulty, pseudorandom generators, zero-knowledge proofs, encryption schemes, digital signature and message authentication schemes, cryptographic protocol.

References:

1. O. Goldreich, "Foundations of Cryptography - Vol. I and Vol. II", Cambridge University Press, 2001, 2004.

M475: Incidence Geometry

Prerequisites: M205

L	P	T	C
3	0	1	4

Outcome: Understanding different kinds of incidence structures such as projective spaces, affine spaces, generalized quadrangles, polar spaces and quadratic sets.

Contents: Definitions and Exampleas, projective planes, affine planes, projective spaces, affine spaces, collineations of projective and affine spaces, fundamental theorem of projective and affine spaces, polar spaces, generalized quadrangles, quadrics and quadratic sets.

References:

M476: Lie Algebras

Prerequisites: M202, M205, M307

L	P	T	C
3	0	1	4

Outcome: This course serves two purposes. (i) To introduce the basics of Lie algebras to the students who are interested in algebra and pursue further in the studies of infinite dimensional Lie algebras like Kac-Moody Lie algebras on one hand and finite dimensional Lie algebras and their representations over any field on the other hand. (ii) As Lie algebras play infinitesimal part of Lie groups, they play important role in understanding Lie groups. The theory of semisimple Lie algebras is extremely rich thanks to Cartan, Weyl.. without which, one can not understand the geometry of semisimple Lie groups and their representations and also compact Lie groups.
After having done this course, one can pursue the studies on either Lie algebras or Representation theory of Lie groups.

Contents: Definitions and Examples, Derivations, Ideals, Homomorphisms, Nilpotent Lie Algebras and Engel's theorem, Solvable Lie Algebras and Lie's theorem, Jordan decomposition and Cartan's criterion, Semisimple Lie algebras, Casimir operator and Weyl's theorem, Representations of $sl(2, F)$, Root space decomposition, Abstract root systems, Weyl group and Weyl chambers, Classification of irreducible root systems, Abstract theory of weights, Isomorphism and conjugacy theorems, Universal enveloping algebras and PBW theorem, Representation theory of semi-simple Lie algebras, Verma modules and Weyl character formula.

4. N. Jacobson, "Lie Algebras", Dover Publications, 1979.

M477: Optimization Theory

Prerequisites: M102, M205

L	P	T	C
3	0	1	4

Outcome: Understanding the different techniques used to solve the linear and non-linear programming problem

Contents: Linear programming problem and its formulation, convex sets and their properties, Graphical method, Simplex method, Duality in linear programming, Revised simplex method, Integer programming, Transportation problems, Assignment problems, Games and strategies, Two-person (non) zero-sum games, Introduction to non-linear programming and techniques.

M478: Advanced Partial Differential Equations

Prerequisites: M401, M454

L	P	T	C
3	0	1	4

Outcome: Students will learn basics of distribution Theory, Sobolev Spaces and their properties. Using Sobolev space Theory, students will learn existence theory of solutions for Dirichlet, Neuman and oblique derivative problems for second order elliptic partial differential equations. They will also learn weak and strong maximum principles, Hopf Maximum Principle and Alexandrof-Bakelmann-Pucci estimate for the solutions. This course is very useful for the students who want to specialize in Partial Differential Equations.

Contents: Distribution Theory, Sobolev Spaces, Embedding theorems, Trace theorem. Dirichlet, Neumann and Oblique derivative problem, Weak formulation, Lax–Milgram, Maximum Principles– Weak and Strong Maximum Principles, Hopf Maximum Principle, Alexandroff-Bakelmann-Pucci Estimate.

M479: Random Graphs

Prerequisites: M206, M208

L	P	T	C
3	0	1	4

Outcome: The aim is to learn random graphs and its applications.

Contents: Models of random graphs and of random graph processes; illustrative examples; random regular graphs, configuration model; appearance of the giant component small subgraphs; long paths and Hamiltonicity; coloring problems; eigenvalues of random graphs and their algorithmic applications; pseudo-random graphs.

References:

1. N. Alon, J. H. Spencer, "The Probabilistic Method", John Wiley & Sons, 2008

M480: Randomized Algorithms and Probabilistic Methods

Prerequisites: M206

L	P	T	C
3	0	1	4

Outcome: The aim is to learn how to use probabilistic techniques to different areas of mathematics and computer science.

Contents: Inequalities of Markov and Chebyshev (median algorithm), first and second moment method (balanced allocation), inequalities of Chernoff (permutation routing) and Azuma (chromatic number), rapidly mixing

Markov chains (random walk in hypercubes, card shuffling), probabilistic generating functions (random walk in d-dimensional lattice)

References:

2. M. Mitzenmacher, E. Upfal, "Probability and Computing: Randomized algorithms and probabilistic analysis", Cambridge University Press, 2005.

M481: Statistical Inference I

Prerequisites: M206 and M305 or equivalent courses

L	P	T	C
3	0	1	4

Outcome: The outcome of this course is to learn about parametric statistical inference to be applicable to almost all branches of statistics. Students will learn various methods of estimation and hypothesis testing and their large sample and small sample properties.

Contents: Review: joint and conditional distributions, order statistics, group family, exponential family. Introduction to parametric inference, sufficiency principle and data reduction, factorization theorem, minimal sufficient statistics, Fisher information, ancillary statistics, complete statistics, Basu's theorem. Unbiasedness, best unbiased and linear unbiased estimator, Rao-Blackwell theorem, Lehmann- Scheffe theorem and UMVUE, Cramer-Rao lower bound and UMVUE, multi-parameter cases. Location and scale invariance, principle of equivarience. Methods of estimation: method of moments, likelihood principle and maximum likelihood estimation, properties of MLE: invariance, consistency, asymptotic normality. Hypothesis testing: error probabilities and power, most powerful tests, Neyman-Pearson lemma and its applications, p-value, uniformly most powerful (UMP) test via Neyman- Pearson lemma, UMP test via monotone likelihood ratio property, existence and nonexistence of UMP test for two sided alternative, unbiased and UMP unbiased tests. Likelihood (generalized) ratio tests and its properties, invariance and most powerful invariant tests. Introduction to confidence interval estimation, methods of fining confidence intervals: pivotal quantity, inversion of a test, examples such as confidence interval for mean, variance, difference in means, optimal interval estimators, uniformly most accurate confidence bound, large sample confidence intervals.

M482: Multivariate Statistical Analysis

Prerequisites: M305, M306, and M205 or equivalent courses

L	P	T	C
3	0	1	4

Outcome: Students will learn about various modern statistical tools to analyze and draw inference from multivariate data sets. Starting from multivariate normal distribution, students will learn inference about multivariate sample mean and variance, techniques of dimension reduction, introductory factor analysis, cluster analysis and statistical pattern recognition.

Contents: Review of matrix algebra (optional), data matrix, summary statistics, graphical representations. Distribution of random vectors, moments and characteristic functions, transformations, some multivariate distributions: multivariate normal, multinomial, Dirichlet distribution, limit theorems. Multivariate normal distribution: properties, geometry, characteristics function, moments, distributions of linear combinations, conditional distribution and multiple correlation. Estimation of mean and variance of multivariate normal, theoretical properties, James-Stein estimator (optional), distribution of sample mean and variance, the Wishart distribution, large sample behavior of sample mean and variance, assessing normality. Inference about mean vector: testing for normal mean, Hotelling T^2 and likelihood ratio test, confidence regions and simultaneous comparisons of component means, paired comparisons and a repeated measures design, comparing mean vectors from two populations, MANOVA. Techniques of dimension reduction, principle component analysis: definition of principle components and their estimation, introductory factor analysis, multidimensional scaling. Classification problem: linear and quadratic discriminant analysis, logistic regression, support vector machine. Cluster analysis: non-hierarchical and hierarchical methods of clustering.

M483: Introduction to Manifolds

Prerequisites: M304

L	P	T	C
3	0	1	4

Outcome: This course lays the foundations of modern Differential Geometry. After taking this course, the students will get a good knowledge of smooth manifolds, tangent and cotangent spaces, vector bundles, (co)tangent bundles, vector fields, differential forms, exterior differentiation, De-Rham cohomology, integration on manifolds, homotopy invariance of De-Rham cohomology and the statement of Poincare Duality. After studying this course, students will be fully prepared to pursue further studies in (complex) algebraic geometry, theory of Riemann surfaces and Riemannian Geometry. Students will also be fully equipped to pursue further studies in analysis on manifolds, particularly the theory of Elliptic operators on smooth manifolds and Hodge Theory (which culminates in the proof of Poincare Duality). Students who are interested in either Topology, Differential Geometry, Algebraic Geometry and certain topics in analysis and PDE, with a geometric flavor (i.e. Geometric Analysis) will find this course very useful.

Contents: Differentiable manifolds and maps: Definition and examples, Inverse and implicit function theorem, Submanifolds, immersions and submersions. The tangent and cotangent bundle: Vector bundles, (co)tangent bundle as a vector bundle, Vector fields, flows, Lie derivative. Differential forms and Integration: Exterior differential, closed and exact forms, Poincaré lemma, Integration on manifolds, Stokes theorem, De Rham cohomology.

M551: Algebraic Computation

Prerequisites: M205, M307

L	P	T	C
3	0	1	4

Outcome: It is a unique style of course where the mathematics students having interest in computation can learn to compute different algebraic problems in computer. Here students will learn the computation of the problems related (i) linear algebra, (ii) non-linear system of equations like Grobner bases, (iii) polynomial, (iv) algebraic number theory and (v) elliptic curve.

Contents: Linear algebra and lattices: Asymptotically fast matrix multiplication algorithms, linear algebra algorithms, normal forms over fields, Lattice reduction; Solving system of non-linear equations: Gröbner basis, Buchberger's algorithms, Complexity of Gröbner basis computation; Algorithms on polynomials: GCD, Barlekamp-Massey algorithm, factorization of polynomials over finite field, factorization of polynomials over $\mathbb{Z}$ and $\mathbb{Q}$; Algorithms for algebraic number theory: Representation and operations on algebraic numbers, trace, norm, characteristic polynomial, discriminant, integral bases, polynomial reduction, computing maximal order, algorithms for quadratic fields; Elliptic curves: Implementation of elliptic curve, algorithms for elliptic curves.

M552: Analytic Number Theory

Prerequisites: M201, M207, M308

L	P	T	C
3	0	1	4

Outcome: Expects students to learn elementary properties of Dirichlet series and distribution of primes.

Contents: Arithmetic functions, Averages of arithmetical functions, Distribution of primes, finite abelian groups and characters, Gauss sums, Dirichlet series and Euler products, Reimann Zeta function, Dirichlet L-functions, Analytic proof of the prime number theorem, Dirichlet Theorem on primes in arithmetic progression.

References:

M553: Classical Groups

Prerequisites: M202, M205, M307

L	*P*	*T*	*C*
3	0	1	4

Outcome: Understanding the basic facts about classical groups defined over fields such as General Linear groups, Special Linear groups, Symplectic groups, Orthogonal groups and Unitary groups.

Contents: General and special linear groups, bilinear forms, Symplectic groups, symmetric forms, quadratic forms, Orthogonal geometry, orthogonal groups, Clifford algebras, Hermitian forms, Unitary spaces, Unitary groups.

References:

1. L. C. Grove, "Classical Groups and Geometric Algebra", Graduate Studies in Mathematics 39, American Mathematical Society, 2002.
2. E. Artin, "Geometric Algebra", John Wiley & sons, 1988.

M554: Ergodic Theory

Prerequisites:

L	*P*	*T*	*C*
3	0	1	4

Outcome: The origin and motivation of studies of Ergodic theory comes from the statistical physics. One of the main branches in Analysis, it aims to give a formal mathematical treatment of movements of particles in a measure space. The important application is to study the behaviours of atoms and molecules in the ambit of aggregate systems. So, naturally the probability theory lies in the undercurrent of Ergodic theory. This theory emerged as a bridge between Probability theory, Physics and Functional analysis. It has a lot of applications in Statistical physics and mathematical biology.

Contents: Measure preserving systems; examples: Hamiltonian dynamics and Liouvilles theorem, Bernoulli shifts, Markov shifts, Rotations of the circle, Rotations of the torus, Automorphisms of the Torus, Gauss transformations, Skew-product, Poincare Recurrence lemma: Induced transformation: Kakutani towers: Rokhlins lemma. Recurrence in Topological Dynamics, Birkhoffs Recurrence theorem, Ergodicity, Weak-mixing and strong-mixing and their characterizations, Ergodic Theorems of Birkhoff and Von Neumann. Consequences of the Ergodic theorem. Invariant measures on compact systems, Unique ergodicity and equidistribution. Weyls theorem, The Isomorphism problem; conjugacy, spectral equivalence, Transformations with discrete spectrum, Halmosvon Neumann theorem, Entropy. The Kolmogorov-Sinai theorem. Calculation of Entropy. The Shannon McMillanBreiman Theorem, Flows. Birkhoffs ergodic Theorem and Wieners ergodic theorem for flows. Flows built under a function.

M555: Harmonic Analysis

Prerequisites: M301

L	P	T	C
3	0	1	4

Outcome: knowldege on Fourier Series , Fourier transforms and celebrated differentiation theorem and important operators like Hilbert transform and Maximal function.

Contents: Fourier series and its convergences, Dirichlet kernel, Frejer kernel, Parseval formula and its applications. Fourier transforms,the Schwartz space, Distribution and tempered distribution, Fourier Inversion and Plancherel theorem. Fourier analysis on L_p-spaces. Maximal functions and boundedness of Hilbert transform. Paley-Wiener Theorem for distribution. Poisson summation formula, Heisenberg uncertainty Principle, Wiener's Tauberian theorem.

M556: Lie Groups and Lie Algebras - I

Prerequisites: M205, M304, M306

L	P	T	C
3	0	1	4

Outcome: Understanding the technique used for constructing combinatorial designs and its relation with linear codes Outcomes: The aim of this course and M564- Lie groups and Lie algebras II is to give a strong foundation on the study of Lie groups and their infinitesimal version viz., Lie algebras. The prominent role played by Lie groups in the study of Geometry and theoritical physics needs no further emphasis. This course is tremendously beneficial for the mathematics students and physics students as well. It begins with the rudiments of Lie groups and finally ends with irreducible representations of compact Lie groups parametrised by Weyl Character formula.

Contents: General Properties: Definition of Lie groups, subgroups, cosets, group actions on manifolds, homogeneous spaces, classical groups. Exponential and logarithmic maps, Adjoint representation, Lie bracket, Lie algebras, subalgebras, ideals, stabilizers, center Baker-Campbell-Hausdorff formula, Lie's Theorems. Structure Theory of Lie Algebras: Solvable and nilpotent Lie algebras (with Lie/Engel theorems), semisimple and reductive algebras, invariant bilinear forms, Killing form, Cartan criteria, Jordan decomposition. Complex semisimple Lie algebras, Toral subalgebras, Cartan subalgebras, Root decomposition and root systems. Weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, BGG resolution, Weyl character formula.

M557: Operator Algebras

Prerequisites: M401

L	P	T	C
3	0	1	4

Outcome: Upon successful completion of the course students will become familiar with concepts and various structure theorems of C*-algebra and von-Neuman algebra.

Contents: Banach algebras/C*–algebras: Definition and examples; Spectrum of a Banach algebra; Gelfand transform; Gelfand-Naimark theorem for commutative Banach algebras/ C*-algebras; Functional calculus for C*-algebras; Positive cone in a C*-algebra; Existance of an approximate identity in a C*-algebra; Ideals and Quotients of a C*-algebra; Positive linear functionals on a C*-algebra; GNS construction. Locally convex topologies on the algebras of bounded operators on a Hilbert space, von-Neumann's bicommutant theorem; Kaplansky's density theorem. Ruan's characterization of Operator Spaces (if time permites).

M558: Representations of Linear Lie Groups

Prerequisites: M205, M304, M306

L	P	T	C
3	0	1	4

Outcome: This course is a more basic than M556 and M564 laying foundation for the students who want to take up one of the branches of mainstream mathematics namely, non-abelian harmonic analysis. The prototype of the complications that might arise in the study of non-abelian harmonic analysis, is amply found in the study of Linear Lie groups. Yet, these linear Lie groups are plausible to understand as they are concrete examples of non-compact non-abelian Lie groups.

The course starts from the first principles of representations and goes upto understanding the important examples of 3 different types of groups, viz., compact, nilpotent and solvable groups. It is quite beneficial for the students who want to get into representation theory.

Contents: Introduction to topological group, Haar measure on locally compact group, Representation theory of compact groups, Peter Weyl theorem, Linear Lie groups, Exponential map, Lie algebra, Invariant Differentail operators, Representation of the group and its Lie algebra. Fourier analysis on $SU(2)$ and $SU(3)$. Representation theory of Heisenberg group . Representation of Euclidean motion group.

M559: Harmonic Analysis on Compact Groups

Prerequisites: M205, M304, M401

L	P	T	C
3	0	1	4

Outcome: Knowledge on representaion on compact lie groups with examples $SU(2)$, $SO(n)$.

Contents: Review of General Theory: Locally compact groups, Computation of Haar measure on $\mathbb{R}$, $\mathbb{T}$, $SU(2)$, $SO(3)$ and some simple matrix groups, Convolution, the Banach algebra $L^1(G)$. Representation Theory: General properties of representations of a locally compact group, Complete reducibility, Basic operations on representations, Irreducible representations. Representations of Compact groups: Unitarilzibality of representations, Matrix coefficients, Schur's orthogonality relations, Finite dimensionality of irreducible representations of compact groups. Various forms of Peter-Weyl theorem, Fourier analysis on Compact groups, Character of a representation. Schur's orthogonality relations among characters. Weyl's Chracter formula, Computing the Unitary dual of $SU(2)$, $SO(3)$; Fourier analysis on $SO(n)$.

M560: Modular Forms of One Variable

Prerequisites: M202, M205, M207, M308

L	P	T	C
3	0	1	4

Outcome: This course gives an introduction to modular forms over 2 and their congruence subgroups, and their Hecke theory.

Contents: $SL_2(\mathbb{Z})$ and its congruence subgroups, Modular forms for $SL_2(\mathbb{Z})$, Modular forms for congruence subgroups, Modular forms and differential operators, Hecke theory, L-series, Theta functions and transformation formula.

M561: Elliptic Curves

Prerequisites: M202, M207, M308

L	P	T	C
3	0	1	4

Outcome: This course gives an introduction to elliptic curves and the structure of their rational points.

Contents: Congruent numbers, Elliptic curves, Elliptic curves in Weierstrass form, Addition law, Mordell–Weil Theorem, Points of finite order, Points over finite fields, Hasse-Weil L-function and its functional equation, Complex multiplication.

References:

1. J. H. Silverman, J. Tate, "Rational Points on Elliptic Curves", Undergraduate Texts in Mathematics, Springer-Verlag, 1992.

M562: Brownian Motion and Stochastic Calculus

Prerequisites: M472

L	P	T	C
3	0	1	4

Outcome: Students will learn about the theory of Brownian motion and it applications to stochastic differential equations.

Contents: Brownian Motion, Martingale, Stochastic integrals, extension of stochastic integrals, stochastic integrals for martingales, Itô's formula, Application of Itô's formula, stochastic differential equations.

References:

1. H. H. Kuo, "Introduction to Stochastic Integration", Springer, 2006.
2. J M Steele, "Stochastic Calculus and Financial Applications", Springer-Verlag, 2001.
3. F. C. Klebaner, "Introduction to Stochastic Calculus with Applications", Imperial College, 2005.

M563: Differentiable Manifolds and Lie Groups

Prerequisites: M304, M306

L	P	T	C
3	0	1	4

Outcome: This course will introduce the students to the fundamentals of Lie groups and Lie Algebras. After studying this course, students will get a working knowledge of smooth manifolds, but unlike M483, this course will get into an in depth study of Lie Groups. The students will study about (bi)invariant vector fields, integration on Lie Groups, Cartan's Theorem etc. After studying this course, students will be fully equipped to study Abstract Harmonic Analysis on Lie Groups (and the construction of Haar Measure).

Contents: Review of Several variable Calculus: Directional Derivatives, Inverse Function Theorem, Implicit function Theorem, Level sets in $\mathbb{R}^n$, Taylor's theorem, Smooth function with compact support. Manifolds: Differentiable manifold, Partition of Unity, Tangent vectors, Derivative, Lie groups, Immersions and submersions, Submanifolds. Vector Fields: Left invariant vector fields of Lie groups, Lie algebra of a Lie group, Computing the Lie algebra of various classical Lie groups. Flows: Flows of a vector field, Taylor's formula, Complete vector fields. Exponential Map: Exponential map of a Lie group, One parameter subgroups, Frobenius theorem (without proof). Lie Groups and Lie Algebras: Properties of Exponential function, product formula, Cartan's Theorem, Adjoint representation, Uniqueness of differential structure on Lie groups. Homogeneous Spaces: Various examples and Properties. Coverings: Covering spaces, Simply connected Lie groups, Universal covering group of a connected Lie group. Finite dimensional representations of Lie groups and Lie algebras.

M564: Lie Groups and Lie Algebras - II

Prerequisites: M556

L	P	T	C
3	0	1	4

Outcome: This course is the sequel of M556 - Lie groups and Lie algebras I. It mostly deals with the representation theory of Lie groups. Lie groups that are studied in this course, are compact Lie groups and the group SL(2,C) . Another aspect of this course is to classify all simple Lie algebras through root system. As it is well known, the study of subatomic particles depend on the irreducible representations of certain Lie groups that are contained in $\mathrm{GL}(n, \mathbb{R})$. This course gives a vivid account of mathematics that is needed to understand these representations. To sum up, it is a gateway for the students of mathematics to pursue harmonic analysis of Lie groups.

Contents: General theory of representations, operations on representations, irreducible representations, Schur's lemma, Unitary representations and complete reducibility. Compact Lie groups, Haar measure on compact Lie groups, Schur's Theorem, characters, Peter-Weyl theorem, universal enveloping algebra, Poincare-Birkoff-Witt theorem, Representations of Lie($SL(2,\mathbb{C})$). Abstract root systems, Weyl group, rank 2 root systems, Positive roots, simple roots, weight lattice, root lattice, Weyl chambers, simple reflections, Dynkin diagrams, classification of root systems, Classification of semisimple Lie algebras. Representations of Semisimple Lie algebras, weight decomposition, characters, highest weight representations, Verma modules, Classification of irreducible finite-dimensional representations, Weyl Character formula, The representation theory of $SU(3)$, Frobenius Reciprocity theorem, Spherical Harmonics.

M565: Mathematical Foundations for Finance

Prerequisites: M472

L	P	T	C
3	0	1	4

Outcome: Students will learn about the mathematical modeling of simple stock markets and techniques to analyze them.

Contents: Financial market models in finite discrete time, Absence of arbitrage and martingale measures, Valuation and hedging in complete markets, Basic facts about Brownian motion, Stochastic integration, Stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem, Black-Scholes formula

References:

M566: Designs and Codes

Prerequisites: M205, M307

L	P	T	C
3	0	1	4

Outcome: Understanding the technique used for constructing combinatorial designs and its relation with linear codes.

Contents: Incidence structures, affine planes, translation plane, projective planes, conics and ovals, blocking sets. Introduction to Balanced Incomplete Block Designs (BIBD), Symmetric BIBDs, Difference sets, Hadamard matrices and designs, Resolvable BIBDs, Latin squares. Basic concepts of Linear Codes, Hamming codes, Golay codes, Reed-Muller codes, Bounds on the size of codes, Cyclic codes, BCH codes, Reed-Solomon codes.

M567: Statistical Inference II

Prerequisites: Statistical Inference I or equivalent courses

L	P	T	C
3	0	1	4

Outcome: Students will be introduced to decision theory and learn about Bayesian estimation and testing. Moreover, students will learn about large sample theory including asymptotic tests, confidence intervals, asymptotic efficiency and optimality of estimators and tests.

Contents: General decision problem, loss and risk function, minimax estimation, minimaxity and admissibility in exponential family. Introduction to Bayesian estimation, Bayes rule as average risk optimality, prior and posterior, conjugate families, generalized Bayes rules. Bayesian intervals and construction of credible sets, Bayesian hypothesis testing. Empirical and nonparametric empirical Bayes analysis, admissibility of Bayes and generalized Bayes rules, discussion on Bayes versus non-Bayes approaches. Large sample theory: review of modes of convergences, Slutsky's theorem, Berry-Essen bound, delta method, CLT for iid and non iid cases, multivariate extensions. Asymptotic level α tests, asymptotic equivalence, comparison of tests: relative efficiency, asymptotic comparison of estimators, efficient estimators and tests, local asymptotic optimality. Bootstrap sampling: estimation and testing.

SCHOOL OF HUMANITIES

DETAILED COURSE STRUCTURE

FOR

INTEGRATED M.Sc. COURSE

Revised Jan 2017

National Institute of Science Education and Research (HBNI)

Humanities courses for integrated M.Sc.

Year/Semester	**Course no.**	**Credits**	**Course Name**
CORE COURSES			
1/Semester I	H109	2	Technical Communication I
1/Semester I	H133	2	Introduction to Sociology
1/Semester II	H110	2	Technical Communication
1/Semester II	H101	2	Introduction to Economics
ELECTIVE COURSES			
2/Semester III	H225	2	Introduction to Psychology
	H201	2	Environmental Economics and Environmental Impact Assessment
	H239	2	Introduction to Innovation System
	H238	2	Life and Community in Urban World.
2/Semester IV	H227	2	Organizational Behaviour
	H235	2	Sociology of Science and Technology
	H236	2	Perspectives on Indian Society
	H237	2	Science Communication and Citizen

SEM- I	**H 109**	+	**H 133**
SEM – II	**H 110**	+	**H 101**
SEM – III			**2 Electives**
SEM-I V			**2 Electives**

Economics

H101:Course title: Introduction to Economics

Instructor/Proposed by: Dr Amarendra Das

Prerequisite: None

Course Content:

1.	Role of Government in Organised Society	[1 class]
2.	Expenditure Obligation of Union, State and Local Government	[2 classes]
3.	Sources of Revenue for Union, State and Local Governments	[4 Classes]
4.	Concepts of Budget, and Different deficits	[1 class]
5.	Channels of Resource Transfer from Union to State Governments	[2, classes]
6.	Balance of Payment	[3 classes]
7.	Laws of Demand and Supply	[3 classes]
8.	Equilibrium Price Determination	[1 class]
9.	Exchange rate Determination	[2 classes]
10.	Consumer's Equilibrium	[2 classes]
11.	Producer's Equilibrium	[2 classes]
12.	Current Economic events	[3 classes]

References:

H201: Environmental Economics and Environmental Impact Assessment

Instructor/Proposed by: Dr Amarendra Das

Prerequisite: None

Course Content:

12. Definition of Environmental Economics, Ecological Economics and Natural Resource Economics [1 class]
13. Key environmental problems faced by humanity [2 classes]
14. Limits to Growth [2 classes]
15. Sustainable Development: Strong and weak sustainability [2 classes]
16. Indicators of sustainability [1 class]
17. Market Failure: Causes and Remedies [3 classes]
18. Perspective on Environmental Policy/Regulation [2 classes]
19. Informal Regulation [1 class]
20. Population, Poverty and Economic Growth [1 class]
21. Climate Change, Causes and Consequences [2 classes]
22. Principles of using Renewable resources [2 classes]
23. Principles of using Non-renewable resources [2 classes]
24. Environmental Kuznets Curve [2 classes]
25. Mainstreaming of Environment [2 classes}
26. Environmental Impact Assessment [2 classes}
27. Environmental Regulations in India [1 class]
28. Green Accounting, Concepts, Integrated Economic and Environmental
29. Accounting [2 classes]

H109: Technical Communication I

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **Ideations of Science** (4 classes)
   Categorization and social perspective.

2. **Inscription and the material arts** (4 classes)
   Scientific representation and the figural social.

3. **Mechanics of Writing** (6 classes)
   Structure and compositional logic

4. **The Rhetorical Process** (6 classes)
   Building the argument

5. **Cultural Context and the Sciences** (4 classes)
   Literature and the aesthetic of science.

H110: Technical Communication II

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **The logic of Critique** (4 classes)
   Notions of evidence, proof and fact.

2. **Humanities and empiricism** (4 classes)
   Empirical fallacy and social intervention.

3. **Mechanics of Writing II** (6 classes)
   The forms of knowledge production. Understanding readership.

4. **The Rhetorical Process II** (6 classes)
   Staging the argument. Perspective and Institutional / Disciplinary norms.

5. **Narrativizing the Sciences** (4 classes)
   Scientific correspondence and reflections. Popular science and Science fiction.

Psychology

H 225: Introduction to Psychology

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. Introduction: perspectives, methods, issues.	(3 classes)
2. Perceptual Process.	(4 classes)
3. Learning Process	(3 classes)
4. Memory	(2 classes)
5. Intelligence	(2 classes)
6. Emotion	(2 classes)
7. Personality	(4 classes)
8. Motivation	(4 classes)
9. Attitude	(3 classes)

References:

H 226: Applied Behavioural Science

Instructor/Proposed by: Rooplekha Khuntia

Prerequisite: None

Course Content:

1. Introduction: Personality	(1 class)
2. Interpersonal Relationship and Personal Effectiveness	(5 classes)
3. Social Perception: errors, biases, impression management	(3 classes)
4. Emotional Intelligence: managing emotions.	(3 classes)
5. Group and Team Dynamics.	(5 classes)
6. Effective Communication.	(4 classes)
7. Values and Value System	(3 lectures)
8. Stress: coping and managing stress	(4 classes)

References

Organizational Behaviour by Stephen Robbins, 11th edn, Prentice-Hall India
Understanding Organizations by Udai Pareek, Oxford University Press.
Handouts will be given as and when required.

H 227: Organizational Behaviour

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. **Introduction to Organizational Behaviour** (2 classes)
   Nature of Organizations, what is OB, contributing disciplines, Functions, role and skills of a manager, environmental challenges.
2. **Individual Decision-making process** (3classes)
   Rational decision-making, creativity, bounded rationality, errors and biases, constraints, ethics in decision-making.
3. **Work attitudes** (2 classes)
   Job satisfaction, job involvement, organizational commitment, cognitive dissonance theory.
4. **Motivation** (3 classes)
   Hierarchy of needs theory, two factor theory, ERG theory, equity theory, goal setting and expectancy theory, MBO in practice, other applications.
5. **Power and Politics** (3 classes)
   Bases of power, the general dependency postulate.
6. **Leadership** (3 classes)
   Behavioural theories, contingency theories, contemporary theories, issues in leadership studies.
7. **Groups and team dynamics** (3 classes)
   Stages of group development, group structure, group decision-making, Types of teams, creating effective teams.
8. **Conflict and conflict resolution** (2 classes)
   Functional and dysfunctional conflict, the conflict process, negotiation.
9. **Organizational Structure** (2 classes)
   Elements of organizational structure, common organizational designs, why do structures differ?
10. **Organizational Culture** (2 classes)
    Functions of culture, creating and sustaining culture.
11. **Organizational Change** (3 classes)
    Forces for change, resistance to change, approaches to managing planned change.

Sociology

H 237: Science Communication & the Citizenship

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course content:

1. Introduction, citizenship and Science (4 classes)
2. Science in public, the public understanding of science (4 classes)
3. Public engagement with science (5 classes)
4. Science, communication, ethical codes & scientific norms (4 classes)
5. Patents and dissemination of scientific knowledge (4 classes)
6. Science communication in age of innovation (4 classes)

H 238: Life &Community in Urban world

Proposed by: Debashis Pattanaik

Prerequisite: None

Course content:

1. Introduction, urban space and urban thought, urbanization (4 classes)
2. Emergence and evolution of cities (4 classes)
3. Urban life, urban communities (online and offline) (4 classes)
4. The city in context, migration, sorting and niches (4 classes)
5. Markets and networks (5 classes)
6. Urban ecology, suburbia, urban design, policy and planning (4 classes)

H239: Introduction to Innovation System

By: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course Content:

1. Nature of innovation (4 classes)
2. The innovative firm (2 classes)
3. Innovation processes (4 classes)
4. Regional innovation system (3 classes)
5. Innovation and IPR (4 classes)
6. Education, universities and national innovation system (2 classes)
7. Multinational enterprises and innovation processes (2 classes)
8. Science and innovation policy (4 classes)

H 133: Introduction to Sociology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Origin and Growth of Sociology (2 Lectures)
   Origin and development of sociology as a separate discipline,
   Nature and Scope of Sociology,
   Sociology as a Scientific Discipline.

2. Sociological Perspectives (2 Lectures)
   Conflict, Functionalism and Interactionsim

3. Basic Sociological Concepts (6 Lectures)

Society, Community, Association, Institution, Status and Role,
Types of Society: From early hunting gathering to
industrial development and globalization,
Culture: Components of culture; Norms, values,
folkways, mores, Cultural unity and diversity.
Socialization: Agents of Socialization, Early development
of infant, stages of socialization

4. Social Groups (4 Lectures)

Meaning of Social Groups and Types: Primary Group,
Secondary Group, In-Groups, Out- Group, Quasi- Group,
Reference Group

5. Structure and Stratification (4 Lectures)

Structure, System and Function, caste and class and
Racial and Ethnic group inequalities Social Stratification:
Meaning and Types, Functionalist and Conflict Perspectives
of Stratification, Social mobility: Meaning, horizontal and
vertical mobility

6. Social Institutions (4 Lectures)

Family, marriage and kinship, religion, economy, polity and
education. Functionalist and Conflict Perspectives of institutions.

7. Social processes and Change (4 Lectures)

Social Processes: Co-operation, accommodation, integration,
competition and conflict;
Social Change: Meaning and Definition, Factors of change.

8. Social Problems and Social Control (2 Lectures)

Social Problems and Social disorganization
Social control : Meaning and Types

H 235: Sociology of Science and Technology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Social significance of science and technology (4 Lectures)
   a. Contextual nature of science
   b. Scientist as Indexical and Analogical reasoner
2. Robert Merton's approach to science (3 Lectures)
   a. Ethos of science;
   b. Thomas Theorem and Matthew Effect
3. Perspectives on scientific knowledge (8 Lectures)
   a. Karl Marx, Emile Durkheim, Karl Manheim's sociology of knowledge,
   b. Thomas Kuhn's structures of scientific revolutions
   c. Karl Popper's theory of falsification
4. Recent trends in Sociology of Science (8 Lectures)
   a. Science and technology in developing and developed countries,
   b. Indian context,
   c. Information Technology and globalization,
   d. Manuel Castell's network society, internet and social inequality
5. Case Study Discussions (4 Lectures)

H 236: Perspectives on Indian Society

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content:

1. Indian Social Structure (2 Lectures)
    - a- Traditional Social Organizations
    - b- Culture and Tradition
2. Caste System and Class Structure (7 Lectures)
    - a- Cultural and Structural Views about Caste System
    - b- Inequality, Differentiation and Hierarchy
    - c- Dominant Caste, Sanskritization
    - d- Change and Persistence of Caste system in Modern India
    - e- Caste in Indian Politics
    - f- Backward Caste Movements
    - g- Social Backwardness and Social Justice
3. Class Structure (3 Lectures)
    - a- Class Structure in India
    - b- Agrarian and Industrial Class Structure
    - c- Emergence of Middle Class and Elites

4. Social Institutions: Marriage, Kinship and Family (2 Lectures)

5. Rural and Urban Social Structure: Poverty, Unemployment, etc. (2 Lectures)

6. Changing faces of Rural society/economy/market, Green revolution (2 Lectures)

6. Political processes: Political system and Governance (2 Lectures)

7. Education (2 Lectures)

8. Religion and Society (2 Lectures)

9. Social Change and Development Sustainable and Inclusive (2 Lectures)
Development, Basic developmental issues: Health, Education and Livelihood

10. Contemporary Social Issues (2 Lectures)

SCHOOL OF COMPUTER SCIENCES

A proposal for minor in Computer Science

1 Structure of the curriculum

The curriculum is divided in two category of courses, core courses and optional courses.

1.1 Core Courses

The following courses have been recommended by the steering committee as core courses. The Programming and Data Structure course are proposed to be two lab courses (2 credit each).

1. CS141 and CS142: Programming and Data Structures Lab
2. CS201: Theory of Computation
3. CS202: Discrete Structures and Computation[1]
4. CS301: Design and Analysis of Algorithms

1.2 Elective Courses

For the initial years, we shall offer the following optional courses. A student has to do three courses from the following list to obtain minor.

- CS451: Modern Cryptology
- CS452: Algorithmic Coding Theory
- CS453: Complexity Theory
- CS454: Linear Programming and Combinatorial Optimization
- CS455: Distributed Network Algorithms

In future, more elective courses will be offered based on the interests of the faculties.

1.3 Similarity with other courses

School of Mathematical Sciences offer some courses which are similar to the courses listed above. We make the following observations regarding this.

- Programming and Data Structure course can be merged with the existing Computational Laboratory courses (M141 and M142). I141 and I142 are the two lab courses, which may be offered instead of M141 and M142. The major difference in syllabus is the inclusion of different data structures which are core concepts in Computer Science.

[1] This course was originally titled Discrete Mathematics for Computer Science. We have renamed the course to capture the spectrum of the topics covered, and to avoid any confusion.

- School of Mathematical Sciences also offer Algorithms, Theory of Computation, Cryptology, Information and Coding Theory as PG optional courses. However, in Computer Science, Algorithms and Theory of Computation are fundamental courses, and need to be offered to the undergraduate students. The syllabus of Modern Cryptology, as well as Algorithmic Coding Theory has been designed from Computer Science point of view and significantly different from the SMS courses.

  However, to avoid repetition, we propose, students who take M462 (Cryptology) and M464 (Information and Coding Theory) will not be allowed to take CS451 (Modern Cryptology), and CS452 (Algorithmic Coding Theory) respectively.

2 Syllabi

Syllabi of the courses are given in the following pages. For each subject, the syllabus is organized as follows

1. prerequisite
2. topics
3. references

3 Core Courses

3.1 CS141: Programming and Data Structures Lab-I

Credit : 2

Prerequisite: None

Classes per week: 3P+1L.

Topics Module 0: (6P+2L): Introduction to Computers, Notion of Algorithm, Linux Bash Shell, Simple Shell Programs.
Module 1 (12P+4L): Introduction to Programming: Variables, operators and expressions, input and output statements, Conditions and loops. Functions and recursions.
Module 2 (12P+4L): Arrays, Pointers, Structures, Classes and Objects.
Module 3 (9P+3L): File i/o, command line arguments.
Module 4 (6P+2L). Abstract data type. Linked lists.

- D. Knuth: The Art of Computer Programming. Vol. 1, 2nd ed. Narosa/Addison-Wesley, New Delhi/London, 1973

3.2 CS142: Programming and Data Structures Lab-II

Credit : 2

Prerequisite: CS141 **Classes per week**: 3P+1L. **Topics**

Module 0 (9P+3L): Review of programming, Arrays and Linked List. Bubble Sort and Quick Sort. Binary Search.
Module 1 (12P+4L): Circular Linked Lists, Doubly Linked Lists, Stacks, Queues.
Module 2 (12P+4L): Trees. Binary Search Trees, Tree traversal, Balanced Binary trees. Module 3 (6P+2L): Heap, Priority Queues.

Module 4 (3P+1L). Strings and Searching for Phrases.
Module 6:(Optional) (3P+1L) Dictionaries: universal, k-wise independent, simple tabulation hashing; chaining, dynamic perfect hashing, linear probing, cuckoo hashing

3.3 CS201: Theory of Computation

Credit : 4

Prerequisite: None **Classes per week**: 3L+1T. **Topics**

Module 1 (12L+4T): Introduction to Finite State Automata; DFA,NFA, and their equivalence, Regular Ex- pressions and equivalence with finite state automata.Regular Languages and Properties, Pumping Lemma and applications, Myhill-Nerode Theorem, State Minimization.

Module 2 (12L+4T): Context Free Languages (CFL) and grammars, parse trees, Chomsky Normal Form. Pushdown Automata (PDA), Equivalence of acceptance by final state and empty stack. Equivalence of CFL and PDA, Pumping Lemma for CFL.

Module 3 (12L+4T): Turing Machines and equivalence of different models. Universality. Decidability, Recog- nizability, Enumeration, and Undecidability. Reductions. Rice’s Theorem, recursion theorem.

Module 4 (9L+3T): Notions of P,NP,co-NP, hierarchy theorem, NP completeness, Cook-Levin Theorem, NP completeness proofs of some NP complete problems.

3.4 CS202: Discrete Structures and Computation

Credit 4
Prerequisite: none **Classes per week**: 3L+1T. **Topics**

Module 1 (6L+2T): Review of Sets, Operations, Principles of Inclusion and Exclusion. Functions, relations, Equivalence relations. Countable and uncountable sets. Review of Pigeonhole principle.

Module 2 (6L+2T): Introduction to Propositional Logic, Equivalence and Implications. Truth tables, De Mor- gan's Law, Quantifiers, Inference and Proofs. Introduction to First Order Logic, Syntax and Semantics, Soundeness and Completeness.

Module 3 (6L+2T): Mathematical Induction, Recursions, First order linear recurrence, Geometric series, Re- cursion trees and growth rates of solutions to recurrences, Master Theorem. Generating Functions.

Module 4 (6L+2T): Introduction to counting, sum and product principles, counting subsets. Binomial coefficients and Pascal's triangles. Polya's theory of counting (optional).

Module 5 (3L+1T): Arithmetic Algorithms: Computing GCD, primality testing, RSA.

Module 6 (12L+4T): Graph Theory: Graphs, representations, connectivity, cycles, trees, Spanning tree of a graph, Algorithms to find minimum spanning trees. Eulerian Cycle and Hamiltonian paths, independence number and clique number, chromatic number, Dominating Sets, and Covering Sets. Planar Graphs. Directed Graphs and tournaments.

Module 7(3L+1T) Probabilistic tools, Tail Bounds and Applications.
Module 8 (3L+1T)(optional): Linear Algebraic tools in Combinatorics.

3.5 CS301: Design and Analysis of Algorithms

Credit 4
Prerequisite: CS201, CS202
Classes per week: 3L+1T.
Topics

Module 1 (4L+1T). Introduction and basic concepts - mathematics of algorithm analysis, asymptotic notations, worst case and average case complexity. Review of Searching and Union Find.

Module 2 (8L+3T): Divide and conquer- Motivating algorithms that leads into recurrences, solving recurrences, merge sort and its recurrence, Median computation. Analysis of quicksort.

Module 3 (9L+3T). Greedy algorithms- Greedy choice, optimal structure property, minimum spanning tree, knapsack

Module 4 (8L+2T). Dynamic programming- Integral knapsack, longest increasing subsequence, edit distance, independent sets in trees

Module 5 (8L+3T). Graph algorithms- Recall of representation of graphs, BFS, DFS, shortest path, connected components, topological sort of DAGs, biconnected components and strongly connected components in directed graphs

Module 6. (Optional)(3L+1T) Randomization- Median, randomized quicksort, probabilistic primality testing.

Algebraic Algorithms. Karatsuba's algorithm and the Fast Fourier transform

4 Optional Courses

4.1 CS451: Modern Cryptology

Credit 4

Prerequisite: CS202, CS301.

Classes per week: 3L+1T.

Topics

Module 1: (3L+1T) Introduction and Classical Cryptography, Perfect Secrecy, One Time Pad.

Module 2: (9L+3T) Symmetric Key Encryption. Computational Security, Concrete vs Asymptotic Approach. Semantic Security. Pseudorandom generators and Stream ciphers, Pseudorandom Functions and Block Ciphers. Practical Constructions.

Module 3: (6L+2T) Hash Functions and Message Authentication Codes. Notions of Security, Generic Attacks, Domain Extension techniques, CBC MAC, HMAC, PMAC, Idea of Authenticated Encryption.

Module 4: (6L+2T) Review of Basic Number Theory. Hardness Assumptions. One-way functions, Trapdoor Permutations, RSA assumptions, Discrete Log and Diffie Hellman Assumptions, SIS and LWE Assumptions. Introduction to Elliptic Curves (Optional)

Module 5. (3L+1T) Key Exchange Protocols and Key Management.

Module 6. (6L+2T) Public Key Encryption, Semantic Security, El Gamal Encryption, Padded RSA PKCS#1 v1.5. Random Oracle Technique, OAEP.

Module 7. (6L+2T) Digital Signatures, Hash and Sign paradigm, Schnorr Signature, Forking Lemma, DSA. SSL/TLS.

Module 8. (6L+2T) (Optional) Idea of some of the following notions, Protocols and Zero Knowledge Proofs, Multiparty Computations and Oblivious Transfers, Secret Sharing. Algorithms for factoring and computing discrete logarithms, Linear and Differential Cryptanalysis, Crypto Currencies.

References

- J. Katz and Y. Lindell, Introduction to Modern Cryptography. CRC, 2014.

Possible Instructor: Rishiraj Bhattacharyya.

4.2 CS452: Agorithmic Coding Theory

Credit 4

Prerequisite: CS202

Classes per week: 3L+1T.

Topics Module 1: (9L+3T) Entropy, Characterization and Properties. Application to Combinatorics. Mutual Information and KL Divergence.

Module 2: (6L+2T) Source coding theorem, lossless compression of data, Lempel-Ziv Algorithm, Optimal lossless coding.

Module 3 (6L+2T) Communication channels (binary symmetric, erasure) and channel capacity, channel coding theorem.

Module 3: (6L+2T) Introduction to Error Correcting Codes. Hamming Codes and Hamming Bounds. BCH Codes, Maximum likelihood decoding and syndrome decoding; coding theory bounds.

Module 4: (9L+3T) Reed-Solomon codes and the Berlekamp-Welch decoding algorithm with Analysis. List Decoding of Reed-Solomon Codes.

Module 5. (6L+2T)Reed-Muller Code and Local decoding. Module 6.

(3L+1T) (Optional) Lovasz Local lemma and proof.

Possible Instructor: Rishiraj Bhattacharyya.

4.3 CS453: Complexity Theory

Credit 4

Prerequisite: CS201, CS202, CS301

Classes per week: 3L+1T.

Topics

Module 1 (9L+3T): Introduction, P and NP - Review of Turing machines, universal Turing machines, and uncomputable functions, P vs. NP, NP vs. co-NP, and NP-completeness, EXP, NEXP

Module 2: (3L) Cook Levin’s Theorem

Module 3 (12L+4T): Diagonalization, Space complexity, Polynomial Hierarchy

Module 4 (9L+3T): Interactive Proofs - PCP theorem and its application to approximability Module 5 (4L+1T): Circuit complexity and lower bounds

Module 6 (6L+2T): Hardness vs. Randomness - Randomized Computation, derandomization, Pseudo-random generators

Module 7 (3L+1T): Polynomial identity testing vs Lower bounds for arithmetic circuits

Possible Instructor: Anisur Rahaman Molla.

4.4 CS454: Linear Programming and Combinatorial Optimization

Credit 4
Prerequisite: CS202, CS301
Classes per week: 3L+1T.

Topics

Module 1: (10L+3T) Basic geoemetry and linear algebra related to Linear Programming. Simplex-method and Duality theorem (leading to Von Neumann's minmax principle) and complimentary slackness.

Module 2: (8L+3T) Ellipsoid algorithm. separation oracles.

Module 3: (9L+3T) Semidefinite programming as an extension of linear programming.

Module 4: (9L+3T) LP relaxation. Examples of problems where LP relaxation achieves optimum. Examples where LP/SDP relaxation achieves approximate solution. Integrality gaps.

Module 5: (6L+2T) Rounding, probabilistic roundings, iterative rounding, primal dual methods.

Module 6 (Optional): (3L+1T) Gale-Shapley algorithm, Connection of LP to Cooperative Game Theory core, nucleolus, combinatorial optimization games.

Possible Instructor: Rishiraj Bhattacharyya, Anisur Rahaman Molla.

4.5 CS455: Distributed Network Algorithms

Credit 4

Prerequisite: CS202, CS301

Classes per week: 3L+1T. **Topics** Module 1: (9L+3T) Foundations of distributed network algorithms - Broad- cast, converge-cast, maximal independent set, coloring, leader election, spanning tree algorithms, shortest paths, and routing.

Module 2:(9L+3T) Fundamental concepts in distributed algorithms - Symmetry breaking, locality, synchronizers Module 3:(9L+3T) Basics of distributed network systems - Communication, synchronization, fault-tolerance,

and resource allocation

Module 4:(9L+3T) Applications to real-world networks - Internet, peer-to-peer networks, wireless networks, sensor networks and dynamic networks

Module 5:(9L+3T) Lower bounds using communication complexity, distributed computation of large-scale data, dynamic network algorithms.

NISER

INTEGRATED M.Sc PHYSICAL SCIENCES
(PROGRAM CODE: PHYS13)

Theory courses:

Discipline : **Physical Sciences**
Course Level : **Int. M.Sc**

Course Title : **Physics I (Mechanics and Thermodynamics)**
Course Code : **P101**
Credits : **3**
Course Category : **Core/Elective**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **42**

Proposed by : **UGCS, SPS**

Outcome of the Course:

1. Builds understanding of basic classical mechanics and thermodynamics.

Course Contents:

1. Coordinate systems, elements of vector algebra in plane polar, cylindrical, spherical polar coordinate systems;
2. Dimensional analysis;
3. Solutions for one dimensional equation of motion in various forms, line integrals, conservative forces, potential, work- energy theorems, energy diagrams;
4. Conservation of linear momentum and collisions, variable mass problems;
5. Simple harmonic motion, forced oscillations, damping, resonance;
6. Conservation of angular momentum and elementary rigid body dynamics;
7. principles of thermodynamics, concept of thermodynamic state, extensive and intensive variables;
8. Heat and work, internal energy function and the first law of thermodynamics;
9. Equations of state;
10. Concepts of entropy, entropy maximum and energy minimum principles;
11. Second law of thermodynamics;
12. Thermodynamics potentials, enthalpy, Helmholtz potential, gibbs potential;
13. Conditions of equilibrium, first order phase transitions and Clausius-Clapeyron equation, applications;
14. Chemical reactions;
15. Heat engines and black body radiation;
16. Elementary kinetic theory of gases, equilibrium properties-pressure and equation of state;
17. Transport processes, illustration with simple examples.

Text Books (if any) & Suggested References:

1. Introduction to mechanics: Daniel Kleppner & Robert Kolenkow. new York: Mcgraw-Hill Book Co., inc., 1973.
2. Heat and thermodynamics: an intermediate textbook: Mark W. Zemansky & Richard H. Dittman. 7th ed., new York: Mcgraw-Hill Book co., inc., 1997.
3. Fundamentals of physics: David Halliday, Robert Resnick, & Walker. 8th ed., new Jersey: John Wiley, 2008.
4. University physics: Francis W. Sears, Mark Zemansky, & Hugh D. Young. 7th ed. Massachusetts: addison Wesley, 1987.
5. Mechanics: Keith R. Simon. 3rd ed. Massachusetts: addison Wesley pub. Co., 1971.
6. Thermodynamics, kinetic theory, & statistical thermodynamics: Francis W. Sears, & ger- hard L. Salinger, 3rd ed., norosa 1998.
7. Mechanics: Charles Kittel, Walter D. knight & Malvin a. Ruderman. 2nd ed., new York:
8. Mcgraw-Hill Book Co., inc., 1973.

Course Title : **Physics II (Electricity, Magnetism and Optics)**
Course Code : **P102**
Credits : **3**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **42**

Proposed by : **UGCS, SPS**

Outcome of the Course:

Builds basic understanding of electro and magneto static phenomena and processes. Introduces important concepts of polarization, electromagnetic waves, interference and diffraction.

Course Contents:

1. Summary of electrostatics and magneto statics;
2. gauss law in differential form, electrostatic potential and curl of E;
3. Electric displacement and boundary conditions, linear dielectrics;
4. Motion of charge in electric and magnetic field;
5. Current density, curl and divergence of B, Amperes law, magnetic field H, magnetic susceptibility, boundary conditions
   of B and H;
6. Faradays law in differential form, displacement current;
7. Maxwell’s equations in media, e.m. wave equation, plane waves, polarization and types of polarization, energy and momentum of plane e.m. waves, grating and diffraction experiments, X-rays and Braggs law.

Text Books (if any) & Suggested References:

1. Introduction to Electrodynamics: David J. Griffiths. 3rd ed. New Jersey: Prentice Hall, 1999.
2. Optics: Eugene Hecht. 4th ed. Massachusetts: Addison Wesley, 200
3. Fundamentals of physic: David Halliday, Robert Resnick & Jearl Walker. 8th ed. new York: John Wiley & Sons Inc., 2004.
4. Foundations of Electromagnetic theory: John R. Reitz, Fredrick Milford & Robert Christ. 4th ed. Massachusetts: Addison Wesley, 1993.
5. Fundamentals of optics: Francis a. Jenkins & Harvey e. White 4th ed. new York Mc graw Hill Book Company Inc., 2001
6. Electricity and magnetism (Berkeley physics Course; vol.2): Edward M. Purcell. 2nd ed. new York Mc Graw Hill Book Company Inc., 1985.
7. Optical physics: Stephen g. Lipson, Henry Lipson & D.S. Tannhauser. 3rd ed. new York:
8. Cambridge University press, 1995.

Course Title : **Classical Mechanics I**
Course Code : **P201**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

Training in basic classical mechanics, prepares the student for advanced mechanics courses.

Course Contents:

1. Two-body central force problem (reduced mass); planet orbits; virial theorem.
2. Collisions and scattering, CM and Lab frames, scattering cross section.
3. Motion in non-inertial frames; Coriolis force.
4. principle of virtual work; constraints; D alemberts principle.
5. generalized coordinates, velocities and momenta; Lagranges formulation.
6. principle of least action; formulation by Maupertuis, Euler, Hamilton; Liou- villess theorem.
7. Hamiltons equations; poisson brackets.
8. Canonical transformations; Hamilton-Jacobi equation; generating functions; Symmetries and conservation laws.
9. Small oscillations; normal modes.

Text Books (if any) & Suggested References:

1. Classical Mechanics - Simon
2. Classical Mechanics - Kibble
3. Classical Mechanics - Rana and Jog
4. Classical Mechanics - Goldstein

Course Title : **Mathematical Methods I**
Course Code : **P202**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

Provides training in basic mathematical methods needed in all areas of physics

Course Contents:

1. Vector Calculus.
2. Review of Linear vector spaces, linear operators in linear vector spaces, Hermitian, projection and Unitary operators, normal matrices and diagonalization.
3. Cartesian tensors, 4-vectors and 4-tensors
4. Review of 2nd order linear homogeneous differential equations with variable coefficients, Laplace's equation and method of separation of variables, Solutions to the Bessel, Hermite, Legendre, hyper-geometric and confluent hyper-geometric equations.
5. Review of Bessel functions and spherical Bessel functions.
6. Legendre polynomials and Spherical Harmonics, expansion of a plane wave in terms of spherical waves.

Text Books (if any) & Suggested References:

1. Mathematical Methods in the physical sciences: M. L. Boas
2. Mathematical Methods For physicists: g. B. arfken and H. J. Weber
3. Mathematical Methods for physics: H.W. Wyld
4. Mathematical Methods of physics: Mathews and Walker
5. Mathematical physics i and ii: S.D. Joglekar

Course Title : **Electronics**
Course Code : **P203**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

Provides training in basic methods and theory of electronics needed in all areas of applied physics as well as most experimental fields.

Course Contents:

Foundations, passive elements, sources : dependent sources , survey of network theorems and network analysis, more on dependent sources, transient response of R-L circuit , R-C circuits, sinusoidal steady state response, diodes and diode circuits, power supply: rectifiers, full wave rectifier without center tapped transformer, bipolar junction transistors, constant current source, constant voltage source, field effect transistors, basic differential amplifier circuits, feedback and operational amplifiers, digital electronics, gates, universality of certain gates: using NAND gates, Boolean expressions, other ways of realizing logic functions, multiplexers, flip-flops and latches, counters, sequential circuits: master slave flip-flop (S-R), edge triggered flip-flops, transducers, signal averaging, lock-in amplifier, D/A & A/D converter, multi channel analyzer etc., introduction to microcomputers and microprocessors.

Text Books (if any) & Suggested References:

1. Paul Horowitz, Winfield Hill, The art of electronics, Cambridge University Press
2. Allan R. Hambley, Electronics, prentice Hall
3. Thomas L. Floyd, Electronics Fundamentals, prentice Hall
4. Earl gates, introduction to Electronics, Cengage Learning
5. R.A.gayakwad, Opamps and linear integrated circuits, prentice Hall of india
6. Millman, Grabel, Microelectronics, Mc Graw-Hill
7. DeCarlo, and Lin, Linear circuit analysis, Oxford University press
8. Hayt, Kammerly and Durbin, Engineering Circuit analysis, Tata Mc graw-Hill

Course Title : **Electromagnetism I**
Course Code : **P204**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

Trains the student in detailed computations involved in electrostatics and magnetostatics, solving Maxwell's equations. Introduces to the idea of energy momentum tensor and Gauge invariance.

Course Contents:

1. Coulomb law and electrostatics, greens functions.
2. Laplace and Poisson equations, uniqueness theorem, method of images.
3. Dielectrics, polarization, electric displacement.
4. Steady currents; and magneto statics, magnetic materials.
5. Time-varying fields, Faradays law, displacement current.
6. Maxwell's equations, electromagnetic waves,
7. Lorentz force, Poynting's theorem, electromagnetic energy momentum tensor.
8. Gauge transformations and gauge invariance, electromagnetic potentials.

Text Books (if any) & Suggested References:

1. Classical Electrodynamics: J.D. Jackson 3rd Edition
2. Classical electromagnetic radiation: Mark Heald, J. B. Marion
3. Introduction to electrodynamics: D.J. Griffiths 3rd Edition
4. Foundations of Electromagnetic theory: Reitz and Milford
5. Lectures in physics: Vol. 2: R. P. Feynman, Mathews and Sands

Course Title : **Mathematical Methods II**
Course Code : **P205**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **Mathematical Methods I**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by **: UGCS, SPS**

Outcome of the Course:

Prepares the student in important advanced mathematical concepts and tools. This is needed for advanced physics courses such as applications of quantum mechanics in solid state physics quantum field theory and particle phenomenology

Course Contents:

1. Functions of a complex variable, analytic functions, residue theorem and applications, Taylor and Laurent series, analytic continuation, special analytic functions, method of steepest descent.
2. Hilbert space, Differential operators and Sturm-Liouville theory,
3. partial differential equations,
4. greens functions.
5. generalized functions.
6. Elements of group theory.

Text Books (if any) & Suggested References:

1. Mathematical Methods For physicists: g. B. Arfken and H. J. Weber
2. Mathematical Methods for physics: H.W. Wald
3. Mathematical Methods of physics: Mathews and Walker
4. Mathematics for physicists: P. Dennery and A. Krzywicki

Course Title	**: Quantum Mechanics I**
Course Code	**: P206**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**:**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

First in-depth introduction of basic ideas and methods in quantum mechanics. This is necessary across almost all advanced modern physics courses.

Course Contents:

1. Historical development of quantum theory,
2. Schrodinger equation, one-dimensional problems, Scattering and tunneling from 1-dimensional potentials.
3. Central potentials; hydrogen atom,
4. Symmetries in quantum mechanics, general treatment of angular momentum; spin.
5. identical particles; Pauli exclusion principle.

6. Time-independent perturbation theory; degenerate perturbation theory and variational method.

Text Books (if any) & Suggested References:

1. Introduction to Quantum physics by A. P. French , Edwin F. Taylor
2. Quantum Mechanics: Schiff
3. Introduction to Quantum Mechanics: Griffiths
4. principles of Quantum Mechanics: R. Shankar
5. Modern Quantum Mechanics: J. J. Sakurai

Course Title	**: Electromagnetism II**
Course Code	**: P301**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**: Electromagnetism I**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

Provides training in advanced concepts and methods for understanding advanced electromagnetic phenomena. Important concepts of radiation retardation, multipole expansions, covariant formulation of classical mechanics and relativistic kinematics are taught.

Course Contents:

1. Boundary-value problems in electrostatics and magneto statics.
2. Wave propagation in conductors and dielectrics, Reflection, Refraction, Total internal reflection, Attenuation of waves in metals, Brewster's angle; Lorentz theory of dispersion; wave-guides, fibers and plasmas.
3. Special relativity, Minkowski space and four vectors, four-potential, relativistic formulation of electrodynamics, Maxwell equations in covariant form. Relativistic kinematics.
4. Lenard-Weichert potentials, radiation from an accelerated charge, Larmor formula, bremsstrahlung and synchrotron radiation.
5. Multipole radiation, scattering by free charges.
6. Diffraction.

Text Books (if any) & Suggested References:

1. Classical Electrodynamics: J.D. Jackson 3rd Edition
2. Classical electromagnetic radiation: Mark Heald, J. B. Marion
3. Foundations of Electromagnetic theory: Reitz and Milford
4. Classical theory of fields: L. Landau and E. Lifshitz

Course Title	**: Statistical Mechanics**
Course Code	**: P302**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

The course trains the student in basics of statistical mechanics, introduces important concepts like the density matrix, different kinds of quantum statistics and the idea of fluctuation dissipation theorem.

Course Contents:

1. Thermodynamic potentials, entropy and concepts related to equilibrium state and thermodynamic stability.
2. Kinetic theory of gases, Boltzmann distribution and its implications.
3. Concepts in statistics; randomness, probability distribution, central limit theorem.
4. Density matrix, Liouville's equation, ensemble theory.
5. Gibbs distribution: Classical and Quantum free particles, systems with continuous and discrete spectrum, application to electrons in metals, black-body radiation, white dwarf and Bose-Einstein condensation.
6. Real gases and gas-liquid transition: virial expansion, radial distribution function, Born green Hierarchy, van der Waals equation.
7. Introduction to response, fluctuation and noise, Einstein formula.

Text Books (if any) & Suggested References:

1. Statistical physics - Reif
2. intro to Stat. physics, Kerson Huang (Taylor and Francis)
3. Statistical physics of particles, M. Kardar (Cambridge)
4. Statistical physics Chandler
5. Statistical physics: R. P. Feynman
6. Statistical physics Vol. I: L. Landau and E. Lifshitz

Course Title : **Quantum Mechanics II**
Course Code : **P303**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **Quantum Mechanics I**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

Prepares the student in intermediate level of quantum mechanics needed across many advanced disciplines. Introduces important concepts for time evolution in quantum mechanics, propagators and path integrals and relativistic quantum mechanics.

Course Contents:

1. Hilbert space formalism for quantum mechanics
2. Review of time independent perturbation theory. WKB approximation, bound state perturbation theory.
3. Time-dependent perturbation theory; scattering theory.
4. greens function methods; path integral in non-relativistic theory.
5. Relativistic wave equations: Dirac Equation, Dirac particle in presence of an electromagnetic field leading to g = 2;
   holes.
6. Foundational issues in quantum theory.

Text Books (if any) & Suggested References:

1. Introduction and advanced Quantum Mechanics books by J. J. Sakurai
2. Principles of Quantum Mechanics: R. Shankar
3. Quantum Mechanics: by Merzbacher
4. Quantum Mechanics (volumes 1 and 2): A. Messiah
5. Quantum Mechanics: Cohen-Tannoudji

Course Title : **Special Theory of Relativity**
Course Code : **P304**
Credits : **4**
Course Category : **Core**
Course Prerequisite :
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

Trains the student in basic and advanced concepts in special relativity and introduces the basic ideas up on which General relativity is based on. Also provides in depth training in applications of group theory in relativity. Prepares the student for studying general relativity in future.

Course Contents:

1. Physics before relativity: Galilean relativity, Newtonian mechanics, electrodynamics and inconsistency with Galilean relativity, ether and experiments for its detection, failure to detect ether. Measurement of velocity of light in moving frames. Lorentz, Poincare and developments towards relativity.
2. Einstein's special theory: Constancy of velocity of light as a postulate. Derivation of Lorentz transformation. Length contraction and time dilation. Mass- energy relation, Doppler shift. Minkowski space-time diagram, boosts as complex rotations in Minkowski space.
3. Four dimensional space-time continuum, Lorentz transformations as coordinate transformations, vectors, scalar product, scalars, tensors, contravariant and covariant objects, laws of physics as tensor equations. Mechanics, hydro-dynamics and electrodynamics as tensor equations.
4. Beyond special relativity: Inertial and gravitational mass. Equivalence principle. Introducing gravitational field as general coordinate transformation. Principle of general covariance. Metric tensor and affine connection. Gravitational potential as metric tensor. Laws of physics in presence of gravitation. gravitational time dilation and red shift. Experimental observation of gravitational red shift.
5. Lorentz and Poincare groups: abelian and non-abelian groups. Rotations in two and three dimensions. generators of rotations. Representations (finite dimensional). Casimir operators. Lorentz transformations as a group. Generators for translations, rotations and boosts. Finite and infinite dimensional representations. Casimir operators.

Text Books (if any) & Suggested References:

1. Introduction to Special Theory of Relativity, Resnick
2. Relativity, a. Einstein

3. Classical Electrodynamics, J. D. Jackson
4. Electrodynamics, Panofsky and Phillips
5. Classical Mechanics, Goldstein
6. GTR and Cosmology, Weinberg
7. Lecture notes in NISER wiki (also at http://www.iopb.ser.in/ phatak)

Course Title	**: Atoms, Molecules and Radiation**
Course Code	**: P305**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**: Quantum Mechanics I and II**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

Important topics in atomic physics, selection rules, atomic and molecular spectroscopy is taught. The training is imperative to work in the area of applied solid state physics and optics.

Course Contents:

1. Hydrogen atom including L.S coupling and hyperfine interaction.
2. Helium atom introduction to exchange and correlation; variational calculation of ground and excited-states.
3. introduction to the idea of effective potentials for electrons in many-electron atoms (Hartree theory and idea of self- consistency); use of Clementi-Roetti wave-functions.
4. One-electron atomic systems in an electromagnetic field; dipole approximation and associated selection rules; Stark and
   Zeeman effect (note: instructor will have to introduce the students to time-dependent perturbation theory here).
5. Einstein's A and B coefficients, population inversion, laser action, derivation of A and B coefficients from semi-classical
   treatment of light-atom interaction.
6. Molecular formation: Discussion of atom-atom interaction, van der Waals force, ionic interaction and covalent bond.
7. Molecular structure: Hydrogen molecule MO and VB pictures; importance of correlations.
8. Molecular spectra (restricted to two atom molecules) electronic, rotational and vibrational.
9. Some lectures left for interesting current topics.

Text Books (if any) & Suggested References:

1. Elementary atomic Structure - G. K. Woodgate
2. atomic physics: C. J. Foot
3. atoms, molecules and photons: W. Demtroder

4. The Theory of atomic Spectra: Condon and Shortley
5. Topics in atomic physics: C.E. Butkhardt and J. L. Leventhal
6. physics of atoms and Molecules - B. H. Bransden and C. J. Joachain

Course Title	**: Introduction to Condensed Matter Physics**
Course Code	**: P306**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**: Quantum Mechanics I and II, Statistical Mechanics**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by	**: UGCS, SPS**

Outcome of the Course:

This is the first course in condensed matter physics and draws on quantum and statistical mechanics to provide a foundation in basic concepts and techniques required to tackle advanced courses in the area of solid state physics.

Course Contents:

1. General introduction, Drude and Sommerfeld model;
2. Crystal structure; x-ray diffraction;
3. Cohesive energy;
4. Bloch's theorem; Band theory nearly free electrons; tight binding approximation; semi-classical dynamics of electrons in a band; motion of electrons in super-lattices; motion of atoms in an optical potential;
5. Semiconductors;
6. Thermal properties of insulators; phonons;
7. Landau levels - de Hass van Alphen effect and integer quantum hall effect;
8. Magnetism;
9. Superconductivity;

Text Books (if any) & Suggested References:

1. Introduction to Solid-state physics, C. Kittel
2. Solid-state physics, N. Ashcroft and N.D. Mermin,
3. Solid-state physics, Rosenberg
4. Solid state physics, Burn
5. Oxford Series in Condensed Matter [Oxford university press]

Course Title : **Nuclei and Particles**
Course Code : **P307**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **Quantum Mechanics I**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

Provides training in basic concepts and methods in nuclear physics, stability of nucleons and classification of interactions. The course prepares the student to begin working in experimental and theoretical high energy physics.

Course Contents:

1. Nuclear systematics and stability (masses, sizes, spins, magnetic moments, quadrupole moments, energetics and stability against particle emission, beta decay).
2. Nucleon-nucleon interaction, space-time symmetries, conservation laws, isospin symmetry, low energy (effective range, shape independence, meson exchange picture (qualitative).
3. Liquid drop model, compound nucleus and fission, nuclear vibrations and rotations.
4. Shell model, introduction to Hartree-Fock, spins and magnetic moments.
5. Direct nuclear reactions.
6. Mesons and baryons, resonances, SU(3) classification, isospin and strangeness, quark model, colour.
7. Weak interactions (nuclear and particle decays, neutrinos).

Text Books (if any) & Suggested References:

1. introduction to nuclear physics - Roy and Nigam
2. nuclear physics - Preston and Bhaduri
3. Introduction to particle physics - Griffith
4. introduction to particle physics - Perkins

Course Title : **Classical Mechanics II: Mechanics of Continuous Media**
Course Code : **P401**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **Classical mechanics I**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This is an advanced course introducing the students to concepts and techniques in mechanics of continuous media. It prepares them to tackle a variety of problems in many areas such as fiber optics, fluid dynamics and structural stability of materials.

Course Contents:

1. Rigid body dynamics; Euler angle, Euler equations (should solve up to nutation of a top).
2. Elastic Continua: Small deformations, stress tensor, elastic energy, equation of motion. Mechanics of continuous media.
3. Strings: Euler Lagrange equation for continuous medium, Bernoulli's and D'alembert's solutions, Sturm-Liouville theory.
4. Membranes: Scalar Helmholtz equation and its solution in various geometries.
5. Fluids: Newtons second law for an ideal fluid, continuity equation, Euler equation, Bernoulli's theorem, sound waves in fluids.
6. Surface waves on Fluids: Tidal waves (long waves on shallow water), surface waves on deep water, solitary waves.
7. Viscous Fluids: Viscous stress tensor, Navie'r Stokes equation, examples of incompressible flow, sound waves in viscous fluids.

Text Books (if any) & Suggested References:

1. Classical Mechanics - Rana and Joag
2. Classical Mechanics - Goldstein
3. Classical Mechanics - Fetters and Walecka
4. Fluid Mechanics: L. Landau and E. Lifshitz
5. Theory of Elasticity: L. Landau and E. Lifshitz

Laboratory Experiments

Course Title	**: Physics Laboratory I**
Course Code	**: P141**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by **: UGCS, SPS**

Outcome of the Course:

Introduces the students to basic methods in experimental techniques, statistics and error analysis. The focus is on basic mechanics and little amount of solid state physics experiments.

Course Contents:

1. Compound pendulum
2. Moment of Inertia
3. Young's modulus
4. Soft massive spring and standing waves
5. Specific heat of graphite
6. Electrical Equivalent of Heat
7. Measurement of Thermal Conductivity
8. Viscosity
9. Surface tension by capillary rise

Text Books (if any) & Suggested References:
None

Course Title	**: Physics Laboratory II**
Course Code	**: P141**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by **: UGCS, SPS**

Outcome of the Course:

Expands on the training provided in P141 with further basic experiments focused on electromagnetism and optics.

Course Contents:

1. Conversion of Voltmeter to Ammeter and vice-versa.
2. Study of Electromagnetic Damping
3. Tangent Galvanometer
4. Magnetic field variation along the axis of a circular coil and a Helmholtz coil
5. Determination of the resolving power of a telescope
6. Dispersive Power of Prism
7. Study of Newton's rings.
8. Laser Diffraction and Interference
9. Malus's law

Text Books (if any) & Suggested References:

None

Course Title : **General Physics Laboratory**
Course Code : **P241**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

Expands the training of the students, building on P141 and P142 to train them in experimental methods in basic solid state experiments.

Course Contents:

1. Verification of Coulomb's law
2. Coefficient of linear expansion
3. Magnetic susceptibility of a paramagnetic material.
4. Young's modulus of glass by Cornu's method
5. Specific charge (e/m) of electron
6. Magnetic hysteresis
7. Dielectric constant

Text Books (if any) & Suggested References:
None

Course Title	**: Basic Electronics Laboratory**
Course Code	**: P242**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This final basic training in experimental physics equips the student with concepts and methods for doing advanced experiments in electronics.

Course Contents:

1. Study of Normal and Zener Diode Characteristics
2. Half-wave Rectifier Circuit Without and with filter
3. Full-wave Rectifier Circuit Without and with filter
4. Setting up a Power Supply using a Zener Diode as Voltage Regulator
5. Study of LCR Resonant Circuit
6. RC CIRCUIT AS A FILTERING AND PHASE SHIFTING NETWORK
7. Bipolar Junction Transistor Static Characteristics
8. Study of Common Emitter Transistor Amplifier circuit

Text Books (if any) & Suggested References:

None

Course Title	**: Modern Physics I & Optics Laboratory**
Course Code	**: P243**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

The course, though experiments introduces to fundamental findings that lead to the discoveries of special relativity and quantum mechanics. In the process the course also teaches them how to use interferometers and diffraction gratings required in future courses.

Course Contents:

1. Franck-Hertz Experiment
2. Emission spectra of metals and hydrogen
3. Planck's constant by Photoelectric Effect
4. Sodium D-line splitting
5. Diffraction by ultrasonic waves in liquids
6. Michelson Interferometer
7. Fabry-Perot Interferometer

Text Books (if any) & Suggested References:

None

Course Title	**: Advanced Electronics Laboratory**
Course Code	**: P244**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

In this course the students learn advanced electronic experimentations. This includes transistors, operational amplifiers digital circuits and counters and are crucial to carrying our future experimental research.

Course Contents:

1. Study of basic configuration of OPAMP (IC-741), simple mathematical operations and its use as comparator and Schmitt trigger
2. Differentiator, Integrator and active filter circuits using OPAMP (IC-741)
3. Phase shift oscillator using OPAMP (IC-741)
4. Study of various logic families (DRL, DTL and TTL)
5. Study of Boolean logic operations using ICs
6. Design and study of full adder and subtractor circuits
7. Design and study of various flip flop circuits (RS, D, JK, T)
8. Design and study of various counter circuits (up, down, ring, mod-n)
9. Design and study of astable multivibrators using IC 555

Text Books (if any) & Suggested References:
None

Course Title	**: Nuclear Physics and Instrumentation Laboratory**
Course Code	**: P341**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This course teaches the students about basic experimentation in nuclear physics. It in conjunction with theory course on Nuclear physics P307 builds a background to carry our basic research in the field of experimental particle physics.

Course Contents:

1. Experiments using GM counter and counting statistics
2. Rutherford Alpha scattering
3. Gamma Ray spectroscopy
4. Compton Scattering

Text Books (if any) & Suggested References:

None

Course Title	**: Computational Physics Laboratory**
Course Code	**:**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by **: UGCS, SPS**

Outcome of the Course:

The course provides a basic training in numerical and statistical methods used in all branches of physics though programming and hands on tutorial sessions.

Course Contents:

Language: C++ (adequate background is expected from previous programming Labs in earlier semesters). Statistical description of data: Mean, Variance etc.; Finding zeroes of a function; Differentiation, integration; Matrix algebra; Inverse of Matrix, Differential equations; algebraic computation; Least square fitting for linear and non linear functions, Minimization of a function, General non-linear fit.

Text Books (if any) & Suggested References:

None

Course Title	**: Modern Physics II Laboratory**
Course Code	**: P343**
Credits	**: 2**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 42**

Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course provides further experience to the students in experiments in modern quantum mechanics including highly specialized experiments on electron spin resonance and introduces them to cutting edge research area of solar cells.

Course Contents:

1. Zeeman effect
2. Electron spin resonance of DPPH
3. Experiments using Expeyes interface board
4. Solar cell characteristics

Text Books (if any) & Suggested References:

None

Course Title : **Solid State Physics Lab I Laboratory**
Course Code : **P344**
Credits : **2**
Course Category : **Core**
Course Prerequisite :
Contact Hours (28/42/56) (including tutorials) : **42**

Proposed by : **UGCS, SPS**

Outcome of the Course:

In this course the student is introduced to a variety of basic experiments in solid state physics. This prepares them for taking up more challenging experiments in this are in future courses.

Course Contents:

1. Hall effect with temperature
2. Energy band gap of semiconductor
3. Lattice dynamics of monoatomic and diatomic lattice
4. Study of Magnetoresistance

Text Books (if any) & Suggested References:
None

Course Title	**: Solid State Physics II Laboratory**
Course Codes	**: P441**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**:**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course exposes the student to advanced solid state experiments. It, in part, prepares them in both areas to take on further advanced experiments in future courses.

Course Contents:

1. Superconductivity using LC Circuit
2. Dielectric constant at microwave frequency
3. Study of Magnetostriction using Michelson's interferometry
4. Study of Earth Field Nuclear Magnetic Resonance
5. Study of optical Tamm surfaces

Text Books (if any) & Suggested References:
None

Course Title	**: Laser and spectroscopy Laboratory**
Course Codes	**: P442**
Credits	**: 4**
Course Category	**: Core**
Course Prerequisite	**:**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course exposes the student to basic laser optics and spectroscopy experiments. It, in part, prepares them in both areas to take on further advanced experiments in future courses.

Course Contents:

1. Study of Faraday effect
2. Study of Raman spectroscopy
3. Alignment of He-Ne Laser and study of spectral and spatial properties of the beam
4. Study of Nd-Yag laser
5. Study of Z-scan technique

Text Books (if any) & Suggested References:

None

Course Title : **Integrated Physics Laboratory I**
Course Code : **P443**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course extends the knowledge and expertise of students in advanced experimental techniques readying them to begin experimental research across a multitude of areas in solid state and high energy physics.

Course Contents:

1. Study of Negative group delay in electronics circuit
2. Study of Lock-in-amplifier
3. Study of Coupled Oscillators
4. Study of Holography
5. Study of LED as single photon detector

Text Books (if any) & Suggested References:
None

Course Title : **Integrated Physics Laboratory II**
Course Code : **P444**
Credits : **4**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course extends the knowledge and expertise of students in advanced experimental techniques readying them to begin experimental research across a multitude of areas in solid state and high energy physics.

Course Contents:

1. Study of Laser Gyroscope
2. Study of Noise fundamentals
3. Study of various optical experiments using Microwaves
4. Study of Laser Doppler Anemometry
5. Study of Muon life time using FPGA

Text Books (if any) & Suggested References:

None

Projects

Course Title : Physics Project I
Course Code : **P398**
Credits : **4**
Course Category : **Mandatory**
Course Prerequisite : **None**
Contact Hours (28/42/56) :
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course, is meant to provide mini research or advanced reading project with a supervisor on very specialized topic. At the end the student is expected to have mastered the fundamentals of the relevant area and present a poster on the semester long project work.

Course Contents:
6^{th} semester project

Text Books (if any) & Suggested References:
None

Course Title **:** Physics Dissertation project I
Course Code **: P598**
Credits **: 12**
Course Category **: Mandatory**
Course Prerequisite **:**
Contact Hours (28/42/56) **:**
(including tutorials)

Proposed by **: UGCS, SPS**

Outcome of the Course:

This is the first half of a year-long project that the final year Int. MSc student has to do. This involves preparing adequate reading material that will allow the student to take up challenging reach problem with a supervisor in a specific area of work.

Course Contents:
Project work

Text Books (if any) & Suggested References:
None

Course Title **:** Physics Dissertation project II
Course Code **: P599**
Credits **: 20**
Course Category **: Mandatory**
Course Prerequisite **:**
Contact Hours (28/42/56) **:**
(including tutorials)

Proposed by **: UGCS, SPS**

Outcome of the Course:

In the final semester project, the student is expected to be able to build on the background in the ninth semester to work on a research problem. Many times this typically leads to a publication of a paper is a reputed international journal.

Course Contents:

Project work

Text Books (if any) & Suggested References:
None

Elective courses

Course Title : **Advanced Solid State Physics**
Course Code : **P451**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : P302 (Quantum Mechanics II), P305 (Introduction to condensed matter Physics)
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This is a course which aims to prepare students with advanced concepts, techniques and knowledge of solid state physics that allows them to start working on basic research problems in the broad area of condensed matter theory, materials theory or solid state experiments.

Course Contents:

1. Introduction to physics of metals and insulators. Electrical, thermal and optical properties of metals and insulators, and need to study excitation spectrum in detail.
2. Electrons, phonons and Magnons, Screening and plasma Oscillations
3. Charge impurity in a metal: Friedel Oscillation, Magnetic impurity in a metal,
4. Moment formation and suppression in metals.
5. Electron gas in Low dimension: impurity and interaction effects.
6. Quantum Hall Effect
7. Metal-insulator transition
8. Electron - phonon interaction, Frohlich Hamiltonian and Superconductivity

Text Books (if any) & Suggested References:

1. Advanced Solid State physics: Philip Phillips
2. Elementary Excitations in Solids: D. Pines
3. Solid State physics: Marder
4. Concepts in Solids: P.W. Anderson
5. Basic notions in Condensed Matter: P.W. Anderson

Course Title : **Computational Physics**
Course Code : **P452**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : P206 (Quantum Mechanics I), P301 (Statistical Mechanics)
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course provides training in computation tools required in research across a wide variety of fields including condensed matter, high energy phenomenology and lattice field theories.

Course Contents:

1. Monte Carlo: Markov chain, Metropolis algorithm, Ising Model, Quantum Monte Carlo
2. Molecular Dynamics: integration methods, extended ensembles, molecular systems
3. Variational methods for Schrodinger Equation: Hartree and Hartree-Fock methods, post HF methods
4. Density Functional Theory: Fundamental theorem, XC-potentials
5. Quantum Molecular dynamics: Carr-Parinello approach, hybrid QM/MM method
6. Computational methods for lattice field theories

Text Books (if any) & Suggested References:

1. Computational physics, Joseph Marie Thijssen, Cambridge University press
2. an introduction to Computational physics, Tao pang, Cambridge University press
3. M. P. Allen and D. J. Tildesley, Computer Simulation of Liquids, Clarendon press
4. D. p. Landau and K. Binder, a guide to Monte Carlo Simulations in Statistical physics, Cambridge University press
5. M. Suzuki, editor, Quantum Monte Carlo Methods, Springer-Verlag
6. I. Prigogine and Stuart a. Rice, new Methods in Computational Quantum Mechanics, Wiley.
7. D. Frankel and B. Smit, Understanding Molecular Simulation, second edition, academic press.
8. Computational Methods in Field Theory, H. Gausterer and C.B. Lang, Lecture notes in physics 409
9. R. G. Parr and W. Yang, Density Functional theory of atoms and molecules

10. F. Jensen, introduction to Computational Chemistry

11. C. J. Crammer, Essentials of computational chemistry

Course Title : **Quantum Field Theory I**
Course Code : **P453**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : P304 (Electromagnetism II), P302 (Quantum Mechanics II
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This first course on quantum field theory prepares the student for tackling future advanced courses in the area of high energy physics.

Course Contents:

1. Relativistic quantum mechanics - Klein-Gordon equation, Dirac equation, free- particle solutions
2. Lagrangian formulation of Klein-Gordon, Dirac and Maxwell eqns., Symmetries (Norther's theorem), Gauge field, actions.
3. Canonical quantization of scalar and Dirac fields.
4. Interacting fields - Heisenberg picture, perturbation theory, Wicks theorem, Feynman diagram.
5. Cross-section and S-matrix.
6. Quantization of gauge field, gauge fixing.
7. QED and QED processes.
8. Radiative corrections - self-energy, vacuum polarization, vertex correction.
9. LSZ and optical theorem.
10. Introduction to renormalization.

Text Books (if any) & Suggested References:

1. An Introduction to Quantum Field Theory by M. Peskin and D. V. Schroeder
2. Quantum Field theory: From Operators to Path Integrals, 2nd edition by Kerson Huang
3. Quantum Field Theory by Mark Srednicki
4. Quantum Field Theory by Claude Itzykson and Jean Bernard Zuber
5. Notes from Sidney Coleman's Physics 253a, arXiv: 1110.5013

Course Title	**: Particle Physics**
Course Code	**: P454**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**:** P306 (Nuclei & Particles) P303 (Special Theory of Relativity)
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the basics of particle physics and allows the student to start beginning research work in high energy phenomenology.

Course Contents:

1. Elementary particles, discrete symmetries and conservation laws.
2. Symmetries and Quarks.
3. Klein-Gordon equation, concept of antiparticle.
4. Lorentz symmetry and scalar / vector / spinor fields.
5. Dirac equation
6. Scattering processes of spin-1/2 particles (Feynman rules as thumb rule QFT course), propagators.
7. Current-current interactions, weak interaction, Fermi theory.
8. gauge symmetries, spontaneous symmetry breaking, Higgs mechanism
9. Electroweak interaction, Glashow-Salam-Weinberg model.
10. Introduction to QCD, structure of hadrons (form factors, structure functions), parton model, Deep inelastic scattering.

Text Books (if any) & Suggested References:

1. Gauge Theories in Particle Physics, Vol I & II by Aitchison and Hey
2. Foundations of Quantum Chromodynamics by T. Muta
3. Modern Particle Physics by Mark Thomson
4. Introduction to Elementary Particle by David Griffiths
5. Quarks and Leptons by F. Halzen and A.D. Martin
6. Introduction to High Energy Physics: D.H. Perkins
7. Introduction to Elementary Particle Physics: A. Bettini
8. Particle Physics by B. R. Martin and G. Shaw

Course Title	**: Introduction to Phase Transitions and Critical phenomena**
Course Code	**: P455**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P301 (Statistical Mechanics)**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in statistical mechanics crucial for the student to take up basic research work.

Course Contents:

Experimental evidences of classical and quantum critical phenomena, thermodynamic potentials. heat capacity, magnetic susceptibility, phases, phenomenology of 1st order phase transitions, continuous transitions, order parameters and models: Ising, XY, Heisenberg, universality and scaling, Ginzburg-Landau-Wilson theory, spontaneous symmetry breaking. Bose- Einstein condensation, expansion around upper critical dimension, domain walls and surface tension, 1D Ising model and instantons, critical behavior, critical exponents, relations between critical exponents, Kadanoff scaling, universality conjecture, calculation of critical exponents: real space RG methods, phi- 4 theory, 4-epsilon expansion.? RG of Wilson and Fisher, continuous symmetry: Mermin-Wagner theorem. goldstone modes, non- linear sigma-model, vortices, Kosterlitz-Thouless phase transition, topology and duality, surface roughening and Sine-Gordon models, quantum critical phenomena, dissipative quantum tunneling, quantum phase transitions, Bose-Hubbard model.

Text Books (if any) & Suggested References:

1. Introduction to phase Transitions and Critical phenomena by H. Eugene Stanley
2. Modern approach to Critical phenomena by Igor Herbut
3. Statistical physics: Statics, Dynamics and Renormalization by Leo p. Kadanoff
4. The Theory of Critical phenomena by J. J. Binney, a. J. Fisher, M. E. J. Newman
5. Modern Theory of Critical phenomena by Shang-keng Ma
6. Statistical Mechanics of phase Transitions by J. Yeomans
7. Field Theory, the Renormalization group and Critical phenomena by Daniel J. Amit

Course Title : **Nonlinear Optics and Lasers**
Course Code : **P456**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P204 (Electromagnetism I)**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in modern topics in laser optics and non-linear optics necessary for the student to take up basic research work in optics.

Course Contents:

1. Introduction to general lasers and their types, emission, absorption processes and rate equations, population inversion, gain, optical cavities, three and four level lasers, CW and pulsed lasers, Q-switching and mode-locking, physics of gas discharge, atomic, ionic, molecular, liquid, and excimer lasers, optical pumping, Holography
2. Overview of non- linear Optics, nonlinear polarization, nonlinear optical susceptibility, Symmetry considerations
3. Wave propagation in nonlinear media
4. Electro optical and magneto optical effects
5. Higher harmonic generations, phase matching and quasi phase matching, Sum and difference frequency generation, Optical parametric amplification and oscillation
6. Kerr effect, Cross-Phase Modulation, Self phase modulation, Multi-photon processes , Self focusing, Four-Wave Mixing
7. Laser Spectroscopy, wave front conjugation Stimulated Raman Scattering, Stimulated Brillouin Scattering, Optical solitons and Optical pulse compression

Text Books (if any) & Suggested References:

1. Lasers by P. W. Milonni and J. H. Eberly
2. Lasers by A. E. Siegman
3. Principles of Lasers by Orazio Svelto
4. The Principles of Nonlinear Optics by Y. R. Shen
5. Nonlinear Optics by Robert W. Boyd
6. Nonlinear Optics: Basic Concepts by D.L. Mills
7. Optical waves in crystals by Amnon Yariv and Pochi Yeh

Course Title	**: General Theory of Relativity and Cosmology**
Course Code	**: P457**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P303 (Special Theory of Relativity)**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This course teaches the students, advanced concepts and methods in general relativity crucial for the student for building their background for research work in general relativity and cosmology.

Course Contents:

1. Review of Newtonian Mechanics. Special theory of relativity. prelude to general relativity, historical developments
2. 4-Vectors and 4-tensors, examples from physics
3. Principle of Equivalence, Equations of motion, gravitational force
4. Tensor analysis in Riemannian space, Effects of gravitation, Riemann-Christoffel curvature tensor, Ricci Tensor, Curvature Scalar
5. Einstein Field Equations, Experimental tests of GTR
6. Schwartzchild Solution, gravitational lensing
7. Gravitational waves: generation and detection
8. Energy, momentum and angular momentum in gravitation
9. Cosmological principle, Robertson-Walker metric, Redshifts
10. Big-Bang Hypothesis, CMB
11. Issues in Quantum gravity

Text Books (if any) & Suggested References:

1. A first course in General Relativity by Bernard Schutz
2. Gravity by James B. Hartle
3. The Classical Theory of Fields by L. D. Landau and E. M. Lifshitz
4. Gravitation and Cosmology by Steven Weinberg
5. Introducing Einstein's Relativity by Ray D'Inverno
6. General Relativity by P. Dirac

Course Title : **Soft Condensed Matter**
Course Code : **P458**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P301 (Statistical Mechanics)**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in soft matter physics, with the aim to build their background for future research work in this area.

Course Contents:

1. What is Soft Condensed Matter: forces, energies and time scales.
2. phase transition in soft matter, Radial distribution function and description of liquids.
3. Colloids polymers gels Liquid Crystals
4. Soft matter in nature

Text Books (if any) & Suggested References:

1. Principles of Condensed Matter Physics by P. M. Chaikin and T. C. Lubensky
2. Soft Condensed Matter by R. A. L. Jones
3. Structured Fluids: Polymers, Colloids, Surfactants by T. Witten
4. Introduction to Soft Matter: Polymers, Colloids, Amphiphiles and Liquid Crystals by I. W. Hamley
5. Soft Matter Physics by M. Klemanand and O. D. Lavrentovich
6. Colloidal Dispersions by W. B. Russel, D. A. Saville and W. R. Showalter
7. Dynamics of Colloids by J. K. G. Dont
8. Intermolecular and Surface Forces: With Applications to Colloidal and Biological Systems by J. Israelachvili
9. Introduction to Liquid Crystals by P. J. Collings and M. Hird
10. Polymer solutions -- an introduction to physical properties by I. Teraoka

Course Title	**: Applied Nuclear Physics**
Course Code	**: P459**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P303 (Quantum Mechanics II)**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in applied nuclear physics, with the aim to build their background for future research work in this area.

Course Contents:

1. Basis of nuclear structure and reactions
2. Radioactivity and radioactive decays: Detecting nuclear radiations, Alpha decay, beta decay, gamma decay
3. Passage of charged particle through matter.
4. Detectors and accelerators.
5. Applications: Effects of radiation on biological systems and Nuclear medicine, Industrial Applications
6. Power from Fission and Fusion: Characteristics of Fission, Nuclear Reactors, Thermonuclear fusion.

Text Books (if any) & Suggested References:

1. Nuclear Physics: Principles and Applications, John Lilley, Wiley Publications
2. The Atomic Nucleus, Robley D. Evans, Tata McGraw-Hill Publishing.
3. Fundamentals of Nuclear Reactor Physics, Elmer Lewis, Elsevier Publishing.
4. An Introduction to the Passage of Energetic Particles through Matter, N. J. Carron, CRC Press
5. Accelerator Physics, S. Y. Lee, World Scientific

Course Title	**: Many Particle Physics**
Course Code	**: P460**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P301 (Statistical Mechanics), P302 (Quantum Mechanics II)**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in many particle physics, with the aim to build their background for future research work in this area.

Course Contents:

1. Second Quantization, One and two body operators
2. Observables and their relationship to one and two body greens functions
3. Thermodynamic potential, Spectral functions, analytic properties of greens function
4. Linear Response, correlation function, sum rules
5. Canonical Transformation: Bogoliubov Valetin, Schrieffer Wolf, etc.
6. Equation of motion,
7. Diagrammatic perturbation theory for green function and the thermodynamic potential, Luttinger Ward identities.
8. Mean field theory
9. Functional integration Methods

Text Books (if any) & Suggested References:

1. Statistical Physics part 2 by E.M.Lifshitz & L.P. Pitaevskii
2. Quantum Theory of Many body particle systems by Fetter Walecka
3. Introduction to Many-Body Physics by Piers Coleman
4. Many particle physics by Ben Simon
5. Green’s Function for Solid State Physics by S. Doniach & E.H. Sondheimer
6. Quantum Mechanics R. Shankar

7. Quantum many particle systems J. W. Negele and H. Orland

8. Techniques and Application of Path-integration by S.Schulman

Course Title	**: Physics of Mesoscopic Systems**
Course Code	**: P461**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P305 (Introduction to Condensed Matter Physics)**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This course teaches the students advanced concepts and methods in mesoscopic physics, with the aim to build their background for future research work in this area.

Course Contents:

1. Effects of magnetic fields: The Aharonov Bohm effect; 2D electron gas; Landau levels; Transverse modes in 2D quantum
   wire; Shubnikovde Haas oscillations; Magnetic edge states; integer Quantum Hall effect, Fractional Quantum Hall effect

2. Electron transport: Boltzmann semiclassical transport; Onsager reciprocity relations; Conventional Hall effect; Drude conductivity; Einstein relation; Electronic states in quantum confined systems; Conductance from transmission; Ballistic transport; Quantum of conductance; Landauer formula; Quantum point contact; T .matrices; Smatrix and green functions; Current operator; Landauer Buttiker formalism; Linear response and Kubo formula; nonequilib- rium green's function approach to transport; Scattering: Breit Wigner resonance and Fano resonance; Delay time for resonances; Friedel sum rule; Levin- son.s theorem; Singleelectron tunneling: Coulomb blockade and Kondo effect
3. Quantum information: Josephson Junctions and Cubits; Metastable states and escape dynamics
4. Disordered conductors: Weak localization; Mesoscopic fluctuations; Random Matrices; Anderson localization; Quantum
   Chaos; Dephasing; Decoherence

Text Books (if any) & Suggested References:

1. Electronic Transport in Mesoscopic Systems by S. Datta, Cambridge University press.
2. Introduction to Mesoscopic Physics by Y. Imry
3. Mesoscopic Electronics in Solid State Nanostructures by T. Heinzel
4. Quantum Transport in Mesoscopic Systems: Complexity and Statistical Fluctuations by P. Mello and N. Kumar

Course Title : **Introduction to Quantum Optics**
Course Code : **P462**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P204 (Electromagnetism I), P206 (Quantum Mechanics I)**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in quantum optics, with the aim to build their background for future research work in this area.

Course Contents:

1. Electromagnetic field quantization: Quantum fluctuation and Quadrature operators of a single mode field, Thermal fields, Vacuum fluctuation and zero point energy, Quantum phase
2. Coherent and squeezed states of radiation field: Properties and phase space picture of coherent state, Generation of a coherent state, Squeezed state physics, generation and Detection of squeezed light, Schrodinger cat states, Multi- mode squeezing, Broadband squeezed light, Squeezing via non-linear process
3. Atom-field interaction: Rabi model (Semi-classical model for atom-field interaction), Jaynes-Cummings model (fully quantum mechanical model for atom-field interaction), Dressed states, Density operator approach, Hanle effect, Coherent trapping, electromagnetically induced transparency, Four wave mixing
4. Quantum coherence function: photon detection and quantum coherence functions, First order coherence and Youngs type double source experiment, Second order coherence, physics of Hanbury-Brown-Twiss effect, Experiments with single photon, Quantum mechanics of beam splitter, interferometry with single photon
5. Optical test of quantum mechanics: photon sources: spontaneous parametric down-conversion, Hong-Ou-Mandel interferometer, Superluminal tunneling of photons, EPR paradox and optical test of Bell's theorem
6. atom Optics: Mechanical effects of light, Laser cooling, atom interferometry, atoms in cavity, Experimental realization of Jaynes-Cummings model
7. Heisenberg-limited interferometry and quantum information: Entanglement and interferometric measurements, Quantum teleportation, Quantum cryptography, an optical realization of some quantum gates.

Text Books (if any) & Suggested References:

1. Introductory Quantum Optics by C. C. Gerry and P. L. Knight, Cambridge

University press
2. Quantum Optics by M. O. Scully and M. S. Zubairy, Cambridge University press
3. Quantum Optics by M. Fox, Oxford Master series in atomic, Optical and Laser physics
4. Quantum Theory of Light by R. Loudon, Oxford science publication

Course Title : **Astronomy and Astrophysics**
Course Code : **P463**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P201 (Classical Mechanics I), P204 (Electromagnetism I) & P303 (Special Theory of Relativity)**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course introduces the students to the field of Astonomy & Astrophysics, with the aim to build their background for future research work in this area.

Course Contents:

Part I: Introduction and Tools
1. Tools - astronomical objects, scales, distance ladder, astrometry, magnitude scale
2. Gravity - Kepler's law, Virial theorem
3. Radiation physics - radiative flux, transfer function, absorption, scattering and emission, Einstein coefficient, local thermodynamic equilibrium, source function and line formation, concept of opacities

Part II: Stars
1. Stars and stellar structures - stellar spectra, HR diagram • Equilibrium in stars
2. Star formation and Protostar
3. Stellar evolution
4. Supernovae
5. Black holes and gravitational waves

Part III : Interstellar medium

Part IV: Galaxies
1. The Milky way Galaxy - distribution of matter, differential rotation, formation of the spiral arms
2. Elliptical and Spiral Galaxies
3. Evidence for dark matter
4. Active Galaxies - Active Galactic Nuclei, Seyfert Galaxies, Quasars, Blazers

Part V: Magnetic fields
1. Astrophysical phenomena where magnetic fields are critical
2. Galactic magnetic fields - dust and synchrotron polarization, Faraday rotation, Zeeman measurements

Part VI: Gravitational Lensing

Part VII: Clusters and Superclusters (optional)

Part VIII: Cosmology (optional)

- Cosmological Observations and the Cosmological Principle - Newtonian Cosmology and Cosmological Models

- Cosmic Microwave Background

Text Books (if any) & Suggested References:

1. Fundamental Astronomy by H. Karttunen, P. Kröger, H. Oja, M. Poutanen, K. J. Donner
2. Introduction to Modern Astrophysics by B. W. Carroll and D. A. Ostlie
3. An invitation to Astrophysics by T. Padmanabhan
4. Astrophysical Concepts by Martin Harwit
5. Introductory Astronomy and Astrophysics by Zelike and Gregory
6. Universe by Roger Freedman
7. Physical Universe by F. Shu
8. Astrophysics Processes by Hale Bradt
9. Radiative processes in Astrophysics by Rybicki and Lightman
10. An introduction to Astronomy and Astrophysics by Pankaj Jain
11. Quasars and Active Galactic Nuclei by Kembhavi and Narlikar

Course Title	**: Plasma Physics and Magnetohydrodynamics**
Course Code	**: P464**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**:**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.

Course Contents:

1. Introduction to plasmas, applications: in fusion, space and astrophysics, semi-conductor etching, micro- wave generation, characterization of the plasma state, Debye shielding.
2. Plasma and cyclotron frequencies, collision rates and mean-free paths, atomic processes, adiabatic invariance, orbit theory, magnetic confinement of single charged particles.
3. Two-fluid description, magneto-hydrodynamic waves and instabilities, heat flow, diffusion, kinetic description, and Landau damping.
4. Ideal magneto-hydrodynamic (MHD) equilibrium, MHD energy principle, ideal and resistive MHD stability, drift-kinetic equation, collisions, classical and neoclassical transport, drift waves and low-frequency instabilities, high frequency micro instabilities, and quasi-linear theory.

Text Books (if any) & Suggested References:

1. Plasma physics by Peter Andrew Sturrock
2. Principles of Magnetohydrodynamics by J. P. Hans Goedbloed, Stefaan Poedts
3. Hydrodynamic and Hydromagnetic Stability by S. Chandrasekhar
4. The Physics of Plasmas by T. J. M. Boyd, J. J. Sanderson
5. Fundamentals of Plasma Physics by Paul M. Bellan,
6. Introduction to Plasma Physics by R. J. Goldston, P. H. Rutherford
7. An Introduction to Magnetohydrodynamics by P. A. Davidson

8. An Introduction to Plasma Astrophysics and Magnetohydrodynamics by M. Goossens

Course Title : **Quantum and Nanoelectronics**
Course Code : **P466**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P302 (Quantum Mechanics II), P301 (Statistical Mechanics)**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in nanoelectronics, with the aim to build their background for future research work in this area.

Course Contents:

1. Introduction and review of electronic technology
2. From electronics to nano-electronics: particles, waves and Schrodinger equation, quantum description of atoms and molecules, quantum description of metals, semiconductors, junction devices, some newer building blocks for nano-electronic devices
3. Fabrication and characterization methods for nano-electronics
4. The field effect transistor FET: size limits and alternative forms
5. Devices based on electron tunneling, resonant tunnel diodes, single electron transistors, molecular electronics, hybrid electronics
6. Devices based on electron spin and ferromagnetism
7. Qubits vs. binary bits in a quantum computer, applications of nano-electronic technology to energy issues
8. Summary and brief comment on the future of nano-electronic techniques

Text Books (if any) & Suggested References:

1. Quantum nano-electronics: An Introduction to Electronic Nanotechnology and Quantum Computing by Edward L. Wolf
2. Quantum Electronics by Amnon Yariv
3. Nanophysics and Nanotechnology: An Introduction to Modern Concepts in Nanoscience by Edward L. Wolf
4. Fundamentals of Nanoelectronics by George Hanson

5. Introduction to Nanoelectronics: Science, Nanotechnology, Engineering and Applications by Vladimir Mitin, Viatcheslav, A. Kochelap, Michael, A. Stroscio

Course Title	**: Nonlinear Physics, Chaos and Turbulence**
Course Code	**: P467**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P201 (Classical Mechanics I)**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in classical nonlinear dynamics, with the aim to build their background for future research work in this area.

Course Contents:

1. General introduction and motivation: examples of linearity and nonlinearity in physics and the other sciences; modelling systems using iterated maps or differential equations, nonautonomous systems
2. General features of dynamical systems : Systems of differential equations with examples; control parameters; fixed points and their stability; phase space; linear stability analysis; numerical methods for nonlinear systems; properties of limit cycles; nonlinear oscillators and their applications; the impossibility of chaos in the phase plane; bifurcations: their classification and physical examples; spatial systems, pattern formation and the Turing mechanism; strange attractors and chaotic behaviour
3. The logistic map: Linear and quadratic maps; graphical analysis of the logistic map; linear stability analysis and the existence of 2-cycles; numerical analysis of the logistic map; chaotic behaviour and the determination of the Lyapunov exponent; universality and the Feigenbaum numbers; other examples of iterated maps
4. Hamiltonian Sytems: Phase space; Constants of motion and integrable Hamiltonians; Nonintegrable systems, the KAM theorem and period-doubling; applications
5. Fractal geometry: dimension of an object, Mandelbrot set, Julia set, iterated function systems
6. Spatio-temporal dynamics: Spatio-temporal chaos
7. Quantum Chaos: Quantum analogies to Chaotic behaviour, Correlations in wave functions, chaos and Semi-classical approaches to Quantum mechanics

Text Books (if any) & Suggested References:

1. S. H. Strogatz, Nonlinear Dynamics and Chaos: With Applications in Physics, Biology, Chemistry and Engineering.

2. Robert C. Hilborn, Chaos and Nonlinear Dynamics.

3. Brian Davies, Exploring Chaos: Theory and Experiment.

4. K. T. Alligood, T. D. Sauer and J. A. Yorke, Chaos: An Introduction to Dynamical Systems.

5. Edward Ott, Chaos in Dynamical Systems.

6. M.Tabor, Chaos and Integrability in Nonlinear Dynamics: An Introduction.

Course Title : Magnetism and Superconductivity
Course Code : P468
Credits : 4
Course Category : Elective
Course Prerequisite : P305 (Introduction to Condensed Matter Physics)

Contact Hours (28/42/56) : 56
(including tutorials)

Proposed by : UGCS, SPS

Outcome of the Course:

This course teaches the students important concepts and methods in plasma physics and magnetohydrodynamics, with the aim to build their background for future research work in this area.

Course Contents:

1. The phenomenon of Superconductivity: historical perspective, characteristics, occurrence,
2. London Equations, Thermodynamics
3. Ginzburg Landau Theory, Abrikosov Vortices,
4. Josephson Effect
5. Cooper instability, BCS wave function, gap equation, thermodynamics and magnetic response
6. Conventional and non-conventional superconductors
7. Diamagnetism paramagnetism Ferromagnetism characteristics, Occurrence
8. Orbital magnetism, de Haas van alfen effect,, Meissner Effect in superconductor
9. Heisenberg Model: ground state, Spin waves
10. Hubbard Model and itinerant exchange
11. Magnetic domains and hysteresis

Text Books (if any) & Suggested References:

1. Theory of Superconductivity by J. R. Schrieffer
2. Superconductivity of Metals and Alloys by P. G. De Gennes
3. Introduction to Superconductivity by M. Tinkham
4. Quantum Theory of Magnetism by R.M.White
5. The theory of Magnetism by D. C. Mattis

Course Title	**: Density Functional Theory of Atoms, Molecules &Solids**
Course Code	**: P469**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P302 (Quantum Mechanics II)**
Contact Hours (28/42/56) (including tutorials)	**: 56**
Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in density functional theory, with the aim to build their background for future research work in this area.

Course Contents:

1. Many-body problem: QM of electrons and nuclei, approximation methods for many electron systems, Born-Oppenheimer approximation, Hartree and HF theory, tight binding method, greens functions, electron correlation, Ci & many-body and Moller-plesset theory, complete active space methods, coupled cluster theory, density matrices, time-dependent approach to all the above formalism
2. Foundations of Density Functional Theory(DFT): Hohenberg-Kohn (HK) theo-rem, degenerate ground states, variational DFT, N − and v− representability problem, Levy-Lieb constrained search, fractional particle number & derivative discontinuity, spin polarized systems, Exited states part i: Effective Single particle picture: Kohn-Sham (KS) construction, non-interacting v− representability, degenerate KS DFT, KS equations for spin polarized systems, interpretation of KS eigenvalues
3. Exchange-Correlation (XC) Energy Functional: exact exchange formalism within DFT, exact representations of the energy functional, LDa, gga, meta-gga, weighted density approximation, self interaction correction (SiC), virial theorems, exact exchange formalism (OpM, KLi, HS), where DFT goes wrong, strengths of DFT, strong correlation: DFT+U, Rpa, gW, DFpT, DMFT, orbital free DFT, DFT- hybrid
4. Crossover to Excited-States: time-dependent DFT: Runge-gross theorem, time- dependent KS equations, adiabatic LDa & TD XC potentials, linear response TDDFT, Excited states part ii, spin polarized TDDFT, frequency dependent XC kernel, TDCDFT, TDOEp, relativistic DFT, molecular orbital theories

Text Books (if any) & Suggested References:

1. Density Functional Theory of atoms and Molecules by Robert G. Parr and Weitao Yang
2. Density functional Theory by R.M. Dreizler and E.K.U. Gross
3. Density Functional Theory by Eberhard Engel
4. Primer in Density Functional Theory by C. Fiolhais, F. nogueira, Miguel and A. L. Marques
5. Fundamentals of TDDFT by Miguel A. L. Marques et al.
6. Time-dependent Density Functional Theory by Miguel A. L. Marques et al.
7. Time-dependent Density Functional Theory by Carsten Ullrich
8. Quantal Density Functional Theory I & II by Viraht Shani
9. Recent advances in Density Functional Methods (Part I, II & III) by Delano P Chong
10. Atomic and Electronic Structure of Solids by Ethimios Kaxiras

11. Electronic Structure: Basic Theory and Practical Methods by Richard M. Martin
12. Many-Body Quantum Theory in Condensed Matter Physics by H. Bruus and K. Flensberg
13. Quantum Theory of the Electron Liquid by Gabriele Giuliani and Giovanni Vignale
14. Molecular Electronic Structure Theory by T. U. Helgaker, P. Jorgensen and J. Olsen
15. Electronic Structure Calculations for Solids and Molecules by J. Kohanoff
16. Methods of Electronic Structure Calculations by M. Springborg
17. Self Consistent Fields in Atoms by Norman March
18. Computational Materials Science by J. G. Lee
19. Density Functional Theory in Quantum Chemistry by Takao Tsuneda
20. Material Modeling using DFT by Feliciano Giustino

Course Title	**: Quantum Field Theory II**
Course Code	**: P470**
Credits	**: 4**
Course Category	**: Elective**
Course Prerequisite	**: P453 (Quantum Field Theory I)**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by	**: UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in advanced quantum field theory, with the aim to build their background for future research work in this area.

Course Contents:

1. Path-integral formulation of quantum mechanics
2. Path-integral for scalar fields, generating functional, connected Greens functions, Feynman rules, 1 loop diagrams
3. Grassmann variable, path-integral for Dirac field
4. Path-integral for Electromagnetic field, gauge fixing
5. QED, symmetries and Ward identity
6. Renormalization divergences and power counting, Φ4 theory, QED, spontaneous symmetry breaking, Renormalization group basics (running of coupling).
7. Yang-Mills theory, gauge fixing and ghosts, BRST, asymptotic freedom

Text Books (if any) & Suggested References:

1. An Introduction to Quantum Field Theory by M. Peskin and D. V. Schroeder
2. Quantum Field theory: From Operators to Path Integrals, 2nd edition by Kerson Huang
3. Quantum Field Theory by Mark Srednicki
4. Quantum Field Theory by Claude Itzykson and Jean Bernard Zuber
5. Notes from Sidney Coleman's Physics 253a, arXiv: 1110.5013

Course Title : **Quantum Information & Quantum Computation**
Course Code : **P471**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P206 (Quantum Mechanics I)**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in quantum information and computation, with the aim to build their background for future research work in this area.

Course Contents:

1. Introduction to Classical information: Shannon entropy, Mutual Information
2. Quantum Information I: Hilbert space, density matrices, quantum entropy and Holevo bound
3. Quantum Information II: Entanglement, Teleportation, super dense coding & Bell inequalities
4. Quantum dynamics: Two level systems, decoherence and Rabi oscillations
5. Quantum computation: single qubit gates-phase, swap, Hadamard, two qubit gates-CNOT
6. Quantum algorithms: Deutsch, Grover, Introduction to Shor's algorithm
7. Quantum error correction
8. Applications: Quantum simulation and Adiabatic quantum computation
9. Solid state quantum information & computation: Introduction to entanglement in nanostructures, quantum computation with superconducting devices and topological quantum computation

Text Books (if any) & Suggested References:

1. Introduction to Quantum Information Science by V. Vedral (Oxford U. Press)
2. Quantum Information & Computation by M. A. Nielsen & I. L. Chuang (Cambridge U. Press)
3. An Introduction to quantum computing Kaye by P. R. Laflamme and A. M. Mosca (Oxford U. press)

Course Title : **Experimental High Energy Physics**
Course Code : **P472**

Credits : 4
Course Category : Elective
Course Prerequisite : P206 (Quantum Mechanics I), P303 (Special Theory of Relativity)
Contact Hours (28/42/56) (including tutorials) : 56

Proposed by : UGCS, SPS

Outcome of the Course:

This course teaches the students important concepts and methods in experimental high energy physics, with the aim to build their background for future research work in this area.

Course Contents:

1. The interaction of high-energy particles with matter: specific applications related to EHEP. Relativistic kinematics: Detailed derivation of kinematic variables and their transformations whenever needed. Decay kinematics. Rapidity, pseudo-rapidity, space-like and time-like. Some examples where relativistic kinematics play important role for understanding of data.
2. Detectors in High Energy physics: general concept of building a HEp experiment, coverage and option
3. Gas detectors; Semiconductor detector; Scintillator and Cerenkov detectors Specific to EHEP
4. Calorimeter and Pre-shower detectors: principle of electromagnetic and hadronic shower generation. Detector Simulation: need of simulation, various techniques, MC, some general concepts
5. Data analysis in HEP: general approach of data cleanup, calibration, track reconstruction, reconstruction of events Error analysis in EHEP. Computing in EHEP: Basics of OO programming using C++, few applications in EHEP data analysis.

Text Books (if any) & Suggested References:

1. Relativistic Kinematics; a guide to the kinematic problems of High Energy physics by R. Hagedorn
2. The Experimental Foundations of particle physics by R. N. Cahn and G. Goldhaber
3. Techniques for nuclear and particle physics experiments: a How to approach by W. R. Leo (Springer)
4. Experimental Techniques in Hugh Energy Nuclear and Particle physics by T. Ferbel (World Scientific)
5. Introduction to Experimental particle physics by R. C. Fernow
6. Data Reduction and Error analysis for the physical sciences by P. Bevington and D. K. Robinson
7. Data analysis Techniques for High Energy physics by R. Frunwirth, M. Regler, R. K. Bock and H. Grote

Course Title : **Experimental Techniques**
Course Code : **P473**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P305 (Introduction to Condensed Matter Physics) P242 (Basic Electronics Theory & Lab)**

Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in experimental techniques, with the aim to build their background for future research work in this area.

Course Contents:

1. Mechanical drawing and designs: Mechanical drawing tools, basic principles of mechanical drawing, dimensions, tolerances, from design to working drawings
2. Basics tools: hand tools, machines for making holes, lathe & milling machines, grinders, casting
3. Vacuum technology: gases, gas flow, pressure and flow measurement, vacuum pumps, pumping mechanisms, ultrahigh vacuum, leak detection
4. Optical systems: optical components, optical materials, optical sources
5. Charge particle optics: electrostatic lenses, charged-particle sources, energy and mass analyzer
6. Detectors: optical detectors, photoemission detectors, particle and ionizing radiation detectors, signal to noise ration detection, surface barrier detector, Particle detector: interactions of charged particles and photons with matter; gaseous ionization detectors, scintillation counter, solid state detectors
7. Electronics: electronic noise, survey of analog and digital I/Cs, signal processing, data acquisition and control systems, data analysis evaluation
8. Nano- and micro-fabrication: various lithography techniques such as photolithography, nanoimprint lithography, e-beam lithography, ion-ball milling
9. SEM, TEM, X-ray diffraction, SQUID Magnetometry, Magnetotransport, PL/CL time resolved spectroscopy, Rutherford Backscattering spectrometry (RBS), RBS-Channeling, UV-ViS-iR spectrometry.

Text Books (if any) & Suggested References:

1. The art of Measurement, by Bernhard Kramer (V. C. H. Publication)
2. Building Scientific Apparatus by J. H. Moore et al.
3. Experiments in Modern Physics, Second Edition by Adrian C. Melissinos and Jim Napolitano
4. The art of Experimental Physics by Daryl W. Preston,
5. Vacuum Technology by A. Roth (North-Holland publisher)
6. Charge particle Beams by Stanley Humphries (John Wiley and Sons)
7. Principles of Charged Particles Acceleration, by Stanley Humphries (John Wiley and Sons)
8. Radiation Detection and Measurements by G. Knoll (3rd Edition)
9. Techniques for Nuclear and Particles Physics Experiments by W. R. Leo (2nd edition, Springer)

Course Title : **Introduction to Cosmology**
Course Code : **P474**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P457 (General Theory of Relativity & Cosmology)**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This course teaches the students important concepts and methods in introductory cosmology, with the aim to build their background for future research work in this area.

Course Contents:
1. The cosmic history and inventory
2. A sketch of general Relativity.
3. The expanding Universe
4. Friedmann Equations and Cosmological Models
5. The Standard cosmological model.
6. The inflationary Universe.
7. Primordial nucleosynthesis and the thermal history of the Universe.
8. Perturbations in an expanding Universe.
9. Growth of perturbations
10. Dark Matter Halos.
11. Statistical description of gravitational clustering
12. Special Topics: Fluctuations in the CMB, Lensing, Cluster Cosmology, The Lyman-alpha Forest, Re-ionization, Halo Model, Redshift Space Distortions.

Text Books (if any) & Suggested References:
1. Introducing Einstein's General Relativity by Ray D'inverno
2. The Early Universe by E. W. Kolb and M. S. Turner
3. Introduction to Cosmology by Barbara Ryden
4. Modern Cosmology by Scott Dodelson
5. Principles of Physical Cosmology by P. J. E. Peebles
6. Large Scale Structure of the Universe by P. J. E. Peebles
7. Structure Formation in the Universe by T. Padmanabhan

Course Title : **Relativistic Nucleus-Nucleus collision & Quark-Gluon Plasma**
Course Code : **P475**
Credits : **4**
Course Category : **Elective**
Course Prerequisite : **P306 (Nuclei and Particle Physics), P303 (Special theory of Relativity), P301 (Statistical Mechanics), P201 (Classical Mechanics-I)**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **UGCS, SPS**

Outcome of the Course:

This is an advanced course which introduces the students to the field of heavy ion collision in high energy physics, with the aim to build their background for future research work in this area.

Course Contents:
1. Introduction to high energy heavy ion collisions and Quark-Gluon-Plasma, comparison of big bang and the little bang
2. Thermodynamics: Relativisticgas (hadrons, quarks and gluons) and its statistical and thermodynamical properties, MIT Bag model, Hagedorn gas, phase diagram of QCD

3. Relativistic Kinematics: four vectors notation, rapidity variables, pseudo rapidity variables, light cone variables, relativistic invariants, Dalitz plot, cross sections
4. Collision Dynamics: initial state of nuclear collisions, fluid dynamical evolution, kinetic transport model, freeze-out and particle production
5. Experiments: a general overview of different experimental setup related to search for QGP and relevant observables
6. Signatures of QGP: collective flow, J/Ψ suppression, strangeness enhancement, jet quenching, electromagnetic probes, Hanbury-Brown-Twiss measurement
7. Recent progress

Text Books (if any) & Suggested References:

1. Hadrons and QGP by Letterssier and Rafelski
2. Introduction to High Energy Heavy Ion Collissions by C. Y. Wong
3. Phenomenology of Ultra Relativistic Heavy Ion Collissions by W Florkowski
4. Ultra relativistic heavy ion collisions by R. Vogt
5. Introduction to relativistic heavy ion collisions, by L. P. Csernai
6. A Short Course On Relativistic Heavy Ion Collission by A. K. Chaudhuri
7. Extreme states of matter in strong interaction physics by Helmut Satz
8. Relativistic Hydrodynamics by L. Rezzolla and O. Zanotti
9. Finite Temperature Field Theory by J. I. Kapusta and C. Gale
10. The Early Universe by Kolb and Turner
11. Fantastic Realitis by Frank Wilczek
12. Research Reports in Physics, Quark Gluon Plasma, Invited lectures of Winter School, Published by Springer Verlag, Editors - B. Sinha, S. Pal and S. Raha
13. The Physics of Quark Gluon Plasma, Introductory lectures, Lecture Notes in Physics 785, Publisher - Springer, Editor - S. Sarkar, H. Satz and B. Sinha
14. Quark Gluon Plasma - From big bang to little bang, K. Yagi, T. Hatsuda, Y. Miake, Cam- bridge Monograms on Particle Physics, Nuclear Physics and Cosmology
15. Quark Gluon Plasma: Theoretical Foundations, An annotated reprint collection - J. Ka- pusta, B. Muller and J. Rafelski, Publisher - Elsevier Science

PhD course in School of Physical Sciences

Course Title : **Classical Mechanics**
Course Code : **P601**
Credits : **6**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **PGCS, SPS**

Outcome of the Course:

This course reviews the concepts of Masters level classical mechanics with more emphasis on the applied/problem solving aspects. This course is meant to prepare the students for more rigorous analytical treatment of the subject required for research.

Course Contents:

1. Two-body Central force problem (reduced mass), planet orbits,Virial theorem.
2. Collisions and scattering, CM and lab frames, scattering cross section.
3. Motion in non-inertial frames, Coriolis force.

4. principle of virtual work, constraints, D Alemberts principle.
5. Generalized coordinates, velocities and momenta, Lagranges formulation.
6. principle of list action, fomulation by Maupertuls, Euler, Hamilton, Liouvilles theorem.
7. Hamilton's equations, poisson brackets.
8. Canonical transformation, Hamilton-Jacobi equation, Generating functions, Symetries and conservation laws.
9. Small oscillations, Normal modes.
10. Rigid body dynamics, Euler angles, Euler equations (should solve up to rotation of a top)

Text Books (if any) & Suggested References:

1. H.Goldstein-Classical mechanics
2. Morion and Thorton- Introduction to classical mechanics.
3. Landau & lifshitz-Mechanics
4. John R Taylor- classical mechanics

Course Title	**: Mathematical methods**
Course Code	**: P602**
Credits	**: 6**
Course Category	**: Core**
Course Prerequisite	**: None**
Contact Hours (28/42/56) (including tutorials)	**: 56**

Proposed by **: PGCS, SPS**

Outcome of the Course:

This course reviews the important mathematical tools required for physicists for implementation in research work in all specialization of physical sciences.

Course Contents:

1. Vectors and Tensors (index notation,vector analysis in curvilinear coordinates. Cartesian tensors and four vectors, General tensors).
2. Review of Linear Algebra with emphasis on applications to physical problems (linear transformations + Matrix representations, Eigen values + Eigen Vectors, Innner product spaces).
3. Review of complex analysis with applications (Cauchy-Riemann equations, Complex integration, Cauchy theorems, Contour integration, Branch points and branch cuts, Applications to integrals, series etc.)
4. Hilbert Space methods, special functions (hilbert space, Orthonormal series expansions in Hilbert space especially Fourier series, Special functions
5. Ordinary and partial differential equations (Analysis of second order OFE’s Sturm-Liouville system, Boundary value problems for Laplace Diffusion (Heat) and wave equations)
6. Integral transforms, its applications and generalized functions (Laplace and Fourier transform, Dirac delta and other generalized functions, Green’s functions of ODE and PDE)
7. Group theory (introduction using various groups occuring in physics, its algebra, Representation of groups, Characters)
8. Probability and Statistics (probability distributions, Stochastic processes like Brownian motion, Error analysis for experiments, Statistical inference)

Text Books (if any) & Suggested References:

1. Arfken and Weber, Mathematical Methods

2. C.Harper, Mathematical methods
3. T L Chow, Mathematical method for physicists.

Course Title : **Electromagnetism**
Course Code : **P603**
Credits : **6**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **PGCS, SPS**

Outcome of the Course:
This course reviews masters level electricity and magnetism with more emphasis on problem solving and applications. This course is meant to prepare students for taking up realistic research challenges involving one of the most important class of interactions in Physics.

Course Contents:
1. Electrostatics in vacuum, force, field, potentials and enegry.(4 hrs)
2. Electrostatic boundary conditions and conductors. (2 hrs)
3. Solution of Laplace's equation in one, two and three dimensions, uniqueness theorem, methods of images, separation of variables, multipole expansion.(12 hrs)
4. Dielectrics(4 hrs)
5. Current distributions, magnetic fields and magnetostatic boundary conditions(4 hrs)
6. Motion of charges in E & B fields, energy and momentum of electromagnetic fields(8 hrs)
7. Maxwell's equations, EM waves and their propagation in free space and in media(12 hrs)
8. Potential formulation, Coulomb and Lorentz gauge, radiation from an accelerated charge, dipole radiation (10 hrs)

Text Books (if any) & Suggested References:
1. David Griffith, "Introduction to electrodynamic"
2. Reitz, Milford, Christy, "Foundation of electromagnetic theory"
3. J.D.Jackson, "Classical Electrodynamics"
4. M.H Nayfeh, M.K Brussel, "Electricity and magnetism"

Course Title : **Statistical Mechanics**
Course Code : **P614**
Credits : **6**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) : **56**
(including tutorials)

Proposed by : **PGCS, SPS**

Outcome of the Course:
This course reviews masters level statistical mechanics and thermodynamics and prepares students for analyzing research problems/results in a wide variety of situations involving statistical mechanics.

Course Contents:
1. Review of thermodynamics, thermodynamic potentials, thermodynamic equilibrium and stability
2. Gibbs distribution: Ensembles, classical and quantum free particles, systems with continuous and discrete spectrum, degenerate Fermi systems, Bose-Einstein condensation.
3. Interacting system: Cluster an Virial expansions, radial distribution function.
4. Introduction to response, fluctuation and noise, Einstein formula.
5. Phase transition: phenomenology of first order and continuous phase transitions, order parameters, 1D Ising model, Iniversality and scaling, Ginzburg-Wilson theory, Spontaneous symmetry breaking.
6. Fundamentals of statical mechanics: phase space, Liouville theorem, statistical distribution theorem.
7. Probability theory: Probability densities, cumulants and correlations, central limit theorem, laws of large numbers.
8. Brownian motion, Langevin equation, Markov process and Fokker Planck equation.

Text Books (if any) & Suggested References:

1. Kerson Huang - Introduction to statical mechanics
2. Reif - Statistical physics
3. M. Kardar- Statistical physics of particles
4. H.E Stanley - Introduction to phase transitions and critical phenomena

Course Title : **Quantum mechanics**
Course Code : **P615**
Credits : **6**
Course Category : **Core**
Course Prerequisite : **None**
Contact Hours (28/42/56) (including tutorials) : **56**

Proposed by : **PGCS, SPS**

Outcome of the Course:
This course reviews masters level quantum mechanics and prepares students for analyzing research problems/results in a wide variety of situations involving quantum mechanics.

Course Contents:
9. HIlbert space (states, operators, evolution)
10. One dimensional problems & Harmonic oscillator, delta & periodic pots
11. Bound states vs scattering states
12. The central force problem
13. The hydrogen atom, hard and soft sphere
14. Time-independent perturbation theory, WKB approximation, variational method
15. Time-dependent perturbation theory, Heisenberg and interaction represtations
16. Dirac equation
17. Scattering theory/semi classical theory of radiation/identical particles/ angular momentum/ path integrals(depending of available time)).

Text Books (if any) & Suggested References:

1. R. Sankar-principles of Quantum Mechanics
2. Cohen-Tannoudji, Diu and Laloe- Quantum Mechanics I & II
3. J.J Sakurai-Modem Quantum mechanics
4. David Griffiths-Intruduction to Quantum mechanics
5. S.Gasiorowicz-Quantum Physics
6. Eugen Merzbacher-Quantum mechanics
7. Bransden and joachain-Quantum mechanics
8. Richard Liboff-Introductory quantum mechanics

SCHOOL OF HUMANITIES

DETAILED COURSE STRUCTURE

FOR

INTEGRATED M.Sc. COURSE

Revised Jan 2017

National Institute of Science Education and Research (HBNI)

Humanities courses for integrated M.Sc.

Year/Semester	Course no.	Credits	Course Name
CORE COURSES			
1/Semester I	H109	2	Technical Communication I
1/Semester I	H133	2	Introduction to Sociology
1/Semester II	H110	2	Technical Communication
1/Semester II	H101	2	Introduction to Economics
ELECTIVE COURSES			
2/Semester III	H225	2	Introduction to Psychology
	H201	2	Environmental Economics and Environmental Impact Assessment
	H239	2	Introduction to Innovation System
	H238	2	Life and Community in Urban World.
2/Semester IV	H227	2	Organizational Behaviour
	H235	2	Sociology of Science and Technology
	H236	2	Perspectives on Indian Society
	H237	2	Science Communication and Citizen

SEM- I	**H 109**	+	**H 133**
SEM – II	**H 110**	+	**H 101**
SEM – III			**2 Electives**
SEM-I V			**2 Electives**

Economics

H101:Course title: Introduction to Economics

Instructor/Proposed by: Dr Amarendra Das

Prerequisite: None

Course Content:

1.	Role of Government in Organised Society	[1 class]
2.	Expenditure Obligation of Union, State and Local Government	[2 classes]
3.	Sources of Revenue for Union, State and Local Governments	[4 Classes]
4.	Concepts of Budget, and Different deficits	[1 class]
5.	Channels of Resource Transfer from Union to State Governments	[2, classes]
6.	Balance of Payment	[3 classes]
7.	Laws of Demand and Supply	[3 classes]
8.	Equilibrium Price Determination	[1 class]
9.	Exchange rate Determination	[2 classes]
10.	Consumer's Equilibrium	[2 classes]
11.	Producer's Equilibrium	[2 classes]
12.	Current Economic events	[3 classes]

H201: Environmental Economics and Environmental Impact Assessment
Instructor/Proposed by: Dr Amarendra Das
Prerequisite: None

Course Content:

12. Definition of Environmental Economics, Ecological Economics and Natural Resource Economics [1 class]
13. Key environmental problems faced by humanity [2 classes]
14. Limits to Growth [2 classes]
15. Sustainable Development: Strong and weak sustainability [2 classes]
16. Indicators of sustainability [1 class]
17. Market Failure: Causes and Remedies [3 classes]
18. Perspective on Environmental Policy/Regulation [2 classes]
19. Informal Regulation [1 class]
20. Population, Poverty and Economic Growth [1 class]
21. Climate Change, Causes and Consequences [2 classes]
22. Principles of using Renewable resources [2 classes]
23. Principles of using Non-renewable resources [2 classes]
24. Environmental Kuznets Curve [2 classes]
25. Mainstreaming of Environment [2 classes}
26. Environmental Impact Assessment [2 classes}
27. Environmental Regulations in India [1 class]
28. Green Accounting, Concepts, Integrated Economic and Environmental
29. Accounting [2 classes]

<u>English</u>

H109: Technical Communication I

Instructor/Proposed by: Joe Varghese Yeldho

Prerequisite: None

Course Content:

1. **Ideations of Science** (4 classes)
   Categorization and social perspective.

2. **Inscription and the material arts** (4 classes)
   Scientific representation and the figural social.

3. **Mechanics of Writing** (6 classes)
   Structure and compositional logic

4. **The Rhetorical Process** (6 classes)
   Building the argument

5. **Cultural Context and the Sciences** (4 classes)
   Literature and the aesthetic of science.

H110: Technical Communication II

Instructor/Proposed by: Joe Varghese Yeldho
Prerequisite: None

Course Content:

1. **The logic of Critique** (4 classes)
   Notions of evidence, proof and fact.

2. **Humanities and empiricism** (4 classes)
   Empirical fallacy and social intervention.

3. **Mechanics of Writing II** (6 classes)
   The forms of knowledge production. Understanding readership.

4. **The Rhetorical Process II** (6 classes)
   Staging the argument. Perspective and Institutional / Disciplinary norms.

5. **Narrativizing the Sciences** (4 classes)
   Scientific correspondence and reflections. Popular science and Science fiction.

Psychology

H 225: Introduction to Psychology

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. Introduction: perspectives, methods, issues. (3 classes)
2. Perceptual Process. (4 classes)
3. Learning Process (3 classes)
4. Memory (2 classes)
5. Intelligence (2 classes)
6. Emotion (2 classes)
7. Personality (4 classes)
8. Motivation (4 classes)
9. Attitude (3 classes)

H 226: Applied Behavioural Science

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. Introduction: Personality (1 class)
2. Interpersonal Relationship and Personal Effectiveness (5 classes)
3. Social Perception: errors, biases, impression management (3 classes)
4. Emotional Intelligence: managing emotions. (3 classes)
5. Group and Team Dynamics. (5 classes)
6. Effective Communication. (4 classes)
7. Values and Value System (3 lectures)
8. Stress: coping and managing stress (4 classes)

References

Organizational Behaviour by Stephen Robbins, 11th edn, Prentice-Hall India
Understanding Organizations by Udai Pareek, Oxford University Press.
Handouts will be given as and when required.

H 227: Organizational Behaviour

Instructor/Proposed by: Rooplekha Khuntia
Prerequisite: None

Course Content:

1. **Introduction to Organizational Behaviour** (2 classes)
   Nature of Organizations, what is OB, contributing disciplines, Functions, role and skills of a manager, environmental challenges.
2. **Individual Decision-making process** (3classes)
   Rational decision-making, creativity, bounded rationality, errors and biases, constraints, ethics in decision-making.
3. **Work attitudes** (2 classes)
   Job satisfaction, job involvement, organizational commitment, cognitive dissonance theory.
4. **Motivation** (3 classes)
   Hierarchy of needs theory, two factor theory, ERG theory, equity theory, goal setting and expectancy theory, MBO in practice, other applications.
5. **Power and Politics** (3 classes)
   Bases of power, the general dependency postulate.
6. **Leadership** (3 classes)
   Behavioural theories, contingency theories, contemporary theories, issues in leadership studies.
7. **Groups and team dynamics** (3 classes)
   Stages of group development, group structure, group decision-making, Types of teams, creating effective teams.
8. **Conflict and conflict resolution** (2 classes)
   Functional and dysfunctional conflict, the conflict process, negotiation.
9. **Organizational Structure** (2 classes)
   Elements of organizational structure, common organizational designs, why do structures differ?
10. **Organizational Culture** (2 classes)
    Functions of culture, creating and sustaining culture.
11. **Organizational Change** (3 classes)
    Forces for change, resistance to change, approaches to managing planned change.

Sociology

H 237: Science Communication & the Citizenship

Instructor/Proposed by: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course content:

1. Introduction, citizenship and Science (4 classes)
2. Science in public, the public understanding of science (4 classes)
3. Public engagement with science (5 classes)
4. Science, communication, ethical codes & scientific norms (4 classes)
5. Patents and dissemination of scientific knowledge (4 classes)
6. Science communication in age of innovation (4 classes)

H 238: Life &Community in Urban world

Proposed by: Debashis Pattanaik

Prerequisite: None

Course content:

1. Introduction, urban space and urban thought, urbanization (4 classes)
2. Emergence and evolution of cities (4 classes)
3. Urban life, urban communities (online and offline) (4 classes)
4. The city in context, migration, sorting and niches (4 classes)
5. Markets and networks (5 classes)
6. Urban ecology, suburbia, urban design, policy and planning (4 classes)

H239: Introduction to Innovation System

By: Debashis Pattanaik

Prerequisite: Life & Community in Urban World

Course Content:

1. Nature of innovation (4 classes)
2. The innovative firm (2 classes)
3. Innovation processes (4 classes)
4. Regional innovation system (3 classes)
5. Innovation and IPR (4 classes)
6. Education, universities and national innovation system (2 classes)
7. Multinational enterprises and innovation processes (2 classes)
8. Science and innovation policy (4 classes)

H 133: Introduction to Sociology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Origin and Growth of Sociology (2 Lectures)

    Origin and development of sociology as a separate discipline,
    Nature and Scope of Sociology,
    Sociology as a Scientific Discipline.

2. Sociological Perspectives (2 Lectures)

    Conflict, Functionalism and Interactionsim

3. Basic Sociological Concepts (6 Lectures)

Society, Community, Association, Institution, Status and Role,
Types of Society: From early hunting gathering to
industrial development and globalization,
Culture: Components of culture; Norms, values,
folkways, mores, Cultural unity and diversity.
Socialization: Agents of Socialization, Early development
of infant, stages of socialization

4. Social Groups (4 Lectures)

Meaning of Social Groups and Types: Primary Group,
Secondary Group, In-Groups, Out- Group, Quasi- Group,
Reference Group

5. Structure and Stratification (4 Lectures)

Structure, System and Function, caste and class and
Racial and Ethnic group inequalities Social Stratification:
Meaning and Types, Functionalist and Conflict Perspectives
of Stratification, Social mobility: Meaning, horizontal and
vertical mobility

6. Social Institutions (4 Lectures)

Family, marriage and kinship, religion, economy, polity and
education. Functionalist and Conflict Perspectives of institutions.

7. Social processes and Change (4 Lectures)

Social Processes: Co-operation, accommodation, integration,
competition and conflict;
Social Change: Meaning and Definition, Factors of change.

8. Social Problems and Social Control (2 Lectures)

Social Problems and Social disorganization
Social control : Meaning and Types

H 235: Sociology of Science and Technology

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content :

1. Social significance of science and technology (4 Lectures)
   a. Contextual nature of science
   b. Scientist as Indexical and Analogical reasoner
2. Robert Merton's approach to science (3 Lectures)
   a. Ethos of science;
   b. Thomas Theorem and Matthew Effect
3. Perspectives on scientific knowledge (8 Lectures)
   a. Karl Marx, Emile Durkheim, Karl Manheim's sociology of knowledge,
   b. Thomas Kuhn's structures of scientific revolutions
   c. Karl Popper's theory of falsification
4. Recent trends in Sociology of Science (8 Lectures)
   a. Science and technology in developing and developed countries,
   b. Indian context,
   c. Information Technology and globalization,
   d. Manuel Castell's network society, internet and social inequality
5. Case Study Discussions (4 Lectures)

H 236: Perspectives on Indian Society

Instructor/Proposed by: Pranay Swain

Prerequisite: None

Course Content:

1. Indian Social Structure (2 Lectures)
    - a- Traditional Social Organizations
    - b- Culture and Tradition
2. Caste System and Class Structure (7 Lectures)
    - a- Cultural and Structural Views about Caste System
    - b- Inequality, Differentiation and Hierarchy
    - c- Dominant Caste, Sanskritization
    - d- Change and Persistence of Caste system in Modern India
    - e- Caste in Indian Politics
    - f- Backward Caste Movements
    - g- Social Backwardness and Social Justice
3. Class Structure (3 Lectures)
    - a- Class Structure in India
    - b- Agrarian and Industrial Class Structure
    - c- Emergence of Middle Class and Elites

4. Social Institutions: Marriage, Kinship and Family (2 Lectures)

5. Rural and Urban Social Structure: Poverty, Unemployment, etc. (2 Lectures)

6. Changing faces of Rural society/economy/market, Green revolution (2 Lectures)

6. Political processes: Political system and Governance (2 Lectures)

7. Education (2 Lectures)

8. Religion and Society (2 Lectures)

9. Social Change and Development Sustainable and Inclusive (2 Lectures)
   Development, Basic developmental issues: Health, Education and Livelihood

10. Contemporary Social Issues (2 Lectures)

SCHOOL OF COMPUTER SCIENCES

A proposal for minor in Computer Science

1 Structure of the curriculum

The curriculum is divided in two category of courses, core courses and optional courses.

1.1 Core Courses

The following courses have been recommended by the steering committee as core courses. The Programming and Data Structure course are proposed to be two lab courses (2 credit each).

1. CS141 and CS142: Programming and Data Structures Lab
2. CS201: Theory of Computation
3. CS202: Discrete Structures and Computation[1]
4. CS301: Design and Analysis of Algorithms

1.2 Elective Courses

For the initial years, we shall offer the following optional courses. A student has to do three courses from the following list to obtain minor.

- CS451: Modern Cryptology
- CS452: Algorithmic Coding Theory
- CS453: Complexity Theory
- CS454: Linear Programming and Combinatorial Optimization
- CS455: Distributed Network Algorithms

In future, more elective courses will be offered based on the interests of the faculties.

1.3 Similarity with other courses

School of Mathematical Sciences offer some courses which are similar to the courses listed above. We make the following observations regarding this.

- Programming and Data Structure course can be merged with the existing Computational Laboratory courses (M141 and M142). I141 and I142 are the two lab courses, which may be offered instead of M141 and M142. The major difference in syllabus is the inclusion of different data structures which are core concepts in Computer Science.

[1]This course was originally titled Discrete Mathematics for Computer Science. We have renamed the course to capture the spectrum of the topics covered, and to avoid any confusion.

- School of Mathematical Sciences also offer Algorithms, Theory of Computation, Cryptology, Information and Coding Theory as PG optional courses. However, in Computer Science, Algorithms and Theory of Computation are fundamental courses, and need to be offered to the undergraduate students. The syllabus of Modern Cryptology, as well as Algorithmic Coding Theory has been designed from Computer Science point of view and significantly different from the SMS courses.

  However, to avoid repetition, we propose, students who take M462 (Cryptology) and M464 (Information and Coding Theory) will not be allowed to take CS451 (Modern Cryptology), and CS452 (Algorithmic Coding Theory) respectively.

2 Syllabi

Syllabi of the courses are given in the following pages. For each subject, the syllabus is organized as follows

1. prerequisite
2. topics
3. references

3 Core Courses

3.1 CS141: Programming and Data Structures Lab-I

Credit : 2

Prerequisite: None

Classes per week: 3P+1L.

Topics Module 0: (6P+2L): Introduction to Computers, Notion of Algorithm, Linux Bash Shell, Simple Shell Programs.
Module 1 (12P+4L): Introduction to Programming: Variables, operators and expressions, input and output statements, Conditions and loops. Functions and recursions.
Module 2 (12P+4L): Arrays, Pointers, Structures, Classes and Objects.
Module 3 (9P+3L): File i/o, command line arguments.
Module 4 (6P+2L). Abstract data type. Linked lists.

3.2 CS142: Programming and Data Structures Lab-II

Credit : 2

Prerequisite: CS141 **Classes per week**: 3P+1L. **Topics**

Module 0 (9P+3L): Review of programming, Arrays and Linked List. Bubble Sort and Quick Sort. Binary Search.
Module 1 (12P+4L): Circular Linked Lists, Doubly Linked Lists, Stacks, Queues.
Module 2 (12P+4L): Trees. Binary Search Trees, Tree traversal, Balanced Binary trees. Module 3 (6P+2L): Heap, Priority Queues.

Module 4 (3P+1L). Strings and Searching for Phrases.
Module 6:(Optional) (3P+1L) Dictionaries: universal, k-wise independent, simple tabulation hashing; chaining, dynamic perfect hashing, linear probing, cuckoo hashing

3.3 CS201: Theory of Computation

Credit : 4

Prerequisite: None **Classes per week**: 3L+1T. **Topics**

Module 1 (12L+4T): Introduction to Finite State Automata; DFA,NFA, and their equivalence, Regular Ex- pressions and equivalence with finite state automata.Regular Languages and Properties, Pumping Lemma and applications, Myhill-Nerode Theorem, State Minimization.

Module 2 (12L+4T): Context Free Languages (CFL) and grammars, parse trees, Chomsky Normal Form. Pushdown Automata (PDA), Equivalence of acceptance by final state and empty stack. Equivalence of CFL and PDA, Pumping Lemma for CFL.

Module 3 (12L+4T): Turing Machines and equivalence of different models. Universality. Decidability, Recog- nizability, Enumeration, and Undecidability. Reductions. Rice's Theorem, recursion theorem.

Module 4 (9L+3T): Notions of P,NP,co-NP, hierarchy theorem, NP completeness, Cook-Levin Theorem, NP completeness proofs of some NP complete problems.

3.4 CS202: Discrete Structures and Computation

Credit 4
Prerequisite: none **Classes per week**:
3L+1T. **Topics**

Module 1 (6L+2T): Review of Sets, Operations, Principles of Inclusion and Exclusion. Functions, relations, Equivalence relations. Countable and uncountable sets. Review of Pigeonhole principle.

Module 2 (6L+2T): Introduction to Propositional Logic, Equivalence and Implications. Truth tables, De Mor- gan's Law, Quantifiers, Inference and Proofs. Introduction to First Order Logic, Syntax and Semantics, Soundeness and Completeness.

Module 3 (6L+2T): Mathematical Induction, Recursions, First order linear recurrence, Geometric series, Re- cursion trees and growth rates of solutions to recurrences, Master Theorem. Generating Functions.

Module 4 (6L+2T): Introduction to counting, sum and product principles, counting subsets. Binomial coefficients and Pascal's triangles. Polya's theory of counting (optional).

Module 5 (3L+1T): Arithmetic Algorithms: Computing GCD, primality testing, RSA.

Module 6 (12L+4T): Graph Theory: Graphs, representations, connectivity, cycles, trees, Spanning tree of a graph, Algorithms to find minimum spanning trees. Eulerian Cycle and Hamiltonian paths, independence number and clique number, chromatic number, Dominating Sets, and Covering Sets. Planar Graphs. Directed Graphs and tournaments.

Module 7(3L+1T) Probabilistic tools, Tail Bounds and Applications.
Module 8 (3L+1T)(optional): Linear Algebraic tools in Combinatorics.

3.5 CS301: Design and Analysis of Algorithms

Credit 4
Prerequisite: CS201, CS202
Classes per week: 3L+1T.
Topics

Module 1 (4L+1T). Introduction and basic concepts - mathematics of algorithm analysis, asymptotic notations, worst case and average case complexity. Review of Searching and Union Find.

Module 2 (8L+3T): Divide and conquer- Motivating algorithms that leads into recurrences, solving recurrences, merge sort and its recurrence, Median computation. Analysis of quicksort.

Module 3 (9L+3T). Greedy algorithms- Greedy choice, optimal structure property, minimum spanning tree, knapsack

Module 4 (8L+2T). Dynamic programming- Integral knapsack, longest increasing subsequence, edit distance, independent sets in trees

Module 5 (8L+3T). Graph algorithms- Recall of representation of graphs, BFS, DFS, shortest path, connected components, topological sort of DAGs, biconnected components and strongly connected components in directed graphs

Module 6. (Optional)(3L+1T) Randomization- Median, randomized quicksort, probabilistic primality testing.

Algebraic Algorithms. Karatsuba's algorithm and the Fast Fourier transform

4 Optional Courses

4.1 CS451: Modern Cryptology

Credit 4

Prerequisite: CS202, CS301.

Classes per week: 3L+1T.

Topics

Module 1: (3L+1T) Introduction and Classical Cryptography, Perfect Secrecy, One Time Pad.

Module 2: (9L+3T) Symmetric Key Encryption. Computational Security, Concrete vs Asymptotic Approach. Semantic Security. Pseudorandom generators and Stream ciphers, Pseudorandom Functions and Block Ciphers. Practical Constructions.

Module 3: (6L+2T) Hash Functions and Message Authentication Codes. Notions of Security, Generic Attacks, Domain Extension techniques, CBC MAC, HMAC, PMAC, Idea of Authenticated Encryption.

Module 4: (6L+2T) Review of Basic Number Theory. Hardness Assumptions. One-way functions, Trapdoor Permutations, RSA assumptions, Discrete Log and Diffie Hellman Assumptions, SIS and LWE Assumptions. Introduction to Elliptic Curves (Optional)

Module 5. (3L+1T) Key Exchange Protocols and Key Management.

Module 6. (6L+2T) Public Key Encryption, Semantic Security, El Gamal Encryption, Padded RSA PKCS#1 v1.5. Random Oracle Technique, OAEP.

Module 7. (6L+2T) Digital Signatures, Hash and Sign paradigm, Schnorr Signature, Forking Lemma, DSA. SSL/TLS.

Module 8. (6L+2T) (Optional) Idea of some of the following notions, Protocols and Zero Knowledge Proofs, Multiparty Computations and Oblivious Transfers, Secret Sharing. Algorithms for factoring and computing discrete logarithms, Linear and Differential Cryptanalysis, Crypto Currencies.

References

- J. Katz and Y. Lindell, Introduction to Modern Cryptography. CRC, 2014.

Possible Instructor: Rishiraj Bhattacharyya.

4.2 CS452: Agorithmic Coding Theory

Credit 4

Prerequisite: CS202

Classes per week: 3L+1T.

Topics Module 1: (9L+3T) Entropy, Characterization and Properties. Application to Combinatorics. Mutual Information and KL Divergence.

Module 2: (6L+2T) Source coding theorem, lossless compression of data, Lempel-Ziv Algorithm, Optimal lossless coding.

Module 3 (6L+2T) Communication channels (binary symmetric, erasure) and channel capacity, channel coding theorem.

Module 3: (6L+2T) Introduction to Error Correcting Codes. Hamming Codes and Hamming Bounds. BCH Codes, Maximum likelihood decoding and syndrome decoding; coding theory bounds.

Module 4: (9L+3T) Reed-Solomon codes and the Berlekamp-Welch decoding algorithm with Analysis. List Decoding of Reed-Solomon Codes.

Module 5. (6L+2T)Reed-Muller Code and Local decoding. Module 6.

(3L+1T) (Optional) Lovasz Local lemma and proof.

Possible Instructor: Rishiraj Bhattacharyya.

4.3 CS453: Complexity Theory

Credit 4

Prerequisite: CS201, CS202, CS301

Classes per week: 3L+1T.

Topics

Module 1 (9L+3T): Introduction, P and NP - Review of Turing machines, universal Turing machines, and uncomputable functions, P vs. NP, NP vs. co-NP, and NP-completeness, EXP, NEXP

Module 2: (3L) Cook Levin's Theorem

Module 3 (12L+4T): Diagonalization, Space complexity, Polynomial Hierarchy

Module 4 (9L+3T): Interactive Proofs - PCP theorem and its application to approximability Module 5 (4L+1T): Circuit complexity and lower bounds

Module 6 (6L+2T): Hardness vs. Randomness - Randomized Computation, derandomization, Pseudo-random generators

Module 7 (3L+1T): Polynomial identity testing vs Lower bounds for arithmetic circuits

Possible Instructor: Anisur Rahaman Molla.

4.4 CS454: Linear Programming and Combinatorial Optimization

Credit 4

Prerequisite: CS202, CS301
Classes per week: 3L+1T.

Topics

Module 1: (10L+3T) Basic geoemetry and linear algebra related to Linear Programming. Simplex-method and Duality theorem (leading to Von Neumann's minmax principle) and complimentary slackness.

Module 2: (8L+3T) Ellipsoid algorithm. separation oracles.

Module 3: (9L+3T) Semidefinite programming as an extension of linear programming.

Module 4: (9L+3T) LP relaxation. Examples of problems where LP relaxation achieves optimum. Examples where LP/SDP relaxation achieves approximate solution. Integrality gaps.

Module 5: (6L+2T) Rounding, probabilistic roundings, iterative rounding, primal dual methods.

Module 6 (Optional): (3L+1T) Gale-Shapley algorithm, Connection of LP to Cooperative Game Theory core, nucleolus, combinatorial optimization games.

Possible Instructor: Rishiraj Bhattacharyya, Anisur Rahaman Molla.

4.5 CS455: Distributed Network Algorithms

Credit 4

Prerequisite: CS202, CS301

Classes per week: 3L+1T. **Topics** Module 1: (9L+3T) Foundations of distributed network algorithms - Broad- cast, converge-cast, maximal independent set, coloring, leader election, spanning tree algorithms, shortest paths, and routing.

Module 2:(9L+3T) Fundamental concepts in distributed algorithms - Symmetry breaking, locality, synchronizers Module 3:(9L+3T) Basics of distributed network systems - Communication, synchronization, fault-tolerance,

and resource allocation

Module 4:(9L+3T) Applications to real-world networks - Internet, peer-to-peer networks, wireless networks, sensor networks and dynamic networks

Module 5:(9L+3T) Lower bounds using communication complexity, distributed computation of large-scale data, dynamic network algorithms.

BACK TO MAIN

M.Sc NURSING
(PROGRAM CODE: HLTH15)

09HLTH15-001-C ADVANCED NURSING PRACTICE

Placement: I year

Hours of Instruction
Theory 150 Hours
Practical 200 Hours
Total: 350 Hours

Course Description

The course is designed to develop an understanding of concepts and constructs theoretical basis of advanced nursing practice and critically analyze different theories of nursing and other disciplines.

Objectives:

At the end of the course the student will be able to:

1. Appreciate and analyze the development of nursing as a profession.
2. Describe ethical, legal, political and economic aspects of health care delivery and nursing practice.
3. Explain bio- psycho- social dynamics of health, life style and health care delivery system
4. Discuss concepts, principles, theories, models, approaches relevant to nursing and their application.
5. Describe scope of nursing practice.
6. Provide holistic and competent nursing care following nursing process approach.
7. Identify latest trends in nursing and the basis of advance nursing practice.
8. Perform extended and expanded role of nurse.
9. Describe alternative modalities of nursing care.
10. Describe the concept of quality control in nursing.
11. Identify the scope of nursing research.
12. Use computer in patient care delivery system and nursing practice.
13. Appreciate importance of self development and professional advance

UNIT	HOURS	CONTENT
I	**10**	◆ History of development of nursing profession, characteristics, criteria of the profession, perspective of nursing profession - national, global ◆Code of ethics (INC), code of professional conduct (INC), autonomy and accountability, assertiveness, visibility of nurses, legal considerations. ◆ Role of regulatory bodies. ◆ Professional organizations and unions- self defense, individual and collective bargaining. ◆Educational preparations, continuing education, career opportunities, professional advancement role and scope of nursing education. ◆Role of research, leadership and management. ◆ Quality assurance in nursing (INC). ◆ Futuristic nursing.
II	**5**	**Health care delivery**: ◆ Health care environment, economic constraints, planning process, political process vis a vis nursing profession. ◆ Health care delivery system –nation, state district and local level. ◆ Major stakeholders in the health care system Govt, non government, industry and other professionals. ◆ Patterns of nursing care delivery in India. ◆ Health care delivery concerns, national health and family welfare program, inter- sectoral coordination, role of non-governmental agencies. ◆ Information, education and communication (IEC). ◆ Tele – medicine.

UNIT	HOURS	CONTENT
III	10	**Genetics** ◆ Review of cellular division, mutation and law of inheritance, human genome project, the genetic era. ◆ Basic concepts of genes, chromosomes and DNA. ◆ Approaches to common genetic disorders. ◆ Genetic Testing – basis of genetic diagnosis, pre-symptomatic and predisposition testing, prenatal diagnosis & screening, ethical, legal and psychosocial issues in genetic testing. ◆ Genetic Counseling. ◆ Practical application of genetics in nursing.
IV	10	**Epidemiology** ◆ Scope, epidemiological approach and methods. ◆ Morbidity, mortality, ◆ Concepts of causation of diseases and their screening. ◆ Application of epidemiology in health care delivery, Health surveilliance and health informatics. ◆ Role of nurse

UNIT	HOURS	CONTENT
V	20	**Bio- psycho social pathology** ◆ Pathophysiology and psychodynamic of disease causation. ◆ Life processes, homeostatic mechanism, biological and psycho- social dynamics in causation of disease, life style. ◆ Common problems : Oxygen insufficiency, fluid and electrolyte imbalance, nutritional problems, hemorrhage land shock, altered body temperature, unconsciousness, sleep pattern and its disturbances, pain, sensory deprivation. ◆ Treatment aspects: pharmacological and pre-post operative care aspects. ◆ Cardio pulmonary resuscitation. Care of dying and dead. ◆ Infection prevention (including HIV) and standard safety measures, bio-medical waste management. ◆ Role of nurse –Evidence based nursing practice.
VI	**20**	**Philosophy and Theories of Nursing.** ◆ Values, conceptual models, approaches. ◆ **Nursing theories:** Nightingale's Henderson's, Roger's, Peplau's Abdella's , Lewine's, Orem's Johnson's, King's, Neuman's, Roy's , Watson's, parsce etc. and their applications. ◆ Health belief models, communication and management etc. ◆ Concept of self health. *Evidence based practice model.

UNIT	HOURS	CONTENT
VII	**10**	**Nursing process approach** ◆**Health Assessment**- illness status of patients/ clients (Individual, family, community), Identification of health illness problems, health behaviors, signs and symptoms of clients. ◆Methods of collection, analysis and utilization of data relevant to nursing process. ◆Formulation of nursing care plans, health goals, implementation, modification and evaluation of care.
VIII	25	**Psychological aspects and Human relations** ◆ Human behavior, Life processes and growth and development, personality development, defense mechanisms. ◆ Communication, interpersonal relationships, individual and group, group dynamics, and organizational behavior. ◆ Basic human needs, Growth and development, (Conception through preschool, School age through adolescence, young and middle adult, and Older adult) ◆ Sexuality and sexual health. ◆ stress and adaptation, crisis and its intervention. ◆ Coping with loss, death and grieving, ◆ Principles and techniques of ◆ Counseling.

UNIT	HOURS	CONTENT
IX	**10**	**Nursing Practice** ◆ Framework, Scope and trends. ◆ Alternative modalities of care, alternative systems of complementary therapies. ◆ Extended and Expanded role of the nurse in promotive, preventive, curative and restorative health care delivery system in community and institutions. ◆ Health promotion and primary health care. ◆ Independent practice issues – Independent nurse midwifery practitioner. ◆ Collaboration issues and models within and outside nursing. ◆ Models od prevention. ◆ Family nursing, Home nursing. ◆ Gender sensitive issues and women empowerment. ◆ Disaster nursing. ◆ Geriatric considerations in nursing. ◆ Evidence based nursing practice. ◆ Trans- cultural nursing.
X	**30** **T = 10** **P = 20**	**Computer application for patient care delivery system and nursing practice**. ◆ Use of computers in teaching, learning, research and nursing practice. ◆ Windows, MS office, Word, Excel, Power Point. ◆ Internet, Literature search. ◆ Statistical packages. ◆ Hospital management information system software.

Practicals

Clinical posting in the following areas:

- Specialty area - inpatient unit - 2 weeks
- Community Health Center / PHC - 2 weeks
- Emergency / ICU - 2 weeks

Activities

- Prepare case studies with nursing process approach and theoretical basis
- Preparation of comparative picture of theories
- Family case work using model of prevention.
- Annotated Bibliography.
- Report of field visit (5)

Methods of Teaching

- Lecture cum discussion
- Seminar
- Panel Discussion
- Debate
- Case Presentation
- Exposure to Scientific Conferences
- Field Visits

Methods of Evaluation

- Tests
- Presentation
- Seminar
- Written Assignments

MEDICAL SURGICAL NURSING

Placement : 1ST Year

Hours of Instruction
Theory – 150 Hours
Practical – 650 Hours
Total : 800 Hours

Course Description

This course is common for the students undergoing clinical speciality-II in neuro science nursing / cardiovascular & thoracic nursing / critical care nursing /oncology nursing / orthopaedica and rehabilitation nursing / nephro & urology nursing, gastroenterology nursing / geriatric nursing.

It is designed to assist students in developing expertise and in depth knowledge in the field of Medical Surgical Nursing. It will help students to appreciate the patient as a holistic individual and develop skill to function as a specialized Medical-Surgical Nurse. It will further enable the students to function as educator, manager and researcher in the field of Medical Surgical Nursing.

Objectives

At the end of the course the students will be able to:

1. Appreciate trends and issues in the field of Medical – Surgical Nursing as a speciality
2. Apply concepts & theories related to health promotion.
3. Appreciate the client as a holistic individual.
4. Perform physical, psychosocial assessment of Medical – Surgical patients.
5. Apply Nursing process in providing care to patients.
6. Integrate the concept of family centered nursing care with associated disorder such as genetic, congenital and long-term illness.
7. Recognize and manage emergencies with Medical – Surgical patient's.
8. Describe various recent technologies & treatment modalities in the management of critically ill patients.
9. Appreciate the legal & ethical issues relevant to Medical – Surgical Nursing.
10. Prepare a design for layout and management of Medical – Surgical Units.
11. Appreciate the role of alternative systems of Medicine in care of patients.
12. Incorporate evidence based Nursing practice and identity the areas of research in the field of Medical – Surgical Nursing.
13. recognize the role of Nurse practitioner as a member of the Medical – Surgical health teams
14. Teach Medical – Surgical Nursing to undergraduate nursing students & in-service nurses.

Course Content

Unit	Hours	Content
I	5	**Introduction** ◆ Historical development of Medical – Surgical Nursing in India. ◆ Current status of health and disease burden in India. ◆ Current concept of health. ◆ Trends & issues in Medical – Surgical Nursing. ◆ Ethical & cultural issues in Medical – Surgical Nursing. ◆ Rights of patients. ◆ National health policy, special laws & ordinances relating to older people. ◆ National goals. ◆ Five years plans. ◆ National health programs related to adult health.
II	20	**Health Assessment of patients** ◆ History taking. ◆ Physical examination of various systems. ◆ Nutritional assessment. ◆ Related investigations and diagnostic assessment.
III	5	**Care in Hospital settings:** ◆ Ambulatory care. ◆ Acute and Critical care. ◆ Long term care. ◆ Home Health Care ◆ Characteristics, care models, practice settings, interdisciplinary team. ◆ Hospitalization- effects of hospitalization on the patient & family. ◆ Stressors & reactions related to disease process ◆ Nursing care using Nursing process approach
IV	10	**Management of patients with disorders of Gastro intestinal tract** ◆ Review of anatomy and physiology. ◆ Disorders-etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up

Unit	Hours	Content
V	**10**	**Management of patients with disorders of nervous system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
VI	**10**	**Management of patients with disorders of respiratory system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
VII	**10**	**Management of patients with disorders of cardio vascular system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up

Unit	Hours	Content
VIII	5	**Management of patients with disorders of blood** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
IX	10	**Management of patients with disorders of genitor urinary system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
X	10	**Management of patients with disorders of endocrine system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up

Unit	Hours	Content
XI	**10**	**Management of patients with disorders of musculo-skeletal system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
XII	**8**	**Management of patients with disorders of integumentory system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
XIII	**5**	**Management of patients with disorders of Eye and ENT** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up

Unit	Hours	Content
XIV	8	**Management of patients with disorders of reproductive system** ◆ Review of anatomy and physiology. ◆ Disorders- etiology, Patho physiology, Clinical manifestations, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
XV	8	**Geriatric nursing** ◆ Nursing Assessment – History and Physical assessment. ◆ Ageing; ◆ Demography; Myths and realities. ◆ Concepts and theories of ageing. ◆ Cognitive Aspects of Ageing. ◆ Normal biological ageing. ◆ Age related body systems changes ◆ Psychosocial Aspects of Ageing. ◆ Medications and elderly. ◆ Stress & coping in older adults. ◆ Common Health Problems & Nursing Management; ◆ Psychosocial and Sexual. ◆ Abuse of elderly. ◆ Role of nurse for care of elderly; ambulation, nutritional communicational, psychosocial and spiritual. ◆ Role of nurse for caregivers of elderly. ◆ Role of family and formal and non formal caregivers. ◆ Use of aids and prosthesis (hearing aids, dentures, ◆ Legal & Ethical Issues. ◆ Provisions and Programmes for elderly; privileges, Community Programs and health services; ◆ Home and institutional care. ◆ Issues, problems and trends.

Unit	Hours	Content
XVI	8	**Management of patients with communicable and sexually transmitted diseases:** ◆ Review of immune system. ◆ Disorders of immune system – HIV / AIDS. ◆ Review of infectious disease process. ◆ Communicable diseases- etiology, Patho physiology, Clinical manifestations complications, prognosis ◆ Health assessment- History taking physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up
XVII	8	**Emergency, trauma and multi-system organ failure** ◆ DIC (disseminated intravascular coagulation) ◆ Trauma, burns, poisoning ◆ Etiology, Patho physiology, Clinical manifestatios, complications, prognosis. ◆ Health assessment- History taking, physical examination, investigation and diagnostic assessment. ◆ Treatment modalities and trends. ◆ Nursing management. ◆ Related research studies. ◆ Evidence based nursing practice. ◆ Rehabilitation and follow-up

PROFORMA & GUIDELINE FOR CASE PRESENTATION

I] Patient Biodata

Name, Age, Sex, Religion, Marital status, Occupation, Source of health care, Date of admission, Provisional Diagnosis, Date of surgery if any.

II] Presenting complaints

Describe the complaints with which the child has been brought to the hospital

III] Socio-economic status of the family: Monthly income, expenditure on health, food, education etc.

IV] History of Illness (Medical & Surgical)

i) History of present illness – onset, symptoms, duration, precipitating/aggravating factors
ii) History of past illness surgery, allergies, medications etc.
iii) Family history – Family tree, history of illness in the family members, risk factors, congenital problems, psychological problems etc.

V] Diagnosis: (Provisional & confirmed).

Description of disease: Includes the followings

1. Definition.
2. Related anatomy and physiology
2. Etiology & risk factors
3. Path physiology
5. Clinical features.

VI] Physical Examination of Patient (Date & Time)

Physical examination: with date and time.
Clinical features present in the book Present in the patient

VII] Investigations

Date Investigation done Results Normal value Inferences

VIII] Management - (Medical /Surgical)

a) Aims of management
b) Objectives of Nursing Care Plan

IX] Treatment:

S.No Drug (Pharmacological name) Dose Frequency/ Time Action Side effects & drug reaction
Nurse's
responsibility

- Medical or Surgical Management.
- Nursing management

X] Nursing Care Plan: Short Term & Long Term plan.

Assessment Nursing
Diagnosis
Objective Plan of
care
Rationale Implementation Evaluation

XI] Discharge planning:

It should include health education and discharge planning given to the patient.

XII] Prognosis of the patient:

XIII] Summary of the case:

COURSE DESCRIPTION

This course is designed to assist students to develop a broad understanding of fundamental principles, trends and issues related to education and nursing education. Further, it would provide opportunity to students to understand, appreciate and acquire skills in teaching and evaluation, curriculum development, implementation, maintenance of standards and accreditation of various nursing educational programs.

OBJECTIVES

At the end of the course, students will be able to:

1. Explain the aims of education, philosophies, trends in education and health: its impact on nursing education.
2. Describe the teaching learning process.
3. Prepare and utilize various instructional media and methods in teaching learning process.
4. Demonstrate competency in teaching, using various instructional strategies.
5. Critically analyze the existing nursing educational programs, their problems, issues and future trends.
6. Describe the process of curriculum development, and the need and the methodology of curriculum changes, innovation and integration.
7. Plan and conduct continuing nursing education programs.
8. Critically analyze the existing teacher preparation programs in nursing.
9. Demonstrate skill in guidance and counseling.
10. Describe the problems and issues related to administration of nursing curriculum including selection and organization of clinical experience.
11. Explain the development of standards and accreditation process in nursing education programs.
12. Identify research priorities in nursing education.
13. Discuss various models of collaboration in nursing education and services.
14. Explain the concept, principles, steps, tools and techniques of evaluation.
15. Construct, administer and evaluate various tools for assessment of knowledge, skill and attitude.

COURSE CONTENT

UNIT	TOPIC	THEORY	PRACTICALS	M OT	T/L ACTIVITIES
I	**INTRODUCTION** • Education: definition, aims, concepts, philosophies & their education implication. • Impact of social, economical, political & technological changes on education: - Professional education - Current trends and issue in education - Educational reforms and national educational policy - Trends in development of nursing education India. • Concepts of Nursing education • History of nursing education in India • Philosophy and objectives of nursing education • Purposes of nursing education in India • Scientific approach in Nursing • Current issues and emerging trends in Nursing education Liberal education and nursing education	10		L	• Students to apply various philosophies of educations to nursing education • Present the history of nursing education in India, issues & trends in nursing education
II	**OBJECTIVES AND THEIR CLASSIFICATION** • Meaning of educational objectives. • Formulation and statement of objectives • Classification of objectives • Taxonomy of educational objectives Objectives and learning outcomes	05	04	L/D	• Formulate objectives as per the domains and subject
III	**TEACHING –LEARNING PROCESS** • Concepts of teaching and learning: Definition, theories of teaching and learning, relationship between teaching and learning. • Competency based education (CBE) and outcome based education (OBE) • Instructional design: planning and designing the lesson, writing lesson plan, meaning, its need and importance, formats. • Instruction strategies: Lecture, discussion, demonstration, simulation, laboratory, seminar, panel, symposium, problem based learning(PBL), workshop, project, role play (socio drama), clinical teaching methods, programmed instruction, self directed learning (SDL), micro teaching, computer assisted instruction (CAI), computer assisted learning(CAL) • Sensitivity training and transactional analysis • Training for nursing leadership Development of effective study habits	30	28	L	• In clinicals supervise students prepare rotation plan • Prepare lesson plan, • Carry out practice teaching • Carry out 2 microteaching

IV	**INSTRUCTIONAL MEDIA AND METHOD** • Key concepts in the selection and use of media in education. • Developing learning resource material using different media • Instructional aids- types, uses, selection, preparation, and utilization Teacher's role in procuring and managing instructional Aids- project and non projected aids, multi media, video-tele conferencing etc.	10	06	L/D	• Visit to IEC Bureau • Preparation and utilization of Instructional aids
V	**MEASUREMENT AND EVALUATION** • Concept and nature of measurement and Evaluation, meaning, principles, purpose, problems in evaluation and measurement. • Principles of assessment, formative and summative assessment –internal assessment external examination, advantages and disadvantages • Criterion and norm referenced evaluation **Evaluation process** • Defining objectives for evaluation purposes. • Relating evaluation procedures to objectives. • Formative and summative evaluation • Characteristics of evaluation	10		L/D	• Relate evaluation to educational objective
VI	**STANDARDIZED AND NON STANDARDIZED TEST** • Meaning, characteristics, objectivity validity, reliability, usability, norms, construction of tests. • Blue Print • Essay, short answer questions and multiple- choice questions. • Rating scales, checklist, OSCE/ OSPE • Differential scales, and summated scales, sociometry , anecdotal record, attitude scale, critical incident technique • Question bank-preparation, validation, moderation by panel, utilization Developing a system for maintaining confidentiality	10	15	L/D Work shop	• Prepare blue print • Construct tests • Reliability validity • Prepare question bank • Prepare an aptitude test for entrance examination for B.Sc. Nursing students
VII	**ADMINISTRATION, SCORING AND REPORTING OF TESTS** • Administrating a test, scoring, grading versus marks • Objective tests, scoring essay test, methods of scoring, item analysis	05		L/D	Carry out item analysis
VIII	**STANDARDIZED TOOLS** • Test of intelligence aptitude, interest, personality, achievement, socioeconomic status scale, tests for	05	08	L/D	• Observe various tests - Personality aptitude &

	special mental and physical abilities and disabilities				intelligence Formulate an aptitude test
IX	**NURSING EDUCATIONAL PROGRAMS** • Perspectives of nursing education: Global and national. Patterns of nursing education and training program in India. Non-university and university programs: ANM, GNM, Basic B.Sc. Nursing , Post certificate B.Sc. Nursing , M.Sc. (N) M Phil and Ph D post diploma program, Nurse practitioner programs	05	10	L/D	• Visit to nursing institution s- ANM, GNM, B.Sc., M.Sc. • Critically evaluate any nursing education al program in Maharash tra / India
X	**CONTINUING EDUCATION IN NURSING** • Concepts – Definition, importance, need, scope, principles of adult learning, assessments of learning needs priorities, resources. • Program planning, implementation, and evaluation, of continuing education programs. • Research in continuing education Distance education in nursing	05	15	L/D	• Plan CNE Program me & conduct one workshop (group activity)
XI	**CURRICULUM DEVELOPMENT** • Definition, curriculum determinants, process & steps of curriculum development, curriculum models types and framework. • Formulation of philosophy, objective, Mission statement. Selection and organization of learning experiences, current trends in clinical learning experiences. • Master plan, course plan, unit plan, lesson plan. • Evaluation strategies, process of curriculum change, role of students, faculty, administrators • Statutory bodies, and other stakeholders. • Equivalency of courses: transcripts, credit system • Curriculum committee • Selection of text books • Assignments	10	10	L	• Prepare the mission statement philosoph y, education al objectives for a nursing education program me • Formulate education al objectives for various lessons- eg FON, Medical – Surgical nursing • Select learning experienc es for a specific subject

XII	**TEACHER PREPARATION** • Definition, nature of teaching • Characteristics of good teaching • Communication process in teaching • Principles of teaching • Maxims of teaching • Levels of teaching • Characteristics of an effective teacher • Innovations in teaching • Modification of teacher behaviour • Teacher-roles & responsibilities, function, characteristics, • Competencies, qualities • Preparation of professional teacher • Organizing professional aspects of teacher preparation programs • Questioning technique Evaluation : Self and peer. Critical analysis of various programs of teachers education in India	10	05	L/D	• Application of principles and maxims of teaching • Carry out any one innovative teaching strategy
XIII	**GUIDANCE AND COUNSELING** • Concepts and principles of guidance and counseling • Purpose and phases of counseling • Need for guidance and counseling in nursing education • Types of guidance and counseling • Difference between guidance and counseling • Problems of guidance and counseling • Responsibilities of the nurse administrator in student guidance and counseling • Guidance and counseling services: diagnostic and remedial. • Coordination and organization of services • Techniques of counseling: interview, case work and characteristics of counselor Professional preparation and training for counseling	10	08 + 16	L/D	• Role play • Visit to visually impaired • Deaf and dumb gifted children, slow learner, mentally handicapped
XIV	**ADMINISTRATION OF NURSING CURRICULUM** • Role of curriculum coordinator. Planning, implementation and evaluation. • Evaluation of educational program in nursing course and program • Factors influencing faculty staff relationship and techniques of working together. • Concept of faculty supervisor (dual) position. • Curriculum research in nursing Different models of collaboration between education and service	10	05	L/D	• Evaluate present curriculum of any educational program GNM, B.Sc. Nursing

XV	**MANAGEMENT OF NURSING EDUCATION INSTITUTIONS** • Planning , organizing , staffing budgeting, recruitment, discipline, public relation, performance appraisal, welfare services, library services, hostels • Development and maintenance of standards and accreditation in nursing education programm. • Role of Indian Nursing council, state Registration Nursing councils, board and university. Role of professional association and unions	08	08	L/D	• Visit to educational institutions • Plan to set-up a SON/ CON • Visit to INC/SNC
XVI	**EVALUATION OF CLINICAL PRACTICE IN NURSING** • Clinical evaluation methods • Written communication methods as clinical evaluation Oral communication methods as clinical evaluation	05	08	L/D	• Formulate clinical evaluation criteria: • Conduct practical examination for undergraduate students
XVII	**INTERNAL ASSESSMENT** • Needs for internal assessment • Component of internal assessment system • Validity of internal assessment Advantage and disadvantage of internal assessment	02	04	L/D	• Prepare an internal assessment system for particular education programme
		150	150		

PLANNED ACTIVITIES:

- Panel discussion/group presentation – Educational psychology – Theories and laws of learning and
  teaching, Personality, Intelligence, Individual differences, Motivation, Group Dynamics
- Framing philosophy, aims and objectives of an educational Institution
- Lesson Planning
- Micro teaching –2
- Conduct Practice teaching using different teaching strategies –10 (Classroom – 5,Demonstration
- Construct a written objectives type test for the lessons taken.
- Construct tests, administer and determine reliability and validity.
- Preparation and utilization of instructional aids using different media.
- Design a curriculum for a basic B.Sc. Nursing Programme; Develop course plan, units plan, rotation plans,
- Prepare cumulative records for students.
- Prepare rotation plan for clinical practice

- Planning and organizing field visits
- Plan, conduct and evaluate a continuing nursing education workshop
- Annotated bibliography 10
- Critical evaluation of any nursing education program offered by a selected institution.
- Educational visit – Educational institutions –GNM, B Sc, Diploma course etc
- Field visits (INC/SNC) to get familiar with recognition / registration process.
- Construct, administer and evaluate tools (objective & essay type test, observation checklist, rating scale etc).
- Observe and practice application of various non-standardized tests (intelligence, aptitude, personality, sociometry, physical and mental disabilities tests.)
- Prepare aptitude test for entrance exams of B.Sc nursing students.
- Prepare a plan for evaluation of the students in the B.Sc nursing programme.
- Visit to schools – gifted children, slow learners, mentally handicapped, deaf & dumb & visually impaired

METHODS OF TEACHING

Method of teaching

- Lecture cum discussion
- Demonstration
- Seminar/Presentation
- Project work
- Field visits
- Workshop

Methods of evaluation

- Written Tests
- Class room /Clinical teaching
- Presentation
- Project work
- Written assignments

09-HLTH15-004-C NURSING MANAGEMENT

Placement: II year

Hours of Instruction
Theory 150 Hours
Practical 150 Hours
Total : 300 Hours

Course Description:

This course is designed to assist students to develop a broad understanding of Principles, concepts, trends and issues related to nursing management. Further, it would provide opportunity to students to understand, appreciate and acquire skills in planning, supervision and management of nursing services at different levels to provide quality nursing service.

Objectives:

At the end of the course, students will be able to:

1.Describe the philosophy and objective of the health care institutions at various levels.

2.Identify trends and issues in nursing.

3.Discuss the public administration, health care administration vis a vis nursing administration.

4.Describe the principles of administration applied to nursing.

5.Explain the organization of health and nursing services at the various levels / institutions.

6.Collaborate and co-ordinate with various agencies by using multisectoral approach.

7.Discuss the planning, supervision and management of nursing workforce for various health care settings.

8.Discuss various collaborative models between nursing education and nursing service to improve the quality of nursing care.

9.Identify and analyse legal and enthical issues in nursing administration.

10.Describe the process of quality assurance in nursing services.

11.Demonstrate leadership in nursing at various levels.

COURSE – PLAN

UNIT	HRS	CONTENT
I	10	❑ Philosophy, purpose, elements, principles & scope of administration. ❑ Indian Administrative system vis a vis health care delivery system: National, State and Local, Indian Constitution. ❑ Planning Processes: Five year plans, various committee reports on Health State and National Health Policies, National Population Policy on AYUSH & plans.
II	10	**MANAGEMENT: -** ❑ Functions of administration. ❑ Planning and control. ❑ Co- ordination and delegation ❑ Decision making – decentralization basic goals of decentralization ❑ Concept of management. **NURSING MANAGEMENT: -** ❑ Concept, types and principles. ❑ Vision and mission statements. ❑ Philosophy, aims and objectives ❑ Current trends and issues in Nursing administration ❑ Theories and models. Ap application to nursing service and education.
III	15	PLANNING :- ❑ Planning process: concept, principles. ❑ Mission, philosophy, objectives. ❑ Strategic planning ❑ Operational plans. ❑ Management plans ❑ Programme evaluation and review technique (PERT), Gantt chart, management by objectives (MBO). ❑ Planning new venture. ❑ Planning for change Application to nursing service and education
IV	15	ORGANISATION :- ❑ Concept, principles, objectives, types and theories, minimum requirements for organization, developing an organizational structure, levels, organizational effectiveness and organizational climate ❑ Organizing nursing services and patient care : methods of patient assignment – advantages and disadvantages, primary nursing care.

UNIT	HRS	CONTENT
		❑ Planning and organizing : hospital, unit and ancillary services (specially central sterile supply department, laundry, kitchen, lab. Services, emergency etc.) ❑ Disaster management : plan, resources, drill., etc. Application to nursing service and education
V	15	**HUMAN RESOURCES FOR HEALTH :-** ❑ Staffing ❑ Recruitment : credentialing, selection, placement, promotion ❑ Retention . ❑ Personnel policies ❑ Termination ❑ Staff development programme. ❑ Duties and responsibilities of various category of nursing personnel.
VI	15	**DIRECTING :-** ❑ Roles And Functions ❑ Motivation : Intrinsic, extrinsic, creating motivating climate, motivational theories. ❑ Communication : process, types, strategies, interpersonal communication, channels,barriers,problems, confidentiality, public relations ❑ Delegation; common delegation errors ❑ Managing conflicts: process, management, negotiation, consensus ❑ Collective bargaining: health care labour laws, unions, professional associations, role of nurse manager ❑ Occupational health and safety. Application to nursing service and education
VII	10	• Material Management • Concepts, principles and procedures : Specifications • ABC analysis • VED (very important and essential daily use) analysis • Planning equipments and supplies for nursing care : unit and hospital • Inventory control • Condemnation Application to nursing service and education

UNIT	HRS	CONTENT
VIII	15	**Controlling** • Quality assurance Standards Models Nursing audit • Performance appraisal : Tools, formats, Management, interviews • Supervision and management : concepts and principles • Discipline : service rules, self discipline, constructive versus destructive discipline, problem employees, disciplinary proceedings enquiry etc. Application to nursing service and education
IX	15	**Fiscal planning** • Steps • Plan and non-plan, zero budgeting, mid-term appraisal, capital and revenue • Budget estimate, revised estimate, performance budget • Audit • Cost effectiveness • Cost accounting • Critical pathways • Health care reforms • Health economics • Budgeting for various units and levels Application to nursing service and education
X	10	**Nursing informatics** • Trends • General purpose • Use of computers in hospital and community • Patient record system • Nursing records and reports • Management information and evaluation system (MIES) • E-nursing, Telemedicine, telenursing • Electronic medical records
XI	10	**Leadership** • Concepts, Types Theories • Styles • Manager behaviors • Leader behaviors • Effective leader : Characteristics, skills • Group dynamics • Power and politics • Lobbying • Critical thinking and decision making • Stress management Application to nursing service and education

UNIT	HRS	CONTENT
XII	10	**Legal and ethical issues** **Laws and ethics** • Ethical committee • Code of ethics and professional conduct • Legal system : Types of law, tort law, and liabilities • Legal issues in nursing : negligence, malpractice, invasion of privacy, defamation of character • Patient care issues, management issues, employment issues • Medico legal issues • Nursing regulatory mechanisms : licensure, renewal, accreditation • Patients rights • Rights of special groups : children, women, HIV, handicap • Infection control • Standard safety measures

Practical

1. Prepare prototype personal files for staff nurses, faculty and cumulative records
2. Preparation of budget estimate, Revised estimate and performance budget
3. Plan and conduct staff development programme
4. Preparation of Organization Chart
5. Developing nursing standards / protocols for various units
6. Design a layout plan for speciality units / hospital, community and educational institutions
7. Preparation of job description of various categories of nursing personnel
8. Prepare a list of equipments and supplies for speciality units
9. Assess and prepare staffing requirement for hospitals, community and educational institutions
10. Plan of action for recruitment process
11. Prepare a vision and mission statement for hospital, community and educational institutions
12. Prepare a plan pf action for performance appraisal
13. Identify the problems of the speciality units and develop plan of action by using problem solving approach
14. Plan a duty roster for speciality units / hospital, community and educational institutions
15. Prepare : anecdotes, incident reports, day and night reports, handing and taking over reports, enquiry, nurses notes, official letters, curriculum vitae, presentation etc.
16. Prepare a plan for disaster management
17. Group work
18. Field appraisal report.

ESSENTIALS FOR A P. EXP.

1) DEMONSTRATION
2) PREPARATION/STUDY MATERIAL & PRESENTATION
3) ANALYSIS STUDY-REPORT

(GUIDE LINE TO BE PROVIDED) THAT IS

AIMS-OBJECTIVES EVALUATION

AREA FOR EXPERIENCE

- PREPARATION FOR DUTY ROSTER UNIT
- PREPARATION FOR INVENTORY
- PROCESS OF CONDEMNATION
- SUPERVISION FOR NSG/NON NSS STABB ?
- CLINICS FOR TRAINEE NURSES (BEDSIDE)
- OBSERVATIONAL STUDY OF NURSES ADM AREA.

VISIT- APECIFIC Department

C S S D, kitchen

Waste disposal

Special unit

College Demonstration format

- Cumulative Record
- Personal Appraisal
- Various evaluation performe
- Organizational charts
- Job description
- Recruitment Process
- Vision-Mission statement
- Standing orders/protocol
- Staff development programme
- Model budget

Practical Experience:-Observational Study Report Preparation.

SN	Departments/Area	Weeks	Hours
1	Hosptial Administration Nursing service administartion Nursing education administartion	$1^1/_2$	60 hrs.
2	Community Health Administartion	$1^1/_2$	60 hrs.
3	Visit to Specialised Unit /Hosptial	1 (5 hrs. per day)	30 hrs.
	Total		150 hrs.

Hosptial Administration: -

- Account Section
- CSSD
- Dietary Section
- Waste Disposal etc.

Nursing Services Administration:-

- Office of Nursing Superintendent
- Departmental Incharge

Nursing Education Administration:-

- Office of Principal of School/College of Nursing

Community Health Administration: -

- DHS/DHO/CHC/RH/NGO/Govt.Agencies

Assignments: - Theory

- Seminar
- Module Preparation (Staff development programme)
- Vision Mission Statement
- Standing orders
- Job Description
- Cumulative reword
- Evaluation Performa
- Personal Appraisal
- Recruitment process.

Method of Teaching: -

- Lecture Discussion
- Group Discussion
- Field Visit
- Project work
- Seminar Presentation

ASSIGNMENT FORMAT FOR WRITING PERFORMANCE APPRAISAL :-

Guidelines :-

1 Define the purpose of assessment

2 Decide as to which groups are to be assessed

3 Select and define the qualities to be assessed on a Five point Rating scale.

4 Include the following areas

- Quality of performance
  - Quantity of work
  - Quality of work
- Mental qualities
  - Ability to learn
  - Adaptability
  - Originality
  - Reasoning powers
- Supervisory qualities
  - Leadership
  - Organizing ability
  - Cooperation
- Personal qualities
  - Honesty
  - Self control
  - Initiative
  - Appearance
  - Attitude towards fellow workers
  - Attitude towards work
- Capacity for further development
  - Intelligence
  - Acceptance of responsibility
  - To Lead a group

09HLTH15-005-C NURSING RESEARCH AND STATISTICS

Placement 1st Year

Hours of Instruction
Theory :150 Hours
Practical :100 Hours
Total: 250 Hours

Part A: Nursing Research

Course Description:-

The Course is designed to assist the students to acquire an understanding of the research methodology and statistical methods as a basis for identifying research problem, planning and implementing a research plan. It will further enable the students to evaluate research studies and utilize research findings to improve quality of nursing practice, education and management.

General Objectives:

At the end of the course, the students will be able to :

1. Define basic research terms and concepts.
2. Review literature utilizing various sources
3. Describe research methodology
4. Develop a research proposal.
5. Conduct a research study.
6. Analyze and interpret the research data
7. Communicate research findings
8. Utilize research findings
9. Critically evaluate nursing research studies
10. write scientific paper for publication

CONTENT OUTLINE

Unit	Hours		Course Content
	Theory	Practical	
I	10 +2		**Introduction :** • Methods of acquiring knowledge – problem solving and scientific method. • Inductive and deductive reasoning • Research – definition, Characteristics, purposes, kinds of research • Historical Evolution of research in nursing • Basic research terms • Scope of nursing research : areas, problems in nursing, health and social research**,** • Role of research in nursing • Evidence based practice • Ethics in research • Overview of Research process
II	5 **(-2)** **3**	5	**Review of Literature** * Importance, purposes, scope, sources, criteria for selection of resources and steps in reviewing literature.
III	12		**Research Approaches and designs** • Type: Quantitative and Qualitative • Historical, survey and experimental – Characteristics, types advantages and disadvantages • Qualitative: Phenomenology, grounded Theory, ethnography • Research designs, its importance , characteristics of good design • Threats to internal and external validity
IV	10	5	**Research problem** : • Identification of research problem, • **Sources of research problem** • Formulation of problem statement and research objectives • Definition of terms • Assumptions and delimitations and **limitation** • Identification of variables • Hypothesis – definition, formulation and types

Unit	Hours		Course Content
	Theory	Practical	
V	5	5	**Developing theoretical / conceptual framework** • Theories: Nature, Characteristics, Purpose and uses • Using, testing and developing conceptual framework, models and theories
VI	**6**	-	**Sampling** • Population and sample • Factors influencing sampling • Sampling techniques • Sample size • Probability and sampling Error • Problems of sampling
VII	20	10	**Tools and methods of Data collection** : • Concepts of data collection • Data sources, methods/techniques quantitative and qualitative • Tools for data collection – types, characteristics and their development • Validity and reliability of tools • Procedure for data collection
VIII	5		**Implementing research plan** • Pilot study, review research plan (design), planning for data collection, administration of tool / interventions, collection of data
IX	10	10	**Analysis and interpretation of data** • Plan for data analysis: quantitative and qualitative • Descriptive and Inferential Analysis • Preparing data for computer analysis and presentation • Statistical analysis • Interpretation of data • Conclusion and generalizations • Summary and discussion

Unit	Hours		Course Content
	Theory	Practical	
X	10		**Reporting and utilizing research findings:** • Communication of research results; oral and written • Writing research report purposes, methods and style-vancouver, American Psychological Association (APA), Campbell etc • Writing scientific article for publication: purposes & style
XI	3	8	Critical analysis of research reports and articles
XII	4	7	Developing and presenting a research proposal

Activities

- Annotated Bibliography of research reports and articles
- Review of literature of selected topic and reporting
- Formulation of problem statement, objective and hypothesis
- Developing theoretical/conceptual framework.
- Preparation of a sample research tool
- Conducting validity and reliability of research tool
- Analysis and interpretation of given data
- Developing and presenting research proposal
- Journal club presentation
- Critical evaluation of selected research studies
- Writing a scientific paper.

Method of Teaching

- Lecture - cum – discussion
- Seminar / Presentations
- Project
- Class room exercises
- Journal club

Methods of Evaluation

- Quiz, Tests (term)
- Assignments / Term paper
- Review of literature of at least 20 Journals and 20 book - 50 marks
- Research Critiques- 50 marks
- Presentations- Presentation of two related researches **50 marks**
- Project Work Project on topic of Interest **100 marks**

PART – B : STATISTICS

Course Description

At the end of the course, the students will be able to develop an understanding of the statistical methods and apply them in conducting research studies in nursing.

Theory 50 Hrs. & Practical 50 Hrs.

General Objectives

At the end of the course the students will be able to

1. Explain the basic concepts related to statistics
2. Describe the scope of statistics in health and nursing
3. Organize, tabulate and present data meaningfully
4. Use descriptive and inferential statistics to predict results.
5. Draw conclusions of the study and predict statistical significance of the results.
6. Describe vital health statistics and their use in health related research
7. Use statistical packages for data analysis.

Unit	Hours		Course Content
	Theory	Practical	
I	7	4	**Introduction :** • Concepts, types, significance, and scope of statistics meaning of data, parameliric and no-paraametrc data • Sample, parameter • Type and levels of data and their measurement • Organization and presentation of data – Tabulation of data: • Frequency distribution • Graphical and tabular presentations
II	4	4	**Measures of central tendency :** • Mean, Median, mode
III	4	5	**Measures of variability**: * Range, Percntiles, average deviation, quartile deviation, standard deviation

Unit	Hours		Course Content
	Theory	Practical	
IV	3 2	2 2	**Normal Distribution :** * Probability , Characteristics and application of normal probability curve; sampling error. Cumulative distribution The cumulative frequency graph, Percentiles and percentile ranks The Cumulative percentage curve or Ogive
V	6	8	**Measures of relationship** : • Correlation – need and meaning • Rank order correlation • Scatter diagram method • Product moment correlation • Simple linear regression analysis and prediction.
VI	4	2	**Designs and meaning:** • Experimental designs • Comparison in pairs, randomized block design, Latin squares
VII	8	10	**Significance of statistic and significance of difference between two statistics (testing hypothesis)** • Non parametric test – Chi – square test, Sign median test, Mann-Whitney test. • Parametric test – 't' test, anova, manova, ancova, Pearson's r
VIII	5	5	**Use of statistical methods in psychology and education:** • Scaling – Z Score , Z Scaling • Standard Score and T score • Reliability of test Scores: test-retest method, parallel forms, spilt half method
IX	4	2	**Application of statistics in health:** • ratios, Rates, Trends • Vital health statistics – Birth and death rates. • Measures related to fertility, morbidity and mortality
X	3	6	**Use of computers for data analysis** Use of statistical package.

Activities

- Exercises on organization and tabulation of data.
- Graphical and tabular presentation of data
- Calculation of descriptive and inferential statistics (Chi, square, t-test, correlation)
- Practice in using statistical package
- Computing vital health statistics

Methods of Teaching:

- Lecture – cum-discussion
- Demonstration – on data organization, tabulation, calculation of statistics, use of statistical package, Classroom exercises, organization and tabulation of data,
- Computing Descriptive and inferential statistics; vital and health statistics and use of computer for data entry and analysis using statistical package.

Methods of Evaluation:

- Test , Classroom statistical exercises

Internal Assessment

Techniques	Weightage 10 marks
Test – (2 tests)	100%

Internal Assessment : Theory

I. Test

	Marks	Research	Statistics
1) Mid term	50	30	20
2) Pre final	75	50	25
	125	80	45

40% of test marks - **10 marks**

II. **Assignments**

i. Review of literature on topic of Interest (At least 20 books and 20 Journals) - 50 marks

ii. Critiquing - 50 marks

Total 100 marks

20% of Assignments – 5 marks

III. Presentation

Presentation of two related researches - 50 marks - **Total 100 marks**

20% of Presentation - **5 marks**

IV. Project work

20% - **5 marks**

MEDICAL SURGICAL NURSING – ONCOLOGY NURSING

Placement: II year M.Sc Nsg.

Hours of Instruction
Theory : 150 hours
Practical : 950 hours
Total : 1100 hours

Course Description:

This course is designed to assist students in developing expertise and in-depth understanding in the field of oncology Nursing. It will help students to develop advanced skills for Nursing intervention in various oncological conditions. It will enable the student to function as oncology nurse practitioner/specialist and provide quality care. It will further enable the student to function as educator, Manager, and researcher in the field of oncology nursing.

Objectives:-

1. Explain the prevention, screening and early detection of cancer.
2. Describe the epidemiology, etiology, pathophysiology and diagnostic assessment of oncological disorders of various body systems.
3. Describe the psychological effects of cancer on patients and families.
4. Demonstrate skill in administrating/ assisting in various treatment modalities used for patients with cancer.
5. Apply nursing process in providing holistic care to patients with cancer.
6. Apply specific concepts on pain Management.
7. Appreciate the care of death and dying patients and value of bereavement support.
8. Describe the philosophy, concept and various dimensions of palliative care.
9. Appreciate the role of alternative systems of medicine in care of cancer patients.
10. Appreciate the legal & ethical issues relevant to oncology nursing
11. Recognize and manage Oncological emergencies.
12. Counsel the patients with cancer and their families.
13. Incorporate evidence based nursing practice and identify the areas of research in the field of oncology nursing.
14. Recognize the role of oncology nurse practitioner as a member of oncology item.
15. Collaborate with other agencies and utilize resources in caring for cancer patients.
16. Teach and supervise nurses and allied health workers.
17. Design a layout and develop standards for management of oncology units/hospitals and nursing care.

COURSE OUTLINE

Unit	Time Hours		Content
	T	P	
I	**4**		**Introduction** • Epidemiology- incidence, Prevalence- Global, National, State and Local • Disease burden, concept of cancer, risk factors • Historical perspectives • Trends and issues • Principles of cancer management • Roles and responsibilities of oncology nurse
II	**5**		**The Nature of Cancer** • Normal cell biology • The Immune system • Pathological and • pathophysiological changes in tissues ○ Biology of the cancer cell ○ Clone formation Transformation ○ Tumors stem lines ○ Structure of a solid tumor ○ Products produced by the tumor Systemic effects of tumor growth
III	**4**		**Etiology of Cancer** • Carcinogenesis • Theories of cancer causation • Risk factors • Carcinogens – genetic factors, chemical carcinogens, radiation, viruses, Immune system failure, rapid tissue proliferation • Hormone changes, diet, emotional Factors.

Unit	Time Hours		Content
	T	P	
IV	**10**	**2**	**Diagnostic Evaluation** * Health assessment: History taking, physical examination * Staging and grading of tumors * TNM classification * Common diagnostic tests • Blood investigation: Haematological, Bio-chemical, Tumor markers, Hormonal assay • Cytology: Fine needle aspiration cytology (FNAC) • Histopathology: Biopsy • Radiological assessment: MRI, Ultrasound, Computed tomography, Mammography, Positron Emission tomography (PET), Radio nuclide imaging, Functional metabolism imaging • Endoscopies Nurses responsibilities in diagnostic measures
V	**10**	**2**	**Levels of prevention and care** * Primary prevention – Guidelines for cancer detection, general measures, Warning signs of cancer. * Self examination – Oral, Breast, Testicular * Secondary prevention – early diagnosis * Screening * Tertiary prevention – disability limitation * Rehabilitation : Mobility, Speech, Bowel and bladder, Ostomies etc. * Patient and family education * Discharge instruction, follow-up care and use of community resources.

Unit	Time Hours		Content
	T	P	
VI	25	4	**Cancer Treatment Modalities and Nurse's Role** **** Surgery*** • Principles of surgical oncology • Current surgical strategy • Determining surgical risk • Special surgical techniques • Pre-intra postoperative nursing care • Acute and chronic surgical complications • Future directions and advances **Chemotherapy** • Principles and classification of chemotherapeutics. • Pharmacology of antineoplastic drugs -Mechanism of action, Absorption, protein binding, Biotrans-formation, excretion common side effects, drug Toxicity. • Calculating drug doses, • Therapeutic response to chemotheraphy-Tumor variables, drug resistance, • Safety precautions **Radiation Therapy** • Physics of radiotherapy • Types of ionizing rays • Radiation equipments : Linear accelerator, cobalt, Implants, Isotopes. • Types of therapies: Oral, Brachytherapy, tele-therapy, selection Therapy.

Unit	Time Hours		Content
	T	P	
			• Effects of radiation on the body Tissue. • Radiation biology-cell damage hypoxic cells, alteration of tumor Kinetics. • Approaches to radiation therapy • External radiotherapy • Internal radiotherapy-unsealed, • Sealed sources. • Effectiveness of radiotherapy-Radiosensitivity, treatment effects • Complications of radiotherapy • Radiation safety : Standards of Bhaba Atomic Research Centre (BARC) **Bone Marrow Transplantation/Stem Cell Transplantation** • Types, indications, t transplantation Procedure and complications. • Types and donor sources • Preparation and care of donor and recipient • Legal and ethical issues **Immunotherapy (Biotherapy)** • Concepts and principles • Classifications of agents • Treatment and applications **Gene Therapy** • Current Concepts and practices **Alternative and Complementary Therapies** • Current practices

Unit	Time Hours		Content
	T	P	
VII	**10**	**4**	**Pain management : Theories, types and** • Nature of cancer pain • Pathophysiology of pain • Pain threshold **Assessment of pain** • Principles of cancer pain control • Pharmacological: Opioid and nonopioid analgesic therapy • Patient controlled analgesia (PCA) • Other invasive techniques of pain control • Recent developments in Cancer pain **Non-Pharmacological pain relief technique.** • Complementary therapies (Music, massage, meditation, relaxation techniques, biofeed back etc) • Psychological intervention in pain control • Alternative system of medicines Role of nurse
VIII	5		**Palliative care** • Definition an scope, philosophy • Concept and elements of palliative care • Global and Indian perspective of palliative care • Quality of life issues • Communication skill • Nursing perspective of palliative care and its elements • Home care • Hospice care Role of nurse in palliative care

Unit	Time Hours		Learning Objectives	Content	Method of Teaching	Evaluation
	T	P				
IX	**2**		Recognize the process of infection and preventive methods	**Infection control** • Process of infection, risk of hospitalization, nosocomial infections-prevention and control of in acute, long term care facility and community based care • Standard safety measure	Seminar Presentation	Essay type questions
X	30		Describe the care of patients with various type of malignancies.	**Nursing Care of Patients With Specific Malignant Disorders** • Malignancies of G.I. system-oral, oesophagus, stomach, rectal, liver & pancreas, care of ostomies/stoma • Respiratory malignancies • Genito urinary system malignancies prostate Bladder, renal testicular malignancies. • Gynecological malignancies-cervix uterus, ovary. • Hematological malignancies-Lymphomas, Leukemias. • Malignancies of musculoskeletal system • Endocrine malignancies • Skin • Head and Neck – brain tumors • Other malignancies – Breast cancer	Clinical presentation Nursing Process Nursing rounds Case conference	Evaluation of case study, care plan
XI	**10**		Provide nursing care to paediatric group of patients	**Paediatric malignancies** • Leukemia, Lymphoma, Neuro blastoma • Wilm's tumor, Soft tissue sarcoma, Retinoblastoma • Nursing Management of children with Paediatric Malignancies	Clinical presentation Nursing Rounds	Assess the skill with evaluation nursing care plan

Unit	Time Hours		Learning Objectives	Content	Method of Teaching	Evaluation
	T	P				
XII	**15**		Recognize the clinical manifestations of cancer patients	**Nursing Management of Physiological Conditions and Symptoms Of Cancer Patient** • Nutrition – effects of cancer on nutritional status and its consequences: Anemia, Cachexia, Xerostomia, mucositis, Dysphagia, Nausea and vomiting, constipation, Diarrhea, electrolyte imbalances, Taste alterations. • Impaired mobility: Decubitus ulcer, pathologic fractures, thrombophlebitis, pulmonary embolism, contractures, footdrop **Other symptoms** • Dyspepsia & hiccup, dyspnoea • Intestinal obstruction • Fungating wounds • Anxiety & depression, insomnia • Lymph edema **Impact of cancer on sexuality** • Effects of radiotherapy/ chemotherapy/surgery on sexuality of the cancer patient • Nursing management of cancer patients experiencing sexual dysfunction • Sexual counseling	Clinical presentation Ward Teaching Nursing Process Guided Group Discussion	Evaluate care plan case study
XIII	**10**			**Cancer Emergencies** • Disseminated intravascular Coagulation (DIC). • Malignant pleural effusion • Neoplastic cardiac tamponade and septic shock spinal cord compression • Superior venacava syndrome		

Unit	Time Hours		Learning Objectives	Content	Method of Teaching	Evaluation
	T	P				
			Appreciate the role of the nurse in cancer emergencies	• Metabolic emergency: hyper and hypo calcemia • Surgical emergency • Urological emergency • Haemorrhage • Organ obstruction • Brain metastasis • Nurses role in managing oncologic emergencies	Lecture Cum Discussion Seminar Presentation	Short Answers
XIV	**8**		Describe the psychosocial aspects of nursing care Explains the ethical, moral and legal issues in caring for the cancer patients	**Psycho-Social Aspects of Nursing Care** • Psychological responses of patients with cancer • Psychosocial assessment • Crisis intervention, coping mechanisms • Stress management, spiritual/ Cultural care and needs. • Counseling: individual and family • Maximizing quality of life of patient and family **Ethical, moral and legal issues** • Care of dying patient • Grief and grieving process • Bereavement support • Care of Nurses who care for the dying	Guided Group Discussion Conducting Guidance and Counseling Group Conference	Short answers checklist
XV	**2**		Design a layout and develop standards for management of Oncology units/hospitals and nursing care	**Layout and Design of an oncology institution/ward, OPD, chemotherapy unit, Bone marrow trans-plantation unit, pain clinic etc.** • Practice Standards of oncology nursing Policies and Procedures • Establishing Sanding orders and Protocols **Quality Assurance Programme in Oncology units** • Nursing audit	Field Trip Presentation of Observation Report	Evaluate the project work and presentation

Journals:

1 Oncology nursing news letter.

PRACTICALS

1. Clinical practice in the care of patients with various malignant disorders.
2. Assessment of clients suffering with various malignant disorders.
3. Applying Theories and nursing process in the management of patients suffering with various malignancies.
4. Providing care to patients with ostomies and other appliances.
5. Assisting for implantations of radioisotopes.
6. Clinical case presentations of a patient.
7. Projects
8. Clinical and classroom teachings.
9. Health education on related disease conditions.
10. Field Visits Regional cancer centers/ cancer specialty hospitals /unit, Hospice, mobile palliative care, community oncology centers /home care unit, cancer registry, cancer detection centers etc.

Procedures Observed

1. **CT Scan**
2. **MRI**
3. **Ultra sound**
4. **Mammography**
5. **Radio Nuclide Imaging**
6. **Bone Scan**
7. **Thyroid Function Test**
8. **Functional and Metabolic Imaging**
9. **Transportation of radioactive materials**
10. **Others**

Procedures Assisted

1 **IV cannulation –Open method**
2 **Chemotherapy**
3 **Radiotherapy – Brachytherapy – Low Density Radiation, High Density Radiation.**
4 **Interstitial implantation**
5 **Teletherapy – Treatment planning**
6 **Bone marrow aspiration and biopsy**
7 **Biopsy – tissue**
8 **FNAC – Fine Needle Aspiration Cytology & Biopsy**
9 **Advance cardiac life support**
10 **Endotracheal intubation**
11 **Defilbrillation ventilation**
12 **Tracheostomy**
13 **Thoracentesis**
14 **Paracentesis**
15 **Lumbar Puncture**
16 **Arterial Blood Gas**
17 **Nerve Block**
18 **Chest tube insertion**
19 **Intercostal drainage**
20 **CVP monitoring**

Procedure Performed

1. **Screening for cancer**
2. **Assessment of pain**
3. **Assessment of Nutritional status**
4. **Care of Tracheostomy**
5. **Endotracheal intubation**
6. **Gastric gavage**
7. **Pap smear**
8. **IV cannulation**
9. **Care of surgical flaps**
10. **Care of ostomies**
11. **Blood transfusion and component therapy**
12. **Counseling**
13. **Practice standard safety measure**
14. **Care of dead body and mortuary formalities**

Other procedures

1. **Alternative therapies**

Clinical Experience

SN	Department/Unit	No. of Week	Total Hours
1	Medical Oncology Ward	6	180
2	Surgical Oncology Ward	6	180
3	Bone marrow transplantation	2	60
4	Operation Theatre	2	60
5	Radiotherapy Unit	2	60
6	Chemotherapy Unit	4	120
7	Out patient department and pain clinic	2	60
8	Pediatric Oncology Ward	2	60
9	Palliative Care Ward	2	60
10	Community Oncology	2	60
11	Hospice	1	30
12	Other field visits	1	30
	Total	32	960

GUIDELINES TO WRITE CLINICAL PRESENTATION – MSc NURSING

1. Introduction
2. Patient's Profile
3. Health History
   a. Chief complaints on admission
   b. Present & Past illness (Medical surgical, Obstetrics, pediatric, psychiatric, Oncology)
   c. Family History
   d. Specific information of the patient
4. Health Assessment
   a. Physical examination (head to foot & system assessment)
   b. Investigation
   c. Health information from other sources
5. Provisional Medical diagnosis
6. Treatment
7. Correlation of clinical and book picture
   a. Definition
   b. Clinical features
   c. Prognosis
   d. Etiology
   e. Investigation
   f. Complication
   g. Pathophysiology
   h. Treatment
8. Nursing Management – Nursing process
9. Plan of discharge & rehabilitation
10. Conclusion
11. Bibliography

Practical Experience Assignments

Case study	:	02	(50 marks each)	50 x 2 =	100
Case Presentation	:	02	(50 marks each)	50 x 2 =	100
Care Plan	:	03	(50 marks each)	50 x 3 =	150
Clinical Performance	Evaluation:	03	(100 marks each)	100 x 3 =	300
Practical Examination			Mid Term		50
			Pre Term		100
					800

Internal Assessment Total marks out of 100
External Assessment Total marks out of 100

(Theory)

Midterm Exam	**50**
Prefinal Exam	**75**
Seminar	**50**
Project work on planning oncology unit	**75**
	800

PROFORMA & GUIDELINE FOR CASE STUDY
Area :- (Maximum Marks – 50)

01. Selection of patient.
02. Demographic data of the patient.
03. Medical history past and present illness.
04. Comparison of the patient's disease with book picture.
    a) Anatomy and physiology.
    b) Etiology.
    c) Patho physiology.
    d) Signs and symptoms.
    e) Diagnosis - provisional & final
    f) Investigations
    g) Complications & prognosis.
05. Management:- Medical or Surgical
    a) Aims and objectives.
    b) Drugs and Medications.
    c) Diet.
06. Nursing Management (Nursing Process approach)
    a) Aims and objectives.
    b) Assessment and specific observations.
    c) Nursing diagnosis.
    d) Nursing care plan (Short term & long term with rationale.)
    e) Implementation of nursing care with priority.
    f) Health teaching.
    g) Day to day progress report & evaluation.
    h) Discharge planning.
07. Drug Study.
08. Research evidence.
09. Summary and conclusion.
10. Bibliography.

EVALUATION CRITERIA FOR CASE STUDY.

(Maximum Marks – 50)

SN	Criteria	Marks allotted.	Marks obtained	Total
01.	Assessment	5		
02.	theoretical knowledge about disease	5		
03.	Comparative study of the patient's disease & book picture.	10		
04.	Management: Medical or Surgical.	5		
05.	Nursing Process.	15		
06.	Drug study.	3		
07.	Summary & conclusion including research evidence.	5		
08.	Bibliography.	2		
	Total	50		

Signature of Student   Signature of Clinical supervisor

M Sc NURSING: CLINICAL SPECIALITY – II
PROFORMA & GUIDELINE FOR CASE PRESENTATION

I] Patient Biodata

Name, Age, Sex, Religion, Marital status, Occupation, Source of health care, Date of admission, Provisional Diagnosis, Date of surgery if any.

II] Presenting complaints

Describe the complaints with which the child has been brought to the hospital

III] Socio-economic status of the family: Monthly income, expenditure on health, food, education etc.

IV] History of Illness (Medical & Surgical)

i) History of present illness – onset, symptoms, duration, precipitating / aggravating factors
ii) History of past illness surgery, allergies, medications etc.
iii) Family history – Family tree, history of illness in the family members, risk factors, congenital problems, psychological problems etc.

V] Diagnosis: (Provisional & confirmed).

Description of disease: Includes the followings

1. Definition.
2. Related anatomy and physiology
3. Etiology & risk factors
4. Path physiology
5. Clinical features.

VI] Physical Examination of Patient (Date & Time)

Physical examination: with date and time.

Clinical features present in the book Present in the patient

VII] Investigations

Date Investigation done Results Normal value Inferences

VIII] Management - (Medical /Surgical)

a) Aims of management
b) Objectives of Nursing Care Plan

IX] Treatment:

S.No Drug (Pharmacological name) Dose Frequency/ Time Action Side effects & drug reaction
Nurse's
responsibility

- Medical or Surgical Management.
- Nursing management

X] Nursing Care Plan: Short Term & Long Term plan.

Assessment Nursing
Diagnosis
Objective Plan of
care
Rationale Implementation Evaluation

XI] Discharge planning:

It should include health education and discharge planning given to the patient.

XII] Prognosis of the patient:

XIII] Summary of the case:

IVX] References:

EVALUATION CRITERIA FOR CASE PRESENTATION

Maximum Marks – 50)

SN	Criteria	Marks Allotted	Marks Obtained	Total
1	Content Subjective & objective data.	08		
2	Problems & need Identified & Nsg. Care Plan	15		
3	Effectiveness of presentation	5		
4	Co-relation with patient & Book i. e. research evidence.	10		
5	Use of A. V. Aids	5		
6	Physical arrangement	2		
7	Group participation	3		
8	Bibliography & references	2		
	Total	50		

CLINICAL EVALUATION: COMPREHENSIVE NURSING CARE

(Maximum Marks – 100 each area.)

Name of the Student

Year: II Year M.Sc Nursing   Duration of Experience:

SN	Criteria	1	2	3	4	5
I	UNDERSTANDING OF PATIENT AS PERSON **A. Approach.** 1. Rapport with patient/ family members. 2. Collects significant information. **B. Understanding of patient's health problems.** 1. Knowledge about disease condition. 2. Knowledge about investigations. 3. Knowledge about treatment. 4. Knowledge about progress of the patient.					
II	NURSING CARE PLAN **A. Assessment of the condition of the patient.** 1. History taking – past & present health and illness. 2. Specific observation of the patient. 3. Nursing diagnosis. **B. Development of the short – term & long term Nursing care plans.** 1. Identification of all problems in the patient/ family. 2. Prioritization & implementation of the plans. 3. Evaluation of the care given & replanning					
III	TECHNICAL SKILL 1.Economical & safe adaptation to the situation & available facilities. 2.Implements the procedure with skill speed & completeness.					
IV	RECORDING & REPORTING 1.Prompt, precise, accurate & relevant. 2.Maintenance of clinical experience file.					
V	HEALTH TEACHING 1.Incidental/ planned teaching with principles of teaching & learning. 2.Uses visual aids appropriately					
VI	PERSONALITY 1. Professional appearance (uniform, dignity, tact fullness interpersonal relationship, punctuality etc. 2. Sincerely, honesty & Sense of responsibility.					
	TOTAL MARKS					

Positive & Negative aspects.

BACK TO MAIN

Homi Bhabha National Institute (HBNI)
Post Graduate Diploma in Fusion Imaging Technology (PGDFIT)
(PROGRAM CODE: HLTH16)

Syllabus

The **Post Graduate Diploma in Fusion Imaging Technology (PGDFIT)** courses shall have 1 years course. The number of theory papers and practical courses, along with their marking system, are described below. It is necessary to secure minimum 45% pass marks separately in each theory paper and practical courses in each year. It is also necessary to secure minimum 50% marks in aggregate each year to pass.

Code	**Broad topics**	**Details**	**Contact Hours per week**	**Total contact hours (Duration of course 1 year)**	**Hours of workload (Duration of course 1 year)**	**No. of credits**
Paper 1: Basic Sciences in Nuclear Medicine						
09-HLTHI6-001-C	**Basic physics in nuclear medicine**	Atomic structure Radioactivity and radioactive decay and X-rays Electricity, Electromagnetism and Electronics	1 hrs. of class room teaching	22-25	80-90	3
09-HLTHI6-002-C	**Basic chemistry in nuclear medicine**	Periodic table Chemical element, compound & chemical bonding Chemical reaction	1 hrs. of class room teaching	22-25	80-90	3
09-HLTHI6-003-C	**Basic mathematics and statistics in nuclear medicine**	Quadratic Expressions Matrices Calculus Probability Random Variables and Distributions Compartmental analysis Counting statistic Statistical technique used in medical sciences	1 hrs. of class room teaching	22-25	80-90	3

09-HLTHI6-004-C	**Basic computer relevant in nuclear medicine**	Number system & Fundamentals of computer hardware Basics of computer operating system Basics of software programming Networking Computer in nuclear medicine Image formation Hardware and software fusion	1 hrs. of class room teaching	22-25	80-90	3
09-HLTHI6-005-C	**Basic biology in nuclear medicine**	Structure of Cell DNA, RNA and Protein Enzymes Vitamins Cell cycle Tissue, organ and organ system Immunology	1 hrs. of class room teaching	22-25	80-90	3
Paper 2: Radiation Safety, Radiation biology and Radiopharmacy						
09-HLTHI6-006-C	**Radiation Biology**	Radiation Quantities and Units Interaction of Radiation with Matter Biological Effects of Radiation Operational Limits Radiation Detection & Measurement Radiation Hazard Evaluation and Control Radiation Dosimetry	1 hrs. of class room teaching	22-25	80-90	3
09-HLTHI6-007-C	**Radiation protection**	Regulatory Aspects for Nuclear Medicine Laboratories Planning of Nuclear Medicine (NM) Laboratories Transport of Radioactive Material Quality Control for Nuclear Medicine Equipments	1 hrs. of class room teaching	22-25	80-90	3

		Radionuclide Therapy- Radiation Safety Aspects Radiation Hazard Evaluation and Control Emergency Response Plans and Preparedness Radiation Accidents, Case Studies, Lessons Learn Disposal of Radioactive Waste	1 hrs. of class room teaching	22-25	80-90	3
09-HLTHI6-008-C	**Radio pharmacy and radiopharmaceuticals**	**Radio-pharmacy:** good manufacturing practices (GMP) used in hospital radio-pharmacy and cold kit preparation. **Quality Assurance** program in Hospital radio-pharmacy **QC Equipment:** equipments used for Quality control of Radiopharmaceuticals i.e. TLD, HPLC etc. **Radionuclides:** Characteristics of Radio nuclides used in diagnostic and therapeutic nuclear medicine	1 hrs. of class room teaching	22-25	80-90	3
		Production of radionuclide : Reactor produced radionuclide pharmaceutical and cyclotron produced radionuclide **Conventional radio pharmacy:** formulation and quality control of SPECT radiopharmaceuticals **PET radio pharmacy:** formulation and quality control of PET radiopharmaceuticals **Intervention drugs:** used in nuclear medicine **Emergency drugs:** used in nuclear medicine	1 hrs. of class room teaching	22-25	80-90	3

M.Sc. CLINICAL RESEARCH (PROGRAM CODE: HLTH17)

2 year course + 1 year internship

- 1.5 years of teaching: to be tentatively divided into 6 modules (approximately 3 months each). Each module to consist of 10 to 12 teaching sessions and 1 or 2 tests
- Teaching sessions on Wednesdays / Saturdays
- Supervised training on remaining days
- 6 months of project work: this will include 960 hours of field work (5 days a week for 6 months) – one month of this will be spent on epidemiological studies
- 1 year of internship (post-degree): this will include 2 months of epidemiological work

Total: 50 credit hours

INTRODUCTION	
Introduction to the course	1 session
MODULE – 1 (13 SESSIONS)	**10 credit hours**
09-HLTH17-001-C: BASICS OF PHARMACY, DRUG DISCOVERY AND DEVELOPMENT	
• Process of drug development and narrowing down to few molecules • Pre-clinical testing • Phases of trials • Basic principles – Bioavailability, Bioequivalence, Pharmacokinetics	2 sessions
09-HLTH17-002-C: ETHICS	
Ethics Part A (Regulations) • History of Ethics and Evolution of Laws • Declaration of Helsinki • Good Clinical Practice – ICH, Indian GCP, ICMR guidelines, Schedule Y • Brief overview of US-FDA and EMEA	1 session 3 Sessions 1 Session
Ethics Part B (Informed consent) • Informed consent process • Informed consent form	2 Sessions
Presentation by students	1 Session
Recap / Q&A	1 Session
Test	1 Session
Feedback	1 Session
MODULE – 2 (12 SESSIONS)	10 credit hours
09-HLTH17-003-C: CLINICAL TRIAL DESIGN	

• Phases of trials - Review
• Clinical trials
  ○ Study design
  ○ Randomization
	1 Session
	2 Sessions

○ Blinding ○ Placebo ○ *To cover breaking of blind, simultaneous use of blinded and unblinded groups* ○ Basic statistics • Elements of a protocol ○ *To cover protocol violation and deviation*	 2 Sessions 3 Sessions
• Presentation – preparing a protocol	1 Session
• Presentation by students	1 Session
• **Test**	1 Session
• **Feedback**	1 Session
MODULE – 3 (12 SESSIONS)	10 credit hours
09-HLTH17-004-C: CLINICAL TRIALS IN PRACTICE – PART 1	
Roles and Responsibilities • IRB (Ethics committee) ○ *To cover compensation policy* • Investigator • Sponsor • CRA/CRC/Monitor	 1 Session 1 Session 1 Session 1 Session
• **Test**	1 Session
• **Feedback**	1 Session
Safety Reporting • Adverse event / SAE reporting • Data Monitoring and Interim Analysis	 2 Sessions 1 Session
• **Quiz and case scenarios**	1 Session
• **Test**	1 Session
• **Feedback**	1 Session
MODULE – 4 (10 SESSIONS)	8 credit hours
09-HLTH17-005-C: CLINICAL TRIALS IN PRACTICE – PART 2	
Quality control and Quality Assessment • Overview • Essential documents • Study files • Source documentation • Monitoring • Audits and Inspections including preparation • Training records • Standard Operating Procedures • CAPA	 1 Session 1 Session 1 Session 1 Session 1 Session

Recap/presentation by students	2 Sessions
Investigational Product Management • Storage • Temperature • Accountability • Destruction	1 Session
• **Test**	1 Session
• **Feedback**	1 Session
MODULE – 5 (12 SESSIONS)	10 credit hours
09-HLTH17-006-C: CLINICAL TRIALS IN PRACTICE – PART 3	
Data Management • Methods of Data Collection • CRF design and types	4 Sessions 2 Sessions 1 Session
Group project presentation	1 Session
Project Management • Putting it all together – including laboratory management, investigations, processes, recruitment potential, patient recruitment and retention	3 Sessions
• **Test**	1 Session
MODULE – 6 (4 SESSIONS)	2 credit hours
09-HLTH17-007-C: EPIDEMIOLOGICAL STUDIES	
• Basic concepts • Surveillance systems to understand disease burden • Design and planning of Epidemiological studies including field intervention trial • Quality control and good Epidemiological practices • Epidemiology field work in Population Based studies • Ethical aspects of Epidemiological research	3 Sessions
• **Test**	1 Session
SPECIAL MODULE (OTHER TOPICS)	
09-HLTH17-008-C: Medical writing **09-HLTH17-009-C:** Communication **09-HLTH17-0010-C:** Clinical etiquette and Office Practice **09-HLTH17-0011-C:** Investigator-initiated studies – special issues **09-HLTH17-0012-C:** Studies in alternative systems – Ayurveda, Homeopathy	1 Session 1 Session 2 Sessions 1 Session 1 Session

FINAL EVALUATION (3 SESSIONS)	
• Overall recap / Final Q and A	1 Session
• Examination – written and viva	2 Sessions

GOVERNMENT OF INDIA

BHABHA ATOMIC RESEARCH CENTRE

INTEGRATED Ph.D. (SINGLE DEGREE) ENGINEERING SCIENCE

(PROGRAM CODE: ENGG18)

SYLLABUS

Orientaion Course for Engineering Graduates and Science Post Graduates (OCES)

BARC Training School, Mumbai

HUMAN RESOURCE DEVELOPMENT DIVISION

MUMBAI 400085

PREFACE

The Department of Atomic Energy (DAE) has the multi pronged mandate of the utilisation of the power of the atom towards generation of power, development of advanced technologies, directed research in various scientific and engineering disciplines, production of radioisotopes for societal applications in medicine and agriculture and towards national security. In order to become self reliant and self sustaining in this high technology area, the need for generating highly skilled manpower and ensuring its continuous availability was indispensable. Thus in 1957, the BARC Training School (BARCTS) was established as a centre for in house training of professionals. These professionals today form the backbone of the Nuclear Power Programme. More than 9000 trainees have graduated from BARC TS over the last 61 years and provide the technological leadership in DAE for all its important programmes. Over the last five and a half decades, the BARCTS has grown into a model institute, recognised internationally as a school of excellence.

The academic activities of BARCTS are carried out by the Human Resource Development Division (HRDD) from its campus situated at Anushakti Nagar, well away from the hustle and bustle of Mumbai, nestling between wooded hills and sylvan surroundings, close to the BARC premises. This crucible of learning has been a focus of attraction to many a bright young talent, eager and willing to learn, guided and mentored by an academia drawn from the pool of experts available within DAE. Hailing from some of the best universities in India, they are nurtured with care and concern, by means of a holistic approach to training and personality development. A judicious mix of academics, practical training and soft skills training is imparted at the Training School and at the state of the art laboratories of BARC. A well equipped hostel with sports, recreation, and internet facilities provides the right environment needed for wholesome development. The lure of a professionally challenging career with opportunities for upgradation of skills, an objective merit recognition based career growth pattern and attractive compensation packages have attracted the best talents to BARCTS.

The BARCTS has two principle programmes, the One-Year **Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)** and the **DAE Graduate Fellowship Scheme (DGFS)**

Orientation Course for Engineering Graduates and Science Post-Graduates (OCES)

OCES is the flagship programme of the BARC Training School and its affiliates. Under this scheme, engineering graduates from eight engineering disciplines- Mechanical, Chemical, Metallurgy, Civil, Electrical, Electronics, Instrumentation & Computer Science and Science Post-Graduates from Physics, Chemistry & Biological Sciences are selected and imparted a

rigorous one year training in the field of Nuclear Science and Technology. In addition to the above 11 disciplines, selected post graduate candidates from the Physics and Chemistry disciplines are also inducted into a course specifically designed for the purpose of providing a holistic training in all aspects of radiological safety. This course has been named as "Radiological Safety Engineering' course.

The curriculum provides multidisciplinary training in topics relevant to the nuclear industry, frontier areas of science and technology and some super specialized areas. Training is imparted by adjunct faculty comprising the scientists and engineers working in various projects of DAE. In this manner, not only the objective of training but also the greater task of seamless and effective knowledge transfer from the expert to the acolyte is carried out successfully. The scheme also ensures the retention of the trained manpower within the Department thereby maximising the benefits of the training programme to the Department.

A total of about 150 courses in the above disciplines comprising more than 4000 lectures are delivered by more than 500 adjunct faculty members from BARC and other educational institutes during this period.

OCES Training Objectives: It involves one year of academic and training programme at the BARC Training School. The training programme aims to ensure that the selected candidates are provided with the necessary facilities and opportunities to acquire knowledge and develop skills for meeting the challenging technological goals of the country in the field of nuclear S&T. The training courses are organized in a structured manner as detailed below

- Foundation courses impart multidisciplinary training in the topics relevant to the nuclear industry.
- Core courses bring all selected candidates from different universities to the same or common level of understanding in the core subjects of the respective disciplines.
- Elective courses impart training in few specialized areas in respective disciplines.

OCES graduates are also eligible for the award of Post Graduate Diploma in Nuclear Science/Engineering & Technology of HBNI. After joining the DAE, the eligible OCES graduates can undertake one year project work leading to the award of M.Tech./M.Phil. Degree of the HBNI.

DAE Graduate Fellowship Scheme (DGFS)

In order to meet the requirement of highly specialised professionals in specific areas, DAE initiated the DGFS Programme for inducting engineers at MTech level in collaboration with the six IITs viz. Bombay, Delhi, Kanpur, Kharagpur, Madras, Roorkee and BHU in addition to some other elite institutes such as NIT Rourkela and ICT, Mumbai. The scheme strengthens the research-education linkage with premier institutes of the country in the areas of interest to DAE and provides useful synergy between the nuclear sector and the academia

Under this scheme, trainees selected for the OCES programme as well as one of the above institutes pursue the M.Tech degree under the sponsorship of DAE. On completion of the MTech degree, the candidates are absorbed into DAE as a Scientific Officer with advance increments. These Fellows then undergo a 4-month Orientation Course for DGFS Fellows (OCDF) after successful completion of M.Tech.

Orientation Course for DGFS Fellows (OCDF)

Several topics of interest to the Department do not form part of the MTech curriculum. To provide an exposure to such topics, the DGFS Fellows undertake a four months orientation course in the BARC Training School **(Orientation Course for DGFS Fellows- OCDF)** after successful completion of their MTech. Programme.

This document furnishes the course structures of all disciplines and syllabi of the courses conducted by the BARC Training School under each discipline.

FOUNDATION COURSES

EN501: Accelerator Physics and Technology

Basic Accelerator Physics (5)

- Introduction to accelerators; basic concepts; DC accelerators; Cockcroft – Walton, Van de Graaff and tandem Van de Graaff; linacs; cyclotrons; synchrotrons;
- Ion sources.
- General equations of motion in a combined electric and magnetic field, beam rigidity; relativistic expressions, weak and strong focusing principle; condition for strong focusing.
- Concept of magnetic field index; introduction of focusing forces in magnets; transverse focusing (betatron) oscillations; betatron frequencies.
- General design of a cyclic accelerator.
- Linear Beam optics, Beam transport systems: bending magnets, quadrupole lenses; Solenoidal lens; drift spaces;
- Matrix techniques in beam optics; first order transfer matrix of dipole, quadrupole, transfer matrix of a drift space; quadrupole doublet;
- Phase-space ellipse; beam emittance; Liouville's theorem; emittance matching, Twiss parameters
- Introduction of normal (room temperature) DC and pulsed magnets, construction features. Superconducting coils, magnets and their construction features.
- Momentum compaction; Phase stability, phase (synchrotron) oscillations; frequency of synchrotron oscillations.
- Synchrotron radiation sources; spectrum of emitted radiation; critical wavelength; energy lost by an electron per revolution; total power radiated; number of photons emitted in a given bandwidth – Physics of wiggler magnets; undulators.

RF Linacs (12)

Introduction to Linacs

- Generation of an electric field in the loaded cavity; damping of waves; dispersion relations; frequency evaluation; application to the different types of linacs including traveling and standing wave types.
- Limitations of DC accelerators, acceleration using time varying fields, principle of successive acceleration, Isochronism, concept of phase, Wideroe and Alvarez linac
- Transit time factor and the energy gained in a linac.
- Linac focusing devices; quadrupole doublet focusing; stability criteria; phase advance and stability in linacs, etc.
- General ideas of Q value; power loss; surface resistance; shunt impedance, etc; room temperature RF structures.

Proton Linac

- Linac structures: Radiofrequency Quadrupole linac, DTL, CCDTL, CCL, IH linac, CH linac.
- RF superconductivity & introduction of superconducting RF structures, effects of RF frequency selection, Advantages of SC systems over room temperature ones, Breakdown mechanisms in superconducting cavities.
- Introduction to Space charge effects.
- Beam diagnostics for measurement of beam current, position, profile, energy and emittance.

Accelerator Driven Systems & RF electron accelerators

Electron beam generation, propagation and applications in generation of microwaves. RF electron accelerators.

Accelerator Technology (13)

General

- Material selection for Accelerator components
- Mechanical Design and fabrication issues; tolerances, surface finish, etc
- Thermal management in accelerator systems
- Alignment requirements of accelerator magnets and RF structures, methods and instruments for alignment and surveying in accelerators.

Ultra High Vacuum Systems

Basic concepts in Vacuum

- The ideal gas law, Throughput and pumping speed, Leak rate, Outgassing, Adsorption, Desorption, Mean free path, Gas flow regimes, Conductance.
- Pumps: Oil sealed rotary vane type pump, Diaphragm pump, Roots pump, Cryosorption pump, Oil diffusion pump, Hydrocarbon free vacuum, Turbomolecular pump, Sputter ion pump, Cryopump, Getter Pumps
- Basics of low pressure measurement techniques, McLeod Gauge, Thermocouple gauge, Pirani gauge, Cold-cathode/Hot-cathode gauge. Leak rate, Real leak, Virtual leak, Helium mass spectrometer, leak test, Sealing materials and lubricants, Pump fluids and sorbents, Special materials, Outgassing rates of materials, Stainless steel, OFHC Copper, Aluminum, Glasses, Ceramic, Sealing materials, Diffusion pump fluids.

Cryogenics Systems

Introduction to Cryogenic Engineering

- General and basics, Cryogenic properties, Basic cycles
- Large Cryogenic Systems for Accelerators

Cryogenic Equipments

- Process compressor, High speed Turboexpanders, Compact high effectiveness, Heat Exchangers, Cold Box and Piping, Dewars and Storage Vessels, Vacuum Systems, Cryomodules, Cryogenic Instrumentation and Control systems.

12. The Principles of Circular Accelerators and Storage Rings - Philip Byrant.
13. Introduction to Vacuum Technology-Compiled by K.G. Bhushan, BARC

EN 502:Engineering Maths-I (15) (All Engg)

- Overview of arithmetic errors in computations
- Desirable features of an algorithm with respect to speed, accuracy, computer memory, stability etc.
- Linear systems solutions by direct methods, iterative methods and acceleration techniques.
- Linear systems: matrix inverse, ill conditioned matrices, sparse matrices.
- Linear systems: Eigen values.
- Non -Linear systems: Newton-Rapson & Successive Approximation methods
- Data Approximation: curve fitting, Lagrange & Hermite interpolations, Least Square & Chebyshev fittings
- Numerical Integration: Newton Cotes quadratures, Gauss quadratures.
- Solution of Ordinary Differential equations: Methods of Euler, Adams, RK, Predictor-Corrector, Stability of solutions, solutions of Stiff Equations.

EN 503: Engineering Maths-II (20) (ME Group)

- Introduction to discretization methods and approximate solution of differential equations (FDM, FEM and FVM), Finite Difference Approximations in 1-D, Solution of steady and unsteady heat conduction equations, wave equation
- Formulation of the matrix methods by equilibrium concepts (1D-heat conduction, 2D-truss and 1D-hydraulic flow examples).
- Approximate solution of differential equations – Weighted residual method, collocation, least squares and Galerkin's methods, Piecewise approximations. Basis of Finite Element Method, energy principles in structural mechanics and principles of minimum potential energy, assembly concept.
- Solution of steady and unsteady heat conduction equations with finite element method, Implicit and explicit methods.
- Finite element formulations of convection dominated problems using classical Galerkin methodology and need for alternate trial functions and upwinding.
- Finite element formulation for laminar and turbulent flows.
- Modern Iterative Techniques Conjugate Gradient Method, Krylov Subspace Method, Preconditioning
- Finite Element Method, Energy Theorem and integral equations, Weighted Residual Approximations, Point and sub domain collocations, Galerkin Method, Variational Principles, Lagranges multipliers
- Interpolation Function, Lagranges interpolation, B-spline, Bezier curves
- Response Surface Method 2K+1, factorial design, 3k factorial design
- Monte Carlo Method
- Probability Distribution: continuous and discrete random variables, commonly used probability distributions, Extreme value distributions.
- Artificial Intelligence and Genetic Algorithm
- Artificial Neural Network
- Gram-Schmidtt Orthogonalization
- Transformation of matrix

EN 504:Engineering Maths-II (20) (MT)

Applications in Materials Science:

- Use of matrix in crystallography. Stereographic analysis, lattice correspondence, orientational relationship, applications to twinning and martensitic. transformations,
- Tensor analysis in phase transformation and deformation studies
- Analysis of diffusion data, Solutions of diffusion equations - error function and Eigen value analysis, Polynomial fitting of diffusion profiles.

Application in thermodynamics of metallurgical systems:

- Temperature dependence of thermodynamic quantities, graphical and analytical integration of Gibbs-Duhem equation. Introduction to database for thermodynamic tables
- Analysis and synthesis of phase diagrams, introduction to first principles calculations of phase diagrams with computer demonstration, cluster variation and Monte Carlo methods

EN 505: Engineering Maths-II (20)(EE Group)

- Transforms: Laplace & solution to ODE, Bilinear & Z transforms, Discrete cosine transforms & compression, Entropy & Haufman coding for compression
- Solution of Matrix Differential Equation: Existence & uniqueness of solutions, Solution of Non-Linear continuous time state equation, Solution of Linear time varying continuous time state equation, Solution of linear time invariant continuous time state equations
- Basic Procedure for Designing Conservational Logic: Quine McCluskey method, Iterative consensus method, Design example
- Design of Sequential Circuit Using Sequential Machine Flow Chart: Sequential machine flow chart, Reading reduced dimension maps, Output function synthesis, Next state function synthesis, State assignment & design examples
- Counting Statistics and Error Prediction: Statistical models -Binomial, Poisson and Gaussian distributions, Application of statistical models: Error propagation, Optimization of counting experiments, Limits of detectability, Distribution of time intervals

EN 506:Health Physics and Radiological & Industrial Safety (20)

Health Physics

Introduction

- Radiation sources, its interaction with matter and units**:** Natural and Induced radioactive sources,
- Units of radioactivity, half-life and decay constant, specific activity.
- Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter.
- Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (stress should be given to use only SI units however for continuity sake old and new units relation can be given).
- Exposure measurement: Free air and Air wall chambers (concept of wall thickness should be given),
- Exposure-dose relationship, Bragg-Gray principle.

Biological effects, Radiation Protection and Regulation:

- Human body: Cells, tissues and organs, structure of cell, cellular effects.
- Factors, which influence the damage of cell. Interaction of radiation with biological matter.
- Radiation effects: stochastic and deterministic.
- Acute and delayed effects.
- Importance of radiation protection programme in DAE.
- Types of exposure (natural, occupational, medical and public).
- National and International regulatory bodies, their role and responsibilities.
- Dose limits stipulated by these bodies.
- Dose limits observed in India.

- Radiation protection philosophy,
- Principles of radiation protection, concept of ALI & DAC (with suitable problems).
- Fundamentals of ICRP respiratory model, entry through ingestion, GI track model.
- Changes in latest ICRP recommendations.
- Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

Principles of radiation detection and monitoring

- Basic operating principles ofa) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors.
- Type ofRadiation monitors/Radioactivity measurement methods adopted for radiation protection should be taught.

Radiation protection and measurement (External and Internal)

- Control of external exposures (with problems in each case).
- Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, radiotoxicity and classification of laboratories, design of laboratory for radioactive work, radioactive waste classification and management.
- Personal monitoring, area-monitoring, air monitoring, contamination monitoring, Bioassay, whole body counting techniques.
- Use of personal dosimeters (TLDs, pocket dosimeters)

Radiation Protection procedures:

- Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (contains gloves + absorbing paper),
- Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation, Protective equipments

Nuclear Accidents, Emergency Preparedness and Management:

- Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

INDUSTRIAL SAFETY ASPECTS

Introduction:

- Recognition of Workplace Hazards: Chemical Agents, Physical Agents, Biological Agents, Ergonomic Factors, Mechanical hazards: Safe working with machines, Tools and equipment, Electrical hazards, Accident prevention techniques

Hazards due to physical agents:

- UV and IR radiation, Lasers, Microwave radiation; noise, heat

Chemicals hazards:

- Classification of chemicals, fire and explosion hazards, health hazards: airborne chemical contaminants, routes of entry, types of exposures, harmful effects of toxic substances – pneumoconiosis, irritants, asphyxiants, anaesthetics and narcotics, systemic poisons and cancer causing chemicals

Evaluation:

- Instrumental methods, air sampling methods, liquid effluent monitoring

Occupational exposure limits:

- Threshold Limit Values- TLV-TWA, TLV-STEL, TLV-Ceiling; IDLH, LD50/LC50

Handling, storage and control:

- Engineering control measures and safety features,
- Safety management techniques such as safety audit, Personal/ administrative control, and Medical control

Fire and explosion hazards:

- Fire pyramid, classification of fires, hazardous operations, explosion hazards - dusts, flammable liquids - explosive limits,
- USNFPA Classification of Flammable/combustible liquids: flammable gases;
- Engineering safety for prevention of fire and explosion,
- Hazard area classification, selection of equipment, detection and extinguishing systems.

Hazard identification, assessment and control:

- Hazard identification: Concept of risk and Risk management
- Formal methods of hazard identification and assessment:
- Process/ System Check-Lists, Safety Review, Preliminary Hazard Analysis (PHA), "What If" Analysis, Hazard and Operability (HAZOP) Studies
- Relative Ranking - Dow and Mond Indices, Failure Modes, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Event Tree Analysis (ETA), Cause-Consequence Analysis, remedial measures and implementation.

Management of major hazard Installations:

- Plant Layout and Engineering Design Consideration
- Leakage of Flammable Material, Explosions, Fires, BLEVE, Toxic Releases,
- Major Hazard Control Plan: Identification, Risk Assessment, Environmental Impact Assessment,
- Emergency Planning Guidelines, Development of Emergency Plan

Health and safety regulatory aspects:

- Statutory bodies, AERB, BSC, CCE, CPCB, State PCB, Electrical Inspectorate, DGFASLI, Boiler Inspectorate.
- EPA-1986 and Rules, Factories Act, Atomic Energy (Factories) Rules 1996, Gas cylinder and SMPV rules, Indian Electricity rules 1956.

EN 507:Material Science in Nuclear Engineering (EE) (20)

- Materials classifications in terms of structure, electronic configuration, nature of bonding, type of disorder and dimensionality (nanostructured materials).
- Free electron theory, MB and FD statistics, electrons in periodic potential,
- Bloch's theorem, Basics of electron band structure, density of states and Fermi surface.
- Crystal structure and symmetry, Bravais lattice, Reciprocal lattice, Bragg's Law,
- Diffraction methods --- X-rays, Electron and Neutron scattering.
- Electronic processes in solids, Bonds and Bands in semiconductors, ANB8-N compounds, basics of intrinsic and extrinsic semiconductors (donor and acceptor levels, carrier generation and recombination, mobility, drift and diffusion, etc.)
- Hall effect, physics of p-n junction, semiconductor heterostructures and Superlattices.
- Material characterization techniques --- XRD, RBS, SEM, TEM, EDAX, XPS, IR and Raman Spectroscopy.
- Microstructure-property relationship, thermodynamics and phase diagram (binary) of materials, mechanical properties and measurement techniques, strength and ductility, creep, fatigue and wear testing
- Dielectric, optical, magnetic and superconducting materials and properties
- Dielectrics, piezoelectrics, ferroelectrics
- Optical and Non-linear optical materials, laser materials, fiber optics
- Ferromagnetic, Antiferromagnetic, Ferrimagnetic materials
- Type-I and Type-II Superconductors, Josephson junctions, SQUIDS
- Nano-technology, MEMS and nano-phase materials, sensor technology and applications.
- Nuclear Materials and processing
- Reactor core materials, Zircalloys, Zr-Nb alloys --- fabrication, properties and applications in reactors
- Nuclear fuels: Metallic, ceramic (Oxides, MOX and Carbide fuels) --- fabrication, properties and applications.
- Chemistry of fuel materials: Production of Uranium, Plutonium and Thorium.
- Heavy water: Production process, purification, properties and applications.

EN 508: Nuclear Fuel Cycle Technology(35)

An overview (1)

FRONT END

Mining, Milling and Associated Processing of Indian Uranium Resources(1)

- General Introduction
- Uranium Resources and Mining Technology
- Processing Concepts –(a) Mineralogy, (b) Leaching, (c) Solid-liquid Separation, (d) Solution Purification, (e) Product recovery, (f) Waste management.

Case Studies (1)

- Jaduguda and Turamdih Uranium Ore Processing
- Tummalapalle Uranium

Metal Purification using Hydro-Metallurgical Processes (1)

- Process, Equipment, Quality control

Metal Production by Metallothermic Reduction Processes (1)

- Process, Equipment, Quality control

WasteManagement and Safety (1)

- Associated wastes, characterisation and management

BACK END

Reprocessing (4)

- Nuclear fuels and generation of Pu239 & U233
- Spent fuel management options.
- Characteristics of spent fuel (RR, PHWR, AHWR ,FBR&LWR).
- Reprocessing by PUREX -Head end operations, solvent extraction cycles including the conversion of nitrates to oxides.
- Reprocessing of AHWR and FBR spent fuels.
- Prevention of criticality in reprocessing plants.

Waste Management (3)

- Waste sources.
- Radioactive waste classification.
- Management of low and intermediate level wastes.
- Vitrification of high level liquid waste.
- Schemes for partitioning of high level waste including recovery of valuable fission products.
- Storage and disposal of radioactive wastes.
- Various decontamination techniques to address alpha bearing materials.

Instrumentation & Control (3)

- Measurement techniques for level, pressure, temperature, interface density and flow Instrumentation and control associated with transfer devices—steam jets, pumps and air lift pots
- Interlocks related to major equipments like pulse column, dissolver, evaporator, joule melter and ion exchange column
- Computerised data acquisition and control system

Radiation Monitoring System (2)

- Area monitoring instruments, stack monitors, criticality alarm systems, effluent monitors,PCW & steam condensate monitors
- Single line diagram for Class-4, Class-3 and UPS
- Earthing, cabling, lightening protection system, VF drives

Civil (1)

Design aspects of back end technology facilities- Design classification and seismic categorization, considerations for external events, Standards/codes for design

Metallurgy (2)

- Corrosion aspects and material of construction for reprocessing and waste management plants.
- Degradation modes of SS 304L in nitric acid.
- Welding techniques, quality assurance and special requirement for in cell equipment.

Mechanical (7)

- Spent fuel transportation- shipping cask design and regulatory requirement.
- Spent fuel storage. Spent fuel charging and chopping system. Hull transfer and disposal system.
- Remote handling system in reprocessing.
- Automation in plutonium powder handling.
- Mechanical design aspects of dissolver, thermo-syphon evaporator, feed clarifier and pulse column.
- Sampling system. Transfer devices and valves for radiochemical plants.

Features of Radiochemical Plant (7)

- Layout considerations and design philosophy for back end operation.
- Control of radiation exposure including shielding and barriers.
- Ventilation aspects and Off gas handling and treatment.
- Utilities requirement for back end.
- Mechanical design aspects of metallic and joule melter.
- Radiation shielding windows.
- Remotisation and remote handling in vitrification plants

EN 509: Nuclear Power Plants Engineering & Advanced Reactor Concepts (40)

Module 1: Thermal Reactors (22)

- Description of schematic of NPP: site requirements; Layout of Nuclear Power plant-Zoning requirements, layout within Reactor Building: Reactor components / systems: Calandria, End shield, Coolant Channel and End fitting.
- Reactivity control mechanisms: Zone control / Regulating rods, Absorbers, Shut down System.
- Primary Heat Transport System including Steam Generators, Shut Down Cooling, Emergency Core Cooling System, Moderator System.
- Auxiliary systems: Ventilation, Annulas gas, Process water & Fire water systems.
- Secondary System: Description of flow sheet and major components, comparison of operating conditions; Thermal Cycles and Major components of thermal and nuclear units.
- SGPC and ΔT correlation, base load operation. Control and protection channels with typical examples.
- Electrical Systems: Electrical power systems for a nuclear power plant with relevant definitions; Key single line diagram for various classes of power supply system.
- Nuclear Power Plant Safety: Design principles for providing nuclear safety: Basic Principles (Reliability, Single failure, Redundancy and Diversity), Process systems, Safety Systems and Support Systems, Defence in depth approach, Design basis accidents, Beyond DBA.

- Safety Evaluation and Safety Criteria: Description of Deterministic and Probabilistic approaches.
- Safety Monitoring of Operating Plants: IAEA Classification, NUSS Codes, Safety systems, Description of role of defence in depth, Exclusion zone, Design Principles - Reliability, Single Failure, Redundancy, Diversity.
- PWR Module: PWR core & important design parameters, core components, major primary system components, safety philosophy for handling LOCA / station black out etc.

References:

2. Strosal and Vapet, "Power Plant Engineering & Economics".
3. Lewis E.E., "Nuclear Power Reactor Safety", Wiley Inter Science.
4. Glasstone S. and Sesonske A., "Nuclear Reactor Engineering", 1977, Von-Nostrand, 1981.

Module 2: Fast Breeder Reactors (12)

- Fast Reactor Physics: Characteristics of fast reactor, breeding ratio, internal / external breeding, doubling time.Reactivity coefficients, concepts of fuel expansion and bowing, core slumping, sodium void and Doppler effects
    - Fast Reactor Core Design: Requirement of core materials: Coolant, structural material and fuel. Design: Specific power, linear rating, burn up, fluence, operating conditions, constraints, maximum temperatures of clad and coolant, coolant velocity, pressure drop in core, core height / diameter ratio, blanket thickness. Fuel pin diameter, number of pins per subassembly and reactivity worth of subassembly
    - Heat Transport System: Coolant: Requirements of fast reactor coolant, comparison of various coolants & choice of sodium as coolant, properties of sodium, purification & purity control, corrosion and mass transport. Heat transfer in liquid metal. Primary sodium circuit, secondary sodium circuit and inert gas system. Sodium pumps: Mechanical pump and electromagnetic pump. Intermediate heat exchanger and steam generator. Safety: Decay heat removal, steam generator tube leak detection and sodium water reaction discharge circuit
    - Fuel Handling System: On-line Vs Off-line refueling, salient features & safety requirements, In-vessel & Ex- vessel handling & storage, Sodium cleaning and decontamination

References:

1. Walter A.E., & Reynolds A.B., "Fast Breeder Reactors", Pergamon Press
2. Yevick J.G., "Fast Reactor Technology", Plant Design, M.I.T, Press.

Module 3:Advanced Reactor Concepts (6)

Introduction(1)

- Need for Advanced Reactors and in what way these are different from conventional reactor
- International initiatives – INPRO, GIF etc.
- Definition of sustainability and INPRO areas of sustainability
- Brief Description of the INPRO Guidelines and Methodology to Evaluate INES
- Basic principles, User requirements, Key Indicators, Allowable parameters etc.

Directions of Development in the World(1)

- GIF and other advanced reactor concepts

Indian Programme on Advanced Reactors and Associated Challenges (2)

- AHWR
- AHWR-LEU
- CHTR, IHTR, MSBR etc.

Reactor Physics Design Challenges(1) ADS and applications(1)

EN 510:Reactor Physics & Engineering (55)

Module 1 :Nuclear Reactor Physics (33)

Properties of Nuclei

Binding energy-formula and interpretation, nuclear forces, nuclear structure.

Fission Process

- Fission rate and reactor power
- Fission neutrons, delayed neutrons, fission gammas, fission products energy balance, photo neutrons
- Fissile, fertile and fissionable materials
- Fission product activity after shut down –decay heat.

Interaction of Neutrons with Matter

- Production of neutrons

Concept of microscopic cross section:

- Inelastic and elastic scattering

Variation of cross-section with energy

- Fast, resonance and thermal ranges
- 1/v law of neuron cross-section
- Resonance absorption, Doppler effect.
- Eta vs E curve conversion & breeding concept
- Thorium utilization

Diffusion of Neutrons

- Fick's law and its validity
- Steady state neutron diffusion equation
- Concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance.

Chain Reaction

- Four Factor formula
- Conceptual treatment of diffusion of one group neutrons in non multiplying and multiplying media Infinite and effective multiplication factors
- Bare homogeneous reactor-concepts of material and geometric buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and lifetime in finite reactor,

Slowing Down Process

- Neutron slowing down
- Slowing down power/ moderating ratio of moderators
- Slowing down with spatial migration
- Fermi age concepts, migration length
- Multi zone reactors
- Ideas of reflectors/blankets, reflector savings, form factor.

Heterogeneous Reactors

- Multigroup neutron diffusion with special reference to 2 group approach
- Heterogeneous reactors, comparison with homogeneous reactors, unit-cell concepts.

Reactor Kinetics

- Time dependent neutron diffusion equation, one group kinetic equation
- Role of delayed neutrons, prompt neutron life time
- Point kinetic model to illustrate importance of delayed neutrons
- Reactor period, reactivity and its units.

Core Burn Up

- Burn up equations including fission products, neutron poisons
- Burnup dependent lattice parameters and their variation.

Neutron Poisons

- Xenon and Samarium Poisons
- Xenon loads (operating and post shutdown), Variation of xenon load with power and enrichment
- Xenon oscillations and their control.

Reactivity Coefficients

- Temperature coefficients of reactivity and void coefficient of reactivity, their relevance to reactor safety.
- Techniques to control reactors, typical reactivity balance, long-term burnup, fuel management. Reactor control system – requirements of physics aspects. Reactor shutdown mechanisms and neutron monitoring during operation and shut down.
- Approach to criticality, physics measurements and calibrations/validations.
- Physics design aspects of PHWR and AHWR. Differences in the physics design of research reactors, PWRs, BWRs, PHWRs and AHWR

Module 2: Reactor Engineering & Radiation Shielding (22)

Reactor Engineering (14)

- Introduction to reactor system & Indian Nuclear power programme
- Station schematic line diagram to indicate interlinks between reactor, turbine, generator, grid & auxiliary systems
- Classification of reactors, characteristics of research, test & power reactors with examples. Core configuration & cycle diagrams thermal reactors (BWR, PWR, PHWR),
- Fast reactors;
- Research reactors (DHRUVA) characteristics, selection criteria & comparison of different reactor materials & structural materials for reactor internals.
- Basic principles of heat generation, heat sources and distribution; Steps involved in heat removal from reactor systems.

Heat flow & temperature distribution in solid cylindrical, fuel elements; temperature distribution in clad for the above type of fuel elements and assessment of film drop temperature in each case with a solved example in each case; significance of KdT with example; Axial clad surface & coolant temperature distribution in fuel channel; maximum clad surface temperature and its location with a solved example.

- Brief description of various types of fuel; metallic (DHRUVA) Oxide (PWR, BWR, PHWR, AHWR) & Coated Fuel (HTGR); Design requirements & limitations for various types of fuel element design.
- Economic comparison of differ coolants based on pumping & heat removal capability; Boiling in reactor system critical heat flux & Burnout phenomena in water reactors; Heat transfer coefficient & assessment in reactor systems; Brief data of coolant (pressure, temp) in various reactors.

Nuclear Fuel Cycle (2)

- Concept of Nuclear Fuel Cycle ¾ open and closed fuel cycles.
- Global options of fuel cycles; Issues related to Resources, Proliferation, and Advanced Technologies.
- Mineral resources and nuclear fuel cycle strategies of Indian Nuclear Power Programme, 3-stage nuclear fuel cycle,
- Advanced fuel cycles

Radiation Shielding (6)

- Source of various neutron & Gamma radiation within the reactor system
- Attenuation of neutrons & gamma rays

- Dose rates for gamma rays for various source geometries
- Buildup factors for homogeneous & multiple layer shields
- Removal diffusion theory for neutron attenuation
- Coolant activation, heat generation
- Streaming of radiation through gaps & void in the shield

CORE COURSES

E601: Advanced Chemical Reaction Engineering (25)

- Review of basic concepts of reaction engineering
- Non ideal flow in reactors, distribution of residence times, experimental RTD studies, RTD Modelling, application. Micro-mixing and segregated flow, boundaries to micro-mixing, modeling segregation, experimental results, design strategies.
- Non-isothermal effects, dynamic behaviour of chemical reactors, steady state multiplicity and oscillations
- Heterogeneous reactions, transport and heat effects, reactions in the continuous phase; fluid, solid-fluid reactions, design procedures incorporating flow non-idealities in each phase.
- Reactor design: counter-current moving bed reactors, fluidized bed reactors.
- Advanced topics in reaction engineering- three phase reactors, photochemical reactors, integral reactor-separators, complex systems.
- Examples from nuclear chemical engineering.

EN602: Advanced Electrical Engineering Design-I (20)

- Materials: Soft Magnetic Materials and their properties and applications, Permanent Magnetic Materials and their properties and applications, Super conducting Materials and their properties and applications. (5)
- Special Electrical Machines and their applications: Servo motors, their design and application in control rod mechanisms, Hysteresis motors, Switched Reluctance motors, Canned motors, High speed motors (5)
- Control Machines: Conventional control, Vector control (5)
- Special Techniques of Magnetic Circuit Design: Finite Difference Methods, Finite Element Methods, Their applications, design of machines and Transformer, chokes and other Electromechanical Equipment.
- NDT Methods: MFL Technique, Eddy current Technique, Remote Field eddy current Methods. (5)

References:

(Reference materials will be provided during the course)

EN603: Advanced Electronics Circuit Design Techniques (30)

- Silicon Processing: Various steps involved in fabrication of Silicon devices (2)
- Semiconductor Detectors: Theory, design, fabrication and applications (2)
- Micro-Electro-Mechanical Systems (MEMS): Theory, design, fabrication and applications (2)
- Programmable Logic Devices: PLD, CPLD and FPGA, Technology architecture (4)
- Hardware Description Languages: VHDL – language details (6)
- Digital Circuit Design using VHDL: Design methodology and optimization, Design of a multiplexer, counter, finite state machine etc., test bench (4)
- RF Electronics: RF system for particle accelerator (1)
- RF System Components: Transmission lines, waveguides, circulators, resonators, power couplers (3)
- RF Power Amplifiers: Theory, design (2)
- RF Signal Processing: Low level RF controls, beam diagnostics, measurement and protection (4)

EN604: Advanced Mass Transfer (25)

- Theories of mass transfer with and without chemical reaction with examples from gas-liquid, liquid-liquid, and liquid-solid systems;
- Rate based approaches for design.
- Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors.
- Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors.
- Adsorption and ion exchange equipment.
- Membrane separation and other advanced mass transfer processes.
- Process intensification approaches.

EN605: Advanced Nuclear Instrumentation (40)

- High Resolution Energy Spectroscopy: Types of Pre-Amplifiers, Noise in Pre Amplifier, Optimum time constant, Resolution, Cooled detector Pre-Amplifier, Spectroscopy Amplifier, Gated Integrator, Triangular Shaping Amplifier, Pulse peak stretcher, Different types of Nuclear ADC's, Multi Channel Analyzers and their different modes. Particle identification by pulse shape analysis, DSP techniques for nuclear pulse spectroscopy.
- Timing Spectroscopy: Walk, Jitter, and methods of time pick-off, Resolving Time and Coincidence units, Timing single channel Analyzer, Experimental set-up for measurement of Absolute activities using coincidence, Time to digital converter, Time to amplitude converter and biased amplifier.
- Nuclear Laboratory Instruments: Isotope Calibrator, Low level alpha, beta and gamma counting systems, Liquid scintillation counting systems ,Nuclear medical instruments, Gamma Camera Spect.
- Miscellaneous Topics: Accelerator Instrumentation, Introduction to CAMAC, Application of CAMAC and VME for Beam-line and Control Instrumentation, Application of Nuclear Instrumentation in different fields.

Reactor Instrumentation:

- Fundamental Considerations / Philosophies, requirements, and scope.
- Measurement ranges of reactor neutron flux and considerations
- Types of neutron detectors FC,10B, BF3, CIC and SPND for in-core and out-of-core use.
- Signal processing blocks in Pulse, Campbell, DC range of measurement and generation of various signals (LCR,LR, Lin, LinR and ρ)
- Noise reduction techniques, considerations and practice: EMI Interference, Grounding and shielding.
- Interfaces of Reactor instrumentation to other relevant plant systems like Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma Monitors, Neutron Monitors, Contamination Monitors, including networking and RADAS.

EN607: Applied Process Instrumentation (40)

- Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables:
- **Flow**: Differential pressure flow elements: Orifices , venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straightners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters. Applications and limitations of various flowmeters. Two phase flow measurements.
- **Pressure**: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezoresistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.
- **Level**: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydrastep level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.
- **Temperature**: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.
- **Temperature transmitters**- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
- **Analytical Instrumentation**: Conductivity, pH, ORP and Turbidity measurement.
- **Other Measurements**: Relative humidity; viscosity and density measurement
- **Control valves:** Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.
- **Instrument Impulse lines and instrument fittings**: Tubes- materials and sizes, tube fittings- materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.
- **P & I Diagrams, loop and hook up diagrams:** P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

EN 608 Civil Engineering Design of Concrete and Steel Structures

EN 608.1Civil Engineering Design of Concrete and Steel Structures-I (30)

Introduction to various structures of nuclear facilities Classification of structure and design basis

Radiation protection objectives, defense in depth, safety functions, safety classification, seismicclassification, quality classification, design classification, design for natural and man induced events.

Design Loads:

- Normal Loads: Dead Load, liveload, equipment load, test pressure and test temperature load, prestress load, operational thermal and pressure load, earth pressure loads, hydrostatic pressure loads, estimation of temperature variation in structures due to solar radiation.
- Abnormal Load: Hydrostatic load due to internal flooding, design accident pressure, design accident temperature.
- Severe Environmental Loads: operating basis earthquake,severe windincluding gust effect and aerodynamic instability, design basis flood load,tsunami.
- Extreme Environmental Loads: Safe Shutdown Earthquake, cyclone, extreme wind loads, wind- induced missile

Design of RC structures:

- DesignofRC structures as per IS456,AERB standards (AERB/SS/CSE-1), ACI 318/ ACI 349 ,designloadcombinations,design of beam, column, slab, walls etc., design of plates & shell structures, Wood's criteria, serviceability design checks of crack width and deflection, case studies

Design for shrinkage, creep & heat of hydration:

Shrinkage & heat of hydration, different types of shrinkage, codal aspects, case studies..

Foundation design

- Engineering layout and selection of type of foundation, foundation stability, safety against bearing, overturning, sliding & uplift; shallow foundations, Winkler model, pile foundation.
- Machine Foundation - Introduction, evaluation of design parameters, analysis and design of block foundations and frame foundations, foundations for misc. machines, vibration isolation, and construction details of machine foundations, turbo generator foundations.
- Fracture mechanics approach- Introduction to fracture mechanics concepts in RCC structural design

EN 608.2 Civil Engineering Design of Concrete and Steel Structures-II (30)

Introduction to Prestressed Concrete structures

Introduction to prestressed concrete structures, Design of pre-tensioned and post-tension prestressed concrete structures, losses in prestress – short term and long term.

Design of lined and unlined containment structures

Lined RC and prestressed containment, Introduction to various codes viz. - RCC-G/BPEL/BAEL, ASME Section-3 Div-2, load combinations, allowable stresses, design criteria against limit state of serviceability and ultimate limit state, case study of design of RB inner/outer containment structure, case studies.

Design of steel structures of nuclear facility

Design of truss and framed structures as per IS 800: 2007, AERB standards, AISC standards etc., design of connections,design of embedded parts and anchor boltsas per AERB and ACI standards, case studies.

Design of water-retaining structures

Design of overhead and underground tanksusingun-cracked section, design for static and hydrodynamic load, serviceability checks, case studies.

Design of cooling towers

Estimation of waste heat for power plants, once through & closed loop water circulation system, selection of design parameters for cooling requirements, Introduction to thermal and structural design of Natural Draft Cooling Tower (NDCT), case studies.

EN 609 Earthquake Engineering and Structural Dynamics(45)

Introduction to Seismology

- Structure of the earth, plate tectonics and faults, seismic waves & wave propagation, seismograph, locations of earthquake, intensity, magnitude, iso-seismal curves, attenuation, identification of capable fault, estimation of magnitude potential, determination of Peak Ground Acceleration (PGA),Design Basis Earthquake,Concept of

Response spectrum, Generation of Artificial Time History, Power Spectral Density, IS 1893 Response Spectra
- Seismic instrumentation for micro-earthquake and strong motions.

Structural Dynamics
- Introduction to dynamic loading, different types of dynamic loadings, concept of damping,derivation of equations of motion, effect of gravity/static loads on equation of motion, equation of motion for support excitation
- Single degree of freedom of system (SDOF)–undamped& damped system, free & forced vibration; Response to harmonic and impulse loading,concept of transmissibility and vibration isolation,estimation of damping of structural system using free & forced vibration approach;response to impulse loading-shock spectra, response to general dynamic loading using Duhamel Integral.
- Numerical procedure to determine dynamic response of SDOF, acceleration-impulse extrapolation, evaluation of dynamic response by direct integration
- Multi degree of freedom system (MDOF) – Equations of motion for lumped mass system, evaluation of Eigen values (natural frequencies)& eigenvectors (mode shapes), orthogonality property of normal modes, response to ground motion, Fourier analysis and response to generalized periodic loading
- Introduction to dynamics of continuous system

Seismic Response Analysis of Structures
- Seismic response analysis using response spectrum and time history approach
- Modal superposition method, Modal combinations and spatial combinations, missing mass correction
- Time history analysis using direct time integration,
- Accidental torsion, soil-structure interaction, fluid structure interaction, equipment structure interaction

Random vibrations
- Fourier analysis and evaluation of power spectral density function, response of structures in frequency domain.

Special Seismic Design Considerations

Failure of structures during earthquake, Layout and irregularities of structures, Concept of ductility-strain, curvature and displacement ductility, design guidelines for achieving ductility in reinforced concrete structures;Seismic Design Optimization, Principles of performance based design, dynamic response control techniques such as base isolation, dampers etc.

Seismic Requalification of Existing Installations

Need and methodology for seismic requalification, seismic walkdown, health assessment, data collection, review basis ground motion, evaluation of seismic margin capacity, retrofitting.

Case Studies

Dynamic analysis of a typical RC and steel structures, requalification and retrofitting of safety related nuclear installments.

EN 610: Code Design for PVP (60)

- Membrane theory for thin shells, stresses in cylindrical, spherical and conical Shells. Dilation of above shells. General theory of Membrane stresses in vessel under internal pressure and its application to ellipsoidal, and torispherical end closures.
- Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 and Div - II equations for cylindrical / Spherical shell and conical, ellipsoidal and torispherical end closures.
- Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
- Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits. Beam on elastic foundation and its application to thin- walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement Rules for ASME, Sec.VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
- Bolted Flanged joints. Types of flange joints. Types of Gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
- Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material

and allowable stresses. Design of saddle supports.
- Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
- Derivation of TEMA Design equation for tube sheets. Background of the ASME Design rules for tube sheets.
- Piping thickness as per ANSI / ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
- Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec.VIII Div.1 code. Non-destructive Examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 and Div.2.
- Difference between metallic pressure vessel and FRP pressure vessels

Nuclear Pressure Vessels and Piping (30)
- Monotonic and Cyclic Stress-Strain Curve, Strain hardening rule, Theory of failure, yield condition and flow rules, Tresca and Von-Mises criterion.
- Limit analysis of beams and cylindrical shell under pressure and moment loading.
- Failure modes of pressure vessels, Ratchetting and shakedown.
- Organization of Boiler and Pressure vessel Sec. Ill code. Safety classification and Criterion for selection of ASME sec. Ill classes. Design loadings and service loadings as per NCA 2140.
- Types of stress, their significance and derivation of stress Intensifies in vessel and piping.
- Allowable stress limits for various service levels for vessels, bolts and pipings.
- Definition of B, C and K stress indices.
- Design of Nuclear piping as per Sec. Ill div.1. Design rules for standard support as per NF 3400, Design rule for piping support - NF 3600.
- ASME code rule for component support
- Design rule for Plate and shell- Type support as per NF 3200, Design rule for Linear-type support - NF 3300.
- Design rule for component support - NF 3500, Core support structure Design - NG 3300.
- Fracture Toughness requirements for materials for pressure vessels, pipings and boltings.
- Failure Analysis Diagram.
- Protection against Nonductile Failure - Appendix G, Basis of Low Cycle fatigue Design. Fatigue evaluation of vessels.
- Strain concentration factor ' Ke', Local strain approach: Neubar and Zarka rule, Elastic and elastic-plastic fatigue analysis of nuclear pipings, Leak-Before-Break Design Concept.
- Pre and Post weld heat treatment requirement for vessels and pipings as per ASME code sec. Ill.
- NDE requirements, Examination of welds, Acceptance standard.

EN 611: Computational Fluid Dynamics & Heat Transfer (50)

Basics of Fluid Flow, Heat Transfer and Numerical Analysis (5):
- Kinematics of fluid flow: Streamline, streakline and pathline; streamfunction,vorticity and deformation of a fluid element.
- Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bernoulli equations.
- Classification of Partial Differential Equations (PDEs)
- Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
- Temporal integration: explicit, implicit scheme
- Discretization of convection, upwinding, Streamline-Upwind Petrov Galerkin method
- Discretization of convection-diffusion problem: exponential scheme, power-law scheme
- Laminar Boundary Layer and Forced Convective Heat (5):
- Formulation of differential equation for hydrodynamic and thermal boundary layer
- Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
- Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
- Convective heat transfer for internal and external flows
- Low and high Prandtl number limits and different thermal boundary conditions
- Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

Turbulent Flow and Heat Transfer (5):
- Reynolds decomposition for turbulence
- Prandtl's mixing length theory, Mixing length models
- Structure of turbulent boundary layer over flat plate and through circular cylinder
- Calculation of friction factor and drag coefficient
- Analytical and semi-analytical correlations for calculating heat transfer coefficients
- Analogy between heat and momentum transfer

- Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
- Turbulence Modeling:
- Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
- Reynolds stress models: algebraic and differential models
- Low Reynolds number models
- Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
- **Natural Convection (3):**
- Basic Equations of natural convection
- Boussinesq approximation
- Derivation of Dimensionless groups from basic equations
- Analytical approximations
- Numerical solution of approximate equations

Numerical Solution of Complete Fluid Flow and Energy Equation (10):

- Formulations of governing equations used in numerical simulation:
- Streamfunction-temperature formulation
- Streamfunction-vorticity-temperature formulation
- Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
- Primitive-Variable (P-V-T) formulation
- Pressure velocity coupling for incompressible flow:
- Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
- Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
- Simple grid generation techniques for structured grid:
- Elliptic, parabolic and hyperbolic equation method
- Grid adaptation
- Domain decompositions in CFD and heat transfer
- SIP and preconditioned conjugate gradient methods for solution

Reactor Heat Transfer (12):

- Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.
- Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.
- Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.
- low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.
- Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.
- Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.
- **Heat Transfer With Phase Change (10):**
- Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.
- Basic equations of two phase flow; Homogenous & separated flow models for two phase flow; void fraction & phase velocity ratio (Zivi's model)
- Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)
- Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.
- Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept. Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
- Critical Flow: Models for single – phase and two-phase critical flow.

EN 612: Computer Based System Design- I (25)

Hardware Design

- Overview of microprocessors and peripherals: 8086, 68000, Digital Signal Processor (TMS320) DMA controller, serial communication controller and timer/counter.
- Personal computer architecture, memory organization, industrial PC
- Standard bus: Overview of PCI and VME bus, mechanical, electrical and functional specifications
- Programmable Logic devices: Introduction to PAL, CPLD and FPGA, Introduction to Hardware Description Language (VHDL)
- Case Study: Design of a single board computer with shared memory interface, I/O board design using ADC, DAC etc with emphasis on signal conditioning and isolation
- System design concepts: Fault tolerance, hot standby, live insertion, triple modular redundancy and safety issues

EN 613: Computer Graphics and Visualization (35)

- Introduction overview, Graphics software/hardware and types of graphics applications (1)
- 2D/3D Geometric Transformations, Affined transformations-Translation, Rotation, Scaling, Shear and reflection. (3)
- Homogeneous coordinates, composite transformations, rotation with qutenion, current transformations and matrix stacks. (3)
- Two dimensional viewing 2D viewing – window, viewport, viewport transformations, clipping operations, line clipping algorithms – Cohen-Sutherland, Liang-Barsky, polygon clippimg algorithm – Sutherland-Hodgman. (4)
- Three dimensional graphics – Planer geometric projections – parallel and perspective, Mathematics for projections, classical three-dimensional viewing, specifying views, viewing transformations, 3D clipping operations. (4)
- Hidden surface removal, object space and image space approach, back face culling, z-buffer algorithm, LOD.(2)
- Illumination and shading – Basic illumination models, light sources, material properties, polygon shading methods – flat, gouraud and phong shading, ray tracing methods. (2)
- Color - Color perception, color models – RGB,CMY,HSV (1)
- Visual Realism – Depth cuing, texture mapping, transparency, shadow, steropsis. (2)
- Curves and surfaces – Representation of curves and surfaces, Algebric and geometric form, Blending functions, interpolation, Hermite, Bezier, B-spline curves and surfaces, Rational polynomials, NURBS (5)
- Modern Graphics Architecture – Graphics Pipeline, GPU, PCI Express (2)
- Case Study – Using OpenGL (3)
- Scientific Visualization – Introduction, Geometry (Structured & Unstructured Grids), Data Representation (Scalar, Vectors), Volume Rendering (Marching Cubes, Ray Casting) (3)

EN 614 Construction Materials, Management and Quality Assurance (30)

Construction Materials

- Concrete: Ingredients, properties of concrete, mix design of normal, heavy density and serpentine concrete, High Performance Concrete with mineral admixtures (micro-silica, fly ash etc.)
- Reinforcement: Passive and active (Prestressing)
- Structural Steel, High Strength Friction Grip Bolt, Mechanical Couplers
- Paints
- Water-proofing materials & membranes

Shuttering/Formwork

Design philosophy, different design requirements, climbing shutter design, slip form work.

Prestressing system

Cable ducts, anchorage and grouting, qualification of Prestressing system

Quality Assurance (QA)

- QA in Civil Engineering design
- QA in materials
- QA in construction
- QA in operation & maintenance
- Inspection during construction, Regulatory inspection

Construction Procedure & Construction Safety

- Dewatering, rock excavation, consolidation grouting

- Construction safety, Job Hazard Analysis.

Contract Management

Introduction, Basics, preparation of tender, mode of tendering, contract and its clauses, discharge of contract, dispute adjudication

EN 615: Corrosion (15)

- Definition and importance of corrosion, corrosion principles; thermodynamic and electrochemical aspects; electrode potentials; polarization and corrosion rates; passivity, mixed potential theory, environmental effects: Dissolved Oxygen, temperature, pH, Velocity bacteria, dissolved salts and metallurgical variables, composition and heat treatment. (3 Lectures)
- Forms of corrosion: uniform attack; corrosion rate measurements, Galvanic corrosion, pitting and crevice corrosion; selective leaching; erosion corrosion; intergranular corrosion, low temperature sensitization, corrosion of weldments; stress corrosion cracking (SCC), irradiation assisted SCC; hydrogen embrittlement, hydrogen attack, corrosion fatigue; oxidation; microbiological induced corrosion (MIC), Corrosion testing procedures, failure analysis, specification tests, advanced methods for on-line corrosion monitoring. (7 Lectures)
- General principles of corrosion control – anodic and cathodic protection, inhibitors and passivators, corrosion protection by alloying, surface treatment and surface modification. (1 Lecture)
- Corrosion in the nuclear industry – Corrosion in nuclear fuel reprocessing, waste management and heavy water plants. corrosion in fluoride and ammonia containing environments; liquid metal corrosion. low alloy steels, stainless steels and Ni and Cu base alloys, protective magnetite formation on carbon steel, stress corrosion cracking of stainless steels and nickel base alloys. high temperature oxidation and hydriding of zirconium alloys, materials for fast breeder reactor system. Effects of radiation on corrosion (4 Lectures).

EN 616: Distributed Computing (45)

Advanced Computer Architecture

- Advances in CPU Architecture
  a. Advancements in CPU architecture – Dynamic Instruction level parallelism, Branch prediction, register renaming
  b. Static instruction level parallelism - EPIC, VLIW
  c. Hyperthreading
- Multi core architectureAdvances in Memory
  a. SDRAM, DDR, DDR-2
  b. Registered ECC, FB-DIMM
  c. CPU – Memory Interfacing techniques - FSB, Hypertransport, Quickpath
- Advances in I/O interfaces
  a. Shared I/O bus
  b. Switched I/O fabric
  c. Serial and parallel I/O bus
  d. Case studies - PCI, PCI-X, PCI-Express, PCI-Express Gen2
- Advances in Interconnect techniques
  a. Shared and switched networks
  b. Interconnect fabrics

   c. Approaches for improving interconnect performance
   d. Case studies – Ethernet, Infiniband, SCI
- Cache
   a. Associative, Direct mapped
   b. Write through, Write back
   c. MESI
   d. Shared caches
- Advances in storage systems
   a. Direct attached storage, Network attached storage, Storage Area Networks
   b. File level and block level accesses
   c. Storage protocols
   d. Case studies - ATA, SATA, SCSI, SAS, Fiber channel
   e. Case studies - FC, iSCSI, iSER, SRP

Parallel Computing

- Introduction to High Performance Computing
   a. Need for HPC
   b. Applications of HPC
   c. HPC Overview – Conventional Supercomputers, Parallel Computers, Classification (SISD, SIMD, MIMD)
- Pipelining, Vector processing, SIMD
   a. Pipeline, Speedup and Efficiency of pipeline
   b. Pipeline stalls, out of order execution
   c. Techniques to improve pipeline efficiency
   d. Superscalar, Superpipelined, VLIW, EPIC architecture
   e. Vector processors, vector instruction sets, registers
- MIMD Architecture
   a. Classification of MIMD machines
   b. UMA, NUMA, CC-NUMA, COMA, NORMA
- Interconnection networks and topologies
   a. Interconnection Concepts – Bandwidth, Latency, Network Diameter, Bisection Width, Node degree, Static and Dynamic Networks
   b. Various topologies – Ring, Hypercube, Torus, Mesh, CLOS, Fat tree etc.
- Current Parallel Architectures
   a. Parallel Vector processor
   b. Symmetric Multiprocessors
   c. CC-NUMA
   d. Massively Parallel Computers
   e. Clusters of workstations
- Clusters
   a. Classification of clusters
   b. Cluster software
   c. File systems for clusters
- Software concepts of High Performance Computing
   a. Parallelism – Algorithmic, Geometric, Event, Data
   b. Granularity – Coarse and Fine grains
   c. Speedup, Efficiency, Amdahl's and Gustaffson's Laws
- Parallel Programming Models
   a. Shared Variable Model
   b. Message Passing Model
   c. Threads Model
   d. Data parallel Model
- Design of parallel algorithms
   a. Data dependencies
   b. Data partitioning
   c. Communication patterns
   d. Synchronization
   e. Load balancing
- Parallel Programming Environments
   a. Parallel Languages
   b. Parallel Extensions to Sequential Languages
   c. Parallel APIs – MPI, OpenMP
- Parallelization of example programs – Dot product, Matrix Multiply, etc. at the pseudo code level
- Message Passing Interface (MPI)
   a. Introduction to MPI
   b. MPI constructs
   c. Example programs in MPI
- Benchmarking
- Case studies – ANUPAM series of parallel computers

Grid Computing

- Introduction to Grid Computing
  a. Evolution of Grid Technology comparison with contemporary technologies,
  b. Issues of virtualization, events that have lead to grid computing, client-server, peer-peer, operating system perspective,
  c. Overview of Grids: Formal definition of Grids - how do they work?
  d. How are they different from clusters? Computational Grids, Data Grids, Production Grids worldwide - Applications of Grid.
- Components of Grid
  a. Grid Security- concepts of single sign on, How the security requirements are met?
  b. Concept of Digital certificate- How RSA works? - Working of Kerberos
  c. Concepts of Myproxy services
- Grid Resource management
  a. Issues in Grid Resource management
  b. Abstract model for Grid Resource Management
- Grid Scheduling
  a. Issues in Grid Scheduling
  b. Taxonomy Of Grid Schedulers
  c. Resource Discovery issues
- Visualization and interactivity in Grids, High Performance Computing in Grids- Grid enabled MPI – MPI-G2
- Grids Services
  a. How are they different from Web services?
  b. Concepts and their implementation
- Data Management in Grids
- Information services- Building information services in Grids
- Grid Portals, Their Purpose, Issues in Portal design, discussion on portlets
- Grid Workflow
  a. Concepts
  b. Taxonomy of Grid Workflow
- Semantic Grids
- Virtualization
  a. Concept
  b. Its utility in Grid Computing
- Grid Enabling Applications
  a. Issues
  b. Implementations
- Discussion about GRID standards
  a. OGSA
  b. OGSA-DAI
- Comparative study of different Grid Middlewares
  a. Lacuna in current Grid Architectures
  b. Grid as operating system of operating systems
- Case study of Middlewares:
  a. GT4,
  b. Glite
  c. DAE Grid
- Future of Grids - Concepts of Cloud Computing

Module I [22]

Part A - Microprocessor based Design [10]

- 8086 Microprocessor: Hardware architecture, memory and I/O interfacing and handling of interrupts;
- Introduction to Microcontrollers and comparison with Microprocessors
- Introduction to DSP Processors

Part B [12]

- ARM processor: architecture details and introduction to programming
- Board level buses: I2C and SPI
- Introduction to USB

Module II [23]

Part A – Computer based hardware design [8]

- Overview of PC Architecture, Industrial PC and Embedded PC, SBC architecture
- Industry standard bus systems: ISA, PCI, VME: Mechanical, electrical, functional and procedural specifications
- Multi processing, bus arbitration and Plug and Play
- System design considerations: thermal, EMC and signal integrity analysis; Design accommodations for testability, reliability and maintainability.
- Design Case Study:
- I/O Board design, bus interface (ISA, PCI) FIFO and shared memory interfaces.

Part B - Computer Communication and Networks [7]

- Overview of asynchronous and synchronous communication standards
- Encoding (NRZ, Manchester),
- Ethernet, Industrial networks, Field Bus, CAN bus
- Networking hardware: Cables, Hubs, switch and routers.

Part C - Software development for embedded and PC based systems (8)

- Basic RTOS concepts
- C programming for ARM based applications
- Programming for PC based systems:
  - Interface between applications & device drivers
  - Windows: Programming of I/O, ISR, DMA

EN 620: Extractive Metallurgy (40)

Principles of Metallurgical Thermodynamics (15)

- Thermodynamic Functions: Enthalpy, Entropy, Free Energy, Chemical Equilibria
- Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Phase Diagrams
- Solution Thermodynamics, Integral and Partial Molar Thermodynamic Properties
- Experimental Methods- Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.
- Computation of predominance area diagram and Phase diagrams

Kinetics(5)

- Principles of Chemical Kinetics, Homogeneous Reactions, Effect of Concentration, Effect of Temperature
- Theory of Reaction Rates, Heterogeneous Reactions, Reaction Models, Mass Transport Phenomena, Heat Transport Phenomena.

Process Metallurgy (25)

- Methods of attaining High Temperatures,Measurement of Temperature,
- Vacuum Metallurgy Principles and Equipments,
- Process Metallurgy of Rare and Refractory Metals,
- Resources of Special Metals, Beneficiation Methods, Physical, Chemical, Separation Methods, Halide Metallurgy, Vacuum Metallurgy, Electro Metallurgy, Reduction Processes, Refining Processes, Ultrapurification Processes,
- Preparative aspects of Special Materials and Alloys,
- Advanced Materials Processing Techniques,
- Reprocessing of irradiated nuclear fuels, Process Metallurgy of - Uranium, Thorium, Plutonium, Beryllium, Zirconium, Hafnium, Niobium, Tantalum, Rare Earths.

EN 621: Finite Element Techniques (35)

- **Introduction to FEM:** Weighted residual method, Galerkin's methods, Weak form formulation, Piecewise approximations. Basis of Finite Element Method, Variational principles, energy principles in structural mechanics, Element libraries 5
- **Element shape functions**: Generalized co-ordinates, General requirements for shape functions, Lagrangean, Hermitian interpolation functions, C0 and C1 continuity, Natural coordinate system; derivation of shape functions for 1-D elements. 15
- **Bar element:** Derivation of elemental stiffness matrix and load vector; transformation from element to global coordinate system; assembly of global stiffness matrix and load vector; solution of typical 2D-plane truss problems to evaluate displacements and member forces/stress; thermal stress evaluation in Bars/Truss
- **Beam element:** Derivation of elemental stiffness matrix and load vector; solution of simple beam problems to evaluate deflections/rotations; BM/SF distribution and determination of stresses shear deformation in beams.
- **2D plane elements** – 3 noded triangular element: Derivation of elemental stiffness matrix and load vector, Plane stress/ Plane strain & Axi-symmetric elements; Evaluation of strain/stress.
- **2D isoparametric formulation** – 4 and 8 noded quadrilateral elements, mapping of parent element to global space, Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of elemental stiffness matrix and load vector for plane and axisymmetric elements; evaluation of strain/stress at Gauss points, numerical integration, Newton-Cotes and Gauss quadrature.
- **Incompatible displacement model**: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral elements.
- **Introduction and Application to 3D elements:** Strain-displacement and stress-strain relationship; Tetrahedron elements; Triangular and prism elements and hexahedron elements.
- Plate bending elements: Thin and Thick plate theory; elements based on Kirchoff's theory, Elements based on Mindlin theory; Shear locking and reduced integration

- **Shell element**: Strain-displacement relation; Flat shell element; 4 and 8 noded degenerated thick shell elements, basic assumptions, degree of freedom, shape functions and shear locking.
- **Introduction to Nonlinear problems:** Sources of nonlinearity, Material non-linearity, Geometric non-linearity, Newton-Raphson method
- **Finite element applications for design**:Finite element modelling and discretization criterion, h & p refinement, sources of potential error in the finite element solution of design problems, order of convergence, patch test, adaptive meshing, error analysis, stress categorization as per ASME.

EN 622: Fracture Mechanics (40)

Linear Elastic Fracture Mechanics (5)

- History and need of fracture mechanics
- Griffith's energy balance theory
- Stress analysis of cracks and concept of 'Stress Intensity Factor' (K)
- Relationship between K and global energy release rate (G)
- Various modes of fracture
- Superposition of K
- Plastic zone correction - Irwin's approach
- Basic design principles in LEFM
- **Plane stress vs. plane strain - Variation of toughness (KIc and Kc)**

Elastic-plastic Fracture Mechanics (5)

- J-integral as energy release rate
- J-integral as amplitude of HRR singularity
- J-integral as contour integral
- Laboratory measurement of J-integral - η factor approach
- Fracture resistance of materials – J-R curve and JIc and possible explanation for shape of J-R curve
- Stable and unstable crack growth – Tearing Modulus approach
- J-controlled fracture
- Basic design principles in EPFM
- **J-estimation schemes**

Laboratory measurements of material fracture properties (2)

- Common specimens – CT, SE(B) or TPB specimens
- Fatigue pre-cracking
- Chevron notch, Side-grooving
- Instrumentations
- KIc testing as per ASTM standard
- J-R curve determination as per ASTM standard
- Determination of JIc from J-R curve – blunting line equation and SZW

Limit load (2)

- Definitions of limit load
- Global and local limit load
- Basic expressions of limit load of some common geometries

R6 method (2)

- Basic principles of R6 method
- Sensitivity analysis

Fatigue (7)

- Conventional high and low cycle fatigue – S-N diagram, Coffin-mansion relation
- Fatigue crack growth under constant and variable amplitude loading
- Rainflow algorithm
- Environmental effects on fatigue crack growth
- Fracture Mechanics approach to fatigue – Paris Power law
- Crack closure effect and modification of Paris law
- **Experimental determination of Paris law constants as per ASTM procedure Fracture assessments of welds (2)**
- Basic aspects of fracture assessment of welds – residual stress effect
- Special considerations in fracture toughness determination of welds

PTS and ASME reference/Master curve (6)

- Relevance of PTS event in nuclear reactors (PWR)
- Safety assessment procedure during PTS
- Warm pre-stress effect

- Reference ASME curve in assessment of PTS
- Master curve concept
- Determination of Master Curve as per ASTM 1921

Computational Fracture Mechanics(4)

- Barsoum's crack tip element and showing the singularity from shape function
- Evaluation of SIF by displacement correlation technique from FEM
- Evaluation of 2-D J-integral by contour integral technique
- Evaluation of 3-D J-integral by domain integral technique

Fracture Mechanism (4)

- Basic mechanism of ductile fracture – Void nucleation, void growth and coalescence
- Cleavage fracture- Mechanism of cleavage initiation
- Mathematical model of cleavage fracture toughness, explanation for scatter in cleavage fracture toughness, RKR model

Application of Fracture Mechanics Principles to Leak-Before-Break (1)

- History of LBB
- Basic concepts of LBB – three levels
- Application to Indian reactors

EN 623: Mechanical Metallurgy (30)

Elasticity and Plasticity

- Concept of stress at a point, stress tensor, state of stress and strain in an elastic continuum.
- Equations of equilibrium.
- Principal stress, hydrostatic & deviatoric stress. Elastic stress-strain relations, compatibility equations. Yield criteria

Dislocations:

- Elastic stress field of edge and screw dislocation.
- Self energy of dislocations.
- Forces on dislocations (Peach-Koehler equation), dislocation Interactions/reactions, Slip systems in FCC, BCC and HCP

Deformation Behaviour

- Single crystal deformation, critical resolved shear stress, Schmidt's factor, Thermally activated deformation, Strengthening mechanisms.

Creep of Metals and alloys

- Various stages of creep and creep laws
- Types of creep tests, evaluation of parameters of a creep test and its use
- Factors influencing creep resistance
- Deformation mechanism map and identification of creep mechanisms, Irradiation creep

Fracture Mechanics

- Concepts of ductile and brittle failure: Griffith's criterion of brittle failure
- Concepts of compliance, triaxiality of stress, Linear Elastic fracture mechanics, Elastic-plastic fracture mechanics
- Concepts of R-curves, Evaluation of various fracture parameters, fracture control

Fatigue of Metals:

- High cycle and low cycle fatigue
- Factors contributing to fatigue failure and its mitigation
- Various stages of fatigue damage and Fatigue life improvement
- Fracture mechanics approach to characterize crack growth behavior

7. Deformation and Fracture Mechanics of Engineering Materials - R. W. Hertzberg

EN 624: Mechanics of Solids (40)

Introduction to Theory of Elasticity Mathematical Frame Work (2)

- Illustration of concepts of elasticity, Stress-strain curve, Isotropy, Homogeneity
- Illustration of equilibrium equation, Cauchy equation and stress strain relation in 1-D
- Solution of 1-D boundary value problems using theory of elasticity equations: (a) Natural frequency determination. (b) Solution under external excitation force to show resonance condition, stress wave etc.
- Tensors algebra : Definitions Scalar, Vector, Matrix, Tensor; Index Notations, Kronecker Delta, Permutation symbol ; Coordinate System Transformation, Tensor Algebra, Tensor Calculus.

Analysis of Stress (3)

- Description / Notations of Forces
- Description / Notations of Stress
- Component of stress
- Reciprocity of shear stress in 3D

- Stresses Transformation using direction cosines
- Stress Traction Vectors or Traction Vectors
- Stress component on an arbitrary plane
- Principal stresses
- Stress Invariants
- Mohr's Diagram for 3D state of stress
- Hydrostatic and Deviator components of stress
- Principle planes and their orthogonally
- Octahedral plane, Octahedral stresses
- State of pure shear

Analysis of Strain (2)

- Description / Notation of Strain in 3D
- Components of strain
- Strain Transformation using direction cosines
- Principle Strains, Strain Invariants
- Cubical Dilation
- Strain Deviator Tensor
- Maximum and Octahedral Shear Strains

Principles and Fundamental Equations of Elasticity (8)

- Strain and displacement relations (Cauchy's equations)
- Compatibility equations (Saint-Venant's Equations)
- Generalized Hook's Law
- Anisotropy and Isotropy of elastic behaviour
- Stress and strain relationship
- Equations of equilibrium (Navier's Equations , Lame's equations)
- Strain Energy
- Uniqueness theorem
- Bounds on elastic constants
- Superposition Principles
- Saint-Venant's Principle
- General Solution Procedures for a elasticity problem

Two and Three Dimensional Formulation (8)

- Elasticity equation for Plane strain
- Elasticity equation for Plane stress
- Biharmonic equations
- Airy's Stress Functions
- Solution for beam bending problems
  a) Special cases by use of polynomials
  b) General solutions using fourier series method
- Solution in polar co-ordinates
  a) Tube subjected to internal and external pressure (Lame's problem) ; shrink fit
  b) Stress Concentration due to a circular hole in stressed plate (Kirsch's problem)
- Stress in spherical shell under internal and external pressure

Thermal Stresses (4)

- Thermal stress definition and their significance
- Thermoelastic stress-strain equations (Duhamel-Neumann's equation)
- 2D thermal stress analysis
  a) The problem of circular disk
  b) The problem of circular cylinder
- 3D thermal stress analysis : The problem of sphere
- Transient thermal stress

Introduction to Plasticity (4)

- Stress-strain curve, Examples of Multiracial stress
- Different Yielding Criteria and their significance
- Yield Surface , Tresca and von-Mises
- Path dependence of Plastic Strains
- Isotropic and Kinematic Hardening (subsequent yield surfaces, loading, unloading)
- Prandtl-Reuss Equations
- Incremental or flow theory
- Deformation theory of plasticity, Hencky equations
- Plasticity Relations (plastic strain and total strain)

Theory of Plates

- Introduction, Small deflections of laterally loaded thin plates, governing differential equations for rectangular and circular plates
- Boundary conditions, Navier type and Levy type solutions, applications to rectangular plates, axisymmetric circular plates. Shear deformation theories.

- Introduction to analysis of Thick Plates

Theory of Shells

- Introduction to shell theory.
- Classification of shells, Membrane theory of shells of revolution and translation.
- Application to spherical, conical and cylindrical shells.
- Bending analysis of cylindrical shells and symmetrically loaded shells of revolution.
- Application to cylindrical shells, spherical and conical shells.

EN 625: Modern Control Systems Design and Simulation (35)

- Introduction, Examples of Dynamic Systems, Elementary definitions, Analyti- cal methods of modeling.
- State Space Characterization State 5PaCe representation, solution of state equation, state Transition matrix, properties of STM, computation methods, Companion form, Diagonal and Jordan form representation of linear models
- Controllability and Observability State transfer and Kaiman Controllability criterion, Algebraic controllability and Observability criteria, Gilbert's criterion, Eigenvalue controllability, Duality, Control- lability and observability of Discrete data systems.
- Stability liapunov,s stability criterion, Application to linear models, Extension to non-linear models.
- Control System Design Guillemin-Truxal design Procedure, pole placement by state feedback. H,' meth- od, Ackermann's formula, Bass and Gura formula, optimal control formulation, LQR theory, Matrix Riccati equation.
- Linear Observers Luenberger observers, Kaiman filter as OPtimum observer.
- Other Modeling Approaches Energy approach of modeling, Empirical modeling - impulse and frequency re- sponse methods, Recurise Least square Identification technique.
- Introduction to Adaptive and Robust control.

References:

(Reference materials will be provided during the course)

EN 626 Design Basis Hazards and Geotechnical Engineering (40)

Design Basis Hazards (Natural)

Role of civil engineering in achieving overall nuclear safety: Considerations made in siting of nuclear facilities, plant and building layout, safety functions, and functional roles of buildings/ structures vis-à-vis safety requirements.

Introduction to hazard evaluation:

Hazard due to internal and external events, case studies.

Seismic Hazard

Source models, recurrence relations, frequency dependent attenuation relations for inter plate and intraplate regions, Deterministic Seismic hazard, data continuity checks, uniform hazard spectrum

Flood hazard

- Inland site: Collection of meteorological data and extreme Value Analysis for Precipitation and floods, Design basis floods including dam break, flood routing and protection
- Cyclone induced flooding for coastal sites: Storm Surge (pressure and wind induced), wave set-up and wave run-up
- Tsunami: Causes of Tsunami, Tsunami hazards, Tsunami characteristics (velocity, wave period, wave run up and inundation), and tsunami induced flooding

Wind hazard

Wind rose diagram, Basic wind speed, Hourly mean wind, evaluation of design wind speed (wind speed map of India,Risk factor, height and structural size factor, Topography factor, cyclonic factor etc.),

Solar radiation

Temperature map(Summer and Winter) of India, direct solar radiation, diffused radiation, radiation from ground surface, Total solar radiation, estimation of surface temperature, minimization of solar radiation effect. Assessment of surface temperature using ASHARE handbook, design of insulation for building roofs/walls (exposed surfaces)

Snow hazard

Design snow load, shape coefficients for various types of roof, ice load on wires, effects and Mitigation Ground subsidence, Landslide and mudslides

Design Basis Hazards (Human-Induced)

Aircraft/missile impact (determination of load-time function, evaluation against impact, fire and vibratory loads), Explosions/Blast (Identification of sources, characterization and impact assessment), Toxic gas release (Identification of sources, characterization and impact assessment)

Geotechnical Engineering

Soil Mechanics

- Soils and their classification based on USCS, IS 1498, AASHTO systems, Grain size distribution, Plastic limits etc.
- Compaction of soils – Laboratory and Field compaction, Selection of compaction equipment on soil characterization, Dynamic compaction, Ground improvement techniques -Vibroflotation, Stone columns etc.
- Tests on soil and rock – Laboratory tests – UCS, Tensile test, Petrography, E value, Permeability; Field tests – Permeability (Packer tests), Vane shear test, Static penetration test, Cone Penetration tests, Pressure meter tests, pile load tests etc.
- Bearing capacity – Determination of bearing capacity for soils and Rock.

Geotechnical and Geophysical investigations:

- Geotechnical investigations: Different Stages of investigations, Scheme of investigations, Soil sampling (Disturbed and Undisturbed), Rock sampling, Core Recovery (CR), Rock Quality Designation (RQD), Rock mass Rating (RMR). Direct and In-direct explorations, Trial pits, Borings etc.
- Geophysical investigations : Seismic waves – Compression, Shear, Rayleigh and Love waves, Seismic refraction survey, Cross-hole, Up-hole and Down-hole seismic surveys, Electrical resistivity, Acoustic logging, Advantages and Disadvantages

Soil Dynamics and Liquefaction

Deformation & strength characteristics of soil under dynamic loading; soil Damping – material & Radiation damping; liquefaction studies, evaluation of liquefaction potential of site.

EN 627: Networking and Information Security (40)

Networking

General Issues in the transport of data traffic over networks of digital transmission media.

- V.24, V.35, Modems, xDSL, Multiplexing

Circuit switching & Packet switching

- ISDN (BRI), PRI.

Datalink Layer

- Data link layer protocols, Medium access method, Flow control, Error Control
- Ethernet technologies, Bridge, Switching, Analysis of collision domain, Layer 2-based network attacks

Introduction to Satellite communication

- Satellite orbits, VSATs, VSAT network Topologies

Network Layer

- IP, IP Fragmentation, ARP, DHCP, Classes of IP address, CIDR, Layer 3 based network attacks, ICMP
- IP Routing algorithms, RIP, OSPF, BGP.

Transport Layer

- TCP & UDP, TCP Call establishment & Call termination, Sockets, TCP state machine, TCP timers
- RTP, Layer 4 based network attacks

Firewall

- Layer 3 firewall, Layer 4 firewall, Application based firewall

Network Applications

- FTP, DNS, Mail, application based attacks

Network Security

- Data security, type of possible attacks on data etc?
- Ecurity services for secure data communication?
- Like Identification, Authentication, Authorization, Data Integrity, Confidentiality, Non-repudiation, Replay, Availability etc.
- Cryptography and its services Cryptology, cryptanalysis.
- Components of cryptology like algorithms, Keys, Message Digest, Digital signature, Digital Certificates etc. with block diagram.

Types of Algorithms

- Symmetric and Asymmetric.

Symmetric Algorithm

- stream cipher algorithms
- Type of stream ciphers, Unconditional security with stream ciphers, one time pad, LFSRs, Linear complexity in LFSRs, Shanon's concept of perfect secrecy
- Type of possible attacks, Conversion of block ciphers onto stream ciphers etc.

Asymmetric Algorithms

- Diffie-Hellman, RSA with detail mathematics and applications.
- Key management methods for symmetric and asymmetric keys.
- PKI infrastructure, Digital certificates, digital signatures for asymmetric key managements. CRL (certification revocation list)
- Symmetric key certificates. Difference between symmetric and asymmetric key certificates etc.

EN 628: Nuclear Chemical Engineering (35)

Intoduction

Role of chemical engineering in the nuclear industry

Recovery & processing of nuclear materials from ores / intermediates (5)

- Uranium ore processing: Ores and their classification, options available and production of Uranium concentrates from Indian ores. Recovery of Uranium from non-conventional sources , New developments, uranium refining.
- Thorium: Occurrence, importance and production of Thorium from Monazite by solvent extraction process involving separation of Thorium, Uranium and Rare Earths.
- Zirconium: Occurrence, importance and production of Zirconium from Zircon. Zirconium and Hafnium separation and production of nuclear grade zirconium.
- Rare Earths : Occurrence, importance and separation.

Uranium Conversion / reconversion (6)

- Conversion of nuclear grade uranium to UO2, production of UF4 and reactor grade U metal / UC from concentrates, process and equipment choices; flow sheets of refining plants. Metallothermic reduction, process choices, applications.
- Electrochemical technology for production of Fluorine, UF6: choice and problems, Fluorination of UF4, Purification and collection process for UF6, Conversion to UO2.

Isotope Separation (9)

- Isotope Separation : SWU and value concepts; Cascade theory; Process for separation of Uranium; Gas centrifuge, Diffusion; Optimisation of separation cascades.
- Processes for heavy water production and their comparative evaluation, Pre-enrichment process; Chemical- exchange: H2S-H20, NH3-H2, monothermal and bithermal process, salient features of equipment like contacting towers, tower internals. Heavy water plants in India. Final enrichment and upgradation plants. Distillation and electrolysis, Tritium removal.
- Laser based separation and new processes (2)
- A brief description of laser based isotopic separation processes.
- Fuel Reprocessing (6)
- Fuel Reprocessing: Introduction to Radiochemistry; Differences between a conventional chemical plant and radio chemical plant- Process and equipment limitations, criticality, safety and other hazards, numerical examples, ventilation, shielding, Typical compositions and burn-up of irradiated nuclear fuels.
- Thermal Reactor Fuel Reprocessing: Spent fuel storage planning at reactor sites, cooling before reprocessing; decontamination, product specification and recovery requirements. Evolution of solvent extraction process fore reprocessing, 'PUREX' and 'THOREX' processes in detail; Head-end process, flow sheet, co-decontamination and partitioning cycles.
- Fast Reactor Fuel Reprocessing and Introduction to reprocessing of Thorium based fuels.

Nuclear Waste Management (7)

- Sources, characteristics and classification of radioactive wastes; general philosophies of management.
- Method of treatment for low, intermediate and high level- solid, liquid and gaseous wastes with examples.
- Discussion of the various chemical engineering operations involved. Use of desalination and membrane separation techniques in waste management.
- Conditioning of radioactive waste- cementation, bituminisation, use of polymers and vitrification methods.
- Storage for primary and secondary solid wastes, ultimate disposal; options in the Indian context.
- Chemical Engineering in Decommissioning of nuclear facilities.

EN 629: Nuclear Materials (50)

Melting & Casting (10)

- Introduction to vacuum measurement units and types of vacuum pumpsincluding diffusion pump & turbo- molecular pump. Vacuum melting & casting processes, including general descriptions of vac. ind. melting, vac arc melting, electron beam melting, plasma arc melting & inductoslag refining with process parameters and comparative studies.
- Relevant curves for variation of vacuum, temperature, fluidity etc. during vacuum melting with their effects on purification, homogeneity, grain-size control. Magnetic stirring in vacuum arc melting, effect of vibration during solidification on grain sizes. Sacrificial deoxidation under EB melting. Control of defects in castings. Discussion of vacuum melting process of uranium, zirconium alloys and Ti-alloys with relevant flowsheets.
- Solidification process, calculation of rate of solidification, parameters affecting solidification process with special reference to formation of defects during solidification under vacuum, and methods to overcome such problems. Introduction to continuous casting processes and other special casting processes and their relative merits

Mechanical working of Metals (10)

- Microstructural Evolution during cold and hot working of Metals, Equilibrium equations, Levy-Von Mises plasticity equations, Methods of solving problems in mechanical working. Evaluation of workability Deformation mechanism maps. Dynamic recovery and recrystallisation, miscellaneous fabrication processes with special reference to fabrication of metallic fuel elements and production of thin walled fuel clads with texture and microstructure control.

Powder Metallurgy & Advanced Ceramics (30)

- Introduction: Particulate materials – Metallic and ceramic powders, Difference between advanced ceramics and traditional ceramics. Different types of advanced ceramics and applications
- Phase equilibria and phase diagram: Reaction Kinetics and example of important ceramic systems.
- Structure: Crystal structure, defects in ceramics, Defect chemistry
- Principles of main powder production methods, Techniques of fabrication of metal powders, ball-milling and high energy milling
- Solid state and wet chemical route of powder preparation of nuclear fuel materials – oxides, mixed oxides, carbides, intermetallics
- Powder processing, Blending, granulation and process aids, Agglomeration and deflocculation, role of surfactants and binders in processing of powders
- Characterization of powders: Particle size and size distribution, particle shape, surface area, porosity, pore size distribution, pycnometry, zeta potential measurement
- Sintering: Solid state, liquid phase and sintering in presence of viscous liquid. Sintering of both oxides and non- oxide materials including nuclear fuel and control rod materials etc. Sintering under pressure. Spark plasma sintering, Microwave sintering
- Shape fabrication: Pressing (cold and hot pressing), iso-pressing (cold and hot); slip and tape casting, powder extrusion, gel casting, powder injection molding, colloidal processing and spray techniques and different new techniques.
- Properties: Mechanical – Effect of defects, Toughening, Super plasticity etc. Electrical – Dielectric, Superionic conductivity and HTSC. Magnetic – Ferrimagnetism. Optical; Thermal. Role of powder metallurgy techniques in imparting specific properties
- Case studies and applications of powder metallurgy with emphasis on applications relevant to DAE

EN 630: Nuclear Metallurgy (30)

- Nuclear Fuels Fabrication and Characterisation Introduction: Research reactor and power reactor fuel types- plates, pins, kernels etc. Indian scenario, fissile and fertile isotopes, fuel cycles and reactivity, fuels of different types- metallic, alloy and dispersion fuels for research reactors, ceramic (oxide, carbide and nitride) fuels for thermal power reactor and fast reactors.
- Fabrication of fuel: Fabrication of oxide, mixed-oxide and mixed-carbide fuel for power reactors. Fabrication, characterization and property evaluation of advanced fuel type such as AHWR fuel and particle fuel. Processes encountered in fabrication, fuel property evaluation- thermal and physical properties.
- Handling of Pu: Health physics, radioactivity and safety aspects. Equipment and laboratory facility for Pu fuel fabrication.
- Irradiation Behaviour and Post- Irradiation Examination of Fuels and Structural Materials Introduction: Design aspects of fuel elements/ bundles and in-core components in power reactor operating environment and criteria for material selection for reactor components.
- Irradition effects in nuclear fuels: Irradiation behaviour of metallic uranium - irradiation growth, thermal cycling, swelling, adjusted uranium, blistering in uranium rods. Irradiation effects in ceramic oxide and mixed oxide fuels,definition and units of fuel burnup, main causes of fuel element failure in power reactors and remedies to avoid failures. Modelling of fuel element behaviour. Behaviour of fuel under off normal and accident condition, criteria for fuel failure during LOCA: oxidation, deformation, stored energy.
- Irradiation effects in structural materials: Irradiation hardening and embrittlement, corrosion and hydriding of Zr alloys under irradiation, enhancement factor, blister fomation in cladding and pressure tube, Delayed hydride cracking, irradiation- creep and growth in Zr alloy components, life assessment of pressure tubes in PHWR, Irradiation effect in stainless steel cladding: Sodium corrosion, helium embrittlement, void swelling etc.
- PIE Techniques for fuel and component Hot cell facility for irradiated material examination, purpose of PIE, NDT and DT techniques for fuel examination, informations obtained on irradiated fuel, pool side inspection of fuel, PIE of pressure tubes and other fuel channel components, Failure analysis of reactor components.

EN 632: Process Control and Instrumentation (MT)(25)

Principles of Measurement (2)

- Basic definitions like Accuracy, Precision, Hysteresis, Resolution, Sensitivity, Time constant etc; Force balance and Motion balance, Instrument Selection criteria, Primary Instrument Standards and their Traceability.

Sensors, Transducers and Transmission methods for parameters (10)

- Temperature: Filled systems, Bi-metallic sensors, Thermocouples, Resistance Temperature Detectors, Thermistors, Optical& Radiation Pyrometers.
- Pressure and Vacuum: Manometers, Diaphragms, Capsules, Bellows, Bourdon tubes (C-Type, Spiral and helical), McLeod gauge, Pirani gauge and Thermocouple gauges, Differential Pressure Transmitters.
- Flow: Bernoulli's Theorem, Constant area and Variable area type flow meters, Ultrasonic flow meters, Electromagnetic Flow meters, Turbine type flow meters and Target type flow meters.
- Level: Direct type (Gauge glass, Float, Piston tube, Torque tube) level indicators and Indirect Type (Pressure gauge, diaphragm type, purge method, Differential Pressure type, Ultrasonic type, electrical conductivity type, Capacitance type and Nuclear radiation type) level indicators.
- Analytical Measurements: Density, Conductivity, pH, Humidity.

Principles of Automatic Control Systems (8)

- Feedback and Feed forward control as applied to Process Instrumentation, Modes of control, Generation of control modes, Selection criteria.
- Final Control Elements, Control Valves and their characteristics, Valve positioners, Actuators and Dampers.
- Fail Safe Principles, Simple logic circuits, Ladder Circuits for control action.

EN 633: Process Control & Instrumentation (EE)(30)

- General Concepts Definition of Accuracy, Linearity, Repeatability, Hysterisis, Deadband, Resolution, Sensitivity. Calibration of instrument, Error analysis of a system, Standards and their traceability.
- Measurement, Transmission and indication of following process variables
- Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter, Different types of standard pressure taps for orifices. Variable Area Flowmeters- Glass tube rotameters, armoured rotameters, bypass rotameters,
- Magnetic, Turbine, vortex flowmeter, Ultrasonic flowmeters- Transit time, Doppler type, clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters.
- Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples- construction and applications, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, cold junction compensation techniques. RTDs- Wire wound and thin film RTDs, self heating error, differential temperature measurement by using RTDs. Thermistors - Construction, performance and applications, Filled system thermometers. Thermowell, Temperature transmitters., Optical pyrometer, total radiation pyrometer, two colour pyrometer.
- Pressure and Differential Pressure: Manometers-U tube, well and inclined manometers, mechanical pressure gauges- Bourdon, Diaphragm, Bellows, Dead weight testers. Pressure and differential pressureTransducers and transmitters, Smart pressure transmitters, Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauges, Mcleod gauge.
- Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass,

Purge system, capacitance probes, displacer type, ultrasonic type, nucleonic type and conductivity type level gauge.

- Conductivity, pH, Relative humidity and viscosity measurement
- Automatic Control and Control Valves Feed back control as applied to process control, Modes of Control, PID controllers, Cascade control, Feed-forward control, Control Valves, Valve actuators, Valve Coefficient, Valve sizing, Valve characteristics, Cavitations and flashing in control valves, Valve positioner.
- Distributed Control System: Programmable Logic Controllers, Smart Transmitters Control room concepts.
- P & I Diagrams: P &ID symbols, Typical P &ID.
- Class 1E Instruments in nuclear power plant: Definition of Class 1E equipment, various tests for Class 1E equipment qualification.

EN 634: Process Dynamics & Control (45)

Instrumentation , Controls & Computers(20)

- General requirements of Instrumentation, sensors/transducers for various process parameters, viz. pressure, flow, level, temperature, conductivity, pH, vacuum, etc., pneumatic & electronic signals, functioning of electronic transmitters, specifications & installation practices, RTDs & Thermocouples, use of thermowells, insertion lengths, etc.
- Introduction to process control & control loop dynamics, controller actions, viz. P, PD, PI & PID, tuning of controllers, cascade, feed-forward, split-range & ratio controls, selection & sizing of control valves.
- Use of PC for data acquisition & control, add-on cards 7 types, concept of a scheduler and use of PC for real- time control applications.

Advanced Process Control (25) Background theory

- Introduction to state-space controls, state & measurement equations, general solution **of** the state equation, state- transition matrix, casting differential equations & transfer functions into state space form, controllability & observability, introduction to the pole-placement problem, introduction to Luenberger observer & parameter estimation, knowledge of Z-transforms, conversion from continuous domain to discrete domain and understanding of the state-space framework in discrete domain.

Introduction to Advanced Process Controls

- Introduction to multi-variable controls, de-coupling, relative gain array (RGA), etc. System identification, model-predictive control (MPC), data processing & introduction to design of experiments.)

EN 635: Process Modelling, Simulation & Optimization (45)

Simulation

- Introduction: Introduction to process modelling, simulation and optimisation. Deterministic versus stochastic models. Dynamic and steady state models.
- Flowsheet Analysis: Degrees of freedom (DOF), DOF of individual units including reactors, heat exchangers etc. DOF analysis of cascades/flowsheets with examples.
- Approaches To Plant Simulation: Sequential modular; Equation oriented; simultaneous modular
- Steady State Sequential Modular Simulators: Concepts of partitioning, tearing and nesting as applied to flow sheets; Methods of representation of plant topology-, recycle detection and calculation ordering algorithm; recycle convergent methods.
- Steady State Equation Oriented Simulators: Strategies for formulation of plant models, sparse systems and Solution procedures; Solution methods for simultaneous modular approach.
- General Approaches for Non-Linear Systems: Conversion promotion criterion, Wegstein's method, Broyden method. Dominant eigen-value method. Examples of solving non-linear systems.
- Commercial Simulators: Use of commercial simulator as a design aid. Introduction to Aspen Plus, Hysim, Process etc. Illustrative example from process plants and nuclear power plant to demonstrate problems solving using commercial simulators.

Optimization:

- Classification of optimization problems. Necessary and sufficiency conditions for optimum, Search procedures for unconstrained optimization problems, Non - linear programme: Complex box; Reduced gradient; Penalty function; Sequential quadratic programming, Optimization using a simulator,
- CASESTUDY: Simulation and modelling of heavy water cascade, use of lumping and de-lumping strategies.Decomposition of complex, topology, rate base model versus equilibrium base model for tower internals,evaluation of transport coefficients using mass transfer with reaction models, use of analogies for evaluation of interface coefficients.

- Recent Developments: Multi-objective optimisation, Plant optimisation by Genetic Algorithms and Neural Nets.

EN 636: Reactor Control and Instrumentation and Human Machine Interface (40)

Module I

- Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.
- Control Room, Control Panels and Cabinets: Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
- Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification.

Module II

- Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, Interfaces with electrical Control gear
- C & I Cables: Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
- Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards.
- PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

Module III

- Overview of plant automation.
- Design of HMI, Soft Console versus Conventional control panels
- Guidelines for design of HMI displays
- Case study of a commercially available Professional HMI package.
- Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package.
- Practical

EN 637: Reactor Control Engineering & Instrumentation -1(15)

- Physics of Reactor Control -Revisit
- Reactor Kinetics - Point kinetic model, Reactor Response to step and ramp reactivity inputs, Stable reactor period.
- Reactor as a Control Element: Basic zero energy state space model and transfer function, Feedback loop transfer functions, Effect of temperature and voidage, Poisoning due to xenon and samarium, Fuel burn-up, Reactor system stability analysis from transfer function and state space model.
- Large Reactor Control: Modeling techniques for large reactors - modal, nodal and quasistatic methods (introduction only) Flux Tilt, Spatial instability.
- Typical Reactor Control System: BWR, PWR, PHWR and Fast reactor control RRS of a research reactor, 235 MWe PHWR and 500 MWe PHWR
- Reactor Operation: Approach to criticality, Re-start up, Operation in power range, Shutdown.
- Power Plant Control: Power plant programming - constant Tav program, constant pressure program, Boiler level and

pressure control, PHT pressure control, Bleed condenser pressure and level control, Pressurizer pressure and level control.

EN 639: Reliability Engineering (EE)(20)

Introduction: Reliability Engg Applied to C&I Systems

- Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
- Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
- Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.

Reliability Maths/Statistics

- Mathematical and statistical expressions required for reliability study.
- Types of failures in electrical, electronic and computer components
- Failure probability concept, statistical distribution models_
- Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
- Chi-square distribution and its use in confidence and risk factors
- Baye's theorem
- Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
- Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions.
- -Derivation of exponential reliability expression_
- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

Fault Tolerance and Systems Reliability:

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model
- Example from C&I system in the NPPs

QA/QC Concepts in Brief:

- QA/QC Concepts in the components, systems procurement, manufacture and

- site installation for C&I systems in the NPPs.

Environmental Qualification and Reliability Testing:

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

PSA/PRA Concepts in NPPs:

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

Additional safety concepts:

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs
- Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc.

ELECTIVE COURSES

EN 701: Advanced Computational Techniques (30)

Programming Language C++

- C: General concepts of programming, Basic data-types and variables, Arrays, Strings, Pointers, Data typecast, Operators, Simple and compound expressions, Simple and compound statements, Functions and arguments, Data scope and lifetime, Dynamic allocation of data, User defined data-types (enum, struct, union), Pre-processor directives and macros, Declaration versus definition of data and functions, Header files and C-library.
- C++: All the features of C++ not available in C, Class and objects, their members, scope and lifetime, Constructors and destructors, Function argument initialisers, Function signatures and overload, Inline functions, Operator functions, Class hierarchy and inheritance, Exception handling, Templates.

Advanced Computational Techniques

- Discretization technique using Finite Difference, Finite Volume, Finite Element, Orthogona Collocation,Meshless, Spectral Method.
- Grid Generation - Transfinite Interpolation, PDE based techniques, grid adaptation
- Artificial Neural Network- Its taxonomy, application for mapping, quantization, prediction & optimisation using Backprogation ANN .
- Optmization - Using traditional Gradient based techniques, population based GA & ACO
- Applications using above all methods to DAE related problems.

Parallel Programming

- Introduction to parallel computers, classification, technologies, ratings
- Parallel programming concepts, examples, terms and definitions,parallelism, parallel programming models
- Different examples of parallel programs and parallelization strategies
- Message Passing Interface (MPI), concepts of MPI, MPI Library calls
- MPI Point to Point communication calls
- MPI Collective communication calls

Scientific Visualization

- Geometry Classification - 2D & 3D grids.
- Structured & Unstructured grid development.
- Data storage techniques for 1D, 2D & 3D grids.
- Data visualization techniques for scalar & vector data.
- Common pitfalls in programming
- Case Studies

EN 702: Advanced Electrical Engineering Design-I I (25)

Special Electrical Machines

- Special Electrical Machines and their applications :Vector Control of PM Synchronous Servo Motor
- Variable reluctance stepper motor (VRSM), Switch reluctance motor (SRM) and Hysteresis Motor
- Materials: Soft and Permanent Magnetic Materials, their properties and applications: Pulse Transformer design, Ferrite Pulse sharpening.

Pulse Power Technology

- Breakdown in gases, Vacuum, liquid and solids
- Concepts of Pulse Power storage, Compression and switching
- High Voltage Generation and measurement
- Transmission line theory and pulse forming networks
- Non-linear pulse circuits Capacitive and inductive pulse generation
- Non-linear pulse circuits
- Special transients (NEMP, HPM, & UWB) Compact generators

EN 703: Artificial Intelligence Methods & Applications (30)

- **AI Basics**Introduction, Problem solving through search, search strategies, A* search, Heuristic functions, Robot path planning – visibility algorithm, wavefront algorithm, sub-division algorithm, probabilistic roadmap planner.
- **Automated reasoning** – propositional logic, predicate logic, resolution-refutation, Knowledge Base and Expert

Systems.

- **Genetic Algorithm (GA):** Introduction, terminology, operators and working principle, encoding and decoding of decision variables, selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling, Elitism, Real-coded Gas, Multimodal function optimization, Multiobjective optimization, Dominance and Pareto-optimality, Multiobjective Gas.
- **Artificial Neural Network (ANN)** Biological neurons and artificial neurons, types of neurons, activation functions, single layer perceptrons and linear separability, training, perceptron convergence **theorem,** Multi layer perceptrons, back propagation and related issues, speeding up backpropagation, Unsupervised clustering and classification methods, ANN applications.
- Data Mining Knowledge Discovery in Databases and Data Mining, Data Mining tasks – Association, Classification, Clustering.
- Reinforcement learning Dynamic programming, Value iteration and Policy iteration, Temporal difference method, Q-learning, ANN implementation of reinforcement learning algorithms, Applications in Robot control.

EN 705: Data Base Management System and Web Technology(30)

Advanced RDBMS

- Architecture of Oracle RDBMS (3)
- Recap of SQL language(5)
- Introduction to PostgreSQL and MySQL(3)
- Data warehousing concepts (2)
- Concepts of clusters, distributed databases, grid enabled databases, database replication(2)

Web Technologies

- Introduction to Web Technology(2)
- DHTML (3)
- CGI /PHP (4)
- Web services and XML (2)
- Ajax(1)
- Content Management Systems(1)
- Web 2.0 / Semantic Web(2)

EN 706: Digital Signal Processing and Image Processing (30)

Digital Signal Processing

- **Introduction**

Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, Convolution, Correlation, Sampling theory, Aliasing, Antialiasing filter, Quantization noise, Signal reconstruction.

- **Discrete Fourier Transform**

  Interpretation of DFT, Properties of DFT, DFT of real signals, Periodic & linear convolution and correlation using DFT.
- Fast Fourier Transform

Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, Computation of Inverse DFT using FFT algorithm, Efficient computation of the DFT of two real sequences and a 2N-point real sequence, Spectrum analysis using the FFT, Windows in spectrum analysis, Use of FFT algorithm in linear filtering and correlation.

- Digital filters

FIR and IIR filters, Design techniques for FIR and IIR filters, Realization of FIR and IIR systems, Overview of DSP processors.

- DSP Applications

  Applications of digital signal processing in nuclear and other fields.

Image Processing

- **Introduction**

  Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- **Image Enhancement**

  Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- **Image Segmentation andAnalysis**

  Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation; Boundary extraction and representation;
- **Morphological operations**

  Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy- based methods;

  Image Compression Models, Error free compression, Lossy compression, Standards;

EN 709:Fluid Power Technology (25)
Basic Fluid Power & Components

Basic principles of Hydraulics and pneumatics
- Fluid power introduction and fundamentals of fluid mechanics
- principle of pneumatics, basic definitions
- pressure – gauge, vacuum, absolute; flow
- Pressure loss, Power, torque, energy – mechanical, hydraulic etc. , power, force, speed, viscosity, hydraulic terms in fluid power, resistances, bulk modulus, Pascal's Law, law of conservation of energy
- Transmission and multiplication of force, Momentum theorem, Angular momentum theorem, continuity equation, Euler's equation of motion, Bernoulli's theorem, laws of compression, forces developed by jets on plates (curved plate, moving plate, etc.) orifice flow formula, flow measurement, pressure measurement, comparison of Pneumatics with Hydraulic power transmissions.

Hydraulic Fluids and pneumatic air
- Basic properties of hydraulic fluids and pneumatic air, compressibility, pour point, flash point, fire point,
- Desirable properties of fluid, undesirable properties of fluids,
- Types of fluid, composition of fluids, effects of additives to hydraulic fluids,
- Advantages of various types of oil.
- Advantages of oil vs. air as working fluid.

Fluid power pumps and compressors
- Function and purposes of pumps and compressors
- Classification of pumps: roto-dynamic pumps - Centrifugal pumps; positive displacement pumps - (i) Rotary pumps - external gear pump, internal gear pump, gerotor pump, sliding vane rotary pump, lobe pump, screw type rotary pump. (ii) Reciprocating piston pumps - radial piston reciprocating pump, rotating barrel type axial – piston pump, bent axis type axial - piston pump, wobble pump, simplex, duplex and triplex reciprocating pumps (iii) Pressure head and energy in pump system, pump characteristics, Types of compressors, selection of compressors and efficiency of compressors.
- Fixed displacement pumps, variable displacement pumps, pressure compensated pumps, load sensing pumps; advantages of pressure compensated and load sensing pumps.
- Advantages of various pumps, advantages of positive displacement pumps Vs. centrifugal pumps, Pump flow and pressure, Pump drive, torque, power and efficiencies – mechanical, hydraulic, volumetric, overall efficiency.

Hydraulic and Pneumatic pressure control

Pressure Control Valves, construction and working principles of relief valves- direct acting and pilot operated relief valves, counter balance valves, sequence valves, unloading valves, pressure reducing valves, Hydraulic fuse, pressure switch, Pneumatic Pressure regulating valves.

Flow control valves

Basic two way valves, non-compensated flow control valves, throttle valves, restrictor valve, needle valve, ball tip valve, check valves, control valve circuits, pressure compensated flow control valve, demand-compensated flow control, pressure, temperature-compensated, flow control valve, methods of speed regulation in pneumatics.

Directional control valves

Application of directional control valve (DCVs),, designs, construction and operation of check valves, pilot operated check valves, rotary and spool type valves, two way valves, shuttle valves, three way valves, diversion valves, four way valves, solenoid operated, control valves, operation of directional control valves, mounting interfaces, designation, type of actuation of DCVs, pneumatic direction control valves – two way, three way, four way valves, etc., solenoid operated, push button operated, lever operated pneumatic DCVs.

Actuators

Definitions, linear actuators – Hydraulic cylinders, Plunger type, , piston type, Single acting, double acting cylinders, spring return type, tandem and telescopic cylinder, construction of hydraulic cylinders, cylinder seals – piston seal, rod seal, wipes, wear pads, etc. mounting style of cylinders, Pneumatic reciprocating actuators.

Rotary actuators –motors and limited rotation rotary actuators, their types, construction, advantages, vane type single and double vane rotary actuators, rack and pinion type rotary actuators, gear motors – external and internal, gerotor motors, vane motors, Radial piston motors, non-rotating barrel type axial piston motors, advantages of hydraulic motors. Pneumatic rotary actuator, radial piston, vane, and axial piston type air motors etc.

Seals

Application and type of hydraulic and pneumatic seals, dynamic and static seals, O-rings, their advantages, O- ring face seals, O-ring radial seal, application of o-rings, installation of O-rings, O-ring failures, labyrinth seals.

Pipes, Tubes and Hoses, fittings

Definitions, designations, construction of hoses, hose end connections – permanent and reusable type, threads in hydraulic applications, BSP, NPT, UNF etc., types of connectors, definitions, adjustable, non adjustable fittings, tube fittings, type of fittings – flared and ferrule type pneumatic tubing and connections.

Accessories

Hydraulic and pneumatic filters, their applications, working principles and designs, beta ratio, absolute filtration, nominal filtration, selection of filters, heat exchangers – types, hydraulic accumulators, Reservoirs, pressure gauges, fillers, breathers, pressure switches, temperature indicators, sight glass, level indicators and switches, types of pneumatic filters, regulators, lubricators, mufflers, dryers, reservoirs etc.

Hydraulic Circuit Design

- Introduction to fluid Power Symbols, Overview of IS 7513,
- Classification of hydraulic circuits, Criteria for designing open loop hydraulic circuits, Analyzing resistive loads, overrunning loads and inertial loads, Heat generation and control.
- Flow control circuits, Pressure control circuits, Direction control & check valve circuits, Cylinder circuits, Pump circuits, Hydraulic motor circuits, Accumulator circuits, Intensifier circuits, Regeneration circuits.
- Sizing of Hydraulic circuit components :
- Reservoir.
- Heat Exchanger: Oil to air heat exchanger, Oil to water heat exchanger.
- Filters: Sizing of suction filter, return line filter, pressure line filter, Beta ratio, Necessary sizing information for filters.
- Fluid Conductors: Flow v/s Pressure drop, Pressure losses, tube/ hose sizing, Pressure rating, Hose/ Tube designation, Calculation of pressure drop in straight lines, bends, fittings etc.
- Pumps: Fixed displacement, variable displacement pumps, Design of suction side and pressure side of pump
- Hydraulic cylinders and motors.
- Accumulator: Isothermal &Adiabatic charging / discharging of accumulator. Sizing of accumulator for various applications i.e. energy storage, shock absorber etc.
- Valves sizing: Direction, pressure & flow control valves.

- Hydraulic Circuit Dynamics considerations: Bulk modulus, Spring rates, natural frequencies, Transmission line dynamics, Pulses in transmissions, Energy controls, Load energy output interaction, system stability, damping, time constant, system response, hydraulic system parameters i.e. resistance, capacitance, impedance.

Advanced Hydraulic Control Circuits

- Various pilot operated valves, construction features, operation, and advantages.
- Modular valves, Stacked type direction control valves, flow control valves, pressure control valves and

combinations.
- Electrically modulated pressure control valves, flow control valves. Pulse width modulation,
- Proportional controls, Servo controls, construction, Uses, differences, operation, advantages and disadvantages.
- Cartridge Valves: Design and construction features of cartridge valves, Types and Operation of cartridge valves, Advantages of cartridge design.
- Advanced pump controls, load sensing, pressure compensation.
- Integrated Hydraulic Circuit:Construction , Advantages of integrated hydraulic circuit, Case study of PVG32 valve, Various modules of PVG 32 valve block, Features of integrated hydraulic circuit of PVG 32, Electronic control capabilities.
- Pneumatic control circuits, proportional and servo valve, proportional and servo actuators

Water Hydraulics and Component Design
- Merits and demerits of water as working fluid, Cavitation in hydraulic components, Seals.
- Case Study-1: Differential Pressure Reducing Valve: Conceptual design and sizing
- Case Study-2: Auto Differential Pressure Control Valve - Conceptual design and sizing.
- Case Study-3: Pressure Compensated Flow Control Valve - Conceptual design and sizing.
- Case Study-4: Pilot Operated Pressure Control Valve - Conceptual design and sizing

Electronics and Instrumentation for Hydraulics:
- Current/ Voltage Sources and its measurements, Electronic components –resistance, capacitor, transistors, Opamps etc. Basic circuits for Addition multiplication, division using Opamps. Digital electronics, Logic gates.
- Analog to Digital converters (ADC) and Digital to analog controllers (DAC), Signal conditioning circuits, filters.
- Sensors-Pressure measurement, pressure switches, Position measurement, limit switches-proximity switches, Velocity measurements, Temperature measurement, temperature switches, Viscosity, density measurement, Force, torque, strain measurements.
- Controllers, Closed loop and open loop controllers, Proportional, Integral, derivative controllers and its uses and characteristics. Analog and digital controllers, comparison between digital and analog controllers. Programmable logic controllers, different I/O modules, wiring sensors to PLC. Introduction to microcontrollers, Applications, programming.
- Data Acquisition, Communication buses RS232,RS485, CAN bus, MODBUS, CANOpen bus uses and applications.

Fluid Logic & Control:
- Need for Fluid Control.
- Building Basic Elements for Control Logic (AND, OR, NOT, NAND, NOR).
- Function Implementations using Control Logic.

Experiments :
1. Tuning of PID controller in rotary actuator test facility.
2. Speed control of hydraulic motor using PLC.
3. Measurement of cleanliness level of hydraulic oil samples using particle counter.
4. Qualitative analysis of oil samples using Ferrograph.
5. Establishing position control using frictionless hydraulic linear actuator.
6. Finding characteristics of Differential Pressure Reducing Valve.
7. Finding characteristics of Auto Differential pressure control valve.
8. Finding characteristics of Pressure Compensated Flow Control Valve.
9. Finding characteristics of Pilot Operated Pressure Control Valve.
10. Study of Rexroth/Bemco oil hydraulic power pack and carrying out pressure setting, flow setting etc. in the same.
11. Experiments on ROHYTAM
12. Testing of oil hydraulic filter using filter test set-up.
13. Dismantling & assembling of various valves and actuators.

EN 710: Image Processing & Machine Vision (30)

Image Processing
- Introduction: Digital image model representation, Image sensor, Digitizer, Computer, Standard file format;
- Image Enhancement: Spatial domain methods, Frequency domain methods, 2-D Fourier Transform, Filtering, Image smoothing & sharpening, Histogram Modification, Colour image processing;
- Image Segmentation and Analysis: Detection of discontinuities, Edge linking and boundary detection, Thresholding, Segmentation;
- Boundary extraction and representation;
- Morphological operations;
- Image Restoration-PSF, Deconvolution, Restoration using inverse filtering, Wiener filtering & maximum entropy-based

methods;

- Image Compression: Models, Error free compression, Lossy compression, Standards;

Machine Vision

- Imaging model, Scene radiance and image irradiance, Reflectance model of a surface, Lambertian and specular reflectance, Photometric stereo;
- Early Vision: Low level processing for noise suppression, Segmentation by thresholding; Edge detection, Boundary representation,Mathematical Morphology;
- Intermediate Vision: Line, Circle, Ellipse and Polygon detection, Hough Transform for detection, Corner detection, The Generalized Hough Transform;
- High Level Vision: Scene interpretation;
- Texture – Statistical, Structural and Spectral approaches;
- Stereo vision and correspondence problem; Structured light; Optical flow;
- Image representation: Invariants;
- Unstructured objects: Snakes;
- Recognition & Interpretation: Patterns & pattern classes, Classifiers in general, Distance metric, Classification and recognition, Various methods of recognition & interpretation, Template matching and area correlation, Matched filtering;
- Introduction to image understanding;
- Robotic applications of machine vision, Camera calibration;

EN 711: Machine Design (25)

Principles of Machine Design:

- Objectives of machine design, general design rules, design methods
- Lightening of' parts and rational design schemes,
- Rigidity of structures, Cyclical/ Contact/ Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs.
- Introduction to inventive problem solving.

Design and Drawing Practices

- Drawing standards, selection of tolerances, fits, and positional tolerances.
- Introduction to Drawing Practices: (matter from various drafting standards),
- Introduction to CAD (including introduction to various drafting and solid modeling softwares)

Sealing Methods

- Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric 'O' rings, mechanical seals, labyrinth, valve packings.
- Methods of sealing for high and ultra high vacuum.

Special Dimensional Inspection Techniques

- Description of special dimensional inspection techniques, gaging techniques including composite and paper gauging, Advanced inspection tools including co-ordinate measuring machines and form measuring machines.

Advanced Manufacturing Techniques:

- Precision machining, super finishing, advanced manufacturing
- Micro machining.

EN 712: Material Science in Nuclear Engineering (ME) (20)

- Mechanical properties of materials and their evaluations as per ASTM or equivalent standards, tension test, hardness test, creep, fatigue (low and High cycle) and Impact toughness measurement.
- Non destructive Examination Techniques: LPT, Magnetic particles, UT, Eddy current, Neutron, Gamma ray, X- ray Radiography, etc. for welds.

Corrosion

- Basic principles, types of corrosion and their mechanism, chemical corrosion, cathodic protection of pipelines and vessels,; bio-fouling; prevention by monolithic coatings, standards, evaluation of corrosion, test methods, NACE/ASTM/IS standards

Metallurgy of steels

- Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martensitic stainless steel.
- Selection and application of advanced alloys.

Nuclear Materials

- Fabrication, properties and application of Zircaloy, Zr-Nb alloys
- Metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide) their properties and applications.

Advanced Polymeric materials and Composites

- Physical and Chemical Properties, corrosion, mechanicalproperties
- Equipment design with polymeric materials
- Fabrication principles; standards for design, fabrication and testing.

EN 713: Materials Characterisation (20)

Microscopy Techniques

- Scope of metallographic studies in materials science, Understanding image formation, resolution of a microscope, numerical aperture, magnification, depth of field and depth of focus, Important lens defects and their correction, principles of phase contrast. Bright field and dark field contrast, sample preparation, Optical microscopy, interference and polarized light microscopy, quantitative analysis using optical microscopy (inclusion analysis, size distribution etc.).
  - Optical Microscopy, Scanning electron microscopy, transmission electron microscopy, X-ray diffraction and analysis, thermal characterization, Chemical analysis by X-rays.
  - Construction and working principles of transmission electron microscopes, Image formation, resolving power, magnification, depth of focus, elementary treatment of image contrast. Bright field and dark field images, sample preparation techniques. Selected area diffraction, reciprocal lattice and Ewald sphere construction, indexing of selected area diffraction patterns, High reolution electron microscopy
  - Scanning electron microscopy: interaction of electrons with matter, construction and working principle of scanning electron microscopes. Secondary and back scattered electron microscopy, resolution depth of field and depth of focus, Other modes of operation, Applications in failure analysis, fracture surfaces etc.
  - Other microscopy techniques: Atom force microscope, scanning tunneling microscope, EBSD, Field ion microscopes.

X-Ray Diffraction and Applications

  - Properties of x-rays: continuous and characteristics x-rays, absorption, filter, production and detection of x-rays.
  - Diffraction of x-rays. Intensity of Diffracted beams - Scattering by an electron by an atom, by a unit cell, structure-factor calculations: factors to be considered in calculating the intensities.
  - Experimental methods in x-ray analysis; Laue methods, powder photographs diffractometer and spectrometer measurements.
- Applications: orientation of single crystal, crystal structures of polycrystalline materials, precise lattice parameter measurements, phase diagram, order-disorder transformation, chemical analysis, residual stress, texture, structure of polycrystalline Aggregates,

crystal size crystal perfection, crystal orientations:

Chemical Analysis (with applications in materials science).

- Basics of spatial-analytical techniques, classification of analytical techniques based on sources, requirements of samples for various technique, precautions required for thin film chemical analysis,
- Principles of energy dispersive and wave dispersive spectrometry

Basics of Analytical Transmission Electron Microscopy,

- Concept of interaction volume and its relation with atomic number and accelerating voltages, Fundamentals of different correction parameters like ZAF correction, llllcorrections
- Cliff Lorimer factor, thin film correction

Basics of SIMS, RBS and their Derivatives

- Advantages and shortcomings, concept of analytical images, different modes of analytical information, resolutions and limitations, concept of electron energy loss spectra, Zero loss, plasmon, near edge spectrum
- Fundamentals of energy filtering and its uses in life sciences
- Near edge and far edge fine spectrum and their applications in determining energy states of material at atomic level.
- Case studies for metallic bulk samples, life science samples, nano-materials

Physical and Thermal Characterization Techniques

- **Thermal expansion**: Methods and their principle, Type of Dilatometers and their application for sintering studies, Estimation of Phase diagram
- **Thermal Conductivity**: Methods and their principle, advantages and limitations of each method, data of nuclear Fuels
- **TGA/DTA/DSC**: Methods and their principle and application for estimation of properties like Melting point, Transition Temperatures, Heat Capacity, Heat of Reaction, Oxidation behavior, Measurement of (O/M) ratio ,
- **Elastic Properties**: Methods and their principle and application for estimation of different properties like Elastic Modulus, Shear Modulus, Poisons Ratio, Bulk Modulus_ application of these properties for estimation of other parameters
- **Hardness**: Different methods and their principle and application for estimation of different properties like Softening Coefficient, Intrinsic hardness, Activation Energy of creep, Indentation Creep. Estimation of Fracture toughness of ceramics by indentation method

EN 714: Membrane Technology (35)

Fundamentals and Overview of Membrane Processes: (5)

- Introduction, Membrane definition & characteristics of membrane Processes
- Merits and Demerits over conventional unit operations
- Growth Potential, Classification and description of membrane processes
- Pressure driven membrane processes (MF, UF, NF and RO)
- Electro-membrane processes (Electro-dialysis, Bipolar Electrolysis)
- Membrane processes with phase changes (Pervaporation, Membrane distillation).

Novel Membranes

- Features, transport mechanism and application areas
- Polymeric membranes, Inorganic Membranes, Nano-composite membranes, Membrane Bio-reactor, Fuel cell membranes, Membrane sensors, Ion-exchange membranes, Gas Separation membranes
- Carbon nano-tubes based membranes for water desalination and purification.

Membrane Materials, Preparation and Characterization: (10)

- Material selection
- Physico-chemical properties, Mechanical and Chemical stability, Polarity and non-polarity Molecular weight and molecular architecture
- Membrane preparation techniques- Phase-Inversion, In-situ polymerization, Track-etching, Slip-casting, Sintering
- Membrane Casting Aspects for continuous casting
- Casting parameters – its monitoring and adjustment, Types of defects and identification, Preparation chemistry of charged membranes.
- Membrane Characterization & Diagnostic Tools and Techniques
- Surface characterization -pore size, roughness, in-homogeneities, and hydrophilicity
- Bulk characterization -porosity, permeation study through flux and solute rejection.

Engineering and Design Aspects of Membrane Technology (10)

- Transport through membranes-Preferential sorption-capillary model,Solution Diffusion model, Irreversible thermodynamics model
- Derivation of basic transport equation for RO membranes

- Application of basic transport equations and solute transport parameters for predicting RO membrane performance
- Module designs and analysis – tubular, plate and frame, spiral wound and hollow-fiber, Concentration polarization and its effects on performance.
- Design Aspects of Membrane based plants
- Pretreatment considerations, Water chemistry- turbidity, alkalinity, pH, hardness, dissolved silica and residual chlorine
- Fouling and Scaling – types and control,Scaling assessment parameters (SDI, MFI)
- Materials of construction
- Process design and system design for water desalination-Cascade arrangements of modules, High pressure pumps
- Energy considerations and Energy Recovery devices -pelton wheel, turbo-charger and pressure exchanger
- Effect of operating parameters on membrane performance
- Membrane cleaning and protocols
- Trouble-shooting analysis of operating plants
- Post-treatment techniques
- Membrane autopsy, Reject disposal techniques and brine management.

Membrane Technology Applications (10)

- Techno-economics of membranedesalination plant - seawater / brackish water
- Design aspects of water recovery & recycle from spent streams including sewage Application potential and design considerations of membrane processes with regard to aqueous streams of nuclear fuel cycle
- Hybrid membrane systems, Combo systems -membrane + conventional- for separation application
- Nuclear Desalination
- Membrane based water purification systems-RO/UF application in food processing, pharmaceuticals and Bio-technology
- Fractionation & Value Recovery.
- Zero Liquid Discharge (ZLD)

EN 715: Multi-Scale Material Modeling (20)

Introduction

- Spatial and temporal hierarchy of microstructure and dynamics in materials
- Types of models: quantum mechanical, atomistic, mesoscopic, continuum
- Multiscale approaches

Short review and elements of differential equations (numerical solution)

- Differential equations in discrete and continuum simulation methods
- Ordinary differential equations for particle dynamics
- Partial differential equations, conduction/diffusion equation

Atomistic models: Molecular dynamics

- The basics of classical molecular dynamics
- Initial conditions, creating lattice structures, introducing defects
- Defining and maintaining temperature and pressure
- Boundary conditions (periodic, stochastic, conducting, non-reflecting)
- Methods for constant temperature or/and pressure simulations
- Tricks of the trade (neighbor lists, force/energy tables, potential cutoffs, etc.)

Monte Carlo methods

- The basics of Monte Carlo
- Monte Carlo integration, thermodynamic averages
- Importance sampling, Metropolis scheme
- Lattice Monte Carlo, Ising model
- Multi-state Potts models (grain coarsening, recrystallization)
- Kinetic Monte Carlo (surface processes, thin film growth)

Interatomic potentials

- Introduction, Born-Oppenheimer approximation
- Pair potentials and their limitations
- Calculation of elastic constants from potential function

- Potentials for ionic systems, ceramics
- Many-body potentials for metals
- Many-body potentials for covalently bounded systems
- Forces from "first principles"

Analysis of the simulation results

- Equilibrium properties (energy, temperature, pressure, velocity distributions)
- Structural properties (geometrical tessellation, pair correlation functions, atomic level stresses)
- Dynamic properties (diffusion, time correlation functions)

Mesoscopic methods

- Discrete dislocation dynamics
- Strain and stress fields for edge and screw dislocations in an isotropic medium
- The equation of motion in Newtonian Dislocation Dynamics
- Examples from 2D and 3D simulations
- Current problems
- Coarse-grained models

Bridging the scale gaps between different simulation levels

- Simultaneous integration of the models
- Sequential integration of the models (hierarchical approach)
- Examples of combined methods (MD-FEM, MD-MC, etc.)

Modeling at microscale

- Mechanism of ductile fracture and cleavage fracture
- Gurson constitutive law for modeling ductile damage
- Roussiler constitutive law for modeling ductile damage
- Beremin's model for cleavage fracture
- Modeling of material under transition temperature
- Case studies

EN 716: Preparedness & Response to Nuclear Emergencies (35)

- Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
- Radiation Shielding & Study of Criticality parameters and control
- Nuclear Waste Management
- Nuclear Accidents/emergencies
- Transport of Radioactive material
- Radiological accidents/emergencies
- Effects of Hiroshima & Nagasaki bombing
- Detection of Nuclear detonation
- Nuclear weapons: effect (Blast, heat, Radiation and EMP)
- Medical decontamination with demonstration
- Nuclear weapon tests (atmospheric)
- Nuclear & Radiological terrorism (Method to contain and control)
- Chemical warfare & Biological warfare (Method to contain and control it)
- Emergency Response methodology/ Philosophy
- Systems and methodology for Radiological impact assessment
- Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities
- Emergency Monitoring & Shelters
- Civil defence WEB plan for Nuclear attack on major cities
- Monitoring of High radiation field area
- Lab Visits

EN 717: Project Management (25)

- Definition of a Project, type of project, cost & schedule of Nuclear Power Projects.
- Definition of Planning, importance of planning in a Project
  - Resources of project.
  - Project Organization Chart, functions of different units of construction
- Contract packages: Types of, Tendering requirements action steps, delegation of power in a project.
- Scheduling in a project by PERT: resource requirements, resource allocation for an activity, constraints for an

activity, earliest start time EST, latest completion time LCT.
- o Scheduling in a project by critical path method, CPM
- o Scheduling in a project by Precedence Diagram Method.
- o Use of Project Management Software for project planning, scheduling & monitoring.
- o Preparation of master control management milestone network, Level-1,2, 3 & 4 network.

- Preparation of Target Plan, updating of progress, monitoring variance & reporting
  - o Constraints of project and its effective management o Development of Six Monthly Plan and its review process o Resource based planning
  - o Physical & Financial Monitoring of project, Use of S-curve
  - o Capital Budgeting & expenditure control in a project
  - o Daily, weekly & monthly progress reporting
- Verification of project data and their analysis, type of float/slack, critical path and near critical path.
- Agenda for the daily, weekly & monthly meeting, record of the meeting.
- Contingency plan.
- Construction Interface with different Units of Construction.
- Construction Management, Project Management, Project management Software Tools.
- Management Milestones, Incentive Milestones.
- Daily work plan. Target evaluation. Supervision. Target review meet. Mid course correction. ERP, ERM. Analysis methods, SWOT analysis.
- Problem Solving techniques, RCA, Activity network preparation.

EN 719: Signal Conditioning, Recovery & EMI Aspects (25)

Review of Analog Signal Conditioning & Recovery Techniques

- Conditioning raw signals from transducers, signal extraction from a common mode reference, Error budget in Signal Conditioning circuits, Recovery of Signal buried in Noise, Phase Lock Loops, Lock-in Amplifiers, Noise Equivalent circuits of Pre-amplifiers, Pulse Amplifier designs, Active Filter Design, Types ofA/D and D/A converters, nature of errors in the devices, advances in A/D and D/A technology, Sigma-Delta converters.

Theory of Quantization

- Theory of analog to digital conversion, analysis of quantization errors, theory of digital to analog conversion, application of decimation and interpolation to A/D and D/A conversion, over-sampling, design of digital anti- aliasing filters, fast algorithms for implementation.

Theory of Signal Analysis and Reconstruction

- Function space, orthogonal basis functions, Limitation of Shanon's theorem, Reconciliation by approximation in shift invariant space, generalized basis functions, analysis and reconstruction with B-spline basis, wavelet basis, bi-orthogonal wavelet (dual) basis, consistent estimate (sampling), Interpolating wavelets, perfect reconstruction with wavelets, over-sampling, multi-scale characterization from extremas in wavelet domain.

Review of EMI Aspects

- Introduction to Electro-Magnetic Interference, EMI sourcing circuits, Capacitance Coupling, Inductance Coupling, Shielding, Shielding materials for electro-static coupling & electro-magnetic coupling, Shielded Cables, Use of Twisted cable pairs, Equipment Shields, Grounding, Various grounding schemes, Schemes for Instrumentation Grounding in Reactors, Design for Electro-magnetic Compatibility, Overview of EMI Test Standards for Systems in Nuclear Installations, Testing Standards for Emissivity & Susceptance, Anechoic chambers.

EMI Modeling

- Propagation of EM waves, Antenna theory, Synthesis of Radiation Patterns, Waveguide theory, Coupling & Reflection, Reflective Surfaces, Source-term modeling, Susceptance Modeling, EM Topology.

EN 720: Software Engineering (25)

- Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work-products of different phases (1)
- Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics. CASE tools.(3)
- Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalisation, composition, polymorphism. Modeling structure and behavior.
- Use case diagrams, class diagrams, state diagrams, sequence diagrams. architectural and detailed design. Modeling real-time software. Introduction to Object Oriented languages. CASE tools.(10)
- Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities(3)
- Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods Testing principles, unit testing, integration testing, acceptance testing Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing(2)
- Software Configuration Management: Configuration items (with examples), baselines, libraries, version control. (2)
- Software engineering standards (2)

EN 721: Vibrations (25)

- Single-degree-of-Freedom (SDOF) Systems: Free vibration - equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations - underdamped, overdarnped and critically damped systems; Material and structural damping - evaluation of damping in SIDOF systems; Response to harmonic loading - complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duharnl's Integral.
    - Multi-Degree-of-Freedom (MDOF) Systems: Equations of motion - Lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations - Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
- Response of Systems To Ground Motion: Earthquake motion - Safe Shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake - Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis - Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
    - Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft - Jeff Cott rotor;

Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating rnachinary.

- Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
- Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
- Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, aperiodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, Coherence, auto and cross - Correlation and significance of these parameters; Application of vibration for condition monitoring and diagnostics; Vibration standards for acceptance.

EN 722: Safety and Reliability of Civil Engineering Structures (25)

Introduction to Probability Theory

Set theory, statistics and probability, failure and success, reliability terminology, safety and reliability, maintainability, availability, ProbabilityDistributions: continuous and discrete random variables, Binomial, Geometric, Poisson, Normal, Lognormal, Exponential, Weibull, Gumbel.

Structural Reliability

Loads and strength, concept of probability failure and structural safety, Limit State, Monte Carlo Method, simulation of random variables, Cornell Reliability Index, Mean Value First Order Second Moment Method, Hasofer Lind Reliability Index, Rackwitz Fiesseler Method, Treatment of correlated random variables, Partial Safety Factors and their estimation, system failure probability, case studies.

Probabilistic Safety Assessment

Probabilistic Seismic Hazard Assessment, Source models, Ground motion prediction models, Seismic fragility analysis of components, system analysis for seismic risk, safety assessment with respect to external events such as Tsunami & Flood

Industrial Safety

Consideration of industrial safety aspects in layout and design of buildings, fire hazard analysis, fire protection, fire prevention and firefighting, safety in handling machinery, equipment and tools, organizational aspects of industrial safety, fitness and protection of personnel.

Safety assessment of existing structures:

Health assessment of concrete and steel structures, rehabilitation and retrofitting of structures, service life prediction.

Introduction to decommissioning of structures

EN723: Welding Science and Technology (MT) (25)

- Overview of welding processes
- Cold Bonding/Solid State Bonding
- Arc Welding Processes
- BeamWelding Processes
- Arc-Beam Hybrid WeldingProcesses
- Study of welding arc characteristics
- Metal transferduringarcwelding
- Heat flow during welding
- Gas-metal and slag-metal reactions
- Weld pool solidification
- Effect of welding process parameters on themacro-andmicro-structure of weld metal
- Thermal cycles in the heat affected zone
- Phase transformations in the weld metal and the heat affected zone
- High power density processes such as laser and electron beam welding
- Welding metallurgy under high coolingrates
- Phenomena of hot-crackingand coldcracking
- Residualstresses anddistortion duringand afterwelding
- Residual stressmeasurements
- Application ofaboveprinciplesto welding ofcarbon and alloy steels, cast irons, stainless steels, aluminium and titanium alloys.

EN724: Advanced Structural Dynamics and Earthquake Engineering(CE) (30)

I. Introduction to Structural Dynamics and Earthquake Engineering

II. Performance Based Design of structures, systems and components subjected to earthquake loading

Concepts of performance bases, Seismic demand, Capacity of structures, systems and components, performance levels, energy dissipation and damping.

II. Seismic and Vibration Control

Concepts of seismic and vibration control, Passive control using Yielding dampers, friction dampers, tuned mass dampers, Tuned liquid damper, etc., Semi active and active control strategies.

III. Base Isolation Techniques

Concepts of vibration and seismic isolation, laminated rubber bearings, Lead plug bearings, Friction Isolation System etc.

V. Testing and Modal analysis

Need of testing, Methods of testing, qualification of systems by testing, data processing using FFT and Wavelets, modal analysis for frequency, mode shapes and damping. Causes and types of experimental error, statistical analysis of data.

VI. Seismic and Vibration Instrumentation

Measurement Methods and Applications: Measurement of displacement, velocity, acceleration, pressure, forces, strain and optical methods of measurements; Data Acquisition and Processing.

Types of inputs: analog and digital signals, calibration and uncertainty, Measurement System: Performance characteristics, linearity, dynamic range, sensitivity, stability, accuracy, bandwidth, noise, repeatability, hysteresis- threshold- resolution, readability and span.

VII. Fluid-structure interaction techniques

Coupling of fluid with structure, Dimensionless numbers in fluid-structure interactions, Added mass and added stiffness, Fluid sloshing, Flow induced vibration, Flow over bluffed bodies, Vortex shedding.

VIII. Multibody Dynamics

Rigid-Body Kinematics, Kinematics for General Multibody Systems, Modelling of forces in multibody systems, contact forces, friction effect, Equations of Motion of Multibody Systems.
Numerical integration methods for free standing objects, spring-mass system with friction, Runge Kutta methods, error estimation, Computer programs.

NON-SUBJECT ASSIGNMENTS

EN 591: Viva Voce

In addition to the formall assessment carried out by the mehod of written examinations, a viva voce examination is also conducted in each semester. The objective of the examination is to assess the grasp of the basic concepts in the courses covered and also to examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.

EN 592.1: Process Control Trainer (15)

This module is aimed at introducing the trainees to the Feedback Control Systems and providing them with hands-on experience on a process control trainer. It comprises a series of experiments as detailed below.

Expt 1

Introduction to typical process under control – a boiler with drum pressure as feedback parameter and fuel flow as controlled parameter.

Elements of control loop. Sensor, controller, final control element. Study of process response with P, PI and PID control.

Expt 2

Optimisation of process control - using ultimate sensitivity method.

Critical gain and critical period for the process is found by increasing controller gain till sustained sinusoidal oscillations are set with constant amplitude.

Optimum gain and integral / differential time constants are calculated using empirical formulae.

Expt 3

Feed forward control configuration - study of process response in comparison with normal feedback control.

Steam flow is used as an additional parameter to implement feedforward – feedback configuration.

Expt 4

Smart Differential Pressure transmitter.

Study the transfer characteristics – pressure v/s current output. Calibrate transmitter for a given pressure range.

Re range transmitter using HART communicator.

Re configure transmitter for linear and square root characteristics.

Expt 5

Final control element - Linear pneumatic control valve.

Study of transfer characteristics - percentage of flow rate v/s opening of valve. Discussion on types of control valve and salient specifications.

Virtual instrumentation and wireless data communication between controller and PC.

EN 592.2: Nuclear Detectors (15)

A series of experiments are carried out by the trainees to make them conversant and proficient in the handling of equipment for 'Nuclear Radiation Detection and Measurements'.

NaI(Tl) γ- Ray Scintillation Detector

This experiments imparts training on the use of NaI(Tl) detector using known γ- Ray sources (Co^{60} & Cs^{137}) , plotting of calibration curves and identification of unknown sources.

α-Particle spectroscopy using a Solid State Detector

This experiment imparts training on the use of the Solid State Detector using known α-Particle source (Th^{229}), plotting of calibration curves and determination of the thickness of a Mylar Foil using the experimental setup. **Gieger-Muller Counter**

This experiment imparts training on the use of the G-M counter using known sources, studying plateau of the G-M counter , testing counting statistics of the counter and studying absorption behaviour of β-rays emitted from Tl^{204} for finding the Half Value Layer thickness of Al.

EN 593: Mini-Project Work (300)

The 11 week Mini-Project is prescribed as an integral part of the training school curriculum. It is carried out in the third trimester on completion of the foundation and core courses. The principle objective of carrying out a Mini- Project is to provide a hands-on experience to the trainee of working in an ongoing project of the Department. If feasible, the mini project is linked to the M.Tech. Project and the future work profile of the trainee, thus providing a meaningful synergy between the training, M Tech Project and work profile of the trainee. The experience gained in formulating and executing a scientific/technical problem and the possible pathways to its solution serves as value addition to the training provided. Interactions with senior scientists/technologists during the project work provides useful insights into the methodologies of research, development and deployment adopted by the BARC scientists and technologists.

The trainee compiles a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee of the work carried out. The Mini-Project carries a weightage of 300 Marks, 225 being awarded by the expert committee and 75 by the guide.). Project runs on a part time basis for 11 weeks from mid May to Mid July.

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity

2 **Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor

3 **Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors

4 **Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation

5 **Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions

6 **Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization

B BASIC REACTOR PHYSICS-STATIC

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety
Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down
Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
7. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

   Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. **Thermal Power Reactors :**

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. **Fast Power Reactors :**

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flowmeter: Electromagnetic pumps and flowmeter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6.	Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7.	Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Code Design for Pressure Vessel & Piping (ME1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3
11.	Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , ‘Pressure vessel design’ CBS publication
2. Brownell. L. E & Young. E. D , ‘Process equipment design’, Wiley Eastern Ltd., India

3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Finite Element Method (ME8) (30 hours)

S.No.	Course content
1.	Introduction to FEM as applied to solid mechanics. Energy principles in structural mechanics and principles of minimum potential energy
2.	Element Shape and Shape Functions: Generalised co-ordinates. General requirements of shape functions; Lagrangian and Hermitian interpolation functions – CO, C1 continuity; Natural coordinate system; Derivation of shape functions for Bar, Beam, Plane, Brick and Plate elements.
3.	Bar Element: Derivation of elemental stiffness matrix and load vector; Transformation from element to global coordinate system; Assembly of Global stiffness matrix and load vector; Solution of typical 2D-plane Truss problems to evaluate Displacements and Member forces/stress; Thermal stress evaluation in Bars/Truss.
4.	Beam Element: Derivation of elemental stiffness matrix and load vector; Solution of simple Beam problems to evaluate Deflections/rotations; BM/SF distribution and determination of stresses, Shear deformation in beams. Curved Beam Element: Derivation of elemental stiffness matrix and load vector; Derivation of stiffness matrix for elbow.
5.	Axisymmetric Thin Shell Element: Strain-displacement and stress-strain relationship; Derivation of stiffness matrix and load vector for 2 noded axisymmetric thin shell element. 2D Plane Elements – 3 Noded Triangular Element: Derivation of elemental stiffness matrix and load vector, Plane Stress/Plane Strain & Axisymmetric elements: Evaluation of Strain/Stress.
6.	2D Isoparametric Element – 4, 8 and 12 noded quadrilateral Element: mapping of parent element to global space; Jacobian matrix; necessary and sufficient conditions for existence of inverse of Jacobian; Derivation of stiffness matrix for plane & axisymmetric elements; Evaluation of strain/stress at Gauss points.
7.	Introduction and Application of 3D Elements: Strain displacement and stress-strain relationship; Tetrahedron, Triangular prism and Hexahedron elements.
8.	Plane Bending Elements: Thin and Thick plate theory; Elements based on Kirchoff's Theory; Elements based on Mindlin Theory; Shear locking and Reduced Integration.
9.	Shell Element: Strain-displacement and stress-strain relationship; Flat plate and curved shell elements; 4 and 8 noded degenerated thick shell Elements, basic assumptions, degree of freedom, shape functions and shear locking.
10.	Incompatible Displacement Model: Bending deficiency in the linear strain quadrilateral element; Incompatible quadrilateral element.
11.	Introduction to Nonlinear Problems. Meshing and Errors: Finite Element Modeling and Discritization Criterion, Adaptive meshing, classification of FEM stresses per ASME code, sources of potential error in the finite element solution

Books Suggested:

1.Finite Element Procedures-K.J.Bathe, Prentice Hall, 1996.
2.Concepts and Applications of Finite Element Analysis, R.D.Cook,D.S.Malkus & M.E.Plesha, 4th Ed., Prentice-Hall India, 2003.
3.An introduction to the Finite Element Method-J.N.Reddy, 2nd Ed., McGraw Hill Education (ISE editions)-1993.
4.Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.1, Butterworths-Heinemann,2000.
5. Finite Element Method-O.C.Zienkiewicz & R.L.Taylor, 5th Ed., Vol.2, Butterworths-Heinemann,2000.

6.The Finite Element Methods: its basics and fundamentals- O.C.Zienkiewicz ,R.L.Taylor &J.Z.Hu, Elsevier,2005.
7.The Finite Element Method: Linear,Static and Dynamic Finite Element analysis-T.J.R.Hughes, Dover Publication,2000.
8.Fundamentals Finite Element Analysis and Applications-M.Ashghar Bhatti, John-Wiley & Sons, NJ,2005.

3. Advanced Heat and Mass Transfer (ME10) (30 hours)

S.No.	Course content
1.	**Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes & Bemoulli equations.
2.	**Laminar Boundary Layer and Forced Convective Heat:** Formulation of differential equation for hydrodynamic and thermal boundary layer. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory. Convective heat transfer for intemal and extemal flows. Low and high Prandtl number limits and different thermal boundary conditions Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method.
3.	**Turbulent Flow and Heat Transfer:** Reynolds decomposition for turbulence**.** Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical. correlations for calculating heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy
4.	**Turbulence Modeling:** Eddy diffusivity models: k-£ and k-w) models, RNG based k- £ model. Reynolds stress models: algebraic & differential models. Low Reynolds number models Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models
5.	**Natural Convection:** Basic Equations of natural convection. Boussinesq approximation. Derivation of Dimensionless groups from basic equations. Analytical approximations
6.	**Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Moment, porosity, permeability etc.., homogenization method, continuity equation & energy equation, introduction to 2 phase flows & heat transfer in fluid flows.
7.	**Heat Transfer With Phase Change** : Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post dryout heat transfer. Various models available for calculation of heat transfer coefficient.. Critical Flow. Models for single - phase and two-phase critical flow.
8.	**Radiation heat transfer:** Radiation heat transfer. Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies.

Books suggested:
1. Fox. J. A, Introduction to Engineering Fluid Mechanics, New York, Mc Graw Hill, 1974
2. Frank M White, Fluid Mechanics, 5th Edition, Boca Raton, CRC Press, 2000.

3. Cengel Y.A, Introduction to Thermodynamics and Heat Transfer, New York, Mc Graw Hill, 1997.
4. Frank P. Incropera, David P. DeWitt, Fundamentals of Heat and Mass Transfer, 5th Edition, New York, John Wiley & Sons, 1996
5. Adrian Bejan, Convection Heat Transfer, New York, John Wiley & Sons, 2004.
6. Wilcox. D.C, Turbulence Modeling for CFD, California, Dcw Industries, 1993.
7. Pope S.B, Turbulent Flows, Cambridge, Cambridge University Press, 2000.
8. Stephan K, Heat Transfer In Condensation Boiling, Berlin, Springer Verlag, 1992.
9. Tong. L.S, Boiling Heat Transfer And Two Phase Flow, New York, John Wiley & Sons, 1966.
10. P.B. Whalley, Two-Phase Flow and Heat Transfer, Oxford Press, 2005.
11. Hetsroni G, Handbook of Multiphase Systems, Washington, Hemisphere, 1982.
12. Hewitt. G.F, Process Heat Transfer, Boca Raton, CRC Press, 1994.
13. Collier. J.G, Convective Boiling and Condensation, London, Mc Graw Hill, 1972.

4. Computational Fluid Dynamics (ME6) (30 hours)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme
B.	**Numerical Solution of Complete Fluid Flow and Energy Equation:**
1.	Formulations of governing equations used in numerical simulation:
2.	Stream function-temperature formulation
3.	Stream function-vorticity-temperature formulation
4.	Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5.	Primitive-Variable (P-V-T) formulation
6.	Pressure velocity coupling for incompressible flow.
7.	Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8.	Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9.	Simple grid generation techniques for structured grid:
10.	Elliptic. parabolic and hyperbolic equation method
11.	Grid adaptation
12.	Domain decompositions in CFD and heat transfer
13.	SIP and preconditioned conjugate gradient methods for solution

14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.

15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.

16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Books suggested:

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

5. Reliability Engineering (ME13) (20 hours)

S.No.	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.
2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.
4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.\
5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.
6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.
7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987
8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.
9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY.

6. Manufacturing Technology (ME14) (40 hours)

S.No. **Course content**

Curriculum for Metal Forming

1. **Uniaxial tensile test**:
   a. Engineering stress, engineering stain, true stress, true strain;
   b. Extraction of plastic stress-plastic strain data from load – elongation data of uniaxial tensile tests; Hollomon type and Voce type constitutive relations;
   c. Tensile instability and significance of strain harkening exponent;
   d. Determination of strain rate sensitivity index and the significance of strain rate sensitivity;
2. Stress matrix and the derivation of the Cauchy relation from the law of conservation of linear momentum; concept of principal stress;
3. Small strain matrix and rotation matrix obtained from the displacement functions;
4. **Elements of the theory of plasticity**:
   a. Decomposition of stress matrix to hydrostatic and deviatoric matrices;
   b. Yield surfaces as a function of the second and third invariants of the deviatoric matrix with von Mises and Tresca criteria being examples; concept of equivalent stess;
   c. Normality flow rule and convexity of the yield surface; concept of equivalent strain

Curriculum for Materials Joining

1. **Welding Processes**
   a. Fusion Welding Processes: Arc Welding Processes like SMAW, GTAW, GMSE, GVSE etc. and Beam welding process like EB welding and Laser Welding
   b. Solid state Welding Process like Friction Welding, Friction Stir Welding, Diffusion bonding, Explosive welding
   c. Resistance Welding Processes
2. **Thermal Cycle during welding**
   a. Weld Thermal Cycle, Dependence of bead shape with welding speed, prediction of weld thermal cycle
3. **Residual Stress and Distortion**
   a. Generation of residual stress, Effect of residual stress on performance, removal of residual stresses, measurement of residual stresses
   b. Origin of Distortion, Control of distortion

7. High Temperature Design & Inelastic Analysis ME4: (25 hours)

S.No. **Course content**

1. Introduction: Modes of failure, material selection, criteria to assess creep effect, creep law, creep-fatigue interaction, thermal striping
2. Design Practice: Loading category, primary, secondary and peak stress intensity, allowable stress intensity (S_m), assessment of basic wall thickness, strain limits

3. Analysis: strain range under multi axial state of stress, Nuber’s rule, triaxiality, elastic followup, fatigue damage, allowable numbers of cycle, creep damage, creep life prediction, creep rupture strength, creep fatigue interaction, ratcheting, efficiency diagrams and creep buckling
4. Fracture mechanics, creep crack growth, introduction to RCC-MR A16
5. In elastic Analysis: General principles for constitutive models, non unified model (plastic + creep), flow rule, creep strain hardening, classified models, viscoplastic material model, non-linear kinematic hardening, isotropic hardening, plastic strain memory, finite element Implementation, automatic time integration

Books Suggested:

1.Creep Analysis – H.Krauss
2.Mechanical Metallurgy-G.E. Dieter
3.Creep in Structures-A.R.S.Ponder and Drkhayhurst
4.Advances in Creep Design-Ed.A.I.Smith and A.M.Nickelson
5.ASME Section3 Subsection NH-1
6.French Design Code-RCCMR-Subsection RB

SPECIALISED/ELECTIVE COURSES

1. Machine Design (25 hours)

S.No.	Course content
1.	Principles of Machine Design: Objectives of machine design, general design rules, design methods, variable loads, Lightening of parts and rational design schemes, Rigidity of structures, Cyclical/Contact/Thermal strengthening, Surface finish, special machine elements bearings. Expansion bellows and springs. Introduction to inventive problem solving.
2.	Design and Drawing Practices: Drawing standards, selection of tolerances, fits, and positional tolerances. Introduction to Drawing Practices: (matter from various drafting standards), Introduction to CAD (including introduction to various drafting and solid modelling softwares)
3.	Sealing Methods: Static, dynamic, metallic and non-metallic seals, pipe threads, seal materials and their selection, elastomeric `O’ rings, mechanical seals, labyrinth, valve packings. Methods of sealing for high and ultra high vacuum.
4.	Special Dimensional Inspection Techniques: Description of special dimensional inspection techniques, gauging techniques including composite and paper gauging, advanced inspection tools including co-ordinate measuring machines and form measuring machines.
5.	Advanced Manufacturing Techniques: Precision machining, super finishing, advanced manufacturing, Micro machining.

Books suggested:

1) Mechanical engineering design (In SI Units) - Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2) Design Of Machine Elements Edition 7 - Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3) Machine Elements in Mechanical Design - Mott (R L), Columbus, Charles E Merril, 1985.
4) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.

5) Mechanical Engineering Design (In SI Units) – Joseph E Shigley & Charles R. Mischke, New Delhi, Tata Mcgraw Hill, 2001.
6) Design of Machine Elements - Ed. 7 – Spoots M F, Shoup T E, New Jersey, Prentice Hall 1998
7) Machine Elements in Mechanical Desgin – Moot R L, Columbus, Charles E Merril, 1985.
8) Design of machine elements – V B Bhandari, Tata Mcgraw Hill.
9) Fundamentals of machine design – Oriov, Mir Publishers, Moscow.
10) Fluid power applications – Anthony Esposito, Pearson education
11) Precision engineering manufacturing – Murthy R.L., New Age International
12) MEMS and Microsystems design and manufacture – Tai-Ram Hsu, Tata McGraw Hill.

2. Structural Integrity Assessment Methods and NDE (ME3) (30 hours)

S.No.	Course content
1.	Fracture Mechanism in Metals
2.	Linear Elastic Fracture Mechanics
3.	Elastic Plastic Fracture Mechanics
4.	Low Cycle Fatigue
5.	Assessment of Creep damage and creep-fatigue interaction
6.	Creep crack growth models
7.	Experimental determination of fatigue and creep curve CTOD, KIC, KIa, J-R curve and C*
8.	Basis of ASME Sec. XI Reference Curve and its use in Pressurised Thermal Shock
9.	CTOD design method
10.	J-Estimation Schemes and J-based failure assessment diagram
11.	Net Section Collapse Criteria and Reference Stress approach
12.	R-6 method and its application
13.	Thermal background of international assessment procedure
14.	RCCMR code/A-16 method and its application
15.	CEGB codes
16.	Application of R-5/R-6 for design of high temperature components
17.	Failure Assessment Diagram of PD-6493 and BS-7910
18.	J-Estimation Schemes and J-based failure assessment diagram
19.	Leak-Before-Break design method
20.	Analysis of numerical techniques/Computational fatigue, Fracture and creep
21.	Probabilistic Fatigue, Fracture and creep
22.	Bench Mark solutions
23.	Manufacturing and process-induced defects that influence structural integrity -
24.	Principles, capabilities and applications of surface examination NDE techniques
25.	Principles, capabilities and applications of volumetric examination NDE techniques
26.	Quality assurance of nuclear components with relevant codes and standards and quality concepts
27.	Structural integrity, in-service inspection and life assessment of nuclear components using NDE
28.	NDE Lab visit and Practicals

Books Suggested:

1. Practical Non-destructive testing- Baldev Raj, Jayakumar.T. and Thavasimuthu. M., Narosa publishing house, New Delhi, 1997
2. Advances in NDE for structural integrity, - Nichols. R.W., Applied Science Publishers, London, 1982.
3. Non destructive Evaluation: A tool in Design, Manufacturing and Service and Francis – Don E.Bray and Roderick K. Stanley, Taylor, CRC Press, New york, 1996.
4. Non-destructive testing, R. Halmshaw, Edward Arnold, 1991.
5. Electrical and Magnetic Methods for Non-destructive testing, - J. Bllitz, Adam Hilger, Bristol, 1997.
6. Ultrasonic testing of materials, - Josef Krautkramer, Herbert Krautkramer, Springer-Verlag. January 1983.

3. Vibration Engineering and Condition Monitoring (20 hours)

S.No.	Course content
1.	Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2.	Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3.	Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; Aseismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4.	Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5.	Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6.	Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.
7.	Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum,

coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

4. Seismic Design of Nuclear Reactors and Facilities (ME5) (20 hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson’s ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
7.	**Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.

Books Suggested:

1. Chopra, A.K., "Dynamics of Structures, Theory and applications to Earthquake Engineering", Pearson Education Inc., 2003.
2. Ray W.Clough and Joseph Penzien, Dynamics of Structures", New York, McGraw-Hill Book Company.
3. Mariopaz, "Structural Dynamic (Theory and Computation)", CBS Publishers and Distributors, Delhi.
4. Bathe, K.J., and Wilson, E.L., "Numerical Methods in Finite Element Analysis", Englewood, N.J., Prentice-Hall.
5. ASCE 4-98, "Seismic Analysis of Safety Related Nuclear Structures and Commentary", ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, "Engineering Seismology", IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, "Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, "Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites". AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design", BIS, New Delhi.

5. Plant Dynamics (20 hours)

S.No.	Course content
1.	**Pressure drop** in fuel Subassembly, friction, local acceleration and elevation pressure drop in wire-wrap. Flow zoning
2.	**Hot spot factors**: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors. Subchannel analysis of fuel subassemblies, mixing parameters, introduction to computer codes.

3. **Event analysis**: General safety features, General Considerations on Design Basis Events, Thermal and Hydraulic Modeling for Analysis, Safety Criteria, Design Criteria for Selection of SCRAM Parameters, Sympathetic Safety Actions, Primary Sodium Flow Halving Time, Maximum Permissible Absorber Rod Speed.

4. **Results of Analysis of Major DBE:** One Primary Sodium Pump Acceleration, Both Primary Sodium Pumps Acceleration, One Secondary Sodium Pump Acceleration, Both Secondary Sodium Pumps Acceleration, Feed water Flow Increase Events, Continuous Withdrawal of One CSR, One Primary Sodium Pump Trip, One Primary Sodium Pump Seizure, Off-Site Power Failure with Emergency Backup for PSP, Primary Pipe Rupture, One Secondary Sodium Pump Trip, One Secondary Sodium Pump Seizure, One Boiler Feed Pump Trip, Loss of Feed Water Flow to Steam Generator, Intermediate Heat Exchanger Sleeve Valve Closure, Loss of Heating in High Pressure Feed water Heaters, Spurious SCRAM. Reactor start-up, BFP Trip and over speeding at full power, Turbine Generator -Trip and subsequent plant operating actions, power setback.

5. **Decay Heat Removal:** Decay Heat Removal through OGDHRS, Decay Heat Removal through SGDHRS, Need for Forced Convection Core Flow, Decay Heat Removal during Station Blackout Situation, Adequacy of SGDHRS Capacity.

6. **Energy Release In Beyond Design Basis Events:** Local Events: Subassembly Accident, Whole Core Events: Pre – disassembly Phase, Disassembly Phase, Mechanical Energy Release / System Response Phase, Analysis of Transient Over Power Accident, Computer Codes, Analysis of Loss of Flow Accident (LOFA), Sodium Void Worth, Consequences of Fuel - Coolant Interaction

Books Suggested:
Material will be provided during the course

6. Experimental Mechanics (20 hours)

S.No.	Course content
1.	Stress & Strain: State of stress, strain, plane stress, plane strain, Thermal stress, Hydrostatic & Deviatoric Component of stress, Elastic stress-strain relationship, Elastic-Plastic strain relations, Von-mises plasticity criteria, plastic flow rule, strain hardening law, perfectly plastic material, Isotropic strain hardening material, kinematic strain hardening, combined strain hardening stress concentration, cyclic stress, Fatigue, Endurance limit, Creep, Larson Miller parameter.
2.	Photo elasticity: Polarisation, polariscope, diffused light and lense polariscope, stress optics law, plane polariscope, circular polariscope, criteria for model material selection, Isochromatic fringe pattern, Iso fringe pattern, scaling model to prototype stress.
3.	3D photo elasticity: locking of model deformations, scaling model and interpretation of the resulting fringe pattern, effective stresses, Birefringent coating, scattered light and its relation to photo elasticity, scattered light polariscope.
4.	Strain measurement methods: strain gage, basic characteristics, types of strain gages, factors in gage selection, electrical resistance strain gage, potentiometer for strain measurement, strain gage circuit, wheat stone bridge

5. Recording Instrument: galvanometer with oscillograph, transient response galvanometer, frequency response of the wheatstone bridge and galvanometer, cathode ray oscilloscope and potentiometer recorder.

Books Suggested:

1.Mechanical engineering design (In SI Units)', Joseph E Shigley & Charles R Mischke, New Delhi, Tata Mcgraw Hill, 2001.
2.Design Of Machine Elements Edition 7, Spoots (M F), Shoup (T E), New Jersey, Prentice Hall, 1998.
3.Machine Elements In Mechanical Design, Mott (R L), Columbus, Charles E Merril, 1985.
4.Experimental methods for engineers- J.P.Holman, McGraw Hill.
5.Theories of engineering experimentation-Hilbert Schenck, McGraw Hill.

7. Process Control & Instrumentation (Co-ordinator: A. Venkatesan) (20 hours)

S.No.	Course content
1.	Basic Concepts
2.	Units of measurements, Definitions (accuracy, precision, repeatability, span, range, hysterisis, drift, sensitivity, resolution, lag etc.) -- Sensors, transducers, Transmitters, PI diagrams, Symbols., Digital and analog devices.
3.	Sensing, Transmission, Receiving of the following Process Variables
4.	Temperature: classification, thermocouples, RTD, Thermistors, Pyrometers.
5.	Flow: Direct type, inferential type, constant area sensors, differential pressure meters, variable area meters, magnetic, ultrasonic, vortex type flow meters, and mass flow meters.
6.	Level: Direct type (Float, gauge glass, torque tube, piston tube, reflex etc) indirect type (Pressure gauge, purge, d/p with open/closed tanks, Ultrasonic, nucleonic, capacitance & conductivity).
7.	Pressure: Manometers, Bourdon, bellows, diaphragms, D/P Tx, (electronic & pneumatic), strain gauges, load cells.
8.	Analytical: pH, viscosity, conductivity, humidity, isotopic purity, and turbidity.
9.	Control System: Feedback Control theory, Modes of control, generation of control modes, Controllers, feedback & feed forward control, final control elements and valve positioners.
10.	Safety principles: Trip logic, annunciators, simple logic circuits, and smoke/fire detectors.
11.	Current Trends In Instrumentation: Smart transmitters, Instrumentation for a process loop, Paperless recorders, DAS, PLC, DRS, etc.

Books Suggested:

1. Instrument Technology Vol. I to V E.B. Jones.
2. Mechanical & Industrial Measurements, R.K. Jain
3. Automotive Process Control, Donald P. Eckman
4. Measurement Systems Application & Design, Ernest Doebelin.
5. Process Instrument & Control Handbook, Douglas Considine.
6. Instrument Engineers Handbook, Vol. I&II, Dela G. Liptak
7. Instrumentation for Process Measurement & Control, N.A. Anderson

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
ELECTRONICS AND INSTRUMENTATION ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
Total		**230**	**25**

CORE ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
EL2	Reactor Control Engineering	20	2
EL3	Nuclear Instrumentation	20	2
EL4	Reliability Engineering	20	2
EL5	Software Engineering	20	2
EL8	Human Machine Interface for Reactor Control Instrumentation	45	6
EL10	Modern Control of Dynamic Systems	30	4
Total		**155**	**18**

SPECIALISED COURSES

Course Code	Course Name	Hours	Credits
EL6	Artificial Intelligence and Digital Signal Processing	40	4
EL7	Process Instrumentation	35	4
EL9	Embedded and Computer based systems Design	45	6
EL11	Analytical Instrumentation	25	2
Total		**145**	**16**

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-002-P	Project	Duration : 9 Weeks	
2.	02ENGG04-002-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers B-splines, Bezier curves, Response surface method, different levels of factorial design.

Book suggested

8. Davis, H. T. and Thompson, K., Linear Algebra and Linear Operators in Engineering: with Applications in Mathematica, Academic Press, 2000.
9. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
10. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
11. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
12. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).

13. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
14. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

Sl.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

13. Introduction to Materials Science for Engineers - James Shackelford
14. Physical Metallurgy Principles & Practice - V.Raghavan
15. Introduction to Solids - L.V.Azaroff
16. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
17. Materials in Nuclear Application - C.K.Gupta
18. Nuclear Chemical Engineering - Benedict and Pigford
19. Physical Metallurgy, Reed - Hill
20. Heat treatment of steel - Avener
21. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
22. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
23. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
24. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Fast Reactor Physics and Shielding (RP) (35 hours)

S.No.	Course content
A	NUCLEAR THEORY BASICS :
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick’s law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units
2	**Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

8. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
9. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
10. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
11. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
12. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
13. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
14. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics and Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

13. Introduction to Health Physics – Herman Cember
14. Introduction to Radiation Protection – Alan Martin
15. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
16. Nuclear Radiation Detection - W.J. Price
17. Radiation Detection and Measurement - G.F. Knoll
18. Biological Effects of Radiation – J.E. Coggle
19. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
20. Atoms, Radiation and Radiation Protection by James E. Turner 1986
21. Problems and solutions in Radiation Protection by James E. Turner, 1988
22. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
23. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
24. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) – (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :**
	Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR’s, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D **Sodium Technology (NRST)**

1 **Properties of Sodium:** Physical and chemical properties, (hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

11. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
12. Steam Power Station, G.A. Gassort.
13. Power Plant Engineering & Economics, Strosal & Vapet.
14. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
15. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
16. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
17. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
18. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
19. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
20. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.
B.	**Coolant circuits**
1.	Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2.	Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3.	Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4.	Design criteria, Loadings to be considered, Analysis method and validation methodology
5.	Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Reactor Control Engineering (EL2) (20 hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (EL3) (20 hours)

S.No.	Course content
1.	Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2.	Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3.	Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4.	Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5.	Introduction to various reactor instrumentation and radiation monitors:
6.	Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (EL4) (20 hours)

S.No.	Course content
12.	**Introduction: Reliability Engg. Applied to C&I Systems** Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors. Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems. Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
13.	**Reliability Maths/Statistics:** • Mathematical and statistical expressions required for reliability study. • Types of failures in electrical, electronic and computer components • Failure probability concept, statistical distribution models_ • Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions • Chi-square distribution and its use in confidence and risk factors • Baye’s theorem • Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software. • Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions. • Derivation of exponential reliability expression_ • R(t)=[exp-(lt)] for electronic components and systems. • Examples to solve

14. **Fault Tolerance and Systems Reliability:**

- Fault tolerance concept for electronic and Computer based C&I systems.
- Circuit hardware redundancy concept to enhance system reliability, types of redundancy_
- Series, parallel, active, passive, and voting redundancy
- Redundancy and other fault tolerance methods for software
- FMEA, FMECA concepts for C&I and Examples to solve
- Concepts for the analysis of System Reliability, availability, and maintainability.
- System reliability and availability analysis methods:
- Boolean logic
- Digraph, cutest-tie set method
- Fault tree model, and consideration of CCF, CMF, software errors
- Markov Model

Example from C&I system in the NPPs

15. **QA/QC Concepts in Brief:**

- QA/QC Concepts in the components, systems procurement, manufacture and
- Site installation for C&I systems in the NPPs.

16. **Environmental Qualification and Reliability Testing:**

- Environmental qualification, testing of the C&I systems.
- Effects of various environments on the electrical/ electronic components
- Climatic Qualification tests: Temperature, Humidity
- Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
- Reliability Testing of the electronic components, equipment and C&I systems.
- Reliability screening tests for electronic components
- Accelerated environmental tests
- Failure terminated and time terminated tests
- Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
- Few examples to solve

17. **PSA/PRA Concepts in NPPs:**

- Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs.
- Explain Event Tree
- Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency.
- Level-1, Level-2, Level-3 PSA studies (Brief introduction only).

18. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ. (1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants (2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment (1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher (2001), (‘Formal Methods’ has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Software Engineering (EL5) (20 hours)

S.No.	Course content
1.	Introduction: Importance of software engineering, software characteristics, life cycle and models, phases, processes, work- products of different phases
2.	Analysis and Design I: Data models, Functional modeling, structured analysis and design, design attributes and metrics, CASE tools.
3.	Analysis and Design II: Object oriented methods, Unified Modeling Language (UML), notion of objects, classes, attributes, methods, interfaces, associations, generalization, composition, polymorphism. Modeling structure and behavior, Use case diagrams, class diagrams, state diagrams, sequence diagrams, architectural and detailed design., Modeling real-time software. Introduction to Object Oriented Languages. CASE tools.
4.	Software Quality Assurance: Quality attributes, metrics, reliability, SQA activities.
5.	Verification and Validation: Reviews, inspection and walk-through, Static analysis, formal methods. Testing principles, unit testing, Integration testing, acceptance testing., Unit testing: black box testing, white box testing – coverage criteria, Equivalence class partitioning, boundary value testing.
6.	Software Configuration Management: Configuration items (with examples), baselines, libraries, version control
7.	Software Engineering Standards

Books suggested:
1. Software Engineering by Roger S. Pressman, McGraw Hill International Students Edition
2. Software Engineering by Ian Sommerville, 5th Edition, Addison Wesley
3. An Integrated Approach to Software Engg. by P. Jalote, Springer/Narosa Publishers
4. Unified Modeling Language User Guide by G. Booch, J. Rumbaugh, I. Jacobson, Addison Wesley
5. Real-time UML, second edition, Bruce P. Douglass, Addison Wesley

5. Human Machine Interface for Reactor Control Instrumentation (EL8) (45hours)

S.No.	Course content
A .	**Reactor Instrumentation:**
1.	Instrumentation for design of Reactor Regulating System and Reactor Protection System: Introduction to Reactor Protection System and Reactor Regulating System: Elements in RPS/RRS, from sensor to Reactor Protection/Control Devices, Design Principles, Typical list of Reactor Trip parameters, Seismic qualification, Class-1E qualification, EMI/EMC qualification
2.	RPS & RRS for FBRs : Core Temperature Monitoring System, Diversified Safety Logics, Control Logics for CSRDM & DSRDM
3.	Supervision Systems : Startup systems, Discordance supervision systems for SCRAM signals & CSRs, Alarm Generation system, ESR & PDA
4.	Component Handling Systems: I & C for Rotatable plugs, Transfer Arm, IFTM, CTM, Under Water Trolley and Storage Bays, HMI in HCR for Component handling and fuel movement monitoring.
5.	Relay & Control Interlock Logic Circuits: Relay Terminology and general application: Criteria for relay selection, Pickup, hold and dropout voltage, Contact type and arrangement, Contact protection, latched relay, Electromechanical versus Solid-State Relay characteristics and comparison. Typical control logic circuits for control of process equipments, low selector, high selector, median selector, voting logics, Interfaces with electrical Control gear.
6.	C & I Cables : Types of cables, Conductor materials, insulating materials, Sheath materials, Shielding, armouring, FRLS and Fire Survival cable, mineral insulated cables, cable sizing, noise reduction, cable layout, cable trays, panel wires, conductor identification, Cable Testing, wiring practices.
7.	Incident monitoring & mitigation systems : RCB Isolation, I&C for SGDHR, Seismic Instrumentation, Post Accident monitoring system, Video monitoring system
8.	Special systems: Fire Alarm System, Physical protection systems, Biometric Sensors, etc.
9.	Distributed Control System (DCS) and Computer Based Systems: Distributed Process Control, DCS configurations, Components of DCS, Data Highways, Human machine interface, Operator Stations, Presentation of information on operator station, DDCS for PFBR. Programmable Controllers (PLC) - Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, relevant communication protocol and standards, PLCs for package systems.
10.	PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.

11. Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.

B. Human Machine Interface (HMI)

1. Overview of plant automation.
2. Design of HMI, Soft Console versus Conventional control panels.
3. Guidelines for design of HMI displays.
4. Case study of a commercially available Professional HMI package.
5. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package
6. Practical.

Books suggested:

1. Intellution Ifix documentation
2. NPC Guidelines for development of soft consoles.

6. Modern Control of Dynamic Systems (EL10) (30 hours)

S.No.	Course content
1.	**1.** State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	**.** Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	**.** Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

SPECIALISED COURSES

1. Artificial Intelligence & DSP (EL6) (40 hours)

S.No.	Course content
	A. Introduction to Artificial Intelligence
1.	Introduction – Nature of AI problems
2.	Search – State space search
3.	Robotics – Kinematics and dynamics
4.	Knowledge Representation – Predicate logic
5.	Neural Networks – Feed forward vs Feedback
6.	Fuzzy Logic – membership functions
7.	Reinforcement Learning – Intelligent agents
8.	Genetic Algorithm – Solution representation
9.	Engineering applications including in Robotics
	B. Digital Signal Processing
1.	Introduction: Basic elements of a digital signal processing system, Fourier series and Fourier transform, z-transform, convolution, correlation, sampling theory, aliasing, anti-aliasing filter, quantization noise, signal reconstruction.
2.	Discrete Fourier Transform: Interpretation of DFT, properties of DFT, DFT of real signals, periodic & linear convolution and correlation using DFT.
3.	Fast Fourier Transform: Efficient computation of DFT using decimation-in-time and decimation-in-frequency algorithms, computation of Inverse DFT using FFT algorithm, efficient computation of the DFT of two real sequences and a 2N-point real sequence,

spectrum analysis using the FFT, windows in spectrum analysis, use of FFT algorithm in linear filtering and correlation.

4. Digital filters: FIR and IIR filters, design techniques for FIR and IIR filters, realization of FIR and IIR systems, overview of DSP processors.
5. DSP Applications: Applications of digital signal processing in nuclear and other fields.

Books suggested:

1.Johnny R. Johnson, Introduction to Digital Signal Processing, Prentice- Hall of India,2000.
2.John G. Proakis and Dimitris G. Manolakis, Digital Signal Processing- Principles, Algorithms and Applications, Prentice- Hall of India,1995.
3.Allan V. Oppenheim and Ronal W. Schafer, Digital Signal Processing, Prentice- Hall of India,1988.

2. Embedded & Computer based systems Design (EL9) (45 hours)

S.No.	Course content
A.	**Microprocessor Based Hardware Design:**
1.	Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16 bit Micro-controllers (e.g. 80196), DSPs (e.g. TMS320, SHARC family) and ARM processor.
2.	Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3.	Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play.
4.	Design Case Study: Single board computer architectures, circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.
5.	IO board design, bus interface (ISA, PCI), FIFO and shared memory interfaces, Analog and Discrete IO interfacing, signal conditioning, isolation and protection issues, testability.
6.	Embedded computer system design example.
B.	**Computer Communication and Networks**
	Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Field bus standards, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.)

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.

2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Real-Time System Design

1. Real-time system concepts, Timeliness Vs speed, hard Vs soft real time systems, scheduling methods, concurrency, process and thread concepts, inter process communication and synchronisation, Case study of Real Time Operating Systems, development tools, real time programming, device drivers. Validation and performance evaluation of Real-time systems.

2. Overview of LINUX and Embedded NT.

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons
7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek & R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.

3. Process Instrumentation (EL7) (35 hours)

S.No.	Course content
7.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors,

flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.

8. Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors -performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques.

   Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.

9. Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

10. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

11. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

12. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type-Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

    Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

13. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

    Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

14. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

    Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

15. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication
3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrment Engineer’s Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Fieldbus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

4. Analytical Instrumentation (EL11) (25 hours)

S.No.	Course content
	Measurement related issues
1.	Sensitivity, detection limit, signal-to-noise ratio enhancement
2.	Absorption and Emission Spectroscopy
3.	UV-VIS-IR Spectrophotometry
4.	Atomic Absorption Spectrophotometry
	IR absorption methods for detection of Carbon, Sulphur, Oxygen, Nitrogen
5.	**Fluorescence Spectrometry**
6.	Generation of X-Rays
7.	X-Ray Fluorescence Spectrometry
8.	X-Ray Diffraction Spectrometry
9.	Laser florescence
10.	**Mass Spectrometry**
	Applications and importance of mass spectrometry
	Various types of ion sources
	Various types of mass analysers
	Various methods of detection
	Computer based automation and measurements
11.	**Thermo analytical methods**
	Thermal analysers-DTA and TG
	Differential Scanning Calorimeters
12.	**Electro analytical instruments**
	Voltametry, amperometry and Coulometry
	Conductivity and pH

Books Suggested:

1. Instrumental methods of analysis, - Willard & Others, Pub: CBS, New Delhi, 7th Ed.
2. Principles of instrumental analysis, - Douglas A.Skoog and James J. Leary, Saunders College Publishing, Harcourt Brace College Publishers. (IGCAR Acc. No. 063944)

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
CHEMICAL ENGINEERING

NUCLEAR ENGINEERING
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
NR	Nuclear Reactors	50	6
EM	Engineering Mathematics	35	4
MM	Materials and Metallurgy	25	2
RP	Fast Reactor Physics and Shielding	35	4
RE	Reactor Engineering	40	4
HP	Health Physics and Radiological Safety	25	3
PM	Project Management	20	2
	Total	**230**	**25**

CORE ENGINEERING (CHEMICAL)
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE1	Nuclear Chemical Engineering	35	4
CE2	Chemical Engineering Thermodynamics	40	4
CE3	Transport Phenomena	40	4
CE4	Multi Phase Flow Systems	40	4
CE5	Code Design for Pressure Vessels and Piping	25	2
CE6	Computational Fluid Dynamics and Heat Transfer	40	4
CE7	Advanced Chemical Reaction Engineering	25	2
	Total	**245**	**24**

SPECIALISED COURSE
(All subjects are Compulsory)

Course Code	Course Name	Hours	Credits
CE8	Process Analysis and Control	25	2
CE9	Advanced Mass Transfer	25	2
	Total	**50**	**4**

ELECTIVE COURSES
(One course amongst the three to be chosen)

Course Code	Course Name	Hours	credits
CEEL	Preparedness &Response to Nuclear Emergencies	30	4
	Artificial Intelligence Methods &Applications	30	4
	Membrane/ Separation Process and Technology	30	4

PROJECT /SEMINAR

	Course Code	Course Name		
1.	02ENGG04-003-P	Project	Duration : 9 Weeks	
2.	02ENGG04-003-S	Seminar -1,2,3		
		Total		12

NUCLEAR ENGINEERING

1. Engineering Mathematics (EM) (35 hours)

Sl.No.	Course content
1	Computer arithmetic and errors . Types of errors, error estimates and its propagation, Data analysis : Difference tables, Interpolation methods of Lagrange and Hermite, Chebyshev polynomials and Pade's approximation with rational functions. Numerical differentiation of interpolating polynomials. Numerical Integration : Trapezoidal, Monte-Carlo and Gaussian Quadrature methods Solution of algebric and transcendental equations, Newton-Raphson method, Graffe's root squaring method; Data approximation by method of least square, curve fitting
2	Linear vector space and subspaces, Basis, Gram-Schmidt orthogonalization, Linear system of equations: LU decomposition, Cholesky factorization and Gauss-Jordan technique. Iterative techniques using the methods of Jacobi, Gauss-Seidel and over relaxation. Convergence criteria and error estimation. Matrix inverse, Ill conditioned and sparse matrices. Bilinear forms, Principal axes transformation and eigen values, Determination of eigen values and eigen vectors. LU and QR algorithms, Singular matrices and singular value decomposition.
3	Ordinary differential equations, Different types of differential equations, Lipschitz theorem and conditions for existence and uniqueness of solutions, Numerical methods for solving differential equations. Method of Euler, Adams and Runge Kutta, Predictor corrector method, Solving stiff equations
4	Probability and Statistics:Probability and Random variables, Binomial, Poisson and Normal distributions, Moments of a distribution, Counting experiments Estimation of model parameters, Confidence intervals, Testing of hypotheses, Goodness of fit, Chi-square test.
5	Integral Transforms: Laplace transform, Linearity of LT, LT of derivatives and integrals, Solution of differential equations using LT, Response of electric circuits, Response of damped oscillator to a square wave, Differentiation and integration of LT.Periodic functions, Fourier series representation of functions, Even and odd functions, Determination of coefficients, Fourier integrals. Data compression, Hauffman coding and wavelet transforms.
6	Partial Differential Equations, Finite difference method in one and two dimensions, Solution of steady and transient heat conduction and diffusion equations.
7	Finite element method, Energy Theorem and integral equations, Weighted residual approximations, Point and subdomain collocation. Galerkin method, Variational principles and Lagrange multipliers. B-splines,Bezier curves, Response surface method, different levels of factorial design.

16. Chapra, S.C. and Canale, R.P., Numerical Methods for Engineers, McGraw-Hill, 1985.
17. R. L. Burden and J. D. Faires, Numerical Analysis, 6th ed., PWS-Kent Publishing, 1997.
18. Krishnamurthy, E. V., Computer based numerical algorithms, East West Press, 1976
19. Gupta, S.K., Numerical methods for Engineers, Wiley (1995).
20. Press, W.H.; Teukolsky, S.A., Vetterling, W.T. and Flannery, B.P., Numerical Recipes in Fortran (or C), Cambridge University Press (1992).
21. Scarborough, J. B. Numerical Mathematical Analysis, Oxford and IBH Publishers, 1968

2. Materials and Metallurgy (MM) (25 hours)

S.No.	Course content
9.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
10.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
11.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
12.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
13.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
14.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
15.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
16.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

25. Introduction to Materials Science for Engineers - James Shackelford
26. Physical Metallurgy Principles & Practice - V.Raghavan
27. Introduction to Solids - L.V.Azaroff
28. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
29. Materials in Nuclear Application - C.K.Gupta
30. Nuclear Chemical Engineering - Benedict and Pigford
31. Physical Metallurgy, Reed - Hill
32. Heat treatment of steel - Avener
33. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
34. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
35. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
36. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

3. Introduction to Fast Reactor Physics (RP) (35 hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect
	Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	BASIC REACTOR PHYSICS-STATIC
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance
2	**Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor
3	**Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor
C	TIME DEPENDENCE
1	**Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

15. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
16. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
17. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
18. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
19. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
20. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc.
21. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press.

4. Health Physics & Radiological Safety (HP) (25 hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors. Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection.
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)

5. **Radiation Protection procedures:**

Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.

6. **Nuclear Accidents, Emergency Preparedness and Management:**

Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.

7. **Radiological aspects and Environmental Impact of FBRs**

Radiological aspects of Fuel Cycle Facilities

8. **Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996,ndustrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

25. Introduction to Health Physics – Herman Cember
26. Introduction to Radiation Protection – Alan Martin
27. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
28. Nuclear Radiation Detection - W.J. Price
29. Radiation Detection and Measurement - G.F. Knoll
30. Biological Effects of Radiation – J.E. Coggle
31. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
32. Atoms, Radiation and Radiation Protection by James E. Turner 1986
33. Problems and solutions in Radiation Protection by James E. Turner, 1988
34. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
35. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
36. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

5. Nuclear Reactors (NR) (50 hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:**
	Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.

B. Thermal Power Reactors :

Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR

C. Fast Power Reactors :

1 Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.

2 Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.

3 Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.

4 Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.

5 Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.

D Sodium Technology

1 **Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals

2 **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.

Impurities in Sodium, Purification Methods: Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors)

Sodium System: Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control

Sodium Pumps and flow meter: Electromagnetic pumps and flow meter for sodium systems

Electrical Systems for Sodium Loops: Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

21. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
22. Steam Power Station, G.A. Gassort.
23. Power Plant Engineering & Economics, Strosal & Vapet.
24. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
25. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
26. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
27. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
28. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
29. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
30. Material for Sodium Technology portion will be provided during the course.

6. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.

9. Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.

10. Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.

11. Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.

12. Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements

2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.

3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types

4. Design criteria, Loadings to be considered, Analysis method and validation methodology

5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.

6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features

7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

CORE ENGINEERING

1. Nuclear Chemical Engineering (CE1) (30 Hours)

S.No.	Course content
1.	**An Introduction to Nuclear Chemical Engineering** General Introduction and course schematics
2.	**Production of Nuclear Materials** Production of nuclear fuels (i.e.)uranium, thorium and zirconium form ores. Alternate sources for uranium Isotope separation technologies for uranium and water Fuel fabrication technologies for various types of reactors Less common nuclear materials like Zr, Hf, Th, Be,V, Nb and Ta
3.	**Solvent Extraction of Nuclear Materials** Introduction to archival extractants and flowsheets Science and technology of primary extractant (TBP) Alternate extractants for fuel reprocessing applications Extractants for nuclear waste management applications Classical and novel nuclear solvent extraction equipment Criticality and its prevention. Other safety aspects
4.	**Nuclear Fuel Reprocessing** PUREX, Advanced PUREX, SuperPUREX processes Reprocessing of thermal reactor (PHWR and AHWR) Fuels Reprocessing of fast reactor (FBTR & PFBR) Fuels UREX process and its variants Supercritical Fluid Extraction based Superdirex Process Pyrochemical and other non-aqueous processes for reprocessing
5.	**Nuclear Waste Management** Characterization of nuclear wastes Conditioning and remediation. Post-PUREX and Post-UREX processes for isolation of important radionuclides (TRUEX, UNEX, ARTIST, SETFICS, SESAME etc.) Decontamination and decommissioning
6.	**Modeling and Simulation in Nuclear Chemical Engineering** Generation of SX data by conventional & **AKUFVE** techniques Modeling of solvent extraction data Computer codes for simulation of nuclear SX Simulation of solvent extraction process flowsheets Experimental design based variation analysis of flowsheets

Books Suggested:

1. Benedict M., Pigford T.H. and Lewi H. Nuclear Chemical Engineering, McGraw Hill. 2nd ed. (1981)
2. Long, J.T. , Engineering for Nuclear Fuel Reprocessing, American Nuclear Society, IL (1978)

3. Schulz. W.W, Navratil, J.D. and Talbot A.E., Science and Technology of Tributyl Phosphate, Vol.1, CRC Press Inc., Boca Raton, FL (1984)
4. Schulz. W.W, Burger, L.L.,Navratil, J.D. and Bender K.P., Science and Technology of Tributyl Phosphate, Vol.3, CRC Press Inc., Boca Raton, FL (1984)
5. Knief, R.A. Nuclear Energy Technology, Hemisphere Publishing corporation, NY, (1981)
6. Vilani, J., Isotope Separation, (IGCAR library)
7. Selected IGCAR Reports Concurrent literature on AFCI, UREX and allied processes

2. Chemical Engineering Thermodynamics (CE2) (30 Hours)

S.No.	Course content
1.	Classical thermodynamics - the scope of classical thermodynamics, basic concepts and definitions. Laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures.
3.	Multicomponent systems: the chemical potential, fugacity, activities, and activity coefficients.
4.	Solubilities of gases in liquids, solids in gases and in liquids.
5.	Vapour liquid equilibria at low and high pressure. (Van Laar, Peng-Robinson equations). Thermodynamics of super critical fluid
6.	Liquid-Liquid equilibria.
7.	Models for Non ideal, Non-electrolyte solutions and ionic liquids.
8.	Solution thermodynamics
9.	Phase Equilibrium: Phase rule, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations, Equilibrium in systems with supercritical components, phase stability applications.
10.	Chemical Reaction Equilibria: Equilibrium constants for Homogeneous and heterogeneous reactions.
11.	Statistical Thermodynamics

Books Suggested:

1.Denbigh, K. G., The Principles of Chemical Equilibrium, Cambridge, 1971.

2.Tester, J. W. and Modell, M., Thermodynamics and its Applications, 3rd ed., Prentice-Hall, 1997.

3.Bejan, A., Advanced Engineering Thermodynamics, Wiley, 1988.

3. Transport Phenomena (CE3) (40 Hours)

S.No.	Course content
1.	Phenomenological description of continuum approach. Reynolds transport theorem. Basic laws of conservation of mass, momentum and Energy and Multicomponent systems.

2. Transport properties. Modeling of Engg systems and the specification of boundary conditions. Shell balances, Navier-Stokes equations; Momentum, Heat and Mass transfer in steady and unsteady viscous flows; turbulent flows; shell and differential thermal energy balances; steady and unsteady conduction; laminar, forced and natural convection; shell and energy balances of mass of species; diffusion under various driving forces, diffusion with chemical reaction; convective diffusion in dilute solutions; integral balances. Transport coefficient and the macroscopic treatment of momentum, Energy and mass transport in complex system.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Multi-phase flow systems (CE4) (30 Hours)

S.No.	Course content
1.	Multiphase flows and Classification of Multiphase, Flow Patterns (gas-liquid, liquid-liquid and gas-solid and gas-liquid-solid) - flow pattern and flow regime map with and without phase change. One-dimensional models for continuity, momentum and energy transfer for different models: Multi-dimensional and flow regime specific models.
2.	Hydrodynamics of Gas-liquid flow, Homogeneous flow model. Separated flow model. Drift flux model. One-dimensional waves and their applications, Bubble formation and dynamics. Mass bubbling and liquid entrainment. (Gas-liquid mixture transport in horizontal and vertical pipe.), vapour-liquid flow, flow boiling, sub-cooled boiling, critical heat flux.
3.	Applications of two-phase flow in the design of steam generators, thermo-syphon evaporators, condensers with non condensibles and air lift pumps. Hydrodynamic of liquid-liquid flow design variables such as holdup, characteristic velocity and pressure drop.
4.	Hydrodynamics of solid-liquid flow, homogenous and heterogeneous flow. Design equations for hydraulic transportation. (Liquid-solid mixture transport in pipe: flow pattern, accelerating length, velocity profile and pressure drop for turbulent slurry flow.)
5.	The phenomena of fluidization and its industrial application. Characteristics of particles. Principle of fluidization and mapping of various regimes. Two phase theory of fluidization. Bubbles in fluidized bed. Entrainment and Elutriation. Fast fluidized bed. Mixing, segregation and gas dispersion. Heat and mass transfer in fluidized bed. Solid-liquid fluidized bed and three phase fluidized bed. Design of fluidized bed reactors

Books suggested:

1. Wallis, G.B. - " One Dimensional Two phase flow", McGraw Hill Book Co., New York, 1969.
2. Govier, G.W. and K.Aziz., - " The flow of Complex Mixtures in Pipes ", Van Nostrand Reinhold Co., New York, 1972.
3. Brodkey, R.S. - " The Phenomena of Fluid Motions ", Addison - Wesley Publishing Co., New York, 1967.
4. Gad Hestsroni, (Ed.in Chief) - " Handbook of Multi Phase Systems ", Hemisphere Publishing Corporation, Washington and McGraw-Hill Book Company London, 1982.
5. Two-phase flow in pipe lines and heat exchangers – D.Chisholm, Longman Inc, NewYork.
6. Fluidization Engineering- Author: Daizo Kunni and Octave Levenspiel, Butterworth-Heinemann
7. Fluidized bed technology in Materials Processing**, -**Author: C. K. Gupta and D. Sathiyamoorthy, CRC Press.
8. Chemical Reaction Engineering, - Octave Levenspiel,Wiley Eastern Limited.
9. Handbook of separation techniques for Chemical Engineers, - Philip A. Schweitzer,: McGraw- Hill

5. Code Design for Pressure Vessels & Piping (CE5) (25 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. Derivation of ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc.

6. Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel and B 31.3 Code.

7. Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.

8. Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, Buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.

9. Derivation of TEMA Design equation for tube sheets. Background of the ASME design rules for tube sheets.

10. Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Non-destructive examination of welds as per ASME Sec.VIII, Div.1 code. Difference between Sec. VIII Div.1 & Div.2.

Books suggested:

1. Harvey J F , 'Pressure vessel design' CBS publication
2. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
3. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
4. American standard code for pressure piping , B 31.1
5. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

6. Computational Fluid Dynamics & Heat Transfer (CE6 & CE610) (40 Hours)

Syllabus for CE6 : Computational Fluid Dynamics (30 hrs.)

S.No.	Course content
A.	**Basics of Fluid Flow, Heat Transfer and Numerical Analysis:**
1.	Kinematics of fluid flow. Streamline, streakline and pathline; streamfunction, vorticity and deformation of a fluid element.
2.	Basic equations governing heat conduction, fluid flow and mass transfer (viz. the continuity', momentum and energy' equations) with special reference to Navier-Stokes and Bemoulli equations.
3.	Classification of Partial Differential Equations (PDEs)
4.	Discretization of conduction equation with Dirichlet, Neumann and periodic boundary conditions, by ADI and TDMA methods.
5.	Temporal integration: explicit, implicit scheme
6.	Discretization of convection, upwinding, Streamline-Upwind Petrev Galerkin method.
7.	Discretization of convection-diffusion problem: exponential scheme, power-law scheme

B. Numerical Solution of Complete Fluid Flow and Energy Equation:

1. Formulations of governing equations used in numerical simulation:
2. Streamfunction-temperature formulation
3. Stream function-vorticity-temperature formulation
4. Velocity-vorticity-temperature formulation: Poission, Cauchy-Riemaim and Biot-Savart form
5. Primitive-Variable (P-V-T) formulation
6. Pressure velocity coupling for incompressible flow.
7. Staggered, Non-Staggered Grid (momentum interpolation, pressure-weighted interpolation)
8. Discussion on MAC, PISO, SIMPLE and SIMPLEN family of Methods
9. Simple grid generation techniques for structured grid:
10. Elliptic. parabolic and hyperbolic equation method
11. Grid adaptation
12. Domain decompositions in CFD and heat transfer
13. SIP and preconditioned conjugate gradient methods for solution
14. Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method for laminar and forced convective boundary layer problems.
15. Numerical solution of approximate equations for natural convective heat transfer problems including porous medium.
16. Mathematical formulation and numerical solution of compressible flows and heat transfer.

Syllabus for CE610 : Heat Transfer (10 hrs.)

C. Laminar Boundary Layer and Forced Convective Heat:

1. Formulation of differential equation for hydrodynamic and thermal boundary layer
2. Different analytical method of reduction of boundary layer equations and theoretical formulation of boundary layer thickness.
3. Study of jets and inlet flow and flow separation in the light of Boundary Layer Theory
4. Convective heat transfer for internal and external flows
5. Low and high Prandtl number limits and different thermal boundary conditions
Numerical Solution of Reduced Boundary Layer Equations: BVP, Keller box method

D. Turbulent Flow and Heat Transfer:

Reynolds decomposition for turbulence
Prandtl's mixing length theory, Mixing length models
Structure of turbulent boundary layer over flat plate and through circular cylinder
Calculation of friction factor and drag coefficient
Analytical and semi-analytical correlations for calculating heat transfer coefficients
Analogy between heat and momentum transfer
Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy

Turbulence Modeling:
Eddy diffusivity models: k-ε and k-ω) models, RNG based k- ε model
Reynolds stress models: algebraic and differential models
Low Reynolds number models
Large eddy simulation: Smagorinsky and Dynamic sub-grid scale models

E. Natural Convection:

Basic Equations of natural convection
Boussinesq approximation
Derivation of Dimensionless groups from basic equations
Analytical approximations
Numerical solution of approximate equations

F. Reactor Heat Transfer:

Pressure drop in rod cluster fuel element friction, local acceleration and elevation pressure drop in wire-wrap & grid spacers; effect of creep and bundle misalignment on PHWR bundle pressure drop. Flow orificing objectives & methods; effect of orificing in BWR.

Hot spot factors: Classification, basic statistical relationship, determination of subfactors, multiplicative & statistical methods of combining subfactors.

Subchannel analysis of rod cluster mixing mechanisms, mixing parameters, introduction to computer codes.

low loops: Determination of operating point during forced and natural circulation; Loss of flow accident; Decay heat generation and flow coast down in primary loop. Transition to thermosyphon cooling; steady state theory of thermosyphon loops. Transient and stability behaviour of the thermosyphon loops.

Loss of coolant Accident; Events during blow down, description of emergency core cooling system; flooding and sputtering.

Radiation heat transfer: Introduction; Reflection, absorption, transmission and emission; concept of black and grey body; total emissive power and Stefan-Boltzmann constant. Kirchoff's law. Radiation heat transfer between two bodies: shape factor & law of reciprocity; radiation heat transfer between two grey bodies

G. Heat Transfer With Phase Change :

Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows.

Basic equations of two phase flow; Homogenous & separated flow models for two hase flow; void fraction & phase velocity ratio (Zivi's model)

Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling (b) flow boiling: Heat transfer correlation for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation)

Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling.

Critical heat flux: Various models of critical heat flux, CHFR, MCHFR. Critical power concept.
Post dryout heat transfer: Various models available for calculation of heat transfer coefficient.
Critical Flow: Models for single – phase and two-phase critical flow.

Books suggested:

1. Knudsen, J.G. and Katz, D.L. (1958): Fluid Dynamics and Heal Transfer, McGraw-Hill: NY.
2. Bird. R.B., Stewart, W.E. and Lightfoot, E.N. (1960): Transport Phenomena, John Wiley & Sons: NY.
3. Schhchting, S. (1979): Boundary' Layer Theory, 7* ed., McGraw-Hill : NY.

4. Tennekes, H. and Lumley, J.L. (1972): A First Course in Turbulence, MIT Press: Cambridge.

22. Turek, S. (1999): Efficient Solvers for Incompressible Flow Problems, Springer-Verlag.
23. Wesseling, P. (1992): An Introduction lo Multigrid Methods. Wiley : NY.
24. Wagner, S. (1995): CFD on Parallel Systems, Friedrich Wieweg & Sons.

7. Advanced Chemical Reaction Engineering (CE7) (30 Hours)

S.No.	Course content
1.	Stoichiometry rates and thermodynamics of chemical reactions. Influence of concentration and temperature. Reaction mechanism. Generalized balance equation for reactive systems.

2. Collection and analysis of rate data: differential method, Integral method, Graphical method, polynomial fit method, Methods of initial rates, Methods of excess, Methods of half life. Kinetics of homogeneous and heterogeneous reactions.

3. Conservation equations for chemically reacting mixtures; heterogeneous catalytic reactions.

4. Chemical reactions and processes of transport: external diffusion effects on heterogeneous reactions, diffusion and reaction in porous catalysts.

5. Design and analysis of chemical reactors: Isothermal and non-isothermal reacting systems, catalytic and non-catalytic reactions systems.

6. Uniqueness and multiplicity of steady states, stability analysis.
Non-ideal reactors: distributions of residence time for chemical reactors, models for non-ideal reactors.

7. Modeling of multiphase reactors: fixed, fluidized, trickle bed, slurry etc.

Books Suggested:

1. Aris R., Elementary Chemical Reactor Analysis, Prentice-Hall 1969.
2. Foggler, H. S., Elements of Chemical Reaction Engineering, Prentice Hall of India, 1994.
3. Froment G.F. and Bischoff K.B., Chemical Reactor Analysis and Design, John Wiley, 1994.
4. Smith J.M. - " Chemical Engineering Kinetics ", McGraw-Hill, 1981.

SPECIALISED COURSES

1. Process Analysis and Control (CE8) (25 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.
2.	Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3.	Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.

4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

2. Advanced Mass Transfer (CE9) (25 Hours)

S.No.	Course content
1.	Theories of mass transfer with and without chemical reaction-with examples from gas-liquid, liquid-liquid, and liquid-solid systems; Rate based approaches for design. Film, Penetration & Surface Renewal models, Solvent extraction theory
2.	Selection and design of contacting equipment in nuclear chemical industries-Spray, packed and tray columns trickle bed reactors. Extraction equipment: mixer settlers, centrifugal contactors, pulsed extractors, hollow fibre extractors. Adsorption and ion exchange equipment.
3.	Membrane separation and other advanced mass transfer processes. Process intensification approaches. (few hours for seminar by TSO’s).

Books suggested:

1. Transport phenomena in liquid extraction – G.S. Laddha and T.E. Degaleesan. McGraw Hill, 1978.
2. Separation process principles – J.d. Seader, Ernest J.Henley. John Wiley & Sons. 2nd Ed. 2005.
3. Mass transfer – Thomas K.Sher wood, Robert L.Pigford, Charles R. Wilkey. McGraw hill.
4. Mass transfer operations - Robert E. Treybal. Mcgraw-hill (1980)
5. Handbook of solvent extraction – The. C. Lo. Malcolm, H.I. Baird, Carl Hanson (editor), Krieger Pub. Co. Reprint edition (Feb 1991).

ELECTIVE COURSES

1. Preparedness & Response to Nuclear Emergencies (CE-EL) (30 Hours)

S.No.	Course content
1.	Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment
2.	Radiation Shielding & Study of Criticality parameters and control
3.	Nuclear Waste Management
4.	Nuclear Accidents/emergencies
5.	Transport of Radioactive material
6.	Radiological accidents/emergencies
7.	Effects of Hiroshima & Nagasaki bombing
8.	Detection of Nuclear detonation

9. Nuclear weapons: effect (Blast, heat, Radiation and EMP)

10. Medical decontamination with demonstration

11. Nuclear weapon tests (atmospheric)

12. Nuclear & Radiological terrorism (Method to contain and control)

13. Chemical warfare & Biological warfare (Method to contain and control it)

14. Emergency Response methodology/ Philosophy

15. Systems and methodology for Radiological impact assessment

16. Emergency Response Centres (Requirement in terms of instruments, manpower and communication facilities

17. Emergency Monitoring & Shelters

18. Nuclear Fuel Cycle, Reprocessing of Plutonium & Uranium enrichment

19. Civil defence WEB plan for Nuclear attack on major cities

20. Monitoring of High radiation field area

21. Lab Visits

Books suggested:

Material will be provided during the course.

2. Artificial Intelligence Methods & Applications (30 hours)

S.No.	Course content
1.	**Robotics** Forward and Inverse kinematics, Jacobians, Manipulator Dynamics, Trajectory generation, Sensors, Manipulator Control, Force control, Path planning, Mapping & Localisation of Mobile robots, Behavior based control, Robot learning.
2.	**Genetic Algorithm** Introduction to GA and its terminology, GA operators and working principle of GAs. Different selection mechanisms, selection pressure vs. population diversity, premature convergence, fitness scaling and elitism. Constraint handling. Multimodal function optimization. Application of GAs, real-coded GAs. Multiobjective optimization, difference with single objective optimization, concept of Dominance and Pareto-optimality. Multiobjective GAs.
3.	**Fuzzy Logic** Introduction;Need, Historical Development and Perspective of applications. Crisp and Fuzzy Sets, Operations on fuzzy Sets. Fuzzy Arithmetic, Fuzzy relations, Fuzzy logic. Possibility Theory and Uncertainty Based information. Construction of Fuzzy Sets (with examples), Approximate Reasoning.

Applications; Pattern Recognition and Process Control (with examples).

Books Suggested:
Material will be provided during the course.

3. Membrane/Separation Processes and Technology (30 hours)

S.No.	Course content
1.	Type of membranes and membrane processes
2.	Membrane transport theory – solution, diffusion model
3.	Membrane and modules
4.	Concentration polarization – boundary layer film model – concentration polarization in liquid separation processes
5.	Reverse osmosis – membranes and materials, RO membrane categories, membrane modules, fouling control and cleaning
6.	Ultra-filtration – characterization of UF, membrane fouling and cleaning – modules and system design
7.	Other membrane processes – microfiltration, nanofiltration, pervaporation and electrodialysis
8.	Application of membranes in water and wastewater treatment
9.	Application of membranes in radioactive waste management

Book suggested:

1. Membrane Technology and Applications (2nd edition) by Richards W. Baker
2. Membrane Filtration Handbook – Practical Tips and Hints (2nd edition) by Jorgen Wagner
3. Application of Membrane Technologies for Liquid Radioactive Waste Processing – IAEA Technical Report Series No. 431.

BARC Training School at IGCAR Campus
SYLLABUS SUMMARY
Materials Science

Course Code	Course Name	Hours	Credits
MS1	Engineering Mathematics	35	4
MS2	Computational Methods	30	4
MS3	Materials and Metallurgy	25	3
MS4	Reactor Physics and Fuel Design	30	4
MS5	Health Physics	25	2
MS6	Metallurgical Thermodynamics	30	4
MS7	Experimental Methods for Materials Research	45	6
MS8	Structural Materials for Nuclear Reactors	45	6
MS9	NDE Science and Technology	30	4
MS10	Physical Metallurgy	45	6
MS11	Fuel Cycle Physics and Introduction to Fuel Cycle	30	4
MS12	Introduction to Materials Science and Engineering	45	6
MS13	Corrosion Science and Engineering	30	4
MS14	Mechanical Behavior of Engineering Materials	30	4
MS15	Manufacturing Technology	30	4
Total		**505**	**65**

1. Computational Methods (MS2 -45 hours)

S.No	Course content
1.	**Programming:** Introduction to programming with C# as the reference language (C# software will be provided for practice), Getting familiarized with Matlab
2.	**Numerical Techniques:** Overview of standard numerical techniques with wpecial emphasis on statistics and solving ordinary and partial differential equations
3.	**Optimization:** Overview of techniques with special emphasis on non-linear optimi9zation using gradient descent, conjugate gradient and genetic algorithm
4.	**Neural network for predictive applications:** Overview of various neural network architectures, Multilayer perceptron model for prediction, need for neuro-fuzzy models
5.	**Atomistic modeling:** Introduction to Monte-Carlo Simulation, Basics of molecular dynamics, prediction of thermo-physical properties by molecular dynamics, computational challenges
6.	**Introduction to application of FEM:**Introduction to FEM and its application, demonstration of few simple application using Abaqus (FEM software)
7.	**Current status in modeling and simulation:** With respect to mechanical metallurgy

Books Suggested:

1. Sams Teach Yourself C# in 21 Days, B.L. Jones, SAMS publications
2. Numarical Recipes in C++: The art of scientific computing, *W.H. Press et al*, Cambridge University Press
3. Numerical Mathematical Analysis *J.B. Scarborough, MacMillan Publishers*
4. Genetic algorithms in search, optimization and machine learning, *D.E. Goldberg, Addison Wesley*
5. Guide to neural computing applications, *L. Tarassenko, Arnold publishers*
6. Monte Carlo Basics, *K.P.N. Murthy, ISRP publishers*
7. Molecular Dynamics Simulation by *J.M. Haile, John Wiley and sons*

2. Fast Reactor Physics and Fuel Design (MS4/CH8- 30 hours)

S.No.	Course content
1.	**Basic Nuclear Physics Concepts:** Properties of nuclei. Nuclear forces, Nuclear models. Nuclear decay, Liquid drop model and nuclear stability, Nuclear reactions including fission, Compound nucleus formation, Microscopic cross-section, Partial and total cross-sections.
2.	**Basics Neutron Physics Concepts:** Introduction to physics of fission process. Definition of flux current and sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures.
3.	**Chain Reaction:** four factor formula; definitions of k-infinity, k-effective w.r.t. neutron balance equation (with diffusion approximation); boundary conditions; definition of reactivity; criticality.
4.	**Homogeneous Reactor:** Space dependence of neutron flux. Flux shape in different geometries, Slab/cylinder/spherical reactor, Geometric and material, buckling. Diffusion length, reflected slab, reflector saving. Heterogeneous reactors; typical examples.

5. **Reactor Kinetics:**Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, Inhour formula, one group delayed neutrons, one dollar of reactivity, Prompt and delayed criticality. Feed back coefficients.

Books Suggested:

1. The Elements of Nuclear Reactor Theory, Samuel Glasstone and M.C. Edlund. Van Nostrand, 1952.
2. Introducation to Nuclear Reactor Theory, Lamarsh J.R., ANS, 2002
3. Physics of Nuclear Reactors, Jakeman D., English Universities Press, 1966.
4. A.E. Walter and A.B. Reynolds, "Fast Breeder Reactors", Pergamon Press, 1981.

3. Metallurgical Thermodynamics(MS6- 30 hours)

S.No.	Course Content
1.	**Classical thermodynamics -** the scope of classical thermodynamics, basic concepts and definitions. First and second laws of thermodynamics and its applications.
2.	Thermodynamic Properties of pure substances and mixtures. The chemical potential, fugacity, activities, and activity coefficients, Phase rule
3.	Solubilities of gases in liquids, and solids
4.	**Solution thermodynamics**: Integral and Partial Molar Thermodynamic Properties, Solution Models, Ideal Solution, Regular Solution, Real Solutions
5.	**Phase Equilibrium and Stability**: Phase equilibria in multicomponent systems, phase diagrams, the differential approach for phase equilibrium relationships, pressure-temperature relations,
6.	**Chemical Reaction Equilibria**: Equilibrium constants for Homogeneous and heterogeneous reactions.
7.	Graphical Representation of Thermodynamic Information, Ellingham Diagrams, Predominance Area Diagrams, Pourbaix Ellingham Diagrams, Phase Diagrams,
8.	**Experimental Methods**: Methods for Determining Thermodynamic Properties, Presentation of Thermodynamic Data, Examples of Calculations.

Books Suggested:

1.D. Gaskell, Materials Thermodynamics, Talyor and Reid, 1981.
2. O. Kubaschewski, C.B. Alcock and P.J. Spencer, Materials Thermochemistry, Pergamon, 1985

4. Experimental Methods for Materials Research (MS7-45 hours)

S.No	Course Content
1	Vacuum Techniques (3): Fundamentals, Creation & Pressure Measurements, units, Pumps – fore Vacuum, high Vacuum and UHV
2	Thin Film synthesis methods- Physical, Chemical and MBE

3. X-RAY TECHNIQUES - techniques based on measuring the energy or angular distribution of scattered x-rays,

1.1 Wide angle elastic scattering (XRD): Atomistic – form factors; unit cell structure factors, Bragg equation, reciprocal lattice, Laue equations; Expwrimental methods- transmission, reflection, thin film, in-situ; Otjer information-particle size distributions.

1.2 Inelastic scattering- x-ray absorption spectroscopy: Basics- edges and extended fine structure; XANES and EXAFS quantitation; Surface sensitivity; Experimental methods
1.3 Small angle scattering-SAXS: Basics- what SAXS sees; Mathematical modeling;
1.4 X-ray fluorescence spectroscopy: Basics- core hole formation, fluorescence yield, transport ("ZAF"); Experimental realization – Bulk analysis; lab and synchrotron x-ray sources; Surface analysis – TXRF; Microscopy – x-ray beam manipulation.

4. **ELECTRON MICROSCOPIES:**

2.1 Transmission electron microscopy (TEM/STEM):
Electron interactions in solids-elastic and inelastic scatterin, phase change; Contrast generation-bright field, dark field, "high-resolution"; Images-information and resolution; Diffraction; Beam damage; Experimental methods hardware, specimen preparation; Inelastic scattering- electron energy loss; Emitted x-rays – elemental analysis, sensitivity, spatial resolution; STEM
2.2. Scanning electron microscopy:
Beam transport in bulk solids; Signals and images- backscattered and secondary electrons; Diffraction- channeling patterns – EBSD; X-ray generation and transport, detection and analysis; Other useful signals; Experimental methods;
EPMA Electron probe micro-analyzer
2.3. LEELS

5. ION BEAM TECHNIQUES

techniques using ions or neutrals made from them as the bombarding species
3.1. Ion beams – production-ion guns; manipulation- ion, filters
3.2. Rutherford (Nuclear) Backscattering Spectroscopy- (RBS):
High energy ions in solids- electronic and nuclear (Rutherford) stopping; Quantitative description; Experimental methods – energy spectroscopy
3.3. Nuclear reaction analysis – elemental specificity – depth profiling
3.4. PIXE (Proton Induced X-ray Emission) Signal to noise ratio – trace element analysis
3.5. Surface Mass Spectriscopy-SIMS:
Ejection of matter by bombardment: sputterin; Fate of ejected materials subsequent reaction, charge state; Mass dedtection – quad, magnetic sector, ToF; experimental issues

6. ELECTRON SPECTROSCOPIES -

techniques based on measuring the energy distribution of emitted electrons
4.1 Photoelectron spectroscopy:
Basics- energy balance, element identification; Not-so Basics- relaxation, chemical states, satellites; Surface sensitivity; Quantitation; UPS- the unfamiliar cousin
4.2 Auger Electron Sepctroscopy:
Electron excitation- why bother ? The Auger spectrum- energy balance; Chemical effects; Quantitation; Imaging- meaning of maps.
4.3 Experimental methods;
Surface of real-world things; Below the surface- profiling, variable energy; Hardware and software; samples and handling.

7. PROXIMAL PROBE MICROSCOPIES

Scanning Tunneling Microscopy (STM) and Atomic Force Microscopy (AFM): Basics; Experimental methods; Spectroscopy in Scanning Probe Microscopy

8. NUCLEAR SPECTROSCOPY

Positron annihilation, Mossbauer – Application to defects, radiation damage defects in metals and alloys

9. VIBRATIONAL SPECTROSCOPIES

7.1 Vibrations in molecules and solids – normal coordinates, group frequencies

7.2 Infrared spectroscopy;

IR absorption – dipole scattering, selection rules; Optical arrangements-transmission, specular reflectance, diffuse reflectance, attenuated total reflectance, microscopy, in-situ; Signal collection and Fourier transform processing, data analysis

7.3 Raman: Energy transfer, selection rules; Normal, resonance, surface-enhances, Fourier transform, UV

10. 8.RESONANCE ABSORPTION SPECTROSCOPIES

8.1 Nuclear Magnetic Resonance (NMR):

Fundamentals; Experimental Techniques; Magnetic Resonance Imaging

8.2 Electron Paramagnetic Resonance (EPR): Fundamentals; Experimental Techniques

BOOKS FOR STUDY AND REFERENCE:

1. Cullity Addision, B.D., "Elements of X-ray Diffraction", Wesley Publishing Co., 1967.
2. Williams (D B), Carter (C B), Transmission Electron Microscopy: A Textbook For Materials Science, New York, Plenum, 1996
3. J.R. Tesmer et al 'Handbook of modern ion beam materials analysis' (MRS, Pittsburgh,1995)
4. L.C. Feldman, J.W. Mayer 'Fundamentals of surface and thin film analysis' (North-Holland, N.Y, 1986)
5. Prutton, M., "Surface Science and Technology, Volume27, "Analytical techniques for thin films", Academic Press, Inc.Newyork, 1991.
6. Bacon, G.E., "X-ray and Neutron Diffraction", Pergamon Press, 1966.
7. Concise Encyclopedia Of Materials Characterization Ed. Cahn (R W) and lifshin (E) Ed Oxfod, Pergamon, 1993
8. Advances in Materials Characterization Ed. G. Amarendra, Baldev Raj, M.H. Manghnani, University Press (India), 2007

8. Structural Materials for Nuclear Reactors (MS8)(Coordinator: –45hrs)

S.No.	Course Content
1.	Three stage Nuclear Power Program (Importance of Material Selection)
2.	**Thermal Reactors:** Concept, Selection of Materials – Core and out of core, Processing of Materials, Properties/Performance of Materials
3.	**Fast Breeder Reactors:** Concept, Selection of Materials for different systems, Brief description of different systems, Core materials, Design criteria for clad and wrapper, Radiation damage, Evolution of materials for clad and wrapper, Material performance, Material processing and fabrication, Structural materials, Design criteria, Materials processing and fabrication, Steam generator materials, Design criteria, Selection of materials, Materials processing and fabrication, Properties of materials and performance
4.	**Materials in Reprocessing Applications,** Closing of nuclear fuel cycle, Design concept of reprocessing plant component, Selection of materials, Processing and fabrication, Evaluation of properties and performance
5.	**Materials in Waste Storage Applications**

Books Suggested:

1. Materials research: Current scenario and future projections, Chidambaram R, Banerjee S Ed, Allied Publishers, New Delhi, 2003
2. High temperature reactor materials (workshop La Jolla,CA March18-21,2002), Allen T, Oak Ridge, U.S.Department of Energy, 2002.
3. Nuclear materials: Issues and concerns Vol 2., Bhaskara Rao D Discovery Publishing House, New Delhi, 2001.
4. Materials R & D for PFBR: Compilation of articles: (Eds) S.L. Mannan and M.D. Mathew, IGCAR, Kalpakkam, 2003.
5. An overview of R&D on fast reactor fuel cycle, Baldev Raj, Int. J. Nuclear Energy Science and Technology, Col.1, Nos.2/3, 2005, pp.164-177.
6. Selection of materials for PFBR, S.L. Mannan, S.C. Chetal, Baldev Raj, S.B. Bhoje, Trans IIM, Vol..56, No.2, April 2003, pp.155-178.
7. Development of fuels and structural materials for fast breeder reactors, Baldev Raj, S.L. Mannan, P.R. Vasudeva Rao and M.D. Mathew, Sadhana, Vol.27, Part 5, October 2002, pp. 527-558
8. Input of the atomic energy programme on special materials development in India, C. V. Sundaram, Trans IIM, vol. 41, No.5, Oct 1988, p.407.
9. Recent trends in fast breeder reactor materials, C.V. Sundaram, P. Rodriguez and S. L. Mannan, IE (I) Journal –MM, Vol.67, Sept. 1986, pp.1-11.
10. Radiation effects in nuclear reactor materials – correlation with structure, P. Rodriguez, R. Krishnan and C.V. Sundaram Bull. Mater. Sci. Vol. 6, No.5, May 1984, PP.339-367.

Nuclear Reactor Materials, C.O.Smith, Addison Wesley, 1967

<u>9. NDE Science and Technology (MS9 - 30 hours)</u>

S.No.	Course Content
1.	**Introduction to NDE:** Importance and need for NDE, classification of techniques, origin of defects; material processing related-casting, forging, rolling, welding etc., and service related-fatigue, creep, corrosion, irradiation etc. Detection, characterisation, sensitivity, reliability, accuracy,
2.	**Surface NDE:** Principle, instruments & sensors, capabilities, applications and limitations of visual, liquid penetrant, magnetic particle, eddy current and flux leakage techniques
3.	**Volumetric NDE:** Principle, instruments & sensors, capabilities, applications and limitations of radiography and ultrasonic techniques. Gamma, Micro-focal, LINAC and real-time radiography and tomography. IRIS, TOFD, SAFT, MEMS, Non-linear ultrasonics related to ultrasonics.
4.	**Dynamic NDE:** Acoustic emission, infrared radiography, intelligent processing of materials and continuous monitoring.
5.	**Digital NDE:** Forward and inverse problems, signal processing, numerical modeling, imaging, automation, probability of detection (POD), multiple NDE, data fusion and robotics.
6.	**Industrial NDE:** NDE for quality assurance, structural integrity, material characterization, condition monitoring and in-service inspection, reference standards for calibration, codes & standards, selection of NDE techniques
7.	**Practicals:** 1. Ultrasonic testing – detection of defects in weld/HAZ and measurement of thickness

2. X-radiography of welds and interpretation of radiographs
3. Eddy current testing of plates and heat exchanger tubes for defects
4. ***Seminar***: Preparation and submission of report on a topic in advanced NDE. Presentation and viva-voce

Books Suggested:

1. A practical NDT – Baldev Raj, T. Jayakumar and M. Thavasimuthu, Narosa, New Delhi, 1996.

2. ASNT Volumes on Visual, penetrant, magnetic particle, eddy current, ultrasonic, radiography, acoustic emission, thermography and other techniques, ANST, Ohio, Coloumbus.

3. Grandt, A. F. Jr., Fundamentals of Structural Integrity: Damage Tolerant Design and Non-destructive Evaluation, John Wiley & Sons, Inc. Hoboken, NJ, 2004.

4. Bray, D.E. and R.K. Stanley, 1997, Nondestructive Evaluation: A Tool for Design, Manufacturing and Service; CRC Press, 1996.

5. Peter J. Shull, Nondestructive Evaluation: Theory, Techniques, and Applications, Marcel Dekker Inc., 2002.

10. Physical Metallurgy (MS10- 45 Hrs)

S.No.	Course Content
1.	Structure and Properties of Materials
2.	**Crystalline solids:** Introduction: Engineering materials, materials cycle, application and selection criteria of materials. Significance of microstructure; crystalline defects:- dimensions, origin and their effect on properties; amorphous structure.
3.	**Phase diagrams**: Origin, construction, interpretation and application of binary phase diagrams with reference to a few important metallic and ceramic systems. introduction and classification of phase transformations, calculation of phase equilibria based on thermodynamic principles
4.	Correlation between Free energy, selection of a Phase and order parameter, different thermodynamic classification of phase transformations, order of a transformation
5.	**Diffusional transformations:** Diffusion in solids: phenomenological approach and atomistic approach. Nucleation and growth theories of vapour to liquid, liquid to solid, and solid to solid transformations; homogeneous and heterogeneous strain energy effect during nucleation; interface-controlled growth and diffusion controlled growth; overall transformation kinetics. Principles of solidification, evolution of microstructures in pure metals and alloys**.** Precipitation from solid solution: types of precipitation reactions, crystallographic description of precipitates, precipitation sequence and age hardening, spinoidal decomposition**.**
6.	**Iron-carbon alloy system:** iron-carbon diagram, nucleation and growth of pearlite, cooling of hypo-eutectoid, eutectoid, and hyper-eutectoid steels, development of microstructures in cast irons. Heat treatment of steels: TTT and CCT diagrams
7.	**Diffusionless transformations:** martensitic transformation, hardenability, role of alloying elements in steels. Bainitic transformation, Widmanstatten transformation, Massive transformation. Order-disorder transformation**.**

8. Diffusion, rate theory, mechanisms of, measurement techniques
9. Phase transformations in some nuclear non-ferrous metals and alloys
10. Characterization of microstructure – microscopy techniques, X-ray spectroscopy and diffraction.
11. **Metallographic techniques**: Optical metallography, image analysis, quantitative phase estimation.
12. Properties of X-rays: continuous and characteristics x-rays, absorption, filter, production and detection of X-ray Diffraction methods: X-ray diffraction, X-ray topography, residual stress measurement techniques, small angle X-ray and neutron scattering.
13. **Electron optical methods**: (a) Scanning electron microscopy and X-ray microanalysis including electron probe microanalysis, electron optics, electron beam specimen interaction, image formation in the SEM; (b) Transmission electron microscopy and analytical transmission electron microscopy: Electron diffraction, reciprocal lattice, analysis of SAD patterns; different electron diffraction techniques, atomic resolution microscopy, analytical devices with TEM, field ion microscopy, scanning tunneling microscopy, advanced techniques.
14. **Introduction to novel materials and processes**: composites, intermetallics, cermets, metallic foams, intelligent materials, Dependence of their properties on structure, Nanocrystalline Materials: Synthesis, Structure and Properties.: Amorphous Materials; Metallic glasses, Glass forming ability, Bulk Metallic Glasses, Properties; Quasi crystalline Materials; Structure, Synthesis, Properties;
15. **Advanced Processes**: Rapid solidification processing, Laser surface Modification, Mechanical Alloying, Rapid prototyping, Self propagating High temperature synthesis, inert gas condensation etc.
16. **LABORATORY** Microstructures of alloys of Fe, Al, Cu and Ti for each type of transformation at different levels of resolution; Crystal structure by diffraction techniques; Defects of different dimensions; Advanced processes – Laser Ablation, Magnetron Sputtering and Plasma and Chemical deposition methods.

11. Fuel Cycle Physics& Introduction to Fuel Cycle (MS11/PY11 - 30 Hrs)

S.No	Course content
1.	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India.
2.	Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Beneficiation, preconcentration, purification and recovery. Radio-activity of mill tailings.
3.	Methods of U enrichment:
4.	Oxide fuels: Preparation of UO_2, PuO_2, MOX and ThO_2. Physical and chemical properties. Phase diagrams of relevance.
5.	Advanced ceramic fuels : carbides and nitrides
6.	Metal and Alloy fuels: Preparation of U, Pu, Th. Historical over view of the alloy fuel development, alloys (U-Zr, U-Pu-Zr, U-Pu-Minor Actinide). Dispersions and composites. Salient physical and chemical properties. Relevant phase diagrams. Fabrication and quality control.
7.	Inert matrix fuels for partitioning and transmutation – A brief account of the current developments.

8. Fuel fabrication and criticality safety. Fresh and spent fuel transport and storage in SFSP and burnup credit. Transport of fresh and irradiated fuel.
9. U-Pu cycle: U, U-Pu (MOX), Th-U cycle. Examples in thermal and frast reactor systems. Enrichment versus discharge burnup; enrichment versus reactivity coefficients; fertile host versus inert matrix.
10. Fuel cycle indices - Conversion and breeding ratios; reactor doubling time. Fuel and system doubling times.
11. Fissile and fertile actinides and MA (inventory and isotopic vector) in discharged fuel in different fuel cycles; Long lived fission products (LLFP).
12. Issues related recycling – Effective fissile content of discharged fuel for next cycle; refabrication of fuel for the next cycle. Results of Pu composition change with once through, one recycle and multiple recycle in thermal and fast systems.
13. Activity and toxicity of discharged fuel – FPs and actinides; activation of structural materials. Fuel reprocessing – thermal and fast reactor fuel - U-Pu, U-Th and U-Pu-Th fuels.
14. Isotopic separation operation of bred uranium in thorium cycles to remove U-232.
MA and LLFP incineration. Waste management strategies; different levels of waste, LLW and HLW. Methods of dilution, discharge and fixation; long term storage in geological structures.

Books Suggested:

1. F.J.Rahn et al., A Guide to Nuclear Power Technology, John Wiley and Sons (1984).
2. R.G.Cochran and N.Tsoulfanidis, Nuclear Fuel Cycle Analysis and Management, ANS (1990).

12. Introduction to Materials Science & Engineering (MS12/CH4-40 hours)

S.No.	Course content
1.	**Structure, Bonding & Defects in Solids:** Single crystal & polycrystalline materials, Unit cell, Crystal symmetry, Bravais lattices, point groups & space groups, Miller indices, Cohesive forces in crystals, Madelung energy and its calculation for NaCl and CsCl, Crystal structures, Close packing, Ionic Radii and Radius ratios, Common crystal structures of elements & compounds, Factors influencing crystal structures, Structure-property relations, Defects in solids, Thermodynamics of defect formation, Non-stoichiometry, Ionic conduction, Solid electrolytes.
2.	**Diffraction Techniques:** Diffraction phenomenon, X-ray, neutron and electron diffraction, Bragg's Law, Size and shape of unit cell, Basics of crystal structure determination, Powder diffraction and single crystal methods, Phase identification by XRD, Powder diffraction data base, Indexing of diffraction patterns and lattice parameter calculation, Rietveld refinement, Particle size & residual stress determination by XRD.
3.	**Microstructure & Microscopy:** Microstructure - origin and significance, Optical & electron microscopy

4. **Physical Properties:** Mechanical properties, Fracture, Strengthening mechanisms, Thermal expansion, Thermal conduction, Thermoelectric effects, Electrical and magnetic properties - metals, semiconductors and insulators, Band picture of solids, Ferroelectric materials, Superconductors, Magnetic properties, Magnetic domains, Optical properties, Non-linear optical properties, Lasers, Fibre optics & applications.

5. **Chemical Reactivity of Solids:** Factors affecting chemical reactivity, Diffusion, Surfaces of solids, Surface analysis techniques – ESCA, Materials at very low and high temperatures, Materials under pressure, Radiation damage in solids, Corrosion.

6. **Synthesis of Materials:** Solid state reactions, Wet chemical reactions and precursor techniques, Combustion synthesis, Sol-gel process, Soft chemical reactions, Crystal growth techniques with examples, Thin films, Nanocrystalline materials, Sintering.

7. **Phase Diagrams &Phase Transformations:** Phase diagrams – significance, experimental & computational methods of phase diagram determination, Classification of phase transformations, Order-disorder transitions, Nucleation and growth theory, diffusion-controlled and diffusionless transformations, Thermal analysis techniques.

Books suggested:

1. Materials science and technology: a comprehensive treatment, (18 Vols.) Ed. R.W. Cahn, P. Haasen and E.J. Kramer, VCH, Weinheim, 1991.
2. Encyclopedia of materials: science and technology, (11 Vols.) K.H.J. Buschow et al., Elsevier, Amsterdam, 2001.
3. Introduction to solid state physics, C. Kittel, VII Ed, John Wiley & Sons, 1996.
4. Solid state chemistry and its applications, A.R. West, John Wiley & Sons, 1984.
5. The structure and properties of materials, (4 Vols.) Ed. J. Wulff, Wiley Eastern, 1974.
6. Materials science and engineering: an introduction, V Ed, W.D. Callister, John Wiley &Sons, N.Y., 2003.
7. Introduction to materials science and engineering, K.M. Ralls, T.H. Courtney and J. Wulff, Wiley Eastern, 1978.
8. Elements of x-ray diffraction, B.D. Cullity, Addison – Wesley, 1978.
9. Analytical chemistry by open learning: X-ray methods, C. Whiston, John Wiley & Sons, 1987.
10. X-ray diffraction: a practical approach, C. Suryanarayana and M. Grant Norton, Plenum, 1998.
11. The science and engineering of materials, IV Ed D.R. Askeland and P.P. Phule, Brooks/Cole, 2003.
12. The physics and chemistry of materials, J.I. Gersten and F.W. Smith, John Wiley & Sons, 2001.
13. Metallic materials: physical, mechanical and corrosion properties, P.A. Schweitzer, Marcel Dekker, 2003.
14. Introduction to Solids, L.V. Azaroff, Tata McGraw-Hill, Bombay, 1960.
15. Materials science and engineering: a first course, III Ed V. Raghavan, Prentice Hall of India, 1996.
16. Understanding materials science: history, properties, applications, R.E. Hummel, Springer Verlag, N.Y., 2004.
17. Crystal growth: processes and methods, P. Santhana Raghavan and P. Ramasamy, KRU Publications, Chennai.
18. Preparative methods in solid state chemistry, P. Hagenmuller, Academic, 1972.
19. Thin film deposition: principles and practice, D.L. Smith, McGraw-Hill, 1995.
20. Properties of materials, M.A. White, Oxford Univ. Press, 1999.

13. Corrosion Science and Engineering (MS13/CH13 - 30 hours)

S.No.	Course content
1.	Thermodynamics of Aqueous Corrosion: Electrode processes – electrode potential, free energy, EMF series, potential measurements with reference electrodes, three electrode systems, computation and construction of Pourbaix diagrams of Fe, Al, Ni and Zn, practical use of E-pH diagrams. Chemical Vs electrochemical mechanisms of corrosion reactions, corrosion rate expressions.
2.	Kinetics of Aqueous Corrosion: Corrosion current density and corrosion rate, exchange current density. Polarization – activation control, Tafel equation, mass transport control, mixed potential theory and behavior of galvanic couples in acidic environments, effect of oxidizer, combined polarization, factors affecting polarizations and rate of corrosion. Passivity, potentiostatic polarization curves, factors affecting passivity, mechanism of action of passivators.
3.	Forms of Corrosion: General corrosion – atmospheric corrosion, galvanic corrosion, general biological corrosion. Localized corrosion – filiform corrosion, crevice corrosion, pitting corrosion, localized biological corrosion. Metallurgically influenced corrosion-inter granular corrosion, de-alloying. Mechanically assisted corrosion – erosion corrosion, fretting corrosion, corrosion fatigue. Environmentally induced cracking – mechanisms of stress corrosion cracking and hydrogen embittlement.
4.	Corrosion in Reactor and Reprocessing Plants: Corrosion in liquid sodium, cooling water, sea water; Corrosion in nitric acid – effect of flow, environment and metallurgical variables of materials.
5.	Prevention and Control of Corrosion: Corrosion control by design. Selection of corrosion resistant materials – alloying, stainless steel and brass. Oxidation resistant materials, control of high temperature oxidation. Cathodic and anodic protection methods. Use of inhibitors-types. Corrosion in cold water pipes – Langalier saturation index.
6.	**Corrosion Monitoring:** Introduction – On-stream monitoring – Electrical resistance, linear polarization, hydrogen test probe, ultrasonic testing, radiography and corrosion coupons. Off-stream monitoring equipments – Acoustic emission testing, eddy current inspection, liquid penetration inspection.
7.	**Corrosion Testing:** Purpose and classification. Dimensional charge – Ultrasonic thickness measurements, eddy current, microscopic examination. Weight charge – Specimen preparation, test conditions and evaluation of results for overall corrosion, SCC, IGC. Electrochemical techniques – Polarization curves, Tafel extrapolation, linear polarization, AC impedance methods (EIS).

Books Suggested:

1. Herbert H. Uhlig and R.Winston Revie, “Corrosion and corrosion control – An introduction to corrosion science and engineering”, Third Edition, John Wiley & Sons, 1985.
2. Mars G. Fontana, “Corrosion Engineering”, Third Edition, Mc Graw Hill Inc., 1987.
3. D.A.Jones, Principles and prevention of corrosion, Second Edition, Prentice Hall Inc, 1996.

4. ASM hand book – Vol 13: Corrosion, ASM International, 2001.
5. Philip A. Schweitzer, “Corrosion and corrosion protection handbook”, USA, 1983.

14. Mechanical Behaviour of Engineering Materials (MS14- 30 hours)

S.No.	Course Content
1.	**Engineering Materials:** Alloys, intermetallics, ceramics, composites, polymers.
2.	**Basic Crystal Structure of Materials**: Unit cell, packing fractions, planes and directions, slip systems
3.	**Defects in Materials:** Point defect, line defect (dislocation), surface defects (grain boundary, twins, stacking faults), volume defects
4.	**Dislocation:** Types, Burger's vector, stress field and energy, stacking faults, dislocation glide and slip systems in crystal, interaction between dislocations, interaction between dislocations and point defects, dislocation pile up, dislocation climb, dislocation sources, multiplication of dislocations.
5.	**Elastic Behaviour of Materials:** Stress and strain at a point and their relationship
6.	**Plastic Behaviour of Materials:**
7.	**Tensile Deformation:** single crystal, yield point, CRSS, polycrystalline materials (Schmidt's factor), grain size effect-Hall-Petch relation, thermally activated deformation, constitutive equation for plastic deformation, strain hardening and dynamic strain ageing (DSA).
8.	**Strengthening Mechanism:**Strain hardening, strengthening from grain boundary, solid-solution strengthening, order-disorder strengthening, precipitation strengthening, dispersion strengthening, strengthening by point defects, martenisitic strengthening, and composite materials.
9.	**Creep:** Creep curve, mechanisms of creep deformation, activation energy for creep deformation, structural changes during creep, deformation mechanism map, super plasticity, presentation of creep data, prediction of long-term creep properties, irradiation creep, grain boundary sliding, nucleation, growth and coalescence on inter granular cavities, effect of impurity segregation on cavitation, creep fracture of weld joint, design of creep deformation and fracture resistance materials.
10.	**Fatigue:** Types of loading, high cycle fatigue, low cycle fatigue, thermo-mechanical fatigue, creep-fatigue interaction, fretting fatigue and corrosion-fatigue of various engineering materials, effect of surface treatment and coating, fatigue behaviour of welds, characterization of fatigue deformation and damage, fatigue under combined stresses, notch sensitivity, design criterion, life prediction techniques, alloy design against fatigue.
11.	**Fracture Mechanics:** Ductile to brittle transition, Griffith's law, strain energy release rate, introduction to linear and non-linear fracture mechanics, fracture toughness, fatigue and creep crack growth, material design against fracture.

Books Suggested

1. Physical Metallurgy Principle – R. E. Reed-Hill
2. Modern Physical Metallurgy – R. E. Smallman
3. Mechanical Metallurgy – G. E. Dieter
4. Plastic Deformation of Metals – R. K. W. Honeycomb
5. Introduction to Creep – W. W. Evans
6. Fatigue of Materials - S. Suresh, CambridgeUniversity Press.
7. Deformation and Fracture Mechanics of Engineering Materials – R. W. Hertzberg

15. Manufacturing Technology (MS15 - 30 hours)

S.No.	Course content
1.	**Nuclear materials and their melting practices**: Selection criteria for in-core, structural and steam generator materials, Radiation damage, Properties of nuclear materials. Principles of Vacuum melting & casting processes, including general descriptions of vacuum induction melting, vacuum arc re-melting and electro-slag refining.
2.	**Hot and cold working processes and tube making processes**: Fundamentals of mechanical processing, defects during manufacturing, Various techniques for producing seamless pipes, design of tooling for hot extrusion and principles of pilgering and Various presses and their characteristics.
3.	**Special metal forming processes**: High velocity forming processes like explosive forming, pertroforge forming, electro magnetic and hydraulic forming, comparison of HVF methods, Super-plastic forming.
4.	**Powder metallurgy** : Introduction, characterization of metal powders. Manufacturing of metal and composite powders. Compaction and sintering of metal powders. Secondary operations. Applications of typical P/M components.
5.	**Computer aided design:** Role of computers in design and manufacture, Solid modeling – techniques and algorithms for modelling – data structures for solid models; Surface modeling – curves and surface representation – composite surfaces – application to computer aided manufacture; Current developments in CAD – feature based modeling – Design by feature – function, feature linkages – Application of feature based models. Parametric modeling.
6.	**Metal joining principles and processes**: Fusion and non- fusion welding processes, modern welding processes, design of welded joints, Introduction to residual stresses and distortion in welds.
7.	**Weldability of materials**: Welding of austenitic stainless steels, ferritic steels, weldability tests, dissimilar welding and selection of weld consumables and welding defects, principles of post weld heat treatment and stress relieving.
8.	**Welded Fabrication**: Codes and Standards, Procedure and performance Qualification, Evaluation of the welded joints, NDT of welds.
9.	**Hard facing Technology**: Introduction, Need for hard facing, Hard facing processes, Hard facing in nuclear power plants.
10.	**Heat Treatment**: Annealing, normalizing, quenching and tempering, Precipitation hardening, Recrystallisation annealing, Importance of heating and cooling rate and hold time in heat treatment, Heat Treatment furnaces.

Books Suggested:

1.Metal Forming Handbook, Schuler, Springer Verlag, Berlin, 1998.
2.Welding Technology for Engineers, Baldev Raj, Shankar (V) And Bhaduri (A K), Narosa Publishing House, New Delhi, 2006.
3.Fundamentals of Metal Forming, Wagoner (R H), John Wiley & Sons, New York, 1997.
4.CAD/CAM from Principles To Practice, Chris Mcmahon And Jimmie Browne, Addison – Wesley, 1993.
5.Manufacturing Technology: Foundry, Forming And Welding, Rao (P N), Tata Mcgraw-Hill, New Delhi, 1987

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING I

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (MECHANICAL/CHEMICAL)

S. No	*Code*	*SUBJECT TITLE*	***HOURS***	***CREDITS***
1.	FRE1	Code Design for pressure vessel and piping	30	4
2.	FRE2	Advanced Heat and Mass Transfer and Computational Fluid Dynamics	30	4
3.	FRE3	Transport Phenomena	30	4
4.	FRE4	Reliability Engineering	20	2
5.	FRE5	Process Design and Control	30	4
6.	FRE6	Vibration Engineering and Condition Monitoring	20	2
7.	FRE7	Seismic Design of Nuclear Reactors and Facilities	30	4
8.	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**210**	**26**

MODULE III- OPERATIONS

S. No	*Code*	*SUBJECT TITLE*	***HOURS***	***CREDITS***
1.	FRE9	Plant Dynamics and Control	25	3
2.	FRE10	Turbine Generator Fundamentals	25	3
3.	FRE11	Mechanical and Electrical Equipments	25	3
4.	FRE12	Maintenance Engineering	25	3
5.	FRE13	Regulatory Framework for NPPs	25	3
6.	FRE14	Practical's	**6 Weeks**	**12**

1.	Viva Voce	**Grand Total**		**76**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths.A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals **Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc.
2	**Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

31. Nuclear Power Engineering, M. El-Wakil, Mcgraw Hill Book Co., New York.
32. Steam Power Station, G.A. Gassort.
33. Power Plant Engineering & Economics, Strosal & Vapet.
34. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
35. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
36. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
37. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
38. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
39. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
40. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**
1	**Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.

2. **Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3. **Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4. **Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5. **Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6. **Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7. **Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8. **Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities
8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II - CORE ENGINEERING (MECHANICAL/CHEMICAL)

1. Code Design for Pressure Vessel and Piping (FRE1) (30 Hours)

S.No.	Course content
1.	Membrane theory for thin shells, stresses in cylindrical, spherical and conical shells, dilation of above shells, general theory of membrane stresses in vessel under internal pressure and its application to ellipsoidal and torispherical end closures.
2.	Thick cylinder and sphere and derivation of Lame's equations. ASME Sec. VIII Div. 1 & Div -2 equations for cylindrical, spherical and conical shells, ellipsoidal and torispherical end closures.
3.	Bending of circular plates and determination of stresses in simply supported and clamped circular plate. Basis of ASME equation for flat closures. Thermal stresses in plates and shells.
4.	Openings, nozzles and external loading. Stress concentration in plate having circular hole due to bi-axial loading. Theory of reinforced opening and reinforcement limits.
5.	Beam on elastic foundation and its application to thin-walled pressure vessels. Extent and significance of load deformation on pressure vessel. Reinforcement rules for ASME, Sec. VIII Div.1. Local Stresses in shells due to external loadings from nozzles and lugs etc (WRC-297)
6.	Bolted Flanged joints. Types of flange joints. Types of gasket and their selection. Bolting design. Flange loads and moments. Design of flange as per ASME Boiler and Pressure Vessel Code.
7.	Supports for vertical and horizontal vessels. Design of base plate and support lugs. Types of anchor bolt, its material and allowable stresses. Design of saddle supports.
8.	Buckling of vessels under external pressure. Elastic buckling of long cylinders, buckling modes, buckling (collapse) coefficients. ASME procedure for design of vessels under external pressure. Design for stiffening rings. Design of shells for axial compression.
9.	Design of tube sheets as per TEMA and ASME Sec VIII Div. 1.
10.	Piping thickness as per ANSI ASME B31.1 and B31.3 piping code. Flexibility factor and stress intensification factor. Design of piping system as per B31.1 piping code. Design of piping for hazardous fluid as per B31.3

11. Design consideration for pressure vessel. Design pressure and temperature, Allowable stresses, Impact toughness requirement as per ASME Sec. VIII Div.1 code. Difference between Sec. VIII Div.1 & Sec III-NB.

12. Introduction to design codes (structure of RCC-MRx) both insignificant and significant creep. Service levels and design class. Introduction to shell and piping design. Thin Shell Design Against Buckling as per RCC-MR Appendix A-7, Elastoplastic instability under monotonic loading – linear elastic analysis, Elastoplastic instability under cyclic loading - elastic linear analysis -negligible creep, Elastoplastic instability in significant creep - simplified method.

Books suggested:

11. Harvey J F , 'Pressure vessel design' CBS publication
12. Brownell. L. E & Young. E. D , 'Process equipment design', Wiley Eastern Ltd., India
13. ASME Pressure Vessel and Boiler code, Section VIII Div 1 & 2, 2003
14. American standard code for pressure piping , B 31.1
15. Standards of Tubular Exchanger Manufacturers Association, Eighth Edition ,1998

2. Heat Transfer and Computational Fluid Dynamics (FRE2) (30 Hours)

S.No **Course content**

1. **Basic equations:** Kinematics of fluid flow. Streamline, streakline and pathline; stream function, vorticity & deformation of a fluid element. Basic equations governing heat conduction, fluid flow & mass transfer (viz. the continuity, momentum and energy equations) with special reference to Navier-Stokes & Bernoulli equations.
2. **Laminar Boundary Layer and Forced Convection:** Formulation of differential equations for hydrodynamic and thermal boundary layers. Different analytical methods for reduction of boundary layer equations and theoretical formulation for boundary layer thickness. Study of jets and flow separation in the light of Boundary Layer Theory. Convective heat transfer in internal and external flows. Low and high Prandtl number limits and different thermal boundary conditions.
3. **Turbulent Flow and Heat Transfer**: Reynolds decomposition for turbulence. Prandtl's mixing length theory, Mixing length models. Structure of turbulent boundary layer over flat plate and through circular cylinder. Calculation of friction factor and drag coefficient. Analytical and semi-analytical correlations for heat transfer coefficients. Analogy between heat and momentum transfer. Reynolds analogy, von Karman-Prandtl analogy, Martenelli analogy, Lyons analogy.
4. **Natural Convection**: Basic Equations of natural convection. Boussinesq approximation. Derivation of dimensionless groups from basic equations. Analytical approximations.
5. **Principles of heat transfer in porous media**: Single phase flow in porous medium Darcy Law, porosity & permeability, homogenization method, continuity equation & energy equation.
6. **Heat Transfer with Phase Change**: Introduction of two phase flow and basic relations; flow regimes in adiabatic and diabatic vertical co-current flow and in adiabatic co-current horizontal flows. Basic equations of two phase flow; Homogenous & separated flow models for two phase flow, void fraction & phase velocity ratio (Zivi's model). Introduction to boiling heat transfer and bubble nucleation; Regimes in boiling heat transfer (a) pool boiling & (b) flow boiling: Heat transfer correlations for pool boiling (Rohsenow's correlation) and flow boiling (Chen's correlation). Condensation heat transfer: Nusselt's theory and its limitations: Jet condensation fundamentals and its application in containment cooling. Critical heat flux: Various models of critical heat flux, CHFR, MCHFR Critical power concept. Post-dryout heat transfer. Various

models available for calculation of heat transfer coefficient. Critical Flow. Models for single -phase and two-phase critical flows.

7. **Radiation heat transfer**: Radiation heat transfer. Reflection, absorption, transmission and emission; concept of black and grey bodies; total emissive power and Stefan-Boltzmann constant. Kirchoffs law. Shape factor & law of reciprocity; Radiation heat transfer between two grey bodies
8. **Numerical Methods in Heat Transfer**: Discretization of conduction equation with Dirichlet & Neumann boundary conditions; Temporal integration: Explicit & Implicit schemes. Discretization of convection-diffusion equations (Upwind & Exponential schemes). Estimation of flow field: stream function-vorticity formulation and primitive variable formulation. SIMPLE family of algorithms. Turbulence Modeling: Eddy diffusivity models: k-ε and k-ω models. Reynolds stress models: algebraic & differential versions. Large eddy simulation and Director numerical simulation.

Books suggested:

CFD

1. An Introduction to Computational Fluid Dynamics: The Finite Volume Method - H.K. Versteeg and W. Malalasekera, Addison-Wesley Longman, Limited, 1995, Reprinted in 1996.
2. Numerical Heat Transfer and Fluid Flow - S.V. Patankar, McGraw-Hill, 1981.
3. Computational Fluid Flow and Heat Transfer – K.Muralidhar, T.Sundararajan, Narosa Publishing - New Delhi, 2003 (IIT Kanpur series of advanced texts).
4. Heat Transfer- J.P.Holman, 9th Ed., McGraw Hill, NY.
5. Convective boiling and condensation- J.G.Collier, McGraw Hill, London,1972.

3. Advanced Mass Transfer (FRE3) (30 Hours)

S.No.	Course content
1.	**Momentum Transport:** **1.1 Viscosity and Mechanisms of Momentum Transport**: Generalized Newton's Law of Viscosity, Pressure and Temperature Dependence of Viscosity, Molecular Theory of the Viscosity of Gases and Liquids, Viscosity of Suspensions and Emulsions, Convective Momentum Transport.

1.2 Velocity distributions with two independent variables: Time-Dependent Flow of Newtonian Fluids, Flow near Solid Surfaces by Boundary-Layer Theory.

1.3 Macroscopic Balances for Isothermal Flows: Macroscopic mass, momentum, mechanical energy balances; Estimation of viscous loss, Performance of Liquid-Liquid Ejector, Thrust on pipe bends.

2. **Energy Transport:**

Fourier's Law of Heat Conduction; Thermal Conductivity, its measurement & its dependence on temperature / pressure. Theory of thermal conductivity of gases, gas mixtures and liquids, Effective thermal conductivity of composite solids, Convective transport of energy.

3. **Mass Transport:**

3.1 Diffusivity and the Mechanisms of Mass Transport: Fick's Law of Binary Diffusion, Diffusivity, its measurement & its dependence on temperature / pressure, Theory of diffusion in gases, binary liquids, colloids etc. Molar transport by convection.

3.2 Concentration Distributions in Solids and Laminar Flows: Diffusion through Gas Films, homogenous / heterogeneous chemical reactions, Diffusion into a Falling Liquid Films.

3.3 Equations of Change for Multi-component Systems: Equations of Continuity for a Multi-component Mixture, Multi-component Equations of Change, Multi-component Fluxes and their applications.

3.4 Concentration Distributions with More than One Independent Variable: Time-Dependent Diffusion, Steady-State Transport in Binary Boundary Layers, Boundary Layer Mass Transfer with complex interfacial motion. Concentration Distributions in Turbulent Flows.

3.5 Interphase Transport in Nonisothermal Mixtures: Definition of Transfer Coefficients in One Phase, Analytical Expressions for Mass Transfer Coefficients, Correlation of Binary Transfer Coefficients in One Phase, Transfer Coefficients in Two Phases, Mass Transfer and Chemical Reactions, Combined Heat and Mass Transfer by Free Convection, Effects of Interfacial Forces on Heat and Mass Transfer, Transfer Coefficients at High Net Mass Transfer Rates.

3.6 Other Mechanisms for Mass Transport: Equation of Change for Entropy, The Flux Expressions for Heat and Mass, Concentration Diffusion and Driving Forces, Applications of the Generalized Maxwell-Stefan Equations, Mass Transport across Selectively Permeable Membranes, Mass Transport in Porous Media.

Books Suggested:

1.Bird, R.B, Stewart, W.E. and Lightfoot, E.N., Transport Phenomena, Wiley, 1994.
2.Denn, M.M, Process Fluid Mechanics, Prentice Hall, 1980.
3.Whitaker, S., Fundamental Principles of Heat Transfer, NewYork, Pergamon, 1997.
4.Cussler, E, L., Diffusion: Mass Transfer in Fluid Systems, Cambridge, 1985
5.Welty, J.R., C.E. Wicks and R.E. Wilson - " Fundamental of momentum, heat and mass transfer ", John Wiley and Sons, 1976.
6.Sissom, L.E. and D.R.Pitts - " Elements of Transport Phenomena ", McGraw Hill, New York, 1972.
7.Brodkey, R.S. and H.C.Hershey - " Transport Phenomena ", A United Approach McGraw Hill, 1988.

4. Reliability Engineering (FRE4) (20 hours)

S.No	Course content
1.	Reliability Mathematics- Fundamentals of probability, Random Variables and their probability distributions, common distribution functions, Uniform, Normal, Lognormal, Exponential and Extreme value distribution, correlations, Regression analysis, Bayesian Methods, Functions of Random Variables, Central Limit theorem
2.	Elements of Component Reliability – Definition of reliability, Availability and risk, Basic Component reliability model, Failure rate & hazard rate, Life testing, Component reliability.
3.	Reliability in Engineering Design – Limit state, Probability of failure, Monte Carlo simulation method, Generation of Uniform Random Number, Generation of Normal Random Number, General procedure of generating random numbers from an arbitrary distribution, Accuracy of probability estimates, Reliability Index, First Order Second Moment Reliability estimates, Reliability Index, First Order Second Moment Reliability Index, Hasofer Lind Reliability Index, Rackwitz Fiessler procedure, Correlated random variables.
4.	Probabilistic Fracture Mechanics – Brief overview of failure modes for flawed structures, linear elastic fracture mechanics, net section collapse, R6 method, fatigue analysis, crack growth analysis, Application of PFM to nuclear structural components.
5.	System Reliability Analysis – Elements and systems, series and parallel systems, Reliability bounds on structural systems, Failure mode and Effect analysis, Reliability block diagram, Redundancy techniques in system design, Fault tree and Event tree analysis, Reliability and availability of repairable systems.
6.	Application of Reliability – PSA of Nuclear Plants, Identification of initiating event, Event sequence modeling, system modeling, input data analysis including common cause failure and human reliability data quantification, determination of Core Damage. Frequency and its significance. Internal and External events, Reliability centered maintenance, Risk based in-service inspection strategies, Important measures, Risk based ranking matrix.

Books Suggested:

1. Reliability and Maintainability Engineering, Charles.E.Ebeling, Tata- McGraw Hill, 2000.

2. Fracture Mechanics- Fundamentals and Applications, T.L.Anderson , CRC Press, 2005.

3. Lecture Notes-Topics in Solid Mechanics-Reliability Analysis and Design, Sharit Rehman, 1999.

4. Structural reliability analysis and prediction-R.E.Melchers, Ellis Horwood Limited, 1987.

5. Probablistic Safety Assessment in Chemical and Nuclear Industry-R.R.Fullwood, BH, Oxford, 2000.

6. Probability, reliability and statistical methods in engineering design – Halder. A and Mahadevan.S., 2000, John Wiley & Sons, Newyork.

7. Introduction to reliability engineering - E.E. Lewi, John Wiley, NY, 1987

8. An introduction to reliability and maintainability engineering, Tata-Mcgraw hill, New Delhi 2000.

9. Probabilistic structural mechanics handbook – C(Raj) Sundararajn, 1995, Chapman and Hall, NY

5. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	Distinctive characteristics of dynamics of chemical process systems; process control objectives and strategies; material balance and product quality control Review of dynamic behavior of linear systems and their control system design. Linear processes with difficult dynamics.

2. Nonlinear process dynamics; phase-plane analysis; multiple steady-state and bifurcation behavior; Process Identification; Controller design via frequency response analysis; Model based control; Cascade, feed forward & ratio control; Controller design for nonlinear systems; Introduction to multivariable systems. Interaction analysis and multiple single loop design.
3. Design of multivariable controllers; Introduction to sampled-data systems; Tools of discrete-time systems analysis; Dynamic analysis of discrete-time systems; Design of digital controllers; Introduction to model predictive control; Convolution models; Model predictive control of MIMO systems

Books Suggested:

1. Buckley P.S., Techniques of Process Control, John Wiley, 1964.
2. Douglas, J.M., Process Dynamics and Control, Vols, I & II, Prentice Hall, 1972.
3. Stephanopoulos G., Chemical Process Control, Prentice Hall, 1988 Current Literature.
4. Emanule, S.Savas - " Computer Control of Industrial Processes ", McGraw-Hill London, 1965.
5. Peter Harrior - " Process Control ", Tata McGraw Hill publishing Co., Ltd., New Delhi., 1977

6. Vibration Engineering and Condition Monitoring (FRE6) (20 Hours)

S.No. Course content

1. Single-degree-of Freedom (SDOF) Systems: Free vibration equation of motion; Concept of natural frequency; Solution of equation of motions for undamped and damped free vibrations – underdamped, overdamped and critically damped systems; Material and structural damping – evaluation of damping in SIDOF systems' Response to harmonic loading – complementary solution and particular solution; Response to periodic loadings using Fourier Series, Response to general dynamic loading – Duhaml's Integral.
2. Multi-Degree-of Freedom (MDOF) Systems: Equations of motion – lumped mass and distributed parameter systems; Eigen value problem, concepts of Eigen values and eigenvectors; Normal mode vibrations – Free and forced; Orthogonality conditions; Mode superposition method & Direct integration methods; Vibration of continuous systems; Vibration absorption, vibration isolation and dampers, transmissibility and isolation efficiency.
3. Response of Systems to Ground Motion: Earthquake motion – Safe shutdown Earthquake (SSE) and Operating Basis Earthquake (OBE); Magnitude and Intensity of an earthquake; Design basis earthquake – Design Time History and Design Response Spectra; Response Spectrum Method and Time History Method of Analysis – Concept of Mode participation factor, modal Combination and spatial combination rules; A seismic design of equipments and piping systems as per ASME Sec.III Appendix-N
4. Rotor Dynamics: Basic Concept: a) Critical speed, b) Unbalance response; Whirling of rotating shaft – Jeff Cott rotor; Phase-amplitude relationship, effect of damping; Amplitude build up at critical speed; Effect of support flexibility; Performance verification of rotating machinery.
5. Dynamic Balancing: Static and Dynamic unbalance; Single plane and two plane balancing; Sources of unbalance; Method of mass correction and balancing practice; Balancing quality standards and specification for rotors; Classification of rotors and type of balancing required.
6. Flow Induced Vibration: Fluid-Flow across smooth circular cylinder and in an array of cylinders; Strouhal number, Added Mass; Models and analysis for vortex-induced Vibration; Sources of Vibration in pipes containing fluid; Codes and standards applicable for flow induced vibrations.

7. Vibration Measurement and Signal Analysis: Types of transducer, their principle and application ranges; Accelerometer, Eddy current transducer and LVDT, Modes of vibration measurement (Displacement, Velocity and acceleration); Characterization of periodic, periodic and random signals; Fourier Spectrum, Power spectrum, Cross-power spectrum, coherence, auto and cross – Correlation and significance of these parameters; Application of vibration of condition monitoring and diagnostics; Vibration standards for acceptance.

Book suggested:

1. Theory of Vibration with Applications, William T. Thomson, CBS Publishers & Distributors, 1988.
2. Mechanical Vibration Practice with basic theory – V. Ramamurti, Narosa publishing house, Chennai.
3. Vibration measurement and analysis - B.C. Nakra, G.S.Yadava, L.Thuestad, National Productivity council.
4. Flow-induced vibration – Robert D. Blevins, Krieger publishing, Latest edition.
5. Machinery vibration - Victor Wowk, Tata Mcgraw hill publishers, Latest edition
6. Machinery malfunction diagnosis and correction – Robert C. Eisenmann, Pearson education publications, Latest edition.
7. Practical machinery management for process plant – H.P. Bloch, vol 2, Gulf publishing company, London, Latest edition.
8. Engineering applications of correlation and spectral analysis – Bendat J.S. and Piersom A.G., John wiley publications, Latest edition.

7. Seismic Design of Nuclear Reactors and Facilities (FRE7) (30 Hours)

S.No.	Course content
1.	**Introduction to Earthquakes:** Tectonic features, faults e.g., plate boundaries, intra faults, horizon of earthquakes, Definition of various terms e.g., focus, epicenter distances, energy release, relations of magnitude v/s energy, magnitude v/s peak ground accelerations, definition of various waves generated e.g., p-waves, recording of earthquake motions, strong motions, attenuation relations.
2.	**Design Basis Ground Motion and IS 1893 Spectra:** Selection of design magnitudes of earthquakes, Evaluation of peak ground accelerations, return/recurrence periods, spectral shapes, synthetic time histories, peak ground accelerations for various zones of India.
3.	**Introduction to Earthquake Engineering:** Equations of motion for simple systems, importance of inertia forces, elastic forces, energy dissipation and damping, natural frequencies, mode shapes, modal participation factors, evaluation of seismic forces for single and two degree freedom systems.
4.	**Analysis Procedures for multi degree freedom systems:** Formation of matrices for stiffness, mass and damping. Frequency evaluation methods-subspace iteration, lanczos. Response spectrum analysis-modal combinations. Time history analysis- Wilson-q, Newmark-b
5.	**Soil-Structure Iteration:** General requirements, types of foundations, evaluation of subsurface material properties such as shear modulus, material damping ration, Poisson's ration etc. Analyses- direct method, impedance method, foundation uplift analysis.
6.	**Analysis and design of Structures:** Modeling of structures considering soil-structure interaction, structure-equipment interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.

7. **Analysis and design of Equipment:** Modeling of equipment, structure-equipment interaction, equipment-piping interaction, damping of the structures, analysis of structures, evaluation of seismic forces, design of structures for seismic loads.
8. **Analysis and design of Piping:** Modeling of piping, equipment-piping interaction, damping of the piping, analysis of piping, evaluation of seismic forces, and design of piping for seismic loads.
9. **IS 1893, 2002, Indian Standard Criteria for earthquake resistant design:** Seismic Coefficient method, Importance factors for industrial systems, response reduction factors, ductility design provisions, seismic design of chimneys, towers as per IS 1893.
10. **Testing:** Pseudo-dynamic testing, shake table testing, in situ testing, ambient testing, testing for functional requirements, determination of natural frequencies and damping.
11. **Response Control and Retrofitting:** Merits of response control design, passive (EPD, LED, base isolation etc) and active control, various devices of active and passive control, various retrofitting techniques, FRP wrapping, steel plate wrapping.
12. **Seismic Design of Nuclear Facilities:** Earthquake resistant design of nuclear facilities with limited radioactivity inventory such as Research Reactors, `Waste Management Plants suing IAEA-TECDOC-348, Design of nuclear fuel cycle facilities using IAEA-TECDOC-1250.
13. **Seismic re-qualification of old plants:** Inelastic response spectra, push over analysis, retrofitting techniques.
14. **Tutorials:** Simplified models for structures like towers, chimneys, simple frames, equipment like heat exchangers, pressure vessels and piping considering various support conditions like fixed-fixed, fixed-free, pin-pin, evaluation of seismic responses using first fundamental modes or peak values of design response spectrum.
15. **High Temperature and Creep Fatigue Interaction:** Damage mechanisms and failure modes, Time-dependent and frequency-dependent damage, Cumulative damage rules, Different approaches for life prediction under creep-fatigue conditions: Frequency-modified approach, strain range partitioning (SRP), Ductility exhaustion method, Creep-fatigue interaction Diagram, Thermomechanical fatigue, Codes and Standards

Books Suggested:

5. ASCE 4-98, “Seismic Analysis of Safety Related Nuclear Structures and Commentary”, ASCE, New York.
6. United States Nuclear Regulatory Commission (USNRC), 1990, Standard Review Plan
7. P.N. Agarwal, “Engineering Seismology”, IBH Publishers, New Delhi.
8. Safety Guide, AERB/SG/D-23, “Seismic Qualification of structures, Systems and Components of PHWRS.
9. AERB/SG/S-11, 1990, “Seismic Studies and Design Basis Ground Motion for Nuclear Power Plant Sites”. AERB, Mumbai, India.
10. IS: 1893 (Part 1,2 & 4) 2002, criteria for Earthquake Resistant Design”, BIS, New Delhi.

8. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.

- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.
- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.
- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings, Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,

Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.

- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.
- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evolution of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extension of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Independence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.

- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974

11. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

1. **Class room Training**
    a. Reactor System

        Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

    b. Sodium system

        Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

    c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*
    d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

2. **Field training**
    a. Reactor Operation
    b. Maintenance Activities
    c. Technical Service Activities
    d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

SYLLABUS SUMMARY: FAST REACTOR ENGINEERING II

MODULE I: FUNDAMENTALS

S.No	Code	Subject Title	HOURS	CREDITS
1	NR	Nuclear Reactors & Sodium Technology	50	6
2	RE	Reactor Engineering	40	5
3	RP	Fast Reactor Physics and Shielding	35	4
4	MM	Materials and Metallurgy	25	3
5	HP	Health Physics and Radiological Safety	25	3
		Total	**175**	**21**

MODULE II-CORE ENGINEERING (ELECTRICAL/ELECTRONICS)

S. No.	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE15	Reactor Control Engineering	30	4
2	FRE16	Nuclear Instrumentation	25	2
3	FRE4	Reliability Engineering	20	2
4	FRE5	Process Design and Control	30	4
5	FRE17	Embedded System Design & Human Machine Interface	45	6
6	FRE18	Process Instrumentation	45	6
7	FRE8	Emergency Preparedness and Disaster Management	20	2
		Total	**215**	**26**

MODULE III- OPERATIONS

S. No	Code	SUBJECT TITLE	HOURS	CREDITS
1	FRE9	Plant Control	25	3
2	FRE10	Turbine Generator Fundamentals	25	3
3	FRE11	Mechanical and Electrical Equipments	25	3
4	FRE12	Maintenance Engineering	25	3
5	FRE13	Regulatory Framework for NPPs	25	3
6	FRE14	Practical's	6 Weeks	12
		Total	125	27
		Total	515	74
1	**Viva-Voce**			**2**
		Grand Total		**76**

Fast Reactor Engineering - 2018
MODULE - I : FUNDAMENTALS

1. Nuclear Reactors and Sodium Technology (NR) (50 Hours)

S.No.	Course content
A.	**Mechanical Aspects of Power Plant Engineering:** Basic thermal Cycle used in NPS, means of Improving cycle efficiency, Major components in thermal and Nuclear stations, Heat Balance typical calculations, Details of equipment – Steam Generators, Turbines, Condensers, Feed Water heaters, De-aerator feed pumps, condensate and other pumps: condenser cooling water system: C&I; steam pressure control, steam discharge and steam dumping features.
B.	**Thermal Power Reactors :** Layout of Nuclear Power Plant; Zoning requirements: layout of typical PHWR; description of layout in the reactor building; Special requirements for'; nuclear components regarding material selection, reliable operation with examples of pumps, valves, heat exchangers etc. operating environment (including capabilities to withstand seismic loads). Description of calandria, end shield and coolant channel (including fitting). Description of reactivity control scheme and related hardware e.g. zone control, regulating rods, absorbers, shutdown systems etc. Fuel and Fuel transfer system; Primary Heat Transport System; emergency core cooling system; Moderator system; Auxiliary System; Description of process Water, Fire Water and Ventilation system (emphasis on role played as safety support systems); Containment and associated safety systems to mitigate consequences of accidents and contain reactivity release; ultimate heat sink and heat removal paths. A brief overview of PWR, BWR and AHWR
C.	**Fast Power Reactors :**
1	Fast Reactor Physics and Safety: Role of FBR's, breeding ratio, doubling time, core design features - Static and Dynamic, control rod design, shielding principles, Fuel management, safety.
2	Overview of FBR: FBTR and PFBR. Comparison of FBRs: Core & important design parameters, comparison of core components, major primary and secondary system components.
3	Core Engineering: Description, choice of core materials, Engineering design of core, High temperature design methods.
4	Heat Transport Systems: Introduction, Design of IHX, SG, sodium pump, sodium piping, Decay heat removal system.
5	Instrumentation & Control: FBR instrumentation requirements, Neutronic Instrumentation and failed fuel detection methods, Reactor protection instrumentation and process instrumentation.
D	**Sodium Technology**
1	**Properties of Sodium:** Physical and chemical properties, (Hazardous nature and sodium-air, sodium-water reactions), heat transfer properties, Manufacture of sodium, Heat transfer in liquid metals, Hartman effect in liquid metals
2	**Sodium Systems – General Description:** Components of a sodium system, process, cover gas system etc. **Impurities in Sodium, Purification Methods:** Impurities in sodium, purification methods, impurity monitors, (plugging indicator, on-line hydrogen, oxygen and carbon monitors) **Sodium System:** Components, piping and Quality Control Materials, design aspects, tanks, valves, vapor traps and other mechanical engineering aspects, sodium centrifugal pumps, high temperature piping for sodium, fabrication aspects, quality control **Sodium Pumps and flowmeter:** Electromagnetic pumps and flowmeter for sodium systems **Electrical Systems for Sodium Loops:** Electrical supply, heating systems, heater control, types of power supply

3 **Instrumentation and Control:** Level, leak, flow and temperature monitoring, pressure measurement, control of process parameter in sodium systems, under sodium viewing.

System Operation Aspects: Sodium system pre-commissioning checks, methods of checking all components, limiting conditions of operation, surveillance checks etc.

Sodium component cleaning, fire and safety

Sodium removal and sodium disposal methods, sodium fire and extinguishment methods, system and industrial safety aspects.

Books suggested:

1. Nuclear Power Engineering, M. EI-Wakil, Mcgraw Hill Book Co., New York.
2. Steam Power Station, G.A. Gassort.
3. Power Plant Engineering & Economics, Strosal & Vapet.
4. Central Electricity Generating Board (London), Modern Power Station Practice, Nuclear Power Generation Ed 2, Oxford, Pergamon, 1971.
5. Weisman. J. Modern Power Plant Engineering, Englewood Cliffs, Prentice Hall, 1985.
6. IAEA Directory of Nuclear Reactors, Vol. IV, Power Reactors, Vienna.
7. Fast Reactor Technology: Plant Design, J. G. Yevick, M.I.T. Press.
8. Fast Breeder Reactors, A.E. Waltor & A.B. Reynolds, Permagon Press.
9. Status of liquid metal cooled fast reactor technology, IAEA-TECDOC—1083
10. Material for Sodium Technology portion will be provided during the course.

2. Reactor Engineering (RE) (40 Hours)

S.No.	Course content
A.	**Core design**
1.	Introduction - Role of FBR, Main Characteristics of LMFBR, Sodium as coolant, Core Configuration, Definition of NSSS & BOP, Pool & Loop Type Design.
2.	Fixing Size & Parameters of LMFBR - Test Reactor, Commercial & Prototype Reactor, Unit energy cost, Hot Spot temperature of Clad, Optimisation on Pin Diameter.
3.	Definition of Smear Density, DPA & Burn up.
4.	Fast Reactor Core – Fuel, Basic Requirements, Choice of fuel material, Candidates for Fuel, Swelling, Fabrication cost, Reprocessing, Negative Doppler coefficient, Thermal expansion, Burnup.
5.	Absorber – required features, candidate materials.
6.	Structural Material in Core - Requirements of Core Structural Material, Effect of Neutron Irradiation on SS, Radiation Hardening, Embrittlement, Void Swelling, Irradiation Creep, Effect of Swelling & irradiation induced creep, Efforts to reduce swelling
7.	Sub-Assembly (SA) Design - Basis for Number of pins in a fuel SA, Pin spacers, Gas Plenum, Duct considerations, Volume Fraction, Assembly Length.
8.	Other Subassembly design - Blanket, CSR, DSR, Reflector, Inner B_4C, Outer B_4C and Steel Shielding subassemblies.
9.	Thermal Design of Fuel Pin - Thermal Analysis, Causes for fuel restructuring, Developing Analytical Model, Necessary physical parameters, Na Heat Transfer coefficient, Hot spot Analysis, Calculation of temperature distribution across fuel pin.
10.	Mechanical Design of Fuel Pin - Failure Criteria for Pin, Strain Limit Approach, Cumulative Damage Fraction, Stress analysis, Cladding wastage.
11.	Hydraulic Design of Core - Factors to be reviewed for Core Hydraulic Design - Hydraulic lifting force, Mixing studies, Power flattening & flow zoning, Vibration.
12.	Handling of core subassemblies - Inherent problems associated with on-line fuel handling, Fresh SA Handling, Spent SA Handling.

B. Coolant circuits

1. Selection of coolant for FBRs, thermal, transport, nuclear, chemical and other considerations. comparison between various coolants. Special characteristics of sodium. Its impact on heat transfer and structural mechanics considerations. Selection of structural materials, basis and important alloying elements
2. Main heat transport system: primary and secondary sodium system, necessity of intermediate loop. Safety Grade decay Heat removal system, Decay heat, necessity for independent system.
3. Features of major components such as intermediate heat exchangers, steam generators, sodium to air exchangers, sodium pumps, electro magnetic pumps, sodium tanks, support design for sodium components from thermo mechanical and seismic considerations, sodium valves and types
4. Design criteria, Loadings to be considered, Analysis method and validation methodology
5. Special characteristic of sodium piping, sodium leak, sodium fire, various types of leak detectors, continuous and discontinuous level detectors etc.
6. Sodium purification loop, oxygen control, plugging indicator, cold trap, characteristics and features
7. Operating experiences of fast reactors, failures and sodium leaks reported for Phenix, Monju, PFR and other fast reactors, reasons for leak and remedy.

Books suggested:

1. Fast Breeder Reactors - Walter, A.E. & Reynolds, A.B., PERGAMON Press.
2. Fast Reactor Technology - Plant Design - Yevick, J.G., M.I.T. Press.
3. Fundamental Aspects of Nuclear Reactor Fuel Elements - Donald R. Olander, U.S.Department of Energy, 1985.

3. Fast Reactor Physics and Shielding (RP) (35 Hours)

S.No.	Course content
A	**NUCLEAR THEORY BASICS :**
1	**Properties of Nuclei:** Size, shape and density of the nucleus, nuclear forces, nuclear structure, binding energy, stability of nucleus, radioactivity
2	**Fission Process :** Spontaneous and induced fission, liquid drop model, fission neutrons, delayed neutrons, fission gammas, fission products, fission product yield, FP mass asymmetry, formation and removal of FPs in a reactor
3	**Concept of Nuclear Reactor** Fission energy, fission rate and reactor power, energy balance, fissile, fertile and fissionable materials, reactor materials: fuel, coolant, structure, control and shield, fission product activity after shutdown – decay heat, types of reactors
4	**Interaction of Neutrons with Matter** Production of neutrons, elastic and inelastic scattering, radiative capture and their significance in reactors, production of photo neutrons, transmutation
5	**Concept Cross-section** Microscopic and macroscopic cross-section, mean free path, Maxwell-Boltzmann distribution and its departure, structural changes caused by neutron reactions
6	**Variation of Cross-section with Energy** Fast, resonance and thermal ranges, 1/v law of neutron cross-section, resonance absorption, Breit-Wigner formula, Doppler effect Capture to fission ratio, Eta vs E curve, conversion and breeding concepts, Thorium utilization
B	**BASIC REACTOR PHYSICS-STATIC**

1 **Diffusion of Neutrons:** Fick's law and its validity, steady state neutron diffusion equation, concepts of neutron flux and current, interface conditions, diffusion coefficient, diffusion length and extrapolation distance

2 **Chain Reaction :**Four factor formula, conceptual treatment of diffusion of one group of neutrons in non multiplying and multiplying media, infinite and effective multiplication factors, bare homogeneous reactor concepts, material and geometrical buckling, sub criticality and super criticality, critical mass, non leakage probabilities in bare homogeneous cores, neutron cycle and life time in finite reactor

3 **Slowing Down Process:** Neutron Slowing down, slowing down power and moderating ratio of moderators, slowing down with spatial migration, Fermi age concepts, migration length, multi zone reactors, ideas of reflectors/blankets, reflector savings, form factor

C TIME DEPENDENCE

1 **Reactor Kinetics:** Time dependent neutron diffusion equation, one group kinetic equation, role of delayed neutrons, prompt neutron life time, point kinetic model to illustrate importance of delayed neutrons, reactor period, reactivity and its units

2 **Core Burnup and Neutron Poisons**: Burnup equations including fission products, Xenon and Samarium poisons, Xenon loads (operating and post shut down), variation of Xenon load with power and enrichment, Xenon oscillations and their control

3 **Reactivity Coefficients and Reactor Experiments**: Temperature and void coefficients of reactivity, their relevance to reactor safety

Techniques to control reactors, typical reactivity balance, long term burnup, fuel management, reactor control system – requirements of physics aspects, reactor shutdown mechanisms and neutron monitoring during operation and shut down

Approach to criticality, physics measurements and calibrations/validations

D FAST BREEDER REACTORS

1 **Introduction:** Fast reactors as breeders, comparison of fast and thermal reactors, types of fast reactor, role of fast reactors in Indian nuclear power program

2 **FBR Neutronics:** Neutron spectrum, reaction cross-section, core characteristics, blanket characteristics, breeding potential, breeding ratio and breeding gain, doubling time, Multigroup diffusion theory methods and summary of steady state computational methods for FBR

Effective delayed neutron fraction and prompt neutron life time, fuel expansion and bowing, sodium void reactivity effect, Doppler reactivity effect, long term reactivity effect - in FBR

3 **FBR Core Design:** General features of FBR core, specific power, linear rating, burnup, fluence, requirement and choice of core materials (fuel, coolant and structural materials), test reactors, commercial fast reactors, pin diameter, core height/diameter ratio, blanket thickness.

4 **Salient physics aspects of FBTR and PFBR**

5 **Reactor Shielding:** Source of various neutron & Gamma radiation within the reactor system; Attenuation of neutrons & gamma rays; Dose rates for gamma rays for various source geometries; Buildup factors for homogeneous & multiple layer shields; Removal diffusion theory for neutron attenuation; coolant activation, heat generation. Streaming of radiation through gaps & void in the shield; description of various shielding arrangements of Indian reactors

Books suggested:

1. S. Glasstone and S. Sesonske, Nuclear Reactor Engineering, Van Nostrand, 1963.
2. S. Glasstone and M.C. Edlund, Elements of Nuclear Reactor Theory, Van Nostrand, 1952.
3. J. R. Lamarsh, Introduction to Nuclear Engineering, Addision Wesley, NY, 1960.
4. M. El-Wakil, Nuclear Power Engineering, McGraw-Hill
5. P.P. Zweifel, Reactor Physics, McGraw-Hill, 1973.
6. Weston M. Stacy, Nuclear Reactor Physics, John Wiley & Sons, Inc. A.E. Walter & A.B. Reynolds, Fast Breeder Reactors, Pergamon Press

4. Materials and Metallurgy (MM) (25 Hours)

S.No.	Course content
1.	**Classification of Materials**: Structure, Ferrous and non-Ferrous metals, Polymers, Ceramics, Composites, Electronic materials, Nano-structured materials.
2.	**Selection of Materials**: Classification of carbon steel, low alloy, carbon molybdenum, ferritic, austenitic and martenistic stainless steel. Selection and application of advanced alloys, stainless steels, Cr-Mo steels, Ti-alloys
3.	**Heat Treatment and Mechanical Testing of materials including standards and specifications**: Mechanical properties of materials & their evaluations as per ASTM or equivalent standards, tension, hardness, creep, fatigue (low & high cycle) & impact toughness tests.
4.	**Metal Forming, Welding Science & Technology**: Metal fabrication technologies, rolling, forging, extrusion, deep drawing and introduction to material modelling. Welding metallurgy for stainless steels, ferritic steels, dissimilar metal welds and Ti-alloys, hard-facing and repair welding.
5.	**Metallographic Examination**: Experimental techniques for characterization of microstructure (Optical, TEM/SEM and microscopic techniques) specimen preparation and evaluation of microstructure of different materials.
6.	**Corrosion**: Galvanic, Uniform, Crevice, Stress corrosion cracking, Corrosion fatigue, Corrosion fast reactors and re-processing plants, Corrosion test methods and standards.
7.	**Non-destructive evaluation techniques for materials and components:** Visual, LPT, MPT, UT, Eddy current, X-ray Radiography, Neutron, Gamma ray etc. for quality assurance and in-service inspection.
8.	**Nuclear Fuels**: Production, fabrication, properties and application of nuclear fuels (metallic fuels, ceramic fuels (oxide, mixed oxide, mixed carbide)) and heavy water. Radiation damage and post irradiation examination of core materials.

Books Suggested:

1. Introduction to Materials Science for Engineers - James Shackelford
2. Physical Metallurgy Principles & Practice - V.Raghavan
3. Introduction to Solids - L.V.Azaroff
4. Structure and Properties of Materials - Wulff Series, Wiley Eastern, New Delhi
5. Materials in Nuclear Application - C.K.Gupta
6. Nuclear Chemical Engineering - Benedict and Pigford
7. Physical Metallurgy, Reed - Hill
8. Heat treatment of steel - Avener
9. Introduction to Solid State Physics - Charles Kittel (Wiley Eastern)
10. Physical Metallurgy: Principles and Practice - V. Raghavan (Prentice Hall)
11. The Physics and Chemistry of Materials - Joel Gersten and Fiedenick Smith (Wiley, Canada)
12. Fundamentals of Materials Science and Engineering - D. Callister (Wiley, Europe)

5. Health Physics and Radiological Safety (HP) (25 Hours)

S.No.	Course content
1.	**Introduction:** Radiation sources: Natural and Induced radioactive sources, units of radioactivity, half-life and decay constant, specific activity. Basic interaction mechanism of a) alpha b) Beta c) Gamma/X-rays d) Neutrons with matter. Definition of various dosimetric terms (exposure, absorbed/equivalent/effective dose, concept of radiation/tissue weighting factors and their importance (SI units & new units). Concepts of Exposure measurement: Free air and Air wall chambers, Exposure-dose relationship, Bragg-Gray principle.
2.	**Biological effects of Radiation:** Human body: Cells, tissues and organs, structure of cell, cellular effects. Factors, which influence the damage of cell. Interaction of radiation with biological matter. Radiation effects: stochastic and deterministic. Acute and delayed effects. Types of exposure (natural, occupational, medical and public).
3.	**Radiation Protection and Regulations:** Importance of radiation protection program in DAE, Atomic Energy act, National and International regulatory bodies, their role and responsibilities., Radiation Protection Rules, Dose limits stipulated by these bodies. Dose limits observed in India. Radiation protection philosophy, Principles of radiation protection, concept of ALI & DAC (with suitable problems). Fundamentals of ICRP respiratory model, entry through ingestion, GI track model. Principles of radiation detection and monitoring: Basic operating principles of a) Gas b) Scintillation (including thermo luminescence detectors) and c) Semiconductors detectors Type of Radiation monitors/Radioactivity measurement methods adopted for radiation protection
4.	**Radiation protection and measurement (External and Internal):** Control of external exposures (with problems in each case). Buildup concept, shielding from alpha, beta, gamma and neutron sources. Shielding from mixed sources. Routes of intake of radioactive material, Radiotoxicity and classification of laboratories, design of laboratory for radioactive work, Radioactive waste classification and management. Personal monitoring, area-monitoring, air monitoring. Bioassay, whole body counting techniques. Use of personal dosimeters (TLDs, pocket dosimeters)
5.	**Radiation Protection procedures:** Procedures followed in radiation work places, work permits, zoning concept, contamination control methods, and rubber areas, spill pack (gloves + absorbing paper), Decontamination techniques. Precautions during radioactive source storage and handling, safety during transportation. Nature of duties and responsibilities of Radiation Safety Officer/Health Physicist.
6.	**Nuclear Accidents, Emergency Preparedness and Management:** Reasons for accidents, classifications of accidents, International Nuclear Events Scale. Types of emergency, emergency preparedness.
7.	**Radiological aspects and Environmental Impact of FBRs** Radiological aspects of Fuel Cycle Facilities

8.	**Industrial Safety Aspects**: Introduction to Industrial Safety (accident prevention technique, Job safety analysis, control measures), Factories Act, 1948 & Atomic Energy Factories Rules, 1996, industrial safety aspects (Physical and Chemical Hazards),Industrial safety aspects (safety in Machineries, hand tools & Material handling equipments, personal protective equipments, etc)Construction safety (includes Electrical Safety & Work Permit System)

Books suggested:

1. Introduction to Health Physics – Herman Cember
2. Introduction to Radiation Protection – Alan Martin
3. IAEA Regional Basic Professional Training Course on Radiation Protection (Course jointly organized by BARC and IAEA), October 26-Dember 18, 1998
4. Nuclear Radiation Detection - W.J. Price
5. Radiation Detection and Measurement - G.F. Knoll
6. Biological Effects of Radiation – J.E. Coggle
7. Nuclear Radiation Detectors by S.S. Kapoor and V.S. Ramamurthy (Publication: New Delhi, Wiley Eastern Ltd, 1986)
8. Atoms, Radiation and Radiation Protection by James E. Turner 1986
9. Problems and solutions in Radiation Protection by James E. Turner, 1988
10. Guide Lines for Hazard Evaluation Procedures – American Institute of Chemical Engineers
11. Risk Analysis in the Process Industries: The Institute of Chemical Engineers, England.
12. Loss Prevention in The Process Industries: Hazard Identification, Assessment and Control; Vol-1, 1996 2 Edition, Frank P Lees.

MODULE II A- CORE ENGINEERING (ELECTRICAL AND ELECTRONICS)

1. Reactor Control Engineering (FRE15) (30 Hours)

S.No.	Course content
1.	Physics of Reactor Control
2.	Reactor Kinetics – Point kinetic model, reactor response to step and ramp reactivity inputs, stable reactor period.
3.	Reactor as a control element: basic zero energy state space model and transfer function, feedback loop transfer functions, effect of temperature and voidage, poisoning due to xenon and samarium, fuel burn-up, reactor system stability analysis from transfer function and state space model. Manual and computer control.
4.	Large reactor control: Neutronically decoupled cores. Modeling techniques for large reactors-modal, nodal and quasi-static methods (introduction only) flux tilt and spatial instability.
5.	Typical reactor control system: BWR, PWR, PHWR, Fast Reactor, research reactor and 235MWe PHWR, FBTR and PFBR.
6.	Reactor operation: Approach to criticality, re-start up, operation in power range, shut down.
7.	Power plant control: Power plant programming. Constant T_{av} program, constant pressure program, boiler level and pressure control. PHT pressure control. Pressuriser pressure and level control. Secondary circuit and feed water control.

Books Suggested:

1. Nuclear reactor physics – W.M. Stacey. John Wiley and sons. 2001.
2. Nuclear reactor kinetics – Ash. M. Mcgraw Hill, Newyork, 1979.
3. Nuclear reactor kinetics and control, Weaver. L.E. American Elsevier, 1968.
4. Optimal control of nuclear reactors, Mohler.R.B. and Shen.C.N., Academic Press. 1970.

2. Nuclear Instrumentation (FRE16) (25 Hours)

S.No. **Course content**

1. Fundamental considerations/philosophies, requirements and scope-Reactor and Health Physics Instrumentation
2. Principles of detection and types of radiation detectors: in-core and out – of –core. Consideration in reactor start-up (cold & hot) and normal operation, GM counters, Scintillators, Gamma Ion chambers
3. Detector signal conditioning (Pulse, Campbell and DC modes) and generation of logarithm & period signals
4. Block Schematics of Pre-amplifier, Count rate meters, Nuclear ADCs, MCA, Low-voltage and High voltage Power supplies, Scalar timers.
5. Introduction to various reactor instrumentation and radiation monitors:
6. Start-up, Intermediate and Power Range Instrumentation, Reactor Regulating System, Flux Mapping System, Failed Fuel Detection System, Stack Monitoring System, Area Gamma and Neutron Monitors, Contamination Monitors, GM Survey meters, Gun monitors, Neutron REM monitors, RADAS

Books Suggested:

1. Radiation Detection and measurement -G.F. Knoll
2. Nuclear Electronics - P.W. Nicholson
3. Selected topics in Nuclear Electronics, IAEA-TECDOC-363 (CC library Acc no: 123583)
4. Nuclear Power Reactor Instrumentation Systems Handbook, Vol: 1 J.M. Harrer, J.G. Beckerly
5. The Technology of Nuclear Reactor Safety Vol1, T.J. Thompson, J.G. Beckerly

3. Reliability Engineering (FRE4) (20 Hours)

S.No **Course content**

1. **Introduction: Reliability Engineering Applied to C&I Systems**
   Explain the course coverage and the general issues related to the reliability and safety of the current C&I Systems. The reliability of computer based C&I system as a function of circuit hardware, software and human errors experienced in the NPPs and research reactors.
   Terms and definitions with adequate explanation and giving examples from electrical, electronic and computer based systems.
   Quality, Reliability, Availability, Maintainability and supportability, MTBF, Failure and hazard rates, CCF, CMF, Failure Modes, FMEA, FMECA, Fault tolerance, Confidence and Risk Factors etc.
2. **Reliability Maths/Statistics:**
   - Mathematical and statistical expressions required for reliability study
   - Types of failures in electrical, electronic and computer components
   - Failure probability concept, statistical distribution models
   - Binomial, Poisson, Exponential, Normal, Lognormal, Weibull distributions
   - Chi-square distribution and its use in confidence and risk factors
   - Baye's theorem
   - Reliability or life characteristics of hardware electronic circuit components, and comparison with the characteristics of mechanical/electro-mechanical components and computer software.
   - Bath-tub curve and explanation of different parts of the life characteristic curve, and corresponding failure distributions
   - Derivation of exponential reliability expression

- R(t)=[exp-(lt)] for electronic components and systems.
- Examples to solve

3. **Fault Tolerance and Systems Reliability:**
    - Fault tolerance concept for electronic and Computer based C&I systems.
    - Circuit hardware redundancy concept to enhance system reliability, types of redundancy
    - Series, parallel, active, passive, and voting redundancy
    - Redundancy and other fault tolerance methods for software
    - FMEA, FMECA concepts for C&I and Examples to solve
    - Concepts for the analysis of System Reliability, availability, and maintainability.
    - System reliability and availability analysis methods
    - Boolean logic
    - Digraph, cutest-tie set method
    - Fault tree model, and consideration of CCF, CMF, software errors
    - Markov Model

    Example from C&I system in the NPPs
4. **QA/QC Concepts in Brief:**
    - QA/QC Concepts in the components, systems procurement, manufacture and Site installation for C&I systems in the NPPs.
5. **Environmental Qualification and Reliability Testing:**
    - Environmental qualification, testing of the C&I systems
    - Effects of various environments on the electrical/ electronic components
    - Climatic Qualification tests: Temperature, Humidity
    - Special environments: EMI/EMC tests on C&I Systems, Gamma radiation/LOCA Qualification tests
    - Reliability Testing of the electronic components, equipment and C&I systems
    - Reliability screening tests for electronic components
    - Accelerated environmental tests
    - Failure terminated and time terminated tests
    - Estimation of MTBF (q)/Failure Rate(l) of electronic components and systems using c2 distribution for confidence level.
    - Few examples to solve
6. **PSA/PRA Concepts in NPPs:**
    - Probabilistic Safety (Risk) Assessment: PSA/PRA methods or safety/ risk assessment in the NPPs
    - Explain Event Tree
    - Fault-Tree-Fault Tree method for risk assessment in terms of core damage frequency
    - Level-1, Level-2, Level-3 PSA studies (Brief introduction only)

7. **Additional safety concepts:**

- Defense-in-depth, fail-safe concepts in the design of C&I, and other safety critical systems in the NPPs.
- Single failure criteria, engineered safety systems in the NPPs
- Safety Classification and Seismic categorization of C&I Systems
- Target reliability goals, reliability allocation to safety systems as per their safety importance in the NPPs
- Reliability and safety aspects for the integrated C&I systems
- (hardware, software, human errors considerations)
- IEC, IAEA, AERB, IEEE standards relevant to C&I in the NPPs
- Human Factors (man-machine interface) reliability, and human reliability issues in the NPPs

Current research topics in reliability and safety analysis such as Fuzzy Logic, Neural Network Methods, etc

Books Suggested:

1. Reliability Engineering for Nuclear and other High Tech Systems By Lakner and Anderson, Elsevier
Applied Sci. Publ. (1985)
2. Reliability Engineering for Electronic Systems By R.H. Mayers et al, John Wiley, NY (1964)
3. Practical Electronics Reliability Engg By Jerome Klion, Van Nostrand, NY (1992)
4. Reliability and Risk Analysis By Norman J McCormick, Academic Press (1981)
5. Fault Tolerant and Fault Testable Design By Parag K. Lala, Prentice Hall, (1985)
6. Dependability of Critical Computer Systems, Vol.1&2 By F.J. Redmill, Elsevier Applied Sci. Publ.
(1988)
7. An Introduction to Reliability and Maintainability Engg By Charles E. Ebeling, Tata-McGraw Hill
Publ. (1997)
8. Reliability Technology By A.E. Green and Bourne, UKAEA, John-Wiley (1972)
9. IEC Standards: 880, 987, 1225, 1226 on C&I Systems
10. AEA Safety Standard/Guide G:1.3, Instrumentation & Control for the safety of Nuclear Power Plants
(2002)
11. IAEA-TECDOCS: 780, 790 on Computer based C&I Systems.
12. MIL-Std-217F: US Military Handbook: Reliability Prediction of Electronic Equipment
(1993)
13. Reliability of Computer and Control Systems by Viswanadham et al, North-Holland/ Elsevier
Publ.(1987)
14. Software Reliability Methods, by Doron A.Peled (Bell/Lucent Labs), Springer Publisher
(2001),
('Formal Methods' has been explained).
15. Handbook of Reliability Engg Ed. Igora Ushakov & R. Harrison John Wiley & Sons (1994)
16. Burn-in by Fenn Jenson Failure Models by I.B. Gertsbakh
17. System Reliability_ Concepts & Applications by K.B. Klassen (1989).

4. Process Design and Control (FRE5) (30 Hours)

S.No.	Course content
1.	State Variable Descriptions Introduction, The concept of state, Elementary definitions, state space representations of continuous-time and discrete-time systems, State diagrams, illustrative examples, solutions of state equation, state transition matrix, computation methods of state transition matrix, relationship between state equations and transfer functions, characteristic equations.
2.	Controllability and Observability: Introduction, definitions of Controllability and Observability, Controllability and Observability tests, Kalman Controllability Criteria, Principle of Duality, Controllability and Observability of discrete – time systems
3.	Control System Design: Introduction to state feedback, Controller design using pole placement technique, Stabilizability, LQR technique.

Books Suggested:

1.John J.D'Azzo and C.H.Houpis, "Linear Control System Analysis and Design- Conventional and Modern", 2nd Ed. McGraw Hill Book Co.1986.
2.Chi-Tsong Chen, "Linear System Theory and Design", CBS College Publishing, Holt, Rinehart and Winston, 1984.
3.M.Gopal, "Modern Control System Theory", 2nd., Wiley EasternLtd.,1993.
4.Gene F. Franklin et al, "Feedback Control of Dynamic Systems", 3rdEd., Addison-Wesley Publishing Co. 1994.
5.B.Friedland, "Introduction to State-space methods"
6.K.Ogata, "Modern Control Engineering", Prentice- Hall.
7.H.Kwakarnaak, R.Sivan-"Linear Optimal Control Systems"-Wiley interscience
8.D.G.Schultz,James.L.Melsa- "State Function and linear control systems"- McGraw Hill.

5. Embedded System Design and Human Machine Interface(FRE17) (45 Hours)

S.No. **Course content**

Embedded System Design

A. Microprocessor Based Hardware Design:

1. Overview of Microprocessors: Comparative study of Intel and Motorola family microprocessors (80186, 80486, Pentium series, 68XXX), Overview of 16-bit Micro-controllers (e.g. 80196), Overview of 8-bit Atmel Micro-controller (AT89C51), Real Time Clock, DSPs (e.g. TMS320, SHARC family) and ARM processor.
2. Personal Computers: Architectures, Memory organization, Industrial PC, Embedded PC
3. Industry Standard Bus Systems: ISA, PCI, VME: Mechanical, electrical, functional & procedural specifications, multi-processing, bus arbitration, plug & play
4. Design Case Study: Single board computer architectures, Remote Terminal Unit, Circuit design, and logic design, application of FPGA and CPLDs, ac/ dc analysis, timing analysis, thermal, EMC and signal integrity analysis. Design accommodations for testability, reliability and maintainability. Physical design and design tools.

B. Computer Communication and Networks

Asynchronous & synchronous communication standards, RS232C, RS485, USB, encoding (NRZI, Manchester), Modems, SDLC, Local area networks, Ethernet, Token passing principles, TCP/ IP, Fibre optic communications for LANs, wireless LANs (WAP, Blue tooth), Industrial networks, Real-time issues in networking, Networking hardware (cables, hub, switch, routers etc.);Concept of Fieldbus, fieldbus standards, Industrial networks and Protocols.

C. Fault Tolerant and Distributed Architectures

1. Principles of fault tolerance, Hot- standby and Triple Modular Redundant (TMR) configurations, software implemented fault tolerance, reliability, and availability and safety issues.
2. Principles of distributed systems, architectures, Distributed control systems, Impact of Internet technology, Web enabled devices.

D. Programmable Logic Controller Design

Basic PLC architecture, PLC Programming Languages, Typical PLC Specifications, Redundant PLC architectures, Relevant communication protocol and standards, PLCs for package systems.

Human Machine Interface

E. Human Machine Interface (HMI)

1. Overview of plant automation, Control Room, Control Panels and Cabinets : Conventional control rooms, Modern control rooms, Control room layout, Environmental specifications for control room, Control room lighting, Control room cabling, Communication systems for control room. Control Panels- Panel types, Panel layout, Panel construction materials, Human Engineering principles in control room and panel design- relevant standards (EPRI; NUREG), Components of control panel, Panel wiring, Power distribution in panels, Wiring and terminal identification. Control Cabinets- Sizes, Materials, Degrees of environmental protection, EMI & EMC protection, Standard accessories for mounting and cable routing. Seismic qualification of control panels and cabinets. Alarm Annunciation System-Functions of alarm annunciation; Types of annunciation (audio/visual); Alarm Sequences; applicable standard (ISA S18.1); Modern alarm displays; Grouping and Coding of alarms.
2. Design of HMI, Soft Console versus Conventional control panels, Virtual Control Panel.
3. PC based process control system, Supervisory Control and DATA Acquisition System (SCADA), Features of SCADA software, SCADA for substation. Concept of Fieldbus, fieldbus standardization, Industrial networks and Protocols.
4. Guidelines for design of HMI displays.
5. Case study of a commercially available Professional HMI package.
6. Building HMI systems, Creating and using process databases, managing databases, Implementing an alarm strategy, Configuring and displaying alarms and messages, Security features, Creating process mimics, Trending historical data, Methods of passing data to HMI package

Books Suggested:

1. Microprocessor and interfacing: D. V. Hall – McGraw Hill
2. The Advanced Intel Microprocessors: 80286, 80386, 80486: Barry. B. Brey, - McGraw Hill
3. Microprocessor, Micro-controller and DSP Handbooks: Motorola, Intel, Texas Instruments, Analog Devices
4. Hardware Bible: W.L Rosch- Tech Media
5. VME Bus specifications: IEEE 1014- 1987
6. Embedded System design – A Unified hardware/ software introduction: Frank Vahid / Tony Givargis – John Wiley and sons

7. Computer networks: A.S. Tanenbaum, Prentice Hall
8. Internetworking with TCP/ IP: Vol I to III: D.E.Comer, Prentice Hall
9. Complete guide to networking: P. Norton & Kearns – Tech Media
10. Wireless communication & networks: W. Stallings – Pearson education
11. Fault-tolerant computing – Theory & Techniques: D.K. Pradhan (Ed), Vol I & II – Prentice Hall
12. The theory and practice of reliable system design: D.P. Siewiorek& R.S. Swarz, Digital press
13. Modern Operating Systems: Andrew S Tanenbaum, Prentice Hall
14. Distributed Operating systems: A .S. Tanenbaum – Pearson education
15. Windows NT device driver development: P.G. Viscarola & W. Mason – Tech Media
16. Real-time systems: Jane W.S. Liu – Pearson education Hill.
17. IntellutionIfix documentation
18. NPC Guidelines for development of soft consoles

6. Process Instrumentation (FRE18) (45 Hours)

S.No.	Course content
1.	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of following process variables: Flow: Differential pressure flow elements: Orifices, venturies, flow nozzles, pitot tube, annubar, elbow flowmeter. Different standard pressure taps for orifices, sizing calculations, straight length requirements. Applicable codes for design of Orifices , venturies and flow nozzles. Orifice flanges, Jackscrews, carrier rings, flow straighteners, square root extractors, flow totalisers. Variable Area Flowmeters- Glass tube rotameters; Armoured rotameters; Bypass rotameters; Density correction factors. Magnetic, Turbine, vortex flowmeter; Ultrasonic flowmeters- transit time, Doppler type, Clamp on type ultrasonic flowmeters, Coriolis and thermal mass flowmeters, air velocity meters. Applications and limitations of various flowmeters. Two phase flow measurements.
2.	Temperature: Thermocouples- Types of thermocouples, ranges, sensitivity and their limits of error and applications, mineral insulated thermocouples, types of hot junctions- grounded, ungrounded and exposed junction, thermocouple extension and compensating cables, high temperature thermocouples, cold junction compensation techniques. Applicable standards. RTDs- Wire wound and thin film RTDs, limits of error, self heating error, matched pair of RTDs. Applicable standards for RTD. Thermistors - performance and applications. Thermowell - Design considerations, Applicable design code for thermowell, thermowell installation aspects. Surface temperature measurement techniques. Temperature transmitters- Head mounted temperature transmitters, isolated temperature transmitters, Smart temperature transmitters. Radiation thermometry- Optical pyrometer, total radiation pyrometer, two colour pyrometer, factors affecting the performance of radiation pyrometers.
3.	Pressure: Manometers-U tube, well and inclined manometers, pressure gauges, hydraulic and pneumatic dead weight testers- ranges and factors affecting the performance of dead weight testers. Pressure Transducers and transmitters- strain gauge, capacitance, LVDT, piezo-resistance type and piezoelectric type pressure transducers, transmitters with remote diaphragm seal, high temperature pressure transducers, Smart pressure and

differential pressure transmitters. Vacuum measurement- Pirani and thermocouple gauges, cold cathode and hot cathode ionization gauge, Mcleod gauge.

4. Level: Hydrostatic pressure and differential pressure methods, wet legs- cold reference leg and hot reference leg, condensing pots, density compensation in boiler level measurement, zero elevation and zero suppression. Gauge glass, Purge system, capacitance probes, displacer, ultrasonic, nucleonic, hydra step level gauge and radar level gauge. Level switches- conductivity, capacitance, ultrasonic, displacer, float type.

5. Analytical Instrumentation: Conductivity, pH, ORP , Turbidity dissolved oxygen, silica and sodium Measurement. Other Measurements: Moisture, Relative humidity; viscosity and density measurement Turbovisory Instrumentation: Measurement of speed, vibration, differential expansion, overall expansion, eccentricity, Governor valve position, CIES valve position, Speeder-gear & load limiting gear position

6. Sodium Instrumentation: Properties of sodium-special requirement of sodium Instrumentation-sodium flow measurement- Magnetic flowmeter, Eddy current flowmeter sodium level measurement-continuous- discrete-resistance type-mutual inductance type- Sodium Leak Detection-spark plug type & wire type leak detection-Sodium aerosol detection - Mutual Induction type leak detectors - Steam Generator Leak Detection systems-Hydrogen in sodium detection- Nickel diffuser based detection-Electrochemical meter based detection-Hydrogen in cover gas (argon) detection- Failed fuel detection system-Gammatography etc.,

   Signal Conditioning Circuits: Operational amplifiers-instrumentation amplifiers-signal linearization techniques, isolation amplifiers-two port-three port isolation.

7. Control valves: Valve types, construction and applications, Valve sizing calculations, Applicable standard for sizing calculations, Control valve rangeability, Valve characteristics-inherent and installed, selection of valve characteristics, Cavitation and flashing in control valves, Valve capacity testing, Valve actuators- pneumatic, hydraulic and electric, selection of actuator, Typical specifications for control valve, Smart valves, valve positioner, I/P converter, P/I converter, volume boosters, air lock relays, Solenoid valves, Pressure regulating valves, Installation aspects of control valves, Quality of air for pneumatic valves.

   Instrument Impulse lines and instrument fittings: Tubes- materials and sizes, tube fittings-materials, types of fittings, instrument isolation valves, guidelines for routing of impulse lines, considerations for impulse line response time. Applicable standards for tubes and fittings.

8. P & I Diagrams, loop and hook up diagrams: P &ID symbols, Applicable ISA standard for P &ID symbols, typical loop diagrams, typical instrument hook up diagrams.

   Control and Instrumentation Power Supplies: Class I, II, III, IV power supplies, Centralized 24V/48V DC power supply, Linear and switching mode power supplies, Fault Tolerant Dual redundancy power supplies, distributed power supplies, quality of power supply, Isolation transformer, grounding/earthing aspects in C & I systems.

9. Reliability principles, Fail safe design principles, Diversity, active and passive redundancy, availability, maintainability, MTBF, MTTR, preventive-predictive-proactive-corrective maintenance-spares inventory control principles, Condition Monitoring etc.

   Note:Course Work -35 Hours and Practicals -10 Hours

Books Suggested:

1. Principles & practice of flow meter Engineering by L. K. Spink. The Foxboro Company.
2. Fluid Meters. ASME publication

3. Manual on the use of thermocouples in Temperature Measurements (ASME Publication by subcommittee 4)
4. Measurement Systems: Application and Design, Ernest O Doeblin
5. Process Control Systems: Application, Design and Tuning, F. G. Shinskey, Mcgraw Hill.
6. Applied Instrumentation in the Process Industries, Volume I & II, Edited by W.G. Andrew.
7. Process Control Engineering, M. Polke
8. ISA Handbook of Control Valves, Editor-in-Chief J. W. Hutchison
9. British Standard Code of practice for Instrumentation in Process Control Systems: installation design and practice (BS 6739)
10. Handbook on Applied Instrumentation: Edited by D.M. Considine and S.D. Ross, Mcgraw Hill
11. Process Instruments and Control Handbook: Edited by D. M. Considine, Mcgraw Hill
12. Instrument Engineer's Handbook, Part I & II: Edited by Bela G Liptak, Chilton Book Company
13. Instrumentation in the Processing Industries Edited by Bela G Liptak, Chilton Book Company
14. IEC standard 61131.3 - PLC Programming Languages
15. Human Factors in Control Room Design - EPRI NP 1118 / EPRI NP 3659
16. NUREG-700 Guidelines for Control Room Design Reviews, U.S. Nuclear Regulatory Commission
17. Eight Open Net works and Industrial Ethernet, (www.industrialethernet.com)
18. Basics of Field bus, Rosemount Inc. (www.rosemount.com)
19. MIL-STD-1553B Standard

7. Emergency Preparedness and Disaster Management (FRE8) (20 Hours)

Emergency Preparedness

Bases and contents of emergency response plan by operating organization, Classification of emergencies - Emergency Standby - Personnel Emergency - Plant Emergency Site Emergency - Off-Site Emergency, Organisation for emergency response – Plant Emergency organization - Site Emergency Organisation – Off-Site Emergency Organisation., Emergency measures – Notification - assessment action during emergency - Corrective Actions - Protective Measures - Contamination Control Measures - Termination of Emergency, Assistance to affected personnel - First-aid - Decontamination - Transportation- Medical Treatment, EMERGENCY PREPAREDNESS – Training - Exercises - Review and Updating of Plans and Procedures - Emergency Equipment and Supplies

Disaster Management

Nuclear and Radiological Emergency/Disaster Scenarios

Nuclear and Radiological Emergency/Disaster Scenarios, Accidents in Nuclear Power Plants and Other Facilities in the Nuclear Fuel Cycle, 'Criticality' Accidents, Accidents during Transportation of Radioactive Materials, Accidents at Facilities using Radioactive Sources , Nuclear/Radiological Terrorism and Sabotage at Nuclear Facilities, Need for a Comprehensive National Radiation Emergency Management System , Disaster Management in India

Approach to Nuclear and Radiological Emergency Management

Strategies for Nuclear Emergency Management, Nuclear Emergency Management, Framework, Prevention of Nuclear Emergencies, Emphasis on Prevention (Risk Reduction) and Mitigation Measures, Prevention (Risk Reduction), Mitigation Measures , Compliance with Regulatory Requirements, Nuclear Emergency Preparedness, Capacity Development , Nuclear Emergency Response, Strengthening the Framework of Nuclear Emergency, Monitoring the Implementation of Nuclear/Radiological Emergency Action Plans

Mitigation of Nuclear/Radiological Emergencies

Mitigation Measures, Defence-in-Depth: Salient Features, Mitigation of Nuclear and Radiological Emergencies, Engineered Safety Features, Accident Management, General Mitigation Features, Engineered Safety Features (to Mitigate the Consequences of an Accident) in Nuclear Power Plants

MODULE III - OPERATIONS

1. Plant Control (FRE9) (25 Hours)

- Control Physics: Review of Reactor Kinetics - neutron power - prompt and delayed neutrons - Criticality – Reactivity Feedbacks - reactivity coefficients Sodium void coefficients;
- Reactor Control Concepts: Start-up - Operation at steady power - shutdown criteria - design considerations - reactivity disturbances and transients.
- Reactivity control devices - reactivity insertion rates – principles. Calibration of control rods.
- Plant Dynamics and Overall Control: Reactor Physics and engineering experiments
  Transient analysis concept - Routine Operating transients - Accidents such as LOCA, LOFA, reactivity excursions etc
- Thermal balance & reactivity balance calculations.

2. Turbine Generator Fundamentals (FRE10) (25 Hours)

- Principles of steam turbine cycle, steam turbines, impulse and reaction turbines, Rankine cycle, velocity diagram for impulse / reaction turbine, state point locus or condition line for multistage turbine, reheat factor, Willan's line variation of stage pressure with load, heat rate, thermal efficiency, peak load, base load, spinning reserve and capacity factor.
- Turbine parts, construction of nozzle, turbine blades, turbine rotor, turbine casing, cylinder supports.
- General design aspects, output of a steam turbine, effect of higher steam inlet pressure, effect of high inlet steam temperature, effect of the size of the turbine, effect of back pressure on the economy of a turbine, effect of reheat, effect of feed water regenerating cycle, double cylinder construction speed of a turbine.
- Nuclear turbine, erosion of blades, methods of reducing moisture content, moisture removal within the turbine, external moisture separator, re-heater, protection of blades against erosions, over speeding of turbine.
- Lubrication of bearings, turbine oil system, theory of lubrication of turbine bearings, viscosity, oiliness, boundary lubrication, film lubrication, the journal bearing, hydro dynamic lubrication, hydrostatic lubrication, properties of oil, additives, treatment of oil.
- Governor theory, basic methods of governing, throttle governing, nozzle governing, difference between governor and fly wheel, types of governors, centrifugal governor, effect of friction, speed droop, speed regulation for machines operating, inertia governor, electric governor, new governing systems used in the latest NPPs.
- Turbovisory instruments, purpose of turbovisory instruments, location of Turbovisory instruments, differential expansion indicator, eccentricity recorder, turbine pedestal movement indicator, speed indicator and recorder, vibration indicator.
- Turbine commissioning, pre-start commissioning, lubricating oil system, checking tightness of vacuum system, flushing the condensate, feed water and other piping of the various sub-systems, turbine supervisory instruments, governor systems, main steam line blow out, Vacuum pulling, starting a new turbine for the first time.

- Pre-heating of turbine, cold start and hot start, heating process, heating rates, differential expansion of cylinder and rotor, effect of flanged horizontal joint, flange bolts, conditions in a standing hot turbine, turbine shaft turning gear, thermal expansion during warming up.
- Operation of turbine, start-up procedure, on-load operation, routine tests, turbine shutdown procedure.
- Turbine troubles, shaft vibration, disc vibration, blade vibration, internal defects of material, expansion of steam piping, corrosion of blades and diaphragms, turbine blade deposits.
- Protection and safety devices, turbine regulating system, turbine protective system, protections on boiler feed pumps, H.P. heaters and L.P. heaters
- Inspection and overhauling, lifting the cover, inspection of diaphragms, checking the clearances, inspection of rotor, Inspection of shafts, inspection of steam valves.
- Condensers, design of condenser, effect of changes in cooling water temp. in condenser operation, effect of varying cooling water flow on condenser back pressure, air leakage, water leakage, maintenance of condensers, condenser as a deaerator, back washing of condenser, Hoggers and methods of vacuum creation, replacement of Hoggers with vacuum pumps, reasons for this replacement and their advantages.
- Regenerative feed heating, selection of feed heating system, components of feed water system, effectiveness of feed water heater, deaerating contact heaters, deaerators, closed heaters, cascading of feed water heater drains, venting of feed water heaters, performance of feed heaters.
- Boiler feed pumps, condensate extraction pumps and controls, Boiler feed pump and controls, Boiler feed pump recirculation and up warm-up lines, Net Positive Suction Head (NPSH) for a pump, boiler feed pump NPSH.
- Chemical control, design intent of a system chemical control, review of basis and material of construction, co-ordinated phosphate pH control, all volatile or zero solid treatment, mixed treatment, Oxygen scavenging, ferrous sulphate injection for prevention of condenser tube corrosion.
- Generator and auxiliaries, stator cooling water system, hydrogen cooling system, seal oil system.

3. Mechanical and Electrical Equipment (FRE11) (25 Hours)

- Bearings and Lubrication, Types and identification of bearings - Illustration of different types of bearings - Selection of bearings - Lubrication methods - Types of lubricants - Lubricant properties - Bearings and lubrication methods used in: - Turbine – Primary & Secondary sodium Pumps - Boiler feed pump Bearing mounting in motors (Horizontal and vertical) - Operating care for bearings - Causes of bearing failure.
- Seals, Types of static and dynamic seal. Gland packing - Mechanical seal - O ring – etc. Inspection of mechanical seal - Causes of failure of mechanical seals - Operating care for all the seals - Importance of seals in nuclear power plant operation.
- Power Transmission, Types of couplings and belts - Application of various couplings like tyre coupling, love joy coupling, steel flux coupling, bush and pin sliding disc, sliding block, flange muff and coupling. - Types of misalignment - Effects of misalignment on equipments.
- Pumps, Types of pumps - Centrifugal, rotary and reciprocating pumps – Pumps used in Sodium system-Construction details of pumps - Types of casing - Types of impeller - Effects of radial thrust and axial thrust - Methods of balancing of radial thrust and axial thrust - Operation of centrifugal pump, external gear pump, internal gear pump, screw pump, radial piston pump - Head - Flow characteristics of centrifugal pump - System head characteristics - Power characteristics of centrifugal pump - Effect of drooping head characteristic - Cavitations, aeration and Net Positive Suction Head (NPSH) - Series and parallel operation of centrifugal

pump - Practical operation of centrifugal pump and rotary pump - Effect of direction of rotation - Primary heat transport pump - disassembly and assembly - alignment procedure - lift adjustment - Canned rotor pump details, operation and testing – Trouble shooting procedures. Vacuum pumps - Types of vacuum pumps.

- Electromagnetic Pumps – types of EM pumps – construction- characteristics- protections for EM pump-Operation of EM pumps.
- Valves and Actuators, Types of valves - gate valve - globe valve - check valve - relief valve and safety valve - butterfly valve - diaphragm valve -bellow seal valve Application of the above valves - Construction detail of valves Gland packing - Live loading - Testing of valves - Types of valve actuator - Features of actuators - Hopkinson actuator -Limitorque actuator -Rotork actuator -piston type actuator - diaphragm type actuator. Operation of the above actuators - Test procedures for valves actuators.
- Sodium system valves – bellow seal valves – frozen seal valves
- Hydraulics, Circuits and control - Hardware in hydraulic circuits -tube -pipe -fittings and connectors :-flared fitting, swagelok fitting, quick disconnect coupling.-hoses - Specifications of hardware parts - Operation and maintenance problems - Hydraulic controls, types and application of - hydraulic cylinder – pressure regulating valves - directional valves - sequence valve -decelerating valves - flow control valves - Effect of pressure and flow of hydraulic oil on actuators.
- Compressors, Types of compressors - Constructional details of - reciprocating compressor - sliding vane compressor. Blowers- Types of Blowers.
- Chillers. Types of Chillers , refrigerants, refrigeration cycles, Air handling units
- Filters, Types of filters & specifications, HEFA filters, testing of HEFA filters
- Heat Exchangers, Types of Heat Exchangers - Types of tube and tube sheet connections - General details of heat exchangers. Types of maintenance
- Piping and Tubing, and pipe fitting.
- Vibration and measurements, Causes of vibration, characteristics of vibration, significance of displacement, velocity, acceleration, phase and frequency. Single plane balancing. Vibration measurement devices.

Power Systems and Electrical Equipment

Part – I: Power Systems

Grid characteristics, Interaction of NPP with grid, Power system analysis and representation, Voltage and frequency control, Synchronous machines, synchronizing and load shedding, Main output and station service systems, Line, transformer and generator protections, Short circuit calculations, Power systems components

single line diagrams, concept of real and reactive power flows, voltage and frequency relations to real and reactive power, AC and DC transmission systems, Automatic voltage and frequency control, Definitions of related plant factors, synchronous machine theory, isolated and parallel operation, Automatic voltage regulator, Stability of alternators, steady state & transient stability, abnormal operating conditions, Excitation systems, loss of excitation, loss of synchronism, current unbalance, switchyard concepts, Station service and unit transformer arrangements, Classes of power supplies, standby systems, Automatic and emergency transfer schemes, Transformer, switchgear and protective relaying concepts, specific relaying for generators, motors, transformers, buses and transmission lines.

Part – II Electrical Equipment

Electrical control components and circuit checks. (415V / 3.3kV / 6.6KV), Principles of electrical control, control circuit components like relays, contactors, switches, fuses, control transformers, indicating lights, terminal blocks, control cables, Reading of electrical drawings,

Local and remote controls, interlocks, push buttons, types of hand switches, forward / reverse controls, resetting meaning of logic, auto and standby modes, motor control centres (MCCs), MCC types, parts, construction, Pump, valve, crane, diesel generator controls, synchronizing controls, circuit breaker controls,
Various types of starters and controls (D-O-L), Star- Delta (manual and automatic)

- Electrical test equipment in commissioning checks.
- Use of test equipment in commissioning including - Meggers, Motor Rotation Testers - Phase Sequence Indicators - Transformer Turns Ratio Testers - Tachometers - Tong testers – Multimeters, Resistance bridges - Stroboscopes - Oscilloscopes – Harmonic Analyzers
- Commissioning tests on motors, generators, transformers, valve actuators, switchgear, protective relays, batteries and chargers
- Motors, Identification of motor leads - Measurement of insulation and winding resistance - Measurement of no load current, speed, bearing checks -Magnetic balance tests - Measurement of power factor
- Transformers, Polarity checks - Measurement of turns ratio, vector group - Insulation checks - No load and short circuit tests - Measurement of magnetizing current - Measurement of %impedance - Measurement of dielectric strength of insulating oil - New types of transformers – dry type transformers - On line tap changers
- Generators, Measurement of insulation and winding resistance - Starting, stopping, synchronizing, loading and unloading - Phase sequence tests, Excitation control.
- Switchgear, Measurement of contact resistance - Measurement of closing and tripping time - Measurement of contact pressures - Study of link mechanisms - Study of stored energy features.
- Valve actuators, Limit and torque switches - Valve position indicators – Types of actuators.
- Protective relays, Calibration of relays - Use of primary and secondary injection tests - Testing of time over current, thermal overload and directional relays - Study of relay test sets - Multiamp, Gyro, English Electric Makes - Solid state protective relays and their use in NPPs – Latest methods in relay testing using micro-processors.
- Batteries, Parts of lead acid cells - Measurement of specific gravity, voltage - Charging and discharging of cells - Study of charging circuits, Nickel cadmium batteries.
- High Voltage Equipment, High voltage equipment and electrical layout study of high voltage equipment like - Current transformers - Potential transformers - Disconnect switches - Capacitor voltage transformers - Line traps - Air blast circuit breakers, SF_6 ,Circuit breakers.
- Lightning arresters.
- Switchyard layout, indoor and outdoor switchyards, problems associated with costal sites - corrosion, salt deposition, line washing.
- Uninterrupted Power Supplies (UPS), Control UPS and Power UPS, SCADA.

4. Maintenance Engineering (FRE12) (25 Hours)

- Overview of maintenance in NPPs, Challenges in NPP maintenance, Maintenance economics.
- Reliability engineering and maintenability, Definition of reliability, bathtub curve, reliability prediction for complex plant, reliability for series and parallel arrangement, Maintainability, Availability, mean time to failure, (MTTF) mean time to repair (MTTR), means adopted to improve reliability in NPP.
- Maintenance policies, Different types of maintenance policies, fixed time maintenance, condition based maintenance, opportunity based maintenance, operation to failure maintenance, design out maintenance. Application and relative advantages and disadvantages of the policies.
- Maintenance planning, maintenance decision making, maintenance planning, manrem budgeting, determination of maintenance plan, classification and identification of equipment, equipment histories, selection of maintenance policy, preventive maintenance program.

- Spare parts management and inventory control, Requirement of the spare parts management. Economic order quality. Safety stock and when to order. Special condition for storage of sensitive spares, shelf life management.
- Condition based maintenance, Requirement, relative advantages and disadvantages, condition monitoring categories -on load and off load monitoring. Types of monitoring techniques i.e. lubricant monitoring techniques, wear debris analysis and malfunctions that can be detected by lubricant monitoring. Thermal monitoring, types of thermal monitoring, and parameters that can be detected by thermal monitoring.
- Vibration monitoring, basic characteristics, analysis, vibration meter construction, factors contributing to vibration monitoring.

5. Regulatory Framework for NPPs (FRE13) (25 Hours)

- The Atomic Energy Act 1962 and the Factories Act 1948, Salient features of the Act covering the major provisions and including brief title, scope of application, appropriate government, ownership, processing and usage of radioactive materials, authorisation for power generation and storage of certain chemicals, regulating and enforcing bodies under the Act. Salient features of the Factories Act 1948 with particular emphasis on safety and welfare provisions, inspection of factories and returns needed to be filed. Salient features of the Atomic Energy (Factories) Rules 1996 and authorisation for safe disposal of radioactive waste.
- The Atomic Energy Regulatory Board (AERB), Evoluation of AERB. Statutory status, role, powers and activities of AERB. Approach to safety as defence in depth. Authorisation process - site approval, construction authorisation, commissioning authorisation, operating authorisation, life extention of NPPs, decommissioning authorisation. Regulatory inspection. Safety assessment. Role and powers of SORC and SARCOP. Staffing, training, qualification and licensing. Simulator training and human error reduction. Design review for plant modifications. Major guidelines for NPP O&M. Technical specifications. Licensing practices. Indepence of the regulatory body. Periodic review of NPPs. Advisory committees of AERB. Instances requiring notification and clearances.
- Electricity Act 2003 and the Boiler Act, Salient features of the act covering the major provisions and including brief title, scope of application, appropriate government, regulation and inspection of electricity generating utilities. Training and authorisation of certain personnel.
- Environmental Protection Legislation, Introductory features of covering highlights and permissions needed by NPPs under the following acts:
- The Environmental Protection Act 1986
- The Air (Prevention and Control of Pollution) Act 1981
- The Water (Prevention and Control of Pollution) Act 1974
-

6. Practicals (FRE 14) (6 Weeks)

12. Practicals (FRE 14) (6 Weeks)

Turbine and Generator

- *Class room training on Generation Plant,* Steam water system, Turbo- generator

Simulator and Fuel Handling

- *Class room and Field Training on Fuel Handling*
- *Field Training on PFBR Simulator*

Operations

3. Class room Training

a. Reactor System

Reactor Assembly, Reactor Core, Control Rod Drive Mechanisms, Emergency Core Cooling Systems

b. Sodium system

Primary Sodium System, Secondary Sodium System, Sodium Purification System, Cover Gas System, Steam Generator Leak Detection System, Sodium Instrumentation

c. Control and Electrical system, *Neutronic Instrumentation, Reactor Protection System, CDPS, Power Supply Systems*

d. Radiation protection

At the end of classroom training written exam will be conducted for evaluation. After classroom training field training will be provided as follows

4. Field training

a. Reactor Operation

b. Maintenance Activities

c. Technical Service Activities

d. Quality assurance & Industrial safety

TSOs will be asked present a project report and walk-through test on the above modules.

BACK TO MAIN

PGD in CHEMICAL SCIENCES (Program Code: CHEM00)

Course Structure:

I. Courses at BARC

Program Code : CHEM00	Programme Specific Outcome	Firm foundation in the fundamentals and application of current chemical and scientific theories including those in Analytical, Inorganic, Nuclear and Physical Chemistry.
		Ability to design and carry out scientific experiments as well as accurately record and analyze the results of such experiments.
		Skill development in problem solving, critical thinking and analytical reasoning as applied to scientific problems.
		Ability to clearly communicate the results of scientific work in oral, written and electronic formats to both scientists and the public at large.
		Appreciate the central role of chemistry in DAE programmes and use this as a basis for ethical behavior in issues facing chemists including an understanding of safe handling of chemicals, environmental issues and key issues facing our society in energy, health and medicine.

(A) FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Mathematics, Quantum Chemistry & Computational Methods	CY501
2	Analytical Chemistry	CY502
3	Material Science	CY503
4	Radiation Detection and Measurements	CY504
5	Nuclear and Radiochemistry	CY505
6	Thermodynamics	CY506

(B) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Lasers	CY601
2	Electronics & Chemical Instrumentation	CY602
3	Production and Applications of Radioisotopes	CY603
4	Reactor Physics and Reactor Chemistry	CY604
5	Molecular Structure & Spectroscopy	CY605
6	Radiation and Photochemistry	CY606
7	Chemistry in Nuclear Fuel Cycles	CY607
8	Advanced Chemical Kinetics & Dynamics	CY608
9	Health Physics and Radiation Biology	CY609
10	Research Methodology	CY610
11	Safety in Chemical and Radiochemical labs	CY 611

(C) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Nanomaterials, Chemical Sensors	CY701
2	Soft Condensed Matters	CY702
3	Nuclear Probes for Material Characterization	CY703
4	Molecular Bioorganics	CY704
5	Laser Spectroscopy	CY705
6	Actinide Chemistry	CY706
7	Computational Chemistry	CY707
8	Advanced NMR Spectroscopy	CY708
9	Atmospheric Chemistry	CY709
10	Statistical Analysis	CY710

(D) NON-SUBJECT ASSIGNMENTS

Sr. No.	Name of the Course	Course code
1	Viva Voce	CY591
2	Mini Project	CY592
3	Seminar	CY593

Course Outcomes:

(A) FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Mathematics, Quantum Chemistry & Computational Methods	CY501	Learn foundations of quantum mechanics to understand the difference between classical and quantum phenomena.
		Understanding the role of rotational and spin angular momenta in chemistry.
		Develop expertise in molecular orbital theory that helps in understanding structure of polyatomic molecules.
		Understanding molecular symmetry to predict the chemical reactions of atoms and molecules.
		Calculation and interpretation of errors in numerical computation.
Analytical Chemistry	CY502	Acquaintance with various analytical techniques
		Idea on how to tackle an analytical problem, pertaining to DAE and other industries.
		Acquaintance with theories of various matrix separation techniques
		Acquaintance with statistical treatment of analytical data
		The course gives sufficient expertise leading to enhanced employability
Material Science	CY503	Ability to analyse the Powder X-ray diffraction pattern for solving crystallographic structures
		Description of specific crystal structures by applying basic crystallographic concepts
		Establishing correlation between electrical behavior and crystal structure
		Understanding different types of defects and their effect on the functional properties
		Understanding the concept of solid solution formation for fine tuning the properties
Radiation Detection and Measurements	CY504	Expertise to choose a particular detector for a specific application
		Expertise to carry out identification and quantification of radionuclides
		Knowledge base to understand safety aspects while working with radioactivity
		Basic knowledgebase for orientation towards working in areas involving applications of nuclear techniques
		Basic knowledge to develop need-based measurement systems

Nuclear and Radiochemistry	CY505	Identifying the factors that affect nuclear stability
		Explain the different kinds of radioactive decay and interpret a radioactive decay series, apply radiotracer principles
		Calculate the specific activity of the produced radionuclides, estimate the conditions required for producing important isotopes
		Understand the basic concepts in fission and the production yields of different radioactive isotopes during fission
		Identify the nuclear analytical techniques useful for analysing the samples (neutron activation, Ion beam analysis techniques)
Thermodynamics	CY506	Analyze thermal effects on a chemical process
		Understanding that change in environmental conditions can change the process itself.
		Important concepts on Carnot engine and energy conversion efficiencies
		Thermodynamics of nuclear materials
		Idea about experimental thermodynamics

(B) CORE COURSES

Name of the Course	Course code	Course Outcome
Lasers	CY601	Understanding of the operation of laser
		Understanding the principle behind the selection of specific laser for a specific application in the field of laser spectroscopy
		Knowledge of different classes of laser and their applications in different fields.
Electronics & Chemical Instrumentation	CY602	Understanding the principle of operation of common laboratory instruments
		Setting up / wiring of components for furnace, thermocouple, temperature controller etc.
		Ability to do simple trouble-shooting related to instruments (checking fuse, voltage, resistance etc.)
		Application of noise reduction techniques during measurements
Production and Applications of Radioisotopes	CY603	Knowledge of different processes employed for the production and radiochemical processing of important artificially produced radionuclides
		Understanding how the radiation and radioisotopes can be employed to divulge the useful information regarding different human ailments as well as how to treat various diseases specifically cancer

		Appreciate how the radiation and radioisotopes have emerged as an essential tool in various industries
		Expected to comprehend the important roles radiation technologies are playing in various processes
		Appreciate that radiation and radioisotopes are boon for the development of nation and mankind
Reactor Physics and Reactor Chemistry	CY604	Understand various designs of nuclear reactors and its components.
		Gain insight about the details of reactor physics calculations which are required for designing a nuclear reactor.
		Become conversant with the purification techniques used for the preparation of demineralized water at large scale and also about the variation in its thermo-physical properties with temperature and pressure.
		Develop the understanding of the behaviour of various materials of construction in their operational environment of nuclear power plants.
		Understanding the guiding principles for evolving the chemistry control process and the actual practice been adopted for the various heat transport systems of the nuclear power plants.
Molecular Structure & Spectroscopy	CY605	Understand the general characteristics of the d and f block elements
		Thorough knowledge of the different theories to explain the bonding in coordination compounds
		Improve the level of understanding of the chemistry of lanthanides and actinides
		Develop understanding of various advanced spectroscopic techniques for analyzing complex compounds.
		Thorough knowledge of the fundamentals of microwave, infrared, Raman, electronic and magnetic resonance spectroscopy, X-ray photoelectron spectroscopy.
Radiation and Photochemistry	CY606	Awareness of radiation induced reactions and its applications
		Expertise to analyse and quantify radiation/photochemical induced chemical reactions
		Trained man power for using various radiation and photochemical sources and state-of art experimental facilities
		Hands-on experience and research training during project work

		Knowledge development in the DAE relevant activities and planning for future R&D programs
Chemistry in Nuclear Fuel Cycles	CY607	Knowledge of processes involved in recovery of nuclear material from ores
		Understanding the chemistry involved in different stages of nuclear fuel cycle
		Understanding of fabrication and quality control of nuclear fuel
		Knowledge in physico-chemical characterization of nuclear fuel, irradiation behaviour
		Understanding of reprocessing of spent fuel and waste management
Advanced Chemical Kinetics & Dynamics	CY608	Learn difference between chemical kinetics and dynamics, and their applications in real systems
		Predict the energy state of a reaction product, and required reactant states to obtain a desired product for a simple reaction.
		Learn the importance of energy transfer affecting the population inversion in a gas laser.
		Expertise developed in carrying out research in relevant area of chemical physics with acquired knowledge.
		The course gives sufficient expertise leading to enhanced employability
Health Physics and Radiation Biology	CY609	Basic knowledge of handling hazards of various radioactive materials
		Knowledge of radiation protection aspects in nuclear and radiation facilities
		Radiation Protection Aspects in Designing of Nuclear and Radiation Facilities
		Design of advanced radiation monitoring equipments
		Management of Nuclear/Radiological Emergencies in facilities
Research Methodology	CY610	Demonstrate knowledge of research processes (reading, evaluating, and developing)
		Perform literature reviews using print and online databases
		Identify, explain, compare, and prepare the key elements of a research proposal/report
		Knowledge of writing reports and thesis
		Idea about following ethical practices in research
Safety in Chemical and Radiochemical labs	CY 611	Develop an understanding of the principle of chemical/radiochemical safety.
		Acquire the ability to apply the safety concepts in to practice when they work in chemical /radiological laboratories.

		Inculcate a culture of safety which shall benefit the organization.
		Knowledge about various safety aspects including good laboratory practices.
		Awareness about various emergencies and the need of emergency preparedness plans.

(C) ELECTIVES

Name of the Course	Course code	Course Outcome
Nanomaterials, Chemical Sensors	CY701	Idea about different synthesis methods for nanomaterials,
		Knowledge about modern techniques like pulsed laser deposition, spray pyrolysis etc.
		The concepts of Chemical sensors are taught which comprise of various per-requisites of a sensor material.
		Idea about several characterization techniques which are very useful for research work in this area.
		Theory behind the unique properties exhibited by nano-materials help the students to rationally design these materials.
Soft Condensed Matters	CY702	Students get to know about the physical basis of soft condensed matter systems
		Learn interpretation of rheological properties of soft matter with specific examples relevant to pharmaceutical formulations
		Learn about how to choose appropriate amphiphiles for emulsification
		Learn about tools for kinetic stabilization of colloidal systems
		Get an overview of application of soft matter systems in industry
Nuclear Probes for Material Characterization	CY703	Idea about defects using positron annihilation spectroscopy (PAS)
		Free volume structure characterization of amorphous material using PAS
		Compositional characterization using Ion beam techniques
		Phase structure, pore structure, Dynamics, magnetic structure using neutron scattering techniques
		Analysis of local structure of amorphous and crystalline materials using X-ray absorption methods

Molecular Bioorganics	CY704	Knowledge about synthetic design, and to enable a student to devise a synthetic route for a target molecule
		Knowledge about the various strategies in organic synthesis
		Knowledge about the green strategies, and the know-how of applying the same in organic synthesis
		Knowledge about the most recent advancements in organic synthesis
		Knowledge about the use of functional materials used in nuclear fuel cycle in DAE
Laser Spectroscopy	CY705	Skill development in handling high power ultra-short pulsed laser
		Application of time-resolved and nonlinear laser spectroscopy techniques in chemistry, biology and material science
		Expertise in indigenous development of novel spectroscopy techniques using Lasers
Actinide Chemistry	CY706	Understanding of the fuel cycle operations including reprocessing and waste management.
		Idea about environmental aspects of actinide migration in case of accident
		Pursue further areas of study such as transactinides and ‘atom at a time chemistry’
Computational Chemistry	CY707	Calculation of transition state structure and understand reaction mechanism
		Interpretation of IR and UV-Vis spectra of a system
		Band structure calculations of solids and analyze results
		Planning theoretical calculation to explain experimental results and predict molecular properties
		MD simulation and analysis of simulation results
Advanced NMR Spectroscopy	CY708	Student can learn how to validate the experimental results of synthesis and purity in a fast and efficient way.
		Determination of solution structure with the help of 1H and multi-nuclear NMR spectra
		Student can analyze the inter-molecular interactions and dynamics in solution state
		Familiarise the student to use solid state NMR technique for solving problems in Materials science
Atmospheric Chemistry	CY709	Idea about structure of atmosphere and atmospheric radiation
		Knowledge about various photochemical cycles

		Knowledge about various atmospheric pollutants and their harmful effects
		Idea about experimental methods to study reactions of importance in the atmosphere
Statistical Analysis	CY710	Knowledge of various terminologies used in Statistics
		Understanding of various statistical tools which can help in decision making
		Ways to improve quality in analytical data
		Proper way of representing analytical data

(D) NON-SUBJECT ASSIGNMENTS

Name of the Course	Course code	Course Outcome
Viva Voce	CY591	To evaluate the understanding of subject
		To judge the thinking process
Mini Project	CY592	Idea about how to do literature survey on a given topic
		Idea about planning and execution of an experiment
		Data analysis
		Writing project report
		Presentation of data and results
Seminar	CY593	Idea about how to do literature survey on a given topic
		Dissemination of information available in literature
		Practical experience of preparing presentation slides
		Practical experience of discussing scientific results in front of a knowledgeable audience

Course Structure:

II. Courses at IGCAR

Program Code : CHEM00	Programme Specific Outcome	Theoretical work for understanding solvent – metal ion interactions.
		Matrix isolation spectroscopy to understand conformers and weak molecular attractions
		Solvent development for reprocessing of nuclear fuels.
		Novel sensor materials development and characterization for sensor applications
		Materials development for matrices for nuclear waste immobilization

(A) CORE COURSES

Sr. No.	Name of the Course	Course code
1	Mathematical and Computational Methods, Numerical Analysis and Computer Programming	CH1
2	Chemical Thermodynamics	CH2
3	Electrochemistry	CH3
4	Introduction to Materials Science and Engineering	CH4
5	Analytical Chemistry for Nuclear Fuel Cycle	CH5
6	Chemical Instrumentation and Laboratory Techniques	CH6
7	Health Physics and Radiation Sciences	CH7
8	Introductory Reactor Physics and Fuel Design	CH8
9	Chemistry of Fuel Cycle - I	CH9
10	Chemistry of Fuel Cycle - II	CH10
11	Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH11
12	Nuclear and Radiochemistry	CH12

13	Corrosion Science and Engineering	CH13

Course Outcomes:

(A) CORE COURSES

Name of the Course	Course code	Course Outcome
Mathematics and Computational methods	CH-1	Practical applications of mathematical and computational methods are taught; besides these, computational software packages are introduced. The course basically prepares students to apply these aspects in their research areas for solving problems.
Chemical Thermodynamics	CH-2	This course helps students to understand various processes employed in chemical industries. Experimental methods to determine thermodynamic properties and phase diagram investigations are unique to this course. Estimation of thermodynamic properties and thermodynamic modelling study helps for a career in research and industry.
Electrochemistry and Corrosion Science	CH-3	Fundamentals and practical applications of electrochemistry are discussed. Advanced electrochemical techniques, pyrochemical process are taught. Aqueous corrosion and engineering help students to take up career in research and industry.
Introduction to Materials Science and Engineering	CH-4	Various characterisation techniques are taught. Material synthesis methods e.g. sol-gel are discussed extensively. Students handle various characterisation tools e.g. XRD, and Thin-film deposition followed by characterisation.
Analytical Chemistry for Nuclear Fuel Cycle	CH-5	Handling and learning about various sophisticated analytical techniques and instrumentation. Students are exposed to latest analytical techniques. Methodology for development of analytical technqiues for various materials is discussed. This Course prepare students for both research and industry.

Chemical Instrumentation and Laboratory Techniques	CH-6	This course helps students to have flair for setting-up of facility and analytical instruments.
Health Physics and Radiation Sciences	CH-7	Specialised course for students to work on radiation and associated safety aspects. Basics of interaction of radiation with matter. Introduces theory of various nuclear radiation detectors and their practical applications Introduces Biological Effects, Radiation Protection and Regulation procedure, Emergency Preparedness and Management
Chemistry of Fuel Cycle-I	CH-9	This course gives basic introduction to nuclear materials and thermodynamic properties of fuel at higher temperature. Many theories and concepts taught will be directly applied to nuclear plants.
Chemistry of Fuel Cycle-II: Actinide chemistry and separation science	CH-10	This course gives basic introduction to nuclear reactors and fuels. Many theories and concepts of re-use of nuclear fuel, need for nuclear energy are dealt extensively.
Materials for Nuclear Reactors and Fuel Cycle Processing Systems	CH-11	Brief overview of nuclear reactors in India and across the world. Details of nuclear materials are dealt extensively.
Nuclear and Radiochemistry	CH-12	Advanced course in nuclear chemistry. Helps students to understand and appreciate various fundamental aspects of radioactivity. Practicals help students to develop expertise in handling radioactive materials. Students measure half-life of radioactive nuclides. The fundamentals and applications taught helps in preparing students for various out-reach programs.
Corrosion Science and Engineering	CH-13	Fundamentals and practical applications of corrosion science and engineering help students to take up career in research. Also prepares students for a career in industry.

Quantum Chemistry & Group Theory	CH-14	Train students to gain expertise in theoretical chemistry. Students are trained to handle modelling software packages. Students apply these for metal-complexation, weak intermolecular interactions, thermodynamic calculations.
Molecular Spectroscopy	CH-15	Train students to gain expertise in theoretical chemistry. Besides applied experimental spectroscopy is taught which helps candidate in research career and subsequent job prospects. Special techniques such as matrix isolation spectroscopy, laser-Raman techniques are taught with experimental demonstration.
Lasers and Application	CH-16	(a) Both fundamentals and general applications of Lasers are taught. (b) Students handle lasers in the practical for technological applications. (c) Students handle lasers for various analytical chemistry applications.
Nanomaterials and Advanced Chemical Sensors	CH-17	The fundamental knowledge gained in this course had helped to (a) understanding and development of materials (b) tailor made materials for preparation of chemical sensors (c) indigenous sensors (d) special sensors (for e.g. in-sodium) which have to be developed - which will not be supplied by commercial sources.
Course on Research Methodology	CH-RM	Ethics in research, plagiarism, manuscript writing, Data analysis, presentation of results are dealt extensively. Ensure students are ready for taking up research work.

BACK TO MAIN

PGD in ENGINEERING SCIENCES (Program Code: ENGG00)

Course Structure:

I. Courses at BARC

Program Code : ENGG00	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

	EN593	ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(B) CHEMICAL ENGINEERING COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

		Material characterization techniques
Membrane Technology	EN714	Overview of Novel Membranes
		Preparation and Characterization
		Membrane Technologies
		Applications of Membrane Technology

(B3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1

2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design

		Shallow and deep foundation design; machine foundation design
Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics

		Understanding Transmission Lines, Waveguides, RF Amplifiers,
Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters

		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models

		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(G2) Electives

		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(G3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(H)COMPUTER SCIENCE AND ENGINEERING

(H1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Operating Systems	EN606
2	Computer Graphics & Visualisation	EN613
3	Distributed Computing	EN616
4	Networking & Information Security	EN627
5	Reactor Control Engineering	EN637
6	Software Engineering and Formal Methods	EN640

(H2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Data Base Management System & Web Technology	EN705
3	Digital Signal Processing & Image Processing	EN706
4	Embedded Electronics Software	EN707
5	Feedback Control System	EN708
6	Image Processing & Machine Vision	EN710

(H3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life

Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

BACK TO MAIN

PGD in GEOLOGY & GEOPHYSICS

(Program Code: ENGG00)

CORE COURSE:

II. Courses at BARC - AMD:

Program Code: ENGG00	Program Specific Outcome	
		Thorough knowledge on geological aspects of exploration for uranium and other atomic minerals.
		Inter-disciplinary approach and application of geophysical, geochemical and radiometric methods in exploration.
		Field and laboratory data generation techniques, geological modeling and resource estimation
		Giving research orientation to the young minds, training in formulation and implementation of research projects.

COMMON COURSES:

Sr. No.	Name of the Course	Course Code
1	Nuclear Physics	102
2	Remote Sensing and GIS	110
3	Airborne Geophysics	209
4	Nuclear Reactor and Fuel Cycle	212

Course Outcome:

Name of the Course	Course Code	Course Outcome
Nuclear Physics	102	The course introduces nucleus, it's properties, natural radioactivity, decay, equilibrium, natural decay series, fission and fusion
		Learning principles and types of radiation detectors, and their characteristics
		Familiarization of gamma ray spectrometry, gamma ray logging and sample analysis techniques used in exploration, Instrumental Neutron Activation Analysis.

		The course also introduces radon emanometry, methods for measurement of Radon
Remote Sensing and GIS	110	The course introduces concepts of Remote Sensing, mineral and rock spectra and use in geological studies, available sensors, and types of resolutions
		Learning fundamentals of image interpretation, digital image processing, enhancement techniques, image classification for geological interpretation.
		Introduction to GIS, spatial and attribute data, coordinates and map projections.
		The course also teaches GIS analysis, data integration and modeling techniques in mineral exploration using various software.
Airborne Geophysics	209	The course introduces airborne survey design and survey parameters, type of geophysical surveys carried out.
		Students are acquainted with airborne survey instruments, navigation aids and procedures in data acquisition.
		Learning processing and presentation of airborne data, identification of anomalous zones and conductors.
		The course also teaches QA & QC and validation of data sets, geological interpretation, depth estimates, delineation of alteration zones, forward and inverse modeling, and procedures for obtaining licenses for flying,
Nuclear Reactor and Fuel Cycle	212	Understanding nuclear energy, Indian scenario, fission and fusion
		Reactor systems, types of nuclear reactors, moderator and coolant, control systems, behaviour and safety systems.
		Nuclear fuel cycle options for various types of reactors, mining, processing, manufacturing, usage and burning of fuel, quality control, storage and transportation, enrichment, reprocessing and management of waste.
		Environment, legislation and controls, EIA requirements.

SUBJECTS FOR GEOLOGY:

Sr. No.	Name of the Course	Course Code
1	Mathematics for Geologists	101
2	Geophysics for Geologists	103
3	Uranium Geology	105
4	Drilling and Mining Techniques	106
5	Geochemical Exploration	108
6	Exploration for Beach Sand and RM&RE	202
7	Petrographic Techniques	206
8	Mineral Process Engineering	208
9	Analytical Techniques	210
10	Ore Reserve Estimation (Covered as part of 9 weeks field training in the months of December, January and February)	204

Course Outcome:

Name of the Course	Course Code	Course Outcome
Mathematics for Geologists	101	To introduce the students on concepts of Geostatistics and basic Mathematical techniques.
		Apply principles of Geostatistics and mathematical methods for analysis and predictions in Geoscience research and Geomodelling.
		Development of skill set necessary for solving complex problems in the field of Geoscience.
		Expose the young students to state-of-the art modelling techniques applicable to the Uranium exploration programme and build a strong foundation.
Geophysics for Geologists	103	The course introduces geophysical methods, their role in mineral exploration and geophysical signatures of uranium deposits.
		Learning gravity and magnetic fields, it's variation across the earth, instruments, data collection, processing and application.
		Understanding various electrical and electro-magnetic methods, electrical properties of rocks, instrumentation, data collection, processing and interpretation.
		The course also introduces seismic methods and borehole logging methods in exploration.
Uranium Geology	105	The course imparts knowledge on distribution of uranium in crust, rocks and minerals, time bound character and classification of uranium deposits.
		The course also deals with geological aspects of various types of uranium deposits, world and Indian deposits, controls of mineralization, exploratory guides.
		Students also learn stages of uranium exploration,

		survey methodologies, sampling techniques, drilling, borehole logging techniques
		Training on interpretation of exploratory data, correlation of mineralized intercepts, estimation of resources, recent trends in exploration, status of uranium supply and demand
Drilling and Mining Techniques	106	Understanding types and techniques of drilling used in atomic mineral exploration
		Learning about rock drilling, diamond drilling, controlled directional drilling, types of drilling used in the department.
		The course also introduces mining, mining terminologies, types of mining.
		Students learn techniques in open cast and underground mining, blasting, economic feasibility, milling and waste disposal.
Geochemical Exploration	108	The course introduces geochemistry as branch of geology, elements - primary geochemical differentiation, classification and associations, major, minor, trace, REE and uranium geochemistry.
		Students learn geochemical thermodynamics, standard states, non-ideal solutions and phase diagrams.
		Hydro-geochemical concepts, pH and Eh, physico-chemical environment of ore genesis under various geological environments.
		Types of geochemical surveys for mineral exploration, primary and secondary dispersions, geochemical maps, processing and interpretation of geochemical data.
Exploration for Beach Sand and RM&RE	202	Introduces placer minerals and environments, processes controlling formation of placer minerals, transportation and deposition.
		Learning exploration of beach sands, sampling, analysis, methods of estimation and classification of resources, mining methods and processing, world resource scenario.
		The course also introduces Rare Metal and Rare Earth minerals, their geochemistry, mineralogy. Geology of Rare Metal bearing granites, pegmatites, carbonatites.
		Study of exploration techniques, geochemical methods, sampling, resource estimation and recovery.
Petrographic Techniques	206	Study of minerals and rocks under transmitted and reflected light, polarising microscope, thin sections and polished sections.
		Learn petromineralogical techniques, optical properties of minerals, microindentation hardness, radioactive, rare earth element and rare metal bearing minerals, mineralogical expression of radioactivity, EPMA analysis.
		Study of petrography, paragenesis, learning modal analysis and norm calculation.

		Presentation and preservation of data and assessment
Mineral Process Engineering	208	The course introduces basic principles of mineral processing unit operations and hydrometallurgy with special emphasis on atomic minerals
		The curriculum familiarizes with flowsheet development for low grade uranium ores of Indian origin and beneficiation of beach sand minerals.
Analytical Techniques	210	The course introduces principles and instruments of analytical methods used in atomic mineral exploration.
		X-ray diffraction technique for identification of minerals and cell parameters, WD & EDXRF, ICP, AAS, flourimetry and other chemical methods for analysis of geological materials
		Concepts and use of radiometric dating methods, stable isotope studies for understanding geological processes.
Ore Reserve Estimation (Covered as part of field training)	204	Resource database generation, geological model, density factor, sampling issues, validation of data.
		Ore body configuration, traditional and geostatistical methods of resource estimation
		Resource categories, feasibility studies, environmental issues

SUBJECTS FOR GEOPHYSICS:

Sr. No.	Name of the Course	Course Code
1	Geology for Geophysicists	104
2	Theory of Fields	107
3	Seismic Methods	109
4	Computational Geophysics	201
5	Signal Processing & Inversion Techniques	203
6	Gravity and Magnetic Methods	205
7	Electrical & Electromagnetic Methods	207
8	Well logging Techniques	211

Course Outcome:

Name of the Course	Course Code	Course Outcome
Geology for Geophysicists	104	The course introduces structure and composition of the earth, surface and internal processes, rock structures, stratigraphy principles and elements of Indian stratigraphy.
		Gives brief introduction to rock forming and ore minerals, common igneous, sedimentary and metamorphic rocks, structures and textures.
		Learn dynamic earth, continental drift, plate tectonics and associated mineral deposits.
		The course also introduces ore forming processes and

		mode of occurrence of common ore deposits.
Theory of Fields	107	The Course introduces the basic concepts of the mathematics and physics of Potential Field theory.
		The topics covered in this course are gravitational, magnetic, electrical & electromagnetic fields of the earth and their derivations from potential functions with applications.
		The course also discusses about theorems of Laplace, Poisson's, Gauss and Green and their applications to geophysics. Computations of numerical problems
Seismic Methods	109	Familiarization of the basic concepts and principles of seismic prospecting. Reflection, refraction and diffraction from multilayered media, Seismic wave propagation, Factors affecting seismic wave velocities discussed.
		Energy sources, geophone, hydrophone, noise profile analysis and Source -detector arrays. Seismic reflection & refraction methods, geometry of waves and interaction with two layer and multilayer media. Field layouts, Static corrections, NMO, Migration, Common Depth Point techniques. Vertical seismic profiling; 3D and 4D seismic exploration, Seismic tomography
		Processing and interpretation of seismic refraction and reflection data. Determination of velocities and depths to the layers.
Computational Geophysics	201	The course provides an introduction to different numerical methods applied to geophysical problems. Partial differential equations in geophysics .The course offer hands-on experience in numerically solving partial differential equations, statistical data and variance Analysis in geophysics.
		The finite-difference (FDM) & finite-element methods (FEM) applied to basic geophysical problems. Explicit and Implicit finite difference methods, Error and stability analysis. Fundamentals of FEM, interpolation functions, method of weighted residuals, Laplace and Poisson equation, Numerical integration
Signal Processing & Inversion Techniques	203	Application of advance signal processing techniques in geophysics. Various integral transforms – Fourier, Hilberet, Hankel, Walsh, Laplace and Z transforms. Digital filtering, sampling and designing filters.
		Application of inversion techniques in geophysical data processing. Fundamental concepts of Inversion with discrete and continuous models. Optimization techniques and algorithms, generalized and constrained inversion. Singular value decomposition, Backus-Gilbert Inverse problem
Gravity and Magnetic Methods	205	The course discusses in detail the theoretical concepts of Earth's gravitational field and geomagnetic field. Theory and principles of Gravimeter and magnetometers.
		Data acquisition and corrections applied to gravity and magnetic data are explained in detail with data. Processing of data and application of time domain and frequency domain filters and various data enhancement techniques.

		Computation of gravity and magnetic anomalies due to regular shaped bodies. Spectral analysis of potential field data. Modeling and inversion of gravity and magnetic data.
Electrical & Electromagnetic Methods	207	Electrical properties of rocks and minerals. Electrical conduction in rocks and earth materials. Familiarization of the concepts of electrical and electromagnetic prospecting. Classification of Electrical and Electromagnetic methods
		Resistivity and Induced Polarization techniques – Theory, Practice and applications with case studies. Electromagnetic methods – Frequency domain, Time Domain and Natural Source EM methods – Equipment, field procedures
		Interpretation techniques of Electrical and Electromagnetic data – Vertical Electrical Sounding, Pseudo-sections, VLF, HLEM, TURAM and TEM sounding data.
Well logging Techniques	211	Learning the basic concepts, characteristics of borehole conditions, reservoir properties, principles and instrumentation of well logging techniques.
		The course introduces the different types of electrical, nuclear, sonic, EM and other logging techniques and their application in mineral exploration. Operational survey procedures and interpretation of various logs.
		Identification of sub‑surface formations based on interpretation. Computation of various parameters from the log data.

PGD in ENGINEERING SCIENCES
(Program Code: ENGG00)

III. Courses at NFC:

BARC TS NFC Hyderabad Course Outcome

Chemical Engineering

Nuclear Engineering Module

Sl. No.	Subject Name	Course Code	Course Outcome
1	Engineering Mathematics	NE1 E02	Advanced knowledge in computational data analysis, data fitting and error analysis. Analytic and Theoretical calculation and its practical implementation. Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering.
2	Nuclear and Reactor Physics	NE2 E07	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with Nuclear reactors.
3	Reactor Engineering and Radiation Shielding	NE3 E13	Good understanding of Thermal, Fast Breeder and advanced reactor Engineering concepts Learning the interaction of ionizing radiation with variety of materials like metals, non-metals, glass & plastic, all needed for working with Nuclear reactors.
4	Health Physics, Chemical Plant Safety and Environmental Engineering	NE4 FC02 E06 CC09	Learning the interaction of ionizing radiation with matter, Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation. Principles of radiation detection and Radiation Protection procedures. Learn about Hazardous properties of chemicals, safely handling of Hazardous chemicals, All needed for working in Radiation environment, various Hazardous areas.
5	Nuclear Power Plant Engineering	NE5	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts. Familiarization with reactor physics design challenges Advanced reactor concepts with passive safety features.
6	Material Science in Nuclear Engineering	NE6	Overview of Nuclear materials & their classifications. Structure and properties of nuclear materials. Processing of nuclear materials. Material characterization techniques.
7	Nuclear Fuel Cycle and Water Chemistry I & II	NE7 FC07 FC08 CMEI-50	Familiarisation with front and back end of nuclear fuel cycle technology. Knowledge of radioactive waste generation on nuclear fuel burning and its processing. Knowledge of Isotope separation process and Heavy water production. Need to know working in HWP, BARC facilities etc.

Core Engineering Module

Sl. No.	Subject	Course code	Course Outcome
1	Computational Fluid Dynamics and Heat Transfer	CEM1 E21 CM40	Understanding Kinematics of fluid flow and governing equations Classification of Partial Differential Equations & their discretization Convective heat transfer for internal and external flows. Numerical Solution of fluid flow and heat transfer equations.
2	Basic Process Instrumentation and Control	CEM2 CC03 M20	Detailed exposure to Flow, Pressure, Level, Temperature Understanding Analytical Instrumentation P/I & I/P Converters, Impulse Tubing Exposure to P&I Diagrams and Design Guides.
3	Process Dynamics, Analysis and Control	CEM3 E31 E29:50	Introduction to process control & control loop dynamics Fundamentals of state-space controls, state, measurement equations General solution of the state equation Multi-variable controls, de-coupling, relative gain array.
4	Advanced Mass Transfer, Equipment Design and Solvent Extraction and Equipment design	CEM4 E32 AC03:C45	Understanding Mass transfer with and without chemical reactions Rate based approaches for design Selection and design of various contacting equipment Process intensification approaches.
5	Process Modeling, Simulation and Optimization	CEM5 E 33 C20	Formulation of Dynamic and steady state models Flow sheet Analysis & Plant Simulation General Approaches for Non-Linear Systems. Plant optimization by Genetic Algorithms and Neural Nets.
6	Advanced Chemical Reaction Engineering	CEM6 E30 C25	Fundamentals of Non-ideal reactors & RTD studies Understanding Non-isothermal effects & dynamical behavior. Overview of Heterogeneous reactions Approaches in Advanced reaction engineering & reactor design.

Core Electives Module:

Sl. No.	Name of the Course	Course Code	Course Outcome
1	Systems Management: A, B, C, D and E (Project, Maintenance, Operation & Quality management, Reliability Engineering)	C Elect 1 AC 06 AC 08 CC 10 CEEIM 50	Learning under system management project life cycle, project scheduling, resource planning, analysis; ISO system principles, auditing of QMS &EMS, planning, organizing & controlling; objectives of maintenance functions, component life time, process of failures, routine maintenance, productive maintenance, total quality maintenance; Understanding Reliability Principles and Applications to Nuclear Reactor Systems Overview of Statistical Methods Exposure to Fault Tolerance, Fault Avoidance Techniques.
2	Electrical Engineering Practices in Process Industries	C Elect 2 FC 09 E 20	Exposure on Fundamentals of Electricity, power supplies, electrical machines, circuit breakers and safety aspects need to know working in Industries.
3	Energy Conservation and Demand Side Management	C Elect 3 AC 07 CMI 20	Understanding about Energy scenario, Energy conservation techniques and analysis by Thermodynamics need to optimize the energy consumption in Industries.
4	*Vacuum Technology	C Elect 4.1 M 13 NEW- C 20	Understanding of vacuum physics, its measurement, operation and leak detection and applications.
5	*Statistics for Engineers	C Elect 4.2 NEW- M C 20	Learning about treatment of data, probabilities, random sampling & distribution, testing and control charts.
6	*Corrosion Engineering	C Elect 4.3 EN-615	Understanding electrochemical theory of corrosion& corrosion basics. General principles of corrosion control. Forms of corrosion and its mitigation. Corrosion problems in nuclear industry and its mitigation.

* Optional Subjects (one out of three subjects to be selected)

Practicals /Experiments

Sl. No	Subject	Course Outcome
1	Material Science in Nuclear Engineering and Corrosion Engineering	Better understanding about selection of material and their properties in Nuclear engineering.
2	Health Physics	Enhancing hands on practical experience on Radiation measurement & precautions on safe handling methods.
3	Process Control and Instrumentation	Practical experience on calibration of different type of process instruments, demonstration of field instruments and different type of process controls.

Non-Subject Assignments

Sl. No.	Name of the Course	Course Out come
1	Viva Voce –I,II &III	Assessment of grasp of the basic concepts in the courses covered. Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.
2	Mini Project	To provide a hands-on experience of working in an ongoing project of the Department. Gaining experience in formulating and executing a scientific/technical problem. Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee.

1	Viva Voce –I,II &III	Assessment of grasp of the basic concepts in the courses covered. Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.
2	Mini Project	To provide a hands-on experience of working in an ongoing project of the Department. Gaining experience in formulating and executing a scientific/technical problem. Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee.

BARC TS NFC Hyderabad Course Outcome

Mechanical Engineering

Nuclear Engineering Module

Sl. No.	Subject Name	Course Code	Course Outcome
1	Engineering Mathematics	NE1 E02	Advanced knowledge in computational data analysis, data fitting and error analysis. Analytic and Theoretical calculation and its practical implementation. Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering.
2	Nuclear and Reactor Physics	NE2 E07	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with Nuclear reactors.
3	Reactor Engineering and Radiation Shielding	NE3 E13	Good understanding of Thermal, Fast Breeder and advanced reactor Engineering concepts Learning the interaction of ionizing radiation with variety of materials like metals, non-metals, glass & plastic, all needed for working with Nuclear reactors.
4	Health Physics, Chemical Plant Safety and Environmental Engineering	NE4 FC02 E06 CC09	Learning the interaction of ionizing radiation with matter, Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation. Principles of radiation detection and Radiation Protection procedures. Learn about Hazardous properties of chemicals, safely handling of Hazardous chemicals, All needed for working in Radiation environment, various Hazardous areas.
5	Nuclear Power Plant Engineering	NE5	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts. Familiarization with reactor physics design challenges Advanced reactor concepts with passive safety features.
6	Material Science in Nuclear Engineering	NE6	Overview of Nuclear materials & their classifications. Structure and properties of nuclear materials. Processing of nuclear materials. Material characterization techniques.
7	Nuclear Fuel Cycle and Water Chemistry I & II	NE7 FC07 FC08 CMEI-50	Familiarisation with front and back end of nuclear fuel cycle technology. Knowledge of radioactive waste generation on nuclear fuel burning and its processing. Knowledge of Isotope separation process and Heavy water production. Need to know working in HWP, BARC facilities etc.

Core Engineering Module

Sl. No.	Subject	Course code	Course Outcome
1	Computational Fluid Dynamics and Heat Transfer	CEM1 E21 CM40	Understanding Kinematics of fluid flow and governing equations Classification of Partial Differential Equations & their discretization Convective heat transfer for internal and external flows. Numerical Solution of fluid flow and heat transfer equations.
2	Basic Process Instrumentation and Control	CEM2 CC03 M20	Detailed exposure to Flow, Pressure, Level, Temperature Understanding Analytical Instrumentation P/I & I/P Converters, Impulse Tubing Exposure to P&I Diagrams and Design Guides.
3	Pressure Vessel and Piping Design	CEM 3 E20 CC08 M-30	Understanding the Basis of ASME Sec. VIII and Sec. III eqns. For Pressure Vessel and Piping Design Nozzle openings, Vessel design under ext. pressure ANSI/ASMEB31.1and B31.3 piping code NDE Examination of welds, Acceptance standard
4	Engineering Design and Finite Element Methods	CEM 4 AC09	Detailed exposure on Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element. 2Disoparametric formulation. Introduction to Nonlinear problems Finite element applications for design
5	Computer Aided Design and Manufacturing	CEM 5 M-35	Exposure on Microprocessors & Interfacing Techniques Interconnect Buses and Industrial Systems Introduction to HDL and FPGA based System Design Understanding Fault Tolerant Architectures and TMR.
6	Vibrations	CEM 6 E26 M:20	Learning about Single and Multi-degree-of-freedom Systems, Free vibration. Response of Systems To Ground Motion: Earth quake motion. Flow Induced Vibration Vibration Measurement and Signal Analysis

Core Electives Module

Sl. No.	Name of the Course	Course Code	Course Outcome
1	Systems Management: A, B, C, D and E (Project, Maintenance, Operation & Quality management, Reliability Engineering)	C Elect 1 AC 06 AC 08 CC 10 CEEIM 50	Learning under system management project life cycle, project scheduling, resource planning, analysis; ISO system principles, auditing of QMS &EMS, planning, organizing & controlling; objectives of maintenance functions, component life time, process of failures, routine maintenance, productive maintenance, total quality maintenance; Understanding Reliability Principles and Applications to Nuclear Reactor Systems Overview of Statistical Methods Exposure to Fault Tolerance, Fault Avoidance Techniques.
2	Mechatronics	C Elect 2 AC14 EEMI:20	Exposure under mechatronics regarding pneumatic control engineering, Hydraulic control engineering, Electrical & Electronics engineering & mechanization, automation and about Industrial robotics.
3	Welding and Quality Assurance of Welds	C Elect 3 CC06 M-20	Exposure of various welding processes – Arc welding, Beam welding, hybrid welding Cold bonding/Solid state bonding Welding metallurgy under high cooling rates Types of welding defects and its prevention
4	*Vacuum Technology	C Elect 4.1 M-13 C-20	Understanding of vacuum physics, its measurement, operation and leak detection and applications.
5	*Manufacturing and Industrial Engineering	C Elect 4.2 JNTU M-20	To understand about optimization of complex processes, systems, organizations by developing, improving and implementing integrated systems of people, money, knowledge, information, equipment, energy and materials.
6	*Design of High Temperature Components	C Elect 4.3 Mech-20	Learning about different material properties, life time, corrosion studies, material stability at high temperatures. For the applications in reactors& industries.
7	*Statistics for Engineers	C Elect 4.4 C:20	Learning about treatment of data, probabilities, random sampling & distribution, testing and control charts.

* Optional subjects (one out of four subjects to be selected)

Practicals /Experiments

Sl. No	Subject	Course Outcome
1	Material Science in Nuclear Engineering and Corrosion Engineering	Better understanding about selection of material and their properties in Nuclear engineering.
2	Health Physics	Enhancing hands on practical experience on Radiation measurement & precautions on safe handling methods.
3	Process Control and Instrumentation	Practical experience on calibration of different type of process instruments, demonstration of field instruments and different type of process controls.
4	Structural Dynamics and Vibration	Practical experience on harmonic & non-harmonic base motions, dynamics of vibrations, seismic wave amplification etc.

Non-Subject Assignments

Sl. No.	Name of the Course	Course Out come
1	Viva Voce –I,II &III	Assessment of grasp of the basic concepts in the courses covered. Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.
2	Mini Project	To provide a hands-on experience of working in an ongoing project of the Department. Gaining experience in formulating and executing a scientific/technical problem. Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee.

BARC TS NFC Hyderabad Course Outcome
Quality Assurance Engineering

Nuclear Engineering Module

Sl. No.	Subject Name	Course Code	Course Outcome
1	Engineering Mathematics	NE1 E02	Advanced knowledge in computational data analysis, data fitting and error analysis. Analytic and Theoretical calculation and its practical implementation. Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering.
2	Nuclear and Reactor Physics	NE2 E07	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with Nuclear reactors.
3	Reactor Engineering and Radiation Shielding	NE3 E13	Good understanding of Thermal, Fast Breeder and advanced reactor Engineering concepts Learning the interaction of ionizing radiation with variety of materials like metals, non-metals, glass & plastic, all needed for working with Nuclear reactors.
4	Health Physics, Chemical Plant Safety and Environmental Engineering	NE4 FC02 E06 CC09	Learning the interaction of ionizing radiation with matter, Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation. Principles of radiation detection and Radiation Protection procedures. Learn about Hazardous properties of chemicals, safely handling of Hazardous chemicals, All needed for working in Radiation environment, various Hazardous areas.
5	Nuclear Power Plant Engineering	NE5	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts. Familiarization with reactor physics design challenges Advanced reactor concepts with passive safety features.
6	Material Science in Nuclear Engineering	NE6	Overview of Nuclear materials & their classifications. Structure and properties of nuclear materials. Processing of nuclear materials. Material characterization techniques.
7	Nuclear Fuel Cycle and Water Chemistry I & II	NE7 FC07 FC08 CMEI-50	Familiarisation with front and back end of nuclear fuel cycle technology. Knowledge of radioactive waste generation on nuclear fuel burning and its processing. Knowledge of Isotope separation process and Heavy water production. Need to know working in HWP, BARC facilities etc.

Core Engineering Module

Sl. No.	Subject	Course code	Course Outcome
1	Statistical Quality Control for QA	CEM 1 QA-01	Learning about Measuring errors by using different theories and minimization. Quality control and analysis from raw material to the final product with the help of Standards and standard procedures.
2	NDT & QC of Nuclear Fuel and structural components	CEM 2 QA-02	Learning about various NDT tests and quality checks during fabrication of tubes, components, fuel and structurals.
3	Design of PHWR Fuel and Structurals	CEM 3 QA-03	A Clear understanding of fuels, various structural materials and design of the Reactor, needed to work in Reactors and quality check in Production industries.
4	Engineering Design and Finite Element Methods	CEM 4 AC09	Detailed exposure on Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element. 2Disoparametric formulation. Introduction to Nonlinear problems Finite element applications for design
5	Material Characterization and Applications	CEM 5 EN713	Understanding of microscopy techniques: optical, SEM, TEM, UT, ECT, RT, LPT, MPT, XRD and applications. Analytical TEM and Metrology.
6	Basic Process Instrumentation and Control	CEM 6 CC03 M-20	Detailed exposure to Flow, Pressure, Level, Temperature Understanding Analytical Instrumentation P/I & I/P Converters, Impulse Tubing Exposure to P&I Diagrams and Design Guides

Course Structure:

IV. Courses at IGCAR

Program Code: ENGG00	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(A) MECHANICAL ENGINEERING

(A1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Code Design for Pressure Vessels and Piping	ME1
2	High Temperature Design and Inelastic Analysis	ME4
3	Computational Fluid Dynamics	ME6
4	Finite Element Method	ME8
5	Advanced Heat and Mass Transfer	ME10
6	Reliability Engineering	ME13
7	Manufacturing Technology	ME14

(A2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Machine Design	ME3
2	Structural Integrity Assessment Methods and NDE	
3	Vibration Engineering and condition Monitoring	
4	Seismic Design of Nuclear Reactors and Facilities	ME5
5	Plant Dynamics	

6	Experimental Mechanics	
7	Process Control and Instrumentation	ME15

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Understanding of the Design of pressure vessels and piping as well as various codes.
		Understanding of the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles.
		The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
High Temperature Design and Inelastic Analysis	ME4	This course has direct relevance with the design of fast breeder reactor components & piping system. It covers mainly about the role of high-Temperature design concerning FBR programme, significant failure modes and associated design guidelines and advanced inelastic analysis methods. The high temperature design aspect is followed based on the RCC MRx RB procedure. Reliable design of components and piping system operating under high temperature operating conditions should address the additional damage associated with creep, fatigue and creep-fatigue interactions predominantly under thermo-mechanical loadings. There are many unresolved problems in the area of high-temperature

		design such as visco-plasticity behaviour, ratcheting behaviour, high temperature crack initiation behaviour etc. These aspects are addressed in this course with the support of tutorials.
Computational Fluid Dynamics	ME6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis Numerical Solution of Complete Fluid Flow and Energy Equation
Finite Element Method	ME8	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Advanced Heat and Mass Transfer	ME10	Advanced knowledge in heat and mass transfer Laminar boundary layer and forced convective heat, turbulent flow and heat transfer Heat transfer in porous media and heat transfer with phase change Radiation heat transfer
Reliability Engineering	ME13	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Manufacturing Technology	ME14	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles plastic deformation, processes like rolling, forging, extrusion etc in the case of metal forming module. Arc welding process,welding metallurgy, defects, inspection, quality control aspects are covered inwelding module. Extraction of Uranium and Zirconium from ore to final product form is coveed in the material processingmodule.

(A2) ELECTIVES

Name of the Course	Course code	Course Outcome
Machine Design	ME3	Basic concepts in vibrations analysis
Structural Integrity Assessment Methods and NDE		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
Vibration Engineering and condition Monitoring		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	ME5	Introduction to earthquakes, design basis ground motion and IS 1893 spectra Introduction of earthquake engineering and analysis for multi degree freedom systems
Plant Dynamics		Analysis and design of structures, equipments and piping
Experimental Mechanics		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Process Control and Instrumentation	ME15	Understanding the concepts of instrumentation and control for nuclear power plants
		Able to identify and define instrumentation and control needs of a process or machine
		Able to provide indicative choice of instruments in the design

(A3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-001-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-001-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(B) ELECTRONIC AND INSTRUMENTAL ENGINEERING

(B1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Reactor Control Engineering	EL2
2	Nuclear Instrumentation	EL3
3	Reliability Engineering	EL4
4	Software Engineering	EL5
5	Human Machine Interface for Reactor Control Instrumentation	EL8
6	Modern Control of Dynamic Systems	EL10

(B2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence and Digital Signal Processing	EL6
2	Process Instrumentation	EL7
3	Embedded and Computer based systems Design	EL9
4	Analytical Instrumentation	EL11

(B3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-002-P
2	Seminar -1,2,3	02ENGG04-002-S

Course Outcomes:

(B1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	EL2	Understanding of basics of physics of reactor control and kinetics
		Understanding of basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	EL3	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Reliability Engineering	EL4	Introduction to reliability engineering applied to C&I systems
		Basic concepts of reliability, statistics and fault tolerence
		Probabilistic Safety (Risk) Assessment methods in the NPPs
Software Engineering	EL5	Introduction to software engineering and standards
		Software quality assurance, verification and validation
		Software analysis, design and configuration management
Human Machine Interface for Reactor Control Instrumentation	EL8	understanding advanced design in new trends and development philosophy in the area of human machine interface. The student should obtain an overview of technologies implemented for reactor programmes and acquire an insight of the technical background to apply the same in context of reactor applications.
		The course work is framed in order to give an Introduction to various PFBR systems and HMI models in Distributed Digital Control System and their application to process systems such as special supervision systems, component handling systems, Reactor Protection Systems & Reactor Regulating Systems and Incident monitoring & mitigation systems. Learn about PC based process control system, Supervisory Control and Data Acquisition Systems.
		This course includes Familiarisation of plant automation overview, Soft Console versus conventional control panels, Guidelines for design of HMI displays, Building HMI systems, designing plant databases, alarm management techniques,

		Security features, creating process mimics, Trending historical data, Methods of passing data to HMI package etc. The capabilities of commercially available Professional HMI packages will also be explored.
Modern Control of Dynamic Systems	EL10	Introduction to state variable description with examples
		Controllability, observability and control system design

(B2) ELECTIVES

Name of the Course	Course code	Course Outcome
Artificial Intelligence and Digital Signal Processing	EL6	Exposure to fundamentals of digital signal processing algorithms
		Exposure to practical DSP algorithms and its implementation on different platforms
		Exposure to system design using pre conditioning circuits, anti-aliasing filters and digital signal controllers
		Exposure to system design case studies like Condition Monitoring System for rotating equipments And radar signal processing
		After course completion the student will be able to handle practical engineering problems solvable by digital signal processing techniques
		It is a specialised course which will give an introduction to AI techniques.
		It will give a flavour to fuzzy logic, robotics, neural networks, genetic algorithm.
Process Instrumentation	EL7	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Embedded and Computer based systems Design	EL9	Understanding of VME bus and cPCI bus architecture.
		'C' programming with MISRA C compliant.
		Electronics design in analog and digital domain
		Learning of VLSI based design using EDA tools.
		Learning of VHDL based digital design.
		Electronics system design using TMR architecture, fault tolerant design
		Introduction of reliability analysis for electronics system.
Analytical Instrumentation	EL11	Introduction to the principles and applications of modern analytical instruments Sensitivity, precision, and limitations of analytical instruments

(B3) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-002-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-002-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(C) CHEMICAL ENGINEERING

(C1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Nuclear Chemical Engineering	CE1
2	Chemical Engineering Thermodynamics	CE2
3	Transport Phenomena	CE3
4	Multi-Phase Flow Systems	CE4
5	Code Design for Pressure Vessels and Piping	CE5
6	Computational Fluid Dynamics and Heat Transfer	CE6
7	Advanced Chemical Reaction Engineering	CE7

(C2) SPECIALIZED COURSES

Sr. No.	Name of the Course	Course code
1	Process Analysis and Control	CE8
2	Advanced Mass Transfer	CE9

(C3) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Preparedness &Response to Nuclear Emergencies Artificial Intelligence Methods &Applications Membrane/ Separation Process and Technology	CEEL

(C4) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-003-P
2	Seminar -1,2,3	02ENGG04-003-S

Course Outcomes:

(C1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Nuclear Chemical Engineering	CE1	Introduction to nuclear chemical engineering for production, processing and management of nuclear materials
		Modelling and Simulation in Nuclear Chemical Engineering
Chemical Engineering Thermodynamics	CE2	Understanding the concepts of Thermodynamics , scope of Classical Thermodynamics, Phase Equilibrium, Chemical Reaction Equilibria.
Transport Phenomena	CE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyze transport problems
		Analyze transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyze transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Multi-Phase Flow Systems	CE4	Introduction to multiphase flow and its classification
		Modeling and Simulation in Nuclear Chemical Engineering
		Applications of two-phase flow in the design of steam generators
		The phenomena of fluidization and its industrial application
Code Design for Pressure Vessels and Piping	CE5	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tubesheet design

		for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
Computational Fluid Dynamics and Heat Transfer	CE6	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer
Advanced Chemical Reaction Engineering	CE7	Understanding of thermodynamics and kinetics of chemical reactions
		Design and analysis of chemical reactors
		Modelling of multiphase reactors

(C2) SPECIALIZATION

Name of the Course	Course code	Course Outcome
Process Analysis and Control	CE8	Understanding of dynamics of chemical process systems and nonlinear process dynamics
		Design of multivariable controllers
Advanced Mass Transfer	CE9	Introduction to theories of mass transfer and advanced mass transfer processes
		Selection and design of contacting equipment in nuclear chemical industries

(C3) ELECTIVES

Name of the Course	Course code	Course Outcome
Preparedness & Response to Nuclear Emergencies	CEEL	Introduction to robotics, genetic algorithm and fuzzy logic and their applications
Artificial Intelligence Methods & Applications		
Membrane/ Separation Process and Technology		

(C4) PROJECT/SEMINAR

Name of the Course	Course code	Course Outcome
Project	02ENGG04-003-P	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)
Seminar -1,2,3	02ENGG04-003-S	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(D) MATERIALS SCIENCE

(D1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Engineering Mathematics	MS1
2	Computational Methods	MS2
3	Materials and Metallurgy	MS3
4	Reactor Physics and Fuel Design	MS4
5	Health Physics	MS5
6	Metallurgical Thermodynamics	MS6
7	Experimental Methods for Materials Research	MS7
8	Structural Materials for Nuclear Reactors	MS8
9	NDE Science and Technology	MS9
10	Physical Metallurgy	MS10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	MS11
12	Introduction to Materials Science and Engineering	MS12
13	Corrosion Science and Engineering	MS13
14	Mechanical Behavior of Engineering Materials	MS14
15	Manufacturing Technology	MS15

Course Outcomes:

(D1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Engineering Mathematics	MS1	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
		Introduction to numerical methods for solving ordinary and partial differential equations
		Probability and statistics
		Different types of transformations
Computational Methods	MS2	Introduction to programming languages such as C# and Matlab
		Exposure to numerical techniques for solving partial differential equations
		Neural network for predictive applications
		Basics of atomis modelling, molecular dynamics and introduction to Monte-carlo simulation
		Introduction to FEM and current trends in modelling and imulation

Materials and Metallurgy	MS3	To develop a basic understanding on the classification of materials
		Mechanical property based selection of materials for nuclear application and standards
		Various fabrication related issues in material including welding and corrosion
		Non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Reactor Physics and Fuel Design	MS4	Introduction to basic nuclear and neutron physics concepts
		Nuclear reactors and fuel design concepts
		Reactor kinetics
Health Physics	MS5	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Metallurgical Thermodynamics	MS6	Introduction to Classical thermodynamics: 1st and 2nd laws and their applications
		Thermodynamic properties of pure substances and mixtures Solution thermodynamics
		Phased equilibria in multicomponent systems and stability
		Chemical reactor equilibria Exposure to experimental methods for determining thermodynamic properties
Experimental Methods for Materials Research	MS7	Exposure to various experimental techniques for materials characterization, including X-ray techniques, electron microscopies, ion-beam techniques, electron spectroscopies nuclear spectroscopies, vibrational spectroscopy and resonance absorption spectroscopies
		Basic understanding of underlying physics
Structural Materials for Nuclear Reactors	MS8	Exposure to the three stage nuclear power programme
		Concept of selection of structural materials for different applications
		Materials for thermal reactors, fast breeder reactors and reprocessing applications
		Materials processing and fabrication of components
NDE Science and Technology	MS9	Introduction to various non-destructive evaluation techniques for safe and reliable operation of structures and components
		Surface, volumetric and Dynamic NDE
Physical Metallurgy	MS10	Basic understanding of crystal structure and microstructure
		Knowledge of origin, construction and classifications of metallurgical phase diagrams

		Understanding of different types of metallurgical phase transformations and underlying principles
		Introduction to microstructural characterization techniques and tools
Fuel Cycle Physics and Introduction to Fuel Cycle	MS11	Introduction of nuclear fuel cycles
		Introduction to exploration, recovery and enrichment and uranium and other nuclear fuel materials
		Different types of nuclear fuels and fuel fabrication
		Recycling the spent fuel, fission products and actinides
Introduction to Materials Science and Engineering	MS12	Introduction to basic structures, bonding and defects in solids and techniques for their characterization
		Physcial properties of materials
		Basics of phase diagram and phase transformations
		Techniques for synthesis of materials
Corrosion Science and Engineering	MS13	Basic understanding of corrosion process, monitoring and preventation
		Introduction to thermodynamics and kinetics of corrosion
		Forms of corrosion and corrosion in nuclear reactor and reprocessing plants
Mechanical Behavior of Engineering Materials	MS14	Introduction to engineering materials
		Elastic and plastic deformation in polycrystalline materials
		Strengthening mechanisms in polycrystalline structural materials
		Exposure to damage mechanisms such as creep, fatigue and also exposure to fracture mechanics
Manufacturing Technology	MS15	The course cover Metal forming, Welding & fabrication technologies and extraction of nuclear materials from Ore and processing.
		Participants are introduced to principles of plastic deformation, processes like rolling, forging, extrusion etc. in the case of metal forming module.
		Arc welding process, welding metallurgy, defects, inspection, quality control aspects are covered in welding module. Extraction of Uranium and Zirconium from ore to final product form is covered in the material processing module.

(E) FAST REACTOR ENGINEERING – I

(E1) FUNDAMENTALS

5	Regulatory Framework for NPPs	FRE13
6	Practical's	FRE14
7		Viva Voce

Course Outcomes:

(E1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(E2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for pressure vessel and piping	FRE1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits. The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles. The course also include introduction to tube sheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered.
		It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.

Advanced Heat and Mass Transfer and Computational Fluid Dynamics	FRE2	Advanced knowledge in heat and mass transfer
		Laminar boundary layer and forced convective heat, turbulent flow and heat transfer
		Heat transfer in porous media and heat transfer with phase change
		Radiation heat transfer
Transport Phenomena	FRE3	The subject of transport phenomena includes three closely related topics: fluid dynamics, heat transfer, and mass transfer. Fluid dynamics involves the transport of momentum, heat transfer deals with the transport of energy, and mass transfer is concerned with the transport of mass of various chemical species. In this course we study these three transport phenomena together. After passing the course the student will be able to:
		Apply the shell balance approach to derive differential mass and heat balance equations in Cartesian, cylindrical, and spherical coordinate.
		Apply the generalized differential mass and heat balance equations and the Navier-Stokes equations to analyse transport problems
		Analyse transport problems in simple geometries and derive analytically the concentration, temperature or velocity distribution
		Analyse transport problems in complex geometries and calculate numerically the concentration, temperature, or velocity distribution using a simulation software
		Apply the concept of transfer coefficients to describe mass and heat transfer across interfaces
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Vibration Engineering and Condition Monitoring	FRE6	Basic concepts in vibrations analysis
		Basics of rotor dynamics and rotor balancing
		Flow induced vibrations
		Response of systems to earthquake
		Vibration measurements, instruments used and analysis of vibration signals
Seismic Design of Nuclear Reactors and Facilities	FRE7	Introduction to earthquakes, design basis ground motion and IS 1893 spectra
		Introduction of earthquake engineering and analysis for multi degree freedom systems
		Analysis and design of structures, equipment and piping
		Indian Standard Criteria for earthquake resistant design

		Siesmin design snd requalifications of NPPs
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(E3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine
		Turbine troubles
Mechanical and Electrical Equipment	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To evaluate the understanding of the subject by the student.

(F) FAST REACTOR ENGINEERING – II

6	Practical's	FRE14
7		Viva-Voce

Course Outcomes:

(F1) FUNDAMENTALS

Name of the Course	Course code	Course Outcome
Nuclear Reactors & Sodium Technology	NR	Exposure to mechanical aspects of power plant engineering
		Details understanding of thermal and fast power reactors
		Introduction to sodium technology
Reactor Engineering	RE	Basic understanding of core design of LMFBR
		Coolant circuits of LMFBR and special characteristics of sodium technology

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards
		Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures

(F2) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Reactor Control Engineering	FRE15	Introduction to the physics of reactor control and kinetics
		Basics of typical reactor control systems of different types of reactors
		Reactor operation and power plant control
Nuclear Instrumentation	FRE16	Students learn about basics of interaction of radiation with matter.
		Principle & Techniques to detect and measure ionizing radiation.
		Basics of radiation counting statistics
		Introduction to Neutron Flux Measurement in FBTR and PFBR.
Reliability Engineering	FRE4	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Process Design and Control	FRE5	Introduction to state variable description
		Controllability and Observability
		Control System Design
Embedded System Design & Human Machine Interface	FRE17	Introduction to Microprocessor Based Hardware Design
		Computer Communication and Networks
		Fault Tolerant and Distributed Architectures
		Programmable Logic Controller Design
		Overview of plant automation and Human Machine Interface (HMI)

Process Instrumentation	FRE18	Design, selection, typical specifications, calibration standards, installation, testability and diagnostics of measuring instruments of various process variables
		Reliability principles, Fail safe design principles
Emergency Preparedness and Disaster Management	FRE8	Introduction to Nuclear and Radiological Emergency / disaster scenario and their Management Mitigation and management of Nuclear/Radiological Emergencies

(F3) OPERATIONS

Name of the Course	Course code	Course Outcome
Plant Dynamics and Control	FRE09	Introduction to plant dynamics and overall control
		Reactor control concepts: start up and shut down
		Reactivity control devices
Turbine Generator Fundamentals	FRE10	Introduction to principles of steam turbine cycles and turbine parts
		General turbine design aspects and governor theory
		Commissioning and operation of turbine Turbine troubles
Mechanical and Electrical Equipments	FRE11	Introduction to various mechanical and electrical equipment and their operating cares such as bearings, seals, power transmission equipment, pumps, valves and actuators, compressors, chillers, motors, transformers etc.
Maintenance Engineering	FRE12	Overview of maintenance in NPPs, maintenance policies and planning
		Spare parts maintenance and inventory control, condition based maintenance
		Vibration monitoring
Regulatory Framework for NPPs	FRE13	Introduction to Atomic Energy Act 1962 and the Factories Act 1948
		AERB and its functioning
		Electricity Act 2003 and the Boiler Act
		Environmental protection acts
Practical's	FRE14	Class room training followed by field training on PFBR simulator for reactor operation and maintenance
	Viva Voce	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

2	Engineering courses for Physics Post-graduates	03ENGG00-002-F

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
Engineering Mathematics	03ENGG00-001-C	This course reviews topics in Mathematics which are usually covered at the Master's level and are essential to understand the concepts of science and engineering
		This Course also deals with the advanced topics needed for carrying out research work in different areas of science and engineering
Magnet Physics and Technology	03ENGG00-002-C	Basic understanding of magnetism and its application.
		Analytical approach of magnet design mainly for accelerator application and field measurement technique.
		Fabrication technique and alignment of magnets.
Laser Physics and Technology	03ENGG00-003-C	This course introduces basic mechanism and principles of lasers, beam propagation, and optical resonators
		Introduction to physics and technology of various types of lasers
		This course introduces basic nonlinear optics
Electromagnetic Theory	03ENGG00-004-C	This course is meant for physicists and engineers. It reviews the M. Sc. Level and B. Tech level electromagnetic theory, and further strengthens some of the intricate concepts, and introduces new topics
		It emphasizes basic concepts needed to solve the electromagnetic boundary value problems, and prepares the students to develop better understanding of the computer codes used for that
		Students are expected to develop a better and rigorous understanding of generation of electromagnetic radiation, typically in synchrotron radiation source.
		Students learn about different types of electromagnetic waves – (i) plane waves, including its reflection and refraction at dielectric surface. (ii) Gaussian beams and Bessel beams, (iii) modes in waveguides and cavities, including its transport in

		microwave components and (iv) modes in optical fiber.
Accelerator Physics and Beam Diagnostics	03ENGG00-005-C	The course introduces basic concepts of accelerator physics and beam diagnostics.
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Reactor Physics, Radiation Physics, and Safety Issues	03ENGG00-006-C	Awareness about natural, man-made radiation, dose contribution from various practises, units and quantities, biological effects of radiation exposure and ICRP recommendations on radiation protection
		Awareness about the radiation hazards at work place, safe practises to be followed, exposure control measures, shielding philosophy and radiation detection.
		Understanding the radiation hazards at high energy electron and proton accelerators and laser facilities. Dose build up effects due to electromagnetic and hadronic cascade and its impact on radiation safety and tackling mechanisms
		Gaining fundamental concepts in reactor physics, interaction of various kind of radiation with matter.
Numerical and Mathematical Techniques and Scientific	03ENGG00-007-C	For rigorous and correct analysis of data (which are the outcome of research work), learning numerical and mathematical techniques is absolutely essential.
		This course teaches interpolation, extrapolation, error analysis etc which are integral parts of data analysis. The finite element method is a numerical method for solving problems of applied science and engineering, for example, structural analysis, heat transfer, fluid flow, mass transport etc
		Concept of scientific computing is necessary for numerically analyzing experimental and analytical results. For the same, programming languages (C and fortran) are taught.

		Different operating systems (windows, linux etc), which are taught, also help in understanding the working of computers, in turn, different aspects of scientific computing
Materials Science and Technology- I	03ENGG00-008-C	The course reviews the master's level solid state physics with certain advanced topics
		The advanced topics covered include: nonlinear properties of optical materials, electronic materials for novel applications like spintronics and introduction to symmetry and ferroelectric materials
		Students learn structures of various materials including alloys, ceramics, glasses, polymers, and composites
Applications of Lasers in Nuclear Science, Industry	03ENGG00-009-C	This course covers various applications of lasers in high resolution spectroscopy in metrology and medicine
		This courses exposes application of lasers in material processing
		This course introduces application of lasers in isotope separation
Applications of Accelerators in Nuclear Science, Industry	03ENGG00-010-C	This course aims to expose students to various applications of accelerators.
		Students become aware of applications in accelerator based radiotherapy and radiation processing
Vacuum Physics and Technology	03ENGG00-011-C	This course aims to introduce the basics of theory of vacuum
		Introduces various vacuum systems and components
		Students learn how to design a vacuum system
Quantum Mechanics	03ENGG00-012-C	This course reviews master's level quantum mechanics with more emphasis on problem solving and applications
		This course also covers advanced topics which will enhance understanding in many-electron systems and photo-atom interaction
Research Methodology	03ENGG00-013-C	Definition and characteristics of research, objectives and importance of research, planning of research, types and stages of research, scientific methods, searching for scientific information, accessing scientific literature, reading scientific papers.

(B) Elective Courses

Name of the Course	Course code	Course Outcome
Power Supplies	03ENGG00-001-E	This course aims to introduce various concepts of power supplies to the students
		Make students aware of AC-DC and DC-AC converters and principles of feedback control systems
		Students learn about magnet power supplies for accelerators, power supplies for superconducting magnets, and laser/plasma power supplies
Power Electronics	03ENGG00-002-E	This course develops basic understanding of the power electronics
		Course will cover various power semiconductor devices
		Students will learn modelling of various components and carrying out analysis
		Course covers electromagnetic interference related measurement techniques and mitigation techniques
Advanced Course on RF and Microwaves	03ENGG00-003-E	This course develops understanding of the science and technology of RF and microwaves
		Students will learn various generation and transmission of RF waves
		Course covers various components for RF and cavities
		Course makes students learn various measurement techniques for RF and microwave
Advanced Data Acquisition and Control Systems	03ENGG00-004-E	Process control and Data Acquisition elements and models
		Continuous time domain controllers and digital controllers
		Feed-back and Feed-forward control systems
		Z-transform based Deadbeat and Dahlin algorithms, real time systems and scheduling methods, buses for instrument networks and communication protocols
Reliability Engineering	03ENGG00-005-E	This course aims to introduce various concepts and techniques for evaluating reliability and assessing quality of engineering processes

		Review of basic statistics and probability applied to reliability analysis
		Students will learn various concepts of quality assurance and reliability
		Students will learn topics related to total quality management
Advanced Course in High Voltage Engineering	03ENGG00-006-E	This course aims to introduce concepts and materials related to high voltage engineering
		Students learn about various dielectric materials relevant for high voltage applications
		Students learn various techniques for generating and measuring high voltages
		Course introduces aspects of designing high voltage circuits and safety issue associated with high votages
Digital Signal, Image Processing and Applications	03ENGG00-007-E	Basic understanding of machine vision systems and their specific application areas related to nuclear engineering
		Understanding of camera types, lenses, illumination, Component Selection of a machine vision system
		Understanding of the concept of digital image, basic definitions, image operators, and functions used in digital image processing software
		Applying functions for accomplishing particular image processing task according to application

(C) Laboratory Courses

Name of the Course	Course code	Course Outcome
Laser and Applications	03PHYS04-001-L	To provide first-hand experience in handling various lasers and related optics
		To provide training to carry out spectroscopic studies using laser
Accelerators related applications	03PHYS04-002-L	Students get first-hand experience in handling various instruments needed for accelerator technology
Electronics	03PHYS04-003-L	Students get first-hand experience in handling various instruments required for electronics, image processing, and RF components

		Students are also expected to learn and handle GUI software and communication protocols

(D) Foundation Courses

Name of the Course	Course code	Course Outcome
Physics Courses for Engineering Graduates	03ENGG00-001-F	This is a bridge course which introduces engineering graduates to some specialized subjects of physics
		These subjects helps graduates to understand aspects of lasers, accelerators, and materials sciences
Engineering courses for Physics Post-graduates	03ENGG00-002-F	This is a bridge course which introduces physics post-graduates to some specialized subjects of engineering
		These subjects helps candidates to understand mechanical, electronics, and electrical engineering aspects of lasers and accelerators

BACK TO MAIN

PGD in LIFE SCIENCES
(Program Code: LIFE00)

Course Structure:

I. Courses at BARC

Program Code : LIFE00	Programme Specific Outcome	Basic knowledge on Physics, Mathematics and Chemistry
		Detailed knowledge on different statistical tools
		Thorough knowledge on Theoretical and practical aspects of different branches of Life Sciences
		Ability to write, initiate and carry out research projects

(A) Core courses

Sr. No.	Name of the Course	Course code
1	PHYSICS, MATHEMATICS and STATISTICS	BS502
2	CHEMISTRY and RADIOCHEMISTRY	BS501
3	BIOCHEMISTRY	BS601
4	MOLECULAR BIOLOGY	BS608
5	CELL BIOLOGY	BS603
6	CROP SCIENCE	BS604
7	MICROBIOLOGY & BIOTECHNOLOGY	BS607
8	HUMAN GENETICS	BS606
9	BIOINFORMATICS	BS602
10	RADIATION BIOLOGY	BS609
11	FOOD TECHNOLOGY	BS605

12	RESEARCH METHODOLOGIES	BS592
13	SEMINARS	BS594
14	AUDIT LECTURES	
15	ELECTIVE COURSES	BS701 - BS714

(B) Elective Courses:

Sr. No.	Name of the Course	Course code
1	ADVANCES IN ENZYME TECHNOLOGY	BS701
2	ASSESSMENT OF HEALTH EFFECTS FROM EXPOSURE TO LOW LEVELS OF IONIZING RADIATION	BS702
3	BIOLOGY OF STRESS AND ADAPTIVE RESPONSE IN BACTERIA	BS703
4	CHALLENGES FOR SUSTAINABLE AND CLEAN ENVIRONMENT	BS704
5	FOOD BORNE PATHOGENS	BS705
6	IMMUNOLOGICAL METHODS IN BIOCHEMICAL AND CHEMICAL ANALYSIS	BS706
7	MOLECULAR MARKERS AND GENOMICS FOR CROP IMPROVEMENT	BS707
8	OXIDATIVE STRESS AND REDOX MODIFIERS IN DISEASE MANAGEMENT	BS708
9	CANCER- HALLMARKS, PATHOGENESIS, MICROENVIRONMENT AND THERAPEUTICS (PREVIOUSLY *OVERVIEW OF CANCER*)	BS709
10	PLANT GENETIC ENGINEERING	BS710
11	ADVANCES IN GENOME BIOLOGY	BS711
12	PRINCIPLE AND PRACTICES IN STRUCTURAL BIOLOGY	BS712
13	ADVANCED INSTRUMENTATION FOR BIOANALYSIS AND IMAGING	BS713
14	MOLECULAR BIOLOGY METHODS IN TUBERCULOSIS AND THYROID CANCER	BS714

Course Outcomes:

(A) Core Courses

Name of the Course	Course code	Course Outcome
PHYSICS, MATHEMATICS and STATISTICS	BS502	To make them understand the basic concepts of physics including mechanics, optics and interaction of matter with radioactivity.
		Introduction to different tools of mathematics and statistics
		Hands on training for using different biostatics software for data analysis
CHEMISTRY and RADIOCHEMISTRY	BS501	Building foundation for understanding of biochemical reactions, weak interactions and free radicals in radiation biology.
		Introduction to radiolabelling techniques and applications of radiopharmaceuticals in diagnosis & therapy
		Fundamentals of bio-organic synthesis and secondary metabolites
BIOCHEMISTRY	BS601	Helps to understand the interaction of metabolic pathways through their linkages and establish their important roles in various cellular metabolic processes.
		How proteins and their post-translational modifications lead to diverse structure and function
		Understanding organisation of the enzyme complex and their role. Understanding and application of non-aqueous enzymology
		How biological oxidation and reduction contribute towards electron transport and energy transduction
MOLECULAR BIOLOGY	BS608	Fundamentals of central dogma of molecular biology
		Overview of DNA structure dynamics and regulation of DNA replication in different systems and its implications.
		Understanding of gene expression and its regulation at different levels
		Comprehensive overview of RNA biology including biogenesis and functioning of ncRNAs and RNPs
CELL BIOLOGY	BS603	Understanding of experimental basis of current models of cell cycle/apoptosis
		Knowledge about various signalling pathways and how they were experimentally determined
		Interpretation of flow cytometry data
		Approaches for setting up cell biology experiments with appropriate controls
CROP SCIENCE	BS604	Understanding the basic concepts of genetics, helping students to develop their analytical, quantitative and problem-solving skills from classical to molecular genetics
		To impart theoretical knowledge and practical skills about plant breeding objectives,

		mode of reproduction and genetic consequences, breeding methods for crop improvement.
		To impart theoretical knowledge and computation skills regarding component of variation and variances, scales, mating designs and gene effects.
		To apprise about various abiotic and biotic stresses influencing crop yield, mechanisms and genetics of resistance and methods to breed stress resistant varieties.
MICROBIOLOGY & BIOTECHNOLOGY	BS607	Understanding the microbial diversity
		To apprise about industrial applications of microbes
		To make them learn bacterial and viral genetics and various tools of gene mutation.
HUMAN GENETICS	BS606	Understanding of chromosomal rearrangements in human genetic diseases & syndromes and its implications to human health.
		Learning human genome mapping and role of molecular genetic markers in diseases association studies and pharamacogenetics.
		Learning mendelian and multifactorial inheritance in pedigrees and implications in screening the human population for genetic disorders.
		Learning human genome project goals & achievements using high throughput genomic technologies and their application towards disease identification, treatment and health care.
BIOINFORMATICS	BS602	How databases can be queried for retrieval of meaningful biological data
		Application of sequence analysis techniques for inferring gene or protein functions
		Application of structural bioinformatics approaches such as modelling to drug design
		Tackle real world biological problems through data mining and bioinformatics approaches
RADIATION BIOLOGY	BS609	Understanding the concept of radiation units, radiation protection standards, and dose effect relationships
		Physical and biological dosimetry.
		Molecular basis of cellular radio-sensitivity, radio/ chemo-sensitization of tumor cells, and principles of radiotherapy.
		Understanding biological effects of free radicals and cellular defense mechanisms against free radicals.
		Identifying chronic/acute, genetic and immune effects of radiation.
		General principles of monitoring, assessment and control of radiation hazards in nuclear fuel cycle facilities, and emergency preparedness.
FOOD TECHNOLOGY	BS605	Nutritional & functional properties of food
		Conventional and advanced food preservation methods
		Radiation processing of food products
		Role of microbes in food safety and shelf-life
	BS592	Learning of experimental design

RESEARCH METHODOLOGIE S	BS592	Learning of experimental design
		Planning and execution of experiments
		Data interpretation and data presentation
		Special training in handling of radioactive materials in biological experiments
		Hands on experience of latest instrumentation.
		This course would impart latest and relevant practical approach to address the biological research problems.
		To cultivate the art of communication and presentation
		To make them understand and present scientific papers
		To add professional ability and personality development in trainees.
AUDIT LECTURES		To give the idea of nuclear energy
		To explain them various types of nuclear reactors
		To make them aware about biosafety and animal ethics in biological research

(B) Elective Courses

Name of the Course	Course code	Course Outcome
ADVANCES IN ENZYME TECHNOLOGY	BS701	Gaining knowledge on industrial applications of enzyme, matrix designing, bioprocess development & 'Design of Experiment' (statistical approach)
		Building concepts on biosensors and their applications
		Understanding about enzyme role in remediation
		Exposure to molecular docking and molecular dynamic simulations for understanding enzymes-substrate interactions
ASSESSMENT OF HEALTH EFFECTS FROM EXPOSURE TO LOW LEVELS OF IONIZING RADIATION	BS702	Risk assessment due to low dose and low dose rate radiation effects on human health in high background radiation areas, A-bomb survivor, Chernobyl and Fukushima studies.
		Biological mechanisms relevance to human health due to low dose radiation exposures.
		Integration of biology and epidemiology for evaluation of cancer risk in human population using DNA damage, repair and immune response.
		Evaluating occupational, medical and environmental radiation exposures using

		risk models and its application to radiological protection science.
BIOLOGY OF STRESS AND ADAPTIVE RESPONSE IN BACTERIA	BS703	Understanding the known mechanisms of the abiotic stress responses in bacteria
		Experimental approaches to identifying the proteins responsible for stress tolerance, and their biochemical functions
		Estimation of metal bioremediation by cells
		Zymogram of proteins
CHALLENGES FOR SUSTAINABLE AND CLEAN ENVIRONMENT	BS704	Understanding different methods of waste processing/management.
		Transforming fundamental research to technologies for societal applications.
		Methodology of technology and product development.
		Comparison of waste management processes across major cities of world.
FOOD BORNE PATHOGENS	BS705	Learning types of foodborne pathogens
		Distribution and control of these pathogens
		Detection and identification of pathogens
		In death understanding of molecular mechanism of pathogenicity
IMMUNOLOGICAL METHODS IN BIOCHEMICAL AND CHEMICAL ANALYSIS	BS706	To demonstrate antigen-antibody interactions in imuunoassays
		To make learn radioiodination, QC-QA in immunoassays
		To explain Tg assays and Scatchard plot
		Non-isotopic immunoassays
MOLECULAR MARKERS AND GENOMICS FOR CROP IMPROVEMENT	BS707	Introduction to the different molecular markers techniques and their application in plant breeding
		Concept of reverse genetics and TILLING
		QTLs and their role in plant breding
		Demonstration of different techniques in MAS
OXIDATIVE STRESS AND REDOX MODIFIERS IN DISEASE MANAGEMENT	BS708	To make them understand the role and significance of ROS/RNS
		Demonstration of detection and measurement of free radicals
		To discuss the role of antioxidants in food and therapy
CANCER- HALLMARKS, PATHOGENESIS, MICROENVIRONMENT AND THERAPEUTICS (PREVIOUSLY *OVERVIEW OF CANCER*)	BS709	Understanding of the pathogenesis of cancer
		Observation of bulk tumor tissues and their processing for preservation and sectioning

		Methodologies to study cancer cell lines in tissue culture/animal models
		Understanding of the tumor microenvironment and therapeutics
PLANT GENETIC ENGINEERING	BS710	Understanding of genetic engineering principles including cloning of DNA fragments in different vectors
		Understanding the methods of gene transfer in plant systems such as banana, tobacco etc.
		Understanding gene expression, gene silencing, related molecular biology techniques such as genome editing tools ex; CRISPR –Cas9 system in plants
		Useful lectures and practical in crop improvement though recombinant DNA technology
ADVANCES IN GENOME BIOLOGY	BS711	To impart the importance of genome structure and organization
		Understanding the genome maintenance and segregation
		To make them understand the usefulness of genomic alterations in plant and bacterial systems
PRINCIPLE AND PRACTICES IN STRUCTURAL BIOLOGY	BS712	Understanding the known mechanisms of the abiotic stress responses in bacteria
		Experimental approaches to identifying the proteins responsible for stress tolerance, and their biochemical functions
		Estimation of metal bioremediation by cells
		Zymogram of proteins
ADVANCED INSTRUMENTATION FOR BIOANALYSIS AND IMAGING	BS713	Provides current perspectives on advanced instrumentation for bioanalysis and imaging
		How the different instruments work and what information can be obtained and interpreted to analyse the biological samples
		Acquiring skills and developing interest to employ various instrumentation techniques for solving research problem in biology
		Encouraging innovativeness and adopting new techniques to further biological research
MOLECULAR BIOLOGY METHODS IN TUBERCULOSIS AND THYROID CANCER	BS714	Importance of molecular diagnostics in infectious diseases and cancer
		To understand the importance of phylogeny in tuberculosis

		Introduction to thyroid cancer, diagnostics and treatment
PRINCIPLES AND PRACTICES OF MUTATION BREEDING	BS715	Basis of mutagenesis in crop plants
		Handling of mutagens and plant population
		Invitro mutagenesis technique
		Molecular technique for characterizing induced mutants

PGD. in PHYSICAL SCIENCES (Program Code: PHYS00)

Course Structure:

I. Courses at BARC

Program Code : PHYS00	Programme Specific Outcome	Apply principles of basic science concepts in understanding, analysis and prediction of physical systems.
		Introduce advanced ideas and techniques required in emergent areas of Physics.
		Introduce advanced experimental techniques in proposing experimental investigations in the frontiers of physics.
		Understand the basic concepts of research, data collection and presentation, scientific report writing, and ethics in research
		Gain an overall practical experience to decide and apply the appropriate method in future experimental investigations.
		Get the exposure to the steps needed towards completing a focused topic as well as the research areas of thesis supervisor.

(A) Foundation Courses

Sr. No.	Name of the Course	Course code
1	MATHEMATICAL PHYSICS	PH 501
2	QUANTUM MECHANICS	PH 502

3	STATISTICAL PHYSICS	PH 503
4	ELECTROMAGNETIC THEORY	PH 504
5	COMPUTATIONAL PHYSICS	PH 505

(B) Core Courses:

Sr. No.	**Name of the Course**	**Course code**
1	Nuclear Physics	PH 601
2	Atomic, Molecular & Laser Physics	PH 602
3	Plasma Physics & Technology	PH 603
4	Physics of Materials and Surfaces	PH 604
5	Reactor Physics & Technology	PH 605
6	Accelerator Physics & Technology	PH 606
7	Astrophysics	PH 607
8	Electronics	PH 608
9	Health Physics and Radiation Detectors	PH 609

(C) Experimental and Lab Courses

Sr. No.	**Name of the Course**	**Course code**
1	Engineering Drawing & Workshop Practices	PH 610
2	Research Methodologies and Methods of Experimental Physics	PH 611

(D) Elective Courses

Sr. No.	**Name of the Course**	**Course code**
1	Special topics in Mathematical Physics	PY 701

2	Selected Topics in Classical Mechanics	PY 702
3	Chaos and Nonequilibrium Statistical Mechanics	PY 703
4	Nonlinear Dynamics	PY 704
5	Advanced Computational Physics	PY 705
6	Stochastic Physics	PY 706
7	Selected Topics in Nuclear Physics	PY 707
8	Advanced Accelerator Physics & Technology	PY 708
9	Introduction to Neutrino Physics	PY 709
10	High Energy Astrophysics	PY 710
11	Synchrotron Radiation and its Applications	PY 711
12	Selected Topics in Atomic and Molecular Physics	PY 712
13	Advanced Photonics	PY 713
14	Quantum Optics and Information	PY 714
15	High Power Lasers and Applications	PY 715
16	Laser-Matter Interactions and Applications to Advanced Material Processing	PY 716
17	Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique	PY 717
18	Nonlinear Plasma Theory	PY 718
19	Modeling and Simulations in Physics	PY 719
20	Selected topics in Condensed Matter Theory	PY 720
21	Organic Semiconductor Devices	PY 721
22	Single Crystal Growth and Devices	PY 722
23	Advanced Magnetism and Superconductivity	PY 723
24	Neutron as a Probe of Condensed Matter	PY 724
25	Structure and Crystallography of Biomolecules	PY 725
26	Advanced Reactor Physics	PY 726

27	High Energy Density Physics: Theory	PY 727
28	High Energy Density Physics: Experimental	PY 728
29	Nuclear Data Physics for Advanced Nuclear Applications	PY 729
30	Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport	PY 730
31	Accelerator Driven Systems	PY 731

Course Outcomes:

(A) Foundation Courses

Name of the Course	Course code	Course Outcome
MATHEMATICAL PHYSICS	PH 501	Understand and apply mathematical techniques for describing and deeper understanding of physical systems.
QUANTUM MECHANICS	PH 502	Understand and apply principles of Quantum mechanics for understanding the physical systems in quantum realm.
STATISTICAL PHYSICS	PH 503	Understand and apply statistical methods for describing the classical and quantum particles in various physical systems and processes.
ELECTROMAGNETIC THEORY	PH 504	Gain knowledge in understanding the principles and dynamic phenomena of electromagnetism that occur in the case of time-varying sources (local charges and currents). Equips the students with the necessary mathematical knowledge for a detailed and accurate description of these phenomena and for solving related problems.
COMPUTATIONAL PHYSICS	PH 505	Gain knowledge in basic concepts in computational & numerical skills and apply them for understanding and describing complex physical systems.

(B) Core Courses:

Name of the Course	Course code	Course Outcome
Nuclear Physics	PH 601	Understand the properties and structure of nuclei, nuclear reaction mechanisms and their role in formation of universe consisting of different elements.
Atomic, Molecular & Laser Physics	PH 602	Understand the role of atoms and molecules in the structure and properties of mater. Describe different types of atomic and molecular spectra with and without external field.
Plasma Physics & Technology	PH 603	Describe basic concept of plasma, its physical parameters and applications. Describe basic processes in plasma and associated theory and solve simple plasma physics problems.
Physics of Materials and Surfaces	PH 604	Able to formulate basic models for electrons and lattice vibrations for describing the physics of crystalline materials; and understand band structure and electrical/optical properties, magnetism, superconductivity and surface structure of a material, .
Reactor Physics & Technology	PH 605	Understand the basic principle of nuclear power generation and physics design of a reactor.
Accelerator Physics & Technology	PH 606	Understand working principles and design concepts of different accelerators and their applications in industry and research in basic and applied sciences.
Astrophysics	PH 607	Able to identify and explain the properties of different astrophysical objects, learn experimental techniques to study them, understand the fundamentals of radiative transfers, theory of accretion and jets & outflows.
Electronics	PH 608	Understand how an analog signal is processed through different electronics modules and converted to digital signals,

		stored in memory and transferred to another deivice.
Health Physics and Radiation Detectors	PH 609	Gain basic knowledge of different types of radiations, doses, shielding, health effects and safety

(C) Experimental and Lab Courses:

Name of the Course	Course code	Course Outcome
Engineering Drawing & Workshop Practices	PH 610	Introduce advanced experimental techniques in proposing experimental investigations in the frontiers of physics.
Research Methodologies and Methods of Experimental Physics	PH 611	Understand the basic concepts of research, data collection and presentation, scientific report writing, and ethics in research

(D) Elective Courses:

Name of the Course	Course code	Course Outcome
Special topics in Mathematical Physics	PY 701	Learn about a few special topics in mathematical methods- difference equations, local analysis and global analysis.
Selected Topics in Classical Mechanics	PY 702	Learn about transformation theory of mechanics, integrable systems, canonical perturbation theory and near–integrable systems
Chaos and Nonequilibrium Statistical Mechanics	PY 703	Learn about Chaos and non-linear statistical mechanics involving Boltzmann and Liouville equation, Green-Kubo formulae, nonlinear maps, open systems and dynamical foundation of Boltzmann equation
Nonlinear Dynamics	PY 704	Learn about instabilities and chaos of periodically forced nonlinear oscillators, bifurcations and chaos in laboratory-scale systems, control and synchronization of

		nonlinear phenomena, experiments and numerical projects
Advanced Computational Physics	PY 705	Learn different programming languages and able to solve physics problems using advanced computer programming and/or Monte-Carlo simulation.
Stochastic Physics	PY 706	Learn about classical theory of Brownian motion, nucleation and coagulation theory and growth models.
Selected Topics in Nuclear Physics	PY 707	Learn about theoretical tools and techniques of advanced nuclear physics research areas and topics of current interest.
Advanced Accelerator Physics & Technology	PY 708	Learn about proton and heavy ion advanced accelerators, Giga-watt pulsed power & industrial accelerators, beam dynamics and design of advanced accelerators.
Introduction to Neutrino Physics	PY 709	Able to appreciate the intense activity worldwide in the field of neutrino physics. Get a brief exposition of a non-invasive method of monitoring fissile materials using neutrinos.
High Energy Astrophysics	PY 710	Able to identify and explain the properties of different astrophysical objects, learn experimental techniques to study them, understand the fundamentals of radiative transfers, theory of accretion and jets & outflows.
Synchrotron Radiation and its Applications	PY 711	Learn about the basic of production of Synchrotron radiation, beam line instrumentation and experimental techniques to study atomic, molecular and cluster physics
Selected Topics in Atomic and Molecular Physics	PY 712	Learn about coherent spectroscopy, physics with trapped ions and atoms, and behaviour of atoms and molecules under intense fields.
Advanced Photonics	PY 713	Learn the basics of LASER, fibre and non-linear optics, and get exposed to nano-photonics and meta-materials.

Quantum Optics and Information	PY 714	Learn about quantum theory of radiation, light atom interaction, ultra-cold atoms, quantum degenerate gases, and elements of atom optics and quantum information.
High Power Lasers and Applications	PY 715	Learn about non-linear optical processes, Laser dynamics and pulse generation, ultra-short pulse generation, amplification & compression and their applications.
Laser-Matter Interactions and Applications to Advanced Material Processing	PY 716	Learn about laser matter interaction, surface characterization, measurement & diagnostic techniques, and applications to advanced material processing
Computational Plasma Physics: Introduction to Particle in Cell (PIC) Technique	PY 717	Make mathematical modelling of a particle in a cell and solve Maxwell's equations.
Nonlinear Plasma Theory	PY 718	Learn about non-linear waves, non-linear wave-wave interaction and wave-particle interaction.
Modeling and Simulations in Physics	PY 719	Learn about electronic structure theory and modelling & simulations using Monte Carlo and Cluster Molecular dynamics
Selected topics in Condensed Matter Theory	PY 720	Learn about the application of quantum mechanical and atomistic lattice dynamics and computer simulations to model, understand, and predict the properties of real materials.
Organic Semiconductor Devices	PY 721	Learn about the techniques of preparation of organic thin films and their characterization, molecular electronics, organic electronics, organic solar cells and organic gas sensors.
Single Crystal Growth and Devices	PY 722	Learn about the techniques of single crystal growth, their characterization and applications
Advanced Magnetism and Superconductivity	PY 723	Learn about magnetism, magnetic exchange interaction, spintronics and superconductivity.
Neutron as a Probe of Condensed Matter	PY 724	Learn about neutron scattering, crystal structure study using neutron diffraction technique, neutron reflectometry and dynamics in condensed matter.

Structure and Crystallography of Biomolecules	PY 725	Learn about the computational and experimental methods of determining 3D structures in protein and nucleic acid, macromoleculer crystallisation and characterization, diffraction data collection and data processing
Advanced Reactor Physics	PY 726	Learn about neutron transport theory, numerical methods for solution of the multi-group neutron diffusion equation, reactor dynamics and reactor noise and its applications
High Energy Density Physics: Theory	PY 727	Learn about hydrodynamic and shock wave, equation of state and radiation opacities, radiation hydrodynamic instabilities and inertial confinement fusion.
High Energy Density Physics: Experimental	PY 728	Learn about the physics of high energy density effects in matter, energy storage systems, energetic materials and applications, diagnostic techniques and data interpretation.
Nuclear Data Physics for Advanced Nuclear Applications	PY 729	Learn about nuclear physics data, representation of nuclear data, nuclear data processing, multi-grouping, concept of critical facility and exposure to error propagation and sensitivity studies.
Advanced Computational Methods for Steady State and Transient Behaviour of Neutron Transport	PY 730	Learn about solution of transport equation, neutron thermalization, treatment of resonances, solution of time dependent transport equation and solution of the fuel depletion equations.
Accelerator Driven Systems	PY 731	Learn about spallation neutron sources, sub-critical reactor, accelerator driven systems and waste transmutation

BACK TO MAIN

Course Structure:

II. Courses at IGCAR

Program Code : PHYS00	Programme Specific Outcome	Able to serve as reactor Physicist at both thermal and Fast breeder reactors
		Trained to carryout research on advanced materials for Nuclear reactor applications
		Ability to handle robotics for non-destructive testing of radioactive materials

Course Structure:

Sr. No.	Name of the Course	Course code
1	Mathematical Methods	PY1
2	Computational Methods	PY2
3	Introductory Reactor Physics and Engineering	PY3
4	Nuclear Physics and Nuclear Data	PY4
5	Engineering Drawing and Laboratory Practices and Experimental Methods	PY5
6	Reactor Materials	PY6
7	Radiation Detection and Measurements	PY7
8	Reactor Types and Advanced Reactor Concepts	PY8
9	Radiation Shielding Design and Protection	PY9
10	Reactor Dynamics and Safety Analysis	PY10
11	Fuel Cycle Physics and Introduction to Fuel Cycle	PY11
12	Fluid Dynamics and Thermal Hydraulics	PY12
13	Advanced Computational Methods in Reactor Physics	PY13
14	Experimental and Operational Reactor Physics	PY14
15	Design Methods in Thermal and Fast Reactors and Computer codes	PY15
16	In Core of Fuel Management	PY16

Course Outcomes:

Name of the Course	Course code	Course Outcome
Mathematical Methods	PY1	Students learn vector spaces, Hilbert space, matrix methods, eigen value problems, differential and integral equations, complex variables.
Computational Methods	PY2	Since some complex equations cannot be solved analytically, numerical and computational methods are important. Students study the basics of computer architecture - hardware and software,
		Learn Various numerical methods
		Programming in Fortran and C
Introductory Reactor Physics and Engineering	PY3	Learn neutron physics, reactor physics including fast reactors; reactor kinetics and reactor control, all needed for working with nuclear reactors.
Nuclear Physics and Nuclear Data	PY4	Learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, nuclear models, nuclear data evaluation and processing which are Needed to work with nuclear reactors and for nuclear research.
Engineering Drawing and Laboratory Practices and Experimental Methods	PY5	Machine Drawings Projections, drafting, Autocad other material in this course are essential for engineers to produce accurate drawing for fabrication of small and large components for nuclear reactors and associated facilities.
Reactor Materials	PY6	Properties of nuclear fuels such as uranium, uranium oxide, plutonium, carbide and nitride fuels, MOX fuel, fuel fabrication, structural materials and clad materials, zirconium and alloys, moderators, Mechanical properties of materials, Radiation effects in materials, corrosion of metals and related topics makes this course a very important one for nuclear scientists and engineers.
		Ability to Solve unforeseen materials problems in operational reactors
		Ability to look for future candidate materials
Radiation Detection and Measurements	PY7	Required for radiation, safety workers and related scientists: Interaction of radiation

		with matter, radiation detectors including gas, semiconductor and scintillation detectors; ionization chambers; high resolution gamma spectroscopy, Monte Carlo simulations
Reactor Types and Advanced Reactor Concepts	PY8	Students will learn about different type of reactors such as Thermal reactors, fast reactors, High Temperature Reactor(HTR) and Advanced Heavy Water Reactor (AHWR). Metal fuelled FBR and Accelerator driven systems (ADS); Indian reactors APSARA, CIRUS, DHRUVA, PHWR, FTBR AND PFBR
Radiation Shielding Design and Protection	PY9	Students will study Radiation sources, its interaction with matter; summary of basic interaction mechanisms of alpha, beta, gamma/x -rays and neutrons with matter; radiation dosimetry; Interaction of radiation with biological matter; Radiation toxicity, Risk factors; radiation protection, shielding, and nuclear emergency management
Reactor Dynamics and Safety Analysis	PY10	Neutron kinetics and thermal effects. Feedback effects; Description of main reactor systems. Coolant system behaviour. Plant dynamics; safety systems; Reliability and Probabilistic Safety Analysis and related topics are taught in this course
Fuel Cycle Physics and Introduction to Fuel Cycle	PY11	Basic fuel cycles – once through and multiple recycle strategies, neutron economy, fissile material conservation and three stage program of India. Physics of U exploration methods. Recovery of the starting compounds bearing U,Pu,Th from their primary and secondary sources. Mining and milling. Issues related recycling – Effective fissile content of discharged fuel for next cycle; re-fabrication of fuel for the next cycle Activity and toxicity of discharged fuel
Fluid Dynamics and Thermal Hydraulics	PY12	Fluid continuum – Properties of fluids – Methods of describing fluid motion – Kinematics of fluid streamlines; Navier Stokes equations; Hydrostatics – Manometry; Fluids subjected to uniform linear acceleration and uniform rotation; Thermal hydraulics.

		Important specialisation for understanding behaviour of reactor coolants (liquid sodium and water) for safe reactor operation
Advanced Computational Methods in Reactor Physics	PY13	Students will learn Methods of solving neutron Diffusion equation; Finite element method- its advantages and disadvantages. Coarse mesh rebalancing. Methods of solving neutron transport equation; (a) PN method (b) Discrete ordinates method (c) Collision probabilities methods; Detailed burnup chain with all minor actinides. Solution of the burnup equations. Constant flux and constant power approximations.
Experimental and Operational Reactor Physics	PY14	In-depth exposure and develop expertise to experiential aspects of Reactor operations
		Dynamical methods to evaluate and monitor reactivity measurements
		Expertise to monitor delayed neutron counting and noble gas fission products to detect early stages of fuel failures.
		Exposure to operation aspects of various types of reactors
Design Methods in Thermal and Fast Reactors and Computer codes	PY15	Exposure to model and design of both thermal and fast reactors using neutron production, transport and reactions
		Expertise to use various design and validation codes for neutronics
In Core of Fuel Management	PY16	Develop expertise in various safety aspects of in-core fuel handling and management in different types of reactors
		Exposure to reactor specific fuel handling methods and controls
		Exposure to specialised computer codes for in-core fuel handling

M.Tech.
(Program Code: ENGG01)

Course Structure:

I. Courses at BARC

Program Code : ENGG01	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Accelerator Physics and Technology	EN501
2	Engineering Mathematics	EN502-505
3	Health Physics and Rad & Indl Safety	EN506
4	Nuclear Fuel Cycle Technology	EN508
5	NPP & Advanced Reactor Concepts	EN509
6	Reactor Physics and Engineering	EN510

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Accelerator Physics and Technology	EN501	The course introduces basic concepts of accelerator physics, Vacuum and cryogenic systems
		The course discusses concepts of storage ring physics, RF linear accelerators, and principles and instrumentation related to beam diagnostics.
		The course also introduces different types of accelerators and basic concepts of synchrotron radiation sources
Engineering Mathematics	EN502-505	Advanced knowledge in computational data analysis, data fitting and error analysis

		Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering
Health Physics and Rad & Indl Safety	EN506	Learning the interaction of ionizing radiation with matter
		Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation
		Principles of radiation detection and Radiation Protection procedures
		Familiarization with principles of radiation detection and radiation Protection procedures
Nuclear Fuel Cycle Technology	EN508	Familiarisation with font and back end of nuclear fuel cycle technology
		Knowledge of radioactive waste generation on nuclear fuel burning and its processing
NPP & Advanced Reactor Concepts	EN509	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts
		Familiarization with reactor physics design challenges
Reactor Physics and Engineering	EN510	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with nuclear reactors.

(A) MECHANICAL COURSES

(A1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Code design for PVP	EN610
2	Computational fluid Dynamics and Heat Transfer	EN611
3	Finite Element Method	EN621
4	Fracture Mechanics	EN622
5	Mechanics of Solids	EN624

(A2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Machine Design	EN711
4	Material Science in Nuclear Engineering	EN712
5	Multi-scale material modelling	EN715
6	Nuclear Emergencies	EN716
7	Reliability Engineering	EN718
8	Vibration	EN721

(A3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(A1) Core Engineering

Name of the Course	Course code	Course Outcome
Code design for PVP	EN610	Basis of ASME Sec.VIII and Sec.III eqns. for Pressure Vessel and Piping Design
		Nozzle openings, Vessel design under ext. pressure
		ANSI / ASME B31.1 and B31.3 piping code
		NDE Examination of welds, Acceptance standard
Computational fluid Dynamics and Heat Transfer	EN611	Basics of Fluid Flow, Heat Transfer and Numerical Analysis
		Turbulent Flow and Heat Transfer
		Numerical Solution of Complete Fluid Flow and Energy Equation
		Reactor Heat Transfer

Finite Element Method	EN621	Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element
		2D isoparametric formulation
		Introduction to Nonlinear problems
		Finite element applications for design
Fracture Mechanics	EN622	LEFM and EPFM, Material fracture props. determination
		PTS event of RPV and Master Curve Concept
		Computational Fracture Mechanics
		Fracture Mechanisms
Mechanics of Solids	EN624	Principles and Fundamental Equations of Elasticity
		Analysis of Stress and Strain, Thermal Stresses
		Introduction to Plasticity
		Theory of Plates and Shells

(A2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Programming Language C++
		Parallel Programming
		Scientific Visualization
		Artificial Neural Network
Fluid Power Technology	EN709	Basic principles of hydraulics and pneumatics, pressure control
		Fluid power pumps and compressors, Fluid experiments
		Directional and flow control valves, Fluid Logic & Control
		Advanced Hydraulic Control Circuits, Electronics and Instrumentation for Hydraulics
Machine Design	EN711	Basic Principles of Machine Design, Design and Drawing Practices
		Sealing Methods
		Special Dimensional Inspection Techniques
		Advanced Manufacturing Techniques
Material Science in Nuclear Engineering		Metallurgy of steels
		Nuclear Materials

	EN712	Advanced Polymeric materials and Composites
		Corrosion
Multi-scale material modelling	EN715	Atomistic models: Molecular dynamics, Monte Carlo methods
		Inter-atomic potentials, Mesoscopic methods
		Modeling at microscale
		Bridging the scale gaps between different simulation levels
Nuclear Emergencies	EN716	Radiation Shielding, Nuclear Waste Management
		Nuclear Accidents/emergencies, Effects of Hiroshima & Nagasaki bombing
		Medical decontamination with demonstration
		Monitoring of High radiation field area
Reliability Engineering	EN718	Regression analysis, Functions of Random Variables
		Probabilistic Fracture Mechanics
		System Reliability Analysis
		Reliability in Engineering Design
Vibration	EN721	Single and Multi-degree-of-freedom Systems, Free vibration
		Response of Systems To Ground Motion: Earthquake motion
		Flow Induced Vibration
		Vibration Measurement and Signal Analysis

(A3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
MiniProject		To provide a hands-on experience of working in an

	EN593	ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		To aquare skills in formulating and executing a research problem and communicating the results in writing and orally.

(B) CHEMISTRY COURSES

(B1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Chemical Reaction Engineering	EN601
2	Advanced Mass Transfer	EN604
3	Code design for PVP	EN610
4	Computational Fluid Dynamics and Heat Transfer	EN611
5	Nuclear Chemical Engineering	EN628
6	Process Dynamics and Control	EN634
7	Process Modeling, Simulation and Optimization	EN635

(B2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Fluid Power Technology	EN709
3	Material Science in Nuclear Engineering	EN712
4	Membrane Technology	EN714

(B3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591

2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(B1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Chemical Reaction Engineering	EN601	Fundamentals of Non-ideal reactors & RTD studies
		Understanding Non-isothermal effects & dynamical behaviour
		Overview of Heterogeneous reactions
		Approaches in Advanced reaction engineering & reactor design
Advanced Mass Transfer	EN604	Understanding Mass transfer with and without chemical reactions
		Rate based approaches for design
		Selection and design of various contacting equipment
		Process intensification approaches
Code design for PVP	EN610	Overview of Theories for pressure vessel design
		ASME Sec. VIII Div. 1 and Div - II equations
		Pressure vessel design as per ASME
		Design of piping as per B31.1 piping code.
Computational Fluid Dynamics and Heat Transfer	EN611	Understanding Kinematics of fluid flow and governing equations
		Classification of Partial Differential Equations & their discretization
		Convective heat transfer for internal and external flows
		Numerical Solution of fluid flow and heat transfer equations
Nuclear Chemical Engineering	EN628	Overview of Recovery and processing of nuclear materials
		Uranium conversion and reconversion

		Isotope Separation
		Nuclear Waste Management
Process Dynamics and Control	EN634	Introduction to process control & control loop dynamics
		Fundamentals of state-space controls, state, measurement equations
		General solution of the state equation
		Multi-variable controls, de-coupling, relative gain array
Process Modeling, Simulation and Optimization	EN635	Formulation of Dynamic and steady state models
		Flow sheet Analysis & Plant Simulation
		General Approaches for Non-Linear Systems
		Plant optimisation by Genetic Algorithms and Neural Nets

(B2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Understanding Programming Language C++
		Finite difference, finite volume, finite element discretization, grid generation, artificial neural network
		Parallel Programming, Message Passing Interface and MPI communications
		Scientific Visualization methods
Fluid Power Technology	EN709	Basic principles of Hydraulics and pneumatics
		Properties of hydraulic fluids and pneumatic air
		Roto-dynamic pumps, pressure and flow control
		Approaches in Hydraulic Circuit Design
Material Science in Nuclear Engineering	EN712	Overview of Nuclear Materials & their classifications
		Structure and properties of nuclear materials
		Processing of Nuclear Materials

		Material characterization techniques
Membrane Technology	EN714	Overview of Novel Membranes
		Preparation and Characterization
		Membrane Technologies
		Applications of Membrane Technology

(B3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Science and Engineering

(C) METALLURGY

(C1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Corrosion	EN615

2	Extractive Metallurgy	EN620
3	Mechanical Metallurgy	EN623
4	Nuclear Materials	EN628
5	Nuclear Metallurgy	EN629
6	Physical Metallurgy	EN630
7	Process Control & Instrumentation	EN631

(C2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Computational Techniques	EN701
2	Digital Signal Processing & Image Processing	EN706
3	Image processing and Machine Vision	EN710
4	Materials Characterization	EN713
5	Multi scale Material Modeling	EN715
6	Nuclear Chemical Engineering	EN628
7	Nuclear Emergencies	EN716
8	Welding Science & Technology	EN723

(C3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(C1) Core Engineering

Name of the Course	Course code	Course Outcome
Corrosion	EN615	Understanding electrochemical theory of corrosion & corrosion basics
		General principles of corrosion control
		Forms of corrosion and its mitigation
		Corrosion problems in nuclear industry and its mitigation
Extractive Metallurgy	EN620	Thermodynamics and kinetics of metal extraction
		Advanced material processing techniques
		Process metallurgy of rare metals, special materials and alloys
		Process metallurgy of U, Th, Pu, Be, Zr, Hf, Nb, Ta & rare earths
Mechanical Metallurgy	EN623	Exposure to stress tensor, state of stress, principal stress, hydrostatic, deviatoric stress
		Dislocations and deformation behaviour
		Creep & creep law, deformation mechanism map
		Fracture mechanics and fatigue of metals
Nuclear Materials	EN628	Vacuum melting & solidification, controlling casting defects of U, Zr and Ti alloys
		Cold & hot working, dynamic recovery, recrystallization of fuel tube, texture microstructure control
		Powder metallurgy of oxide, mixed oxide, carbide, intermetallic nuclear fuel material
		Applications of powder metallurgy in applications relevant to DAE
Nuclear Metallurgy	EN629	Fabrication of different types of fuel for research and power reactors

		Health physics, radioactivity and safety aspects of Pu handling
		Effects of irradiation on nuclear fuel and structural materials, hydriding related problems in Zr alloys
		Post irradiation examination (PIE) of nuclear fuel and structural material
Physical Metallurgy	EN630	Understanding basics of crystallography, crystal defects during irradiation
		Thermodynamics, phase equilibria & phase transformation
		Diffusion mechanism, equations & solutions
		Recovery, Recrystalization and Grain Growth
Process Control & Instrumentation	EN631	Understanding basic principles of measurement
		Sensors, transducers & transmission methods for pressure, vacuum, flow, level
		Principles of Automatic Control Systems
		Fail safe principles, simple logic circuits, ladder circuits for control action

(C2) Electives

Name of the Course	Course code	Course Outcome
Advanced Computational Techniques	EN701	Exposure to programming languages: C and C++
		Application of finite difference, finite volume, finite element techniques, ANN etc. in DAE
		Introduction to parallel programming concepts
		Data storage & visualisation techniques and case studies
Digital Signal Processing & Image Processing	EN706	Introduction to digital signal processing system & applications
		Discrete Fourier transform, fast Fourier transform

		Image processing, image enhancement, image segmentation & analysis, morphological operations
Image processing and Machine Vision	EN710	Introduction to digital image model representation, image sensor, digitizer, computer, standard file format
		Image enhancement segmentation and analysis, restoration
		Morphological operations and image compression
		Machine vision & introduction to image understanding
Materials Characterization	EN713	Introduction to microscopy techniques: optical, SEM, TEM, AFM, STEM, EBSD, FIM
		XRD and applications, basics of SIMS, RBS
		Analytical TEM, chemical analysis in materials science
		Thermal expansion and conductivity, TGA/DTA/DSC, mechanical properties
Multi scale Material Modeling	EN715	Introduction to types of models and multiscale approaches
		Atomistic models – molecular dynamics
		Basics of Monte Carlo methods
		Analysis of simulation results, bridging scale gap between different simulation levels
Nuclear Chemical Engineering	EN628	Recovery & processing of U, Th, Zr, rare earths from from ores / intermediates
		Uranium Conversion/reconversion
		Isotope Separation
		Nuclear Waste Management
Nuclear Emergencies	EN716	Introduction to nuclear fuel cycle, transportation of radioactive material
		Radiological accidents / emergencies
		Effects of nuclear detonation, testing nuclear weapons
		Emergency Response methodology/ Philosophy

Welding Science & Technology	EN723	Overview of various welding processes - arc welding, beam welding, hybrid welding
		Cold Bonding/Solid State Bonding
		Welding metallurgy under high cooling rates
		Types of welding defects and its prevention

(C3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I & VivaVoce-II	EN591	Assessment of grasp of the basic concepts in the courses covered
		Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains
Practicals	EN592	Enhancing acquired skills and making reports
Mini Project	EN593	To provide a hands-on experience of working in an ongoing project of the Department.
		Gaining experience in in formulating and executing a scientific/technical problem
		To acqure skills in formulating and executing a research problem and communicating the results in writing and orally.

(D) CIVIL ENGINEERING

(D1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Civil Engg Design of Concrete & Steel Strct I	EN608.1

2	Civil Engg Design of Concrete & Steel Strct II	EN608.2
3	Design Basis Hazards & Geotechnical Engg	EN621
4	Earthquake Engineeing & Structural Dyanmics	EN609
5	Finite Element Method	EN626
6	Mechanics of Solids	EN624

(D2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Struct Dynamics & Earthquake Engg	EN724
2	Construction Materials, Management & Quality	EN614
3	Safety & Reliability of Civil Engineering	EN722
4	Project Management	EN717

(D3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(D1) Core Engineering

Name of the Course	Course code	Course Outcome
Civil Engg Design of Concrete & Steel Strct I	EN608.1	Various structures of nuclear facilities; safety, seismic, design and quality classifications of structures
		Design loads on structures and load combinations as per BIS, ACI and AERB standards
		Design of RC structures; fracture mechanics concept in RC design

		Shallow and deep foundation design; machine foundation design
Civil Engg Design of Concrete & Steel Strct II	EN608.2	Design of prestressed concrete structures
		Design of lined and unlined reactor containment structures using RCC-G/BPEL/BAEL and ASME codes
		Design of steel structures using BIS, AERB and AISC standards
		Design of underground and overhead water retaining structures; design of natural draft cooling tower
Design Basis Hazards & Geotechnical Engg	EN621	Siting of nuclear facilities; hazards due to internal and external events; design basis natural hazards, such as, seismic, flood, wind, snow and solar radiations
		Human-induced design basis hazards, such as, aircraft/missile impact, explosions/blast, and toxic gas release
		Soils and its classifications; laboratory and field tests on soils and rock; compaction of soils; bearing capacity of soils and rocks
		Stages of geotechnical investigations; soil and rock sampling; geophysical investigations; seismic refraction survey, cross-hole seismic test; ERT; liquefaction potential of sites
Earthquake Engineeing & Structural Dyanmics	EN609	Seismic waves and wave propagation; time history; response spectra; seismic instrumentation
		Dynamic loadings; dynamic response of SDOF and MDOF systems; dynamics of continuum system
		Response spectra and time history approaches for determining seismic structural

		response; SSI and FSI; structural response in frequency domain
		Seismic requalification of existing installations; retrofitting techniques
Finite Element Method	EN626	Basis of FEM; energy principles; shape function requirements; C0 and C1 continuity
		Derivation of stiffness matrix and load vector for bar, beam, 2D plane and 2D iso-parametric elements; evaluation of strain and stress
		Incompatible quadrilateral elements; Tetrahedron, and hexahedron elements; plate bending elements; shell elements; patch test; adoptive meshing; error analysis
		Non-linear problems; material and geometric non-linearity
Mechanics of Solids	EN624	Concepts of elasticity; Equilibrium equations; Solution of 1-D boundary value problem; tensors algebra
		Analysis of stress and strain; transformation using direction cosines; principal planes; octahedral plane; state of pure shear; strain deviator tensor
		Strain displacement relationship; Isotropy and Anisotropy; Strain energy; Plane stress and plane strain problems; solution for beam bending problem; solution in polar co-ordinates; thermal stresses
		Analysis of thin and thick plates; shear deformation theories; membrane theory of shells of revolution and translation; bending analysis of shells; application to cylindrical, spherical and conical shells; introduction to plasticity

(D2) Electives

Name of the Course	Course code	Course Outcome
Advanced Struct Dynamics & Earthquake Engg	EN724	Concept of performance based seismic design; seismic demand; capacity of structures; performance levels
		Concept of seismic and vibration control; passive control; semi-active control; active control; base isolation techniques
		Methods of testing; qualification of system by testing; seismic instrumentation; measurement of displacement, velocity, acceleration
		Fluid-structure interaction techniques; multibody dynamics
Construction Materials, Management & Quality	EN614	Construction materials, such as, concrete, reinforcement, structural steel, paints, water-proofing materials
		Design of formworks; slip forms; prestressing systems
		QA in civil design, materials, construction, O&M, and regulatory inspection
		Dewatering; rock excavation, construction safety and JHA; mode of tendering; contract clauses; dispute adjudication
Safety & Reliability of Civil Engineering	EN722	Statistics and probability; discrete and continuous random variables; probability distributions
		Concept of structural safety; limit states; MVFOSM; Hasofer Lind reliability index; Cornell reliability index; Monte Carlo simulation
		Probabilistic safety assessment; seismic fragility analysis; seismic risk; health assessment of existing concrete and steel structures; rehabilitation and retrofitting

		techniques; service life prediction
		Concept of industrial safety; fire hazard analysis; safety in handling machinery, equipment and tools; fitness and protection of personnel
Project Management	EN717	Type, cost and schedule of nuclear power projects; resources of project; project organization chart; delegation of power
		Scheduling in a project by PERT, CPM, precedence diagram method; project management software for planning, scheduling and monitoring
		Preparation of target plan, updating of progress, monitoring variance and reporting; physical and financial monitoring; capital budgeting and expenditure control
		Contingency plan; construction management; project management; SWOT analysis; problem solving techniques

(D3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
Mini Project	EN5A93	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills

		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg.

(E) ELECTRICAL ENGINEERING

(E1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design I	EN602
2	Computer Based System Design I	EN612
3	Electrical Systems for Nuclear Power Plants	EN618
4	Modern Control Systems Design and Simulation	EN625
5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(E2) Electives

Sr. No.	Name of the Course	Course code
1	Advanced Electrical Engg. Design II	EN702
2	Artificial Intelligence and its Applications	EN703
3	Computer Based System Design II	EN704
4	Digital Signal Processing & Image Processing	EN706
5	Image Processing & Machine Vision	EN710
6	Signal Conditioning, Recovery and EMI Aspects	EN719
7	Software Engineering	EN720

(E3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(E1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design I	EN602	Materials and Electrical Properties, NDT, MFL
		Superconducting Properties
		Understanding Control Techniques of Electrical Motors and Electronics
		FEM and Applications
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Electrical Systems for Nuclear Power Plants	EN618	Recapitulation of Power System Design Analysis
		Basics of Switchyard Design Principles
		Understanding Protection Systems
		Exposure to Electrical Systems in NPP
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity

		Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters
		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(E2) Electives

Name of the Course	Course code	Course Outcome
Advanced Electrical Engg. Design II	EN702	Understanding Vector Control of PM Synchronous Motors
		Exposure to Design and Applications of Variable Reluctance Stepper Motors and Switched Reluctance
		Understanding Pulse Power Techniques
		High Voltage Systems
Artificial Intelligence and its Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies

		Understanding Reinforcement Learning and Dynamic Programming
Computer Based System Design II	EN704	Exposure to Data Communication Interfaces for Control Applications, Fieldbuses
		Understanding Real Time System Design Principles
		Understanding IPC mechanisms in RTOS
		Exposure to Safety System Design Regulations
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics

		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems

(E3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting
MiniProject	EN593	Enhancing Skill Set for handling real life problems
		Understanding and Documentation skills
		Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg

(F) ELECTRONICS ENGINEERING

(F1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Electronic Circuit Design Techniques	EN603
2	Advanced Nuclear Instrumentation	EN605
3	Embedded & Computer Based Sys. Design	EN619
4	Modern Control Systems Design and Simulation	EN625

5	Process Control & Instrumentation	EN633
6	Reactor Control Engineering and Instrumentation	EN637-8
7	Reliability Engineering	EN639

(F2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Digital Signal Processing & Image Processing	EN706
3	Embedded Electronics Software	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720
7	Artificial Intelligence & Applications	EN703

(F3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(F1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Electronic Circuit Design Techniques	EN603	Introduction to VLSI Design Flow, HDL, Design and Simulation of HPD
		Understanding Semiconductor Detectors , MEMS Desin
		Introduction to RF Electronics

		Understanding Transmission Lines, Waveguides, RF Amplifiers,
Advanced Nuclear Instrumentation	EN605	Understanding Electronics in Spectroscope Design
		Nuclear Instruments, Alpha, Beta and Gamma Detectors, Scintillation Counters
		Introduction to Accelerator Instrumentation
		Understanding Reactor Neutronic Instruments and Signal Processing
Embedded & Computer Based Sys. Design	EN619	Overview of Microprocessors and Interfacing
		Understanding Techniques for Embedded Systems Design, EMI/EMC Requirements
		Exposure to Computer Communication, Encoding and Technologies
		Understanding Software Developments for NPP/Accelerator C&I
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Process Control & Instrumentation	EN633	Overview of Measurement Principles, Accuracy, Hysteresis
		Understanding Flow, Pressure, Level,Temperature, pH, Conductivity Measurementsand Advanced Instruments
		Understanding, Control Valves, design and PLC, Smart Transmitters

		Industrial Instrumentation, P&I Diagrams, Instrumentation in NPP
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(F2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models

		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications
Signal Conditioning, Recovery and EMI Aspects	EN719	Review of Analog Signal Conditioning & Recovery Techniques
		Understanding Quantization Techniques, Aliasing Filters
		Theory of Signal Analysis, Function bases, orthogonal basis, Wavelet, Multiscale Characterisation
		Exposure to EMI, Modeling Techniques and Shielding
Software Engineering	EN720	Understanding Software Design Fundamentals and Life Cycle
		Exposure to Modelling Techniques for Software Design and UML basics
		Software Quality Assurance, Verification and Planning
		International and Nuclear Standards for Safety Critical Systems
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming

(F3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome
VivaVoce–I& VivaVoce-II	EN591	Assessment of Fundamental Concepts in Nuclear Engineering
		Assessment of Understanding of Domain Subjects and their Applications in Nuclear Sc. & Engg
		Assessment of capabilities to apply to solve real life
Practicals	EN592	Enhancing skills and reporting

(G)INSTRUMENTATION ENGINEERING

(G1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Applied Process Instrumentation	EN607
2	Computer Based System Design I	EN612
3	Modern Control Systems Design and Simulation	EN625
4	Reactor C&I and Human Machine Interface	EN636
5	Reactor Control Engineering and Instrumentation	EN637-8
6	Reliability Engineering	EN639

(G2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Computer Based System Design II	EN706
3	Digital Signal Processing & Image Processing	EN707
4	Image Processing & Machine Vision	EN710
5	Signal Conditioning, Recovery and EMI Aspects	EN719
6	Software Engineering	EN720

(G3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(G1) Core Engineering

Name of the Course	Course code	Course Outcome
Applied Process Instrumentation	EN607	Detailed exposure to Flow, Pressure, Level, Temperature
		Understanding Analytical Instrumentation
		Exposure to Control Valves, Sizing calculation, P/I & I/P Converters, Impulse Tubing
		Exposure to P&I Diagrams and Design Guides
Computer Based System Design I	EN612	Microprocessors & Interfacing Techniques
		Interconnect Buses and Industrial Systems
		Introduction to HDL and FPGA based System Design
		Understanding Fault Tolerant Architectures and TMR
Modern Control Systems Design and Simulation	EN625	Understanding State Space Techniques
		Understanding Controllability and

		Observability, Kalman Criterion
		Stability Analysis, Lyapunov Criterion
		Principles of State Observer, LQR, Ricati Equation
Reactor C&I and Human Machine Interface	EN636	Overview of Reactor C&I & Power Supply Requirements for Instrumentation
		Understanding Control Room Design and Exposure to Codes & Guides
		Exposure to Relay & Control Logic Design, Critera for Relay, PLC & DCS Technologies
		C&I Cable Requirements
Reactor Control Engineering and Instrumentation	EN637-8	Fundamental Principles of Nuclear Instrumentation, In-Core, Ex-Core Detectors
		Modes of Signal Processing, Pulse and Campbell techniques
		Reactor Core Instrumentation and Familiarisation
		Health Physics Instrumentation
Reliability Engineering	EN639	Understanding Reliability Principles and Applications to Nuclear Reactor Systems
		Overview of Statistical Methods
		Exposure to Fault Tolerance, Fault Avoidance Techniques
		Understanding Industrial Quality Assurance Techniques and Processes

(H)COMPUTER SCIENCE AND ENGINEERING

(H1) Core Engineering

Sr. No.	Name of the Course	Course code
1	Advanced Operating Systems	EN606
2	Computer Graphics & Visualisation	EN613
3	Distributed Computing	EN616
4	Networking & Information Security	EN627
5	Reactor Control Engineering	EN637
6	Software Engineering and Formal Methods	EN640

(H2) Electives

Sr. No.	Name of the Course	Course code
1	Artificial Intelligence & Applications	EN703
2	Data Base Management System & Web Technology	EN705
3	Digital Signal Processing & Image Processing	EN706
4	Embedded Electronics Software	EN707
5	Feedback Control System	EN708
6	Image Processing & Machine Vision	EN710

(H3) Non-Subject Assignments

Sr. No.	Name of the Course	Course code
1	VivaVoce–I& VivaVoce-II	EN591
2	Practicals	EN592
3	MiniProject	EN593

Course Outcomes:

(H1) Core Engineering

Name of the Course	Course code	Course Outcome
Advanced Operating Systems	EN606	Understanding IPC Calls
		Shell Programming
		Understanding Distributed File Systems
		Applications of System Calls
Computer Graphics & Visualisation	EN613	Understanding Geometric Transformations
		Applications of Geometric Projections
		Techniques for Hidden Surface Removals
		Applications of Scientific Visualisation
Distributed Computing	EN616	Understanding modern CPU Architectures
		Understanding Interconnect Techniques
		Understanding and Applications of HPC

		Understanding Grid Computing and Workflows
Networking & Information Security	EN627	Understanding Issues in the transport of data and Techniques
		Satellite Communications
		Understanding Network Security Concepts
		Advances in Cryptography and Cryptanalysis
Reactor Control Engineering	EN637	Understanding Physics behind Rector Control
		Understanding Point Kinetics Model and Reactor Periods
		Understanding Issues with Large Reactor Control and Modelling
		Understanding Control Requirements for PWR, PHWR, BWR and FBR
Software Engineering and Formal Methods	EN640	Understanding Techniques for modelling software
		Application of Model Checking and Theorem Proving
		Understanding Agile Programming
		Understanding Software Testing

(H2) Electives

Name of the Course	Course code	Course Outcome
Artificial Intelligence & Applications	EN703	Understanding Search Problems and A* Algoritm
		Soft Computing Techniques like ANN & SVM
		Data Mining Technologies
		Understanding Reinforcement Learning and Dynamic Programming
Data Base Management System & Web Technology	EN705	Understanding SQL and Complex queries
		Understanding Clusters and Distributed Databases
		Understanding and Working with Web Technologies
		Modelling data and design of real data bases

Digital Signal Processing & Image Processing	EN706	Understanding Digital Signal Processing Techniques
		Understanding Fourier Transforms, FFT, Digital Filters and Applications
		Understanding Image Processing Techniques
		Understanding Image Compression Techniques
Embedded Electronics Software	EN707	Understanding Digital System Design Flows and EDA/SE Tools
		Understanding Real time System Task Models
		Scheduling Paradigms for Hard Real Time Systems
		Getting an overview of Practical RTOS
Feedback Control System	EN708	State Space Representation and Applications
		Time Domain Analysis
		Appreciating need for Stability Analysis & Techniques
Image Processing & Machine Vision	EN710	Understanding techniques for Image Processing and Morphological Operations
		Understanding Image Models for Machine Vision
		Scene Interpretation and recognition
		Understanding Robotic Applications

(H3) Non-Subject Assignments

Name of the Course	Course code	Course Outcome

M.Tech. in GEOLOGY & GEOPHYSICS (Program Code: ENGG01)

CORE COURSE:

I. Courses at BARC - AMD:

Program Code: ENGG01	Program Specific Outcome	
		Thorough knowledge on geological aspects of exploration for uranium and other atomic minerals.
		Inter-disciplinary approach and application of geophysical, geochemical and radiometric methods in exploration.
		Field and laboratory data generation techniques, geological modeling and resource estimation
		Giving research orientation to the young minds, training in formulation and implementation of research projects.

COMMON COURSES:

Sr. No.	Name of the Course	Course Code
1	Nuclear Physics	102
2	Remote Sensing and GIS	110
3	Airborne Geophysics	209
4	Nuclear Reactor and Fuel Cycle	212

Course Outcome:

Name of the Course	Course Code	Course Outcome
Nuclear Physics	102	The course introduces nucleus, it's properties, natural radioactivity, decay, equilibrium, natural decay series, fission and fusion
		Learning principles and types of radiation detectors, and their characteristics
		Familiarization of gamma ray spectrometry, gamma ray logging and sample analysis techniques used in exploration, Instrumental Neutron Activation Analysis.

		The course also introduces radon emanometry, methods for measurement of Radon
Remote Sensing and GIS	110	The course introduces concepts of Remote Sensing, mineral and rock spectra and use in geological studies, available sensors, and types of resolutions
		Learning fundamentals of image interpretation, digital image processing, enhancement techniques, image classification for geological interpretation.
		Introduction to GIS, spatial and attribute data, coordinates and map projections.
		The course also teaches GIS analysis, data integration and modeling techniques in mineral exploration using various software.
Airborne Geophysics	209	The course introduces airborne survey design and survey parameters, type of geophysical surveys carried out.
		Students are acquainted with airborne survey instruments, navigation aids and procedures in data acquisition.
		Learning processing and presentation of airborne data, identification of anomalous zones and conductors.
		The course also teaches QA & QC and validation of data sets, geological interpretation, depth estimates, delineation of alteration zones, forward and inverse modeling, and procedures for obtaining licenses for flying,
Nuclear Reactor and Fuel Cycle	212	Understanding nuclear energy, Indian scenario, fission and fusion
		Reactor systems, types of nuclear reactors, moderator and coolant, control systems, behaviour and safety systems.
		Nuclear fuel cycle options for various types of reactors, mining, processing, manufacturing, usage and burning of fuel, quality control, storage and transportation, enrichment, reprocessing and management of waste.
		Environment, legislation and controls, EIA requirements.

SUBJECTS FOR GEOLOGY:

Sr. No.	Name of the Course	Course Code
1	Mathematics for Geologists	101
2	Geophysics for Geologists	103
3	Uranium Geology	105
4	Drilling and Mining Techniques	106
5	Geochemical Exploration	108
6	Exploration for Beach Sand and RM&RE	202
7	Petrographic Techniques	206
8	Mineral Process Engineering	208
9	Analytical Techniques	210
10	Ore Reserve Estimation (Covered as part of 9 weeks field training in the months of December, January and February)	204

Course Outcome:

Name of the Course	Course Code	Course Outcome
Mathematics for Geologists	101	To introduce the students on concepts of Geostatistics and basic Mathematical techniques.
		Apply principles of Geostatistics and mathematical methods for analysis and predictions in Geoscience research and Geomodelling.
		Development of skill set necessary for solving complex problems in the field of Geoscience.
		Expose the young students to state-of-the art modelling techniques applicable to the Uranium exploration programme and build a strong foundation.
Geophysics for Geologists	103	The course introduces geophysical methods, their role in mineral exploration and geophysical signatures of uranium deposits.
		Learning gravity and magnetic fields, it's variation across the earth, instruments, data collection, processing and application.
		Understanding various electrical and electro-magnetic methods, electrical properties of rocks, instrumentation, data collection, processing and interpretation.
		The course also introduces seismic methods and borehole logging methods in exploration.
Uranium Geology	105	The course imparts knowledge on distribution of uranium in crust, rocks and minerals, time bound character and classification of uranium deposits.
		The course also deals with geological aspects of various types of uranium deposits, world and Indian deposits, controls of mineralization, exploratory guides.
		Students also learn stages of uranium exploration,

		survey methodologies, sampling techniques, drilling, borehole logging techniques
		Training on interpretation of exploratory data, correlation of mineralized intercepts, estimation of resources, recent trends in exploration, status of uranium supply and demand
Drilling and Mining Techniques	106	Understanding types and techniques of drilling used in atomic mineral exploration
		Learning about rock drilling, diamond drilling, controlled directional drilling, types of drilling used in the department.
		The course also introduces mining, mining terminologies, types of mining.
		Students learn techniques in open cast and underground mining, blasting, economic feasibility, milling and waste disposal.
Geochemical Exploration	108	The course introduces geochemistry as branch of geology, elements - primary geochemical differentiation, classification and associations, major, minor, trace, REE and uranium geochemistry.
		Students learn geochemical thermodynamics, standard states, non-ideal solutions and phase diagrams.
		Hydro-geochemical concepts, pH and Eh, physico-chemical environment of ore genesis under various geological environments.
		Types of geochemical surveys for mineral exploration, primary and secondary dispersions, geochemical maps, processing and interpretation of geochemical data.
Exploration for Beach Sand and RM&RE	202	Introduces placer minerals and environments, processes controlling formation of placer minerals, transportation and deposition.
		Learning exploration of beach sands, sampling, analysis, methods of estimation and classification of resources, mining methods and processing, world resource scenario.
		The course also introduces Rare Metal and Rare Earth minerals, their geochemistry, mineralogy. Geology of Rare Metal bearing granites, pegmatites, carbonatites.
		Study of exploration techniques, geochemical methods, sampling, resource estimation and recovery.
Petrographic Techniques	206	Study of minerals and rocks under transmitted and reflected light, polarising microscope, thin sections and polished sections.
		Learn petromineralogical techniques, optical properties of minerals, microindentation hardness, radioactive, rare earth element and rare metal bearing minerals, mineralogical expression of radioactivity, EPMA analysis.
		Study of petrography, paragenesis, learning modal analysis and norm calculation.

		Presentation and preservation of data and assessment
Mineral Process Engineering	208	The course introduces basic principles of mineral processing unit operations and hydrometallurgy with special emphasis on atomic minerals
		The curriculum familiarizes with flowsheet development for low grade uranium ores of Indian origin and beneficiation of beach sand minerals.
Analytical Techniques	210	The course introduces principles and instruments of analytical methods used in atomic mineral exploration.
		X-ray diffraction technique for identification of minerals and cell parameters, WD & EDXRF, ICP, AAS, flourimetry and other chemical methods for analysis of geological materials
		Concepts and use of radiometric dating methods, stable isotope studies for understanding geological processes.
Ore Reserve Estimation (Covered as part of field training)	204	Resource database generation, geological model, density factor, sampling issues, validation of data.
		Ore body configuration, traditional and geostatistical methods of resource estimation
		Resource categories, feasibility studies, environmental issues

SUBJECTS FOR GEOPHYSICS:

Sr. No.	Name of the Course	Course Code
1	Geology for Geophysicists	104
2	Theory of Fields	107
3	Seismic Methods	109
4	Computational Geophysics	201
5	Signal Processing & Inversion Techniques	203
6	Gravity and Magnetic Methods	205
7	Electrical & Electromagnetic Methods	207
8	Well logging Techniques	211

Course Outcome:

Name of the Course	Course Code	Course Outcome
Geology for Geophysicists	104	The course introduces structure and composition of the earth, surface and internal processes, rock structures, stratigraphy principles and elements of Indian stratigraphy.
		Gives brief introduction to rock forming and ore minerals, common igneous, sedimentary and metamorphic rocks, structures and textures.
		Learn dynamic earth, continental drift, plate tectonics and associated mineral deposits.
		The course also introduces ore forming processes and

		mode of occurrence of common ore deposits.
Theory of Fields	107	The Course introduces the basic concepts of the mathematics and physics of Potential Field theory.
		The topics covered in this course are gravitational, magnetic, electrical & electromagnetic fields of the earth and their derivations from potential functions with applications.
		The course also discusses about theorems of Laplace, Poisson's, Gauss and Green and their applications to geophysics. Computations of numerical problems
Seismic Methods	109	Familiarization of the basic concepts and principles of seismic prospecting. Reflection, refraction and diffraction from multilayered media, Seismic wave propagation, Factors affecting seismic wave velocities discussed.
		Energy sources, geophone, hydrophone, noise profile analysis and Source -detector arrays. Seismic reflection & refraction methods, geometry of waves and interaction with two layer and multilayer media. Field layouts, Static corrections, NMO, Migration, Common Depth Point techniques. Vertical seismic profiling; 3D and 4D seismic exploration, Seismic tomography
		Processing and interpretation of seismic refraction and reflection data. Determination of velocities and depths to the layers.
Computational Geophysics	201	The course provides an introduction to different numerical methods applied to geophysical problems. Partial differential equations in geophysics .The course offer hands-on experience in numerically solving partial differential equations, statistical data and variance Analysis in geophysics.
		The finite-difference (FDM) & finite-element methods (FEM) applied to basic geophysical problems. Explicit and Implicit finite difference methods, Error and stability analysis. Fundamentals of FEM, interpolation functions, method of weighted residuals, Laplace and Poisson equation, Numerical integration
Signal Processing & Inversion Techniques	203	Application of advance signal processing techniques in geophysics. Various integral transforms – Fourier, Hilberet, Hankel, Walsh, Laplace and Z transforms. Digital filtering, sampling and designing filters.
		Application of inversion techniques in geophysical data processing. Fundamental concepts of Inversion with discrete and continuous models. Optimization techniques and algorithms, generalized and constrained inversion. Singular value decomposition, Backus-Gilbert Inverse problem
Gravity and Magnetic Methods	205	The course discusses in detail the theoretical concepts of Earth's gravitational field and geomagnetic field. Theory and principles of Gravimeter and magnetometers.
		Data acquisition and corrections applied to gravity and magnetic data are explained in detail with data. Processing of data and application of time domain and frequency domain filters and various data enhancement techniques.

		Computation of gravity and magnetic anomalies due to regular shaped bodies. Spectral analysis of potential field data. Modeling and inversion of gravity and magnetic data.
Electrical & Electromagnetic Methods	207	Electrical properties of rocks and minerals. Electrical conduction in rocks and earth materials. Familiarization of the concepts of electrical and electromagnetic prospecting. Classification of Electrical and Electromagnetic methods
		Resistivity and Induced Polarization techniques – Theory, Practice and applications with case studies. Electromagnetic methods – Frequency domain, Time Domain and Natural Source EM methods – Equipment, field procedures
		Interpretation techniques of Electrical and Electromagnetic data – Vertical Electrical Sounding, Pseudo-sections, VLF, HLEM, TURAM and TEM sounding data.
Well logging Techniques	211	Learning the basic concepts, characteristics of borehole conditions, reservoir properties, principles and instrumentation of well logging techniques.
		The course introduces the different types of electrical, nuclear, sonic, EM and other logging techniques and their application in mineral exploration. Operational survey procedures and interpretation of various logs.
		Identification of sub - surface formations based on interpretation. Computation of various parameters from the log data.

BARC TS NFC Hyderabad Course Outcome

Chemical Engineering

Nuclear Engineering Module

Sl. No.	Subject Name	Course Code	Course Outcome
1	Engineering Mathematics	NE1 E02	Advanced knowledge in computational data analysis, data fitting and error analysis. Analytic and Theoretical calculation and its practical implementation. Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering.
2	Nuclear and Reactor Physics	NE2 E07	Learn neutron physics, reactor physics; reactor kinetics and reactor control, all needed for working with Nuclear reactors.
3	Reactor Engineering and Radiation Shielding	NE3 E13	Good understanding of Thermal, Fast Breeder and advanced reactor Engineering concepts Learning the interaction of ionizing radiation with variety of materials like metals, non-metals, glass & plastic, all needed for working with Nuclear reactors.
4	Health Physics, Chemical Plant Safety and Environmental Engineering	NE4 FC02 E06 CC09	Learning the interaction of ionizing radiation with matter, Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation. Principles of radiation detection and Radiation Protection procedures. Learn about Hazardous properties of chemicals, safely handling of Hazardous chemicals, All needed for working in Radiation environment, various Hazardous areas.
5	Nuclear Power Plant Engineering	NE5	Good understanding of Thermal, Fast Breeder and advanced reactor physics concepts. Familiarization with reactor physics design challenges Advanced reactor concepts with passive safety features.
6	Material Science in Nuclear Engineering	NE6	Overview of Nuclear materials & their classifications. Structure and properties of nuclear materials. Processing of nuclear materials. Material characterization techniques.
7	Nuclear Fuel Cycle and Water Chemistry I & II	NE7 FC07 FC08 CMEI-50	Familiarisation with front and back end of nuclear fuel cycle technology. Knowledge of radioactive waste generation on nuclear fuel burning and its processing. Knowledge of Isotope separation process and Heavy water production. Need to know working in HWP, BARC facilities etc.

Core Engineering Module

Sl. No.	Subject	Course code	Course Outcome
1	Computational Fluid Dynamics and Heat Transfer	CEM1 E21 CM40	Understanding Kinematics of fluid flow and governing equations Classification of Partial Differential Equations & their discretization Convective heat transfer for internal and external flows. Numerical Solution of fluid flow and heat transfer equations.
2	Basic Process Instrumentation and Control	CEM2 CC03 M20	Detailed exposure to Flow, Pressure, Level, Temperature Understanding Analytical Instrumentation P/I & I/P Converters, Impulse Tubing Exposure to P&I Diagrams and Design Guides.
3	Process Dynamics, Analysis and Control	CEM3 E31 E29:50	Introduction to process control & control loop dynamics Fundamentals of state-space controls, state, measurement equations General solution of the state equation Multi-variable controls, de-coupling, relative gain array.
4	Advanced Mass Transfer, Equipment Design and Solvent Extraction and Equipment design	CEM4 E32 AC03:C45	Understanding Mass transfer with and without chemical reactions Rate based approaches for design Selection and design of various contacting equipment Process intensification approaches.
5	Process Modeling, Simulation and Optimization	CEM5 E 33 C20	Formulation of Dynamic and steady state models Flow sheet Analysis & Plant Simulation General Approaches for Non-Linear Systems. Plant optimization by Genetic Algorithms and Neural Nets.
6	Advanced Chemical Reaction Engineering	CEM6 E30 C25	Fundamentals of Non-ideal reactors & RTD studies Understanding Non-isothermal effects & dynamical behavior. Overview of Heterogeneous reactions Approaches in Advanced reaction engineering & reactor design.

Core Electives Module:

Sl. No.	Name of the Course	Course Code	Course Outcome
1	Systems Management: A, B, C, D and E (Project, Maintenance, Operation & Quality management, Reliability Engineering)	C Elect 1 AC 06 AC 08 CC 10 CEEIM 50	Learning under system management project life cycle, project scheduling, resource planning, analysis; ISO system principles, auditing of QMS &EMS, planning, organizing & controlling; objectives of maintenance functions, component life time, process of failures, routine maintenance, productive maintenance, total quality maintenance; Understanding Reliability Principles and Applications to Nuclear Reactor Systems Overview of Statistical Methods Exposure to Fault Tolerance, Fault Avoidance Techniques.
2	Electrical Engineering Practices in Process Industries	C Elect 2 FC 09 E 20	Exposure on Fundamentals of Electricity, power supplies, electrical machines, circuit breakers and safety aspects need to know working in Industries.
3	Energy Conservation and Demand Side Management	C Elect 3 AC 07 CMI 20	Understanding about Energy scenario, Energy conservation techniques and analysis by Thermodynamics need to optimize the energy consumption in Industries.
4	*Vacuum Technology	C Elect 4.1 M 13 NEW- C 20	Understanding of vacuum physics, its measurement, operation and leak detection and applications.
5	*Statistics for Engineers	C Elect 4.2 NEW- M C 20	Learning about treatment of data, probabilities, random sampling & distribution, testing and control charts.
6	*Corrosion Engineering	C Elect 4.3 EN-615	Understanding electrochemical theory of corrosion& corrosion basics. General principles of corrosion control. Forms of corrosion and its mitigation. Corrosion problems in nuclear industry and its mitigation.

* Optional Subjects (one out of three subjects to be selected)

Practicals /Experiments

Sl. No	Subject	Course Outcome
1	Material Science in Nuclear Engineering and Corrosion Engineering	Better understanding about selection of material and their properties in Nuclear engineering.
2	Health Physics	Enhancing hands on practical experience on Radiation measurement & precautions on safe handling methods.
3	Process Control and Instrumentation	Practical experience on calibration of different type of process instruments, demonstration of field instruments and different type of process controls.

Non-Subject Assignments

Sl. No.	Name of the Course	Course Out come
1	Viva Voce –I,II &III	Assessment of grasp of the basic concepts in the courses covered. Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.
2	Mini Project	To provide a hands-on experience of working in an ongoing project of the Department. Gaining experience in formulating and executing a scientific/technical problem. Compiling a project report highlighting the scope, methods and deliverables of the project followed by a seminar presentation to an expert committee.

Core Engineering Module

Sl. No.	Subject	Course code	Course Outcome
1	Statistical Quality Control for QA	CEM 1 QA-01	Learning about Measuring errors by using different theories and minimization. Quality control and analysis from raw material to the final product with the help of Standards and standard procedures.
2	NDT & QC of Nuclear Fuel and structural components	CEM 2 QA-02	Learning about various NDT tests and quality checks during fabrication of tubes, components, fuel and structurals.
3	Design of PHWR Fuel and Structurals	CEM 3 QA-03	A Clear understanding of fuels, various structural materials and design of the Reactor, needed to work in Reactors and quality check in Production industries.
4	Engineering Design and Finite Element Methods	CEM 4 AC09	Detailed exposure on Element shape functions, Bar elements, Beam elements, 2D and 3D elements, Shell element. 2Disoparametric formulation. Introduction to Nonlinear problems Finite element applications for design
5	Material Characterization and Applications	CEM 5 EN713	Understanding of microscopy techniques: optical, SEM, TEM, UT, ECT, RT, LPT, MPT, XRD and applications. Analytical TEM and Metrology.
6	Basic Process Instrumentation and Control	CEM 6 CC03 M-20	Detailed exposure to Flow, Pressure, Level, Temperature Understanding Analytical Instrumentation P/I & I/P Converters, Impulse Tubing Exposure to P&I Diagrams and Design Guides

Core Electives Module

Sl. No.	Name of the Course	Course Code	Course Outcome
1	Systems Management: A, B, C, D and E (Project, Maintenance, Operation & Quality management, Reliability Engineering)	C Elect 1 AC 06 AC 08 CC 10 CEEIM 50	Learning under system management project life cycle, project scheduling, resource planning, analysis; ISO system principles, auditing of QMS &EMS, planning, organizing & controlling; objectives of maintenance functions, component life time, process of failures, routine maintenance, productive maintenance, total quality maintenance; Understanding Reliability Principles and Applications to Nuclear Reactor Systems Overview of Statistical Methods Exposure to Fault Tolerance, Fault Avoidance Techniques.
2	Corrosion Engineering	C Elect 2 EN-615	Understanding electrochemical theory of corrosion& corrosion basics General principles of corrosion control Forms of corrosion and its mitigation Corrosion problems in nuclear industry and its mitigation
3	Image Processing and Machine vision	C Elect 3 EN-710	Understanding techniques for Image Processing and Morphological Operations Understanding Image Models for Machine Vision Scene Interpretation and recognition Understanding Robotic Applications
4	*Data Base Management System and Web Technology	C Elect 4.1 EN-705	Understanding SQL and Complex queries Understanding Clusters and Distributed Databases Understanding and Working with Web Technologies Modeling data and design of real data bases
5	*Advanced Computational Techniques	C Elect 4.2 EN-701	Learning about Programming Language C++, Parallel Programming, Scientific, Visualization and Artificial Neural Network.

* Optional subjects (one out of two subjects to be selected)

Practicals /Experiments

Sl. No	Subject	Course Outcome
1	Material Science in Nuclear Engineering and Corrosion Engineering	Better understanding about selection of material and their properties in Nuclear engineering.
2	Health Physics	Enhancing hands on practical experience on Radiation measurement & precautions on safe handling methods.
3	Process Control and Instrumentation	Practical experience on calibration of different type of process instruments, demonstration of field instruments and different type of process controls.

Non-Subject Assignments

Sl. No.	Name of the Course	Course Out come
1	Viva Voce –I,II &III	Assessment of grasp of the basic concepts in the courses covered. Examine the aptitude of the student to apply the knowledge gained in individual subjects to establish linkages and solve problems across domains.
2	Mini Project	To provide a hands-on experience of working in an ongoing project of the Department. Gaining experience in formulating and executing a scientific/technical problem. Learning communication of research results orally and in writing.

Course Structure:

IV. Courses at IGCAR

Program Code: ENGG01	Programme Specific Outcome	To develop manpower for carrying out research and development work in the area of nuclear and engineering sciences
		Provide effective training to the students to work with various equipment including sophisticated facilities

FOUNDATION COURSES

Sr. No.	Name of the Course	Course code
1	Nuclear Reactors	NR
2	Engineering Mathematics	EM
3	Materials and Metallurgy	MM
4	Fast Reactor Physics and Shielding	RP
5	Reactor Engineering	RE
6	Health Physics and Radiological Safety	HP
7	Project Management	PM

Course Outcomes:

FOUNDATION COURSES

Name of the Course	Course code	Course Outcome
Nuclear Reactors	NR	Exposure to mechanical aspects of power plant engineering Details understanding of thermal and fast power reactors Introduction to sodium technology
Engineering Mathematics	EM	Advanced knowledge in Mathematics to understand the mathematical formulation of concepts in science and engineering Introduction to numerical methods for solving ordinay and partial differential equations Probability and statistics Different types of transformations
Materials and Metallurgy	MM	Development of a basic understanding on the classification of materials, mechanical property based selection of materials for nuclear application and standards Understanding of various fabrication related issues in material including welding and corrosion and non-destructive evaluation/assessment techniques to monitor and evaluate material damage

Fast Reactor Physics and Shielding	RP	In this course students learn about Properties of Nuclei; Binding Energy Curve; Stability Curve, liquid drop models of nuclei and importance of nuclear data, which are needed to understand nuclear fissions and fission energy. Further, reactor physics including fast reactors, Indian research reactors; reactor kinetics and reactor control, and concepts of radiation shielding all are needed to the students working with the area of interdisciplinary science as nuclear reactor technologies.
Reactor Engineering	RE	Basic understanding of core design of LMFBR Coolant circuits of LMFBR and special characteristics of sodium technology
Health Physics and Radiological Safety	HP	Introduction to radiation sources and learning the interaction of ionizing radiation with matter Knowledge of Biological effects of ionising radiation, Radiation Protection and Regulation Principles of radiation detection and Radiation Protection procedures Familiarization with principles of radiation detection and radiation Protection procedures
Project Management	PM	To meet the research requirement of the individual student. (Course content varies according to instructor's choice.)

(A) MECHANICAL ENGINEERING

(A1) CORE ENGINEERING

Sr. No.	Name of the Course	Course code
1	Code Design for Pressure Vessels and Piping	ME1
2	High Temperature Design and Inelastic Analysis	ME4
3	Computational Fluid Dynamics	ME6
4	Finite Element Method	ME8
5	Advanced Heat and Mass Transfer	ME10
6	Reliability Engineering	ME13
7	Manufacturing Technology	ME14

(A2) ELECTIVES

Sr. No.	Name of the Course	Course code
1	Machine Design	ME3
2	Structural Integrity Assessment Methods and NDE	
3	Vibration Engineering and condition Monitoring	
4	Seismic Design of Nuclear Reactors and Facilities	ME5
5	Plant Dynamics	

6	Experimental Mechanics	
7	Process Control and Instrumentation	ME15

(A3) PROJECT/SEMINAR

Sr. No.	Name of the Course	Course code
1	Project	02ENGG04-001-P
2	Seminar -1,2,3	02ENGG04-001-S

Course Outcomes:

(A1) CORE ENGINEERING

Name of the Course	Course code	Course Outcome
Code Design for Pressure Vessels and Piping	ME1	Design of pressure vessels and piping are standardised. Various codes present the design in detail. In general ASME Sec VIII Div 1 and B31.1 Power Piping code are most popular for industrial vessels and piping circuits.
		The course contains the design of cylindrical vessels for internal and external pressure, different types of closures, nozzle reinforcement, piping flexibility analysis and WRC bulletin 107 & 298 for qualification of nozzles.
		The course also include introduction to tubesheet design for heat exchangers as per TEMA code, flange design and support design for vessels and piping.
		In the present subject, basic design philosophy and design procedure for thickness calculation are covered. The literature and experimental background to the design procedures and thickness calculation are also covered. It is a thirty hours course, which is sufficient to cover basic theoretical introduction to above subject. This subject gives the insight into the design procedure which is helpful to understand and use the code for designing.
